 24a COMPARATIVE STUDY OF STATE LICENSING BOARDS FOR SCHOOL admimISTRATION AND OTHER SELECTED PROFESSIONS. BY- MOLINARI, RALPH G. AND OTHERS UNIVERSITY OF DENVER, COLO. REPORT NUMBER CRP-S-337 PUB DATE 66 REPORT NUMBER BR-5-8178 EDRS PRICE MF-\$0.18 HC-\$4.32 1U8P.

DESCRIPTORS- *STATE BOARDS, COMPARATIVE ANALYSIS, *SCHOOL ADMINISTRATION, *TEACHER CERTIFICATES, DENVER, COLORADO

COMPARISON OF THE COMFOSITION, CHARACTERISTICS, AND CURRENT LICENSING PRACTICES OF STATE LICENSING BOARDS FOR EDUCATIONAL ADMINISTRATION WITH LICENSING PROGFAMS FOR SEVEN OTHER PROFESSIONS, ZACCOUNTANCY, ARCHITECTURE, DEMTISTRY, ENGINEERING, LAW, MEDIGINE, AND NURSING) WAS THE PURPOSE OF THIS NATIONWIDE STUDY. THE RESEARCH PROCEDURES WERE DIVIDED INTO THREE PHASES--(1) REVIEW OF THE LITERATURE, (2) SURVEYY OF LICENSING BOARDS IN THE 50 STATES, AiNit (3) COMPARATIVE ANALYSIS. SURVEY INSTRUMENTS WERE DEVELOPED AND USED FOR COLLECTING (1) PERSONAL DATA (AGE, SEX, TYPE OF BOARD MEMBERSHIP HELD, PROFESSIONAL STATUS, AND EDUCATION), (2) MAJOR BOARD CHARACTERISTICS EREGULATORY POWERS, QUALIFICATIONS FOR \&EEMBERSHIP, AND LEGAL AND FINANCIAL STATUS OF BOARD), AND (3) MAJOR LICENSING PRACTICES (METHODS AND REQUIREMENTS IMPOSED UPON APPLICANT, LEGAL PROCEDURES USED BY A BOARD ISSUING LICENSES. AND METHODS OF POLICING PRACTITIONERS). DETAILED CONCLUSIONS WERE DISCUSSED AND PRESENTED IN THE REPORT. (GC)

## CHAPTER I

NATURE AND SCOPR OF TER STUDY

## Introduction

To achieve the essential task of establishing balance between freedom and order, state governments continuously sought ways of recono ciling the demands of special groups with the public interest from the late eighteenth century to the twentieth century. One means by which states regulated and controlled apecial occupational groups, such as the professions, was licensure of the practitioner. Ordinarily, the licensing function was delegated to state boards specially created for this purpose. According to Pesler, some state licensing boards were controlled by the professions, while others were not. The sagree of professional autonomy attained by some professions was in direct relationship to the extent of professional control over licemsing. ${ }^{1}$

## Statement of the Problem

The puxpose of this nation-wide study was to compare the composition, characteristics, and current licensing practices of state licensing boards for educational administration with seven other professions; namely: accountancy, architecture, dentistry, engineering, law, medicine, and nureing.

To eatablish the status of the boards, three major areas of inquiry were orgenized for examination. Specific factors in each of

[^0]the thrise following areas were investigated to determine the boards", status.

Composition of the licensing boards for the eight professions. This area of the survey determined:

1. the number of members required on the state licensing boards,
2. the proportion of men to women on state licensing boards,
3. the age ranges of board members,
4. the years served in board membership,
5. the occupational status of the board mempers,
6. the highest degrees attained by board members.

Characteristics of the licensing boards. This area of the survey determined:

1. how members were selected for board merabership,
2. the dependency status of licensing boards,
3. the mechanics of issuing licenses used by the licensing boards,
4. the regulatory status of licensing boards,
5. qualifications for board membership,
6. the degree of state support of scate licensing bosrds,
7. methods by which boards vere financed,
8. methods by which board members were remunerated.

Gurrent licensing practicies of the licensing boards. This area of the aurvey determined:

1. standards for conferring licenses,
2. the status of comity, recipyocity, or lieenge endorsement among the states in granting licenses within the same professions,
3. methods of license renewal,
4. the status of appeal procedures,
5. the frequency of appeals,
6. who held appeal hearings.

## Importance of the Study

As a result of political pressure from the older professional societies during the period from the late eighteenth century to the early twentieth century, state governmencs enacted iegisiation which required the professions to license all practitioners. ${ }^{2}$ This function was ordinarily delegated to professional licensing boards which were expowered to grant licenses, either at their discretion or when a legal, prearranged set of standards was met. ${ }^{3}$ The requirements varied from profession to profession because of the historical settings in which they were deve?oped and the unique factors which distinguished each group from the other. In spite of the differences among professions, wost have followed similar steps in their evolutionary development. ${ }^{4}$

Professional licensare. In 1910, professional persons constituted 4.7 per cent of the total labor force; 5.2 per cent in 1920; 6.7 per cent in 1930; 6.8 per cent in 1940. In 1950 and 1960, profeseional

3tresier, gp. cit., p. 47.
4T. M. Stinnett, The Tnecher and Professional Organizatione (third edition; Washington, D. C.: National Education Association, 1956), p. 9.
persons constituted 8.0 per cent and 12.0 per cent, reapectively, of the total labor force, or $4,342,880$ and $7,156,800$ people. 5 Within the professional ranks of educational administration, there were iod,925 school administrators in $1963 .{ }^{6}$

In 1960 there were 7,324,906 accountants and auditors, 30,329 architects, 87,110 dentists, 869,716 technical engineers, 209,684 1awyers and judges, 590,569 nurses and 230,307 physicians and surgeons. 7

In 1952, the Council of State Governments reported that the states enacted legislation which required education and/or experience qualifications and licensure as conditions of entrance into the practice of approximately seventy-five occupations. ${ }^{8}$ The 3,750 licensing boards for the seventy-five professions wieided considerable state giver power.

Prior to 1949 only limited examination and study were made or licensing boards, although their operation involved several thousand persons. The United States Office of Education conducted a survey of state departments of education in 1949, in which the general composition

[^1]of state boards of educacion was determined. 9 A trend was developing toward appointment of board members by state governors: It was indicated that in order to represent the people well, a board should have nine to twelve members. Four states required some of the board members to be professional educators, while nine states had no state boards of education at all.

In 1926 Schrammel conducted a study of the organization of state. departments of education. 10 His findings on the organization of state boards of education indicated that the number of these boards increased from twenty-nine to forty-one between 1890 and 1925. Earlier, most of the boards were composed chiefly of appointive-ex officio members. By 1925, with the exception of the state superintendent and the governor, ex officio members were almost entirely eliminated. The appointment of members who did not hold ex officio memberships was vested in the governor in nearly all states.

Schramel indicated that e board from five to mine members could work efficiently without domination by one person, and still be adequately representative of the people. In most cases, board members were compensated for expenses. No conclusions as to board functions were drawn, except that state boards of education control all of the educational interests in some of the states.

[^2]Fesler made a general study of state regulatory agencies in which he tried to desermine the effect of professional autonomy and regulation upon (1) the profisssions being licensed, and (2) the public interest. ${ }^{11}$ He concluded that: (3) some sort of liaison or chanael of commanication should be established between the professional specialists on the boards and the public interest, (2) the requirement:s for professional candidates shculd be raised no higher than to keep out the inefficient, (3) the government should impose more effective means of contrel over the professions.

Lieberman pointed out that the factors causing growth lin the ranks of proflessional groups and the evolving forces which determined their occupational status could be applied to upgrade tifie profession of educetion. The licensing characteristics were important vith respect to their effect on professional control of the practitioner. 12

Progessional gutonomy. As a result of the Flexner report in 1910, the medical profession was able to raise its professional standards and attein a status of professional autonomy it had not before achieved. ${ }^{15}$ The same effect was achieved for the dental profession after the 1926 Gies report. ${ }^{14}$ A major part of this autonomy was in the
${ }^{11}$ Fesier, pp. cit., Pp. 46-60.

${ }^{13}$ Abraham Flexner, Madical Education in the United States and Capade (New York: Carnegie Foundation for the Advancement of Teaching, 1910), p. 346.

14 william J. Gies, Dentel Education in the United States and Canda (New York: The Carnegie Foundation for the Advancement of Teaching, 1926), p. 692.
hands of the state and national associations. Fesler indicated that state licencing bosrds for each of these professions were ielegated control over entry into and expulsion from the professione. Standards of performance within the professional group were also upheld by these boards. 15

Fensch and Filson observed that as the American commsity changed from a rural to an urban one, there was a corresponding increase in population, there was a demand for increased specialized school administrative services, and there was a constant consolidation of school dietricts which was taking place. The implication was that greater professionalization of the educational adninistrator was necessary. 16 Could the profession upgrade itself by means of the current scope of licenaing autonomy it possessed?

There was a growing abundance of literature directly related to many aspects of the expanding professional group. Want of literature dealing with the comparative development of the licensing phase of educational administration evidenced the need for the study.

## Yethod of Procedure

Basic research procedure utilized in this study was the descriptive survey, which was divided into three phases: (1) review of literature, (2) survey of licensing boards in the fifty states, and (3) comparative analysis of the composition, characteristics, and

[^3]licensing practices of the state licensing boards for educational adaindatration with accowntancy, architecture, deatistry, engineering, law, medicine, and nursing. The review of literature, the survey, and the comparative analysis were accomplished by the following procedure.

Revitas of literature. The objective of the Rarst phase was to establtah the rationale for the items to be used in the survey instruments. The review of literature indicated that certain specific factors delineated board composition, characteristics and licensing practices. These reviews were placed at the beginuing of Chapter II and Chapter III.

The survey of licensing board in fifty states. The purpose of the second, or survey phase, was to determine the current status of the (1) board members, (2) 1icensing boards, aní (3) licensing procedures of the eight profeseions. Data were collected by means of two survey instruments. The items used in the instruments were formulated by reviewing the literature and then presenting them for criticism and refinement to four persons recognized as authorities in the field of Iicensure and state licensing boards. By means of the first instrument, personal data were collected from members of the state licensing boards. By means of the second instrument, data related to board characteristics and licensing practices were collected from the board secretaries. State departmencs of education, atate directories, statutes, and state licensing board chairwen also helped in collecting data about state licensing boards.

The instruments were administered to all board members and board secretaries. The data collected from the instruments were placed on
data collection sheets for investigation. The findings were then reported in tabular form. As a result, the composition, characteristics, entrance requirements, end licensing procedures and practices of each profession were determined.

There werre 1,673 cepies of the first instrument which were forwarded to the members on 397 state licensing boards. Tabulations indicated that 89.4 pey cent, or 1,495 iastruments were returned. There were 397 copies of the second instrument which were forwarded to the boazd secretaries. Tabulations indicated that 265 instruments, or 65.8 per cent of the total were returned.

The composition of the boards' membership was examined by means of grouping and tabulating susin charactexistics as age, sex, board status, educational, occupational, and professional background.

The characteristica of the boards were established through tabulating personal qualifications required of board members, methods of gaining board membership, and board financial procedures.

The licensing practices of the boards were established by tabulating: methods of applying for licenses; methods of granting licenses; degree of responsibility for issuance of licenses; period for which license was issued; age of licensee; moral requirements; educational and experiential requirements. A tabulation was also made of the codes of ethice controlling the boards, comity and/or reciprocity, and the prosedure used in cases of appeal.

Comparative analyis. The purpose of the last phase was to compare educational administratration with seven other professions. The composition, characteristics, and ilcensing practices of the state
licensing boards for educational administration obtained in step two were compared with the state licensing boards of the seven other professione.

## Delimitations

It was not the purpose of this study to: determine whether or not a monopoly existed in each profession: review the educational requirements for licensure in each profession; examine, evaluate, or question the efficiency of operations or the effectivoness of the policies of state licensing boards.

## Definition of Terms

License. Licensing in this study referred to a regulatory device by which the state protected the people from injury to health, security, and welfare by allowing professional groups to set up standards of admission to and internal control of their ranks. 17

Licenging board. A licensing board in this study consisted of an official state group which isaued licenses for admission to practice in a profession. 18

Seven comparative profengional groups. The seven professional groups which were compared to educational administration in this study were (1) accountancy, (2) architecture, (3) dentistry, (4) engineering, (5) law, (6) medicine, and (7) nursing.

## CHAPYER II

 EOR CURRESII BOARD COMPOSIXION AND SHARACTERISTICS

## Puspons of This Chapter

The purpose of this chapter was to survey and oompare the composition and chazacteristics of state licensing boards for educational adminiatration with seven other professions. A reylew of the ilterature rowealed a narrow variety of factors by which atate licensing boaxds were reviewt. These factors were compiled, classificd, and sumarized into a comprehensive set of litems by vhich the composition and characterlstics of state licensing boards were determined. Further verification of the items was accouplished threugh the involvement of four persons recognied as authorities in the area of licensure and atate licensing boards.

Next, two data collecting instruments were developed. The first Inetrument was sent to mesberz of state licensing boards. The second Ipptrument was sent to the exeçutive secretarios of state licensing boafis. The returned data were put onto data collectipn sheets. These compilations ware then tabulated. The rest of the chapter was devoted to the results of the tabulation dealing whth boapt composttion and characteristics.

## Copmeruction of the Inderuments

 that certain apecific factors dietinctiy delineated board composition
and chasacteristics. Will, ${ }^{2}$ Stinacte amd Huggett, ${ }^{2}$ Licherman, ${ }^{3}$ and the Council of State covarnments" sought to determine what the proper role of a atace licensing board was in reletion to the profession and the meeds which it served. Those factors conaidered to be pertinent to state board composition and charmeteristics ware presented below.

Liekerman stated that " . . the soundest procedure, and one gemerally advocated in the established professions, is for a state board, composed of practitioners of the profession itself, . . . ${ }^{15}$ He pointed out that excapt for edrention, anost of the profeasions in the United States have steadily moved toward the exiterda of professionalisation for almost half a century.

W111 ${ }^{6}$ examined the charectusiatics of state bourds for educational acimaistration in terme of the following factors:

1. the eccupational status of the board manber,
2. the term of affice on the board,
3. special requizemanta for board membership, e.g., age, sax, education,
$1_{\text {Robert }}$. Will, State Educatiof: Structure and oranization Vaited Statea Department of Health, Education, end Welfare, United states Office of Education, Misc. No. 46 (Washington: Goverapent Printias Office, 1964), pp. 12-14.
4. M. Stinnett and Albert J. Huggett, Proferaiopal Problent of Tepehri (Her York: The Macmillan Company, 1963), Pp. 466-470.

3yyron Lieberman, ar. site, p. 95.
4he Council of State Govermments, gp. cit., pp. 87-88.

Gobert F. WK11, 2R. situ- Pp, 12-17.
4. the wethods of selecting boasd members,
5. the size of the board,
6. the legal status of the board, e.g., board services, methods of finance, remineration of member, uses of fees,
7. the regulatory powers of the board (in granting licenses),
8. the degree of board independence.

The Council of State Governments used factors dealing with profesaional reputation. It compared state boards of education with the state boards for ten other occupations.?

Rieberman felt that proper board evaluation must include ". . . the way in which the professional representatives on the Licensing boards are selected. . . . 18 A profession was guided by a code of ethics, and, therefore, the licensing board was also to be guided by this ethical code. ${ }^{9}$

Schrarme1 ${ }^{10}$ examined the historical development of state boards of education in terms of: (1) board composition, (2) board size, (3) legal status of board members, (4) legal qualifications of board members, and (5) compensation of board members.

Items selected. The items which were derived frow the review of literature were divided into two categories.

[^4]The first category, composition of state boarcis, consisted of four batic iteme:

1. board membership,
2. length of board service,
3. professional or occupational status,
4. educational background.

The second category, characteriatics of state boards, consisted of cisht items:

1. qualification for membership,
2. methods of attaining board membership,
3. board size (in membership),
4. remuneration of toard members,
5. number of gearly meetings,
6. code of ethics,
7. board regulation powers,
8. atate control of board functions.

Clarification of the items. To refine and clarify the basic items, the two categories were pxesented to four persons who were widely experienced with state licensing boards.

1. Mrs. M. Annie Leitch, Director, American Jursing Association Program for State Boards of Nursing.
2. Dr. K. H. Crabb, Secretary, The Federation of State Medical Boards.
3. Me. C. R. Locke, Director, Mational Confereace of Bar Ecaminers.
4. Dean L. Gustaveon, Chairman, Mational Council of Architectural Begistration Boards.

Eech persen was asked to criticize and offar suggestions dealing with board compesition and qualifications for membarship.

The iteme were naxt presented to the author's dissertation advisor, Dr. M. Cheoter Noite, and Dr, Kalph A. Forsythe, the Associate Direstor of the Bureau of Bducational Research at the University of Deaver for further criticism and suggestions.

As a secult of the clarification and suggestions, modifications were made in the two major eategories of iteme. It was suggested that the first category ought to include the various methods by which board mamers acquired their posts, the age and sex groups to which members belonged. The second category was expanded to include methods by which boards were financed, and how they disposed of their fees.

The first ingtrumant. An instrument was developed which set forth five major items with twelve subsections. The pereonal data sousht included: (1) age, (2) sex, (3) type of board maberchip held, (4) professional status, and (5) education.

The secgnd instrumat. A second instrument was designed, consiating of eighteen majoz itsme with ninctyotwo subsections. It included if:ems for both characteristics and current licensing practices of ateate boards. The major characteriatics sought included: (1) regulatory powers, (2) qualifications for nemberiship; (3) isgal and financial status of the board. The iteme and findings for board procedures wore reviewed in Chapter IV of this study.

Selection of respondents. The Colorado boards for the eight professions involved in the study were contacted in order to acquire the names and addresses of the executive secretaries and members on the other state licensing boards. During the months of Octcber and November 1965, letters were written to 397 board secretaries and 1,673 members explaining the purpose of the study. The inportance of their cooperation in completing the instruments was emphasized.

Eolloyoup. Dusing the autum, 1965 waiting period, 223 board secretaries and 1,145 board members responded and agreed to cooperate in the study. In January, 1966, feiiow-up letters were sent out to those searetezies and board members who did not respond to the initial letters. Of the 175 and 528 follow-up letters sent to board secretaries and board members, respectiveiy, 42 additional secretaries and 350 additional board members agreed to cooperate. Of the total, 132 board secretaries and 178 board members did not respond. At the end of February, 1966, the instruments were forwarded to 265 board secretaries and 1,495 board members.

## Oremigntion of the Regults of the Survey

Results of the first instrument and that part of the second instrument dealing with board charecteristics were reported in the romainder of Chapter II. The data received were placed on data collection sheets. The findings were organized into twerty tables: (1) eight dealt with board composition, (2) ten dealt with board characteriatics, and (3) two indicated the number of responses.

## Annlyan of the Compostion of State Licensins Boards

Percentase of members ${ }^{\circ}$ reaponses. There were 1,673 instruments which were forwarded to the members on 397 state licensing boards. It was shown in Table I that 89.4 per cent, or 1,495 members, returned inatruments. The mean number of members contacted per professional group was 209.1; the mean number of respondents was 186.9 nembers, or 89.5 per cent per professional group.

Between 94.2 and 100.0 per cent of the boards for each professional group except medicine and educacional administration returned the instruments dealing with board composition.

The educational adminatration group was sent 324 instruments. There were 210 respondents, or 64.8 per cent of the members, who returned completed copies. It was observed that the returns for educational administration were 25.6 per cent tess than for all professional groups as a whole. The medical group returned 85.3 per cent.

Methods of obtaining memership. Table II revealed that there were three mafor methods by which people were able to obtain board membership: (1) through an ex officio atatus, (2) appointiont by the governor, and (3) election.

Of the three methods cited above, 1,138 members, or 76.1 per cent of all respondents, were appointed by the governors of their states. There were 99 respondents, or 6.6 per cent who were elected and 6 respondents, or 0.4 per cent who were ex officio membeas.

At least 82.9 per cent or more of the members for each of the accountancy, architecture, dentietry, engincering, mèdicine, and nüraing

For all professional groups there were no members in the under 25 range, 2.9 per cent in the $26-35$ range and 9.6 per cent in the 66-over-range.

The percentage of members in tie; seven comparative professional groups who were between the ages of 36 and 65 ranged between a low of 78.9 per cent foz 1 lw and 94.5 per cent for dentistry. The respondents for educational administration who were between the ages of 36-65 comprised 175 members, or 83.3 per cent of the professional group; 21.4 per cent in the $36-45$ range; 34.3 per cent in the $46-55$ range; 27.6 per cent in the 56-65 range.

Years gerved on the board. Table $V$ was divided into five ranges for the years which members servect on state boards. It was indicated that 1,015 members; or 67.9 per cent of all respondents, served on the koard from 2-10 years. The table further showed that 218 members, or 14.6 per cent of all respondents, served on the boards from 0-1 year, that 184 mambers, or 12.3 per cent of the respondents, served on the boards from 11-20 years.

The percentage of members who served. on the boards from 2-10 years in each of the seven comparative professional groups ranged between a low of $\mathbf{5 8 . 2}$ per cent for law and a high of $\mathbf{7 9 . 8}$ per cent for dentistry. The percentage of members who served on 'he boards from 0-1 year ranged between 7.7 per cent for medicine and 24.7 per cent for accountancy, while the members who served on the boards from 11-20 years ranged between 2.7 per cent for nursing and 19.8 perr cent for medicine in each of the comparative groupis.

| Totals | 1495 | 218 |  | 1015 |  | 184 |  | 23 |  | 28 |  | 27 |  |
| Per Cent of Total | 100 |  | 14.6 |  | 67.9 |  | 12.3 |  | 1.5 |  | 1.9 |  | 1.8 |

It was observed that 124 members, or 59.0 per cent of the respondents for educational administration, served on the boards from 2-10 years; 28 members, or 13.4 per cent, and 39 members, or 18.6 per cent, respectively, served on the boards from 0-1 year and 11-20 years.

Occupacional status of members. Cable VI was divided into three major categories: professional practicioners, lay people, and other professional groups. Professional practitioners, 1,231 in number, comprised 82.3 per cent of all respondents. It was observed that 173 members, or 11.6 per cent of. the respondents were lay people, while 35 members, or 2.3 per cent of the respondents were members of other professional groups.

It was indicated that the percentage of board members in the seven comparative professions who were practitioners of the professions being licensed ranged between 34.2 per cent for engineering and 98.0 per cent for medicine. Lay people on the boards in these seven groups ranged between 0 per cent for architecture, dentistry, and 1 aw, and 2.5 per cent for-accountancy, while representation from "other professional groups" ranged between 0 per cent for dentistry, engineering, and law and 3.0 per cent for architecture.

In the educational administration group, 20 members, or 9.5 per cent of the group's respondents were practitioners of educational administration. Lay people on the boards for this group comprised 163 members, or 77.6 per cent of the respondents, while representation from "other professional groups" comprised 21 members, or 10.0 per cent of the reapondents.

In the law and the educational administration groups 21 members, or 10.8 per cent, and 28 members, or 13.4 per cent, practiced their professions or occupations from 0-10 years, respectively. In the engineering, law, and educational administration groups, 39 members, or 21.4 per cant, 26 members, or 13.4 per cent, and 24 members, or 11.4 per cent, reapectively, were practicing their professions or occupations 41-more years.
gighest degree gitained. Table VIII revealed that 877 members, or 58.7 per cent of all respondents, held graduate degrees, whereas 498 members, or 33.3 per cent held undergraduate degrees.

It was observed that in the seven comparative professions the parcentage of respondents who held undergraduate degrees ranged between a Low of 1.5 per cent for medicine and a high of $\mathbf{6 9 . 2}$ per cent for arehitecture. Those respondents in the seven groups who held graduate degrees ranged between a low of 19.3 per cent for architecture and a high of $\mathbf{9 8 . 8} \mathbf{8}$ per cent for dentistry. The medical and dental groups, respectively, had a membership in which 98.0 per cent and 98.8 per cent of the respondants heid graduate figgrees. The members of the other five comparative groups who held graduate degrees varied between a low of 19.3 per cent in architecture and high of 76.8 per cent in law.

In the educational administration group 76 members, ox 36.2 per cent of the respondents, held undergraduate degrees. The 107 members who held graduate degrees amounted to $\mathbf{5 0 . 9}$ per cent of all respondents for this group.

Degrees held in profesaional areas. Table IX revealed that 1,103 members, or 73.8 per cent of all respondents, carned degrees in their professional areas.

The memers who held degrees in their professional areas in each of the seven comparative professions, except accountancy, ranged between 76.9 per cent for nursing and $\mathbf{9 6 . 3}$ per cent for dentistry.

The members who did not hold degrees in their professional areas in the seven groups ranged between a low of 3.7 per cent for dentistry and a high of 44.3 per cent for accountancy.

In contrast, 15 mambers, or 7.5 per cent of the respondents in the educational administration group, held degrees in their professional area; 92.9 per cent of the respondents did not hold degrees in educational administration.

The accountancy group had 88 members, or 55.7 per cent of the group's respondents, who held degrees in their professional area.

## Amlyais of the Characteristics of Stite Licensing Boards

Percentage of boards' responses. There were 397 instruments which were forwarded to the executive secretaries of state licensing boards for eight professions in fifty states. It was shown in Table $X$ that 265 completed instruments, or $\mathbf{6 6 . 8}$ per cent of the total, were returned.

It was indicated that the boards for the sevan comparative professions which returned the instruments dealing with board characteristics and licensing practices, ranged between a low of 54.0 per cent for dentistry and a high of $\mathbf{7 4 . 0}$ for nursing. In contrast, 40 boards,

or 85.1 per cent of the educational administration group, responded, The mean average response per professional group was 33.1, whereas, 40 boards for the educationst suinistration group responded.

The requiatory status of the boards. Table XI revealed that 105 boardis, or 77.4 per cent of the respondents, were independent bodies. Within this category, 188 boards, or 70.9 per cent of the total, were independent boards which were empowered to issue licenses. It was indicated that 60 boards, or 22.6 per cent of the respondents, were advisory bodies.

It was observed that between a low of 60.7 per cent and a high of 90.0 per cent of the boards for the seven comparative professions were independent bodies. Within this category, except for law, the boards for the comparative groups which were empowered to issue licenses ranged between 67.7 per cent for architecture and 87.1 per cent for medicine. The number of boards in the law group which were independent bodies empowered to issue licenses were 15 , or 45.5 per cent of the total of the xespondents.

The boards for the seven comparative professions which were advisory bodies ranged between a low of 7.4 per cent and a high of 36.3 per cent. Within this category, the boards for the comparative groups which were empowered to issue licenses ranged between 0 per cent for law and 25.8 per cent for architecture. In the law group, 8 boards, or 24.2 per cent of the respondents were solely advisory bodies.

In the educational administration group, there were 39 boards, or 90.0 per cent of the respondents which were independent bodies. Within this category, 29 boards; or 72.5 per cent of the respondents,

* Department of Education; Department cf Professional and Vocational Studies; Division of Registration; Department of Health; Department of Cosmerce for
Finances; Department of Law and Public Safety; State Department of Banking and Insurance: Division of Professional Licenses
**Scate agency; administrative body under state statute; regulatory body; examining body only
were independent bodies which were empowered to issue licenses. In the category of advisory boards, 1 board, or 2.5 pex cent of the besards for educational administration, were solely advisory.

Codes of ethics. Table XII was divided into five mejor areas in order to determine if a code of etinics was established and if so, by what body. The data revealed that 237 boards, or 89.4 per cent of all respondents, adhered to codes of ethics. Within this category, 101 boards, or 38.1 per cent of the respondents adhered to a code of ethics established by the national professional associations; 52 boards, or 19.6 per cent of the respondents, adhered to codes of ethics established by the boards. State professional societies, state supreme courts, state professional schools, and state 3 tatutes were "other bodies" which established codes of ethics to which 58 boards, or 21.9 per cent of the respondents, adhered.

It was indicated that the percentage of boards in each of the seven comparative professions which adhered to codes of ethics established by the national professional associations ranged between a low of 0 per cent in accountancy and a high of 86.5 per cent in nursing. The percentage of the boards in each of the seven professions which adhered to codes of ethics established by the boards ranged between a low of 0 per cent in law and a high of 48.5 per cent in accountancy. The percentage of boards in the seven professions which adhered to codes of ethics established by "other bodies" ranged between a low of 0 per cent in architecture and a high of 69.7 per cent in law. The law group usually adhered to codes of ethics established jointly by the stare professional societies and the state supreme courts.

[^6]In the educational administration group, 20 boards, or 50.0 per cent of the respondents, adhered to a code of ethics established by the national association; 2 boards, or 2.5 par cent of the respondents, adhered to codes of ethics established by the boards; 6 boards, or 15.0 per cent of the respondents, adhered to codes of ethics established by "other bodies."

Size of state boards. Table XIII indicated that the mean average membership for all boards responding was 6.0 members per board. The mean average membership for each professional group varied from 1.3 below to 2.0 above the mean avarage for all respondents.

The actual membership on the boards in each of the seven comparative professions ranged between a minimum of 3 members for all groups and a maximum of 16 members for law and medicine. The mean average membership for each of the seven groups ranged between 4.7 members for accountancy and 7.5 members for medicine. No boards had less than a minimum of three members, but some were twice as large as others; e.g., some dental boards had eight members, others had sixteen.

In the educational administration group, the actual membership on the soards ranged from 3 to 21 members. The mean average membership for the group was 8.0 members. The maximum size of several boards of educational administration were almost three times as large as boards in the seven other professional groups.

Qualifications for board membership. In Tably XIV the results of mine major qualifications for board membership wre tabulated: (1) citizenship, (2) state zesidence, (3) professional practitioner, (4) lay person, (5) minimum age, (6) not beyond a maximum age, (7) boading, (8) professional experience, (9) mininum educational requirements.

The data revealed that in all professional groups, 235 boards, or 88.7 per cent of the respondents, required their members to be citizens; 247 boards, or 93.2 per cent, required their members to be state residenta; 226 boards, or 85.3 per cent, required their members to be professional practitioners; 29 boards, or 10.9 per cent, required their members to be lay peogle; 89 boards, or 33.6 per cent, reguired their members to be a minimum age; 5 boards, or 1.9 per cent, stipulated that meabers could not be beyond a maximum age; 68 boards, or 25.7 per cent, requixed that their members be bonded; 152 boards, or 57.4 per cent, required that their professional members have some experience; 152 boards, or 57.4 per cent, required that their members have minimum educational requirements.

It was observed that the percentage of boards in each of the seven comparative professions which required their members to be citizens and state residents ranged between 81.1 per cent in nursing and $\mathbf{1 0 0 . 0}$ per cent in accountancy, dentistry, and medicine. The percentage of boards in each of the seven groups which required their members to be professional practitioners ranged between 94.3 per cent In accountancy and 100.0 per cent in dentictry, engineering, and medicine.

* Chosacter and fitness; member of local school advisory council; no professional school affiliations: frivate or public; no other public office; administrative experience; eminence in the profession

Those boards which required their aembers to be lay people ranged between 0 per cent in architectiure and dentistry, and 11.4 per cent in accountancy. The percentage of boards for each of the seven groups which requized their members to be of a minimum age, or not above a maximum age, ranged between a low of 0 per cent for architecture, dentiatry, and engineering and a high of 60.0 per cent for accountancy. The mean minimum age ranged between 21 and 34 years; the mean maximum age limit ranged between 60 and 70 years. The percentage of boards which required their members to be bonded ranged between 6.1 per cent for law and 51.8 per cent for dentistry; those boards which required their members to have some professional experience varied between a low of 21.2 per cent for law and a high of 100.0 per cent for engineering and nursing. No boards had educational requirements for lay members; the percentage of boards who required their professional members to have minimum educational requirements ranged between a low of 32.3 per cent in architecture and engineering and a high or 93.5 per cent in medicine.

In the educational administration group it was observed that 33 boards, or 88.7 per cent of the respondents, required their members to be citizens; 35 boards, or 87.5 per cent, required members to be state residents; 6 boards, or 15.0 per cent, required members to be practitioners; 19 boards, or 74.5 per cent, required members to be lay persons; 8 boards, or 20.0 per cent, required members to be of a minimum age; 1 board, or 2.5 per cent, stipulated that members could not be above a maximum age. The mean average minimum age was 21 years, while the maximum nean age was 30 years. In 2 boards, or 5.0 per cent,
members haĩ to be bonded. No members: either lay or professional, were required to have experience or minimum educational requirements.

Methods of attaining boerd membership. It was established that there were three major methods, or combinations thereof, of obtaining board membership: appointment, election, or ex officio status. In Table XV it was revealed that in 230 boards, or $\mathbf{8 6 . 7}$ per cent of all respondents, membership was attained by means of appointment. There were 18 boards, or 6.8 per cent of the respondents, in which board members were elected. Board members were selected by a combination of the three major methods in 15 beards, or 5.7 per cent of the respondents; a combination of appointment and election was used in 2 boards, or 0.8 per cent of the respondents.

It was observed that the percentage of boards in the seven comparative professions in which members were appointed by the state governors ranged between 87.1 per cent in medicine and 100.0 per cent in architecture, engineering; and nursing. The percentage of boards in which members were elected, ranged between 0 per cent for accountancy, architecture, engineering, and nursing, and 11.1 per cent for dentistry. No boards for each of the seven comparative professions, except accountancy and medicine indicated that their members were selected by a combination of the three major methods; in accountancy and medicine, respective $1 y, 2.9$ per cent and 3.2 per cent of the boards indicated that their members were selected by this combination method.

In the educational administration group, it was indicated that board mabers were appointed in 17 boards, or 42.5 per cent of the

respondents. In 9 boards, or 22.5 per cent of the respondents, it was indicated that board members were elected; in 13 boards, or 32.5 per cent of the respondents, it was indicated that board members were selected by a combination of the three major methods; in 1 board, or 2.5 per cent of the respondents, it was ivuicated that board members were selected by a combination of appointment and election.

Average number of meetings held. Table XVI divided "average number of meetings held," into three categories: (1) meetings required by statute or board by-laws in one year, (2) the number of meetings heid between July 1, 1964 and June 30, 1965, and (3) the required number of meetings that a member must attend.

In the seven professional groups, an average of zero to two meetinge were required ir one year. In contrast, the educational administration group required an average of five meetings per year. The six groups actually held an average of from zero to nine meetings between July 1, 1964 and June 30, 1965; the educational administration group also held an average of nine meetings per year. None of the eight professional groups required that members must attend any meetings.

State support of the boards. The degree of board dependence on support from the state was established in terms of office space, staff and secretarial help allowed the board. Table XVII revealed that slightly more than 50 per cent of all respondents used office space provided by the states; slightly less than 50 per cent employed office staffs and secretaries provided by the states.

The persentage of boards in the seven comparative professions which utilized office space ranged between a low of 40.0 per cent for accountancy to a high of 59.5 per cent for nursing. It was indicated that the percentage of boards which employed office staffs and secretaries ranged between a low of 30.3 per cent for law and a high of 61.3 per cent for architecture.

In the educational administration group 26 boards, or 65.0 per cent of the respondents, utlized office space. There were 23 boards, or 57.5 per cent which employed office staffs and 30 boards, or 75.0 per cent which employed a secretary.

Methods by which boards rere financed. A number of categories were established to determine how boards were financed. Fees, dues, state appropriations or combinations of these three methods were the means by which boards were financed.

Table XVIII indicated that 90 boards, or 34.0 per cent of all respondents, were financed by fees; 81 bnards, or 30.6 per cent were Einanced by general state appropriations; and 46 boards, or 17.4 per cent were financed by a combination of fees and dues.

It was indicated that the percentage of boards for the sewon comparative professional groups which were Einanced by fees ranged between a low of 16.1 per cent for engineering and a high of 61.2 per cent for medicine. The percentage of boards which were financed by general state appropriations ranged between 6.1 per cent for 1 aw and 32. 3 per cent for engineering. Boards which were financed by fees and dues ranged from a low of 9.1 per cent for law and a high of 37.0 per cent for dentistry. The percentage of boards in the seven groups which

* Fees included: examination fees; license fees; registration fees; penalty fees; renewal fees
**Appropriations from the state professional association
were financed by fees and state appropriations ranged between 8.1 per cent for nursing and $\mathbf{1 8 . 5}$ per cent for dentistry.

In contrast, although boards for educational administration collected fees, none mere financed by fees alone, or by a combination of fees and dues. There sere 34 boesds, or 85.0 per cent of the respondents, which were financed by general state appropriations, and 1 board, or 2.5 per cent of the respondents, were financed by a combination of fees and appropziations.

Uses of fees. It was determined that there were six possible general uses of fees. Table XIX revealed that a majority of all respondents used any one of three major methods of using fees. The first method, retaining fees in fund, was used by 125 boards, or 47.2 per cent of the respondents. The second method employed, turning fees over to the state, was used by 90 boards, or 33.9 per cent of the respondents. The third method, in which the state deposited the fees into a special account for board use, was used by 34 boards, or 12.8 per cent of the respondents. The percentage of boards for the seven comparative professional groups which retained their fees in a fund ranged betwren a low of 32.3 per cent for engincering and a high of 71.0 per cent for architecture. The percentage of boards which turand their fees over to the state ranged between 15.2 per cent for law and 29.7. per cent for nursing. The percentage of boards whose funds weredeposited into a special fund by the state for the boards ranged between a low of 0 per cent for architecture and a high of 35.5 per cent for engineering.

In educational administration, although boards were not financed by fees alone, 3 boards, or 7.5 per cent of the respondents, retained cheir fees in a fund; 32 boards, or $\mathbf{8 0 . 0}$ per cent of the respondencs,

[^7]turned their fees over to the state; no boards' funds were deposited into a special fund by the state.

Methods by which members were remunerated. The two nost common methods by which board members were remunerated for their services were tabulated in Table XX. Of the two methods used, 147 boards, or 55.5 per cent of all respondents, reimbursed their members for a combination of sctual services rendered the board and expenses incurred while on board duty. There were 68 boards; or 25.7 per cent of all respondents, which reimbursed members only for expenses incurred. A third method, reimbursement for actual services was used by 26 boards, or 9.8 per cent of the respondents.

Those boards in the seven comparative professions which reimbursed their members for incurred expenses, ranged betweon a low of 7.4 per cent for dentistry and a high of 41.9 per cent for architecture for each group. The percentage of boards which reimbursed their members for actual services and incurred expenses ranged between a low of 36.5 for law and a high of 65.7 per cent for accountancy. Those boards which reimbursed their members for actual services ranged between 5.7 per cent For accountancy and $\mathbf{1 8 . 5}$ per cent for dentistry.

There were 13 boards, or 32.5 per cent of the respondents in the educational administration group, reimbursed their members for incurred expenses; 15 boards, or 37.5 per cent, which reimbursed their members for actual services and incurred erpenses; 3 boards, or 7.5 per cent, which reimbursed their members for actual services.

[^8]THE COASTRUCTION AND FINDINGS OF TEE INSTRUMENI FOR CJRRENT LJCEASING PRACTICES OR THE BOARDS

## Purpose of This Chapter

The purpose of this chapter was to survey and compare the current licenaing practices of state licensing boards for educational administration with seven other professions. A review of the literature revealed a narrow variety of factors by which state licensing boards were reviewed. These factors were compiled, classified, and summarized into a comprehensive sec of items by which the current licensing practices of state licensing boards were determined. Further verification of the items was accorplished through the involvement of four persons racognized as authorities in the area of licensure and state licensing boards.

Next, a data collecting instrument was developed. The instrument was sent to the executive secretaries of state licensing boards. The returned data were put onto data collection sheets. These compilations ware then tabulated. The rest of the chapter was devoted to the results and the findings of the tabulations dealing with current licensing practices.

## Construction of the Instruments

Rationale for items selected. The review of literature indicated that certain apecific factors distinctly delineated board composition
and characteristics. Schrammel, ${ }^{1}$ Segerist, ${ }^{2}$ Lieberman, ${ }^{3}$ and others sought to determine what factors were involved in determining a board's licensing procedure. Those factors considered to be pertinent to state * board composition and characteristics were presented below.

Schramme1 ${ }^{4}$ compared the functions of state boards of eduration historically. Amorg the factors of comparison were methods by which licenses were obtained; means used to make appeals for license reinstate ment; the life of a license; delegation of the duty of acutally issuing iicenses.

Segerist ${ }^{5}$ compared the function of medical licensing boards in relation to methods by which licenses were sought; the kind: of requirements imposed upon license candidates were also considered to be important.

Lieberman ${ }^{6}$ reviewed licensing requirements; the kinds of education licenses issued and their longevity. An extensive comparison was made of the licensing requirements in the fifty states.

Lucien Kinney ${ }^{7}$ reviewed steps he felt were requisites for autonomy In education. One necessary step was the establishment of the regulatory
${ }^{1}$ Schrammel, gp. cit. ; Pp, 17-18.

${ }^{7}$ Lucien B. Kinney, Certification in Education (Englewood Cliffs, New Jersey: Prentice Hall, Inc., 1964), pp. 137-139.
licensing board. ". . This board would be responsible for . . . preparation and licensure of personnel. . . . Professional examinstions might or might not be required. . . "" The board was to handle license reciprocity, out of state credentials, and appeals.

Items selected. The items which were derived from the review of literature were placed into one category. There were eight basic items:

1. methods of applying for a license,
2. licensing requirements,
3. procedure used in granting a license;
4. licensing procedures used by licensing boards;
5. methods of license renewal,
6. methods used in licensing reciprocity,
7. methods by which appeals for reinstatement may be axade,
8. frequency of appeals.

Clarification of the items. To refine and clarify the basic items, the third category was presented to four persons who were widely experienced with state licensing boards.

1. Mrs. M. Annie Leitch, Director, American Nursing Association Program for State Boards of Nursing.
2. Dr. M. H. Crabb, Secretary, The Federation of State Medical Boards.
3. Mr. E. R. Lock, Director, National Conference of Bar Examiners.
4. Dean L. Gustavson, Chairman, National Council of Architectural Registration Boards.

Each person was asked to criticize and offer suggestions for refinement of the items dealing with current lizensing practices.

The items were next presentech to the author's dissertation advisur, Dr. M. Chester Nolte, and Dr. Ralph A. Forsythe, the Associate Lirector of the Burcau of Educational Research, at the University of Denver, for further criticism and suggestions.

As a result of the clarification and suggestions, modifications were made in the items. It was suggested that the category of licensing requirements be expanded to include the various kinds of apprenticeships required in some professions. Required experience was also added.

The instrument. The instrument was designed to consist of eighteen major items with ninety two subsections. It included items for both characteristics and current licensing practices of state boards. The items and findings for board characteristics were reviewed in Chapter II of this study.

The major licensing practices sought included: (1) methods and requirements imposed upon applicant, (2) legal procedures used by a board in issuing licenses, (3) methods of policing practitioners.

Selection of gespondents. The Colorado boards for the eigist professions involved in the study were contacted in order to acquire the names and addresses of the executive secretaries and members on the other state licensing boards. After this initial contact, letters were written to 397 board secretaries explaining the purpose of the study. The importance of their cooperation in completing the questionnaires was emphasized.

## Qrganigation of the Results of the Surver

Results of the part of the instrument dealing with current licensing practices were reported in the remainder of Chapter III. The data raceived were placed on data collection shests. The findings were organized into eight tables which dealt with current licensing pracitices.

## Anslysis of the Current Liceneing Practices of State Licensing Boards

Methods by which applicants sought 1 icensure. Table XXI was divided into six major areas to determine the methods by which applicants were to obtain licenses. A predominant pattern was revealed: 235 boards, or 88.7 per cent of the respondents, required applicants to complete an application; 209 boards, or 78.9 per cent, required the appiicants to complete an application for a specific license. In addition; 223 boards, or 34.2 per cent, required the appiicants to file references; 205 boards, or 77.4 per cent of the respondents, required the applicant to take a test. There were 85 boards, or 32.1 per cent of the reapondents, which required applicants to attend an oral interview; 65 boards, or 24.5 per cent of the respondents; required applicants to forward a personal letter.

It was indicated that the percentage of boards for the seven comparative professional groups which required applicants to complete an application ranged between 81.1 per cent for nursing and 96.3 per cent for medicine; the percentage of those boards which required applicants to complete applications for a specific license ranged between 63.0 per cent for dentistry and 94.6 per cent for nursing. Except for nursing, those boards which required applicants to file

references ranged between 81.5 per cent in dentistry and 96.0 per cent in architecture; a low of 59.5 per cent of the nursing group required references to be filed. It was indicated that the percentage of boards for the seven professions which required applicants to take a test ranged between 83.8 per cent for nursing and 96.8 per cent for architec.ture and medicine. The percentage of boards which required the applicentos to attend an oral interview ranged between a low of 0 per cent for nursing and a high of $\mathbf{7 1 . 0}$ for medicine; the boards which required applicants to forward a personal letter ranged between a low of $\mathbf{8 . 6}$ per cent and a high of 51.6 per cent.

In the educational administration group 33 boards, or 82.5 per cent of the respondents, required applicarts to complete an application; 30 boards, or 75.0 per cent, required applicants to complete an applicar. . . tion for a specific license. There were 28 boards, or $\mathbf{7 0 . 0}$ per cent of the respondents, which required applicants to file references, and 4 boards, or 10.0 per cent of the respondents, which required applicants to take a test. It was indicated that 1 board, or 2.5 per cent of the respondents, in this group required spplicants to attend an oral interview; 5 boards, or $\mathbf{1 2 . 5}$ per cent of the reapondents, had to forward a personal letter.

Requirements for liceasure. The requirements for licensure were divided into five major areas in Table XXII. A predominant pattern was revealed: 161 beards, or 60.8 per cent of all respondents, required that the applicant take an examination along with graduation and institutional recomendation, experience or internship. It was

* Examination, graduation and institutional recommendation; examination and experience; examination, experience graduation and institutional recommendation; examination and internship
**Experience and employer recomendation; experience, graduation, and institutional recommendation
indicated that 31 boards, or 11.7 per cent of the respondents required examination alone. There were 25 boards, or 9.4 per cent, which required graduation from an aceredited institution, and 29 boards, or 10.9 per cent, required various combinations of experience, education, or recommendation. Those boards which required experience and a combination of either employer recomendation, or graduation and institutional recommeadation amounted to 29, or 7.2 per cent of the respondents.

It was indicaiced that the boards for the seven comparative profescians which required examination and a combination of graduation and institutional recomendation, experience, or internship, sanged between low of 45.5 per cent for law and a high of $\mathbf{9 0 . 4}$ per cent for architecture. Those boards for the seven groups which required examination alone ranged between a low of 2.7 per cent for nursing and a high of 37.0 per cent for dentistry. Vone of the seven comparative groups, except accountancy and architecture, required experience and a combination of employer recomendation, or graduation and institutional recommendation; 2.9 per cent and 3.2 per cent of the boards for accountancy and architecture, respectively, required experience and the combination. None of the seven comparative groups, except dentistry, law, and nursing required graduation ftom an accredited institution; 7.4 per cent, 9.1 per cent and 10.8 per cent of the boards for dentistry, law, and nursing required graduation.

In the educational administration group, no boards required examination alone, 2 boards, or 5.0 per cent, required examination, institutional recomendation, experience or internohip. It was indicated
that 17 boards, or 42.5 per cents required experience, employer recomsendation, or graduation or institutional recommendation, while 16 boards, or 40.0 per cent, required graduation from an accredited institution.

Procedures used in granting licenses. Table XXIII revealed that three procedures were used in granting licenses: (1) the discretionary method, (2) the ministerial method, (3) a combination of both. The boards for all professional groups were divided between using both methods; a little less than half, 122 boards, or 46.0 per cent, used the ministerial approach, while 110 boards, or 41.6 per cent, used the discretionary approach. There were 29 boards, or 10.9 per cent, which used both the discretionary and the ministerial methods.

The percentage of boards in the seven comparative professions which used the ministerial approach ranged between a low of 25.8 per cent for aredicine and a high of 62.2 per cent for nursing. Similarly, the boards which used the discretionary method ranged between a low of 18.9 per cent for nursing and a high of 58.0 per cent for architecture and anginaering.

In contrast, 28 boards, or 70.0 per cent of the educational administration group, used the ministerial approach; licenses were issued when a prearranged set of stendaris were met. There were 8 boards, or 20.0 per cent, whicin used a combination of the two methods, and 4 boards, or 10,0 per cent; which used the discretionary method.

Where iseuance of licenses was discretionary, 147 boards, or 55.5 pex cent of all respondenta, made the decisions. There were 36

* Division of professional licensing services; state departments of education; department of health; department of law enforcement; state department of certification and public atandards IN EIGAT PRORESSIONS IN THE FITMY STATES FOR 1966
boards, or 13.6 per cent of all respondents, in which the decisions for granting licenses were made by either the division of professional Iicensing services, state department of education, department of health, department of law enforcement, or the state department of certification and public standards.

It was observed thac the percentage of boards in the seven comparative professions, except for the law group which made the decisions for granting licenses ranged between a low of 60.1 per cent for accountancy and a high of 83.9 per cent for, engineering. Although 5 boards, or 15.2 per cent, in the law group made licensing decisions, in 16 boards, or 48.4 per cent of the group, the decisions were made by the state supreme courts; in 6 other law boards, or 18.2 per cent, the decisions were made by departments of law enforcement, or state departments of education.

There were 6 boards, or 15.0 per cent of the respondents in educational administration, which made decisions concerning the issuance of licenses. It was indicated that in 23 boards, or 57.5 per cent of the respondents, licensing decisions were made by a section within the state department of education, or the state departmant of certification and public stsndards.

Ificanaing procedures of the boris. It was determined in Table XXIV that the actual issuance of a license was a delegated duty. Three categories were eatablisked in the table: a person, another state board, another state department. In the totals for all prow feasional groups, it was revealed that 120 boards, or a little less than half, 45.3 per cent, delegated the task to an individual. Host

* Board chairman; secretary; executive secrezary; state auperintendent of public inatruction; director department of regulation
**1-3 years; 1-5 years; 1-10 years; annually; biennially
were board secrecaries hired for the purpose, state superintendents of public instruction or direstors of the departments of regulation.

There were 56 boards, or 21.1 per cent of all respondents, in which the actual issuance of licenses was delegated to another state department.

It was indicated that the percentage of the boards for the seven comparative professions, except for the lav group, which delegated the issuance of licenses to a person ranged betwaen a low of 29.0 per cent for engineering and a high of $\mathbf{8 9 . 2}$ per cent for nursing. There were 3 boards, or 9.1 per cent of the respondents for the law group, which delegated the issuance of licenses to a person. These boards for the seven professions, except for the law group, in which the issuance of licenses was delegated to another department ranged between 0 per cent for architecture anci 14.8 per cent for dentistry. There were 24 boards, or 72.7 per cent of the respondents for the lafy group, in which the issuance of licenses was delegated to another state department.

In the educational ajministration group, 16 boards, or 40.0 per cent of the respondents, delegated issuance of licenses to a person, while, in 19 bcards, or 47.5 per cent of the respondents, the issuance of licenses was delegated to another state department.

There were 85 boards, or 32.1 per cent of the total respondents, which did not answer this question.

The duration of licensure was divided into life, a specified period, life with annual renewai. The specified periods ranged from one to three years, to one to ten years. A little less than one-half, 122 boards, or 46.0 per cent, of all professional groups Lesued licenses
for a specified period. There were 84 boards, or 31.7 per cent of all respondents, which issued licenses for life, and 48 boards, or 182. per cent, which issued licenses for life with annual renewal. The percentage of boards in the seven comparative groups which issued licenses for a specified period of time, except for the law group, ranged between a low of 22.6 per cent for medicine and a high of 80.5 per cent for architecture. It was indicated that the percentage of boards which issued licenses for life varied from a low of 6.5 per cent for architecture to a high of $\mathbf{6 1 . 2}$ per cent for medicine. There ware 30 boards, or 90.9 per cent, of the law group which issued licenses for life, but none of its boards issued licenses for a specified period. The percentage of those boards in the seven groups which issued licenses for life with anrual renewal ranged between a low of 0 per cent for the law group and a high of $\mathbf{4 0 . 8}$ per cent for the dentistry group.

In the educational administration group 25 boards, or 62.5 per cent of the respondents, issuad licenses for a specified period. There were 6 boards, or 15.0 per cent, which issued licenses for life, and 15 per cent which issued licenses for life with annual renewal.

Methods of license renewal. It was shown in Table XXV that a majority of the respondents, 167 boards, or 63.0 per cent, renewed licenses if licensees reapplied. A comparison of "duration of license," in Table XXIV showed that 46.0 per cent of the boards issued licenses for a specified period; the periods were one to three, one to five, and one to cen years in duration. There were 29 boards, or 10,9 per cent of all respondents, which required the applicant

* Subject to payment of annual fees
to meet further educational requireme s; 24 boards, or 9.1 per cent of the respondents, renewed licenses when annual fees were paid.

The percentage of boards in the seven comparative professions, except for the law group, which renewed licenses when licensees reapplied ranged between a low of 77.5 per cent for engineering and medicine and a high of 96.8 for architecture. Thexe were 36.4 per cent of the boards in the law group which did not require license renewal. Tre boards which required annual payment of fees before licenses could be renewed ranged between 0 per cent for accountancy and 27.3 per cent for law. There were 29 boards, or 72.5 per cent of the respondents for the educational adminiscration group, which stipulated that licensees meet further educational requirements for license renewal. It was required that the licensee reapply in 5.0 per cent of the cases, the licensee have expericace in another 5.0 per cent of the cases, and the licensee pay annual fees in another $\overline{5} .5$ per cent of the cases.

Licensing reciprocity. It was established in Tabls XXVI that 195 boards, or 73.6 per cent of all respondents, practiced license reciprocity. There were 50 boards, or 18.9 per cent of the respondents, which did not practice 1 isense reciprocity.

The percentage of boards which did practice licanse reciprocity for the seven comparative professions ranged between a low of 33.3 per cent for dentistry and a high of 97.1 per cent for accountancy. Those boards which did not practice license reciprocity ranged between a low of 2.9 for accountancy and a high of 63.0 per cent for dentistry.

In the educational admindstration group, 17 beards, or 42.5 per cent, practiced license reciprocity, while, 14 boards, or 35.0 per

cent did not. There were 9 boards, or 22.5 per cent, which did not respond.

In some states, 1imited practice seciprocity was allowed. But in all professions which responded, only a negligibie number allowed it; 173 boards, or 65.3 per cent of all respondents, did not answer the question.

It was indicated that 73 boards, or 27.5 per cent of all respondents, did not practice limited licensing reciprocity.

In the seven comparative professions, it was observed that the percentage of boards which did not practice limited reciprocity ranged between a low of 5.4 per cent for nursing and a high of 48.4 per cent for architecture and medicine. Those boards which did not answer the question ranged between a low of 45.1 per cent for medicine and a high of 91.9 per cent for nursing.

In the educational administration group 34 boards, or 92.5 per cent of the respondents, did not answer the question; 2.5 per cent indicated that they did not practice limited reciprocity while 5.0 per cent did.

Appeals and to whom they were made. If an spplicant was refused a license, or a licensee was refused license renewal, there was usually some means by which an impartial adjudication could be made. Table XXVII revealed that 209 boards, or 78.9 per cent of the respondents, allowed appeals to be made, while 23 boards or 8.7 per cent, did not allow appeals.

| Mean Response | 33.1 | 7.8 | 10.1 | 6.3 | 1.3 | 7.8 |

The" percentage of boards in the seven comparative professions which allowed appeals ranged from a low of 59.3 per cent in dentistry to a high of 97.3 per cent in nursing.

There were 25 boards, or 62.5 per cent of the respondents. in educational administration, which allowed appeals, while 6 boards, or 15.0 per cent, did not.

When the appeal was made, it was referred, initially, to either the board, the state courts, or the state attorney general. None of the three methods were used predominantly: 37.4 per cent of all respondents referred appeals to the board, 29.4 per cent referred appeals to the state courts, while 0.8 per cent referred them to the state attorney general. There were 55 boards, or 20.8 per cent which did net respond.

The percentage of boards in the seven comparative professions, except fer the nursing group, which heard appeals ranged between a low of 6.1 per cent for 1 aw and a high of 45.7 per cent for engineering; 75.7 per cent of the boards for nursing heard appeals. Those boards which indicated that the courts heard appeals ranged between a low of 16.2 per cent for nursing to a high of 60.4 per cent for law. No boards except 2.5 per cent in architecture referred appeals to the attorney general. It was indicated that those boards which referred appeals to the governor, the commissioner of health, or the state superintendeni of instruction ranged between 0 per cent for law and 19,4 per cent for medicine.

There were 17 boards, or 42,5 per cent of the respondents in aducational administration, which heard appeals. No boards referred
appeals to the courts or the at:torney general; 10 boards, or 25.0 per cent referred appeals to the atate superintendent of public instruction.

Frequency of appeals. In Table XXVIII, the frequency of appeals was shown. It was obscrved that from the types of words used by respondente that appeals for license renewal or license refusal, were not many. A mean average response of 6.3 to 10.1 boards per professional group used words such as "infrequent," "none," or "extremely rare." There were 1.3 boards per professional group reported that appeals were made in 1~10 per cent of all cases reported; 7.8 boards per professional group did not respond to the question.

In the Efucational administration group, 18 boards reported that appeals were infrequent; 13 reported that they were extremely rare, while 1 bosrd reported that $1-10$ per cent of the cases were appealed. The only predominant term used by all sespondencs and the educational administration group was the word "infrequent."

## CAAPTER IV

## Sumary and Interpretations

## Purpose of This Chaptex

The purpose of this chapter was to report the conclusions and interpretations of this study for the composition, characteristics, and licensing practices of state licensing boards.

## Micensing Board Composition

1. It was apparent that there was a greater tendency on the part of the meubers of the seven comparative professions to return the instruments dealing with board composition. These professional practitioners indicated a stronger interest in this study than did the lay people on the boards of educational administration.

The reverse situation was true for the board secretaries. There was a greater tendency on the part of the board secretaries for the educational administration group to return the instruments dealing with board characteristics and licensing prastices. These salaried employees, usualiy paid from state appropriations, indicated a stronger interest in this study than did the other secretaries who were usually paid from board funds.
2. It was evident that in the couparative professions, except for the law group, the trend in member selection was toward a special type of gubernatorial appointment. Many board candidates were selected by an electorate made up of members of the profession. A. list of nanse was then presented to the state governor from which he chose the new
board membar:. It was appareat that the law group members were selected either by the state suprsme courts or the state bar commissions. Host likely, because the seven comparative professions could present lista of pyactitioner-candidates to the governor, they were delegated control of state licensing board practices and entrance into and expuleion from their professions.

This trend and the type of gubernatorial appointment was not in evidence for the school administration group.
3. Although the boards for the seven comparative professions did not seem to discriminate against male or female membership, their board members, except nursing, were drawn from professional populations which were mainly male. Apparently, the nursing group board members were predominantly female because they were drawn from a professional population which was mainly femsle. The educational administration board members were lay members who were usually chosen at the pleasure of the governor, regardless of sex.
4. The boards for all professional groups were composed of relatively older people, which was indicated by the fact that a great majority of members were between the ages of thirty-six and sixty-five. It seemed logical that because professional people completed their training in their late twenties or early thirties, and the boards required their members to have some professional experience, that boards necessarily be composed of older people.

Ali boards imposed mininum age limitations and relatively few boards in accovatancy, law, medicine, nursing, and educational administration set up maximum age limits. It was likely that the minimum age
limits were established to prevent minors from taking office, and to ensure that professional society requirements were met.
5. The fact that a majority of nembers served on tite boards from two to ten years apparently indicated that the boards were not static in terms of the holding power of the members. It seemed to indicate further that specific individuals were prevented from monopolizing board membership; it appeared that self-succession on the boards was not the general rule,

The seven comparative professions could easily control the actions of their board representatives; the state professional socfeties usually recommendea a list of names from which the governor would select new board members. It seemed apparent that if the current board members did not meet the wishes of the professional electorate body, their names would not be considered for re-election.

Although a majority of the board members in the educational administration group were appointod by the state governors, appreximately one-fourth of the members were elected by the people or representatives of the people.
6. The board members for the seven couparative professions were experienced practitioners of the professions which they licensed. However, it seemed that the professional electorate bodies which recommended board candidates to the governors preferred practitioners who had experience. It was apparent that, as members of the professional groups which they licensed, they were obliged to keep abresat of current changes and innovations in their professional areas; licensure of candidates demanded
that board members have a broad knowledge of professional mathodology, practices, and procedures.

The boards for educational administration were composed of lay people and professional people from areas other than education. These boards were usually responsible for executing the legislative enactments dealing with education. It was apparent that such matters as incensure were delegated to the state superintendent of education, a section or a department within the state department of education. In effect; although these boards delegated the licensing function, they established a prearranged set of standards which determined whether or not a candidate was eligible for a license. Nevertheless, because of a lay nembership on the boards, the educational administration profession had no control of entry into and expulsion from its ranks as did the other seven professions.
7. It was concluded that a large majority of the board members for all professions were college graduates; it depended upon the professional group whether or not a graduate dagree was necessary for practice. However, while the older professions, such as dentistry, law, and medicine did usually require pre-professional and graduate training in these areas, the newer ones, such as accountancy, architecture and engineering obliged their members to have lengthy experiential backgrounds instead. Nevertheless, a predominance of members in the newer professions held degrees in their professional areas. It mas probable that the state professional societies along with the national professional societies usually established licensure requirements. Therefore, board members had to be professional practitioners, licensed by theiz own profession.

Although a little more than half of the members in the educational edministration groups held graduate degrees, a negligible number held them in the area of school administration. Degrees and lay educated members notwithstanding, this group lacked practitioner representation and, therefore, could not establish professional requirements for entrance into its ranks.

By requiring board candidates to possess professional degrees and to have experiential backgrounds, these comparative groups were ensuring their autonomy, and control of professional standards. Although the professional associations and practitioners made recommencatíons, licensing standards were established by the lay boards of educational administration.

## Licensing Board Characteristics

1. It was apparent that the seven comparative professions were given professional autonomy and control of their ranks by state sanction. As a result of this professional autonomy, the state licensing boards were delegated the right to act as independent bodies empowered to issue licenses. Apparently, these bpards acted for and with the consent of the professional groups.

Although the boards of educational administration were autonomous, independent bodies empowered to issue licenses, they were not composed of professional practitioners. Instead, the members of these boards were predominantly lay people. It was likely that the lay, and other (professional) board members in educational administration were qualified to establish licensing standards, and to issue licemses. The board meabers were empowered to establish licensing standards for the
professional practitioners, even though the members were primarily lay people.
2. Except for law, nursing, and educational administration, the boards for all the other professional groups did not adhere to any one code established by the boards, or the national association more strongly than the other. The nursing and educational administration groups adhered to codes established by the national professional associations, while the law group adhered to the codes established jointly by the state professional societies and the state supreme courts.

It was probable that the codes of ethics which were established by the boards for the practitioners were based upon, or similar to, the nationa? sodes, In conclusion, it was apparent that the definition of the professional standards and conduct of the practitioners were closely controlled by the professional associations through either the boards or the national assocjation. Therefore, professional control of the group was maintained through enforcement of a similar code at the state or national level.

Although a majority of the educational administration boards adhered to a code of ethics established on the national level, there was no indication that there was one code developed by one national association. Nevertheless, it seemed obvious that control of the practitioner was maintained through enforcement of these national codes.
3. The boards for all professional groups exhibited no consistency in the number of members. Although the maximum number of nembers on the boards in each professional group varied from eight to sixteen, no board hei less than three members. This minimum number of boar?
members seemed to indicate an interest in economy rather than board functionality. Of course, it would seem that the larger boards were an attempt to ensure the adequate representation of all factions and schools in a particular profession. Yet, no professional group indicated that there was an established policy or set of guidelines which determined the number of members that a board might have.

Boards of educational administration, which were primarily composed of lay people, had more than adequate representation in terms of size. The implication was that the boards represented the popular electorate and/or the governor and, for them, established educational administration policies and controiled educational administration. The educational administration practitioners, appeared to have little, if anything, to do with the control of board functions.
4. Candidates for board membership had to be United States citizens and residents of the states in which they were to serve. There the similarity between the seven comparative professions and educational administration ended. The qualifications for the comparative group board members went beyond citizenship and residence requirements: the candidate usually had three to ten years of professional practice, a professional license, graduation from an approved professional school, and possession of moral character. Persons who were associated with the administration or staff of professional schools were disqualified from board candidacy. It was apparent that the seven comparative professions, through statutory decree, ensured their professional autonomy by requiring candidates for board membership to be practitioners of the profession.

Autonomy for the educational administration boards was evidenced, although the boards wese not composed of professional pracsitioners. In fact, almost one-half the boards required their members to be lay people. It was probable that the states were concerned with public control of education and, as a result, prevented the state boards of education from being controlled by any one special group.
5. Board members for the seven comparative professions were selected primarily through gubernatorial appointment, rather than by any other method, In addition to the elaborate qualifications of citizenry, residence, expexience and education, the professional groups further ensured professional autonomy through method of candidate selection. It was apparent that governors were legally bound to select appointees from a list of candidates selected by a professional society. Where there were no statutory restrictions where the professional groups could make the nominations, it was probable that the governors would consult with representatives of the professional societies before acting.

In most of the states, appointment of board members was established either by statutory decree, or constitutional provision. However, in keeping with the democratic nature of education in the fifty states, educational administration board members were either elected by the people or appointed by the state governor. Many states placed ex officio officers who were not professional practitioners onto these educational administration boards. It is most likely that educational administration board members will not be practitioners, but rather, lay people or practitioners of other professions.
6. The boards for all professional groups considered their members to be professional enough not to be required to attend any meetings. Although the boards, except for architecture, required that a minimum nurber of meetings be held each year, all board members exhibited a professional attitude by attending more meetings than were required. It was probable, too, that the amount of board business was heavy enough $s 0$ that the members were forced to schedule more meetings than the catablished minimum.
7. It was apparent that the state boards for the seven comparative groups did not seek state provision of office space, staff or secretaries. Only a slight majority of boards in architecture, engineering, medicine and nursing were given orfice space, while less than a majority of all boards for each group, except engineering, accepted office staffs and secretaries provided for by the state.

In keeping with the status of public education it is most likely that a large majority of the boards for educational administration depend upon the state for office space, staff and secretaries.

It was evident that professional autonomy and integrisy was being maintained and extended by the boards for the seven groups. Professional autcnomy might be compromised if the state was sought for board support. It was most likely that this was not true of the educational administration boards. These boards which were established by and represented the people of the state, would logically seek state support of their staffs, secretaries and office space. . : i
8. In keeping with the professional indepencence established in the areas of office space, staff and secretaries, a majority of the
boards for the seven comparative professions were financed by either fees alone, or a combination of fees and dues. It was probably held that professional licensing boards should be self-sustaining rather than be a problem to the taxpayers. Although a small minority of boards were financed by general state appropriations, another minority group was financed by a combination of fees and appropriations; again, professional groups attempted to maintain their autonomy and professional integrity by limiting their dependence upon state funds.

Nevertheless, the educational administration group's depencence upon general state appropriations was consonant with the public nature of the boards. It is most likely that educational administration boards shall depend upon general state appropriations, rather than depend upon the professional prectitioners for financial assistance.

It was indicated that a majority of the boaxds for the.seven professions which collected fees either retained their fees or turned them over to the state for deposit into a tund for board use. The latter method appeared to be a legal, state required accounting of fees collected by quasi-governmental bodies such as licensing boards. It was apparent that professional autonomy was being extended by the boards' maintaining effective control over their finances and financial status.

Apparently, states did exercise control over board financial affairs through auditing and accounting procedures. These practices were usually procedural rather than restrictions limiting board independence. To meet state requirements or criticism many boards bonded those members who hardled board funds.

It was indicated for the boards in the educational administration group that a predominant number turned their fees over to the state. It might be deduced from this procedure, and the fact that these boards Were supported by state appropriations, that educational administration was controlled by the public rather than the professional practitioners: Through the lay representatives on the state boards, the public determined professional requirements, ilcensing practices; and also controlled board financial policy.

There was a definite trend for a majority of the boards for the seven professions, except engineering and law, to raimburse their members for actual services and incurred expenses, while other boards reimbursed members only for incurred expenses. It was apparent that the professional groups were reimbursing their members for time talien away from their practices and the expenses incurred during this time. It would not be equitable to place board members on afull-time method of reimbursement, or full-time salerg, because, it is likely that they work for the boards on a part-time basis.

## Licenising Bonrd Practices

1. A large majority of the boards for all professional groups initially required the license candidates to complete applications for apecific licenses, and file references: In adition, a predominance of the boards for the seven corpparative professional groups required the candidates to take a teat. No pattern was indicated which required the candidates to attend oral interviews or forward personal letters.

Apparentiy, on the one hand, the educational administration group does not consider the test criterion to be of importance or an adequate
indicator in determining who should or should not receive a license. On the other hand, it seemed that the seven comparative groups did consider the test criterion important in maintaining standards or raising standards of entry into the professions.

It was indicated further that a large majority of the boards for the seven comparative groups, except for law and dentistry, required the license applicants to be graduates of approved professional institutions, have institutional recommendation, some experience or internship, or a varying combination of these. The dentistry and law groups were divided between the above requirements and examinations alone. Obviously, the pré̌essional groups maintained high stondards of professional excellence by controlling the type of preparation institutions which they would recognize, and the entrance requirements of the licensing candidates. More than one criterion was used to judge the ability of a candidate.

A large majority of the boards for educational administration required the license candidate to either have experience and a combination of employer recomendation, graduation, and institutional recommendation or only graduation from an accredited institution. It would seem that the first requirement, experience, presupposes that candidates should acqaire previous experience at a lower level, such as teaching. The second, of alternate requirement, graduation from an accredited institution, most likely places some of the burden of adequate preparation upon the preparatory institution. Apparently, compared to the other professional groups, educational administration boards use differant criteria to determine which eandidates should or should not
receive a license. In addition, there were a number of specific kinds of educational administration licenses which were available: for example, school superintendent's license, high school principal's license, elementary school principal's license, assistant principal's license. Most likely, boards for educational administration deem it necessary to differentiate among licensing these sub-groups within the educational administration profession. It seems to imply that special training and preparation fer each of these sub-groups are necessary in order for the practitioners to meet the individual needs apparent in each situation.
2. The boards for the seven comparative groups were divided as to thether or not their right to issue licenses should be ministerial or discretionary. A small majority of boards in each of five groups used the discretionary method in issuing licenses while a small majority of boicrds in each of two groups adhered to the ministerial method. It was apparent that those groups which used the diseretionary method were able to consider the disposition of each license applicant's case on its own merits and individual differences. Hence, the five professional groups were given state sanction to allow the bosrd to handle entrance requirenents for the professions as they saw fit. Obviousiy, board menbers were allowed to adjust standards, within an acceptable range, and take into consideration any and all circumatances for each and every candidate: professional autonomy was more apparent in these five groups than in any other.

The two groups which used the ministexial method had to judge license candidates in terme of a prearranged set of standards, and no
variation was allowed. This seemed to indicate that either the state professional society, state statutory limitations, or both, imposed standards to which the boards were bound to adhere. It was probable that the licensing funciions of these boards were reduced to a routine basis.

Where discretion was allowed in the seven comparative groups, except for law, the board was usually the body which made the decision t. fesse lisenses. Decision making in the lav group was divided among either the board, the scats supreme court, or the department of certification and public standards. Evidently, professional autonomy was further enhanced by allowing state professional boards to use discretion in makiag the final decision in licensure after all factors were weighed asd considered. Although the state supreme courts usually made the decisions to issue licenses, it was done upon strong board recommendation. Further the members of the supreme court were practitioners of the legal profession, hence, decision making was not delegated to a group outside the profession.

In the educational administration group, a majority of the boards delegated licensing decisions to sections within the state departments of education, a division of professional licensing services, or a state department of certification and public standards. Evidently, these boards, established standards of licensure, and then delegated the reoponsibility for decisions based upon these prearranged set of standards to an arm of the state department of education under its jurisdiction. In essence, then, many of the educational administration boards had to grant licenses if the candidate met a prearranged set of $\cdot$...
standards, although the set of standards was not established by the professional association.
3. The actual issuance of licenses for all professionis was a delegated duty. A little less than one-half of all boards, except for the law group, delegated this duty to a person, such as the secretary, executive secretary, the chairman, or the state superintendent of instruction. The law group made recommendations to the state supreme court which was responsible for issuing the licenses. It seemed superfluous that the time of the board members should be taken up in this mechanical, routine job.

The boards of educational administration were almost equally divided between using a person on the board or delegating the duty to a section in the state department of education. Again, it was not necessary to tnke up the time of board members in this routine job.
4. Thare was no pattern which seemed to develop among the seven comparative groups as to the duration of a license. Licenses were issued for stated periods, for life, for life with annual renewal. While the majority of boards in three professional groups issued licenses for a specified period, a majority of boards in two other professions issued licenses for life. Revertheless, the professional groups had to finance their board activities, and usually charge a renewal fee on licenses. Professional autonomy was evidenced by the fact that boards, with the approval of the professional group, could levy fees, dues or boch, on the membership, or the license candidate, as they saw fit.

Licenses were renewed upon reapplication in a large majority of the boards in the seven comparative groups except for law. The law group was divided between not requiring license renewal, and charging an annual fee. It was apparent that the profession members would not have to be forced to keep up with current changes in their fields; rather, in order to remain effective practitioners, the members would, of their own volition, keep abreast of professional advancements in techniques, methodology and research. The reapplicacion seemed to serve the needs of: (1) keeping the professional group aware of the prectitioner's status, (2) keeping the professional group in control of all practitioners, (3) keaping professional ethics and autonomy alymp

In contrast, a large majority of the boards for the educaitional administration group, required the candidate for license renerval to meet further educational requirements with each renewal. Most likely tho boards felt that it was necessary for the practitioner to keep abreast of changes in his profession through further education. In fact it was further implied that educational administration itself was changing.
5. Although the requirements for 1icense reciprocity varied from ane professional group to another, a large majority of the boards for the seven comparative groups except dentistry employed this practice. In contrast, a majority of the dental groups did not use any form of reciprocity.

License reciprocity within each professional group seemed to be a developing characteristic of professionaliem. Standardization of license requitemats for any one professional group was being improved
by either the various states developing aimilar, mutually acceptable requiremants, or the candidate passing an examination administered by the national society, which was recognized by the state societies.

A little less than half of the educational admindetration group andoyed reciprocity, while less than half did not use it at all. It was apparent that license reciprocity for educational administration had not evolved as far as the seven comparative groups.
tho conclusions were drawn about limited reciprocity because a majority of all but two groups did not respond to this question.
6. A majority of the boards finr all professional groups indicated that appeals were possible if an applicant was refused a license. It was apparent that the professional licensing board policed its raniks and as a result allowed candidates to appeal decisions not in their favore finis aspect of judicial hearings pointed to the fact that profeasional autonowy included a review of decisions concerning a candidata's licensure.

The educational administration group aliowed eandidates to appeal decisions not in the $r$ favor. It is likely that boards of educational adininistration composed of lay members, who represent the people of the state, are given power similar to the boards of the other seven professions to hear appeale.

Appeals wate made either co the boards, the courts or other bodies or persong, Only a majority of the boards for the nursing group heard appeals, while a majority of beards for the law and the medical groups indicated that appeals were heard by the courts. It seamed that in many states appeal mechanism was determined by statutory decree, rather than by professional society decisions.

The profeasional groups indicated that the frequancy of appeals was negligible. It was determined that elther the respondents could not truly recall the actual number of cases, the cases were rare, or the respondents were not aincerely intereated in makias pubile the number of appeal casse.

Eunary Tebulation of Findings
Table XXIX summarized the major areas of board composition, characteristics, and licensing practices. The educational administration group was shown to be either similar, dissimilar or aot posasble of comparison with the other seven professions.

TABLE XXIX
SUMNARY OF FINDINGS WHICH COMPARED THE SIMILARITY AND DISSIMILARITY OF STATE BOARDS OF EDUCATIONAL ADMINISTRATION WITH THE BOARDS FOR SEVEN OTHER SELEGTED PROFESSIONS
