DESCRIPTORS \*Biology, \*Geology, Marine Biology, \*Meteorology,  
\*Oceanology, Research Projects, Scientific Research,  
\*Technology

ABSTRACT

Described are 2,589 research projects under the  
general headings of: Properties of Water, Water Motion, Meteorology,  
Survey and Prediction, Living Systems (non-human), Public Health and  
Safety, Marine Geology, Engineering and Technology, Coastal Zone  
Management and Use, Legal Studies, Education and Training, and  
Facilities. Each description outlines the objectives and approach of  
the project. The name of the principal investigator and the address  
of the institution are given, and supporting agencies are identified.  
There is a subject index, a principal investigator index, a  
contractor index, and a supporting agency index. (EB)

## FOREWORD BY THE VICE PRESIDENT OF THE UNITED STATES

The establishment of a long-range program to utilize the oceans for the benefit of all mankind was set forth as a national policy by the Marine Resources and Engineering Development Act of 1966. Meeting marine science needs and opportunities in turn depends significantly upon a strong research capability. Such research encompasses a broad spectrum of disciplines in support of, among others, the development of living and non-living resources, environmental prediction, conservation and recreation, maritime commerce, and national security activities. While these endeavors are supported largely by the Federal Government, they are conducted in some 95 academic institutions; several hundred State and local organizations and laboratories; over 35 private foundations and professional associations; hundreds of industrial organizations; as well as in more than 85 Federal laboratories.

Maximizing benefits from the Nation's growing investment in the oceans requires developing the full potential of this widely dispersed research capability. Because of the very number and diversity of organizations and activities involved, however, there is a serious hazard of unwitting duplication or gaps in research efforts. Complete information about on-going research and effective information transfer thus become key elements for assuring that individual scientists, engineers, administrators, and policy officials have access to knowledge of "who is doing what, where, and with whose support."

Toward that end, the National Council on Marine Resources and Engineering Development is releasing this report: *Marine Research—Fiscal Year 1968*. The 2589 project descriptions contained herein should assist participants in Government, industry, and universities to select new areas for research, while avoiding wasteful duplication. By identifying individuals and organizations active in the same or closely aligned fields, communication of ideas, opinions, and data should be facilitated. And policy planning and decision making at all levels should be enhanced by the overview this compilation provides of the scope, balance, and texture of marine research.

Although invitations for contributions to the catalog were extended to over 400 non-Federal sponsors, this first national inventory of marine research still lacks information about many relevant non-proprietary projects. In addition, marine technology, ocean operations, and capital expenditures are not covered. It is hoped that among the benefits from this publication will be expanded recognition of the value of descriptive information about marine programs, and support for activities designed to improve the flow of information among specialists working in this area. I commend this report to all of those interested in the marine sciences—in their endeavors to help this Nation achieve the goals of more effective use of the seas.

SPIRO T. AGNEW,  
Vice President

## INTRODUCTION

One facet of the United States' marine science program, set forth in the Marine Resources and Engineering Development Act of 1966 (PL 89-454), is:

"The effective utilization of the scientific and engineering resources of the Nation, with close cooperation among all interested agencies, public and private, in order to avoid duplication of effort, facilities, equipment, or waste."

To fulfill its responsibility to assist the President with implementing the Act, the National Council on Marine Resources and Engineering Development has recognized that achievement of this objective depends critically upon the availability of comprehensive, definitive and timely information about the Nation's marine science activities and capabilities. Toward this end, the Council assigned to the Science Information Exchange (SIE) in April 1968 the responsibilities as a national center to collect and disseminate information about current, unclassified marine research. In October, the Council contracted with SIE for preparation of a catalog of marine research sponsored by the United States during fiscal year 1968.

*Marine Research—Fiscal Year 1968* is the product of an inventory of Federal and non-Federal organizations with ocean-related research programs and interests. It contains descriptive summaries of 2,589 unclassified projects which were funded, either for the first time or as continuing efforts, during that fiscal year. Associated with these projects, and identified by name and address, are 3,022 investigators; 457 contractors; 25 Federal supporting agencies; and 95 non-Federal sources of support.

The projects referenced in the catalog cover basic and applied research on the marine environment and its resources. This environment is defined to comprise the oceans, the estuarine and coastal areas, and the Great Lakes. For purposes of project selection, contributors were requested to interpret the guideline definitions in a broad sense so that pertinent items would not be overlooked. Research on properties of saline water systems, the behavior of materials in seawater, and techniques of desalination sponsored by the Office of Saline Water is omitted because these data are presented in the annual *Water Resources Research Catalog* which SIE prepares for the Department of the Interior. In addition, the level of project funding is not presented in this first edition since it was absent on almost one-half of the marine research summaries registered at SIE.

It is hoped that the document will be of sufficient value to encourage users to maintain complete and current records of their projects at SIE, thereby providing a central source for comprehensive marine research information.

The catalog could not have been produced without the full cooperation of the Federal agencies and State and private institutions which reviewed, updated, and supplemented the records of their research on file at SIE. Special appreciation is extended to the many industrial organizations that provided project descriptions to SIE for the first time in support of this inventory. Finally, we wish to acknowledge the effort made by the Science Information Exchange in completing its work with skill and on schedule, and the direction of the project by Mr. Bill Long of the staff of the National Council on Marine Resources and Engineering Development.

## EDITOR'S NOTE

On 30 April 1968, the National Council on Marine Resources and Engineering Development designated the Science Information Exchange of the Smithsonian Institution to be the national information center for unclassified, current marine science research information. Specifically, the Exchange undertook the responsibilities of a National Center for receiving, compiling, cataloging, and disseminating information concerning unclassified ongoing research and development activities in the Marine Sciences.

*Marine Research—Fiscal Year 1968*, prepared by the Science Information Exchange at the request of the National Council on Marine Resources and Engineering Development, is a part of this continuing mission in the marine information area. It provides information on 2,589 projects, supported by both Federal and non-Federal funds. In addition to projects registered with the Exchange, requests for ongoing research projects were made to some 385 non-Federal sources of marine research in an effort to supplement the non-Federal research already registered.

The research listed has been forwarded for inclusion by the supporting agencies. Frequently, more than one agency sponsored a single research project, sometimes resulting in the receipt of multiple records for the same research effort. If these project descriptions were essentially the same, only one was included in the document. However, all sources of support are identified for each project summary appearing in the catalog.

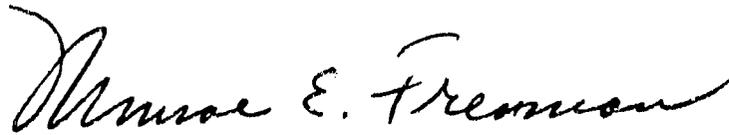

The projects included herein were reviewed, updated, and designated as marine research by the original source of material: Federal and state agencies, private industry, academic institutions, private foundations, or individual scientists. They were assigned to chapters and subchapters according to their subject matter. In addition to the summaries of the 2,589 projects, the catalog contains the following indexes: Subject Index, Investigator Index, Contractor Index, and Supporting Agency Index. The information which appears in the summaries and indexes was taken directly from the project records as received by the Exchange.

The Subject Index was developed by the Science Information Exchange. Each project has been indexed to an average of five terms which are arranged in hierarchies indicating relationships between broader and narrower concepts. The index term is followed by the project title, additional keywords used in indexing, and the chapter and subchapter number of the project. All terms were selected to emphasize the marine aspects of the project and are as specific as the language of the summary. A project which deals with "wave-built terraces" will be indexed to that specific term under a hierarchy consisting of the term "depositional features" and the still broader term "shorelines-geomorphic studies." Thus, one must turn to the high level term "shorelines-geomorphic studies" to find projects dealing with wave-built terraces, but he will also find all geomorphic shoreline studies grouped together in the same section. To further aid in locating subject areas, the first high level hierarchical term to appear on a left-hand Subject Index page is also printed in the upper left-hand corner of that page and the last high level term to appear on the right-hand page will also appear in the upper right-hand corner of that page in dictionary fashion.

The Supporting Agency Index consists of a single alphabetic listing of both Federal and non-Federal sources of support. In view of the large number of state agencies and departments, they are displayed as a combined group under each state. All investigators cited on the source document are included in the Investigator Index. An asterisk is used to designate the individual specified as principal investigator. However, in some instances it is apparent that the "principal investigator" denoted on the source document is, in fact, a program manager who is not working at the contractor location given in the project summary. The Contractor Index is an alphabetic listing of the performing organizations and their locations.

All of the indexes in this catalog were generated by means of a computer, necessitating a limitation on the number of characters available for index terms and captions. Thus, in some instances, abbreviations had to be used.

We hope that the users of the catalog will advise the Science Information Exchange of any errors of omission or commission that have been made. Also critiques of this volume are encouraged so that future editions might best reflect the information therein in a format and with indexes which are most convenient and acceptable to the user.

MONROE E. FREEMAN, *Director*  
Science Information Exchange

# DESCRIPTIONS OF RESEARCH PROJECTS

## 1. PROPERTIES OF WATER

(Studies In-Situ and of Saline Water Systems in Laboratory)

### 1A. ACOUSTICAL PROPERTIES

(see Chapter 7g For Acoustical Properties of Sediments)

#### 1.0001, ARCTIC ACOUSTIC RESEARCH

B.M. BUCK, General Motors Corporation, Goleta, California 93017 (NONR)

A long term study of the properties of the ambient noise in the deep Arctic Basin will be studied with special interest in the effects of anisotropic noise field on the degradation of equipment. Propagation studies will continue.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0002, TURBULENCE STRUCTURE AND NOISE STUDY

E.R. VANDRIEST, North Amer. Rockwell Corp., Long Beach, California 90803

The objective of this research project concerned the measurement of noise produced by turbulent flow as a function of flow projectries. The experiment utilized a pressure transducer located in the wall of a tubular fixture which was subjected to turbulent flow. The project also determined the reduction of such noise through the use of additives which were injected into the flow.

SUPPORTED BY North American Rockwell Corporation

#### 1.0003, DETERMINANTS AND CONTROL OF UNDERWATER VOCALIZATIONS IN THE CALIFORNIA SEA LION

R.J. SCHUSTERMAN, Stanford Research Institute, Menlo Park, California

The purpose of this project is a delineation of the factors influencing the underwater vocalizations of a member of the pinnipeds, *Zalophus californianus*, the California sea-lion. A determination will be made of the degree to which these vocalizations can be utilized to communicate information from visual displays, e.g. different shapes and sizes of objects and patterns. Both the 'naturally' occurring vocalizations encountered in free-swimming situations and controlled vocalizations utilized for information transfer.

While a great deal of scientific and training effort has been placed upon the cetaceans, particularly the dolphins and porpoises, the pinnipeds, or seals and sea-lions have received little attention as to their capabilities and general biology. This project is one part of a program to provide such information on this group of highly adaptable and potentially valuable animals. The Navy should be aware of the physical parameters and behavioral patterns involved in the pinniped contribution to the oceanic acoustic ambient and the feasibility of utilization of these intelligent animals in similar supportive roles to those now filled by the porpoise.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0004, OCEAN DYNAMICS - OCEANOGRAPHIC ANALYSES AND FORECASTING MODELS

T. LAEVASTU, U.S. Navy, Postgraduate School, Monterey, California 93941

OBJECTIVE: To determine those environmental factors affecting acoustical uses of the ocean. Categorize strategic areas into similar acoustical provinces for sonar operation. To provide scientific acoustical synoptic oceanographic analyses/forecasting models.

APPROACH: Extrapolate and interpolate the oceanographic and acoustic properties of known to unknown areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0005, OCEANOGRAPHIC RESEARCH

Y. IGARASHI, U.S. Navy, Undersea Warfare Center, Pasadena, California 91107

Technical Objectives: To conduct an oceanographic research program that will provide an understanding of the effects and limitations imposed by the marine environment on the performance of weapons and weapon systems and the discovery of information which may lead to new concepts.

Approach: An applied research program is being pursued, keyed to acoustic problems in shallow waters. Two related areas are being investigated: (1) spatial dependence of temperature and sound velocity structures in water masses and (2) bottom characteristics at specific frequencies. To obtain basic data on temperature structure, a measurement program has been set up which requires simultaneous measurements at three stations using precision sensors. Physical measurements will be correlated with acoustic propagation tests; an improved theoretical model will be used to compute the intensities. A program has been formulated on the investigation of the relationship between bottom structures, and reflectivity and scattering at specific frequencies. Two reference areas having contrasting geological (and acoustic) properties were selected off the Southern California Coast for extensive oceanographic and supporting acoustic measurements.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0006, OCEANOMETRICS

E.R. ANDERSON, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting acoustical uses of the ocean; to extrapolate and interpolate the oceanographic and acoustic properties of known to unknown areas; to develop theory for predicting the effects of variability of three layers of the sea; develop theory and models for predicting underwater sound propagation; develop statistical, physical and computer techniques.

Approach: Employ oceanographic, statistical, and computer concepts and techniques to develop new approaches for analyzing, summarizing, interpreting and extrapolating oceanographic data in ways meaningful to the scientist, engineer and officer dealing with underwater acoustic propagation research and equipment design and operation. Study the temporal and spatial variation of sound velocity and other pertinent oceanographic variables and their effect on sound propagation.

Make studies and investigations to describe space/time distributions of environmental factors; regional studies of same;

## 1. PROPERTIES OF WATER

verification of theoretical work in dynamic oceanography and statistics; computer programs; special support of laboratory problems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0007, MEASUREMENT AND PREDICTIVE STATISTICS OF REVERBERATION

*W.E. BATZLER*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To acquire and organize information on underwater acoustic reverberation and on the mechanisms controlling back-scattered sound.

Approach: The approach encompasses studies of all factors affecting reverberation. These include the sea surface, wind speed, structure and composition of ocean bottom, scattering layers, other biological scatterers, etc.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0008, MEASUREMENT AND THEORY OF SCATTERED UNDERWATER SOUND

*L.R. DUYKERS*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To study and explain theoretically the reasons for reverberation losses and other propagation phenomena in the ocean.

Approach: The approach will include both experiment and theory. Much of the experimental data will be acquired in connection with propagation studies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0009, OCEANOGRAPHIC RESEARCH-INVESTIGATIONS IN SHALLOW WATER

*O.S. LEE*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting acoustical uses of the ocean; investigate factors in physical oceanography which pertain to underwater sound including physical properties such as thermal structure, water motion; and chemical properties such as salinity and oxygen.

Approach: By use of the NUWC Oceanographic Tower, SCUBA, buoys and bottom mounted equipment, and shallow submersibles: observe, measure, correlate those properties in the surface layers of the sea affecting underwater sound, particularly the marine physical chemical, biological and geological near-shore properties. Develop environmental models for visibility, turbidity, conductivity, tidal and long shore currents, orbital motion, surface and internal waves, gas content and biological population, acoustical and chemical properties, bottom, beach and delta conditions, physical properties of sediments and microtopography; and instrumentation needed to obtain these models.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0010, DEEP OCEAN ACOUSTIC RESEARCH

*K.V. MACKENZIE*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting the acoustical uses of the ocean. Observe and develop theory and models for predicting underwater sound propagation using deep water paths, including near bottom phenomena; conduct underwater acoustic studies by utilizing deep manned submersibles.

Approach: Perform precision measurements on sound speed, temperature, salinity and pressure to study the in-situ relationships, with particular emphasis on the pressure effects on sound speed. Temperature structures and sound velocity structures near the bottom and in the top layers of sediments will be investigated. Adiabatic compressibility anomalies computed from sound speed anomalies will be correlated with other measurements, emphasis will also be given to anomalies near the sea floor, sound speed micro-structure will be analyzed by turbulence theory with application to underwater acoustic scattering and phase amplitude fluctuations affecting signal processing.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0011, PREDICTION OF SOUND FIELDS BY NORMAL MODE AND OTHER THEORY

*M.A. PEDERSEN*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To predict propagation loss for a variety of oceanographic conditions in which the water medium itself, rather than the medium boundaries, is the controlling factor.

Approach: Modern high-speed electronic computers are used extensively and several basic theories of wave propagation in non-simple media are applied in the computer programs.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0012, UNDERWATER ACOUSTIC SIGNAL COHERENCE

*G.O. PICKENS*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To conduct acoustic propagation and coherence studies.

Approach: Propagation is carefully analyzed for ray theory multipath conditions and for dominant propagation modes. Experiments are emphasized and are designed to determine the reliability of existing acoustic models and means for improving them.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0013, AMBIENT SEA NOISE

*G.M. WENZ*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine the sources, mechanism, statistical properties and other characteristics of ambient noise in the ocean as a function of temporal and spatial parameters.

Approach: Make continuous, or sustained periodic sampling, measurements at each of several sites, with as much geographic coverage as possible, supplemented by measurements using ship-borne and buoy systems in more remote areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0014, MEASUREMENT OF UNDERWATER ACOUSTIC PROPAGATION

*H. WESTFALL*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To check, verify, and determine the anomalies between predicted propagation and measurements at sea.

Approach: Measurements stress the accurate determination of sound fields at varying ranges and depths. Measure of pronounced variation in acoustic fields due to variation of a particular propagation factor are also emphasized so that computing methods can be improved and compared with data directly applicable. The general approach is one of verification of predictions leading to subsequent improvement of prediction.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0015, ENVIRONMENTAL SUPPORT OF SONAR DESIGN

*R.B. WHEELER*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To obtain qualitative and quantitative data on acoustic propagation characteristics of various ocean areas.

Approach: Conduct world-wide research cruises utilizing surface and submerged vehicles to obtain simultaneous acoustic and oceanographic measurements in support of acoustic model development.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0016, OCEAN ACOUSTIC ENVIRONMENT

*F.N. SPIESS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (N00014-67-A-0109-0009)

This work unit is part of an overall effort to increase the body of knowledge of the marine acoustic environment.

Reduction of data from at-sea experiments will represent a significant effort during the contract year. Reverberation spatial

## 1. PROPERTIES OF WATER

and spectral measurement analyses will continue and a study of the 'clumping' of scatterers in the deep scattering layers will be conducted. Previously obtained ambient noise data will be analyzed with emphasis on the non-Gaussian general properties of the noise.

OTXT-ZQN-520044\*

Technical Objectives: Short Term. 1. Determine the changes in the sound field which occur in various seasons in one selected location near Bermuda.

Long Term. 1. Extend the propagation loss measurement program to at least two other selected areas where considerable oceanographic differences occur. (This requires equipment development). 2. Determine the need for extension of reverberation measurements and pursue this work if it appears necessary.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0017, ARCTIC PLANKTON ECOLOGY

*UNKNOWN*, McGill University, Graduate School, Montreal - Quebec, Canada

Certain relatively shallow under-ice water layers in the Arctic exhibit a pronounced seasonal interference to acoustic propagation.

These studies are especially relevant to the development or improvement and utilization of underwater acoustic systems. Population studies aid in the identification of water masses of differing physical properties which are in themselves important to acoustic propagation. Organisms whether macroscopic or microscopic but present in large number per unit volume are potential sources of ambient noise and acoustic scatter. All acoustic applications require clear identification of causes of acoustic aberrations as well as determination of corrective procedures.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0018, ACOUSTIC IMAGE INVESTIGATION

*W.L. KONRAD*, Raytheon Company, New London, Connecticut

Perform experimental studies in the MRL tank facility to determine acoustic image quality and characteristics independent of an image converter system. This was accomplished by forming an acoustic image of a known target with a parabolic reflection and then probing the image plane with a high resolution probe hydrophone. The amplitude and phase distribution over the image plane were determined by this technique. The results indicated that the quality of the image formed was in general agreement with the resolution capabilities of the reflector aperture.

SUPPORTED BY Raytheon Company

### 1.0019, ULTRASONICS

*W.L. KONRAD*, Raytheon Company, New London, Connecticut

This project investigated the finite amplitude effects in the mid frequency range (600 KHz). The effects of surface reflection, harmonic generation and difference frequency generation of finite amplitude waves were measured. The work was performed in the MRL tank facility. Additional work was performed at Seneca Lake, New York using the BQS-13.

Results pointed out several interesting application possibilities, including surface, ship bottom identification and source level determination through measurement of harmonic ratios.

SUPPORTED BY Raytheon Company

### 1.0020, SOUND TRANSMISSION IN THE SEA

*H.W. MARSH*, Raytheon Company, New London, Connecticut (N00014-67-C-0241)

This work deals with sound transmission in the sea. It includes: the development of theory; design, performance and analysis of supporting experiments; performance of appropriate surveys related to underwater sound; evaluation of experimental acoustic techniques and equipments; provision of consultant services in the above and related areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0021, INTERNAL WAVE STUDIES

*P.A. BARAKOS*, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: To determine those environmental factors affecting acoustical uses of the ocean. To conduct studies of the effects of internal waves on the scattering and refraction of underwater sound.

Approach: Conduct theoretical studies and related scaled model measurements of the effects of internal waves on acoustical energy by constructing a model tank with scattering and refractions results with theory. Extend studies to a stationary sinusoidal interface between two fluids and continue these studies with a dynamic interface. Develop a program for intermediate and full scale ocean studies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0022, BIOLOGICAL OCEANOGRAPHY

*A.L. BROOKS*, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: To determine those environmental factors affecting acoustical uses of the ocean. To investigate and identify organisms affecting acoustic reverberation and reflection, and ambient noise level. To study the acoustic characteristics and the spatial and temporal distribution of these organisms to develop a predictive capability of their migration habits and population density in areas of the Atlantic Ocean.

Approach: Conduct biological studies of the deep scattering layer in the North Atlantic. Using DRV's, these studies are to consist of selective sampling via a biological sampler. Simultaneous acoustic backscattering studies will be made with available research instrumentation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0023, AMBIENT NOISE RESEARCH STUDIES

*B. CRON*, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: Study the spectral, temporal, and spatial distribution of ambient noise. Develop suitable theoretical models and conduct necessary experiments to relate ambient noise to oceanographic, geometric and acoustic parameters.

Approach: Develop theory describing surface noise and its relationship to oceanographic parameters.

Continue experimental studies of ambient noise as a function of area to develop a general non-area dependent model for ambient noise.

Conduct measurements study first and second order noise characteristics in the deep ocean as a function of depth from near surface to below the deep sound channel.

Study transient and spectral characteristics of biological noise.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0024, SIGNAL COHERENCE AND ARRAY DESIGN STUDIES

*B. CRON*, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: Study the temporal and spatial characteristics of underwater acoustic signals (time and space coherence and signal distortion) and relate these parameters to array gain and design and to expected and measured performance of various methods of signal processing.

Approach: Oceanographic studies are conducted in support of acoustic measurements to physically describe reflecting boundaries. Theoretical studies are undertaken to define distortion or change in waveform and develop criteria to evaluate the experimental results.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0025, BOTTOM-REFLECTED SONAR STUDIES

*J. GEARY*, U.S. Navy, Underwater Sound Lab., New London, Connecticut

## 1. PROPERTIES OF WATER

Objective: To determine quantitatively and qualitatively the effects of surface, bottom, and volume backscattering on the propagation of acoustic energy in the ocean.

Approach: Conduct a series of acoustic measurements at sea, including system calibration tests, under a variety of environmental conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0026, PHYSICAL OCEANOGRAPHY

L.C. HUFF, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: To determine those environmental factors affecting acoustical uses of the ocean. Observe and develop theory models for predicting underwater sound propagation using deep ocean water paths; Predict the effects of variability in properties of the sea surface, air and sea temperature structure related to acoustic propagation.

Approach: Using sea surface and environmental measuring systems installed on surface ships and Argus Island, make short and long term measurements of wave height and direction, wind velocity and turbulence, air and sea temperature structure in areas where acoustic studies are being conducted and integrate these measurements with acoustic programs. Relate all measurements to sound velocity and acoustic propagation and explore computer techniques.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0027, REVERBERATION RESEARCH STUDIES

R.L. MARTIN, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: Describe the spectral, temporal, and spatial distribution and coherence of reverberation as a function of frequency, transmitted signal characteristics and the environment, including both the oceanographic and geometric situation.

Approach: Conduct theoretical and at-sea experimental studies utilizing a variety of surface and deep research vehicles.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0028, ACOUSTIC SCATTERING STUDIES

S. SANTANIELLO, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: Investigate scattering loss of acoustic signals upon reflection from the ocean boundaries as a function of frequency, grazing angle, signal characteristics and boundary characteristics and relate these results to prediction models.

Approach: Collect, process and analyze bottom and surface acoustic reflection data obtained from various geographic areas. Oceanographic measurements are conducted in support of acoustic measurements to physically describe the reflecting boundaries such that reflection loss may be related to boundary makeup.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0029, UNDERWATER SOUND PROPAGATION STUDIES

W. THORP, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: To study and report on underwater sound propagation in shallow and deep water as a function of frequency, environmental conditions and mode of propagation.

Approach: Determine the causes of propagation loss and attempt to resolve differences reported by various investigators. Increase the precision of knowledge concerning the attenuation coefficient. Investigate the temporal stability of shallow water propagation for improving correlation of shallow water propagation with environmental factors.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0030, SHALLOW WATER OCEANOGRAPHY

R.G. WILLIAMS, U.S. Navy, Underwater Sound Lab., New London, Connecticut

Objective: To determine those environmental factors affecting acoustical uses of the ocean. To investigate the oceanographic and meteorological properties of shallow water and continental shelf areas and the effects of these environmental parameters on underwater sound.

Approach: The Block Island Fishers Island oceanographic system will be installed between Block Island and Fishers Island. Oceanographic data will be obtained and related to acoustic shallow water propagation data obtained at the same time. This will be a continuing program (2-year period) such that long and short term relationships - acoustic oceanographic - may be obtained.

Additional buoy emplacements and ships surveys are to be made on the seaward side of Block Island southeastward toward the cyclonic shear region of the Gulf Stream system. This extension will provide information on the hydrodynamic forcing functions affecting Block Island Sound as well as internal waves and turbulence of the Continental Shelf.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0031, PHYSICAL ACOUSTICS AND THE PROPERTIES OF MATTER

M. GREENSPAN, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

Study of properties of matter by physical-acoustic techniques. (1) Acoustic cavitation. What variables are decisive and how those of nuclei interact with those intrinsic to liquid? What are natural nuclei and how are they stabilized? (2) Obtain accurate values for speed of sound in water as function of temperature and produce standard for calibration of velocimeters. (3) Possible anomalies in thermodynamic behavior of single crystal ice at low temperatures. Obtain most needed data, i.e. complete set of elastic constants. Relevance: properties of well-characterized substances and production of calibration standards.

(1) Remove naturally occurring nuclei, which are variable, and substitute reproducible ones using ionizing radiation. Devise techniques for absolute measurement of sound at 'threshold' and study as function of nucleus (neutron-recoil, alpha-recoil, fission) and liquid properties and temperature. (2) Develop instrument based on radiation theory; operating principle as different as possible from existing types. Similar to conventional interferometer, but with progressive waves (simulated by long pulse) and with small baffled transducers for which far-field paraxial theory applies. (3) Elastic constants by refined pulse technique, modified for ice; L-waves and polarized S-waves, ice point to He temperatures.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 1.0032, RELIABLE ACOUSTIC PATH

C.L. BUCHANAN, U.S. Navy, Research Laboratory, Washington, District of Columbia

Technical Objectives: Short Term. 1. Determine the changes in the sound field which occur in various seasons in one selected location near Bermuda. 2. Determine the characteristics of the 'Deep Focus' region in a selected location near Bermuda at the first and second zones during 'winter' conditions.

Long Term. 1. Extend the propagation loss measurement program to at least two other selected areas where considerable oceanographic differences occur. (This requires equipment development). 2. Extend the study of the deep focusing region to different areas. 3. Determine the need for extension of reverberation measurements and pursue this work if it appears necessary.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0033, PREDICTIVE OCEAN ACOUSTICS

J. CYBULSKI, U.S. Navy, Research Laboratory, Washington, District of Columbia

Technical Objectives: The objective is to process and report all experimental data on mean horizontal speed of sound obtained in various ocean areas.

Approach: Determine by means of a theoretical and experimental program the effects of realistic variations in velocity profile, and other oceanographic parameters upon underwater acoustics, using values representative of ocean areas.

## 1. PROPERTIES OF WATER

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0034, PREDICTIVE OCEAN ACOUSTICS

*J. CYBULSKI*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: Develop techniques for predicting acoustic characteristics of ocean areas.

Approach: Conduct experiments to provide acoustic propagation data under known environmental and geometric conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0035, SHALLOW WATER PROPAGATION

*J. CYBULSKI*, U.S. Navy, Research Laboratory, Washington, District of Columbia

The objective is to increase the understanding and interrelation of acoustic and oceanographic parameters in shallow water propagation.

Approach: Undertake a program directed at understanding the fundamentals of shallow water propagation for the purpose of relating reverberation signal level and coherence to the environment, and to develop a mathematical model which will represent shallow water propagation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0036, ULTRASONICS

*V.A. DELGROSSO*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: 1. To describe acoustic propagation within liquid cylinders with realistic boundary conditions. 2. To continue development of acoustic relaxation theory for pressure sensitive chemically active media such as sea water. 3. To prepare definitive tables of sound speed and absorption for pertinent physical and chemical parameters.

Approaches: Formulate more definitive theory of laboratory acoustic propagation parameter measurements. Design and construct advanced acoustic cells as guided by newly developed theory. Improve all ancillary equipment to degree justified by theoretical predictions. Evaluate different techniques and schemes of measurement. Obtain experimental confirmation of theoretical behavior including aberrations. Prepare definitive tables of sound speed and absorption from measurements.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0037, GLOBAL VOLUME REVERBERATION LIMITATION STUDIES

*G.B. FARQUHAR*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

Objective: Establish global environmental time-space models and methods for delineating biological reverberation provinces, by relating distributions and types of biological sound scatterers to observed volume reverberation. Special emphasis is placed on providing models and techniques for improving existing prediction methods.

Approach: Conduct coincident acoustic and biological measurements to determine relationships between biological scattering and the distribution of midwater scatterers. Collected biological samples will be used to identify and determine the distribution of scatterers, and for swimbladder physiology studies. Detailed experiments will be conducted in the North Atlantic using newly developed airborne and shipboard techniques to determine seasonal, diurnal, depth and geographic variations of volume reverberation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0038, UNDERWATER ACOUSTIC ANALYSIS

*R.H. FERRIS*, U.S. Navy, Research Laboratory, Washington, District of Columbia

The objectives are to: 1. Predict effect of oceanographic parameters on the characteristic of the acoustic signal, and 2. Develop requirements for signal design and signal processing to improve propagation.

Approaches: Conduct an extensive search, study, and analysis of all published results and conduct a thorough theoretical and experimental program to determine the relationship of signal characteristics to the ocean environment.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0039, ENVIRONMENTAL REVERBERATION STUDIES

*A.J. HILLER*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: To determine those environmental factors affecting acoustical uses of the ocean. To study the relation between particulate and microbubble distribution in the sea and acoustic volume scattering strengths in order to better understand the nature and cause of volume reverberation.

Approach: Obtain particle, bubble, optical and acoustic profiles at sea utilizing an in-situ particle analyzer and an in-situ microbubble analyzer. Relate data obtained to scattering theory and temperature, salinity and sound velocity. Analyze PARTICULATES using an electron microscope. Using a tank, conduct experiments to determine scattering strength and absorption of water containing known particulates and controlled microbubbles.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0040, SOUND SCATTERING IN THE OCEAN

*B.G. HURDLE*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: Describe in mathematical terms the scattering of acoustic energy from the ocean bottom, volume and surface.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0041, BIOLOGICAL FALSE TARGETS AND RELATED ACOUSTIC CHARACTERISTICS

*R.H. LOVE*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

OBJECTIVE: In conjunction with the Department of the Interior, develop techniques for improving biological false target and fish detection, classification and prediction methods, and techniques of applying such predictions on a global basis in conjunction with Navy environmental prediction systems. In accordance with the Memorandum of Agreement between the Department of the Navy and the Department of the Interior, primary emphasis is placed on cooperation with the Department of the Interior and utilization of joint Navy-Interior capabilities in support of national goals.

APPROACH: In collaboration with the Department of the Interior, conduct investigations to determine the acoustic properties of marine organisms in order to identify potential biological false targets. Experiments will be conducted to determine target strengths and echo signatures of individual organisms and fish schools. Joint experiments will be conducted with the Bureau of Commercial Fisheries to detect, localize and classify marine organisms.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0042, SHALLOW WATER ACOUSTIC STUDIES

*A.T. MCCLINTON*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: To provide fundamental information necessary to develop accurate acoustic prediction models for use in shallow water areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0043, MICROACOUSTICS

*W.G. NEUBAUER*, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: 1. Increase the knowledge of the mechanisms of acoustic reflection and diffraction. 2. To develop the capability of experimental determination of reflection from bodies not possible by analytical means. 3. Establish realistic scaled thermal gradients in a water tank to determine their effect on echo characteristics.

## 1. PROPERTIES OF WATER

Approach: The reflection in water from less complicated bodies, (spheres, cylinders, spheroids) have been experimentally measured by several investigators seldom very extensively or in correspondence with a reliable theory. A group at DRL at the University of Texas have measured such reflection in a lake. Qualitative agreement with theory is available for some cases and quantitative agreement is within a factor of two or three in the best cases. Acoustic reflected and scattered fields must be measured with much more precision than heretofore and a correspondence with complete theory must be achieved for a limited number of specific cases sufficient to establish an experimental method with confidence.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0044, ACOUSTIC PROPAGATION STUDIES

L.C. RICALZONE, U.S. Navy, Research Laboratory, Washington, District of Columbia

Objective: Develop theory, design and develop oceanographic instrumentation, and conduct field experiments in support of acoustic propagation studies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0045, ADVANCED TECHNOLOGY AND BOTTOM PREDICTIONS

R.S. WINOKUR, U.S. Navy, Oceanographic Office, Washington, District of Columbia

Objective: Develop new and improve existing bottom acoustic data collection and analysis methods for improving NAVOCEANO's survey programs. Develop global bottom acoustic models and techniques for predicting the behavior of bottom influenced sound propagation to improve existing prediction methods for use by NAVOCEANO operational programs.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0046, CIRCULATION STUDIES

S. BROIDA, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (NONR)

Objective: This effort is to improve our ability to predict environmental conditions influencing the operations of naval forces and the effective use of systems and equipment, especially those conditions affecting underwater sound.

Approach: Changes in the oceanographic conditions observed across the Florida Current are being correlated with simultaneously observed variations in acoustic transmissions across the current. The amplitude and phase fluctuations observed in low frequency (420 Hertz) acoustic signals transmitted across the Straits of Florida are being related to time series of temperature, salinity and current velocity obtained along the transmission path. The influence of tides upon the current velocity structure and acoustic propagation conditions is being investigated. A two-week series of continuous oceanographic observations will be made to correlate tides and variations in the water masses of the Florida Current.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0047, BEHAVIOR AND SONIC ACTIVITY OF FISHES

A. MYRBERG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (N00014-67-A-0201-0004)

Objective: The identification and prediction of the animal forms involved in the problem of biologically generated underwater sound is assuming increased importance. The design of this work unit, centering on the use of the unique Bimini Acoustic-Video System, is permitting direct and unequivocal observation of sound producers during a variety of activity patterns.

Approach: Utilizing the capability of the Acoustic-Video System located at the Lerner Marine Laboratory, Bimini, Bahamas, a correlation of the behavior and bioacoustic activity of the bicolored damselfish, *Eupomacentrus partitus*, will be made with the operant environmental factors. Taped video and acoustic recordings of behavior will be analyzed and physical data on turbidity, light level, current speed and direction, and temperature will be integrated to reveal causal relationships. Acoustic

playback experiments, using sounds of this and other sonic fishes will be completed, both in the field and in controlled laboratory conditions, as to behavioral reactions of the fish to the sound patterns.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0048, AMBIENT SEA NOISE INVESTIGATION

J.C. STEINBERG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Objective: To determine those environmental factors affecting undersea uses of the ocean. Make time series measurements of ambient noise level related to concurrent wind/wave measurements.

Approach: Using an IBM 7040-1401 computer and applying time series techniques and standard statistical treatments to data obtained off Bimini, Bahamas during the period 10 Sept 66 to May 67, determine relationships between ambient noise levels and environmental parameters to develop a math model in which a frequency dependent linear system of multiple inputs consisting of environmental parameters may be expected to determine a single output which would be ambient noise. Very narrow band noise measurements will be obtained. Real time analyses of the amplitude and phase characteristics of this narrow band noise will be performed. The distribution of pressure fluctuations of 1/3 octave band noise at selected frequencies during different environmental, bio-acoustical and shipping conditions will also be determined. LINC-8 data processors will be used for the high speed analogue-digital sampling and computation of this data.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0049, ACOUSTIC-VIDEO SYSTEM FOR AQUATIC BIOACOUSTICAL AND ETHOLOGICAL RESEARCH

J.C. STEINBERG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (NONR)

Objective: The exigencies of Naval marine technology require that more detailed information be made available on biologically produced underwater sound. The Acoustic-Video System designed by Dr. Steinberg is providing direct and unequivocal observation and recording of sound producers in their natural environment.

Approach: The investigator and his staff will continue to operate, maintain, and modify, as requested by the biologists, the Acoustic Video System located in 20 meters of water off the NW Coast of Bimini in the Bahamas. This array will be used to permit bioacoustic behavioral studies on sonic animals in the field. Dr. Steinberg's team will continue to work closely with the biologists and expand the interdisciplinary approach to marine bioacoustical problems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0050, SHALLOW-WATER ACOUSTICS

M. WEINSTEIN, Underwater Systems Inc., Silver Spring - Wheaton, Maryland 20910 (N00014-67-C-0480)

Review all literature pertinent to shallow-water acoustic transmission. Extract, collate, summarize, and annotate theoretical and experimental data. Visit facilities engaged in shallow-water acoustic studies to obtain unpublished information. Collate new material with original summary acoustic data (SAD) Report (1956) and issue revised and updated publication.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0051, SONAR ACCURACY

A.T. JAKUES, U.S. Navy, Ordnance Laboratory, Silver Spring - White Oak, Maryland

To determine sonar bearing and ranging errors at long ranges.

Make acoustic propagation measurements with a stable research platform (SPAR).

SUPPORTED BY U.S. Dept. of Defense - Navy

## 1. PROPERTIES OF WATER

### 1.0052, OCEANOGRAPHIC RESEARCH

UNKNOWN, U.S. Navy, Ordnance Laboratory, Silver Spring - White Oak, Maryland

To study the effect of ocean dynamics on the behavior of submerged moored bodies. To investigate the effect of shallow water and coast proximity on acoustic transmission properties. To develop the necessary instrumentation to carry out the above studies.

Measure the current and the motion of a submerged body at selected locations. Determine how the two phenomena are related. Measure acoustic signals at selected coastal sites. Determine how the original signal is modified and identify the oceanographic parameters which contributed to the modification.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0053, ACOUSTIC AMBIENT NOISE

M. ARSOVE, Raytheon Company, Waltham, Massachusetts

Design, construction and operation of instrumentation to collect data relevant to determining the characteristic power spectra, amplitude distributions, directional properties, and relationship to ambient noise at depth of the near-surface acoustic ambient noise.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0054, BIOLOGICAL ASPECTS OF MIDWATER SOUND SCATTERING

R.H. BACKUS, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The long term goal is to understand the geographic distribution of mesopelagic fishes in the North Atlantic Ocean and adjacent seas. The investigations will include charting of the distribution of mesopelagic fishes by species in order to show principal distribution patterns, and to point to physical bases for the apparent patterns. Midwater trawl collections are to be accompanied with sound scattering observations in efforts to correlate echo soundings with possible causative organisms. With the development of adequate gear, attempts will be made to determine the relation of patterns of sound scattering to vertical distribution of mesopelagic fishes. Such collections would be accompanied by continuous echo soundings and by broad-band sound scattering observations. Refinement of such gear as midwater sampler, pneuston nets, and echo sounders are to be continued. Further observations are to be made on microbioluminescence both in the sea and in Eel Pond at Woods Hole in order to understand something of the seasonal fluctuations in bioluminescence. Underway observations at sea will be made for studying geographic variations in such activity. Finally, dives are to be made in a deep-going submarine for the purpose of making direct observations of sound scatterers in deep scattering layers using echo-ranging and sounding gear.

SUPPORTED BY U.S. National Science Foundation

### 1.0055, EASTERN ATLANTIC AND MEDITERRANEAN OCEANOGRAPHY

E.E. HAYS, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The purpose of this task is to support Woods Hole research scientists to participate with the UK scientists in a cooperative study of underwater sound experiments in the Eastern Atlantic and the Mediterranean Sea. Bathymetric and sound velocity and noise measurements will be included. The task will also provide for analysis and interpretation of data.

This is part of a coordinated program to determine the oceanographic and acoustic structure of the Mediterranean. The WHOI scientists aboard the R/V CHAIN will participate in a joint cruise with a UK vessel.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0056, WOODS HOLE ENVIRONMENTAL STUDIES IN PHYSICAL OCEANOGRAPHY

E.E. HAYS, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (NONR)

Objective: Improved understanding of the oceanographic factors that affect acoustic systems (both current operations and for future designs. To relate the properties of the oceanic environment to specific modes of acoustic transmission.

Approach: Obtain sound velocity profiles in terms directly related to specific acoustic experiments, and as a general oceanographic tool. Develop an on-line sound velocity profiling system using the shipboard computer. Use a STD (Salinity-Temperature-Depth) system to study oceanic fronts and gain information on the possible structure and movement of the water.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0057, WOODS HOLE ENVIRONMENTAL STUDIES OCEANIC ACOUSTICS

E.E. HAYS, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (NONR)

OBJECTIVE: Improved understanding of sound transmission and scattering in the ocean with a view toward providing equipment designers a description of opportunities and limitations they can use to define the environmental component of their systems.

APPROACH: Complete analysis of sound transmission path data obtained in the Baltic in FY 1967 to determine the extent that it can serve as a model for the deep oceans. Conduct transmission experiments in the Northwest Atlantic, over ridges and down slopes to show bottom effects. Make field measurements of volume reverberation, identify sources of sound scatterers and identify the mechanisms which cause volume reverberation. Include in these measurements the interaction effects caused by fish swim bladders and fish schooling habits.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0058, ACOUSTICS PHYSICS

W. HARDY, Hudson Laboratories Inc., Dobbs Ferry, New York (NONR)

Conduct studies of underwater acoustic transmission to provide the Navy with scientific and technical knowledge of underwater sound and related disciplines.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0059, THE PROPAGATION OF ACOUSTIC WAVES IN THE STRATIFIED ATMOSPHERES

W.L. DONN, Columbia University, Graduate School, New York, New York 10027

Technical Objective: Propagation parameters of pressure perturbation, vertical and horizontal motion, and kinetic energy along the vertical have been developed for gravity and acoustic gravity waves of long period (of the order of minutes). This study will be extended to pure acoustic waves of much shorter period (1 to 10 seconds).

Approach: The program consists of two aspects- (1) Theoretical analysis of acoustic wave propagation involving the application of the wave equations to the real atmosphere considered as being stratified in terms of both temperature and wind. (2) An experimental analysis of spectral characteristics of acoustic waves recorded by microphones.

SUPPORTED BY U.S. Dept. of Defense - Army

### 1.0060, BIOLOGIC SOUND SCATTERING

A.W. BE, Columbia University, Graduate School, Palisades, New York 10964 (N00014-67-A0108-0004)

This program is directed at measuring total volume reverberation levels in the ocean and correlating them with the plankton-nekton standing crop. The newly initiated and specialized biological sampling program will be continued along with the concurrent acoustic measurements under controlled conditions using broad band and discrete sound sources. Correlation of biomass data and PDR records from past cruises will continue.

Volume reverberation is thought to result in part from sound scattering by biological organisms and varies in intensity with depth, geographic locality, time of day, time of year, and sound frequency. The information on such variations and their interrelationships which will be provided by this program, should con-

## 1. PROPERTIES OF WATER

siderably improve the Navy's ability to predict acoustic conditions as a function of time of day, time of year, and geographic location.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0061, OCEAN SOUND TRANSMISSION

*EWING*, Columbia University, Graduate School, *Palisades, New York* 10964 (NONR)

A broad program of applied research is conducted on sound transmission in the ocean, and on phenomena controlling it.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0062, RESEARCH IN OCEANOGRAPHIC SPECIAL CHARTS

*W.M. EWING*, Columbia University, Graduate School, *Palisades, New York* 10964

Objective: To determine those environmental factors affecting acoustical uses of the ocean. To investigate and characterize the properties of the ocean bottom and sub-bottom including acoustic properties and to delineate physiographic provinces of the ocean bottom.

Approach: Extrapolate and interpolate the oceanographic and acoustic properties of known to unknown bottom areas and categorize areas into similar acoustical provinces. Observe and develop theory and models for predicting underwater sound propagation using deep ocean water paths including near bottom phenomena. Delineate and chart oceanic provinces on the basis of topography, sediment type, roughness, etc. and the accompanying acoustic properties of the bottom and the sub-bottom. Refine these charts on the basis of reflectivity measurements and bottom and sub-bottom profile records.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0063, RESEARCH IN REGIONAL TOPOGRAPHIC ANALYSIS

*W.M. EWING*, Columbia University, Graduate School, *Palisades, New York* 10964

Objective: To determine those environmental factors affecting uses of the ocean. Extrapolate and interpolate the oceanographic properties of known to unknown bottom areas and categorize strategic areas into similar provinces.

Approach: Study the statistical properties of the bottom topography including both slope and roughness and relate these properties to the physiographic province in the oceans. Develop suitable data presentation methods and analyses.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0064, BIOLOGICAL SOUND

*M.P. FISH*, Univ. of Rhode Island, Graduate School, *Kingston, Rhode Island* 02881 (NONR)

The investigator, who has frequently been asked by the Navy to provide identifications, measurements, and analysis of biological sources of underwater sound along United States coasts and territorial waters, has established a series of stations at faunally strategic points making possible the collection of continual, integrated simultaneous information on seasonal, diurnal, and vertical distribution of biological ambient sounds and the occurrence, distribution, and significance of these sounds. Monitoring-recording equipment has been supplied to each station for use under the cognizance of a senior scientist. The planned study area covers the geographical range of the most noisy contributors to the general background.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0065, SHALLOW WATER ACOUSTIC PROPAGATION STUDIES (SWAPS)

*K.T. CROCKER*, U.S. Navy, Underwater Weap. Res. & Eng., *Newport, Rhode Island* 02844

Technical Objective: Investigate some of the characteristics of sound propagation in shallow water and to relate these observations to the oceanographic environment.

Approach: Investigation will be conducted on the fluctuations of the level and relative phase of an acoustic signal propagated over a fixed range in shallow water and the regulation of the fluctuations to such oceanographic parameters as tide height, sound speed distribution, thermal microstructure, turbulent motion, and sea state. Upon selection of suitable sites, a detailed study of the bottom topography, the subbottom layering, and their acoustic properties will be undertaken. An indication of the acoustic field expected will be obtained from the geometry of the range, the properties of the bottom, and representative velocity profiles, using ray or normal mode techniques.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0066, EFFECTS OF THERMAL MICROSTRUCTURE ON ACOUSTIC TELEMTRY

*D. BUGNOLO*, Raytheon Company, *Portsmouth, Rhode Island*

Acoustic telemetry channels in the ocean environment will be affected by the relative motion of source and receiver and by the stochastic character of the medium. This study considers the effect of thermal microstructure on the phase and amplitude of an acoustic signal transmitted over the surface to bottom path, as in the case of a surface vessel to bottom mounted buoy. The phase and amplitude variations are related to the spectrum of the sound velocity variations. These are in turn related to the thermal microstructure and currents in the medium. Examples are evaluated using a Kolmogoroff spectrum for the temperature variations, based on physical constraints. Further experimental effort including simultaneous oceanographic and acoustic measurements is required to verify the theoretical predictions.

SUPPORTED BY Raytheon Company

### 1.0067, BI-STATIC ECHO RANGING

*E.L. DANIELS*, Raytheon Company, *Portsmouth, Rhode Island*

Objective: To improve bi-static ranging techniques.

Approach: Collect bi-static echo ranging and reverberation data at sea in various propagation modes over a wide range of geometries.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0068, DEVELOPMENT OF ANALYSIS TECHNIQUES FOR CLASSIFYING TRANSIENT HYDROACOUSTIC SIGNALS

*R. PLUTCHOK*, Teledyne Incorporated, *Garland, Texas*

One part of a continuing effort to develop an operational system for classifying transient hydroacoustic signals was a study to define analytical methods for signal identification. To this end, signal analysis procedures were developed which were based both on in-house research and on the findings of other investigators in this and in related fields.

These investigations were conducted by Earth Sciences, A Teledyne Company, at 314 Montgomery Street, Alexandria, Virginia.

SUPPORTED BY No Formal Support Reported

### 1.0069, ACOUSTIC SCATTERING

*R.S. HAYRE*, Univ. of Houston, Graduate School, *Houston, Texas* 77004 (NONR)

This task deals with the development and evaluation of models for scattering at the ocean surface and in its volume taking account of the effects of waves and entrained bubbles. Both analytic studies and model experiments in a tank will be performed and the results of these studies will be compared with sea data obtained by the University of Miami. It also includes the analysis of reflectivity data.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0070, DEVELOPMENT OF ANALYSIS TECHNIQUES AND EQUIPMENT FOR CLASSIFICATION OF TRANSIENT HYDROACOUSTIC SIGNALS

*J.N. GRIFFIN*, Teledyne Incorporated, *Alexandria, Virginia*

## 1. PROPERTIES OF WATER

This project was undertaken to assemble an on-line hydroacoustic signal processing system implementing the findings of earlier research in methods for classifying transient signals, and to continue the development of robust methods for signal classification and identification.

SUPPORTED BY No Formal Support Reported

### 1.0071, HONEYWELL ACOUSTIC RESEARCH PROGRAM

*P. MOOSE*, Honeywell Incorporated, *Seattle, Washington*

The Honeywell Acoustic Research Program is an applied research project on the physics of acoustic reverberation in the sea. Reverberation, or clutter as it is called in radar, is a noise-like signal present to some degree in all active sonar sets. It is the superposition of many small echoes reflected or scattered from inhomogeneities in the medium and from the boundaries; but it excludes signal returns which have interacted with the target. (Those signals excluded are called the direct echo and attendant multi-path structure of the target.)

In order to accomplish target detection, estimation and/or classification problems with sonar, we need to establish certain statistical parameters of the reverberating structure. The first phase of the Honeywell Acoustic Research Program concentrated on theoretical models and formulations and upon preparation of special purpose instrumentation. The second phase, which is in progress, is to gather and process large amounts of data required in furthering this research.

Reverberation measurements will play an increasingly important role in oceanography and will help advance the state-of-the-art in marine physics and sonar.

SUPPORTED BY Honeywell Incorporated

## 1B. CHEMICAL PROPERTIES

### 1.0072, CHEMICAL OCEANOGRAPHY

*D.W. HOOD*, Univ. of Alaska, Inst. of Marine Sciences, *College, Alaska 99735*

Arctic water masses will be characterized by detailed analyses of inorganic and organic components. These, with selected organic and trace metal analyses, and determination of ionic gradients beneath sea ice, will provide basic data for the understanding of water movement and mixing, and provide insight into biogeochemical processes. Certain organic compounds will be used as specific tracers to provide quantitative data on water source and time-averaged currents. Large samples of dissolved organic material uniquely obtainable due to the slow drift of T-3 will be dated by  $^{14}\text{C}$  and time-averaged currents will be calculated from knowledge of the age distribution of the tracer. Terrestrial and marine sources of water will be determined by study of  $^{13}\text{C}/^{12}\text{C}$  ratio of organic matter. Emphasis will be placed upon processes and mechanisms of cycling of organic carbon.

These studies contribute to basic knowledge of chemistry of marine waters. The physico-chemical structure of sea water has an important bearing upon all of man's uses of the sea. Processes of basic reactions and chemical cycling of the sea, especially organic carbon cycling, are of greatest relevance and the understanding of these for each of the layered water masses provide relevant data on the dynamic processes of water movement and mixing and the interchange of mass and energy with the other oceans.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0073, MARINE INTERFACE CHEMISTRY

*D.W. HOOD*, Univ. of Alaska, Inst. of Marine Sciences, *College, Alaska 99735 (NONR)*

The objectives of this task are to understand the processes responsible for observed concentrations and gradients at the air-sea interface, and to determine if detectable gradients exist at other marine interfaces such as fresh-salt water, and between different water masses. The sampling at the air-sea interface will be accomplished using a screen, and the gradients in the first meter by use of a special float-supported tube with intakes at closely

spaced intervals. Chemical measurements will include plant nutrients, dissolved and particulate organic matter, lipids and a number of inorganic ions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0074, GEOCHEMISTRY OF SAN FRANCISCO BAY

*J.R. KRAMER*, U.S. Dept. of Interior, Water Resources Division, *Menlo Park, California*

Purpose: To determine abundance, distribution, and clay mineralogy of suspended sediments in San Francisco Bay and their influence on the overall quality of bay waters.

Methods: Study of the composition of selected geochemical constituents with depth in sediment in relation to source. Plot distribution and occurrence of trace minerals in bay sediment and waters.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

### 1.0075, ORGANIC GEOCHEMISTRY OF SAN FRANCISCO BAY WATERS AND SEDIMENTS

*D.H. PETERSON*, U.S. Dept. of Interior, Water Resources Division, *Menlo Park, California*

Purpose: To increase our limited knowledge of the factors which control the abundance, distribution, and composition of organic matter in coastal waters and sediment.

Methods: 1) Determine the relative abundance, distribution and clay mineralogy of suspended sediment in San Francisco Bay waters in relation to source and waters, such as the distribution of saline water. 2) Survey the abundance and distribution of organic carbon in San Francisco Bay waters and sediment in relation to season, source and differences in depositional environment such as the distribution of  $\text{NO}_3$  and oxygen dissolved in the waters. 3) Study the distribution of specific trace elements in relation to the distribution of organic matter. 4) Survey the distribution of pesticides in sediment in relation to depositional environment and depth in sediment. 5) Study abundance and composition of organic matter thought to be of prime importance in the engineering properties of sediment. 6) Study the composition of selected geochemical constituents with depth in sediment in relation to source and subsequent alteration of organic matter.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

### 1.0076, SEA WATER CHEMISTRY

*T.J. CHOW*, Univ. of California, Scripps Inst. of Oceanography, *San Diego - La Jolla, California 92038 (NONR)*

Techniques for separating and identifying trace materials in sea water, snow, and atmospheric aerosols will be developed and applied to the determination of the distribution of rare earths, indium, molybdenum, potassium, and calcium. Mass spectrometry will be applied to the detection of small amounts of lead and to determination of isotope ratios for identification of the origins of these lead traces.

Knowledge of the natural and industrial background values for concentration of lead in sea and atmosphere is important in establishing levels above which possible higher concentrations may exist. The present main sources of industrial lead are probably insecticides and motor exhausts.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0077, LIGHT ISOTOPE STUDIES

*H. CRAIG*, Univ. of California, Scripps Inst. of Oceanography, *San Diego - La Jolla, California 92038 (NONR)*

A study of fractionation of hydrogen isotopes (deuterium) and oxygen isotopes in sea waters, sea ice, and atmospheric precipitation will continue and will be interpreted in terms of mixing rates and kinetics of evaporation and gas exchange at interfaces. The recent discovery that the oxygen in sulfate and in sea water exchanges very slowly with oxygen in water molecules will be exploited as a means of investigating past oceanic temperatures, residence times of sulfate in the sea, and the kinetics of the sulfate-sulfide reactions in sediments and stagnant basins.

## 1. PROPERTIES OF WATER

The slow and complex nature of mixing processes in the deep ocean makes it mandatory that all possible parameters be investigated for their contribution to the overall understanding of oceanic circulation. The study of isotopic variations provides an important addition to the chemical and physical methods of examining large-scale ocean mixing processes.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0078, EFFECT OF PRESSURE ON CONDUCTIVITY OF SOLUTIONS

*F.H. FISHER*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The physical chemistry of electrolytes such as magnesium sulfate and its effect on the conductivity and acoustical properties of sea water has been the subject of recent dispute. Minute amounts of salts such as magnesium sulfate in sea water produce a sound absorption of thirty times that exhibited in fresh water. Not only is this of fundamental interest to the physical chemist concerned with reaction kinetics but it is of primary concern to the oceanographer who must interpret conductivity versus pressure data. The problem of the complex relationship between conductivity, temperature, pressure and specific salt content of sea water has been intensified by the introduction of conductivity meters to determine 'salinity' which in turn is converted by an arbitrary relationship to density.

The principal Investigator will make precise measurements on the electrical conductivity of sulfate aqueous solutions as a function of temperature and pressure using data on dielectric constants, viscosity and density. The addition of pressure to the systems should give more realistic values on the shifts in conductivity and acoustic properties of sea water.

SUPPORTED BY U.S. National Science Foundation

### 1.0079, EFFECT OF PRESSURE ON CONDUCTIVITY OF SOLUTIONS

*F.H. FISHER*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Plans are for continuation of the study of the effect of pressure on conductivity of electrolyte solutions, in particular 2-2 sulfates, started under NSF Grant GP-4748. The 2-2 sulfate electrolytes exhibit unusual acoustic absorption properties which have been investigated at atmospheric pressure by ultrasonic relaxation spectroscopy techniques. Wide variations in acoustic properties related specifically to the cation have been discovered which contrast with the great similarities in such properties as activity coefficients and equilibrium constants. The physical chemistry of these salts is difficult and a subject of dispute. Recent work has led to the concept of a four-state dissociation model which is used to account quantitatively for the unusual acoustic absorption in these solutions in terms of simultaneous pressure-dependent chemical reactions.

SUPPORTED BY U.S. National Science Foundation

### 1.0080, STUDY OF THE DISTRIBUTION OF RADIONUCLIDES IN THE OCEAN DETAILED EXPLORATION OF CS137 IN THE OCEAN

*T.R. FOLSOM*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (AT(11-1)34,PROJECT071)

1967 Objective: Collecting detailed distribution of fallout especially in upper layers of the N. Pacific to indicate mixing and circulation rates and the behavior of elemental cesium in the ocean.

Background: Several years work has culminated in a successful means for rapidly surveying Cs137 in the ocean by concentrating in situ on absorbers at any depth.

Procedure: Cartridges of ferrocyanide granules are exposed at sea, then analyzed for Cs137 and Cs133. Environmental cesium is monitored and used to give the yield.

Results: Pacific surface Cs137 concentrations vary with latitude similar to predictions from soils; they vary longitudinally consistent with reported ocean circulation, indicating very slow downward mixing. Several surface minima suggest upwelling in

mid-ocean, also persistent high concentrations in thin laminae below the mixed layer suggest a mixing is so slow as to be described by a mixing constant of the order of 0.001 cm.<sup>2</sup>/sec.

1967 Proposal: 1. Intercepting a concentration front believed advancing south of Hawaii to further determine transport and diffusion rates. 2. Detailed cesium section of 'N. Pacific Current' near 170 degrees W to confirm suspected upwelling. 3. More detailed subsurface measurements near 30 degree N, 150 degrees E and 30 degrees N, 140 degrees W to estimate the advance of intermediate waters southward. 4. Detailed reinspection of Cs133 anomalies discovered near Samoan and California shores. 5. Further refinements in Cs133 and Cs137 collecting and analytical techniques. 6. Summarizing Cs137 findings to date correlated with other data in oceanographic reports.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0081, STUDY OF THE EXCHANGE OF CARBON DIOXIDE BETWEEN THE ATMOSPHERE AND THE OCEANS

*C.D. KEELING*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The long-range goal of this oceanic investigation is to describe the mechanism of the exchange of CO<sub>2</sub> between the oceans and the atmosphere. Towards attainment of this goal it is proposed to: (1) to conduct a seasonal study of horizontal and vertical variations of all of the determinative chemical species related to CO<sub>2</sub> gas, and (2) to continue laboratory investigations of the chemistry of inorganic carbon in ocean water, and (3) to automate additional phases of data processing both at sea and in the laboratory.

SUPPORTED BY U.S. National Science Foundation

### 1.0082, PHYSICAL CHEMISTRY OF BUBBLES

*F. MACINTYRE*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This project, now completed, investigated certain physicochemical hydrodynamic features of breaking bubbles and also the effects of capillary ripples upon interfacial gas exchange. More detailed accounts may be found in MacIntyre, *J. Phys. Chem.* 72, 589 (1968) 'Bubbles: A Boundary-Layer 'Microtome' for Micron-Thick Samples of a Liquid Surface', and in MacIntyre (submitted to *J. Fluid Mech.*) 'Enhancement of Interfacial Gas Transfer by Capillary Ripples'.

SUPPORTED BY Amer. Chemical Society

### 1.0083, DETERMINATION OF TRITIUM IN NATURAL WATERS

*H.E. SUESS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The proposal is a continuation of NSF Grant GA-784 and it is concerned with measurements of tritium in ocean water, in precipitation and in various types of samples representative of the pre-bomb tritium level. Tritium will be used as a tracer in oceanographic problems that include distribution in both vertical and horizontal directions. It will also be used to trace differences in rain water in different parts of the world. Correlations between pre-bomb tritium content of aqueous materials and present tritium content of similar materials will be made.

SUPPORTED BY U.S. National Science Foundation

### 1.0084, NATURAL RADIOCARBON MEASUREMENTS

*H.E. SUESS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This grant provides support for the continued operation of the principal investigator's radiocarbon dating laboratory. Radiocarbon determinations are being carried out in connection with the following lines of research: 1. Distribution of natural radiocarbon in bicarbonate of the deep oceans for the investigation of movement of deep ocean water masses. 2. Distribution of artificial radiocarbon in the surface water of the Pacific Ocean for the purpose of investigating mixing through the thermocline. 3. Determination of carbon-14 dates in connection with other

## 1. PROPERTIES OF WATER

research carried out at the Scripps Institution of Oceanography and by the Earth Sciences Department.

SUPPORTED BY U.S. National Science Foundation

### 1.0085, TRACE ELEMENTS IN SEA WATER

*K.K. TUREKIAN*, Yale University, Graduate School, *New Haven, Connecticut* 06520

During the next year we propose the following program to continue our studies of the marine geochemistries of the trace elements. It is hoped that knowledge of the behavior of the naturally occurring and pollution contributed trace elements in natural waters will also assist in the understanding of the behavior of radioactive nuclides from reactors and other potential sources of radioactive waste.

**Long Island Sound studies:** We will complete the neutron activation analysis for Long Island Sound water profiles for cobalt, nickel and silver. An attempt will be made to make a material balance for as many elements as possible in Long Island Sound using stream, sea water and sediment data. This is of importance not only because of the imminent construction of nuclear reactors in the state of Connecticut but also as a general model of the behavior of trace elements for analogous areas around the world.

**Analytical methods:** We shall continue in the development of neutron activation analytical techniques for the analysis of stream waters. With the use of sodium carbonate carrier and freeze-drying in addition to Co, Ni and Ag we expect to develop techniques for the determination of the following elements from the processing of a single 100 ml aliquot of water: Hg, Se, Sb, Cr, Rb, Cs, Au, Zr, Hf, Ta, Zn, Fe, Sc, Ba, Sr, Te, Mo.

Techniques for the accurate determination of uranium and molybdenum will be developed. Uranium will be determined by neutron activation and alpha spectrometry and molybdenum will be determined by mass spectrometric isotope dilution and possibly by neutron activation. These elements are of interest not only because of their peculiar geochemical properties but also if found to be constant in concentration in sea water as indicated by some workers, for use as monitors in the sponge adsorption experiments.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0086, HEAVY METAL GEOCHEMISTRY OF ANTARCTIC SEA WATER AND MARINE SEDIMENTS

*K.K. TUREKIAN*, Yale University, Graduate School, *New Haven, Connecticut* 06520

This award continues a study of variations in the content of heavy metallic elements in the Antarctic Ocean. Previous support was under GA-110, GA-183, and GA-275. Deepwater samples were collected on Eltanin Cruises 11 and 22. These are being analyzed chemically and radiometrically for Ag, Cu, Ni, U234, U238, and the alkaline-earth metals (Ba, Sr, and Ca). Siliceous sediments from deep-sea cores in the same areas were analyzed for Si32, C14, and the uranium-decay series. These determinations were analyzed to relate the variations of the different elements to biological activity and to the rate of mixing of the ocean water masses. It is proposed to continue the analyses of Eltanin samples and of the data. Strontium in untreated sea water will be determined by atomic absorption spectrophotometry. Results to be compared with analyses obtained by mass-spectrometric, isotopic-dilution techniques. The same water samples to be analyzed for specific alkalinity. These two sets of data will be used to understand both the oceanic circulation around the Antarctic regions, and the geochemical properties of Antarctic water. Analyses already made on isotopes of Si, C, and the uranium-decay series will be compared for a determination of the rates of sediment accumulation in Antarctic deep-sea sediment cores. These rates will be compared with the barium content of the cores and of the water for a further check on the flow rates between the Antarctic Ocean and the other major oceans.

SUPPORTED BY U.S. National Science Foundation

### 1.0087, PH STANDARD REFERENCE MATERIALS FOR USE IN SEA WATER

*R.G. BATES*, U.S. Dept. of Commerce, Natl. Bureau of Standards, *Washington, District of Columbia*

**Technological Objectives:** The hydrogen ion activity (pH) is an important parameter in chemical and biological processes. Over the years a pH scale in water has been developed at the National Bureau of Standards augmented by a series of standard reference materials. As work is extended to other systems (deuterium oxide, sea water, non-aqueous solvents), a parallel activity scale and a series of standard reference materials must be developed. The increasing interest in oceanography has made the development of a pH scale in sea water most pressing. The present work at NBS to define a pH scale in sea water and develop standard reference materials will fill the need in this area.

**Approach:** A 'standard' sea water for this work is being developed and a pH scale is being defined in this medium. Accompanying this is a study of the deviations in pH with changes in salinity. Once the scale is established, work will begin to prepare and standardize a group of defining standard reference materials.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 1.0088, TRACE ELEMENT EQUILIBRIUM STUDIES

*J.D. GASSAWAY*, U.S. Navy, Oceanographic Office, *Washington, District of Columbia*

**Objective:** To investigate equilibrium distribution coefficients and uptake rates of elements and suites of elements on ion-exchange resins containing various organic complexing and precipitating agents.

**Approach:** The initial effort will be directed at establishing the optimum conditions for adsorbing and/or absorbing organic complexing agents onto ion exchange resins. Immediate attention will be given to dithizone, 1-nitroso-2-naphthol, dimethylglyoxime, 8 hydroxyquinoline, and ammonium pyrrolidine dithiocarbamate on Dowex 1 of varying mesh sizes. Using appropriate radioactive tracers (e.g. zinc, cobalt, copper, nickel, antimony, manganese, iron, chromium and the rare earths), studies will be made of: (i) their equilibrium distribution coefficients in a sea water matrix with a pH ranging from 2 to 9 under controlled conditions; (ii) elution characteristics of the exchangers employing various eluants (both organic and inorganic); (iii) trace element recoveries from large volumes of sea water; and (iv) factors affecting recoveries.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0089, OCEAN RADIOACTIVITY

*J.I. HOOVER*, U.S. Navy, Research Laboratory, *Washington, District of Columbia*

**Objectives:** To make measurements of the neutron intensity as a function of depth. To increase our knowledge of the neutron distribution in the ocean.

**Approach:** The experimental approach is to utilize currently available, highly sensitive counters to detect the neutron component in the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0090, ISOTOPIC OCEANOGRAPHY

*R.E. SMITH*, U.S. Navy, Oceanographic Office, *Washington, District of Columbia*

**OBJECTIVE:** Develop capabilities for the measurement and utilization of radioisotopes and stable isotopes in the sea to provide NAVOCEANO survey forces the ability to rapidly and selectively collect marine radiochemical and trace element samples for use in studying oceanographic phenomena and to respond rapidly to oceanic disasters involving nuclear material. Provide the capabilities for survey measurement, prediction and search capabilities for radioisotopes at low levels and stable trace constituents at levels of 1 ppm or less.

**APPROACH:** Collection and radiochemical analysis of sea water, bottom sediment and plankton, samples from selected Arctic areas. The data are studied with other physical and chemical oceanographic parameters to determine the manner in which the

## 1. PROPERTIES OF WATER

spatial and temporal isotope distributions reflect environmental features. Chemical, geological and biological considerations are to be made of Arctic and Tropical areas to fully evaluate controlling factors on stable and non-stable isotopic distributions. The radioisotope levels observed will be used to provide background levels for reference for future measurements in the Arctic and/or other areas of interest. Results will be used as a guideline in determining the feasibility of future isotopic surveillance efforts and for modifying sample collection and laboratory analytical techniques for more efficient and rapid data procurement. Utilize injection sources, such as nuclear reactors, to study the properties of introduced pollutants and their relationships to oceanographic variables present.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0091, SHIPBOARD METHODS OF CHEMICAL ANALYSIS

*J.W. SWINNERTON*, U.S. Navy, Research Laboratory, Washington, District of Columbia

(1) To make shipboard evaluation of method for determining dissolved light hydrocarbons and carbon monoxide in sea water by gas chromatography. (2) To adapt method for determining low-molecular weight hydrocarbons and CO in air over the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0092, PRECISION MEASUREMENTS OF DISSOLVED OXYGEN, NITROGEN AND ARGON IN SEAWATER

*D.E. CARRITT*, Nova University, Graduate School, Fort Lauderdale, Florida (N00014-67-A-0386-0001)

The Navy needs to know the rate of ventilation of subsurface waters as it is pertinent to corrosion of structures; availability of O<sub>2</sub> for isolated, long-term, undersea human habitation; and general ocean circulation. Gas exchange across sea surface has relevance to sea-air interaction and gas-membrane exchange phenomena.

The objectives are to obtain measures of the distribution of dissolved O<sub>2</sub>, N<sub>2</sub> and Ar in the ocean by newly developed techniques which eliminate both systematic and accidental errors present in existing methods, and to use these measures as the basis for (1) describing the distribution of O<sub>2</sub>, N<sub>2</sub>, and Ar in the ocean; (2) establishing the departure (if any) of the gas solubility from predicted thermodynamic equilibrium; (3) elucidating the physical processes by which matter is transferred across the sea-air interface and (4) estimating the rate of ventilation of subsurface parts of the ocean. The system for gas measurements utilizes a sample bottle which captures a measured volume of sample in situ and upon recovery is attached directly to the analysis instrument. Analysis is with a gas chromatograph containing a 30-foot molecular sieve column, thermal conductivity detectors and built-in calibration systems based upon (a) coulometric generation of O<sub>2</sub> or N<sub>2</sub> and (b) injection of air or standard gas mixtures. Measurements will be made using Nova's research vessel and ships of opportunity for studies away from the U. S. East Coast.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0093, CHEMICAL METHODOLOGY - APPLICATIONS OF NITRATE SPECIFIC ELECTRODE TO CHEMICAL OCEANOGRAPHY

*J.W. VANLANDINGHAM*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Objective: To study and evaluate various methods for reducing or nullifying chloride interference on the nitrate specific ion electrode, thus making a useful analytical tool available to chemical oceanography.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0094, DETERMINATION OF VOLATILE ORGANICS IN SEA WATER

*J.F. CORWIN*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Preliminary work by this investigator (1959-1963) has shown the feasibility of the use of Gas Chromatography for the separation and identification of volatile organic compounds in sea water. The principal problems encountered were sensitivity of the instrumentation, suitable stationary phases of the columns and a suitable method of removing the volatile materials from the water. Improvements in instrument manufacture, development of a new stationary phase by U. P. Schlunegger (1965) and the head-gas method of sample treatment indicates that the time is right for devising a good procedure for the analysis of low molecular weight organic content of sea water.

It is proposed to devote one year (sabbatical 1967-1968) to this problem. The success of this year will dictate the extent of effort to be devoted to the program in the future (after July 1, 1968). Dr. Corwin has been appointed Adjunct Professor by the Institute of Marine Sciences and has been offered space for the work.

SUPPORTED BY U.S. National Science Foundation

### 1.0095, THE GEOCHEMISTRY OF RADIOACTIVE ELEMENTS IN THE MARINE ENVIRONMENT - THE GEOCHEMISTRY OF LANDLOCKED SEAS

*E. RONA*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (AT(40-1)2411)

The geochemistry of natural radioactive elements has been studied for several years at this Institute and elsewhere. Considerable contributions have been made in the use of radioisotopes for age determination and in the study of the geochemical conditions during and after the sedimentation process. Methods have been investigated and some have been further developed. We are of the opinion that specific areas of investigation will result in answers to some of the remaining questions.

Ocean sediments and sea water may, in principle, be dated by the radiochemical determination of certain members of the naturally radioactive disintegration series. Thus, Th-230/Pa-231 ratios may be used for dating ocean sediments and radium concentrations for sea water. The purely technical problems of measuring the activities of the actual isotopes are considered to be reasonably well solved. Despite quite extensive previous research, the assignment of age values on the basis of activity measurements is, however, badly hampered by lack of knowledge of the geochemistry of these isotopes; e.g., their chemical distribution at zero time, and the possible chemical and physical processes that could affect the distribution at a later time.

We therefore propose to try a different approach to these problems by investigating the geochemistry of the elements of the natural uranium-thorium series in landlocked seas where chemical conditions will differ, in some case extremely, from those in the open seas. In this connection, we also propose to extend the study to include barium, since its chemistry is similar to radium. Also included will be a comparison between C-14 ages and the uranium-series ages of some of the materials.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0096, THE EXTRACTION OF POTASSIUM FROM FRESH AND SALINE WATERS BY CLAY MINERALS

*C.E. WEAVER*, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The general objective is to determine how and to what extent the chemistry (particularly potassium) of fresh and saline waters is controlled by clay minerals and gels, both in the laboratory and in natural environments.

Using waters of various compositions, the ability of a variety of clay minerals to extract specific cations will be determined and the mean free bonding energies of the cations calculated. The release of interlayer clay water to the fluid will be measured and the factors controlling the return of adsorbed cations to the fluid phase as the chemistry of the water changes will be determined.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Georgia Institute of Technology

## 1. PROPERTIES OF WATER

### 1.0097, SOLUTION-SILICATE REACTIONS AND EQUILIBRIA

*R.M. GARRELS*, Northwestern University, Graduate School, Evanston, Illinois 60201

Studies of silicate-sea water reactions, of ground waters from igneous rocks, and of mass balance relations between rivers and oceans, have led to the conclusion that the gross chemical composition of the oceans represents a dynamic equilibrium between sea water and detrital silicates.

This proposal is to: (a) continue laboratory studies of the interaction between silicate minerals and sea water, with emphasis on reactions that remove cations and dissolved silica. (b) Perform experiments with various salt solutions and silicate minerals to permit equilibrium conditions to be predicted for sea water and allied fluids, such as pore waters of sediments. (c) Process published experimental data on silicates to obtain the best possible numbers for the thermochemical properties of the common silicate minerals. (d) Calculate the solution compositions and solids produced by progressive reactions between aqueous solutions and silicate minerals.

During these studies, it is proposed to continue to develop mass balance relations in the overall rock-water cycle in an attempt to elucidate the chemical history of the oceans.

SUPPORTED BY U.S. National Science Foundation

### 1.0098, CHRONOLOGY OF MARINE SEDIMENTS, CIRCULATION OF WATER AND TRACE ELEMENTS, SEDIMENTARY RECORD AND EXTRATERRESTRIAL ACCRETION

*D. LAL*, Tata Inst. of Fundamental Res., Bombay - Colaba, India

Utilizing the technique of in-situ adsorption as an enrichment device, profile samples of a suite of trace elements in sea water were obtained for 20-3500 m depths at several locations in the Pacific ocean between Hawaii and New Zealand during the Nova expedition. The enriching matrix consisted of dispersed ferric-hydroxide suspended in natural spongin fibres. Several wide diameter gravity cores were also raised during this expedition. These samples will be analysed to study a host of crucial marine problems - nature of large scale circulation of water, trace element budget and sedimentary record of long term phenomena in relation to climatic changes and extra-terrestrial accretion of matter, using as tracers cosmic ray produced isotopes, Si-32, Be-10, Al-26, Mn-53 and those belonging to the U-Th series.

A profile sampler for ferric-hydroxide loaded spongin matrix and low level counting units for measuring alpha, beta and gamma activities at low levels have been developed for the above mentioned studies.

The fabrication of profile samplers and processing of spongin - matrix was carried out at the Scripps Institution of Oceanography, U.C.S.D., La Jolla. Analyses of recovered marine concentrates of trace elements and radioisotopes are being carried out at the Tata Institute of Fundamental Research, Bombay.

SUPPORTED BY Amer. Chemical Society

### 1.0099, CHEMICAL PROPERTIES OF SEA WATER AT PRESSURE

*E.M. STANLEY*, U.S. Navy, Ship Research & Dev. Center, Annapolis, Maryland

Objective: To determine those environmental factors affecting undersea uses of the oceans; to investigate pressure effects on the chemical properties of sea water.

Approach: Determine the characteristics of the seawater supply available for use in the pressure facility, both estuarine and off shore (including cooperative sampling and analysis work with ESSA and the Virginia Institute of Marine Science). Investigate solubilities of gases in sea water including Henry's law constants as a function of salinity, temperature and pressure for certain gases. Instrument development is inclined, such as one for sampling interstitial water in marine sediments which will bring the sample back under pressure for measurement of pH and other properties. Perform intra-laboratory consulting services on oceanographic factors.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0100, EXTENT OF BRACKISH WATER IN TIDAL RIVERS, MARYLAND

*S.G. HEIDEL*, U.S. Dept. of Interior, Water Resources Division, Baltimore - Towson, Maryland

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Maryland.

Purpose: To delineate the boundary zone between brackish and fresh water and provide information to permit maximum utilization of the water in the tidal portions of Maryland rivers.

Methods: Location of the saline water front in all the inland tidal areas of Maryland at varying conditions of tide and runoff and different seasons of the year will be determined through use of continuous conductivity recorders, periodic spot measurements of chloride concentrations and determination of river profiles of salinities. A comprehensive report will be prepared on the extent and variation of the salt water encroachment in surface waters on the basis of these field observations and available supplementary information.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey  
Maryland State Government

### 1.0101, MASS SPECTROMETRIC AND MANOMETRIC STUDIES OF THE OCEANS AND THE ATMOSPHERE

*B.B. BENSON*, Amherst College, Graduate School, Amherst, Massachusetts 01002

This research is a continuation of studies of dissolved gases which have great potential for the study of air-sea exchange phenomena, for the elucidation of processes occurring within the oceans, and for the determination of the past history of ocean waters. For this type of work very accurate dissolved gas measurements are required, and very accurate values for the solubilities of the gases must be known. Because the emphasis is on accuracy, the experimental procedures are described in detail.

During the first year, major activity will be focused on the determinations of the distilled and sea water solubilities of nitrogen, oxygen and the five noble gases, since these are necessary for the correct interpretation of oceanic data. At the same time, however, it is planned to complete and test sampling, processing and analytical equipment for the ocean measurements. The solubility work will be continued in the second year, but the emphasis will be shifted toward studies of the atmosphere and the oceans.

SUPPORTED BY U.S. National Science Foundation

### 1.0102, GEOCHEMICAL OCEANOGRAPHY

*M. BLUMER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

Work will continue on isolation and structural identification of organic compounds of marine organisms, whose production appears to be controlled by environmental factors, using a combined mass spectrometer - gas chromatograph. The movement of these compounds through the food chain and into the water masses will be studied.

Knowledge of the natural background occurrence of organic compounds in the sea is fundamental to development of means of detecting changes resulting from operations such as occupation of underwater habitats.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0103, ORGANIC COMPOUNDS IN THE SEA AND IN MARINE SEDIMENTS

*M. BLUMER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Investigations will continue on the origin and fate of organic compounds in the sea and in marine sediments. Using techniques developed under an earlier grant, compounds of biochemical origin will be isolated from all components of the marine environment. Identification will be carried out by combined gas chromatography-mass spectrometry, and by nuclear magnetic resonance and infrared spectroscopy. Special emphasis will be placed on the study of biogenic hydrocarbons, lipids and selected polar compounds. The type and concentration of these com-

## 1. PROPERTIES OF WATER

pounds vary with the comparison of the plankton present in the water, with the time of the year, with the climate and with the history of the water mass. Thus, they should provide suitable tracers for the study of dynamic processes in the sea.

Selected derivatives of biochemical compounds will be isolated from deep marine, recent and ancient sediments. The structural comparison of these compounds with their biochemical precursors and their eventual conversion products will provide insight into the molecular processes in the subsurface.

### 1.0104, RADIOELEMENT STUDIES IN THE OCEANS - LANTHANIDES IN SEA WATER AND THEIR INTERACTIONS WITH MARINE SEDIMENTS AND SUSPENSIDS

V.T. BOWEN, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543 (AT(30-1))

Using activation analysis, individual lanthanides have been analysed in N. Atlantic sea water. Samples of N. Atlantic Deep Water (11), of Antarctic Bottom Water (3) and of Antarctic Intermediate Water (6) showed each water mass to have a characteristic and distinct profile of relative lanthanide element concentrations. Reported ACS Miami meeting 1967, and in press.

Carrier-free radioisotope studies show La, Y and Ce to react with standard clay minerals, marine sediments and open ocean suspensoids to give measurable and distinct  $K_{sub D}$  values: on a gram per gram basis these range from 1 to 100 for APS standard clays, from 20 to 100 for open ocean sediments, and from less than 20 to 40 for open ocean suspensoids. Analysis of geochemical and oceanographic implications of this data is in process.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0105, SIGNIFICANCE OF FLUORIDE VARIATIONS IN SEA WATER

P.G. BREWER, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543

Recent literature has indicated the presence of abnormally high fluoride/chlorinity ratios at depth in several stations in the North and South Atlantic Ocean. The source of the high fluoride has been tentatively assigned to volcanic activity associated with the Mid-Atlantic ridge. The research described in this proposal is intended to define the source of the fluoride and to determine its importance in understanding deep sea phenomena. We propose to develop a device to measure the fluoride/chloride activity ratio in situ and thus obtain a continuous record of the ratio with depth. During the Summer of 1968 the R/V CHAIN will make two crossings of the North Atlantic and the R/V ATLANTIS II a crossing of the South Atlantic. On each of these cruises we intend to obtain several profiles of the F-/Cl- ratio from the surface to the ocean bottom. The data obtained from these profiles will provide us with a measure of the extent of the fluoride enrichment with depth. Is this a localized phenomenon that may be associated with volcanic activity, or localized outcrops of fluorine rich minerals, or is it more widespread and possibly associated with the dissolution of particulate matter at depth? We also hope to obtain some indication of the value of the F-/Cl-ratio in tracing oceanic circulation at depth.

SUPPORTED BY U.S. National Science Foundation

### 1.0106, STABLE ISOTOPE STUDIES ON COEXISTING MINERALS IN MARINE SEDIMENTS

W.G. DEUSER, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543

A study will be made of the distribution of the stable isotopes of oxygen and hydrogen among coexisting minerals in marine sediments and of the fractionation between the minerals and the interstitial and overlying waters. Samples to be investigated include those collected in and around the ATLANTIS and DISCOVERY deeps of the central Red Sea which are characterized by high salinities and temperatures ranging from 40 to 60 degrees C. The cores taken contain numerous easily identified minerals including various carbonates, oxides, sulfides and silicates, all of which appear to have formed syngenetically. Deter-

mination of the oxygen-isotope ratios in the different minerals and in the water samples coupled with the temperature measurements taken during sampling should reveal data on the mode of formation of the minerals. Knowledge of the water chemistry will aid in this effort. A comparison with the samples collected outside the hot deeps should reveal information on paleotemperatures and also on calcite-dolomite relationships at 20 degrees C. Additional determination of hydrogen-isotope ratios in hydrated minerals will serve as a further check on mode of formation and diagenetic changes of the minerals. A general study of hydrogen and oxygen isotope distribution as a function of depth in sediments will be made for individual minerals and mineral groups to determine the effect of diagenetic processes on isotope ratios.

SUPPORTED BY U.S. National Science Foundation

### 1.0107, ELECTROLYTE-NON-ELECTROLYTE INTERACTIONS IN SEA WATER AND RELATED SOLUTIONS

J.E. GORDON, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543

This is a continuing program in which the firm base provided by the thermodynamic measurements on simple salt mixtures is used to extend investigation of thermodynamic properties of dissolved organic nonelectrolytes to more complex systems, approaching marine phenomena more specifically. These extensions require measurements on polar nonelectrolytes, which represent the bulk of organic constituents of sea water and of compounds of biological interest. They also require a deeper study of solubilization phenomena. The proposed plan of research includes these studies, but places emphasis on the second topic of the original proposal, marine chemical applications of proton magnetic resonance spectroscopy. Results on this half of the program are not as far advanced as the thermodynamic work, due principally to time invested in establishment of the experimental proton magnetic resonance facility. Detailed plans for pursuing the proton magnetic resonance investigation of water in mixed salt solutions, of organic nonelectrolytes in salt solution, and of aspects of the solubilization phenomenon, as well as employing the instrument in structure studies on organic compounds isolated from sea water--all with increased efficiency--are presented. One new topic of investigation is proposed--evaluation of the marine chemical potentialities of the formation of insoluble complexes of alkali and alkaline earth metal salts on treatment of their aqueous solutions with liquid  $CBr_2(CN)_2$ . Suggested applications are removal or fractionation of sea salt and use in trace element determination.

SUPPORTED BY U.S. National Science Foundation

### 1.0108, STABLE ISOTOPES

J.M. HUNT, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543 (N00014-66-C0241)

Profiles will be made across the North Atlantic and South Atlantic, and  $C^{13}/C^{12}$  ratios will be measured in both the dissolved organic carbon (DOC) and inorganic carbon ( $CO_2$ ). The DOC will be photo-oxidized by UV irradiation and the  $CO_2$  produced caught for analysis in the mass spectrometer.  $C^{13}/C^{12}$  ratios in DOC will be compared with values already established for various components of marine life.

Knowledge of distribution of natural variations of isotope ratios in sea water is an important prerequisite to evaluation of man-made variations resulting from test or employment of weapons or operations of vehicles. Program also contributes to overall understanding of mixing rates and turbulence in the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0109, DISTRIBUTION OF CARBON AND RADIUM IN THE ANTARCTIC WATERS

T. KU, Woods Hole Oceanographic Inst. , Woods Hole, Massachusetts 02543

Woods Hole Oceanographic Institution will collect and analyze water samples from the southern oceans for several dissolved elements and gases. Samples will be taken on Eltanin

## 1. PROPERTIES OF WATER

Crusie 35 in the South Australia Basin of the Indian Ocean at 10 stations. Each station sample series will consist of ten 20-liter Niskin bottle samples, one from the surface and nine from pre-determined depths. The concentration and isotopic composition of the dissolved inorganic carbon, and the partial pressure of carbon dioxide, will help to identify surface water, as distinguished from Antarctic bottom water. The method using an infrared gas analyzer has been shown to be more accurate and sensitive as compared to the pH and alkalinity methods employed previously on other research projects. The determination of dissolved oxygen, and the ration of carbon-12 to carbon-13 of the dissolved inorganic carbon, will help to better understand the oxidative processes of the organic compounds present. The heavy radioactive metals, radium and uranium, will also be determined for various depths in order to evaluate the role played by the biota in the vertical distribution of heavy elements in the water column.

The shipboard collecting and analyses will be carried out by a marine geochemist from Lamont Geological Observatory. No personnel from WHOI will be on board the Eitanin during Cruse 35.

SUPPORTED BY U.S. National Science Foundation

### 1.0110, ANALYSIS OF SEA WATER BY DIFFERENCE CHROMATOGRAPHY

*P.C. MANGELSDORF*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (AT(30-1)3838)

The objective of this research is to use the method of ion exchange difference chromatography to study slight variations in the proportions of major elements in sea water. The method in its present form has been shown to be sensitive to differences in the K plus/Na plus and Ca plus/Na plus ratios in sea water of the order of one part in 10 to the 5th power. We will attempt to increase the sensitivity by a factor of 10 in the expectation that well-defined reproducible variations of these and other ratios can be found in water samples from various sources. In particular we are interested in the vertical variations of composition in the deep sea water column, in the effects of run-off on the salt composition of coastal waters, and in the composition in interstitial waters trapped in recent sediments.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0111, ORGANIC MATTER

*D.W. MENZEL*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

Water will be sampled on a cruise from North to South Atlantic and then across the South Atlantic to determine relationships between dissolved organic carbon (DOC) and oxygen depletion in the water masses. Samples will be closely spaced (50 m.) in regions of oxygen and salinity minima. Nitrate and phosphate will also be determined. Significance of dissolved oxygen as a conservative property will be evaluated.

If the quasi-conservative nature of dissolved oxygen can be established, and if it can be demonstrated that DOC content of a water mass is determined in the surface layers, oceanographers will have powerful new tools for identifying water masses and investigating mixing processes and large scale turbulence and water motions in the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0112, THE CYCLE OF ORGANIC MATTER IN THE DEEP SEA

*J.H. RYTHER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (AT(30-1)3862)

A study will be made of the origin, distribution, composition and fate of the particulate matter in the sea, with emphasis on the non living, organic fraction (i.e., detritus). Major emphasis will be placed on determining the flux of this material through the marine ecosystem by investigating its relationship to primary and secondary organic production, its rate of decomposition, its seasonal, geographical, and vertical distribution in the sea, and its rate of sinking and decomposition on the bottom. The ecological significance of the particulate matter will also be investigated with

respect to its ability to scavenge dissolved organic matter by surface adsorption, its role in providing a surface for bacterial growth, and its value as food, both directly and indirectly through the use of organic matter adsorbed to or growing on its surface. The possibility that detritus in the deep-sea represents a stable, refractory, and neutrally buoyant reservoir of organic matter, as indicated by recent evidence, will be examined in detail through intensive distributional studies, laboratory experimentation, and isotope dating techniques.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0113, ELEMENT CHEMISTRY

*D. SPENCER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The purpose of this task is to determine the distribution and concentration of dissolved metals in the oceans. The work involves careful sampling from ships, to avoid contamination, and subsequent analysis in the laboratory using atomic absorption spectroscopy.

Knowledge of the natural background levels of concentrations of metallic ions in sea water masses is fundamental to the development of means of monitoring man-made changes in these levels through military or industrial activity.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0114, HETEROTROPHIC ACTIVITY AND PRIMARY REGENERATION IN THE OCEAN

*R.F. VACCARO*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The amount of surface oriented dissolved organic carbon in the ocean is relatively large in terms of the remainder of the water column and varies according to the rate of biological recycling. Within photic depths both labile and refractory forms of carbon are prominent since organic reproduction and degradation proceed simultaneously. At intermediate depths further decomposition may occur following sinking and the advection of particulate organic residues but ultimately throughout the remaining and deeper portions of the water column dissolved organic carbon remains remarkably constant. Inability in the part to demonstrate significant biochemical oxidation within the deep ocean suggests that most of the organic material is present in a refractory form capable of prolonged resistance to biological decomposition.

The bulk of this deep refractory organic carbon appears in the form of macromolecules believed to be structured on linkages provided by polyphenols, quinones or amino acids. In this regard our current efforts include a shipboard application of charcoal adsorption designed to fractionate and quantitatively evaluate the importance of residual organic carbon in the sea. Observations so far completed include a transatlantic crossing from Barbados to the Cape Verde Islands as well as samplings in the deep and shallow waters of the Gulf of Mexico proximal to the Yucatan Peninsula. The pattern emerging is that between 70 to 90 percent of the deep dissolved organic carbon at midoceanic locations is present as organic condensates which appear to occupy a quasi-terminal position in the organic cycle of the sea. At river outlets, in coastal waters, and in adjacent seas such as the Gulf of Mexico, the fraction of residual organic material is significantly less.

SUPPORTED BY U.S. National Science Foundation

### 1.0115, CHEMISTRY OF THE HYPOLIMNION OF LAKE ERIE

*H.E. ALLEN*, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

During the period of summer stratification much of the hypolimnetic water in Lake Erie experiences severe oxygen depletion. Concurrent large changes occur in the concentration of nitrate, ammonia, phosphate, iron, manganese, and sulfide. Our objectives include describing the magnitude and rate of these changes, determining the chemical compounds involved and determining the effects of these changes on the ecosystem. Subsequent to fall overturn concentrations of these materials return

## 1. PROPERTIES OF WATER

to those concentrations existing prior to stratification. Field studies are being made to determine the concentrations of these and other substances in the waters. Laboratory studies are being conducted to determine the oxidation-reduction potential at which materials are released from the sediments and to determine the kinetics of their buildup in the water. The chemical composition of materials precipitated upon overturn is being investigated. Various sediments are being investigated to determine the substances responsible for oxygen depletion.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0116, CHEMICAL CHARACTERISTICS OF THE GREAT LAKES

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The long-range objectives are to gain an understanding of the cycles of the major nutrients in the Great Lakes and connecting waters and their influences on the productivity of the lakes. Objectives are to demonstrate the vertical, horizontal, and seasonal variations in water quality in various habitats of the lakes. Routine determinations are being made on a variety of Great Lakes waters for sodium, calcium, magnesium, potassium, sulfate, chloride, silica, alkalinity, pH, dissolved oxygen, and total phosphorus.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0117, MINERAL-WATER CHEMISTRY, GREAT LAKES

J.R. KRAMER, Univ. of Michigan, Great Lakes Research Division, Ann Arbor, Michigan

Great Lakes chemistry, relative to major ions, is evolved from a time independent invariant chemical equilibrium model(s). The ability to rigorously define these models rests upon knowing free energy expressions for the specific minerals and aqueous ligands, the crystallography and stoichiometry of the minerals, and the in situ chemistry of the Great Lakes.

Solution equilibrium among end member solid phases permits determination of free energy of formation of the common minerals. This procedure is applied to synthetic simple composition minerals and naturally occurring minerals. Equilibration is considered attained when identical results are achieved for different paths of equilibration.

Standard chemical, X-ray diffraction, and optical techniques are used to define solid phases. Knowing specific solid phases allows one to 'equilibrate' the entire specimen and compare results with those predicted by single solid phase equilibrium studies.

Ultimate goodness of fit is achieved by comparing apparent equilibrium expressions obtained from data for the Great Lakes to the above models. Since parts or all of the Great Lakes are not in the same environment as the analytical laboratory, emphasis must be placed upon in situ or pseudo in situ analyses.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 1.0118, MINERALOGICAL CONTROLS ON THE CHEMICAL COMPOSITION OF OCEAN WATER

H.L. HOLLAND, Princeton University, Graduate School, Princeton, New Jersey 08540

Although it is almost certain now that the chemical composition of ocean water is strongly influenced by reactions of ocean water with silicate minerals, the nature and the geography of these reactions are very inadequately known. This grant is for the study of the interaction of clays with ocean water in the field and in the laboratory.

Preliminary work in the vicinity of Puerto Vallarta, on the Pacific Coast of Mexico, has shown that a good deal of the area is underlain by rhyolites and andesites and that essentially none of the clays in soils and in the rivers is inherited. It is intended to study the mineralogy of soils in this area, the chemistry of at least one of the rivers from its source to its estuary, the mineralogy of river sediments, and the mineralogy of sediments in estuaries and just off-shore.

At the same time it is planned to do some exploratory work on the fate of iron which is brought to the Atlantic Ocean in great abundance by a number of New Jersey rivers. There is some

evidence that  $\text{Fe}_2\text{O}_3 \cdot n\text{H}_2\text{O}$  reacts to form silicates containing abundant Fe<sup>3+</sup> during the diagenesis of marine sediments, which makes it desirable to see how much and how rapidly iron-rich clay is formed in near-shore environments.

SUPPORTED BY U.S. National Science Foundation

### 1.0119, OXYGEN RESOURCES OF TIDAL WATERS

J.P. BARLOW, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

The objective of this project is to evaluate the potential sources of oxygen in tidal waters which may be subjected to organism pollution. The study is presently concerned principally with regions in which horizontal exchanges are so restricted that the ocean is a relatively minor source compared with plant photosynthesis and atmospheric reaeration. Photosynthetic production of oxygen will be evaluated by means of direct experimental methods, and atmospheric reaeration from an analysis of time-changes in concentration effected by diurnal changes in biological processes. It is hoped thereby to obtain some understanding of the influence of hydrographic and biological factors on the reaeration of these regions.

SUPPORTED BY New York State Government

### 1.0120, INVESTIGATIONS OF URANIUM AND THORIUM SERIES ISOTOPE DISEQUILIBRIUM IN THE OCEAN AND IN PLEISTOCENE SEDIMENTS

W.S. BROECKER, Columbia University, Graduate School, Palisades, New York 10964 (AT(30-1)3139)

This research is primarily a study of the conditions which bring about disequilibrium among the isotopes of the U and Th series in nature with an eye toward developing methods of age determination. Thus we are trying to date water masses by studying the distribution of Ra-228, Th-228, Pb-210, Po-210 and Ra-226, oceanic sediments by measuring Th-230 and Pa-231 and pluvial lake salts and volcanic ashes by measuring Th-230, Th-232 and uranium. At the same time, these studies lead to a better understanding of the geochemical behavior of these elements. By applying these methods we are trying to answer the following questions of importance to earth science: 1) what is the source of the high concentration of unsupported Ra-228 in ocean water? 2) is the distribution of Pb-210 surface ocean water controlled by the input of atmospheric Pb-210? 3) do the times of the sharp cold to warm climatic changes as seen in deep sea sediments support the astronomical theory of glaciation? 4) how is the timing of pluviation related to the time of glaciation?

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0121, GEOCHEMICAL STUDIES OF CONTINENTAL WATERS

W.S. BROECKER, Columbia University, Graduate School, Palisades, New York 10964 (AT(30-1)2493)

The purpose of this research is to gain an understanding of the factors controlling the major element chemistry of continental waters. We are contrasting the chemistry of three closed basin saline lakes, a sulfate-rich meromictic lake, and its associated ground waters, two fresh water lakes, lakes within active volcanic regions and subsurface waters in an island coral cap. Measurements of the major elements, pH, and pCO<sub>2</sub> are being made on the lake waters, river and ground waters supplying the lakes, and pore waters extracted from the lake sediments. Stable and radioisotopes (C-14, C-13, Sr-90, Cs-137, Rn-222, ...) provide useful means of tracing sources and determining residence times. The origin of the detrital and authigenic phases in the sediments is also being studied.

A report regarding our study of Green Lake is in press (Limnology and Oceanography). Preliminary reports on our saline lake studies appear in this years Project Report.

SUPPORTED BY U.S. Atomic Energy Commission

## 1. PROPERTIES OF WATER

### 1.0122, MINERALOGICAL STUDIES OF PARTICULATE MATTER SUSPENDED IN SEA WATER

JACOBS, Columbia University, Graduate School, Palisades, New York 10964

The purpose of this study is to establish the mineralogical and chemical nature of particulate matter suspended in sea water. A world-wide sampling program, now in its second year, has produced surface and deep sea water samples of suspended particulate matter, along with samples of corresponding bottom sediment. X-ray diffraction and spectrographic techniques will constitute the principal analytical procedures to yield mineralogical and chemical data for suspended particulate matter in ocean water.

Little is known about the nature of the mineral particles suspended in sea water; even quantitative information of the most basic nature is wanting. Although most of the mineral content of suspended particulate matter has been derived from the weathering of land masses, there is a possibility that an authigenic component of significant magnitude forms within the sea. It is significant to understand the relative importance of these two components. Also, information is needed regarding the changes the land-derived minerals undergo in sea water, as well as their settling times. A widespread layer of cloudy water near the ocean bottom has been discovered, and there is a possibility that this represents an additional means of transport for large quantities of sediment.

SUPPORTED BY U.S. National Science Foundation

### 1.0123, DISSOLVED ORGANIC PHOSPHORUS IN NATURAL WATERS

E.J. KUENZLER, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514 (AT(40-1))

The objectives of this proposal are to continue seeking techniques for identification of the major components of the dissolved organic phosphorus (DOP) pool in natural waters, to investigate the seasonal distribution of DOP compounds, and to examine the nature of the DOP eliminated into the medium by cultures of planktonic algae. The geographical and seasonal changes in total DOP are partially known but the chemical compounds making up these pools are completely unknown. Prior work has shown that the DOP present in natural sea waters consists of several important components. The DOP eliminated by healthy algae in pure culture also consists of several components but it is not yet known whether these are the same as occur in natural waters. This project began in 1965 and should be completed in 1970. To date methods have been developed for concentrating, purifying, and separating organic phosphorus compounds from natural waters and from unialgal cultures. Radioactive phosphate in culture media is taken up by algae and partially eliminated as labeled DOP. This permits measurement of rates of DOP elimination under various environmental conditions. The next steps are the final identification of these compounds, the delineation of their spatial and seasonal distributions, and investigation of their ecological significance.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0124, STRONTIUM ISOTOPE COMPOSITION AND TRACE ELEMENT CONCENTRATIONS IN LAKE HURON AND ITS PRINCIPAL TRIBUTARIES

G. FAURE, Ohio State University, Graduate School, Columbus, Ohio 43210

Concentrations of the major cations: Na, K, Ca, and Mg and Sr were determined for 64 samples of surface water from Lake Huron and for 17 of its major tributary rivers. For addition, isotopic compositions of strontium were measured for 30 samples of lake water and for 13 of the tributary rivers. Concentrations of dissolved iron and total phosphorus were determined for a small suite of lake and river water.

The data documents important differences in the chemical composition of water discharged into Lake Huron by Lake Superior, Lake Michigan and tributary rivers. These differences are related to differences in the chemical and mineralogical composition of the bedrock underlying the Great Lakes drainage basin.

The strontium contributed to Lake Huron by water draining the Canadian Shield along its northern shore is enriched in radiogenic Sr87. The average Sr87/Sr86 ratio is 0.718. The rivers draining sedimentary rocks of Michigan and southwestern Ontario contribute strontium whose isotope composition is similar to that in the modern oceans and has a Sr87/Sr86 ratio of 0.710.

A geochemical model is presented which attempts to represent the chemical composition of water in Lake Huron as a mixture of the different types of water discharged by different sources.

### 1.0125, CHEMICAL FEATURES OF THE SUBARCTIC BOUNDARY IN THE NORTHERN PACIFIC OCEAN

K. PARK, Oregon State University, Graduate School, Corvallis, Oregon 97331

It is proposed to study the chemical features of the unique oceanographic phenomenon in the North Pacific, the confluence of Subarctic and Subtropical waters. The four specific objectives are: (1) Chemistry of the subarctic boundary - to investigate the chemical make-up and history of the Subtropical and Subarctic waters near the Subarctic Boundary. The data arising will help to understand the nature and mixing of the two water masses as they move eastward from near Japan. (2) Deep-sea chemical properties near the Subarctic Boundary - to study the deep-sea gas nutrient interrelationships underneath the Subarctic Boundary. (3) CO<sub>2</sub> Sink near the Subarctic boundary - to learn about the air-sea exchange of CO<sub>2</sub> over both the Subarctic and Subtropical regions. (4) Chemical reference for hydrochemical data from the Subarctic boundary - to establish a reference to intercompare the hydrochemical of Japan, U.S.S.R., Canada, and the U. S. already obtained from the Subarctic boundary region. Three cruises are planned for the study. The first cruise is for a study of the microstructure of the boundary; the second to establish a chemical-conditions reference for winter; and the third is for an intensive study of the entire Subarctic boundary region from near the west coast of the U. S. to Japan. These studies will contribute to the national oceanographic program by providing important information for an understanding of the complex features of the North Pacific.

SUPPORTED BY U.S. National Science Foundation

### 1.0126, CHEMICAL PROPERTIES OF SEA WATER AND THEIR USE IN STUDIES OF WATER MASSES AND MIXING

R. PYTKOWICZ, Oregon State University, Graduate School, Corvallis, Oregon 97331

Objective: The increasing use by the Navy of relatively permanent surface, subsurface, and bottom-mounted installations in both its R&D and its operational activities requires a better understanding of the chemically corrosive environment in which these activities occur. This research is providing fundamental information on the chemical properties of sea water in the NE Pacific, on the variability of these properties in space and time, and on the chemical changes across the air-water and water-sediment interfaces. In addition, this same information is being used in studies of water mass movements, and diffusion and mixing processes.

Approach: Shipboard field-observation programs will be carried out to determine the distributions and concentrations of carbon dioxide, oxygen, phosphates, nitrates, and silicates during the winter months when upwelling is absent and again during the spring and summer when upwelling is present. The amount of dissolved gas in the upwelled water mass should be a distinctive property and will be used to trace the downward and seaward motion of this water mass after it leaves the upwelling area.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0127, RESEARCH ON THE PHYSICAL CHEMISTRY OF CHEMICAL REACTIONS IN SEA WATER

R.M. PYTKOWICZ, Oregon State University, Graduate School, Corvallis, Oregon 97331

## 1. PROPERTIES OF WATER

A study will be made of the application of the newly determined apparent dissociation constants of phosphoric acid in sea water to revise existing data on the solubility of apatites and to compare these data with ionic products in the oceans.

The determination of the apparent dissociation constants of carbonic and boric acids will be extended to 1,000 atmospheres and 0 degrees C.

A study will be made of the solubility and rates of solution of foraminifera in sea water as a function of pressure to verify earlier data on simpler solid phases and to better understand the compensation depth.

Complexes formed by ions in sea water will be studied over ranges of temperature and pressure that reproduce conditions found in the oceans. Initial emphasis will be on sulphate complexes and, if time permits, bicarbonate and carbonate complexes will also be studied.

SUPPORTED BY U.S. National Science Foundation

### 1.0128, MARINE BIOLOGY PROGRAM

*F.G. LOWMAN*, Univ. of Puerto Rico, U.S. Aec Pu. Ri. Nucl. Ctr., Mayaguez, Puerto Rico

In this program, begun at PRNC in Jan. 1962, the distribution and movements of trace elements is being studied in restricted but complete ecological and biogeochemical systems in river basins and offshore along the western coast of Puerto Rico. The program is concerned with coordinated investigations of selected trace elements, with analyses; concentration factors in selected organisms for particular radionuclides; the marine ecosystem; biological productivity; studies of the physical, chemical, and geological oceanography of the west coast of Puerto Rico, and distribution patterns of rare earths in the Anasco River watershed, the neighboring marine waters, the organisms and sediments.

Published results include papers on stable scandium as determined in sediments, soils and minerals by neutron activation analysis; distribution of trace elements in the marine environment; effects of river outflow on the distribution pattern of fallout radionuclides in marine organisms; distribution and partitioning of Fe, Zn, Sc, and Sm within the benthic community of Anasco Bay, P.R.; trace element composition in inshore and offshore populations; uptake of Zn65 by marine algae, etc.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0129, CHEMICAL OCEANOGRAPHY

*J.T. CORLESS*, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881 (NONR)

This task includes studies in the following areas of chemical oceanography: (1) rare earth geochemistry to provide insight into mechanisms of sea floor evolution; (2) trace elements content of sea water and phytoplankton; (3) organic phosphate substances in sea water; (4) biochemistry of silica; (5) effect of pressure on biochemical processes.

Trace element concentrations in sea water give promise as a tool for understanding the circulation and dispersion of materials in the oceans. The fraction of these elements in ionic and in bound forms needs to be understood if full advantage is to be taken of this tool as a water mass tracer. The pressure effects on biochemical processes are pertinent to the Navy's saturated diving programs such as 'Man-in-the-Sea.'

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0130, AN INVESTIGATION OF TRITIUM IN RAIN WATER

*E. ERIKSSON*, Stockholms Universitet, Stockholm, Sweden (AT(30-1)2458)

The objective of the proposed work is to continue the study of the meteorological factors which influence the distribution in time and space of tritium in rainwater and in atmospheric moisture.

The scientific background to this problem is the observed fact that the distribution of tritium in precipitation differs substantially from that of e.g. Sr90 although at present their sources

are common. This difference can be expected because tritium appears as a part of the water molecule and may be taken advantage of as an aid in understanding certain parts of the circulation of water in nature.

The procedure to be adapted is to collect all available data and study their geographical distribution at various times and further, if possible, to relate this distribution to the transport pattern of atmospheric water vapor. Further, to aid the interpretation, studies of the vertical distribution of tritium in atmospheric moisture will also be carried out, both in continental environment and in maritime environment.

So far, it has been concluded from past years' studies that a considerable transfer of tritium from the atmosphere to the oceans takes place through mass exchange between the sea surface and the atmosphere and that this transport is about two times larger than the transport by precipitation. This mass exchange which does not apply to e.g. Sr90 explains in a qualitative way the present geographical pattern of tritium in precipitation.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0131, CHEMICAL OCEANOGRAPHY

*E.R. IBERT*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

This task involves studies into the methods of recovery, analysis and age dating of dissolved and particulate, organic matter in the Gulf of Mexico and Caribbean, leading to determinations of its origin, distribution and fate. Efforts include the extraction of organic carbon from sea water aboard ship in quantities sufficient for carbon-14 age determinations.

Organic materials in sea water are responsible for surface films and it is becoming evident that these compounds have a finite influence on many of the inorganic chemical reactions taking place in the oceans. This program will provide basic information necessary to the understanding of these phenomena.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0132, STABLE CARBON AND OXYGEN ISOTOPE RATIO VARIATIONS IN THE FLOW TO CARBON AND OXYGEN THROUGH NORMAL AND POLLUTED AQUATIC SYSTEMS

*P.L. PARKER*, Univ. of Texas, Graduate School, Port Aransas, Texas 78373

The main goal of the proposed research is to develop ways to use measured variations in stable carbon and oxygen isotope ratios to solve problems concerning the flow of these elements in aquatic systems. By investigating both normal and polluted systems a better understanding of both will result. Rivers, lakes and marine bays are aquatic systems which would be studied. However, single species of organisms, sewage systems and industrial plants also have a flow of carbon and oxygen and would be suitable for study.

In addition to the stable isotope studies the total amount of dissolved and particulate organic matter in area waters will be investigated. The organic geochemical studies which have been conducted here for the past three years will be continued.

SUPPORTED BY U.S. National Science Foundation

### 1.0133, PHYSICAL AND RADIOLOGICAL CHEMISTRY OF OCEAN SOLUTIONS

*R.W. PERKINS*, Battelle Memorial Institute, Richland, Washington 99352

The many radionuclides from fallout, cosmic ray spallation, reactor waste disposal and natural sources, although at extremely low concentrations, are excellent tracers for physical studies of the oceans. Hanford techniques of sufficient sensitivity are available. When combined with neutron activation analysis, these make possible studies of the trace elements present in oceans and the reactions in which they participate. The chemical processes in the oceans, the existing chemical equilibria, and the reaction rates and mechanisms will be studied. The behavior of fallout material and of low level radioactive tracers will be clarified. The various forms - ionic, colloidal, chelate, particulate, or incorporated into

## 1. PROPERTIES OF WATER

biological material will be determined. Automatic equipment will be installed and used on oceanographic research ships.

Studies of radionuclide and trace element concentrations, physical and chemical forms were made on the Oregon coast and across to Hawaii. Mn-54, Co-60, Ru-106, Cs-137 and Ce-144 increased two-to threefold in the first half of the voyage then decreased to about one-half of the west coast concentration at Hawaii. Cs-137 up to 500 miles off the California coast showed relatively uniform surface concentrations dropping to 2 to 3% at 300 meters. A study of contamination associated with sampling led to improved techniques; an all-plastic sampler was built. Trace elements were simultaneously determined in organisms by neutron activation and multidimensional gamma-ray spectrometry. Squid and lantern fish concentrate Ag. Neutron activation proved useful for trace elements in deep sea sediment.

SUPPORTED BY U.S. Atomic Energy Commission

### 1.0134, CHEMICAL OCEANOGRAPHY

T. JOYNER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Phase I. Development and evaluation of techniques for the measurement of trace elements in sea water and marine organisms.

Phase II. Application of trace element measurements to the detection of heterogeneity in water masses and the determination of the patterns of circulation and mixing in coastal and oceanic waters.

Phase III. Evaluation of the effects of variations in environmental proportions of trace elements on the production and ecological organization of marine life. This will be based upon (1) controlled experimentation in laboratory cultures and (2) direct observations made at sea.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0135, STUDIES OF OXYGEN-FREE, SULFIDE-BEARING MARINE ENVIRONMENTS

F.A. RICHARDS, Univ. of Washington, Graduate School, Seattle, Washington 98122

The observations will be designed to elucidate the following unique features of anoxic environments: (1) Denitrification, with the removal of nitrate and nitrite ions and the production of N<sub>2</sub>; (2) Sulfate reduction, with the production of sulfides and other reduced forms of sulfur and the occurrence of low redox potentials; (3) Anaerobic fermentation with the production of methane and possibly other hydrocarbons and hydrogen; (4) Extraordinarily large concentrations of carbonates in solution, high alkalinity values and low pH values; (5) The accumulation and preservation of relatively large concentrations of organic matter in the sediments, which are not worked because benthic organisms are eliminated by the sulfides; and (6) The maintenance in solution or the authigenic precipitation of metals and metal sulfides.

Laboratory studies will be carried out to investigate (1) A stoichiometric model for the decomposition of organic matter in the sea in general and especially in anoxic environments; (2) A mathematical model for the vertical distribution of organic decomposition products, of sulfides, and dissolved oxygen which accounts for interactions between sulfides and oxygen; (3) The effects of the conditions in these environments on the alkaline components; (4) The kinetics of reactions between solutions of oxygen and sulfides, and (5) The effects of sulfides and low oxidation-reduction potentials on the solubility of metals and their solid phases.

SUPPORTED BY U.S. National Science Foundation

### 1.0136, CHEMICAL STUDIES OF THE OCEANIC ENVIRONMENT

F.A. RICHARDS, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: The Navy's man-in-the-sea activities and underwater development of systems and equipment require fundamental knowledge of the occurrence in the sea of reducing sub-

stances, toxic gases and trace metals in order to be able to understand and predict their effects on both man and objects. This investigation of the chemistry of the Pacific Ocean includes the chemical tracing of water masses; the chemical control on the biological regime and its effects on plankton and other sound scattering organisms; the chemistry of oxygen-deficient environments; and the chemistry of trace metals observed in a variety of environmental influences.

Approach: This is a field and laboratory investigation to determine and explain the distributions of the chemical constituents of sea water. Both quantitative and qualitative analyses are being made of water samples collected from different oceanic areas. Comparisons are being made of the waters off the Washington and Oregon coasts where the Columbia outflow and upwelling occurs and in contrasting biologically poor and rich ocean regions of Central America and Peru. The trace metal content of waters in the Peru Trench and Mexican Trough is being measured as a means of determining age, transport, rate of replenishment and exchange of these waters.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 1C. ELECTRICAL PROPERTIES

### 1.0137, INDUCTION IN THE OCEAN

C.S. COX, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

The objective of this research is to measure electric and magnetic field variations at the ocean bottom and to infer from these data something about: (1) large-scale watermass motions, and (2) the composition and thermodynamic properties of rocks in the earth's upper mantle. Techniques and equipment for making the required measurements are being developed and tested. Special measurement programs on the geo-magnetic equator are planned for this year off the coasts of Peru and India.

Information concerning fluctuations in the earth's magnetic field requires an understanding of the interrelations between the geo-magnetic field variations and ocean currents. In addition, the potential use of the earth's crust as a transmitting medium for communications purposes is presently being explored. Evaluation of this potential use requires information about the electrical properties of the earth's crust and upper mantle. This program will help provide such information and understanding.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0138, ELECTROMAGNETIC NOISE MEASUREMENTS IN THE SEA

M. GINKLE, U.S. Navy, Underwater Sound Lab., New London, Connecticut

To measure electromagnetic characteristics of the ocean. Measure electromagnetic noise at the surface of the sea and in the sea as a function of frequency, time, weather, geographic locations, ocean depth and proximity to the bottom and shore line.

Approach: Surface Ship Measurements - Measure simultaneously the electromagnetic noise in the atmosphere immediately above the sea surface and the noise in the sea to depths of 200 feet using surface vessels as measuring platforms. Deep Research Vehicle Measurements - Measure electromagnetic noise in the sea at depths greater than 200 feet using underwater research vehicles (DRV's) as measuring platforms.

Ocean Bottom Measurements - Measure electromagnetic noise near and at the bottom of the sea using the ocean bottom or moored buoys as the measuring platform.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0139, MEASUREMENT AND INTERPRETATION OF MOTIONALLY-INDUCED ELECTRIC FIELDS IN THE SEA

T.B. SANFORD, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

Measurements of changes in the oceanic environment are necessary to the development of environmental prediction networks. This research should develop means of continuously monitoring the transport of water by ocean currents over long time

## 1. PROPERTIES OF WATER

periods, thereby providing measurements of one key environmental parameter.

This work is concerned with the interpretation of measurements of electric and magnetic signals which are caused by oceanic flow. The effort mainly consists of a series of related field experiments. In order to obtain continuous information about the flow between widely spaced current meters, electrodes are being developed for attachment to the same moorings as the current meters. The potential difference between electrodes gives a measure of the volume of water flowing between them. Using electrodes attached to a submarine cable crossing the Florida Straits, between Jupiter Is., Fla. and Grand Bahama Is., a very long time series of fluctuations in the flow through the Straits will be obtained and interpreted in terms of natural phenomena. It is expected that this information will aid developing a predictive model of this flow.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0140, CRITICAL TABLES ON THE ELECTROCHEMICAL PROPERTIES OF INTERFACES

*J. LYKLEMA*, Landbouwhogeschool, Wageningen, Netherlands

The properties covered in this project are the capacitance or charge of the electrical double layer, electrocapillarity curves, electrokinetics including surface conductance and points of zero charge for all well-defined species that can be obtained reproducibly.

Three reports have been received: an uncritical compilation of references in December 1965, a first selection of the references in October 1966, and recently a report containing a first selection of critically evaluated data. Included were a) double layers on systems other than metals, mercury or semiconductors; b) electrokinetic properties such as electrophoretic mobilities, streaming potentials and electroosmosis; c) points of zero charge. The data will be critical reference data of wide use in the study of natural and manufactured colloidal systems and of interfaces in electrolytic solutions such as seawater.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 1D. GENERAL AND MISCELLANEOUS PROPERTIES

#### 1.0141, OCEAN DYNAMICS IN THE STRAITS OF GIBRALTAR AND ADJACENT AREAS

*T. LAVASTU*, U.S. Navy, Postgraduate School, Monterey, California 93941

To determine those environmental factors affecting acoustical uses of the ocean; to categorize strategic areas into similar acoustical provinces. To provide scientific background knowledge for improvement of synoptic oceanographic analyses/forecasting models which provide environmental support to submarine and antisubmarine warfare forces.

Study tidal, synoptic, seasonal and secular changes in oceanographic conditions in the Strait of Gibraltar and adjacent seas and make a dynamic computerized model. Procure all available hydrographic data from the area in cooperation with the Spanish Oceanographic Institute (SOI) and analyze at FNWF using existing computer programs. To monitor the flow into and out of the Mediterranean by measuring the potentials in telephone cables across the Strait.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0142, OCEANOGRAPHIC RESEARCH

*E.C. LAFOND*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting acoustical uses of the ocean, to predict the effects of variability in properties of the surface layers of the sea affecting salinity, sound speed, microbubbles, gas content. Chemical and biological (except sound scattering) factors, water motion (orbital, tidal, turbulence, internal waves) and other dynamic processes; to observe and develop theory and models for predicting underwater sound propagation using deep ocean water paths including near-bottom phenomena.

Approach: Collect physical oceanographic data over depth time and space using the NUWC Oceanographic tower, buoys, ships, airplanes, deep submersibles and bottom mounted equipment to investigate the nature of changes in thermal structure, water density, chemistry and motion as related to underwater acoustics; obtain descriptive and statistical relations between thermistor chain data and geographic location, depth of water, tide currents, upwelling, island wakes, water masses, storms, seasonal and biological growth data; conduct deep sea expeditions and joint investigations with other nations.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0143, OCEANOGRAPHIC RESEARCH - INVESTIGATIONS WITH THERMISTOR CHAIN

*O.S. LEE*, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting acoustical uses of the ocean. Observe and develop theory models for predicting underwater sound propagation using deep ocean water paths. Develop theory to predict water motion, especially internal waves in the deep ocean.

Approach: Obtain descriptive and statistical relations between thermistor chain data and geographic location, depth of water, tide, currents, upwelling, island wakes, water masses, storms, season and biological data; conduct deep sea expeditions and joint investigations with other nations and activities.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0144, SEAWATER/SEDIMENT/BIOLOGY MONITORING PROGRAM

*W.A. ANIKOUCHINE*, Oceanographic Services Inc., Santa Barbara, California 93105

OOONO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Continental Oil Company

#### 1.0145, DETERMINATION OF EQUATION OF STATE, VISCOSITY AND COMPRESSIBILITY OF SEA WATER

*W. DROSTHANSEN*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (NONR)

Objective: A fundamental understanding of the physical chemistry of sea water and its physical properties is necessary to support the development and use of oceanographic instruments in Navy surveys, in more accurately determining ocean current structure from mass distributions, in understanding acoustic propagation influencing detection and communication systems, and operating machinery and equipment in naval underwater facilities. The aim of this research is to develop an accurate equation of state for sea water and obtain a better understanding of the structure of sea water mixtures.

Approach: The viscosity and isothermal compressibility of sea water are being measured as functions of temperature and salinity. Laboratory experiments are being conducted covering a range of temperature from 0 to 40 degrees centigrade; salinity from 0 to 40 parts per thousand; and pressure from One to 50 atmospheres. Artificial sea water of varied salinity is being investigated first, followed by actual sea water samples from a variety of geographic regions.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0146, SHALLOW WATER OCEANOGRAPHY (SEALAB III)

*G.B. DOWLING*, U.S. Navy, Mine Defense Laboratory, Panama City, Florida 32401

Objective: To determine those environmental factors affecting undersea uses of the ocean. Investigate shallow water parameters affecting MAN-IN-THE-SEA including SEALAB support.

Approach: Conduct physical oceanographic experiments while an inhabitant of SEALAB III. Emphasis is placed on use of instrumentation and the recording of useful quantitative data utilizing the judgment and flexibility provided by an in-situ scientist.

## 1. PROPERTIES OF WATER

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0147, HYDROGRAPHY OF APPALACHEE BAY

*K. WARSH*, Florida State University, Graduate School, Tallahassee, Florida 32306

Measurement of the physical environment of the Florida State University Marine Laboratory on Appalachee Bay. Monitoring of currents and salinity and temperature changes in the bay, winds, rainfall, tides, and solar radiation.

SUPPORTED BY Florida State University

### 1.0148, INVESTIGATE SEASONAL VARIATIONS, SURFACE WATER TYPES, HAWAIIAN AREA (KOKO HEAD)

*G.R. SECKEL*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Theory shows that processes which determine temperature and salinity, directly affect their rate of change. At any location, the annual variation of these processes, the net heat exchange across the sea surface and processes associated with water motion (advection and diffusion), is characteristic of that location. Hence, at such a location the rate of change of temperature and salinity also varies in a characteristic manner during the year.

A first approximation of the processes which determine the temperature and salinity in the Hawaiian Islands area has been made (Seckel, 1962, Fish. Bul. 193). It is therefore possible to interpret variations in the rate of change of temperature and salinity at Koko Head, Oahu, in terms of changes in the annually repeating processes which are characteristic of Hawaii.

To refine this method, the seasonal variations of water types, defined by temperature and salinity, are monitored on a continuing basis and will be linked with results of project 131.8G, 'Analyze and publish basic data from pilot study (analytic studies).'

On the basis of the first order approximation, temperatures and salinities monitored at Koko Head, Oahu, are used to predict a favorable or unfavorable environment for skipjack fishing in Hawaii.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0149, PHYSICAL PROPERTIES OF SEA WATER AT PRESSURE

*E.M. STANLEY*, U.S. Navy, Ship Research & Dev. Center, Annapolis, Maryland

Objective: To determine those environmental factors affecting undersea uses of the ocean. Investigate pressure effects on the physical properties of sea water. Investigate in design of heat exchangers, submersible motors, speed reducers, and in deep submergence problems.

Approach: Investigate the physical properties of seawater including viscosity and thermal conductivity as affected by pressure. Special equipment and the Laboratory's high pressure facility will be used, for instance a rolling ball viscosimeter has been adapted for operation under pressure pending completion of the high pressure facility.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0150, PHYSICAL AND CHEMICAL CHARACTERISTICS OF THE UPPER CHESAPEAKE BAY

*W.N. SHAW*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Physical characteristics (temperature, current speed and direction, tidal fluctuations, exchange rates and volumes) of local waters and in large man-made salt water ponds are being and will be determined. Chemical characteristics (salinity, oxygen, phosphate, nitrate, etc.) of local waters and in artificial ponds are being and will be determined. Chemical and physical factors of bottom sediments in natural waters and in artificial ponds will also be determined. Information provides baselines to evaluate effects of environmental extremes on commercial shellfish in natural waters and in laboratory experiments.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0151, OCEANOGRAPHIC RESEARCH

*A.T. JAQUES*, U.S. Navy, Ordnance Laboratory, Silver Spring - White Oak, Maryland

To study the oceanographic environment and its effects on naval systems.

Assist in adaptation of sonobuoys to the measurement of underwater sound reverberation and backscatter.

Investigate fluctuation of shallow water sound propagation and look for causative factors.

Measure seismic signatures of ships.

Measure pressure background on the bottom in various geographic areas.

Study optical transmission, scattering and background in representative ocean areas down to great depths.

Study effect of ocean currents on submerged bodies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0152, FORMATION OF ANTARCTIC BOTTOM WATERS

*H.M. STOMMEL*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

Massachusetts Institute of Technology proposes to investigate the temperature, salinity, and dynamics of water, particularly bottom water, in the Weddell Sea Antarctica. Almost all temperature changes in the oceans occurred at the air-water boundary. Cold ocean water must form only in the polar regions, as surface waters elsewhere have temperatures above the world oceans' potential temperature of about 3.5 degrees C. The Weddell Sea area has been suggested as a major source of the cold bottom water of the world oceans. MIT, in cooperation with the Institute of Geophysics, University of Bergen, Norway, would emplace four submerge buoys instrumented for measurements of currents and temperatures on the sea bottom during January 1968. Multiple sea-water samplers would also be placed on two of the submerged systems to obtain a series of water samples during the Antarctic winter. The data that would be obtained from successful recovery of these instruments in January 1969 would help to determine when and at what intervals cold bottom water is formed, and at what critical density-temperature-salinity relationships the sinking of surface water is initiated.

No MIT personnel will go to the Weddell Sea. Two Norwegian scientists will be on the U. S. icebreaker Glacier.

SUPPORTED BY U.S. National Science Foundation

### 1.0153, PROPERTIES OF SEA WATER

*A.L. BRADSHAW*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

Work under this task is being directed towards more accurate determination of the basic physical properties of sea water, thermal expansion and volume compressibility. This work is in part intended to support the future development of techniques of field measurements by providing accurate and complete measurements of basic properties. A device to measure the microstructure of conductivity and temperature in the ocean is being developed.

More precise knowledge of these physical parameters in the ocean are vital to several Naval activities including large scale surveys.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0154, GREAT LAKES RESEARCH - CHARACTERISTICS OF LAKE WATER

*A.P. PINSACK*, U.S. Army, Lake Survey, Detroit, Michigan 48226

The research involves collection, analysis, and interpretation of data pertaining or related to physical and chemical characteristics of the fresh water in the Great Lakes, including radiological contamination and sound propagation; definition of those water properties which may be utilized as indices of water characteristics and quality; and installation of permanent automatic monitor stations. The broad objectives are to investigate short term variations in water quality and properties, including the factors causing these variations, and to determine and monitor the long term trends. Energy budgets and chemical budgets will be developed to explain evaporation, lake currents and other physical variables.

## 1. PROPERTIES OF WATER

Systematic collection of data on physical and chemical water characteristics, bottom sediments, meteorological parameters, and wave observations was performed during summer and fall 1965 in Lake Erie and in Lake Huron during the open water season 1966. A similar program will be carried out in the eastern basin of Lake Superior during the 1968 open water season. Reduction, analysis and publication of data from Lakes Erie and Huron is in progress.

SUPPORTED BY U.S. Dept. of Defense - Army

**1.0155, (A) ANNUAL SUPPLY OF PARTICULATE MATTER IN THE GREAT BAY ESTUARY (B) LATE PLEISTOCENE HISTORY OF THE GREAT**  
*F.F. ANDERSON, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824*

(A) Sea water samples have been collected on a bi-monthly basis from the Great Bay Estuary since December, 1967. Total particulate matter, particulate carbon, salinity, temperature, and current velocities have been obtained. These data are being related to the factors that affect the particulate matter in estuaries.

(B) Sixty Gravity Cores have been collected from the Great Bay Estuary, New Hampshire and are being processed for texture, composition and Foraminifera. These data, in conjunction with selected C14 dates should enable the investigator to interpret the Pleistocene evolution of the estuarine system.

SUPPORTED BY University of New Hampshire

**1.0156, PHYSICAL AND CHEMICAL PROPERTIES OF THE SHELF AND SLOPE WATERS OFF NORTH CAROLINA**  
*U. STEFANSSON, Duke University, Graduate School, Durham, North Carolina 27706*

This is for the continuation and completion of studies now in progress of the physical and chemical properties of the waters on the continental shelf and in the slope region off North Carolina. The continuing research includes: (1) examination of the acquired data in relation to meteorological factors and processes affecting the renewal of the shelf waters, (2) study of biochemical relationships in Gulf Stream waters and deep and bottom waters of the Hatteras Basin, and (3) investigations of organic and particulate phosphorus and particulate aluminum and iron in the shelf area for studying the distribution of runoff water.

SUPPORTED BY U.S. National Science Foundation

**1.0157, PHYSIOCHEMICAL AND ACOUSTIC PROPERTIES OF SEA WATER**  
*D.N. CONNORS, U.S. Navy, Underwater Weap. Res. & Eng., Newport, Rhode Island 02844*

Technical Objective: (1) Determination of the heat of mixing in sea water between minus 2 degrees C and 25 to 30 C and estimate its effect on thermal structure of upper layers of the ocean. (2) Develop techniques and instrumentation for measuring partial conductance of salts in sea water and another comparable solution. (3) Measurement of the partial conductances of sodium and potassium chlorides and sulphates and salts of the divalent cation magnesium and calcium in sea water and comparable solution, as a function of pressure and temperature. (4) Estimate specific and nonspecific interactions of the above salts and their effect on velocity of sound in sea water as a function of pressure and temperature. (5) Determination of in situ density anomaly from conductance measurements for nonconstancy of composition in sea water.

Approach: Measurements will be conducted on the heat of mixing at approximately 0 degrees C, as a function of concentration, and on two selected concentrations, measurements of heat of mixing from approximately 0 degrees C to 25-30 degrees C. Evaluations will be made of several high pressure set-ups. Preliminary work will be done on the design and fabrication conductance cells.

SUPPORTED BY U.S. Dept. of Defense - Navy

**1.0158, BIOLOGICAL AND CHEMICAL STUDY OF VIRGINIA'S ESTUARIES**

*M.L. BREHMER, Virginia Inst. of Marine Sci., Gloucester, Virginia*

Virginia's three major estuarine systems--the James, the York, and the Rappahannock--exhibit different biological characteristics both within and between years. These differences have been noted in phytoplankton populations; in shellfish reproduction, growth, and condition; and in finfish populations.

This study will compare the biological, chemical, and physical characteristics of the three systems. Stations will be occupied at 5% intervals from 25 to less than 0.5% in each river at slack before flood tide. Water samples will be collected at 2 m intervals from surface to bottom and the water column described by temperature, salinity, dissolved oxygen, pH, alkalinity, chlorophyll, suspended solids (loss on ignition and fixed residue), transparency, phosphorus (soluble reactive, soluble unreactive, particulate reactive, and particulate unreactive), and nitrogen (soluble organic, ammonia, nitrite, nitrate, and particulate organic). Primary productivity levels will be determined.

Nutrient levels and turn-over rates, phytoplankton standing crop and productivity, and the dependent and independent physical and chemical characteristics of the three systems will be compared. Data collected by the shellfish and finfish departments at the Institute will be utilized to complete the analyses.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Virginia Institute of Marine Science

**1.0159, INTERNATIONAL NORTH PACIFIC FISHERIES COMMISSION SUBARCTIC OCEANOGRAPHY**

*F. FAVORITE, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102*

Oceanographic measurements of temperature and salinity versus depth and ocean currents are made in the subarctic region of the North Pacific Ocean from the BCF research vessels George B. Kelez and Miller Freeman. Interrelationships among the physical water properties, ocean currents, and sockeye salmon distribution are investigated and reported to the International North Pacific Fisheries Commission. Local coastal areas are surveyed to establish criterion that will permit prediction of environmental conditions. Participation in cooperative oceanographic surveys is scheduled with other BCF laboratories, universities, and national and international agencies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**1.0160, PHYSICAL OCEANOGRAPHY**

*W.B. MCALISTER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102*

Work in physical oceanography consists of two subprojects: I. Physical and mathematical models of the oceanic processes in the North Pacific Ocean are constructed and examined to obtain insight into the dynamic response of the ocean to the forces acting upon it. Both long term response, and short term departures from average conditions are examined. II. Instrumented field observations and model tests are designed and performed. This has included design and operation of buoy platforms instrumented with oceanographic sensors, telemetry and data recovery and data logging systems including satellite positioning and satellite data relay.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**1.0161, OCEANOGRAPHIC RESEARCH**

*T. EWART, Univ. of Washington, Graduate School, Seattle, Washington 98122*

Objective: Provide essential data for design and development of Naval systems and develop techniques for optimum performance and effectiveness of such systems. Investigate the horizontal variations of oceanographic parameters, with particular emphasis on temperature, as related to the ocean's acoustic properties. Relate these variations to gross environmental features which Navy presently has some capability for predicting in an effort to extend the prediction capability.

## 1. PROPERTIES OF WATER

Approach: Primary data source is the Self-Propelled Underwater Research Vehicle (SPURV) which is a torpedo-like instrument carrier capable of extended cruising at any depth between surface and 12,000 feet. The sensing systems provide for measurement of temperature, sound velocity, pressure, conductivity, and turbulence. Supplemental vertical oceanographic measurements are also made. Understand the basic oceanographic processes which determine the character of the horizontal temperature spectrum and the relationship to acoustic propagation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1E. OPTICAL PROPERTIES

#### 1.0162, MID-DEPTH BIOLUMINESCENCE

**B. BODEN**, Univ. of California, Graduate School, *San Diego - La Jolla, California* 92038

Bioluminescence at sea has been studied for many years, but no standardized, quantitative methodology had been developed until very recently. This investigator is utilizing the new approach which involves the simultaneous use of two photometers and which operates with a minimum of disturbance to the organisms. He observes and measures the characteristic patterns of the natural flashing and determines the relationship of these patterns to the environmental conditions under which light is produced. He will also continue his studies of the physiological mechanisms in crustaceans and other luminescing forms which produce and receive light.

This research will contribute to our knowledge of the oceanic environment and will relate especially to the causes and mechanisms of the distribution of light production in the sea, particularly among the populations which make diurnal vertical migrations.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0163, OPTICAL OCEANOGRAPHY IN FLORIDA BAY, FLORIDA STRAITS AND BAHAMA BANK

**A. IVANOFF**, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124

This research concerns the study of oceanographic phenomena through the application of optical methods.

The first objective is a study of the relationship between the particle load of a water mass in shallow water and the dynamics of wind-stirred waters. The total surface of particles and their size of distribution will be determined by light-scattering methods. The areas of research for this objective will be west of Abaco Island and in Biscayne Bay.

The second objective is a study of the sediment transport from these shallow-water areas to the deeper oceanic area. Long time series will be necessary. However, knowledge of an established relationship in a well-studied area will make it possible to estimate the year-round transport on the basis of wind observation alone. The research will be carried out at Bear Cut and in the area between Bimini and Cat Cay.

The third objective is the study of the mixing of Biscayne Bay water with the Florida Current. The attenuation meter will be utilized to demonstrate the difference of absorption of coastal waters and oceanic waters. In the course of these studies the 'black screen' attenuation meter will be refined by using photomultipliers.

SUPPORTED BY U.S. National Science Foundation

#### 1.0164, MECHANISM STUDIES ON BIOLUMINESCENT REACTIONS WITH EMPHASIS ON ENERGY TRANSFER PROBLEMS

**M.J. CORMIER**, Univ. of Georgia, Graduate School, *Athens, Georgia* 30602 (AT(40-1)741)

The mechanism by which chemical energy is converted to light energy is being investigated in several *in vitro* bioluminescent systems. These include luminous bacteria, sea pansies (*Renilla*), luminous earthworms, and luminous marine fish. Attempts are being made to isolate the enzymes (luciferase) involved so that their properties may be studied. In addition, at-

tempts to determine the structures of certain of the substrates (luciferin) are being made. Where this has been done we find that the luciferins of marine bioluminescent forms are derivatives of indole. Furthermore, a model bioluminescent system is being studied consisting of horseradish peroxidase, luminol and H<sub>2</sub>O<sub>2</sub>. In this case we have found that luminol radicals and H<sub>2</sub>O<sub>2</sub> (or a derivative of it) are substrates for the light reaction.

SUPPORTED BY U.S. Atomic Energy Commission

#### 1.0165, BIOLUMINESCENCE

**W.D. MCELROY**, Johns Hopkins University, Graduate School, *Baltimore, Maryland* 21218

A thorough ecological study of a small phosphorescent bay in Jamaica is being conducted with emphasis on the influence of environmental factors on the physiology, especially photosynthesis and luminescence of the phytoplankton. The bay chosen is in almost constant bloom and provides opportunity for continuous monitoring of temperature salinity, tide, fresh water influx, and flushing rates, as well as chemical parameters for experimental purposes.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0166, SEA WATER OPTICS STUDIES

**J. WILLIAMS**, Johns Hopkins University, Graduate School, *Baltimore, Maryland* 21218 (NONR)

The goal is to develop relationships whereby the significant optical properties of sea water could be computed from knowledge of the concentration size distribution and physical character of the suspended matter and vice versa. During the coming year the results to date will be summarized and reported and this task terminated.

Further knowledge of specific optical properties of sea water is required for design improvements of systems which require visibility underwater. The techniques for utilizing optical methods that may evolve from this task should aid in determining optical and particulate characteristics of estuarine environments.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0167, OCEANOGRAPHIC RESEARCH

**D.E. MATLACK**, U.S. Navy, Ordnance Laboratory, *Silver Spring - White Oak, Maryland*

Objective: Measure optical properties of deep ocean.

Approach: Utilize self-contained submersible cable suspended instrument package to measure spectral absorption, scatter and background visible light for all depths at specific ocean sites. Utilize results to predict utility of optical techniques.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0168, LIGHT IN THE SEA

**H.G. HOUGHTON**, Mass. Inst. of Technology, Graduate School, *Cambridge, Massachusetts* 02139 (NONR)

This project is directed towards developing techniques for the detection, counting and sizing of oceanic particulates through the measurement of the light scattering by the particulates. It may also be possible to deduce the degree of sphericity of the particles through estimation of their optical index of refraction. Both laboratory and field studies are planned. Observations will be made on the optical transmission of light through the water at various wave lengths. Also to be examined are the polarization and angular distribution of the light scattering.

Potential applications of the results of this study are (1) the use of properties of the scatterers as tracers of water motion, (2) predictions of the distribution of solar or artificial light in the sea, (3) possible chemical and biological implications.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0169, FACTORS INFLUENCING THE INTENSITY OF BIOLUMINESCENCE

**F.H. JOHNSON**, Princeton University, Graduate School, *Princeton, New Jersey* 08540 (NONR)

## 1. PROPERTIES OF WATER

The investigator is analyzing the chemical and physical factors influencing or controlling the brightness of biologically produced light by two interrelated approaches; the analysis of variations in light intensity under the influence of temperature, hydrostatic pressure, chemical inhibitory or activating substances, concentration of essential reactants, etc., and the isolation and determination of the properties, the reactants of the biological systems for interpretation in kinetic studies.

Bioluminescence is important in operations where visual search or concealment are critical factors. The light producing action of many organisms serves also as a means for quantitative detection of certain trace elements required for luminescence in some forms.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0170, OPTICAL MEASUREMENTS

*W.M. EWING*, Columbia University, Graduate School, *Palisades, New York* 10964 (N00014-67-A0108-0004)

The objectives of this program are: (1) to study, by means of bottom photographs, the biological and physical properties of and processes which occur at the ocean bottom; (2) to investigate the light scattering properties in the ocean; and (3) to make bottom current measurements. A multipurpose instrument package will replace individual instruments if tests presently underway are successful. This package will provide bottom photographs, bottom current information, water and sediment temperatures, light transmission and light scattering data at up to 20 separate locations on a single lowering.

Naval operations can be made more effective as the nature of the water-sediment interface at the ocean bottom is understood. In support of the need for such knowledge, this program will provide information on the benthos, texture, and strength of the ocean-bottom and on the currents and light-transmissivity in the waters just above the ocean bottom.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1F. PRESSURE-DENSITY

#### 1.0171, STUDY OF STABILITY AND SHEAR IN THE TOP 500 METERS OF THE OCEAN

*W.S. WOOSTER*, Univ. of California, Graduate School, *San Diego - La Jolla, California* 92038

The purpose of this study is to measure and describe the dynamic stability in the upper 500 meters of the ocean at several locations in the California Current. The measurement program is to be carried out by use of a continuous recording in-situ salinometer (STD) and a set of current sensors. The STD records permit calculation of the density profile as a continuous function of depth, while the current sensors determine the vertical shear of velocity. The combination of these two measurements will determine the dynamic stability and permit a quantitative description of the flow regime in and immediately adjacent to the thermocline. This description will be of value in assessing vertical energy transport, leading to a better understanding of the mixing and diffusion processes in the vicinity of the thermocline.

SUPPORTED BY U.S. National Science Foundation

#### 1.0172, SHALLOW WATER OCEANOGRAPHY

*G.B. AUSTIN*, U.S. Navy, Mine Defense Laboratory, *Panama City, Florida* 32401

Objective: To determine those environmental factors affecting undersea uses of the ocean. To relate ocean wave power and directional spectra in the near-shore to causative factors, and formulate means of predicting environmentally caused pressure fluctuations.

Approach: Investigate pressure spectra using in-situ measurements on the ocean bottom and tanks. Investigate waves by means of sensors at two offshore platforms near Panama City, Florida, measuring simultaneously the time-space variation in surface wave and bottom pressure and extracting such information as (1) directional spectra, (2) low frequency coherent line spectra, and (3) the effects of fetch on the sea spectrum within a well-

defined continental shelf area. Use and extend techniques for investigating the oceans' wave spectra at low frequencies. Investigate the environment selectively in time and in space.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0173, OCEAN PRESSURE RESEARCH

*W.P. CHRISTOPH*, U.S. Navy, Ordnance Laboratory, *Silver Spring - White Oak, Maryland*

Gather and analyze oceanographic data in connection with pressure sensitive equipment.

Record pressure background data at selected places in the Atlantic and Pacific Oceans. Analyze the data such that results are applicable to equipment placed in the sea. Selected locations: Frying Pan Shoal, N.C.; Buzzard Bay, Mass.; Argus Island, Bermuda; off Vancouver Island, Canada (oil drilling rig).

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1G. THERMAL PROPERTIES

#### 1.0174, THERMAL WAKE STUDIES

*E.F. FLINT*, North Amer. Rockwell Corp., *Anaheim, California*

Objective: Investigate the thermal discontinuities associated with internal waves and turbulent wakes of submerged bodies.

Approach: Utilize and advanced underwater research instrument previously developed under this effort to measure and analyze the frequency, amplitude, persistence and statistical properties of thermal discontinuities in the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 1.0175, PACIFIC COASTAL ENVIRONMENT AS RELATED TO DISTRIBUTION AND ABUNDANCE OF GAME SPECIES -- SEA SURFACE TEMPERATURE MEASUREMENTS

*G.B. TALBOT*, U.S. Dept. of Interior, Tiburon Marine Lab., *Belvedere - Tiburon, California* 94920

Objective: To determine the sea surface temperature gradients in selected areas of the eastern Pacific Continental Shelf. Survey to be conducted in cooperation with the United States Coast Guard, using an airborne infrared radiometer to provide a near instantaneous isotherm picture of the coastal sea surface temperature structure.

To develop detailed synoptic information on one important physical parameter of the marine environment for correlation with available marine fish catch/effort information.

Procedure: Three sectors of the eastern Pacific Continental Shelf covering the areas from Cape Flattery, Wash., to Tillamook Head, Ore.; Pt. Arena to Pt. Sur, California; and Pt. Conception to San Diego, California, with an infrared radiometer mounted in a U.S. Coast Guard aircraft. Sectors to be surveyed monthly with tracks of 700 to 900 nautical miles in length. Sea surface temperature data will be published immediately after each survey in the form of isotherm charts. Observers will also note and record air temperature, visual changes in water color, the extent and direction of convergence lines, location and observed abundance of marine life (fish and mammals). Survey to be conducted once each month for an indefinite period.

In FY 1963 experiments were conducted with an airborne infrared radiometer on accuracy and repeatability. Airborne water temperature surveys were made of coastal inshore area from Mexico to Cape Flattery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

#### 1.0176, MONITORING SURVEY AND TIME-SERIES ANALYSIS OF SUBSURFACE TEMPERATURE IN THE NORTH PACIFIC OCEAN

*J.F. SAUR*, U.S. Dept. of Interior, Biological Laboratory, *Palo Alto - Stanford, California*

Understanding and prediction of the effects of environmental conditions on the abundance and distribution of fish requires knowledge of the distribution of properties beneath, as well as at, the water surface and the processes by which changes in these

## 1. PROPERTIES OF WATER

properties occur. A glaring obstacle in such research is that subsurface data having both time and space continuity are practically non-existent.

It is impractical because of time, cost, and number of ships required to attempt to obtain such data with oceanographic research and survey vessels. However, the use of expendable instrument systems aboard ships of opportunity, that is, merchant and other ships whose operating costs are already covered, offers the possibility of obtaining highly useful data at a reasonable cost. Use of this method should be begun as soon as possible.

There is no precedent for collecting the subsurface temperature data on a time-series basis as proposed here. The specific data to be collected are needed for research by the BCF Biological Laboratory, Stanford. It is equally important, however, that the feasibility of collecting such data from ships of opportunity be demonstrated and a particular system be tested on an operational basis with the data also feeding into the Navy operational forecasting system.

The objectives are to determine quantitatively the variations in thermal structure of the upper layers of the water column and their relation to other oceanographic conditions, such as currents, and to the local energy exchange at the sea surface; and at the same time to pioneer a joint BCF-Navy effort for producing mutually needed ocean information. The initial step in this is to establish a pilot study for the collection of time-series subsurface temperature data using ships of opportunity. Such a pilot project was started in June 1966 aboard the Matson Navigation Co. ship SS CALIFORNIAN. Temperature observations to 1500 ft. depth and at spacing of 100 naut. miles are being obtained about twice a month from Honolulu to San Francisco.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0177, THERMAL PROPERTIES OF SEA WATER AT LOW TEMPERATURE AND HIGH PRESSURE

*D.R. CALDWELL*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The objective of this task is to obtain precise measurements of the coefficient of thermal expansion, the specific heat, and the thermal conductivity of sea water at low temperature and high pressure, such as occur in deep water and to apply these to investigation of processes affecting heat and mass exchanges in the water layers close to the sea floor. Both laboratory and field measurements are being made. Measurements of water flow at the bottom involve heated thermistor anemometers mounted on the Snodgrass-Munk deep sea tide recorders.

There is a recognized need for better fundamental values of the physical and chemical properties of sea water. Such information will contribute to the accurate determination of the speed of sound in deep water. It will also provide basic engineering knowledge to support naval systems operating at great depths or on the sea floor.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0178, BATHY THERMOGRAPH ANALYSIS

*M.K. ROBINSON*, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

The objective of this task is to provide descriptions and models of the surface and near-surface temperature structure of the oceans as derived from the analysis of bathythermograms achieved at Scripps, Woods Hole and the National Oceanographic Data Center. Objective analytical techniques have been developed and the results of analyses of data from the Pacific, Atlantic and Indian Ocean are being prepared for publication in atlas format by the U. S. Naval Oceanographic Office. A preliminary analysis of Indian Ocean hydrographic stations and BT data is being prepared for publication and analyses of the salinity structure of the upper layers of the oceans is to be undertaken based upon hydrographic station data.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0179, HISTORICAL CHARTS AND INTERPRETATION OF CHANGES IN SEA SURFACE TEMPERATURE IN THE NORTH PACIFIC OCEAN

*L.E. EBER*, U.S. Dept. of Interior, Ocean Research Lab., Stanford, California

Sea surface temperatures (Intake or injection temperature observations taken by surface ships) provide the only ocean-wide data with satisfactory long-term continuity from which to infer historical changes that have taken place in the circulation of the ocean. The construction of monthly sea surface temperature (SST) charts is thus a necessary step towards understanding the interrelationship between atmospheric and oceanographic environments and their effects upon commercial fisheries, following which the changes in SST between different years can be analyzed with relation to changes in other environmental conditions.

The objective is to provide basic data for research on changes in oceanographic conditions by developing and publishing an atlas of mean sea surface temperature for the North Pacific Ocean and of anomalies from a suitable mean period, month by month for the period 1949-1962, during which suitable data are known to exist. The year 1956 and 1957 were selected for initial study. Data for each of the 24 months were plotted and analyzed, and the resulting set of charts were published in the spring of 1962. It was determined that the preparation of charts for additional years would be accomplished more quickly and with improved quality, by switching from manual to machine processing of the data. This change made feasible the inclusion of refined editing procedures too lengthy to carry out by hand. The entire program involves several stages, ending with machine analysis and charting, using programs developed at the U.S. Navy Fleet Numerical Weather Facility, Monterey.

Publication of the 14-year series of charts is expected by the summer of 1968. Continuing work includes the preparation of monthly normal charts based on the 14-year period of reference and of anomaly charts for each month of each year. Charts depicting within-month and year-to-year variation also will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 1.0180, EVALUATION OF LOW LEVEL TEMPERATURE GRADIENTS OVER THE LINE ISLANDS NEAR THE EQUATOR

*W.M. GRAY*, Colorado State University, Graduate School, Fort Collins, Colorado 80521

The purpose of this proposed work is to study the sea-surface and sub-cloud layer temperature gradients in the vicinity of the intertropical zone during the Line Island Experiment in early 1967.

Measurements will be made using two radiometers mounted on the Woods Hole Oceanographic Institution's C-54Q aircraft. An aerosol counter will be placed on the aircraft also to help determine the effect of a hazy environment on the radiometric measurements. The sea surface temperature will be mapped in the vicinity of the Line Islands. Values will be checked with other measurements made by other groups and using different techniques. It is hoped to correlate the measurements with other available synoptic and meso-scale observations to help determine the cause of observed satellite 'cloud blobs'.

SUPPORTED BY U.S. National Science Foundation

### 1.0181, MILLSTONE POINT TEMPERATURE SURVEY

*W. OWEN*, Raytheon Company, New London, Connecticut

A 12 hour temperature and salinity survey was conducted at Millstone Point, Connecticut to document the vertical distribution of temperature and salinity at each of three stations before the world's largest atomic power plant goes into operation next year.

A similar survey will again be conducted in March 1969.

SUPPORTED BY North East Utilities Service Company

### 1.0182, MONTVILLE STATION TEMPERATURE SURVEY (THAMES RIVER)

*W. OWEN*, Raytheon Company, New London, Connecticut

## 1. PROPERTIES OF WATER

The non-consumptive use of water for cooling the condensers of thermal power stations requires a knowledge of the distribution of temperature in the body of water used for the purpose.

In August, September, and November of 1968, MRL conducted a temperature survey of the Thames River Estuary in the vicinity of an operating thermal power plant. An average of 130 continuous temperature profiles were made over a 12 hour period on each of the eight survey days. In addition, meteorological measurements, tide measurements, salinity determinations, and bathymetric measurements were made.

The data from the survey was presented to the funding agency in the form of 184 cross section contour maps and 30 planner contour maps of the temperature data.

SUPPORTED BY Bechtel Corporation

### 1.0183, THE CONTRIBUTION OF ADVECTION AND LOCAL HEATING TO THE MAINTENANCE OF THE THERMAL STRUCTURE IN THE NORTH PACIFIC OCEAN

K. WYRTKI, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

The thermal structure and the distribution of sea surface temperature within the mixed surface layer is maintained by the combined action of heat exchange at the sea surface and of ocean circulation. The heat exchange changes the temperature locally, while the circulation by the processes of advection and mixing redistributes the heat. Since 1948, monthly charts of sea surface temperature and of the anomaly of sea surface temperature from the long-term mean have been published for the North Pacific Ocean, but the interpretation of the origin, redistribution and of the decay of such temperatures anomalies has not advanced beyond speculations.

Under this grant, investigations will be made on the interaction between the field of heat exchange, circulation and temperature distribution, to establish firm quantitative relations between these fields, which are suitable for the calculation of the behavior of anomalies of these fields, and to compare such results with actual observed situations.

SUPPORTED BY U.S. National Science Foundation

### 1.0184, THERMAL STRUCTURE

E. SCHROEDER, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-CO-241)

This program calls for the systematic collection of data from an oceanographic station off Bermuda that has been occupied approximately fortnightly since 1954 and for the analysis of the time series in terms of fluctuations in temperature, salinity and steric sea level. Analysis of North Atlantic thermal data is a continuing program. An atlas of smoothed average temperatures at five levels is being prepared in cooperation with NavOceanO and Scripps.

The results from this task should provide a better understanding of long-term changes in the ocean to assist in the planning of Naval operations and in the development of design criteria. Work from this task has contributed to the program at the Naval Numerical Weather Facility, Monterey.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 1.0185, GREAT LAKES RESEARCH - MONITORING OF WATER CHARACTERISTICS

A.P. PINSAK, U.S. Army, Lake Survey, Detroit, Michigan 48226

A system of permanent automatic monitor stations will be developed to continuously measure and record geophysical processes that affect or are influenced by the Great Lakes and their environment and to program observations for timely use in forecasts and control. As a first phase in this program continuous automatic water temperature recorders have been installed at 10 sites along the periphery of the U. S. portion of the Great Lakes. These stations will be removed as the comprehensive monitoring program develops.

Hourly water temperatures, daily and monthly mean temperatures at each of the ten sites are published regularly.

SUPPORTED BY U.S. Dept. of Defense - Army

### 1.0186, CALORIC - AN INVESTIGATION OF HEAT RELEASE PATTERNS ASSOCIATED WITH PRESENT AND PLANNED LAKESHORE ELECTRICAL POWER PLANTS

G.J. NEUMAIER, Cornell Aeronautical Lab. Inc., Buffalo, New York 14221

The objective of this program is to investigate the thermal pattern in the vicinity of an existing electrical power station and to develop a theoretical model for predicting the thermal pattern that will prevail during the operation of a planned nuclear facility near an existing plant. This program will provide information for assessing the influence of the future thermal discharge from the nuclear plant on lake ecology and for determining the preferred locations of the intake and discharge tunnels of that plant.

The program consists of three tasks: (1) the development of a theoretical model of the lake thermal characteristics, (2) measurement of the lake surface temperature distribution using an airborne infrared radiometer, and (3) the design, fabrication, and installation and routine maintenance of lake temperature and current instrumentation.

SUPPORTED BY United Engineers & Constructors Inc.

### 1.0187, COLLECTION AND INTERPRETATION OF OCEANIC THERMAL GRADIENTS

M.G. LANGSETH, Columbia University, Graduate School, New York, New York 10027

The object of this investigation is to continue regular heat flow measurements from the R/V Vema and R/V Conrad in an attempt to delineate large areas where the heat flow is low, normal, or high. In addition, it is hoped that certain areas such as the East Pacific Rise and the Sigsbee Knolls area of the Gulf of Mexico can be thoroughly investigated with the use of satellite navigation or anchored buoys to determine the nature of large heat flow variations over relatively short distances.

A temperature-measuring instrument, the thermograd, developed at Lamont Geological Observatory, allows the continuous measurement of water temperature from close to the surface to the ocean bottom and also the thermal gradient of the sediment. To date, many hundreds of measurements have been made using this device. Recent results in the East Pacific Ocean show high heat flow over the East Pacific Rise between Panama and Hawaii, low heat flow in the Guatamala Basin, about average heat flow close to Hawaii. Other results in the same area show high heat flow off the coast of Washington State and a surprisingly uniform heat flow south of the Mendocino Fracture Zone in a line between Victoria, British Columbia, and Midway Island.

SUPPORTED BY U.S. National Science Foundation

### 1.0188, TEMPERATURE MICROSTRUCTURE AT THE OCEAN FLOOR

G. BODVARSSON, Oregon State University, Graduate School, Corvallis, Oregon 97331

This is a renewal of GP-4642 to make temperature measurements at the bottom of the ocean in both the water and the bottom sediments for extended periods of time. Two analog recording thermoprobe instruments have been assembled and calibrated. The instrument package has been operated at a depth of 1500-1700 fathoms for a period as long as 22 hours. Techniques have been developed to measure temperature gradients for a period of several weeks, using a buoy. Heat flow measurements have been made in two areas off the coast of Oregon and a number of theoretical studies have been made.

It is proposed to develop the instrument package to arrive at observation periods of three to six months. The data will be studied with regard to the stability of the bottom boundary layer. The importance to the evaluation of existing heat flow measurements at sea are obvious. Theoretical studies will be continued.

SUPPORTED BY U.S. National Science Foundation

### 1.0189, A STUDY OF THE TEMPERATURE MICROSTRUCTURE AND EDDY TRANSPORT IN THE OCEAN FLOOR BOUNDARY LAYER

G. BODVARSSON, Oregon State University, Graduate School, Corvallis, Oregon 97331

Under previous NSF support three analog recording thermoprobe instruments have been assembled, calibrated and field tested. Each probe carries eight thermistor sensors and a sediment sampler. The probes furnish data on the temperature up to 3.3 meters above and down to two meters below the ocean floor as well as on the heat flow through the bottom interface. They have operated satisfactorily in 3,000 meters of water for periods up to 22 hours. The temperature measurements can be made with a resolution of plus and minus 0.004 degree centigrade. Two of the probes were lost during field operations, but a fourth one is now being assembled.

A fifth temperature probe for longer period temperature recording is partially finished. This unit has the capability of scanning ten sensors and converting the input to a digital format for storage by a magnetic tape recorder. The total storage capability of the tape unit will extend the in situ recording time to three months.

The objective of the presently proposed research is to make further improvement of the temperature probing equipment and to continue the experimental program on the temperature structure and heat transport in the lowest section of the ocean floor boundary layer.

SUPPORTED BY U.S. National Science Foundation

#### 1.0190, AIRBORNE SEA SURFACE MEASUREMENTS IN THE EQUATORIAL PACIFIC

R.A. RAGOTZKIE, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The objectives of the proposed research are to map the surface temperature field of the ocean by airborne infrared radiometry and then interpret the results in terms of related atmospheric and oceanic phenomena.

A Barnes (IT-3- infrared radiometer will be mounted in the NCAR aircraft and converted to the ARIS data acquisition system aboard the plane. The radiometer will be used in fixed and tilted modes so both the sea surface temperatures and the amount of water vapor in the atmosphere can be measured.

It is anticipated that the variability in time and space of the sea surface temperature can be documented, that the effect of atolls can be ascertained, currents can be delineated and oceanic fronts observed. All of these observations will be of great use in understanding better the interaction between the ocean surface and the overlying atmosphere.

SUPPORTED BY U.S. National Science Foundation

## 2. WATER MOTION

(see Also Air-sea Interaction in Chapter 3a and Hydrodynamics, Chapter 8i)

### 2A. CIRCULATION-CURRENTS

#### 2.0001, RADIOISOTOPE TRACERS IN OCEANOGRAPHIC RESEARCH

E.A. SCHUERT, U.S. Navy, Radiological Defense Lab., Hunters Point - San Francisco, California 94135

Objective: Investigate radioactivity and measure fallout isotopes in the ocean that are useful in tracing vertical migration and circulation of water and concentration of water properties. To establish methodologies for determining the distributions of naturally occurring and man-introduced radioactivity in the oceans and to develop research instrumentation as required.

Approach: Develop in-situ gamma radiation detectors for employment on submersibles and for more general use from surface vessels. Evaluate the capabilities of such detection systems as oceanic radioactivity probes. Map the known present oceanic inventory of fission products, induced radioactivity and special fuels; locate and account for future injections from oceanic, atmospheric, and terrestrial sources; define the trace elements of interest and their physical and chemical states in sea water; define their interactions with the bio-mass; develop isolation techniques for gamma spectrometric measurements of micro trace quantities; initiate a program for sampling the surface waters of the world from ships of opportunity; and schedule specific cruises in

## 2. WATER MOTION

the North Pacific Ocean for the determination of vertical profiles. Apply data analysis, with the aid of sophisticated computer programs, to the extension of present theories and the development of new theories on the circulation, mixing and turbulent diffusive processes extant.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 2.0002, OCEAN CIRCULATION

R.S. ARTHUR, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The purpose of this investigation is to advance qualitatively, through the development of analytical and numerical models, an understanding of features of both oceanic and near-shore circulation to the point where circulation behavior can be predicted. Wind-driven circulation near-shore and over submarine canyons is being studied to obtain a model of water and sediment transports in rip currents and in the circulation over canyons. Attention also is being given to the eastern boundary current off California in order to establish a dynamic model for the mean flow in this region and help in planning mesoscale arrays of buoys.

Forecasting the movement of ocean water, or deducing such movements, from available oceanographic and meteorological observations depends on adequate theoretical understanding of the processes and dynamics of oceanic systems. This work is making substantial improvements in such theory.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 2.0003, STUDY OF OCEAN CURRENTS AT SEA FLOOR AND THEIR SPATIAL CORRELATION

C.S. COX, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

A continuing effort is underway to obtain the very long time series of ocean current observations necessary to reliably distinguish between the various possible types of water motion having periods longer than tidal periods. It is not planned to measure currents throughout an entire water column, but rather to undertake a variety of measurements using instruments which rest solidly on the sea floor.

The first set of measurements involves operating current meter stations on the sea floor for extended periods of time. The current meters, commercially available, are mounted rigidly in a tripod so as to record at about one meter above sea floor and are recoverable by means of a line attached to a surface float. The meter-buoy station may be left unattended for about six weeks, after which the current meter is retrieved, serviced, and replaced on the bottom.

In conjunction with the current meter observations, measurements of the electric field at the bottom of the sea will be attempted. The measurements of electric field will permit estimation of the barotropic component of water flow. This will complement the bottom current measurements which, of course, make no distinction between barotropic and baroclinic components of the flow.

SUPPORTED BY U.S. National Science Foundation

#### 2.0004, BOTTOM CURRENTS AND DEEP SEA TIDES

M.C. HENDERSHOTT, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The purpose of this task is to develop an understanding of long period waves and currents in the ocean, including tides, through theoretical and observational investigations. The theoretical work consists of devising computational methods capable of representing long period gravity and planetary wave oscillations in deep basins. Observational work consists of measurements of water flow in deep water within a few meters of the bottom where the effects of friction are evident. During the coming year, it is proposed to use finite difference calculations for solving the deep-sea tide problem, on a model which has boundary conditions simulating the effects of energy dissipation and trapping near coasts. Current meters are to be developed to measure the directional components of current velocity in the boundary layer immediately above the ocean floor in the deep sea.

## 2. WATER MOTION

The Navy is embarked on a deep ocean technology program designed to improve man's capability to work and install equipment on the ocean floor. In addition, sound propagation is affected by physical variations in the deep ocean waters. This task will provide knowledge of the variations and causes of such variations pertinent to these Navy problems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0005, A STUDY OF THE DEEP CIRCULATION AND DEEP FISH POPULATIONS IN THE PACIFIC OCEAN

*J.D. ISAACS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (AT(11-1)34-127)

Until this last year the deep currents in the oceans have been only rarely measured, although many aspects of the circulation have been theorized from models and from the evidences of various physical and chemical variables such as temperature, salinity, oxygen, carbon 14, etc. During the last year 15 direct current records (3 meters off the bottom) have been obtained at about 4 km in depth, 400-800 km off the West Coast of northern Baja California, Mexico. The direct measurements in this area show a coherent net transport of about 2.2 cm per sec in a southeasterly direction; a semidiurnal fluctuation of an rms amplitude of about 1.7 per cm. per sec., rotating counterclockwise; and with the phase coherent with the dominant component (the semi-diurnal lunar component) of the tides at La Jolla, California. This extent of coherency greatly increases the possible significance of widely-spaced observations, and it now appears that such measurements can be highly significant in elucidating the deep circulation and tides over the entire basin.

The plan is to conduct a widespread study of deep currents and related factors in the Pacific Ocean during the next year for the purpose of elucidating the nature of the deep circulation and the fluctuating currents.

In one year we will not have gathered a large number of deep measurements but we will have measurements broadly spread in the Pacific Ocean. This information should yield great insight into the nature of the deep currents, and permit the design of an optimum study of currents in the entire basin.

Other measurements that are planned at some current stations are free vehicles with a camera and a fish trap; temperature and salinity to the bottom; and opening and closing net tows in the deeper layers.

SUPPORTED BY U.S. Atomic Energy Commission

### 2.0006, STUDY OF DEEP PACIFIC CIRCULATION USING SILICON-32

*H.W. MENARD*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The research program proposal aims towards an understanding of the nature of circulation in the deep Pacific Ocean using cosmic ray produced Si 32 as a tracer. Whereas several radioactive techniques have recently been employed to investigate the characteristics of circulation of water in the oceans, they are at best primarily suited for evaluating the gross features of circulation, viz., the turnover time of oceans. Extensive studies of cosmic ray produced C 14 in sea water and of another cosmic ray produced radioisotope, Si 32, in surface marine waters have provided useful information in this direction. The available measurements on the specific activity of C 14 in the bicarbonate of deep Pacific waters show that the horizontal and vertical gradients that exist in its specific concentration are often small compared to the precision of measurement and, furthermore, close in magnitude to the effect produced by the dissolution of gravitationally settling skeletons which results in a direct in situ addition of carbon of higher specific activity. In view of the above, the C14 data lead only to a box-model type analysis with most of the deep oceans being considered as a well mixed reservoir.

SUPPORTED BY U.S. National Science Foundation

### 2.0007, CIRCULATION OF THE PACIFIC

*J.L. REID*, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

The objective is to chart and understand the overall large scale circulation of the northwest Pacific and the origin of the deep waters of the major ocean basins. The approach is to examine along with other physical and chemical properties potential density as an indicator of flow, and to measure bottom currents at great depths. During the coming year, data from 10,000 deep water stations spread over the world ocean are to be analyzed. Bottom current meter observations are to be made around the Central Pacific Basin to obtain details of the water exchange between the North and South Pacific.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0008, NATURE AND VELOCITY OF CURRENTS AND OTHER FLOWS IN SUBMARINE CANYONS

*F.P. SHEPARD*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Thorough study will be made of the various currents and sediment flows in submarine canyons where they are particularly amenable to study since the location is predictable. Working together with scientists of the Navy Electronics Laboratory, San Diego, and the local branch of the U. S. Geological Survey, extensive current meter studies in the canyons near Scripps Institution are planned. This would be supplemented by the planting of event recording devices within the canyons, which would be released and rise to the surface after a strong flow down the canyon floors, and would provide us records of the transient flow velocities. In addition, attempts would be made to set off flows in the canyons with the help of the best available information on soil mechanics. The movement of traceable sands and other recognizable objects down the canyon floors would be followed. The work would also involve supplementary studies of upwelling, downwelling, and the sedimentation taking place in the canyon heads. This work would be coordinated with observational studies made by scuba divers and deep diving vehicles presently studying the canyons.

The investigation should provide much needed information on the true nature of turbidity currents, and also should determine to what extent ordinary currents and powerful flows, other than turbidity currents, are contributing to the phenomena that are generally considered the work of turbidity currents. Information coming from the project should prove valuable, not only in interpreting such features as submarine canyons and great sea fans, but could also provide helpful information for man's rapidly expanding utilization of the sea floor.

SUPPORTED BY U.S. National Science Foundation

### 2.0009, DESCRIPTIVE OCEANOGRAPHY/PACIFIC

*B. TAFT*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The purpose is to understand the air-sea interactions involved in large ocean currents. Attention is being focused on the equatorial system using data collected largely on operation EASTROPAC. Physical data from continuous recording devices and time series from buoys are being examined by computation for information on the interaction between the changing atmospheric circulation and the current system.

The results of the analysis from this work are expected to contribute significantly to the understanding of a major portion of the eastern Pacific Ocean. Such knowledge will be useful for planning of naval operations and furthering our ability to describe and predict large scale changes which the atmosphere may induce in the oceans.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0010, CIRCULATION AROUND OCEANIC ISLANDS

*W.G. VANDORN*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Objective: To study the character and mechanisms of circulation around oceanic islands. Initial emphasis will be given to islands in dynamically stable regions where a deep thermocline and steady trade winds prevail. Such regions comprise most oceanic areas between latitudes 30N-30S, and might be termed 'oceanic deserts,' because vertical mixing is strongly opposed by a

## 2. WATER MOTION

stable density structure, and the surface waters are consequently nutritionally impoverished. Except for the equatorial current system, the flow regime in these latitudes consists of the sluggish geostrophic flow of warm surface water under the action of wind stress, with essentially no motion below thermocline depth.

However, the presence of an island protruding on such a flow regime apparently results in an anomalous circulation strong enough to overcome surface stability and cause mixing with subsurface water, as evidenced by locally nutritionally rich water and the abundance of marine life. Because the thermocline depth is generally below the effective depth of wind-wave action in tropical oceans, other mechanisms must be sought to explain vertical mixing. These include: (1) The formation of vortices and vortex streets as the result of perturbed flow around an island. (2) Upwelling and downwelling as a result of differential wind stress and continuity. (3) Enhancement and breaking of internal waves on equi-potential surfaces where strong density gradients exist. (4) A thermohaline circulation, as the result of anomalies in the evaporation-precipitation balance over an island.

SUPPORTED BY U.S. National Science Foundation

### 2.0011, CONVECTIVE STUDIES

*T.D. FOSTER*, Yale University, Graduate School, *New Haven, Connecticut* 06520 (N00014-66-C0171-A01)

The objective of this task is to study the basic aspects of convective processes and their application to oceanographic phenomena. Emphasis is upon the theoretical and experimental study of thermohaline convection induced in the surface layers of the ocean by the evaporation of sea water at the surface. Another theoretical investigation also is attempting to explain the processes which produce the superadiabatic temperature gradients believed to be present in the bottom layers of the deep ocean. Field work at sea on the thermal structure of the mixed surface layer is expected to be carried out from FLIP in the North Pacific Ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0012, DYNAMICAL OCEANOGRAPHY AND GEOPHYSICAL FLUID DYNAMICS

*G. VERONIS*, Yale University, Graduate School, *New Haven, Connecticut* 06520

Studies will include (1) theoretical studies of thermal convective processes in fluids when a salt gradient can act as a stabilizing agent; (2) theoretical and numerical studies of large-scale ocean circulation generated by horizontal temperature differences and by fluctuating winds at the surface; (3) theoretical investigations into the attenuation of low frequency sound in the ocean; (4) experimental models of processes and phenomena which can be produced in a rotating tank in the laboratory and which are meant to simulate natural phenomena. Continuing on these projects will be George Veronis as principal investigator, and George Buzyna as post doctoral research associate.

SUPPORTED BY U.S. National Science Foundation

### 2.0013, FLUSHING PATTERN OF CERTAIN TIDAL STREAMS IN DELAWARE

*F.C. DAIBER*, Univ. of Delaware, Graduate School, *Newark, Delaware* 19711

Our various biological and hydrographic investigations within the tidal creeks adjoining Delaware Bay over the past years point up the need for a more thorough knowledge of the circulation patterns and other hydrographic features within these tidal creeks. This information will identify the location and volume of fresh water during various tidal and seasonal conditions. Such information is of value in selecting sites and times for withdrawal of water for irrigation, farm and industrial usage. It has implications in terms of domestic and industrial pollution and health, transport of plant nutrients from coastal marshes and survival of eggs and larvae of fish and shellfish. This study could serve as a model for study of creeks of other sizes and magnitude of tributaries. This work is to begin in fiscal year 1967 and terminate at the end of fiscal year 1969.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch  
University of Delaware

### 2.0014, WESTERN ARCTIC OCEANOGRAPHIC INVESTIGATIONS

*R.B. ELDER*, U.S. Dept. of Transportation, Oceanographic Unit, *Washington, District of Columbia*

Because of the U. S. Coast Guard's unique capabilities in polar operations, it has a responsibility for conducting and coordinating oceanographic research activities in the Arctic. Present programs conducted by the U. S. Coast Guard Oceanographic Unit include oceanographic studies in the Chukchi, East Siberian and Laptev Seas, the Bering Strait and Bering Sea. Emphasis is on the circulation and interchange of Arctic and North Pacific waters.

Presently this work is being conducted aboard Coast Guard icebreakers during intervals when the vessels are not engaged in their primary mission of the support of shore-based defense and scientific installations.

Also of interest is the study of the oceanography of the Arctic Basin. Studies of areas from which there is little or no oceanographic data are particularly important. Results of these programs are published in the CG-373 Series.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 2.0015, OCEAN CURRENTS AND CIRCULATION

*L.A. BANCHERO*, U.S. Navy, Oceanographic Office, *Washington, District of Columbia*

**OBJECTIVES:** Develop deep-ocean data collection techniques using moored instrument arrays; study the variability of ocean currents and temperature structure through the employment of these systems. Formulate mathematical prediction models for ocean currents.

**APPROACH:** The vertical and horizontal variability of kinematic features of the ocean over synoptic (100-1000km) and meso (10-100km) scales and over temporal scales of one month to one season will be studied. The spectral energy content of currents, particularly the relative amplitude of peaks which appear at inertial and tidal frequencies, is expected to yield significant information. The relationship of current measurements to the general ocean circulation at various latitudes must be studied in order to formulate prediction models.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0016, OCEAN CURRENT TRANSPORT

*W.S. RICHARDSON*, Nova University, Graduate School, *Fort Lauderdale, Florida* (N00014-67-A-0386-0001)

This is a combined field and theoretical study of the structure and variability of ocean currents. Special emphasis is given to measurements of velocity field in vertical cross-sections across the Gulf Stream along the E. Florida coast using freedrop instruments from ships and very accurate, limited-range navigation. Support of this study involves improved instrumentation and associated researches in physical oceanography. The studies of downstream variation in Gulf Stream transport have extended from Miami to Jacksonville; this year will extend these studies to Cape Fear and possibly Cape Hatteras. Emphasis will be placed on study of velocity structure at bottom and lateral boundary layers of Florida Current in Straits of Florida through use of current meter strings. Limited theoretical studies are designed and executed to complement the field program.

The development of navigation and measurement techniques for accurately determining structure of ocean currents is important for a variety of naval problems involving the placement of instrument arrays and structures; economical ship routing; and localized search and survey operations.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0017, STUDIES OF THE TRANSPORT OF THE FLORIDA CURRENT

*W.S. RICHARDSON*, Nova University, Graduate School, *Fort Lauderdale, Florida*

The Principal Investigator has recently developed a technique for the rapid measurement of vector transport which

## 2. WATER MOTION

permits the measurement of total flow of a large current with good accuracy. The method consists of dropping a free instrument at a known point from which it falls to the bottom, releases weights and returns to the surface under its own buoyancy. The instrument contains internal recording of pressure versus time and is accurately fixed when it surfaces.

This method requires the availability of a precise navigation system. By increasing the transmitted power of the presently available HiFix system, it will be possible to provide navigational accuracy of plus or minus 2 meters throughout the Straits of Florida, Northeast and Northwest Providence Channels and to the North and East of Little Bahama Bank (range of 250 miles). With this increase in coverage it should be possible to determine the transport through the Little Bahama Bank-Palm Beach section and the flow out of Northwest Providence Channel, as well as the transport through the Miami-Bimini section. In this way, the contribution of the channels to the Gulf Stream can be determined.

In all of these sections, the vertical and horizontal distribution of transport will be determined and efforts will be made to compare these with geostrophic determinations made from hydrographic stations. In addition to transport measurements of the above type, current meter installations will be made both at the shorelines and in deep water to determine the shape of the tidal wave in the straits and associated channels.

SUPPORTED BY U.S. National Science Foundation

### 2.0018, RESIDENCE TIMES OF WATERS BEHIND BARRIER ISLANDS

*K.G. DEAN*, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

The proposed research comprises the development and evaluation of a numerical model to calculate the residence times of the waters in lagoons behind barrier islands and in interconnected bay systems. The numerical model will be based on the governing differential equations of motion and continuity including all nonlinearities. Wind stresses, precipitation and tidal displacements at the openings to the water system under consideration will be included as 'input' to the numerical model. The model 'output' includes predictions of water velocity and elevation as functions of time and position in the water system. The 'output' is generated by representing the water area as a grid system and solving the governing difference equations for the prescribed spatial and temporal distributions of the input functions. To assess the validity of the model, a field program will be conducted to measure the input and output functions for at least two different water systems. The validity and limitations of the model will be based on a comparison of measured water elevations and velocities with those determined from the numerical model.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res. University of Florida

### 2.0019, SEA SURFACE SURVEILLANCE

*J.T. BRUCKS*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Objectives: 1. To obtain data concerning the variation of properties of surface water entering the Caribbean Sea to test the relationship of the spatial and temporal distribution of tuna schools to variations in the circulation. 2. To contribute to the understanding of the oceanography of the Caribbean Sea and western tropical Atlantic Ocean. 3. To establish effective sampling procedures to be used at shore stations and on ships of opportunity in this and other areas of investigations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 2.0020, WATER MASS TRACERS

*C.H. OPPENHEIMER*, Florida State University, Graduate School, Tallahassee, Florida 32306

The objective of this task is to determine the role of planktonic Foraminifera as biological tracer organisms in identifying major currents and water mass distribution patterns. Specifically,

the research will determine the limits of precision of this method and further develop its application. During the coming year the effort will be devoted primarily to analyzing the several thousand samples which have been collected in the eastern Equatorial Pacific and are being collected in the tropical Atlantic. These analysis will be compared to other physical and chemical measurements.

Sound propagation in the ocean is affected by the density structure as well as water velocity and biological concentrations. The distribution of these properties is dependent upon circulation patterns which are not understood. This task should provide a powerful tool for studies of oceanic circulation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0021, HAWAIIAN OCEANOGRAPHY

*K. WYRTKI*, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822 (NONR)

The effect of the Hawaiian Islands on the North Equatorial Current is being investigated to determine the influence of an island chain in mid-ocean on the structure and dynamics of a larger permanent ocean current. The investigation is concerned with the study of the North Equatorial Current, its modification during flow through the various channels between the islands and the development of eddies behind the island chain. Particular emphasis is on the formation, the duration and the decay of eddies; the correlation of sea-level differences between islands with the flow through channels and development of eddies; and the tidal current pattern in the Hawaiian Islands region and in the open ocean away from the Islands.

This study should result in information on the disturbance of the oceanic structure in the vicinity of a mid-ocean island chain, on the variations in time and space of the thickness of the mixed surface layer, of the depth and intensity of the thermocline and of the surface and subsurface circulation in channels between the Hawaiian Islands. Since naval operations take place in the vicinity of these islands, the knowledge of these oceanic parameters and their fluctuations are of importance to the Navy.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0022, CIRCULATION IN THE GULF OF MEXICO

*K. DRENNAN*, Gulf South Research Institute, Baton Rouge, Louisiana (N00014-67-C-0514)

The purpose of this investigation is to study the circulation of the northeastern and central portions of the Gulf of Mexico. Emphasis is on the circulation of shelf water in the northeast Gulf, particularly the effects induced by the Mississippi outflow and the Loop Current. Both hydrographic data and airborne IRT observations are being used to determine and delineate flow patterns. The surface circulation features of the Yucatan and Loop Currents in the Central Gulf also are being studied by airborne IRT in an attempt to correlate observed patterns with circulation features derived from standard oceanographic observations.

This task is part of the Navy's broad basic research program in oceanography to provide a better understanding of the Navy's operating environment. Results from this task are expected to contribute to operations by furthering the understanding of the circulation and water structuring of such regions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0023, THEORETICAL AND LABORATORY MODEL STUDIES OF LARGE-SCALE OCEAN CIRCULATION

*A.R. ROBINSON*, Harvard University, Graduate School, Cambridge, Massachusetts 02138 (N00014-67-A-0298-0011)

Objective: The accomplishment of many operational Navy objectives such as prediction of subsurface currents during deep-sea operations, is contingent upon knowledge of water movements and the associated physical property distributions. In turn, the goal of predicting three-dimensional configurations of ocean currents depends in large measure on improved understanding of the fundamental processes involved. This research is a successful example of the application of basic fluid mechanics to understand motions in the rotating fluid envelope which is the real ocean.

## 2. WATER MOTION

Approach: Experimental and theoretical model studies of the motions, associated forces and energy of fundamental processes in ocean circulation constitute most of the work. Quantitative comparison of theory with the results of experiments performed with a rotating model of a curved sea will continue to provide critical tests for many aspects of the general ocean circulation. Numerical modeling of time-dependent, intense, jet-like currents will continue. A predictive model of the variation in Gulf Stream path will be tested by a field experiment during summer of 1969. The study of processes involved in the subsurface equatorial current system and in the large-scale interaction between ocean and sea will continue. Field tests will be made on an instrument designed to measure small pressure fluctuations at great depth in an effort to sense very large wave-like disturbances of ocean currents.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0024, (U) OCEAN CIRCULATION MODELS

*R.C. BEARDSLEY*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

A rotating laboratory model which models the dynamics of the large scale wind driven ocean circulation will be used to investigate the interaction of Rossby waves with the mean interior and western boundary layer flow in an enclosed basin. The amplitude and phase response functions will be measured as the relative mean and oscillatory components of the applied stress are varied. A numerical study of the model equations for a steady stress will be compared with experimental results previously obtained to help understand the nature of the flow instability observed.

Many operations in the ocean are contingent upon knowledge of water movements and the associated physical property distributions. In turn, the goal of predicting three-dimensional configurations of ocean currents depends in large measure on improved understanding of fundamental processes involved.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0025, LONG RANGE SOFAR FLOATS

*H.M. STOMMEL*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139 (NONR)

This is a field experiment concerned with measuring water motions at subsurface depths. Measurements will be made of long period and large scale ocean currents by acoustically tracking neutrally buoyant floats in the SOFAR channel. Fixed hydrophones in the sound channel will be used to locate and track the floats and to determine the ambient temperature at the float via transmitted CW pulses. These floats are large, expensive and recoverable. A second type of expendable, one-shot float is under design. The deployment of relatively many of these inexpensive floats could yield information regarding vertical shear and horizontal coherence of subsurface motions.

This is an important step towards understanding the large scale and long period motions of the oceans in the mid-depth range. It is also significant in that it fully recognizes the potential of the permanent sound channel for information telemetering.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0026, EASTERN BOUNDARY CURRENTS

*I. SCHELL*, Ocean Atmospheric Res. Inst., Cambridge, Massachusetts 02138 (N00014-67-C-0334)

The objective of this task is to determine the influence of large-scale atmospheric conditions, such as pressure and wind field patterns, upon the Benguela Current and associated upwelling in the eastern South Atlantic Ocean. From the distribution of atmospheric pressure over the South Atlantic Ocean, indices of atmospheric circulation are being developed to describe the intensity of this circulation. These indices are then being correlated with both sea surface temperature conditions off southwest Africa and subsurface temperature, salinity and oxygen content for sections which extend seaward from areas of upwelling along the coast.

This is part of the Navy's basic research program intended to provide a better understanding of the operating environment of

the Navy. The results from this study should contribute to the understanding of macro-scale air-sea interactions, and, in particular, the influence of large-scale atmospheric systems upon the dynamics and structure of the oceans which relate to acoustical propagation characteristics. From such better understanding of the large-scale influences of the atmosphere upon the oceans should develop improved environmental forecasts.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0027, CIRCULATION ON THE CONTINENTAL SHELF

*D.F. BUMPUS*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

This investigator has endeavored to delineate the horizontal motions in the circulatory system of the continental shelf of the east coast of the United States. With the generalized pattern in hand we are trying to work out the secular changes in the circulation and their causes. We will use a Lagrangian technique with drift bottles at the surface and sea-bed drifters at the bottom and make use of all the physical oceanographic, hydrological, climatic and meteorological data and theory to elucidate these motions.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 2.0028, GULF STREAM EDDIES

*F.C. FUGLISTER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

This is a continuing study of the Gulf Stream system in the region following its departure from the continental shelf off and east of Cape Hatteras. The objective is to gain a better understanding of the structure, behavior and frequency of occurrence of large-scale, cold-water eddies formed by the meandering Gulf Stream. This year emphasis is upon the analyses and interpretation of data from recent cruises concerned with the detailed documentation of the life cycle of a single eddy. This includes both descriptive aspects and the development of numerical models. A series of cruises also will be mounted to search for and tag both old and new eddies to determine the role these large-scale features play in the water mass structure of the northwestern North Atlantic.

It is essential to obtain a detailed quantitative description of the oceanic circulation on both a large and a small scale in order to establish a sound basis for predictions of oceanic structure and to isolate the physical, chemical, biological, and geological processes responsible for the ocean's behavior. The results from this study should assist the development of forecasting methods.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0029, GULF STREAM TRANSPORT

*P.C. MANGELSDORF*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

It has been found that navigation methods now available can provide average surface current measurements between successive hydrographic stations precise enough to be combined with the calculated geostrophic shear to yield true total transport. A cruise of R/V CRAWFORD is scheduled for August 1967 during which it is planned to use this method to measure the total transport of the Gulf Stream across two different sections extending from the Continental Slope to the Bermuda Rise. This grant provides funds for equipment and scientific personnel for this cruise, and for subsequent data processing.

SUPPORTED BY U.S. National Science Foundation

### 2.0030, INVESTIGATION OF SHALLOW CURRENT STRUCTURE IN THE WESTERN TROPICAL ATLANTIC OCEAN

*W.G. METCALF*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Further studies of the circulation in the shallow layers of the Western Equatorial Atlantic are proposed. The classical view of the current pattern shows that water of South Atlantic origin flows northwestward across the equator and enters the Caribbean Sea (and the North Atlantic circulation) by way of the Guiana Current.

## 2. WATER MOTION

Direct current measurements and a study of the hydrographic data in this area indicate that that portion of the water column between 13 to 24C, of South Atlantic origin, does not contribute to the circulation of the North Atlantic. In particular the oxygen concentration in the South Atlantic water is higher than in North Atlantic water through the same temperature range.

Sections of hydrographic stations and direct current measurements are planned to determine the circulation pattern between the mouth of the Amazon River and the Antilles Arc. Special emphasis will be placed in obtaining closely spaced samples through the upper 300 to 500 meters of the water column. Direct current measurements will be made using parachute drogues and a current meter designed to be lowered from the ship.

SUPPORTED BY U.S. National Science Foundation

### 2.0031, NORTH ATLANTIC CIRCULATION

*L.V. WORTHINGTON*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

This task is concerned with the general circulation and water mass distributions of the ocean. It includes both the description of large oceanic features such as current systems and the study of the causes which produce changes in them. Particular emphasis is upon the measurement of the volume transport of the Gulf Stream south of New England using free drop instrument techniques. The validity of the hypothesis that sloping bottom topography controls meanders also is being re-examined using new bathymetric data. A water budget of volume transport and actual volumes of different water masses is being developed for the North Atlantic and the distribution of water mass properties in the Somali Basin are being determined.

This study should provide the understanding of the physical nature of oceanic circulation which has a bearing upon numerous problems in effective use of the oceans for military operations. It will provide the proper input to theoretical models of the circulation which are needed for the long-term goal of prediction of oceanic variables and further our ability to describe and predict the properties of the oceans.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0032, AN INVESTIGATION OF THE OVERFLOW OF NORWEGIAN SEA WATER INTO THE NORTH ATLANTIC THROUGH DENMARK STRAIT

*L.V. WORTHINGTON*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Observations made during the International Geophysical Year have indicated that the Norwegian Sea overflows are major sources of deep water in the North Atlantic. Past measurements have shown that the overflow between Iceland and the Faroes amounts to about  $5 \times 10$  to the 6th power cubic meters/sec. The amount of the Denmark Strait overflow has not been determined. This research proposal is for a detailed examination of this overflow using both hydrographic measurements and current meters. The staff of the Bedford Institute of Oceanography have agreed to cooperate in this effort and the work will be performed aboard the Canadian Research Ship HUDSON.

SUPPORTED BY U.S. National Science Foundation

### 2.0033, VERTICAL CURRENT STRUCTURE IN THE GREAT LAKES

*V.E. NOBLE*, Univ. of Michigan, Great Lakes Research Division, Ann Arbor, Michigan

The objective of this program is to use the wind and current data from the buoy system established in the Great Lakes by the Public Health Service to gain an understanding of the dynamics of the current structure in the Great Lakes. These data are continuous, and have been obtained over a full-year period in Lakes Michigan, Ontario, and Erie. The buoy stations were placed so as to cover the entire basin of each lake. The buoy stations will be in Lake Huron during 1966, and will be moved to Lake Superior in 1967.

Preliminary analysis has shown a seasonal progression of the current patterns in Lake Michigan. This progression of patterns seems to reflect the change in the effectiveness of the air-sea coupling as a result of the air-sea temperature structure.

Detailed analysis of the available data will help to provide the conceptual framework for the development of a theoretical model which will accurately predict the current patterns observed in the Great Lakes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 2.0034, OCEAN CIRCULATION AND CONTROLLING FACTORS FOR PREDICTION

*G. NEUMANN*, New York University, Graduate School, New York, New York 10003 (NONR)

Objective: The Navy needs for oceanic environmental information to plan and execute operations and to install fixed subsurface systems requires knowledge of the movements of water mass and currents as well as a capability to predict changes in them. This research is to determine the factors controlling organic circulation, both large-scale current systems and local upwelling phenomena. By providing a better understanding of the meteorological and oceanographic conditions controlling oceanic circulation, improved environmental prediction techniques may be developed to support naval operations.

Approach: The fresh water discharge of the Amazon River and the differences in precipitation and evaporation are being evaluated as causes for the large salinity variations observed in the upper strata of the Tropical Atlantic. Physical oceanographic data obtained from EQUALANT cruises in the area are being analyzed to determine seasonal variability. Oceanographic and meteorological data also are being collected, analyzed and correlated to determine the causes of anomalous temperatures frequently encountered in the waters off New Jersey.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0035, STUDY OF INFLUENCE OF STRATIFICATION ON CURRENT STRUCTURE

*G. NEUMANN*, New York University, School of Engineering, New York, New York 10003

This research proposal is concerned with the study of the circulation of Lake Michigan. Rotary currents with the local inertial period have been found to be very prominent in the data and frequently mask other long and short term current variations. In order to obtain more definitive clues as to their nature, it is proposed to separate these currents from the data by a least squares technique. This will enable us to study not only the vertical and horizontal structure of these rotary currents but also the residual circulation that remains after the rotary current has been subtracted.

SUPPORTED BY U.S. National Science Foundation

### 2.0036, VERTICAL OCEAN CIRCULATION

*P.K. WEYLE*, State University of New York, Graduate School, Stony Brook, New York 11790

The basic goal of this research is to increase the level of knowledge regarding convective processes within the ocean. Such knowledge will yield better understanding of how the ocean stabilizes our climate and how climatic distributions affect subsurface circulation in the sea. The first objective is to identify ocean areas capable of producing long-term effects on the subsurface circulation through the formation of distinct water types and to estimate the formation and mixing rates of such waters. During this year, the objective will be attacked by the development of a statistical, dynamic model involving knowledge of the distribution of all ocean waters on the basis of some measure of depth, as well as temperature and salinity. Only existing data will be used. (Preliminary studies indicate that the model will be more sophisticated than was expected because of complex equation of state of sea water).

SUPPORTED BY U.S. Dept. of Defense - Navy

## 2. WATER MOTION

### 2.0037, CURRENT STUDY ON THE NEUSE RIVER AND ESTUARY

*W.J. WOODS*, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

A study will be made of water movements in the Neuse River and Estuary. Data obtained will be used to determine flushing rate and circulation patterns. This is the second phase of a study which it is hoped will ultimately determine flushing rates and circulation patterns in the Pamlico Sound complex. Pamlico Sound is a shallow, bar-built estuary in North Carolina.

A fluorescent dye (Rhodamine B or Rhodamine WT) will be added to the river and its distribution traced by boats equipped to pump water continuously through a Turner Fluorometer. The record of concentrations on successive days, as long as the dye is detectable, will be used to determine the rate and direction of water movement and the effect of wind and tidal action.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of North Carolina

### 2.0038, TIME DEPENDENT VARIATIONS IN SURFACE OCEANIC CIRCULATION

*R.G. DOUGLAS*, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106 (AT(11-1)-1796)

It is apparent that in the future demands will be made upon the marine environment for many of the resources which are now available on land. These demands will take many forms, but probably the most important will be the increasing use of the oceans for: 1) waste disposal and, 2) food production. If the exploitation of the terrestrial environment can be taken as a guide (and present indications suggest that it can), increasing use of the oceans will significantly alter the marine environment, probably irreversibly. Before this occurs it is imperative that a comprehensive understanding of the phenomena which control the major physical characteristics of the marine realm be obtained. Since 1880, for example, the North Atlantic has experienced an average sea-surface temperature change of up to 3 degrees Centigrade, presumably due to changes in ocean currents resulting from minor climatic fluctuations. Such changes bear on the ultimate fate of wastes deposited in the sea and on the productivity of the world's fisheries which originate and are maintained largely through a delicately balanced combination of currents and temperature.

Because the oceans undergo time-dependent change, the prediction of oceanographic conditions -- necessary for intelligent utilization of the ocean as a resource -- can only partially be derived from study of the modern situation. To this must be added a historical perspective. It is necessary to know the direction and magnitude of changes which have occurred in the past and may be expected to recur. The necessary models of past conditions can be derived from detailed geological investigation of materials preserved in the sedimentary record on the sea floor. We propose to make an investigation which relates to the development of models of the surface circulation of the ocean under the most extreme conditions of the last few thousand years. Specifically we propose to develop the surface circulation model responsive to the fully glacial conditions which ended about 1,000 years ago, and to the conditions of 6,000 - 8,000 years ago when the earth was warmer than at any other time since deglaciation began. If we are successful in attaining this objective, we plan to examine the models responsive to the smaller scale changes of the last 6,000 years which will be of most interest in predicting future changes.

SUPPORTED BY U.S. Atomic Energy Commission

### 2.0039, TIME FLUCTUATIONS IN OCEAN CURRENTS

*M.S. LONGUETHIGINS*, Oregon State University, Graduate School, Corvallis, Oregon 97331

Two related approaches will be taken towards the study of time-fluctuations in ocean currents having periods of the order of a few pendulum-days.

1. Theoretical studies - (a) Calculation of the normal-mode oscillations in ocean basins of ideal shape on a rotating sphere. The computations will take account of horizontal divergence and will span the whole range of Lamb's parameter. (b) Numerical evaluation of new types of wave motion associated with bottom

topography, including (particularly the double Kelvin waves propagated along a straight) discontinuity.

2. Model experiments - Experiments will be made with a rotating fluid shell contained between two concentric spheres. The initial aim is to set up the shellular modes (those with zero radial velocity) and related wave motions.

SUPPORTED BY U.S. National Science Foundation

### 2.0040, OCEAN CIRCULATION STUDIES

*J.A. KNAUSS*, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881 (NONR)

The work underway involves three aspects of physical oceanography (1) direct measurements of oceanic currents are being made with current meters, swallow floats and Richardson free-dropping buoys for mass transport calculations. In addition, hydrographic measurements are used for dynamic calculations. The work is concentrated in the area of the Blake Plateau where the Gulf Stream appears to cross the deep western boundary current and along the continental slope off New England. (2) fluid dynamics relations to non-linear mechanics, in particular the application of statistical mechanics to equilibrium phenomena. (3) the transfer of energy across the frequency spectra of internal waves.

Better understanding of ocean circulation is essential before models can be constructed for prediction of the variables which influence sound propagation, dispersion of contaminants, and navigation of deep running submarines.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0041, CURRENTS AND WATER MASSES IN THE SOUTHWEST ATLANTIC

*L.R. CAPURRO*, Texas A & M University System, Graduate School, College Station, Texas 77843

This is for the continuation of cruises to the Southwest Atlantic covering 150 oceanographic stations and six surface and deep current stations, the current measurements will be extended from thirty hours to one week and an additional research vessel will be included in the program. It is felt that the study of water masses and currents in this region and the associated front is of fundamental importance to an understanding of Southwest Atlantic circulation as well as to explain some of the observed geophysical phenomena in the Argentine Basin by the LGO scientists.

SUPPORTED BY U.S. National Science Foundation

### 2.0042, CIRCULATION STUDIES

*J.D. COCHRANE*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

This task is concerned with the study of oceanic circulation in three distinct regions: (1) the eastern Gulf of Mexico and Cayman Sea, (2) the western tropical Atlantic, and (3) the eastern tropical Pacific Ocean. A cruise is scheduled to study the Yucatan Current to determine the onset of western intensification in the current as well as evidence of convergence and divergence patterns on the west side of the Campeche Bank. Ongoing analyses of other, previously-collected data are concerned with the origin and downstream modification of the Atlantic Equatorial Undercurrent and the eastern termination of the Pacific Equatorial Undercurrent.

The results from this study should provide a better understanding of the dynamics of the oceans in these little-known areas and assist in planning any future more-detailed surveys in these areas. Through a better understanding of the dynamics of the oceans also can evolve better methods for predicting current behavior.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0043, BOTTOM ENVIRONMENT--GULF OF MEXICO

*W.E. PEQUEGNAT*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

The environment at the bottom is being studied in the deep waters of the Gulf of Mexico, where the depth exceeds 1700

## 2. WATER MOTION

fathoms. The objective is to understand the forces affecting bottom properties. To this end deep sea photography combined with current meters, dredges and other sampling devices are used to relate biological populations, water motion, and chemical content to the observed physical properties of the bottom.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0044, CIRCULATION STUDIES

*R.O. REID*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

This task includes both theoretical and field studies of ocean circulation with emphasis on the Gulf of Mexico. Theoretical models of the Gulf circulation will be treated as will the more general problem of western boundary currents in a layered ocean. A major effort is being directed towards the development of a 3-dimensional numerical model for describing the circulation and associated thermal structure of the Gulf. An observation program also is being mounted to monitor the inflow into the Gulf from the Yucatan Current for use in the numerical model. Another study is investigating the response of a stratified oceanic system and overlying stationary hurricane.

The results of this task should provide a better understanding of the circulation of the Gulf and the cause of spatial and temporal variations. Some generalization to other regions should be possible for forecasting purposes.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0045, CIRCULATION DYNAMICS (GULF OCEANOGRAPHY PROGRAM)

*R.S. ARMSTRONG*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Studies have shown that variations in shrimp catches in the Gulf of Mexico are regional rather than local. This wide-spread effect suggests an influence corresponding to deviations from the normal oceanic environment.

Project goals involve (1) describing the stratification, currents, circulations, and distribution of properties as observed during pertinent periods; (2) defining deviations from the normal, and the rates of changes in climatic variations, seasonal fluctuations, and shorter time variations; and (3) relating the sea and the variations to the driving forces of wind-driven circulations, changes in the water budget, primarily by the volume transport through the Yucatan Straits, and energy associated with heat budget.

The ultimate goal will be to develop usable, routine techniques for predicting the state and character of the waters at any locale in the Gulf.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 2.0046, FINE STRUCTURE FEATURES OF TEMPERATURE AND SALINITY AT WATER MASS BOUNDARIES IN PACIFIC

*G.I. RODEN*, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: An understanding of the temperature and salinity small-scale variation in the transition zone between the subarctic and subtropical water masses of the North Pacific is important to the Navy for sound propagation and the prediction of oceanographic and meteorological conditions that influence naval operations. This research is to better understand the circulation patterns and their relationship to the fine structure of temperature and salinity observed at the boundary of these water masses which extends from Japan to Mexico between 31 and 43 degrees north latitude.

Approach: A detailed observational and theoretical study of the eastern part of the transition zone between 145 degrees west longitude and the American mainland will be made. The fine detailed temperature-salinity structure and oceanic circulation will be investigated. Temperature, salinity, dissolved oxygen and nutrients will be measured. The processes leading to the formation of the transition zone and detailed temperature-salinity structure will be theoretically investigated. The time variability of tem-

perature and salinity in the zone also will be assessed from meteorological and oceanographic information collected on Ocean Weather Station NOVEMBER.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0047, BOTTOM CURRENTS AND THE MOVEMENT OF SEDIMENT ACROSS THE CONTINENTAL SHELF

*R.W. STERNBERG*, Univ. of Washington, Graduate School, Seattle, Washington 98122 (AT(45-1)1752)

Field, experimental, and theoretical work is proposed in several areas as part of the initial stages of an investigation of sediment transport on the continental shelf. In order to relate the general physical oceanography of the shelf to the bed load sediment transport, procedures for accurate calculation of the boundary shear stress must be available. In general, this requires an understanding on non-uniform and unsteady turbulent boundary layer mechanics. Such boundary layers are to be studied in the field using a marine Preston tube in conjunction with a bottom mounted array of rapid response current meters. These two systems give three nearly independent ways of evaluating the boundary shear stress in quasi-uniform quasi-steady flows providing a check on the method presently being used as well as permitting extension of our experimental capabilities to flows hitherto precluded by instrumental limitations. Theoretical and laboratory work on this problem and the related sand wave problem will continue. In addition, field measurements of bed load transport and boundary shear stress will be used to check the validity of the standard bed load equations in the marine environment. Moreover, the boundary shear stress at which sediment motion is initiated and the nature of sand waves will be investigated more thoroughly using the underwater television system, the stereo cameras, and the marine Preston tube. Theoretical work on these sediment transport aspects of the problem will continue. Field work will be carried out in Puget Sound and in the Columbia River during the next contract year. However, in the subsequent year a major part of the offshore work is expected to begin.

Results to Date: In the past few years considerable data has been accumulated on the variation of the drag coefficient relating the boundary shear stress to the flow one meter from the bed with flow conditions and bottom configuration. Information which confirms the use of the Shield's initial motion criterion in the marine environments has also been obtained. Recent results obtained by this project include successful flume measurements of the shear stress and velocity distributions over model sand waves, measurements of Reynolds stress in a tidal channel, measurements of the structure of the tidal flow near slack water, and measurements of boundary shear stress with a marine Preston tube.

SUPPORTED BY U.S. Atomic Energy Commission

### 2.0048, INVESTIGATION OF THE CIRCULATION OF LAKE SUPERIOR

*R.A. RAGOTZKIE*, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The overall goal is to describe and explain the general circulation of Lake Superior throughout the year. Studies have revealed that there are persistent cold cells in Superior, at least until early August, and a narrow and relatively fast surface current flowing northeast along the Keweenaw Peninsula.

Gradient currents calculated from temperature cross-sections in the nearshore region north of the Keweenaw Peninsula indicate currents velocities excess of 1 knot flowing in a northeastward direction. Current measurements from buoys confirm these calculated currents. This boundary current flows from mid-June until at least early September.

Theoretical studies have shown that for a stratified fluid in an enclosed basin the size of Lake Superior, the natural free mode of circulation includes high velocity boundary currents in a cyclonic direction. These may also occur in Lakes Huron and Ontario.

Circulation studies in a rotating laboratory model of Lake Superior also suggest this circulation in the epilimnion. Further analysis of field observations and laboratory experiments is continuing. Additional airborne infrared temperature mapping and in situ current measurements are planned.

University of Wisconsin

### 2E. CONVECTION-MIXING-UPWELLING

**2.0049, TRACERS STUDIES IN ALASKAN HARBORS**  
*D.L. WOLF*, Univ. of Alaska, U.S.D.I. Alaska Water Lab., College, Alaska 99735

Tidal flushing and estuarine water flowing into harbors are the primary means for diluting the industrial and community pollutants discharged into these harbors. The mechanics of this dilution is complex and not well known. The objective of this proposal is to use tracers (dyes and radioisotopes) to measure the rates of dilution at various points in the channel. Variables are seasonal fluctuations in fresh water flow, temperature, amount of natural and man-made wastes discharged into harbors.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

**2.0050, DISPERSION PROCESSES IN ESTUARIES AND RIVERS**

*H.B. FISCHER*, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

Purpose: To determine the mechanics of the dispersion process in streams and estuaries chiefly by the use of previously derived and newly developed analytical and numerical theories and to suggest modifications and more effective methods of analysis.

Methods: Rhodamine WT and Rhodamine B dyes are being used to study longitudinal and lateral dispersion on bays, estuaries, and large streams. Hydraulic models will be constructed to ascertain differences in the models and prototype streams selected for comparative purposes.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

**2.0051, DISPERSION IN HYDROLOGIC AND COASTAL ENVIRONMENTS**

*N.H. BROOKS*, Calif. Inst. of Technology, School of Engineering, Pasadena, California 91109

Hydrodynamics problems of dispersion in hydrologic and coastal environments will be studied theoretically, in the laboratory, and in some instances in the field. The various areas and problems to be considered are:

(1) Natural rivers: longitudinal dispersion, transverse turbulent diffusion, velocity distributions. (2) Reservoirs and lakes: artificial large-scale mixing; buoyant plumes in stratified environment. (3) Ground-water basins: source of buoyancy in a current; free and forced convection. (4) Estuaries: longitudinal dispersion. (5) Oceans (nearshore): buoyant plumes in a current; sewage field thickness; large scale diffusion.

Turbulent diffusion and density-stratified flow phenomena are common to several areas above.

Work will not be conducted in all areas simultaneously but rather a continuing program at a modest level will be developed.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

**2.0052, BIG EDDIES AND MIXING PROCESSES IN THE GREAT LAKES**

*G.T. CSANADY*, Univ. of Waterloo, School of Engineering, Waterloo - Ontario, Canada

Disposal of domestic and industrial waste in the Great Lakes requires a knowledge of the mixing processes involved. Previous work of the principal investigator and his collaborators has shown that mixing in the vertical depends critically on the supply of relatively large eddies, occurring in a more or less organized pattern, and often giving rise to a streaky appearance of the lake surface. The physical mechanism causing such 'streaking' is not known (although several speculative explanations have been proposed), nor is it clear what eddy structure would be set up in a wind driven current or in a gradient current, or how such structure would be modified by convective effects due to surface cooling. The object of the present project is to investigate the eddy structure of the surface layers of the Great Lakes, particularly as regards big ed-

dies (which are known to determine mixing processes in turbulent flow) and relate this to observable diffusive properties of lake currents.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ct.

**2.0053, TRITIUM AS A TRACER FOR MIXING PROCESSES**

*G.H. OSTLUND*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

This is a continuing study of the distribution of fusion-bomb produced tritium in the equatorial Atlantic. Combined with salinity distribution the tritium data have yielded insight into the relative roles of horizontal and vertical mixing. Cruises in 1965 and 1967 have collected some 320 samples from the Equatorial Atlantic Current System and it is proposed to complete these analyses. The implications of these data will be investigated, relative to mixing processes, origins and time scales of components of the current system, etc.

SUPPORTED BY U.S. National Science Foundation

**2.0054, MIXING PROCESSES INFLUENCING THE OCEANIC ENVIRONMENT**

*C. ROOTH*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (NONR)

Objective: The prediction of oceanic environmental conditions influencing naval operations and the effectiveness of naval systems and equipments requires an understanding of the physical processes causing changes within the environment. The aim of this research is to determine the nature of mixing processes such as those in the surface layers that influence the thermal structure, and those at the seabed influencing the operation of underwater facilities.

Approach: Analyses are being made of material from previous laboratory experiments and field studies on entrainment effects and turbulence penetration in pycnoclines and on oceanic velocity spectra obtained from moored current-meter arrays. They are to be the basis for the formulation of a mixing theory for the interior of the oceans. The effects of density-modifying processes acting at the lateral boundaries of a basin (frictional mixing and geothermal heat flow) also are being studied with a number of theoretical and laboratory models.

SUPPORTED BY U.S. Dept. of Defense - Navy

**2.0055, STUDY OF OCEANIC TURBULENCE**

*B. GALLAGHER*, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

Increased knowledge of the structure of oceanic turbulence is necessary to further understanding of the dynamics and transport processes in the sea. It is proposed to begin measurements of this structure in a deep ocean location where the spatial nature of the turbulence is expected to be least complex. The measurements are designed to reveal the spatial structure of the motion in a form to which turbulence theories can be applied. Values for parameters of energy dissipation and vertical diffusion will be found.

SUPPORTED BY U.S. National Science Foundation

**2.0056, TURBULENT DIFFUSION STUDY**

*D.W. PRITCHARD*, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218 (NONR)

The aim is to study turbulent diffusion in estuarine and coastal waters. Emphasis during the coming year is upon the effects of spatial variations in the velocity field on the shape and concentration distribution of a cloud introduced as an instantaneous local source. A field experiment will be conducted in Chesapeake Bay to obtain data on the relationship between the local shear in the horizontal velocity field and the shape, during early stages of dispersion of a nearly instantaneous source. Other field studies include the study of vertical diffusion through the pycnocline in a tidal estuary and the study of large scale advective and diffusive processes which control the longitudinal distribution of salinity in an estuary.

## 2. WATER MOTION

This study will contribute to understanding short-term small-scale fluctuations in temperature in shallow water and estuarine areas as well as to the fate of contaminants introduced deliberately or accidentally.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0057, EXPERIMENTAL AND THEORETICAL STUDY OF THE HYDRODYNAMICS OF DISPERSION IN RIVERS AND ESTUARIES

*M.P. TULIN, Hydronautics Incorporated, Laurel, Maryland*

The general aims of the proposed research are: 1. To improve understanding of river hydraulics inasmuch as it has a bearing on dispersion. 2. To develop methods enabling the calculation of the velocity distribution in streams, which may be used to determine the dispersion coefficient, and to provide systematic experimental assessment of the results. 3. To provide experimentally verified, quantitative results relating to dispersion in channels with varying aspect ratio and boundary roughness distribution. 4. To develop quantitative verified theories relating components of the dispersion tensor to the mean flow characteristics. 5. To provide useful and verified information and procedures relating to the scaling and model testing of dispersion in streams.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res.

### 2.0058, RESEARCH ON TURBULENT CONVECTION

*E. MOLLOCHRISTENS, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139*

Turbulent convection is one of the important processes in geophysical fluid mechanics. The research was for the purpose of obtaining more information about the phenomenon from laboratory experiments performed under controlled conditions. The experiments involved observations of statistical measures of the turbulent fluctuations, such as spatial covariance, time and space intermittency, spectra in frequency and wave number. Turbulent convection in a stratified medium was also investigated.

SUPPORTED BY U.S. Dept. of Defense - Air Force

### 2.0059, RESEARCH IN OCEANIC PHYSICS

*H.M. STOMMEL, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139*

The program centers about a field study of the small scale structures and mixing processes within the main thermocline of the subtropical Atlantic ocean. Various new forms of instrumentation will be used to measure shear, density stability, and life history of laminae on vertical scales of less than ten meters. The field study is scheduled for the Research Vessel ATLANTIS II on August 28 - September 19, 1968, southeast of Bermuda.

Theoretical study of the Ekman layer in the presence of strong heating and application to the Trade wind region of the ocean is contemplated. Also a laboratory model study and theoretical study of density tongues in rotating density-stratified fluids is being pursued: with the hope of eventual application to interpretation of the spreading of water-masses at depth.

During the Spring of 1969 an attempt will be made to locate, identify, and intensively survey a region of active bottom-water formation in the Ligurian Sea. A continuous monitoring of the cold-upwelling region off Somalia, associated with the Monsoon induced Somali Current is also in progress in the hope of providing definite information on the time of response of an ocean current to variable wind-stress. The latter investigations are meant to be part of the U.S.-Italy Cooperative Science Program.

SUPPORTED BY U.S. National Science Foundation

### 2.0060, VERTICAL MOTIONS

*A.D. VOORHIS, Woods Hole Oceanographic Institution, Woods Hole, Massachusetts 02543 (N00014-66-C0241)*

Experiments are being carried out to measure vertical motion and vorticity in depths ranging from 300 to 3000 meters of water in the northwest North Atlantic. Neutrally buoyant floats with vanes that cause rotation as water moves vertically past them are being used. Rotation is reported acoustically to the tending ship. An experiment is to be carried out in the vicinity of a

moored array of current meters to study the partition of kinetic and potential energy in the oceans. Other measurements also will be made at the edge of the Gulf Stream where turbulence is high.

Little is known about the vertical movement of water in the oceans. This program is attempting to measure such movement. It influences the displacement and deployment of naval systems in deep water. Therefore, the magnitude of such motions should be known and sufficiently understood to predict them.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0061, SALINITY INTRUSION AND RELATED PHENOMENA

*H.B. SIMMONS, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi*

The objective of this project is to determine, for conditions of open channels subject to salt-water intrusion and tidal oscillations from the sea, the factors which control the extent of salinity intrusion, the degree of vertical mixing of salt and fresh water, the magnitudes and durations of current velocities at all depths, and the movement and deposition of sediments as influenced by density effects.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0062, CHARACTERISTICS, CAUSES, AND PREDICTION OF UPWELLING WATER MASSES OFF OREGON

*R. SMITH, Oregon State University, Graduate School, Corvallis, Oregon 97331*

Objective: The efficiency of search and rescue, underwater construction and other operations can be strongly influenced by the character and motion of water masses in the operating area. One commonly occurring and very distinct water mass off the west coast of the U. S. results from an intermittent upwelling of deep cold water into the near surface water. A thorough understanding of this upwelling process and the associated changes in horizontal currents and water properties should allow their prediction both in the study area and in similar areas elsewhere in the world.

Approach: Interrelationships between upwelling, tides, local weather, water properties and currents are being studied using concurrent measurements of sea level, atmospheric pressure, and the temperature, salinity, and oxygen content of water. In addition information on currents is being obtained both from tracking drogues which drift with the currents and from fixed current meters anchored above the continental shelf. A team of qualified researchers, mostly advanced graduate students, is carrying out detailed but coordinated studies on various aspects of the program. As the interrelationships become more clearly defined, predictive models will be constructed and tested.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0063, CATALYSIS AND KINETICS OF MANGANOUS ION OXIDATION IN AQUEOUS SOLUTION AND ADSORBED ON THE SURFACES OF SOLID OXIDES

*R.W. COUGHLIN, Lehigh University, School of Engineering, Bethlehem, Pennsylvania 18015*

In view of the several mechanisms which have been proposed for the formation of manganese nodules, and because of the need for further quantitative data on manganese chemistry, this proposal sets forth a program which would: 1. Study the adsorption of soluble manganese from aqueous solution on the surfaces of various solid oxides (especially those of manganese and iron) with the goal of obtaining information about the nature of adsorption and double-layer formation. It will be of special importance to investigate the effects on these processes of foreign ions, complexing molecules, etc. 2. Study kinetics and mechanisms for the oxidation of manganous ions both in aqueous solution and at solid oxide surfaces (especially those of manganese and iron). The possible catalytic action of these surfaces will be of special interest.

SUPPORTED BY U.S. National Science Foundation

## 2. WATER MOTION

### 2.0064, HORIZONTAL DISPERSION IN SHALLOW ESTUARIES OF IRREGULAR SHAPE

F.D. MASCH, Univ. of Texas, School of Engineering, Austin, Texas 78712

This proposed research involves the development and verification of a numerical model to evaluate transport characteristics in shallow vertically-mixed estuaries of irregular shape. The model is designed to assist in developing water quality requirements and evaluating the assimilative capabilities of the shallow irregular estuaries found along the Gulf Coast of the United States.

The study includes the following three phases: 1. Adaptation of an explicit numerical model of the two-dimensional convective dispersion equation to the irregularly-shaped estuary. 2. Evaluation of the dispersion coefficients from graphical and analytical considerations of the circulation and scale of turbulence in the estuary. 3. Verification of Phases 1 and 2 in a hydraulic model and then in the field.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Texas

### 2.0065, COLUMBIA RIVER EFFECTS IN THE NORTHEAST PACIFIC

C.A. BARNES, Univ. of Washington, Graduate School, Seattle, Washington 98122 (AT(45-1)-1725)

WHETTEN

This study, started in 1961, aims to describe quantitatively the Columbia River water and its load of materials in the Northeast Pacific, stressing the movement, mixing, growth, and decay of the lobe of river water throughout the year and unique physical, chemical, biological, and geological properties that identify these waters. An attempt is made to relate conditions found with causative oceanographic and meteorological factors, to explain pertinent processes, and to establish a base for predicting general behavior at sea of river water and its transported load.

Analysis and interpretation continue of conventional oceanographic measurements and collections made on 60 cruises, covering 165,000 kilometers in 825 days at sea and providing 154,000 water samples; 14,900 productivity measurements; 8200 phytoplankton, 2500 zooplankton, 2400 sediment samples; in situ gamma-activity measurements; seabed drifter movement; and miscellaneous samples and observations.

Columbia River effluent moves in response to wind and current, north in winter and south in summer. Nutrients and dissolved oxygen have been correlated with mass properties and with the productivity and distribution of phytoplankton. Phytoplankton studies include productivity-chlorophyll ratios, taxonomic composition, size distribution, seasonal and diurnal variations, and response to light. Preliminary attention has been given to zooplankton speciation and abundance and to benthos. The bathymetry 500 km seaward from Washington and Oregon has been described, and initial reflection studies made of the subbottom. Mineral types, mechanical characteristics, chemical nature, microorganisms, radioactivity, and movement of the sediments have been described in part, and lower river reservoirs have been examined for characteristics, configuration and movement of bottom sediments. Detailed observations currently are being made near the river mouth, at the edge of the river plume, and of water and sediment movement near bottom. Coordination is maintained with pertinent ONR, NSF, ESSA, USGS, other AEC projects and with local Pacific coast groups, including Canadian.

SUPPORTED BY U.S. Atomic Energy Commission

## 2C. GENERAL WATER MOTION

### 2.0066, UNSTEADY FLOW AND SALINE INTRUSION IN ESTUARIES

R.A. BALTZER, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

It is of fundamental importance to recognize that flow in natural channels is basically unsteady flow. To be sure, the degree of its unsteadiness is often of such minor significance that, with sound reason, such flow can be assumed to be steady flow,

thereby taking advantage of greatly simplified analytic representation. Nevertheless, proper and thorough understanding of the mechanics of unsteady flow is important per se in determining the discharge of regulated streams, in flood routing, in determining flows in tidal reaches of homogeneous density, and, in fact, in any situation where open-channel flow cannot be assumed to be steady flow. Moreover, an understanding of the mechanics of unsteady flow is fundamental to improving the understanding of saline intrusion and diffusion in estuaries.

The ultimate objective of this investigation is the development of mathematical models representing unsteady open-channel flow, particularly as associated with estuarine channels. These models, hopefully, could then be used to predict flow using certain field obtained parameters -- to determine such quantities as outflow, saline intrusion, and effects of channel characteristics upon flow.

A thorough appraisal of present knowledge of unsteady, open-channel flow is being conducted, including categorization of flow types and their required mathematical representation. Mathematical models will be derived and evaluated utilizing various solution techniques employing both analog and high-speed digital computers. Selected field data will be employed in the evaluation process.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

### 2.0067, HYDROLOGY OF UPPER OLD TAMPA BAY, FLORIDA

J.A. MANN, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Florida.

Purpose: To provide data for evaluating the hydrological effects of conversion of the bay into a fresh water lake and information by which to judge the feasibility of similar plans in other areas of the State.

Methods: The study will include the area of the proposed lake and an additional 25 to 35 square miles of land adjacent to the lake in Hillsborough and Pinellas Counties. The quantity and quality of surface and ground-water inflow into the bay will be determined. Continuous conductivity and stage gages will be installed on the lake and the bay, and on selected wells in the area to determine the degree of interconnection between the aquifers and the fresh water lake. Conductivity traverses will be made of the upper part of the bay, supplemented by sampling sites, to determine ground-water discharge into the bay. An evaluation will be made of existing geologic and hydrologic data to determine the relation between changes in water quality and ground-water storage. The areal extent, thickness, and permeability of clay beds underlying much of the area will be determined. The fresh water-salt water interface will be monitored continuously.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey Florida State Government

### 2.0068, STUDY OF LOW FREQUENCY SURFACE WAVES IN THE PACIFIC OCEAN

G.W. GROVES, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

Movement of water in the ocean is related to vertical movement of the sea surface, but in a way which is not yet clear. As soon as a relation is established, it will be possible to use tide gauge records to study historical variations in oceanic water movement and their long-term statistical properties. The object of this present work is to study movement of the sea surface and to try to account for the observed activity in terms of local weather, planetary waves, turbulence, etc. Long series of tide-gauge and weather data at Pacific Islands will be used. Cross spectra and other statistical properties of sea level and weather at one location, as well as at different locations will be studied. Existing theories, especially the planetary wave theories of Longuet-Higgins, will be found compatible or incompatible with the results.

SUPPORTED BY U.S. National Science Foundation

## 2. WATER MOTION

### 2.0069, OCEAN KINEMATICS DYNAMICS

*D.W. PRITCHARD*, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218 (NONR)

The purpose of this study are: (1) to measure the turbulent velocities in estuaries and coastal waters corresponding to eddy scales of the order of centimeters to 100 meters (2) to determine the statistical character of the turbulent velocity fluctuation in this scale range; (3) compare turbulent velocity spectra with theory; and (4) determine influences of boundaries, stability and wave induced motion on velocity spectra in this scale range. During the coming year, analyses of data from a field program in June 1967 will be completed and a field program in a Chesapeake Bay tributary will be undertaken to study spatial coherence and boundary effects upon turbulent eddies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0070, THEORY OF LARGE-SCALE ATMOSPHERIC AND OCEANIC PROCESSES

*J.G. CHARNEY*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

The objective of this work is to continue to apply analytic, computational and experimental methods to the study of a large-scale atmospheric and oceanic processes with the intent of incorporating these methods into mathematical models of the general circulation.

The work is subdivided into several parts: (1) tropical circulations - includes the development of a two-level numerical model for studying the symmetric Hadley ITC circulation and its interaction with asymmetric wave-circulation at higher latitudes, problems of the growth of disturbances in the ITC, and the relation of cumulus convection to the large scale field of convergence in the boundary layer; (2) equatorial jets - includes work on a theory of combined wind-driven, thermohaline equatorial undercurrent in a baroclinic ocean and numerical integration to obtain explicit solutions; (3) wave propagation in ocean and atmosphere - includes theoretical and observational work on inertial oscillations in the ocean, the manner in which large-scale eddy motion in mid-latitudes arising from baroclinic instability might propagate to low latitudes, and a check on predicted  $v$  spectra in the tropics with computations of  $v$  spectra from observations; (4) mathematical problems in numerical weather prediction - includes programming basic numerical prediction barotropic and baroclinic models for use in several types of numerical work including short-range prediction and the development of an objective analysis scheme; and (5) miscellaneous - includes the development of a numerical model to study the circulations produced in polar seas by the freezing of surface waters and work on mechanically and thermally produced symmetric circulations in a spherical annulus.

SUPPORTED BY U.S. National Science Foundation

### 2.0071, OCEAN DYNAMICS EXPERIMENTS

*N.P. FOFONOFF*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

This is primarily a program of field observations and experiments. Its objective is a better understanding of the kinematics and dynamics of internal motions of both surface and deep waters. Concomitant development of instrumentation for time series measurements of velocity and thermal structure is necessary. Specific characteristics being studied are the frequency spectra of mechanical energy and their spatial distributions. Operational facilities include ships, moored buoy arrays and neutrally-buoyant floats as well as shore side computer, shop and office facilities. Direct measurements of time series of velocity and temperature are made by specialized internally recording packages. To date measurement sites have been limited to the western North Atlantic.

This study is expected to provide improved understanding of the variability of the environment. Improved knowledge of internal motions in the sea will have an impact on the planning and execution of subsurface rescue, recovery and assistance missions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0072, OCEAN DYNAMICS EXPERIMENTS

*N.P. FOFONOFF*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The objective is to gain an understanding of the ocean as a dynamic system in all of its complexity. This is being pursued through time series measurements of the spectra of horizontal kinetic energy and associated fluctuations in the internal temperature field. The program for the first six months of 1968 is intended to carry out a sequence of steps which are necessary in order to reach the long-term goals. In doing so, the proposal departs from those of recent years. The commitment to a program of systematic measurements at particular sites has been temporarily shelved. In its place, a flexible program giving first priority to studies aimed at improving the performance of moorings and instruments has been substituted. As soon as a better capability for retrieval of moorings is achieved, it is proposed to return to a program whose main emphasis is scientific.

This study is expected to provide major improvement in our understanding of kinetics and dynamics of the ocean which will have an impact on the design of high speed deep running vehicles of the future. It also provides understanding of the variability of the environment.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0073, STUDIES IN THE INDIAN OCEAN

*A.R. MILLER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The objectives are: (1) to process and analyze data collected from field work in the Indian Ocean during the International Indian Ocean Expedition with respect to problems of physical oceanography; (2) to determine the circulation of the Western Indian Ocean in whole and in its parts, from the data at hand; (3) to make use of and extend the capabilities of computer techniques insofar as they are related to the general problem of Indian Ocean circulation.

The general problem is to determine the effects of the monsoon system on the circulations. These effects are interactive. Consequently, the various phenomena observed appear to be closely related seasonally and causally. Transport losses, for instance, indicate significant transfers of moisture to the meteorological environment. Observed strong upwellings, while associated with coastal regions, are related to the westward intensification current. This current, in turn, is continuous with a major system south of the equator. The changing monsoon, in part, may be considered a controlling element over the general circulation and, in part, a major driving force. Peripheral seas provide a deep circulation whose effects may also be seasonal in character.

Two major cruises of ATLANTIS II to the Indian Ocean have provided data for this study. These will be combined with data obtained by other research vessels such as the DISCOVERY, METEOR, DIAMANTINA and KISTNA. Data will be shared with other participants of the Expedition as they are processed and become available.

SUPPORTED BY U.S. National Science Foundation

### 2.0074, GREAT LAKES RESEARCH - HARBOR CURRENTS

*J.G. HOUSLEY*, U.S. Army, Lake Survey, Detroit, Michigan 48226

Objective is to acquire data on winds, currents, waves, water-level fluctuations, atmospheric pressure variations, and lake currents in the vicinity of harbors in order to determine their effect on currents in harbors, and pollution hazards engendered by the lack of currents. Mathematical equations or models will be derived relating currents in harbors with their causative forces and harbor geometry. Flushing rates will be established. The results are applicable to the design or redesign of new and existing harbors, including approach channels.

Currents were measured: 1964 in Calumet, Racine, Muskegon, and Sturgeon Bay harbors; 1965 in Little Lake, Fairport, and Buffalo harbors; and 1966 in Harbor Beach and Toledo harbors. Data and analysis of currents and associated variables in Little Lake Harbor, Lake Superior, was published in 1966. During FY 69 analysis of the data will be continued, and preparation of reports for the various harbors will be continued.

## 2. WATER MOTION

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0075, FLOW AND SALINITY IN THE HUDSON ESTUARY, NEW YORK

*M.W. BUSBY*, U.S. Dept. of Interior, Water Resources Division, Albany, New York 12201

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New York.

Purpose: To define the physical and chemical characteristics of the water in the estuary in order to provide a basis for management of this resource.

Method: River stage at each end of a reach (Poughkeepsie to Clinton) is continuously recorded. These time-synchronized stages are used with the power series method developed by Baltzer and Lai to compute tidal volumes. Water conductivity and temperature are continuously recorded at Poughkeepsie, Beacon, Peekskill and Peirmont. The conductivity data (a measure of salinity) will be related to tidal volume and movement and to fresh-water inflow as measured by several gaging stations on tributaries to the estuary.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey  
New York State Government

### 2.0076, PHYSICAL OCEANOGRAPHY IN OREGON SHELF AND SLOPE WATERS

*J.G. PATULIO*, Oregon State University, Graduate School, Corvallis, Oregon 97331

Study of the dynamics and the physical properties of the water over the continental shelf and slope off Oregon will be continued. Competence in using moored recording current meters and thermographs on the continental shelf and in the analysis of the time-series obtained has been acquired during the past two years.

It is proposed that the measurement program on the shelf be continued and expanded to allow 3-dimensional arrays of instrument strings to be used. This expanded program will allow determinations of the spatial scale of the upwelling phenomenon, temperature inversions, inertial current flow, etc. The static and the dynamic stabilities which influence mixing will be studied, particularly in the region of the temperature inversion. It is further proposed to extend the measurement program offshore to study the water above the continental slope. The continental shelf and slope waters are dynamically interesting because the upwelled water moving offshore meets oceanic water to form a front. The slope region is also where we expect the subsurface poleward flow that many workers think characteristic of a coastal upwelling region.

The longer time-series records will allow investigation of the response of the coastal regime to longer period atmospheric systems. Detailed descriptive statistical analyses will be made of all data. The feasibility of prediction will be studied. Construction of a numerical model for prediction will be made based on the various transfer functions obtained from the time-series measurements.

SUPPORTED BY U.S. National Science Foundation

## 2D. TIDES-SEA LEVELS-SEA STATES

### 2.0077, GRAVITY AND EARTH TIDES

*L.B. SLICHTER*, Univ. of California, Inst. of Geophys. & Pla. Phys., Los Angeles - U.C.L.A., California 90024

Attempts to determine the difference, in amplitude and phase angle, between observed and theoretical earth tides will be made. Measurements of the long-period fortnightly tide and the earth's free vibrations will be obtained in Antarctica where undesirable noise from perturbations in the earth's rotation is minimal.

This research is of basic importance in determining (1) the physical nature of the materials forming the solid earth, and (2) the response of the solid earth to tidal forces. Such information has direct bearing on seismic wave propagation, tides in the open ocean, and the deformation of continental margins by ocean tides.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0078, INTERRELATIONS WITHIN THE PHYSICAL ENVIRONMENT

*J.F. SAUR*, U.S. Dept. of Interior, Biological Laboratory, Palo Alto - Stanford, California

The ultimate objective of the Ocean Research Program is to attain the capability of predicting the abundance and distribution of commercial fishes and thereby increase the efficiency of their harvest. This requires not only information on the state of oceanographic conditions, but also on the physical processes that bring about changes of the state of conditions as they occur with the passage of time. The interacting processes involved in a chain of events will determine the magnitude, time lags and persistence, all of which are pertinent to prediction. Knowledge of the processes leading to the event will also provide insight as to their effect on the biotic community supporting the fish population. For instance, the temperature of a region may be changed either by incursion of a different water mass or by an alteration of heat exchange across the air-sea interface. In the one case a new plankton community will be brought into the region and in the other a new set of conditions would be imposed on plankton community already populating the region.

The objectives of this project are to describe and to reach an understanding of the nature of the interrelationships occurring between parameters of the physical environment, that is, the magnitude and duration of changes, the time lags between changes in the parameters, and the interdependence between parameters. Primary effort under the project at this time is a study of variations of monthly mean sea levels and their relation to atmospheric conditions and density structure of the ocean.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 2.0079, A GLOBAL DIRECTORY OF TIDAL CONSTANTS

*M.C. HENDERSHOTT*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

All available tidal constants derived from observations at coastal and island stations are being collected into an updateable directory written on magnetic tape from which the constants over an arbitrary coastal or island arc may be extracted in the form needed in constructing cotidal maps.

SUPPORTED BY Alfred P. Sloan Foundation

### 2.0080, OCEAN WAVES AND TIDES

*W.H. MUNK*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The objective of this investigation is to study tides in the open ocean and concurrently, temperature variations and water motion near the sea bed. The program includes the development of instrumentation and field measurements. During the coming year, a field experiment will be conducted to determine the horizontal coherence of tidal currents and long waves immediately above the bottom in deep water. The thermal and velocity structure of the benthic boundary layer also will be investigated and methods for analyzing time series will be improved.

The Navy is embarked upon a deep ocean technology program designed to improve man's capability to work and install equipment on the ocean floor. In addition, sound propagation is affected by physical variations in the deep ocean waters. This effort will provide knowledge of the variations and causes of such variations pertinent to these problems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0081, STUDIES OF BAROCLINIC TIDAL MOTIONS ON THE CONTINENTAL SHELF OF THE EASTERN UNITED STATES

*P.P. NIILER*, Nova University, Graduate School, Fort Lauderdale, Florida

Large baroclinic tidal motions occur in the Florida Straits and there is evidence for their existence also on the Blake Plateau. It is proposed to carry out a theoretical and experimental analysis to explain their nature and cause. The theories will be related to existing field measurements and new experiments will be designed to test the theories in a critical manner.

## 2. WATER MOTION

SUPPORTED BY U.S. National Science Foundation

### 2.0082, THE NET EFFECT OF WIND ON RECREATIONAL TIDAL STREAMS IN FLORIDA

D.H. MOREAU, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

Wind stresses acting upon the surface of these shallow tidal rivers and their embayments along portions of the Gulf coast of Florida at times other than during storms can bring about water level changes as great as those resulting from the periodic tide producing forces. The development of procedures to determine the net effect of wind and astronomical tides upon water levels in these tidal rivers is becoming increasingly important with respect to their influence upon recreational use of the river and upon the aquatic environment of the rivers and their estuaries.

The basic data for this correlation study will be that which has been recorded at Cedar Key, Florida for the period July 1, 1963 through June 30, 1964.

It is proposed that the data be subjected to a time-series analysis consisting of the resolution of the data into two components: (1) an oscillatory series representing astronomical tidal action, and (2) a residual series representing the effect of wind and possibly the interaction of wind and astronomical tidal action.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Florida

### 2.0083, SPECTRAL ANALYSIS OF TIDAL CURRENTS

V. GRAEFE, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822

Current data that had been collected under the direction of K. Wyrski near the Hawaiian Islands were analyzed to determine the direction from which the diurnal and semidiurnal tides approach Hawaii. Fifteen series of current data, each covering a period of three to four weeks, had been obtained at ten locations near the Hawaiian Islands, and two series near Palmyra Island. The data of each series were first subjected to a linear filter that rejected all frequencies lower than 1 cpd or higher than 2 cpd, and then a Fourier analysis was performed. The diurnal and semidiurnal Fourier components were used to compute idealized current ellipses for the two frequencies, and the phase differences between the Fourier components of the current and the corresponding Fourier components of the sea level were also determined.

The tentative results of this study are as follows for the Hawaiian Islands: (1) the diurnal tide approaches the islands from a northeasterly direction; (2) the semidiurnal tide from a southwesterly direction. The general flow pattern of the tidal currents between the islands can be determined with a fair degree of accuracy; at certain times, however, the pattern seems to be widely distorted, probably by superimposed long-period currents (perhaps eddies caused by the North Equatorial current).

The results for Palmyra are inconclusive, probably because various diurnal and semidiurnal tidal waves, from different directions, arrive with slightly different frequencies at Palmyra. The available time series are too short to permit discrimination between the various diurnal or semidiurnal constituents, hence the method will give conclusive results only if all major diurnal and all major semidiurnal waves arrive from approximately the same direction.

SUPPORTED BY University of Hawaii

### 2.0084, USE OF TIDAL POWER AND OTHER OCEAN ENERGY SOURCES

R.H. CHARLIER, Northeastern Ill. State Coll., Graduate School, Chicago, Illinois 60625

Survey all likeable sites for harnessing tidal power. Establish feasibility (engineering, financial costs, productivity, inclusion in national grid, consumers market) of various geographical locations. Examine potential of other energy sources from ocean.

Compile comprehensive bibliography, with abstracts, of publications dealing with the tapping of energy resources from the ocean.

\*Only support received was a French Francs \$500 grant for library research from the Institut Oceanographique de Monaco (J. Y. Cousteau, Director) in May 1968.

SUPPORTED BY No Formal Support Reported

### 2.0085, LONG-PERIOD WAVES

H.M. STOMMEL, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139 (NONR)

This is a field operation to be carried out near Bermuda. Using newly available differential pressure sensing devices mounted on bottom, it is expected that instantaneous sea level will be resolvable to better than one centimeter at depths exceeding 3000 meters. Bottom-mounting of arrays in relatively shallow water should yield spatial information about propagating periodic surface disturbances of periods less than the semi-diurnal tidal period. Statistical techniques should permit amplitude resolution to better than one millimeter. Immediate goals include in-house sensor evaluation, development of suitable control and recording equipment, packaging, and field testing.

Understanding, based on field measurements, of the spatial distribution and frequency of occurrence of propagating long-period surface fluctuations is fundamental to our knowledge of variability in the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0086, GREAT LAKES RESEARCH - WATER-LEVEL DISTURBANCES

J.G. HOUSLEY, U.S. Army, Lake Survey, Detroit, Michigan 48226

Water-level disturbances are caused by various forces, including astronomical tides, wind tides, surges, and seiches. Research investigates the formation of these water-level disturbances, their patterns and distribution over the lakes, and their effects on water levels in harbors and in rivers. The derived mathematical models of water motion and its relationship with causative forces are used to develop methods of forecasting dangerous long-period waves and currents, and changes in depths and quantities of water.

A set of 16 water-level recorders was in operation on Lake Michigan in 1964. The data have been reduced, and spectral analysis is in progress. Data from 22 water-level gages in Lake Erie will be used to investigate three-dimensional oscillations of Lake Erie in FY 69.

A contract for theoretical investigation of three-dimensional seiches in Lake Erie is in progress.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0087, TIDAL FLOWS IN RIVERS AND HARBORS

J.B. TIFFANY, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi  
SCHULTZ

The committee known as the Committee on Tidal Hydraulic has been established consisting of civilian employees in various Corps of Engineers Division Offices, District offices, and laboratories who are familiar with tidal theories and tidal problems. The objectives of the Committee are to recommend programs of study, investigation, and research designed to provide the knowledge necessary to arrive at adequate solutions for the engineering problems associated with tidal phenomena, and to render such consultations and advice on specific problems in tidal waterways as may be requested by various offices of the Corps of Engineers.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0088, TIDAL DISCHARGE RESEARCH, NEW JERSEY

A.C. LENDO, U.S. Dept. of Interior, Water Resources Division, Trenton, New Jersey

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New Jersey, the Corps of Engineers, and the Federal Water Pollution Control Administration.

Purpose: To develop and improve techniques for the collection of tidal stage, discharge, quality of water, and sediment data.

Methods: Synchronous records of tidal stage have been collected by digital recorders at estuary stations, computer programs are used to compile these records. Discharge equations have also been programmed and calibration has been based on observed

## 2. WATER MOTION

discharge by diagraphs and other parameters by field measurement. Suspended sediment, particle-size, and other water-quality information is collected during discharge calibration measurements to define changes during tidal cycles.

### 2.0089, DETERMINATION OF TIDES IN THE REAL OCEANS

*C.L. PEKERIS, Amer. Comm. For Weizmann Inst., New York, New York*

The Laplace tidal equations will be solved for the semidiurnal M2 tide in the real world oceans. Account will be taken of the real coastline and of the variable depth in the real world oceans. This work will be preceded by numerical solutions for the tides in simplified models of world oceans. Computational grids down to 1 degree in size will be used.

**SUPPORTED BY** U.S. National Science Foundation

### 2.0090, THEORETICAL STUDY OF OCEAN TIDES FOR PURPOSES OF WORLDWIDE PREDICTION

*C.L. PEKERIS, Amer. Comm. For Weizmann Inst., New York, New York (N00014-66-C0080)*

Objective: It is important that the Navy be able to predict tides on a worldwide basis, not only in the deep sea but near shore as well, since tidal oscillations affect Naval operations. This research is aimed at a numerical solution of the Laplace equation describing tidal motion for the purpose of predicting tides anywhere in the world.

Approach: The solution of this problem was described by the late Dr. John Von Neumann as the greatest challenge for applied mathematicians in our generation. The solution is being obtained by a numerical process using a large digital computer. The effect of the main lunar or M2 tide is currently under study. Outlines of the world's oceans are being approximated in 1 degree segments. Average ocean depths over 1 degree grid squares are included. As the technique improves more complex conditions are being introduced. For example, water depths over continental shelves are being more accurately described; enclosed water masses such as the Mediterranean will be introduced; more accurate friction laws and even the yielding of the solid earth will be included.

**SUPPORTED BY** U.S. Dept. of Defense - Navy

### 2.0091, THE OPTICAL PROPERTIES OF SEA WATER AND THEIR USE IN OCEANOGRAPHIC RESEARCH & DEVELOPMENT

*G. BEARDSLEY, Oregon State University, Graduate School, Corvallis, Oregon 97331*

Objective. The effective use of all optical instrument systems, including the human eye, within the marine environment requires a knowledge of the optical properties of sea water and an understanding of how, where, and to what extent variations in these properties will affect system performance. In support of this requirement, this research is investigating both theoretically and experimentally the optical properties of sea water, their variability and the resultant effects on artificial and natural underwater light fields. As a part of this, the interrelationships between optical properties and other physical oceanographic parameters such as salinity, temperature, and suspended particles are being studied with the view of developing and applying new optical techniques to water mass identification and delineation.

Approach. This research involves coordinated field observations, laboratory measurements, and theoretical analysis of the scattering and absorption of light by dissolved and suspended material in sea water. Theoretical models of light fields in sea water are being refined as new data becomes available from field and laboratory measurements. Continuing optical scattering measurements on normal hydrographic cruises off of Newport, Oregon, are presently being used to study local and seasonal variations in optical properties. These data will provide the basis

for investigating correlations between fluctuations in scattering and the seasonal variability of the oceanographic environment off the coast of Oregon.

**SUPPORTED BY** U.S. Dept. of Defense - Navy

### 2.0092, DIRECT AND INDIRECT DETERMINATION OF OCEANIC WATER MASS MOTION ON ALL SCALES

*J. PATTULLO, Oregon State University, Graduate School, Corvallis, Oregon 97331*

Objective: The efficiency of search and rescue, underwater construction and other operations can be strongly influenced by the character and motion of water masses in the operating area. This research seeks to know and understand water mass movements in the ocean from small-scale and short-lived turbulence to large-scale and steady-state ocean currents in the NE Pacific. Such knowledge and understanding is an important step (i) in learning to predict conditions at a given time and place, and (ii) in the future development of new operational systems, vehicles, or platforms.

Approach: Ships and buoys will be used to continue a detailed description of temperature, salinity, and current conditions and their variations with time off the NW coast of the U. S. Current measurements will be obtained from bottom moored current meters, from dye diffusion field experiments, and from tracking drogues which drift with the currents. The collection and analysis of these data will be improved by the development of an increased hydrographic capability and by the use of modern techniques of signal analysis and statistics. In addition, free-diving deep current meters and a newly designed spar buoy for collecting marine meteorological data will be developed and tested.

**SUPPORTED BY** U.S. Dept. of Defense - Navy

## 2E. WAVE DYNAMICS

### 2.0093, DYNAMICS OF INTERNAL WAVES AND TURBULENCE IN THE THERMOCLINE

*G.M. CORCOS, Univ. of California, School of Engineering, Berkeley, California 94720*

To elucidate the dynamics of the processes in the ocean which result in the transfer of the energy originating in larger scale motion to smaller scale agitation and which intensify and propagate vertically the gradients of salinity and of density found in thermoclines.

Propose to start with the study of elementary flows related to these processes and to carry out these studies by creating stratified flows in a heated tunnel.

A satisfactory scheme for producing a density stratification qualitatively typical of a thermocline and a shear distribution typical of a shear zone between two currents on either side of thermocline has been devised for which the Richardson number range is appropriate for the study of infinitesimal and finite instabilities.

**SUPPORTED BY** U.S. Dept. of Commerce - E.S.S.A.

### 2.0094, WATER WAVE DOCUMENTATION

*J.E. MCNIEL, General Motors Corporation, Goleta, California 93017*

This contract requires AC-DRL to perform oceanographic research tasks as specified. The AEC sent to AC-DRL in FY 1968 45 Data Logging Systems (individual units for measuring wave heights) with their associated computer and data reduction system for overhaul, storage and maintenance. At some future time AC-DRL may be called upon to emplace these units at various Pacific Ocean locations and to operate the data recording network. In April and May 1968 12 of these units were emplaced off Catalina Island as a practise operation. In June several practise emplantments of the large buoy and anchor were made from a Navy ship in 4000 feet of water using special launching gear developed at AC-DRL.

**SUPPORTED BY** U.S. Atomic Energy Commission

## 2. WATER MOTION

### 2.0095, GENERATION, PROPAGATION, AND COASTAL EFFECTS OF TSUNAMIS

V.A. VANONI, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109

This research will be concerned with the experimental and theoretical study of the generation, propagation, amplification of tsunamis (earthquake generated sea waves) and resulting effects on the coastline. The program will involve theoretical and experimental studies which will be concurrent and lend support to each other. Specific areas to be initially examined are:

Experimental - (a) The propagation of tsunamis and the resultant run-up on beaches of small slope and on shore-structures with steep faces. (b) The transient response of harbors to tsunamis.

Theoretical - (a) Generation of tsunamis due to displacements of the ocean bottom for several typical modes of the bottom motion. (b) Propagation of two- and three-dimensional tsunamis through an ocean of arbitrary bottom configuration. (c) Steepening of waves in water of decreasing depth and width variations, including the final stage of run-up on beaches. (d) The wave forces experienced by bodies of simple shapes, both floating and submerged, as well as fixed obstacles.

SUPPORTED BY U.S. National Science Foundation

### 2.0096, INTERNAL WAVE RESEARCH

O.S. LEE, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine those environmental factors affecting the acoustical uses of the ocean; to observe, define and develop theory to predict the effects of variability in properties of the surface layers affecting sound speed, water motion (orbital, tidal turbulence, internal waves) and other dynamic processes; to investigate experimental developments and theory of internal waves in the ocean.

Approach: Make current reviews of progress in internal wave research; establish criteria for experimentation and analyze data in the light of wave theory and plausible models of the medium; record time-series observations at fixed points in space and at different geographical locations by use of a retrieveable buoyed data system; invite capable scientists to participate in analyses of data.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0097, WAVES

W. KRAUSS, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

This investigation is intended to study the nonlinear interaction of surface and internal waves and the effect of this process upon oceanic temperature structure. An experiment is to be undertaken to verify a previously developed theory of nonlinear interaction. A theoretical study also is to be undertaken to explain the existence of domes observed in isothermal surfaces by thermistor chain data in the North Pacific.

This is part of the Navy's oceanography program aimed at obtaining fundamental knowledge of the oceanic environment for the needs of naval forces and should provide information that will contribute to the development of thermal structure and environmental forecasts.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0098, WAVE AND SURGE ACTION STUDY FOR LOS ANGELES-LONG BEACH HARBORS

B.W. WILSON, Science Engineering Assoc. Inc, San Marino, California

This study reviews the phenomenon of surge action in San Pedro Bay, California, and in the basins of Los Angeles and Long Beach Harbors. It considers all observations, measurements and analyses made in previous studies and supplements them with new analyses of both past and recent wave recordings. In general these analyses identify the frequencies and amplitudes of long period wave activity. Ship behavior and surge damage to wharves and shipping are correlated with the disturbances. The natural oscillating characteristics (eigen frequencies and mode shapes) of the

continental shelf and oceanic basins offshore, of San Pedro Bay within the break-water and of the harbor basins are determined by solution of hydrodynamic equations for both mathematical and semi-exact numerical models. These procedures are extended to proposed new harbor basins. Necessary requirements of hydraulic models to simulate the conditions are considered. Finally, the report deals with an instrumentation system design for securing additional field data on long wave heights and currents throughout the harbors.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0099, INTERNAL WAVE STUDY

C.A. GRISCOM, General Dynamics Corporation, Groton, Connecticut

This empirical study will investigate the relationships between internal waves and tidal motions over a continental shelf and the relationship of such motions to the temperature structure. Analyses will be made of existing data from an area southeast of Long Island collected by NavOceanO in 1959 and 1960. This work is expected to yield information on: (1) tidal motions and non-tidal drift at Texas Tower NO. 4; (2) tidal phase lag between Texas Tower No. inshore station, the Scotland Lightship, and (3) relationship between state of tide and variance (including internal wave effects) in the temperature structure observed at Texas Tower No. 4.

The results from this study should contribute to the understanding of tidal and internal wave influences upon the thermal structure and, in turn, sound conditions in shelf areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0100, MECHANICS OF WAVE ACTION IN DEEP AND SHALLOW WATER

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Studies are made in both laboratory and field to determine the characteristics of all types of waves (tsunamis, standing waves, harbor surges, etc., as well as normal ocean gravity waves), and the change in these characteristics as the waves approach shore over a shoaling bottom of varied characteristics, and finally break. Study also involves such phenomena as wave set-up and longshore currents which are generated by wave action. The mechanics and kinematics of these waves are also studied. Breakers and surf, and the reforming of waves after breaking are included in this study.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0101, WAVE RECORDING AND ANALYSIS

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

A cooperative surf observation program with U. S. Coast Guard collects visual data on surf height, period, direction, and type of breaker at 16 U. S. Coast Guard stations. Statistical compilation is planned.

Recorded wave data are also collected at a number of locations along U. S. Coasts, and an automated system is under development.

Work is on a wave direction gage using a rotating sonic current meter as the indicator and a damped Rayleigh disc is underway.

Pressure records are also planned for obtention at a station at 70' and 30' depths directly under the present relay type gage to obtain data on changes in pressure as related to the depth of the gage and period of the waves.

Standardized analytical methods for engineering use are being developed. New types of gages (such as radar, sonar, and laser) are being studied.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0102, FUNDAMENTAL PROBLEMS IN HYDRODYNAMICS

G. KULIN, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

## 2. WATER MOTION

To conduct investigations on problems such as (1) Internal waves produced by a body of revolution moving in density-stratified liquid to a source or sink impulse; (2) Interaction between long waves and superposed short waves; (3) Damping of shallow-water waves--summary of available information; and (4) Mixing effect of raindrop impingement on a water surface. Problems (1), (2) and (4) are primarily experimental.

Quantitative information on problem (3) already exists but there is considerable need for collection, re-analysis and re-evaluation. Problem (1) has specific application to underwater ordnance and atmospheric waves; problems (2) and (3) can be applied to wave and surf forecasts; and problem (4) is useful in several areas, particularly reservoir hydraulics. This project continues NBS work on the development and application of various measurement techniques to the solution of important hydrodynamic problems.

Problem (1) involves the measurement of internal waves generated by moving bodies and other impulses. Additionally, it is necessary to develop the corresponding theory, which has proved difficult, particularly in the case of problem (1). In problem (2), theory is available in the literature, but measurements on complex-wave behavior under controlled conditions have never been made. Problem (3) involves extensive literature search and information evaluation, while problem (4) will involve primarily photographic observations along with some analytical treatment.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 2.0103, WAVE GENERATION

*P.S. DELEONIBUS*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

Objective: To construct a turbulent wind wave generation model based on simultaneous measurements of surface shearing stresses and the directional wave spectrum. Such simultaneous measurements will attempt to provide experimental background required to reconcile proposed wave generation theories with observed turbulent transfer of momentum.

Approach: Surface shearing stresses and wind profiles will be measured from an outriggered probe at Argus Island Tower by 'eddy correlation' and will be augmented by an AGOR ship estimating stress downwind from the tower by 'dissipation' techniques. Directional wave spectra will be recovered from surface wave profile data obtained by 'star flight' patterns flown over the sea surface using an airborne wave profiling device. All three component measurements will be made simultaneously during steady state, high wave conditions, preferably after the passage of a well-developed cold front. Wind stress estimates through 'dissipation' will be used during BOMEX.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0104, NUMERICAL WAVE PREDICTION

*P.S. DELEONIBUS*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

Objective: Develop deep and shallow water wave models to provide automatic forecasts of wave height and directional spectrum in the North Atlantic, North Pacific and for the South China Sea.

Approach: Recent advances in numerical deep water wave prediction technique indicate a militarily useful extension of these models into shallow water and coastal regions. Two approaches are being developed simultaneously. A linear model developed by NYU and a non-linear model which employs radiative transfer equations are being extended into shallow water. Wave sensors for use aboard ships, aircraft, towers, and in shallow water areas are being developed for use in verifying these models. The sensors and techniques would also be used operationally to input wave data into forecasting models.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0105, OCEAN WIND WAVE GENERATION AND DISSIPATION

*T.P. BARNETT*, Westinghouse Electric Corp., Washington, District of Columbia (N00014-67-C-0288)

This study is part of a cooperative field experiment to be carried out in the North Sea during August and September of 1968. The groups involved in the experiment include National Institute of Oceanography in England and the Univ. of Kiel, German Sea-Weather Service and German Hydrographic Office in Germany. The experimental goals are to investigate: (1) the growth of wind waves; (2) interaction between wave-atmospheric fields; (3) processes involved in establishing a fully-developed wave spectrum; and (4) the loss of wave energy due to bottom friction. Measurements of atmospheric parameters and two dimensional wave spectra will be made with aid of buoys, ships and bottom-mounted sensors. Specific objectives of this work unit include obtaining measurements of wave spectra for different wind speeds, participation in overall analysis and interpretation, and documentation of the experiment and results.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0106, OCEAN WAVES AND STRUCTURE

*R.D. GAUL*, Westinghouse Electric Corp., Washington, District of Columbia (N00014-67-C-0288)

This task involves the following investigations: (1) a small field program designed to intercompare ocean wave spectra measured by the ONR telemetering oceanographic buoy and prototype free floating wave meter; (2) analysis of data collected by the principal investigator during the past five years at Texas A&M under ONR contract. Specifically, the data will be analyzed for tidal motions over the continental margin of the Northeast Gulf of Mexico and to determine the characteristics of oceanic stratification from continuous temperature and salinity profiles.

A thorough knowledge of surface waves on the ocean is important to Naval operations. The internal structure of the ocean volume has important implications to the propagation of underwater sound.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0107, WAVE, CURRENT AND STORM SURGE RESPONSE TO EXTREME WIND CONDITIONS

*R.G. DEAN*, Univ. of Florida, School of Engineering, Gainesville, Florida 32601

This research will involve analytical investigations and field measurements to improve the general understanding of effects of extreme wind systems in causing waves, currents and storm surges in the near coastal waters.

The program will include a comparison of measured field quantities with predictions based on realistic numerical models. On the basis of differences between measured and predicted quantities, the relationships governing the generation of waves, currents and storm surges will be refined and re-evaluated by subsequent sets of measurement-prediction tests. Special purpose laboratory investigations may be conducted in an existing wind-wave tank if deemed advisable.

SUPPORTED BY U.S. National Science Foundation

### 2.0108, LONG PERIOD WAVES

*J.A. PURPURA*, Univ. of Florida, School of Engineering, Gainesville, Florida 32601 (NONR)

The purpose of this study is to investigate the penetration into narrow fjords of long period waves, having periods ranging from minutes to hours. It is a cooperative program with the Icelandic Government, which has installed and maintains sea level recorders in Eyafjordur. A selected set of recorded data is to be examined to determine auto-spectra and cross-spectra and the results interpreted hydrodynamically in terms of reflection, transmission, amplification, etc.

These studies are important to shore installations which are subject to storm tides and waves and to damage from tsunamis. An understanding of the effect of harbor shapes and sizes on altering wave shapes and sizes will help in selecting building sites and in predicting storm damage.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 2. WATER MOTION

### 2.0109, WAVE MEASUREMENT IN THE OPEN OCEAN *K. WARSH*, Florida State University, Graduate School, Tallahassee, Florida 32306

Measurement, digitization and magnetic recording of a directional wave spectra in the open ocean from a spar buoy by means of resistance wave wires and accelerometers. The same buoy is also used to measure, digitize and record wind profiles.

SUPPORTED BY Florida State University  
U.S. Dept. of Commerce - E.S.S.A.

### 2.0110, AN ANALYTICAL AND EXPERIMENTAL STUDY OF BED FORMS UNDER WATER WAVES

*M.R. CARSTENS*, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The development of, the geometry of, and the drag exerted by bed forms (dunes) which occur on the sea bed under first-order Stokian waves has been studied experimentally in an oscillatory-flow water tunnel. Three series of runs were performed with a different bed material in each series--0.297 mm glass beads, 0.585 mm Ottawa sand, and 0.185 mm Ottawa sand. Total amplitude of the oscillating water was constant during each run and was varied throughout the range from 0.25 ft. to 3.0 ft. for each series of runs. A final report for Contract DA-49-055-CIVENG-65-1 (Georgia Institute of Technology) was issued in September 1967. Publication as a Technical Memorandum of the Coastal Engineering Research Center, U. S. Army Corps of Engineers is pending.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0111, TSUNAMI RUNUP EXPERIMENTS ON A SCALE MODEL OF OAHU

*W.M. ADAMS*, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822

This research will experimentally determine the relationship between wave height and ramp at the shore to save heights at distances offshore for the entire island periphery under different tsunami approach directions. This data will be compared to theoretical predictions and past records to develop a more accurate forecast system thus ensuring more positive cooperation of the public with authorities in the event of major tsunamis.

SUPPORTED BY U.S. National Science Foundation

### 2.0112, MEASUREMENT OF SURGING IN KUHIO BAY, HILO HAWAII

*W.M. ADAMS*, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822

Pressure gages have been installed at a depth of about 20 feet on pilings of the piers 1 and 2 adjacent to the turning basin in Kuhio Bay. The purpose of this field instrumentation is to permit measurement of the pressure waves for estimating the water motion in the period ranges 8 to 30 second for one gage on pier 2 and period range 3 seconds to 2 minutes at 2 gages under pier 1. These pressure recordings are only made during periods of surging and occasional background control time intervals. Recording is for 12 hour duration on a digital tape transport and, for the high frequency trace, reel time analog chart. The digital records are filtered and played back on a computer facility using IBM 7040, IBM 360 model 50, and IBM 1401. The results of the filtered digital material and analog presentation on a calcomp plotter.

These data are supplied to the Army Corps of Engineers.

Conjunctive study has developed the procedure which predicts the occurrence of surge, as defined by historical notes of the harbor master, and is based on correlation of the harbor master records with meteorological weather maps.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0113, HIGH FREQUENCY WAVES

*L.F. MCGOLDRICK*, Univ. of Chicago, Graduate School, Chicago, Illinois 60637 (N00014-67-A-0285-0002)

This project is concerned with theoretical and experimental investigations of phenomena associated with high frequency

(large wave number) random wave spectra. The work is concentrated on (a) wave spectra at high frequencies; (b) interaction between surface waves and turbulence in the water itself; (c) resonant surface wave interactions resulting in energy transfer; and (d) development and refinement of wave measuring apparatus. During the coming year, experimental measurements of resonant interactions are expected to be completed and spectral measurements of a random high frequency wave system are to be made.

This project is part of the Navy's broad program in oceanography being supported to better understand its operating environment. Knowledge from this project should aid the development of better wave forecasting methods required to support a variety of fleet operations.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0114, AIR/SEA INTERACTION STUDY

*B. KINSMAN*, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218 (NONR)

Research under this task concerns: (1) the generation and growth of wind waves; (b) the interaction of opposing wind waves and swell; (c) convective effects of wave spectrum transformation; (d) the effect of waves on the near surface, vertical wind profile, and (e) the erosion of the thermocline by motion as associated with wind waves. The program during the coming year includes laboratory studies of the processes involved in energy and momentum transfer to short surface waves and the detailed nature of entrainment processes in the turbulent mix layer of the oceans; it also includes the development of instrumentation and data analyses techniques for use in field programs on the study of wind wave generation.

Knowledge of the mechanism of wave generation would permit computation of two dimensional spectra of short crested seas. Forecasting of mixed layer depth would be helped by understanding the mechanisms of thermocline formation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0115, OCEANIC INTERNAL MOTIONS AFFECTING OPERATIONS

*C.I. WUNSCH*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139 (NONR)

This task is directed toward understanding density variations in the oceans and the subsequent effect of those variations on operations. In addition to the benefits derived from a better understanding of effects of internal waves, this work should provide engineering knowledge of motions of deep-sea cable arrays. Such information has direct applicability to many naval missions involving long-term deployment of buoyed cables.

This is principally a field experiment designed to sense and record internal waves in order to obtain a better understanding of the role played by these waves in ocean variability. A fixed horizontal cable array will be deployed at mid-depth near Bermuda. Cable motions will be measured, analyzed, and compared with simulated cable motions obtained by numerical modeling. From this cable, time series measurements of temperature will be made using thermistors; supplementary velocity measurements will be made with internally recording current meters suspended from taut-wire buoy systems. The data will provide a first step in measuring directly the horizontal coherence, directionality and spectral distribution of internal waves. Supporting engineering studies and modeling of internal waves will be carried out.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0116, ISLAND-CURRENT INTERACTIONS

*C.I. WUNSCH*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139 (NONR)

This is a study of large-scale steady or periodic motions of the ocean. It will involve use of the large rotating tank at WHOI for experimental work and the analysis of existing observational field data. Specifically, this study is intended to try to understand the interaction of an island with its environment. The field of motion around an isolated oceanic island is an extremely complicated

## 2. WATER MOTION

function of time undergoing large-amplitude time variations on many scales. The first effort will be to understand how typical of mid-oceanic conditions are those in the vicinity of an island.

This study is intended to gain an understanding of the changes of oceanic structure due to islands, which are, of course, prime operational sites. Such understanding might aid in prediction of the sound propagation field as well as the time changes of major currents in the vicinity of islands.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0117, PROPAGATION AND REFRACTION OF OCEAN WAVES IN NEAR SHORE REGIONS

S.J. JACOBS, Univ. of Michigan, School of Engineering, *Ann Arbor, Michigan* (NONR)

Objective: Predictions of ocean wave conditions are needed by naval forces in the conduct of logistics and salvage and rescue operations in nearshore regions. This theoretical investigation of the study of ocean wave propagation in water of variable depth should further the present knowledge of the modification of ocean waves as they progress from deep water to the shore. Such knowledge should contribute particularly to the improvement of methods for predicting wave conditions in the nearshore regions.

Approach: Mathematical methods will be employed to develop theories to explain the propagation of finite amplitude waves in water of variable depth and also provide a means for calculating the height of waves at any given location and time. A non-linear ray theory is to be synthesized from an improved version of ray theory for variable depth effects and from non-linear mechanics methods used for determining finite amplitude effects. The analytical work is to be supplemented by numerical calculations.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0118, GREAT LAKES RESEARCH - LAKE WAVES

J.G. HOUSLEY, U.S. Army, Lake Survey, *Detroit, Michigan* 48226

The generation, propagation, and decay of waves in the Great Lakes are being investigated and correlated with wind speed and resulting wind stress, wind direction, and lake geometry. The characteristics of waves, including the expected maximum height given locations, will be established; wave climate charts will be prepared; and wave hindcasting methods developed.

Deep-water wave characteristics are being measured at five locations: Eagle Harbor and Whitefish Point on Lake Superior, Point Betsie and Muskegon on Lake Michigan, and Dunkirk on Lake Erie. This program was started in 1964 and will continue through 1971, with subsequent analysis of data.

In FY 69, shallow-water wave characteristics will also be measured at Knife River Harbor, Lake Superior, and Lorain, Lake Erie.

Techniques for wave hindcasting are being developed under contract with the University of Michigan. A report 'Wave Hindcasts vs Recorded Waves' by S. J. Jacobs was published in June 1965; 'Wave Hindcasts vs Recorded Waves Supplement No. 1' by A. L. Cole was published in May 1967. A second contract to apply the developed techniques to the hindcast of waves for Lakes Superior and Huron is in progress.

A contract to develop a sonic wave sensor will be undertaken.

SUPPORTED BY U.S. Dept. of Defense - Army

### 2.0119, NEARSHORE WAVE THEORY

W.J. HINSE, Michigan State University, Graduate School, *East Lansing, Michigan* 48824

Nearshore wave and current energy budgets will be studied through analysis of field measurements and wave tank observations, and construction of theoretical models to express energy transport, flux and dissipation. Field measurements include wave phase velocity, wave angle, longshore energy and mass transport, current profile and sediment movement. These data will be used to test and improve formulas expressing energy conditions and resultant coastal morphology and dynamics.

A better understanding of energy regimes and correlated changes in shore conditions will improve the reliability of predictions of coastal environmental properties.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0120, WHITECAPPING

E.C. MONAHAN, Hobart & William Smith College, Graduate School, *Geneva, New York* 14456

The purpose of this study is to investigate the onset of whitecapping as a function of wind speed, atmospheric stability, and water temperature and determine the growth rate of whitecap concentration as a function of these parameters. During the coming year, an observational program of whitecaps will be conducted in the North Atlantic from research vessels and fixed platforms. The reduction of whitecap photographs and their analysis with respect to observed meteorological conditions is to be undertaken. A laboratory tank experiment simulating salt water whitecaps is to be undertaken to compare salt water and fresh water characteristics.

Knowledge from this basic study of the air-sea interface is expected to further the understanding of the transfer of energy and matter across the interface and also further the development of wave forecasting for a variety of operational needs.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0121, HIGH FREQUENCY OCEAN WAVES

W. MARKS, Oceanics Incorporated, *Hicksville - Plainview, New York* 11803 (NONR)

High frequency wind generated ocean waves are being studied with respect to their role in the generation of wind waves and also radar backscatter characteristics of the sea surface. Their directional spectra are being derived from stereophotographs and correlations are being established between statistics of these waves and of the radar sea return recorded simultaneously by aircraft.

The results from this task should contribute to the improvement of operational wave forecasts.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0122, THEORETICAL STUDIES OF TSUNAMI PROPAGATION

A. CLARK, Univ. of Rochester, School of Engineering, *Rochester, New York* 14627

The object of the work is to learn more about the effects of variable ocean depth on the propagation of tsunamis. The plan of procedure includes a two-fold theoretical attack on the problem: (i) the development and application of a valid statistical theory, and (ii) the detailed calculation of individual scattering events for certain simple bottom topographies. The ultimate aim of much tsunami work is to increase predictive capabilities, especially with regard to wave amplitudes. From this point of view, the significance of the present work would lie in its contribution to an understanding of diffraction of wave energy due to variable depth. The work may also have significance from the point of view of random wave theory, since it appears that present statistical theories will have to be improved if they are to cover the range of parameters of interest in the tsunami problem.

SUPPORTED BY U.S. National Science Foundation

### 2.0123, EXPERIMENTAL STUDY OF THE INTERRELATIONS BETWEEN WIND-WAVE PROPERTIES

G.F. BEARDSLEY, Oregon State University, Graduate School, *Corvallis, Oregon* 97331

A preliminary investigation of the relative importance of turbulence and wave motion as mixing agents will be made in the upper ocean. A secondary outcome of this program will result from the simultaneous measurement of the pressure and velocity fields under a random sea. From these data it is hoped to determine the degree to which these fields and their statistics can be calculated using a knowledge of the surface wave height and linear and second order wave theory.

SUPPORTED BY U.S. National Science Foundation

## 2. WATER MOTION

### 2.0124, AN OPTICAL METHOD OF MEASURING THE FORM OF THE FREE SURFACE OF A FLUID

H. SCHENCK, Univ. of Rhode Island, School of Engineering, Kingston, Rhode Island 02881

This research will deal with the development of a method of studying the speed, form, and character of waves and other disturbances on the surface of a fluid by detecting the angle of refraction of a collimated beam of light at the surface using one or more submerged photocells. It is anticipated that the developed method will have applications in many areas of fluid science including; physical oceanography, theoretical hydrodynamics, ship model testing, stream and river morphology, and other related fields. The theoretical basis for the method is discussed in a July 1957 Optical Society of America Journal, 'On the Focusing of Sunlight by Ocean Waves.'

SUPPORTED BY U.S. National Science Foundation

### 2.0125, FIELD DETECTION AND MEASUREMENT OF INTERNAL WAVES

M. RATTRAY, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: In order to predict the propagation of sound in the ocean, the operational Navy has need of quantitative descriptions of physical processes which affect the density distribution and thereby the sound speed distribution. In support of that need, this research has as its scientific goal the fuller understanding of waves (called internal waves) propagating within the ocean which disturb the density distribution. For internal waves generated by tidal forces near the continental shelf edge and propagating out to sea: (1) the distribution of motions (and thus energy) with depth will be measured, and (2) the adequacy of present theories to predict the propagation of internal waves will be tested.

Approach: Using digital computers to simulate the expected behavior of waves within the ocean the site for a field experiment will be selected. At the locations chosen observations of temperature versus depth will be repeated at closely spaced intervals (order of one minute) for a period of about 15 days duration. These data will be stored and analyzed with the aid of electronic computers. Available analyses techniques should enable the investigators to extract from the temperature variations the associated velocity and energy variations.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 2.0126, THEORETICAL ACOUSTIC-GRAVITY WAVE PROPAGATION

D.G. HARKRIDER, Brown University, Graduate School, Providence, Rhode Island 02912

Objective: Four research projects will be investigated to understand the propagation of acoustic-gravity waves in the atmosphere. The first project will determine the quantitative relations between over-pressure and yield at various source and detector altitudes. Theoretical barograms in the frequency and time domain for a wide range of source yields for various sources and detector altitudes will be calculated. The second project will evaluate the necessity for a more complicated source by comparing the simple-point source to the observed direct wave at close-in distances to a nuclear explosion. The closed form of the green function will enable one to calculate by fourier synthesis the far field pressure pulse generated by nuclear explosions and the direct wave in the region surrounding the source. The third project will investigate the epicenter displacement hypothesis as a source mechanism for some of the detectable air waves associated with seismic events. Surface sources of this type can be used to model volcanic eruptions and sudden vertical surface motion associated with earthquakes and underground nuclear explosions. The fourth project will make use of the previously developed source excitation theory of acoustic-gravity waves to investigate the generation of sea-waves by atmospheric disturbances and the formation of tsunamis by oceanic earthquakes.

SUPPORTED BY U.S. Dept. of Defense - Air Force

## 3. METEOROLOGY

(see Also Environmental Prediction, Chapter 4c)

## 3A. AIR-SEA INTERACTION

(see Also Chapter 2, Water Motion)

### 3.0001, ANALYSIS OF THE MARINE LAYER - A MESO METEOROLOGICAL STUDY

S.R. FRANK, Aerometric Research Foundation, Goleta, California

The project's specific aim is to define and model the Marine Layer of the atmosphere in terms of its diffusion and transport characteristics. In order to do this a systematic network of weather observers has been established in the Santa Barbara Channel Area through the cooperation of Federal, State, and private organizations. Using these observations for basic flow analysis of the area, a program has been established for the determination of heat sources and sinks of the ocean surface. The consideration of surface thermal modification of the overlying Marine Layer plus the distortion of flow due to orographic influences, has resulted in an integrated attack on the problem of potential dispersivity of the atmosphere. The program will involve utilizing a mobile 'turbulence sensor' (a portable tower) with wind and temperature stations, for fine scale determination of turbulence at specific locations during critical meteorological conditions. It is anticipated that use of this 'sensor' will result in quantitative definitions of orographic contributions to turbulence in the Marine Layer.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 3.0002, OCEAN DYNAMICS SEA AIR INTERACTION MODELS-MEDITERRANEAN

T. LAEVASTU, U.S. Navy, Postgraduate School, Monterey, California 93941

To determine those environmental factors affecting acoustical uses of the ocean; to categorize strategic areas into similar acoustical provinces; provide a foundation for medium and long range forecasting, incorporating correct sea-air interaction models which emphasize the dynamics of the surface layers.

Study the sea-air exchange in the Mediterranean in relation to changes in the overlying air masses; to improve computation of exchange and establish physically correct numerical feedback models; investigate synoptic and seasonal behavior of oceanic fronts and their temperature and salinity structure; study the possible similarity of Moroccan and California regions, especially with respect to their response to driving forces (surface wind).

SUPPORTED BY U.S. Dept. of Defense - Navy

### 3.0003, TRANSPORT PROCESSES ACROSS AN AIR-WATER INTERFACE

R.L. STREET, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

The objective of this study is to verify or refute present interface process hypothesis and to discover additional facts about the air-water interface phenomena.

It is proposed to make the following studies: (1) direct measurements of the mass, momentum and energy transfers across an air-water interface; (2) a comparison of measured results with estimates from theoretical and empirical formulae; (3) measurements and analyses of the statistical properties of the fluctuating flow properties in the surface boundary layer; and (4) an attempt to provide new descriptive concepts for the interface transfers as suggested by the above measurements and analyses.

The experimental measurements will be made in the wind, water wave research facility located at Stanford University. The facility is equipped with a centrifugal fan that causes a flow of air over a body of water and a mechanical wave generator.

SUPPORTED BY U.S. National Science Foundation

### 3.0004, OCEAN WAVES

C.S. COX, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

This task is concerned both with surface wind waves and with internal waves and associated causes of temperature variations in the ocean. The relationship between eddy stresses in an overlying

### 3. METEOROLOGY

wind field, the average wind profile, the growth of wind waves and the partition of momentum between waves and currents is being studied in a laboratory wind-wave channel. The study of internal waves concerns the energy distribution according to frequency and also the vertical distribution of this energy. The layered fine scale of temperature structure in the oceans is being examined in order to interpret measurements of temperature fluctuations resulting from internal waves.

Improvements in the theory of wind-wave interaction are expected to contribute to improvements in the prediction of wave conditions. Studies of turbulence (including internal waves) in the ocean contribute directly to understanding time and space variations in sound propagation.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### **3.0005, OCEAN-ATMOSPHERE STUDIES WITH STABLE ISOTOPES AND DISSOLVED GASES**

*H. CRAIG*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This research will cover the following areas of investigation: (1) The formation and mixing of deep and intermediate water masses, using deuterium, oxygen 18, and dissolved gases as additional oceanographic parameters together with salinity and temperature to characterize water masses and mixing process; (2) The exchange of water between the atmosphere and sea, using the variations in deuterium and oxygen 18 content of atmospheric water vapor and surface seawater over the oceans; (3) Experimental studies of the nature of the air-sea interface, based on equilibrium and kinetic isotopic fractionation effects in the transport and exchange of water across the interface; and (4) The carbon dioxide-dissolved oxygen system in the ocean, using gas chromatography at sea to measure concentrations and using the carbon and oxygen isotope ratios of these components as additional parameters.

SUPPORTED BY U.S. National Science Foundation

#### **3.0006, LARGE-SCALE INTERACTIONS**

*J. ISAACS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038 (NONR)

The purpose of this task is to investigate the nature of large-scale variations in oceanographic and meteorological conditions in the North Pacific and the interrelationships of the variations. Deep moored, unmanned instrumented oceanographic and meteorological stations will be used in arrays as the principal means of obtaining the necessary environmental data. During the coming year, two buoy clusters will be deployed north of Hawaii as a pilot study for the larger experiment. The collection and analysis of existing data for the North Pacific will continue and will be used both in the design of the overall experiment and in the interpretation of the resulting data.

Reliable prediction of environmental conditions at sea have long been a necessity for naval operations. The results of this task hold great promise for providing the information and understanding of the environmental processes which control the changes in the oceans. This knowledge is necessary to the reliable prediction systems required.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### **3.0007, TOTAL HEAT FLUX MEASUREMENT WITH A TWO-WAVELENGTH RADIOMETER**

*E.D. MCALISTER*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The objective of this work is to continue an investigation of the total heat flux measurement in the air overlying the ocean surface using a two-wavelength radiometer. It is anticipated that measurements accurate to within 5% of a known heat loss can be accomplished on the open sea.

The study will be divided into three major parts: (1) a laboratory study of factors determining heat flow; (2) a study of the relationship between the heat flow at sea and meteorological elements; and (3) a study of the variations of heat flow.

The laboratory study will establish the accuracy of the two wavelength radiometer (4.45 to 5.1 microns). It will offer a wealth of information upon which can be built an understanding of the mechanisms involved in heat transfer. It is recognized that it will be difficult to correlate the heat flow measurements with meteorological measurements due to the inability to measure meteorological variables accurately over the open sea. The variational studies are aimed at determining differences in surface temperature due to distance from the shoreline and due to the diurnal cycle.

SUPPORTED BY U.S. National Science Foundation

#### **3.0008, WAVE GENERATION BY THE TURBULENT WIND FIELD OVER THE SEA**

*R.W. BURLING*, Univ. of British Columbia, Graduate School, Vancouver - British Columbia, Canada (N00014-66-C-0047)

Sea surface conditions induced by local winds affect a variety of naval operations such as replenishment at sea and other operations. The impact of adverse sea conditions upon such operations may be reduced as a result of accurate prior forecasts. The development of a capability to produce accurate predictions requires an understanding of the physical processes involved in the generation of waves by the wind and is being developed under this task.

Approach: A series of field experiments will be conducted from a research platform located in shallow water off Vancouver, British Columbia. These experiments will attempt to determine the characteristics of the turbulent wind field over the sea. The detailed nature of the turbulent field will be examined close to the sea surface using hot wire anemometers and acoustic anemometers. A system for use from open ocean sites also will be constructed for installation on Cobb Seamount and used during the Barbados Oceanographic and Meteorological Experiment. Pressure fluctuations within the atmospheric boundary layer and on the surface of waves also will be measured in relation to wave generation processes and supplement the wind velocity measurements.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### **3.0009, ATMOSPHERIC-OCEANIC-GLACIOLOGIC INTERACTIONS IN THE ANTARCTIC**

*W.S. WEYANT*, U.S. Dept. of Commerce, Research Lab., Boulder, Colorado 80302

The Polar Meteorology Group of the Air Resources Laboratory at ESSA will perform researches which are directed at providing a further description and explanation of the physical processes which occur in the Antarctic atmosphere. This will be accomplished through studies of 1) the nature and magnitude of energy and water exchange between the atmosphere and the underlying snow, ice or water surface; 2) the heat and mass budgets of the atmosphere-snow-ocean system which controls the Antarctic heat budget; 3) how the Antarctic heat budget is related to the overall terrestrial heat budget; and 4) the relationship of the general high latitude atmospheric circulation to the total planetary circulation. The data used in these studies will be recovered from the International Antarctic Meteorological Research Center at Melbourne, Victoria, Australia, the National Weather Records Center in Asheville, North Carolina, or direct from the records of any station, ship, or satellite engaged in high southern latitude meteorology.

As time permits special attention may be given to studies of 1) radiation balance and the net vertical and horizontal transport of sensible and latent heat, 2) ozone concentrations and the atmospheric circulation model, 3) circulation at all levels up through the stratosphere, and 4) temperature, humidity and wind profiles in the regions of the Antarctic convergence to learn about the effects of the convergence on the boundary layer of air masses.

SUPPORTED BY U.S. National Science Foundation

### 3. METEOROLOGY

#### 3.0010, DEVELOPMENT OF PHYSICAL-NUMERICAL MODELS FOR STUDIES OF THE ATMOSPHERE-OCEAN PLANETARY BOUNDARY LAYER

J.P. PANDOLFO, Travelers Research Center Inc., Hartford, Connecticut

The present model represents a complex local theory for the study of the vertical structure, and temporal changes, characteristics of the atmosphere-ocean planetary boundary layer. The combined effects of boundary layer turbulence in stratified (humidity and salinity dependent) flow, advection by the mean velocity, mixing due to wind generated waves on the interface, and cloud-dependent radiative heating, are calculated iteratively in the mixed initial-boundary value problem represented by the model equations.

Experimental objectives during the past year included model evaluation and climatological supplement calculations for a region of the tropical oceans to be intensively observed next year. The model behavior successfully simulates some already measured characteristics of this region. The model also successfully simulates some recently observed general characteristics of this layer.

The models are now being generalized to include investigation of the horizontal structure of the boundary layer on several scales. Future work will make use of the intensive observational data to be obtained next year in these analyses. The series of projects began in FY '66, and is expected to end in FY '71.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0011, MISCELLANEOUS SERVICES FOR FEDERAL AVIATION AGENCY (VISUAL RANGE)

C.A. DOUGLAS, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

To furnish measurement of the characteristics of fogs during the testing of visibility meters. To obtain data on fog variability, air-sea interface, for example. To furnish technical advice and assistance on problems related to the determination of visibility conditions at airports. This is assistance to other agencies utilizing facilities and knowledge not available elsewhere, NBS Mission Component 1.6.

Measurements of fog density and its variation with time and place will be made as required at the NBS Field Laboratory, Arcata, California. Technical advice and assistance will be supplied as requested.

#### 3.0012, EVAPORATION OF WATER

A. WEXLER, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

The principal objective of this project is to make a study of the feasibility and probable value of performing laboratory or other types of research for investigating the physical processes of evaporation. This project falls within the mission of NBS to conduct research on basic measurement techniques and instrumentation. It should lead to improved methods of measuring water vapor flux and evaporation, which in turn should assist meteorologists and hydrologists in measuring and predicting water losses due to evaporation over land and water.

The study will include a survey of technical literature, visits to laboratory and field facilities where evaporation research is being pursued, development of recommendations for suitable research programs and proposals for equipment and instrumentation.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

#### 3.0013, EXCHANGE METEOROLOGIST WITH JAPANESE ANTARCTIC RESEARCH EXPEDITION

W.S. WEYANT, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Washington, District of Columbia 20235

A study of the atmospheric boundary layer over the Antarctic Ocean will be conducted aboard the Japanese icebreaker, Fuji, by Mr. Martin Sponholz, the U.S. Exchange Scientist with the Japanese. The investigations will include (1) an examination of

the effect of the Antarctic Convergence and the ocean-sea ice boundary on the overlying atmosphere, and (2) a comparison of the data for the lower 1000 feet of the atmosphere over the ocean, over the sea-ice and along the coast, with similar information obtained inland at Plateau Station (elevation 11,690'). The data will be obtained from sensors suspended from four kites towed from the stern of the ship. A modified radiosonde will transmit pressure, humidity, wind speed and temperature observations obtained to a height of 1000 feet from the sensors to the ship.

SUPPORTED BY U.S. National Science Foundation

#### 3.0014, RESEARCH AND COMPUTATIONS ON THE THERMODYNAMIC PROPERTIES OF AIR AND RELATED GASES

H.W. WOOLLEY, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

XXA computer program for the NBS UNIVAC for the calculation of thermodynamic properties for a gas mixture such as air or hydrogen with other gases of up to triatomic molecules has been prepared (except for general de-bugging) by modification and merging of two previous 7094 programs. A capability of free energy minimization as composition is changed by chemical reaction is provided. Transport property estimates with Enskog type density corrections can also be made. For polar gas pairs, a collision-integral increment between Lennard-Jones and Stockmayer values is used. Non-polar values are based on the exp-6 potential with alpha read in or based on the close approach behavior from theory, with the 1, exp-6 potential. The program has provision for up to six terms in a polynomial in the density representing  $\ln(PV/RT)$  for each of the constituents. The temperature dependence is by series compatible with the Stockmayer potential. The constants required may be obtained via another program under development for fitting isotherm data. It fits second virials with a 1, 12-6 potential and extrapolates to high temperatures with rigid sphere relations for higher virials. Accepted critical constants can be fitted; provision is also made for later use of a singularity function in the critical region to fit liquid-vapor equilibrium data in using the main thermodynamic property program. In the absence of newly fitted PVT constants, it is possible to use old constants such as were used for B and C for some gases in NBS Circular 564 if their densities or mole fractions are low. Inter-ionic effects have been coded for another program and can be added here also. New theoretical estimates for negative ion effects have been derived. Spectroscopic constants for diatomic constituents have been studied with the view of improvement for high temperature calculations. New procedures for theoretical analysis of spectroscopic constants for diatomic molecules have been devised.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

#### 3.0015, BARBADOS OCEANOGRAPHIC AND METEOROLOGICAL EXPERIMENT

R. MORSE, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The Barbados Oceanographic Meteorological Experiment (BOMEX) is a comprehensive synoptic meteorological and air-sea interaction study to be conducted in the vicinity of Barbados Island during the summer of 1969.

Evaluation of momentum transfer, sinks and sources of vapor in the atmospheric system, wind system at sea and measurements of standard oceanographic variables, salinity and temperatures, as a function of depth will be made. The U. S. Coast Guard Cutter ROCKAWAY (WAGO 377) will participate in the program.

Other agencies participating are the Environmental Science Services Administration, Atomic Energy Commission, Bureau of Commercial Fisheries, National Aeronautics and Space Administration, National Center for Atmospheric Research, National Oceanographic Data Center and the National Science Foundation.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 3. METEOROLOGY

#### 3.0016, AIR-SEA INTERACTION (WAVES)

R.L. SNYDER, Nova University, Graduate School, Fort Lauderdale, Florida (N00014-67-A-0386-0001)

This is research into processes of energy exchange between wind and ocean waves. It involves field measurement program at an experimental site in the Bight of Abaco. Three interrelated activities are involved: (1) studies of white caps as a possible mechanism for dissipation of energy put into the sea by wind; (2) measurement of wave induced pressure fluctuations in an effort to explain growth rates of wind waves; and (3) instrumentation of Abaco site for measurements of turbulent fluctuations in the water and interpretation of such measurements.

An improved understanding of wind generation and decay of ocean waves will assist in the development of improved wave forecasting conditions. Improved knowledge of sea state conditions assists many naval operations.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0017, EXPERIMENTS IN AIR-SEA INTERACTION INVOLVING SURFACE PRESSURE MEASUREMENTS

E.B. KRAUS, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The objective of this work is to carry out two separate but related experiments using the same location and instrumentation of internal waves in the lower atmosphere and the second deals with the measurement of the geostrophic and actual surface winds as a method of computing the stress at the air-sea interface.

The first experiment is designed to test Bretherton's theoretical concept that wave groups and their propagation can be used to describe gravity waves that travel in the lower atmosphere associated with low level inversions. It is hoped that measurements of travelling perturbations of the surface pressure and the surface wind can be used to express the group velocity and the wave energy of the group. These quantities can be expressed as a function of the absolute frequency, the horizontal wave number components, the wind velocity and the local Brunt-Vaisala frequency. From the mean distributions of wind and temperature from nearby radiosonde stations as well as the records from the array of surface pressure transducers, information about the energy, frequency, and propagation of the wave groups in the atmosphere will be obtained.

The second experiment is designed to clarify the observation that there is a wide divergence between the actual wind and the geostrophic wind near the sea surface. It is hoped that systematic, simultaneous recording of actual and geostrophic surface winds over the water will permit a derivation of a frequency-dependent empirical transfer function between the two vectors.

SUPPORTED BY U.S. National Science Foundation

#### 3.0018, TRITIUM IN HURRICANES

G. OSTLUND, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The objective of this research is to study the air/sea exchange of water in hurricanes and in the region of the trade winds by measuring the tritium content of the water and water vapor in the oceans, rain, clouds and air. Hurricanes and tropical storms in various stages of development have been studied in an effort to establish a connection between the intensity of air/sea exchange and the development of the tropical disturbance.

It is planned to achieve the above objective by sampling the rain, clouds and air in and around hurricanes. Aircraft from ESSA's Aircraft Flight Facility will be the sensor platforms. Sea water will be sampled by ships and small boats from the Institute of Marine Science. In addition samples of water vapor will be obtained during the non hurricane season in the trade wind flow that moves off the African continent and travels across the Atlantic to the Lesser Antilles. It is hoped that such information might be instructive in studying the modification of the air by the sea. The collection phase will be supported by ESSA.

An emphasis will be made to bring more interested atmospheric scientists into this work to interpret the chemical data collected and analyzed by Dr. Ostlund. This aspect will become a major effort under NSF support. An effort will be made to measure other tracers such as the tritium component in the normally

occurring hydrogen gas in the air and develop techniques for instantaneous analysis of the tritium.

SUPPORTED BY U.S. National Science Foundation

#### 3.0019, STUDY ASSOCIATION BETWEEN TRADE WIND SYSTEM AND NORTH PACIFIC OCEANOGRAPHIC CLIMATE

G.R. SECKEL, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

The objective of the investigation is to develop a model for air-sea interactions. The most important of these concerns the linkage between the trade wind system and surface water motion. The Hawaiian oceanographic climate, the seasonal changes in temperature and salinity, are largely determined by changes in the location of the boundaries and changes in the speed of the California Current extension, or, surface water movement. A project to make preliminary investigations concerning surface water motion as reflected by the Hawaiian Oceanographic climate, and associated changes in the trade wind system, are an important part of the initial phase of the experiment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

#### 3.0020, ATMOSPHERIC TURBULENCE FIELD STUDIES

P. FRENZEN, Argonne National Laboratory, Argonne - Lemont, Illinois

The structure of small-scale turbulence in the lowest 10 meters of the atmosphere is being investigated with the object of developing operational methods for the routine measurement of energy exchange at the surface of the earth. Turbulent fluctuations of wind speed and temperature are recorded under conditions in which the vertical flux is invariant with height, using specially developed instruments mounted on portable towers over selected, uniform sites. A recent theoretical method for determining the turbulence dissipation rate (and, subsequently, the vertical flux of momentum) from reductions in variance effected by averaging wind records over successively larger intervals (Frenzen, Quart. J. Roy. Meteor. Soc., 91 (1965); 28-34) has been verified in the field using data collected by a fast-response wind measuring system constructed for the purpose. A similar theoretical treatment of thermal fluctuations has been prepared (Frenzen, Radiol. Phys. Div. Ann Rep., July '64 - June '65, ANL-7060; Argonne National Lab.; 140-133) and a temperature system designed to utilize this result for the measurement of vertical heat flux is being completed. Because of the relative simplicity of the instrumentation required and an inherent freedom from longer period disturbances such as those caused by waves rocking an instrumented platform, these 'variance reduction' methods appear to be especially suited to the problem of measuring vertical eddy transfer over large bodies of water.

Apparatus is currently being constructed for the direct measurement and computation of vertical fluxes in the field by the eddy-correlation method. Unlike most devices of this kind previously used in micrometeorological investigations, the present equipment will employ digital rather than analogue computation procedures.

SUPPORTED BY U.S. Atomic Energy Commission

#### 3.0021, EXPERIMENTAL FLUID DYNAMICS

A.J. FALLER, Univ. of Maryland, School of Engineering, College Park, Maryland

The objective of this proposal is to continue the studies of boundary layer instability in rotating systems, of oscillatory circulations due to the tilt of the rotation axis, of the generation of wind waves, and of the stability of a barotropic geostrophic jet on a 'beta' plane. It is further proposed to initiate an experimental study of thermally-driven circulations that are designed to simulate the general circulation of the atmosphere.

The problems will be approached in the following manner: (1) Boundary layer instability and transitions - numerical integrations for combined shear flow and thermal convection will be undertaken. Boundary layers with both stable and unstable stratifications will be studied. (2) Oscillations in a tilted rotating tank -

### 3. METEOROLOGY

the tilted axis will be processed to allow various combinations of tidal and rotation frequencies. Regions of resonance will be investigated theoretically and experimentally. (3) Analogues of the general circulation of the atmosphere - thermally-driven circulations will be generated by heating and cooling a large cylindrical rotating tank. Statistics of the flow will be measured directly. The resulting numerical models will compare statistical features with corresponding statistical measurements of the experiment. (4) Wind-generated waves and small-scale air-sea interactions - studies will include the determination of velocity profiles in both air and water, the turbulence level in air and water and the effects of surface films.

SUPPORTED BY U.S. National Science Foundation

#### 3.0022, DYNAMICS OF AIR-SEA INTERACTION

*E.L. MOLLOCHRISTENS*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

The objective of this work is to continue studies of the dynamics of air-sea interaction. The ultimate goal is to obtain quantitative measures of the vertical fluxes of heat, moisture and momentum across the sea surface as a function of time history, scale, and atmospheric and oceanographic parameters. The emphasis will be on understanding the details of the small scale dynamic processes such as the processes of generation of turbulence and the structure of the turbulent field over the sea surface.

Problems related to the small scale processes are being investigated in laboratory experiments. These studies include investigations of stratified shear flow stability and turbulence, the structure of the turbulent Ekman layer, and phenomena involving stratification and rotation.

Field studies are being conducted also so the full scale range of parameters can be obtained as well as the full complexity of the natural processes. These studies include measurements in the boundary layer over the sea surface of the spatial and temporal structure of the velocity and temperature field under known mean conditions of wind profile, temperature profile, current, water temperature structure and surface wave field.

This program is supported jointly by the Office of Naval Research and the National Science Foundation.

SUPPORTED BY U.S. National Science Foundation

#### 3.0023, AIR-SEA INTERACTION

*E.L. MOLLOCHRISTENS*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

This task is concerned with the dynamics of small scale air-sea interaction processes within the boundary layers of the ocean and atmosphere, with particular emphasis on fluctuations in velocity, temperature and salinity to determine the turbulent flux of momentum, salinity and heat throughout the surface layer of the ocean. It is primarily a field program with experiments being conducted from a buoy system set in Buzzards Bay, Massachusetts.

The results from this task are expected to further our understanding of the environmental processes influencing wave generation and the thermal structure of the oceans. From this understanding may result improved forecasting methodology to support marine operations.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0024, LARGE-SCALE INERTIAL OCEAN-ATMOSPHERE RELATIONSHIPS

*I.I. SCHELL*, Ocean Atmosphere Res. Inst., Cambridge, Massachusetts 02138

The objective of the work is to conduct an investigation into the nature of large-scale inertial ocean-atmosphere relationships involving the equatorward extent of ice and the contemporary and subsequent large time-scale monthly and seasonal sea surface temperatures and weather as a basis for possible long-range forecasting.

To accomplish the above objective it is planned to analyze synoptically and statistically the southerly ice limit in the Greenland Sea and the Okhotsk Sea and compare them with charts of

sea level and upper level pressure distributions, winds and jet streams, sea temperatures, etc. Indices of circulation are to be developed from an analysis of the correlation of ice limits and sea temperatures with subsequent weather as a basis for long range forecasting of the sea surface temperatures of the northeastern Atlantic and the weather of northwestern Europe as well as the sea surface temperatures of the northwestern Pacific and the weather of northern Japan, the Aleutians and Alaska.

SUPPORTED BY U.S. National Science Foundation

#### 3.0025, INTERACTIONS BETWEEN TURBULENCE, CLOUDS, SEA TEMPERATURE

*A.F. BUNKER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The objective of the proposed work is to analyze, evaluate and interpret the vast body of meteorological data obtained by the WHOI C-54Q aircraft during the International Indian Ocean Expedition (1963-65) and the Line Island Experiment (1967).

The Indian Ocean work will include vertical cross-sections of clouds collated with streamlines, temperature cross-sections and photographs from satellites and the aircraft. Turbulence and turbulent flux measurements in clear and cloudy air above the frictional level will be studied in detail to find their relation to sea surface temperatures, wind fields and gradients, the conditional instability of the air in the southwest monsoon, the stability of the air in the northeast monsoon, and the convective activity in the equatorial trough.

The Line Islands work will include making cloud cross sections and relating the cloud types and heights to the thermal, water vapor and wind fields of the atmosphere in the equatorial region. Turbulence measurements and turbulent flux computations made in the moist layer between 6 degrees S and 21 degrees N will be studied to determine their relation to the sea-surface temperature and the thermal and kinetic fields that were observed at the same time.

SUPPORTED BY U.S. National Science Foundation

#### 3.0026, AIR-SEA EXCHANGE

*P. SAUNDERS*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The objectives of this investigation are to improve our knowledge and understanding of the short wave isolation reaching the surface layers of the ocean and to improve the accuracy and usefulness of measurements of sea surface temperature using remote techniques. The relationship between bulk water and interface temperatures and the exchange of energy and momentum from air to sea is to be examined by observations obtained from a tower in Buzzards Bay. Measurements also are to be made of the albedo of the ocean for both diffuse and direct insolation, and the apparent surface temperature observed from infrared radiation measurements is being examined as a function of the height of the sensor.

The results from this work are expected to provide basic understanding of the radiative processes which heat and cool the surface layers of the oceans, thereby affecting the thermal and sound velocity structures. Such knowledge is required to develop meaningful models from which forecasting methods can be developed.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.027, TURBULENCE OVER WAVES

*D.J. PORTMAN*, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan (N00014-67-A-0180-0005)

The objective of this task is to investigate the structure of turbulence and of the turbulent fluxes of momentum and heat in the atmospheric boundary layer immediately over the sea surface. An experimental investigation will be made of the three-dimensional structure of turbulence and of the spectral characteristics of temperature fluctuations. Analyses will include determination of the Reynold's fluxes of heat and momentum over water waves. Measurements will be made from a fixed tower or buoy and also a low-flying aircraft.

### 3. METEOROLOGY

The results from this task are expected to contribute to the understanding of the nature of the wind field immediately above the sea surface. Better knowledge of its characteristics are needed to improve wave forecasts for naval operations and to assist aircraft operations at low altitudes and landings at sea. Improved understanding of heat flux should aid in improving forecasts of thermal structure as well as meteorological forecasts over oceanic areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0028, AIR-SEA INTERACTION PROCESS

A.C. WIINNIELSEN, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

Since the wind is the chief driving force of the lake, specification of the wind in the layer of air just above the water surface is of fundamental importance. To obtain wind fields over the lake on a routine basis, parameters must be chosen which a) are themselves routinely available, b) uniquely define the wind profile near the surface or the wind at some significant level and c) are representatives of large portions of the lake.

On the other side of the air-lake interface the problem of specifying the possible modes of response of the Lake arises. To provide information of water flow a relatively dense network of instrument buoys was placed in Lakes Michigan, Ontario and Erie by the Great Lakes-Illinois River Basins Project of the Division of Water Supply and Pollution Control, U.S. Public Health Service.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0029, GREAT LAKES RESEARCH - ENERGY TRANSFER AT THE AIR-WATER INTERFACE

J.G. HOUSLEY, U.S. Army, Lake Survey, Detroit, Michigan 48226

The direct contact between water and air at their interface produces an exchange of energy and mass. Analysis of the interface activity will establish the mechanism by which energy and mass transfers, both air to water and water to air, are accomplished. These transfers are in the form of heat energy, such as radiation, conduction, convection, condensation, and evaporation; kinetic energy as in wind tides and waves; mass as in absorption of gases and solids by water; and electric charge transfer. Results will lead to improved methods of predicting waves, currents, wind tides, water supply, and modification of regional climate by the lakes.

Under contract with the University of Michigan, data are being obtained at an instrumented tower about one mile offshore, near Muskegon in Lake Michigan. The tower was in operation for the seasons 1963, 1964, and 1965, and 1967. Reduction and analysis of the data will continue in FY 69; the instrumented tower was reestablished in May 1968. Development of equipment for wind-stress measurements on a continuous basis is underway.

SUPPORTED BY U.S. Dept. of Defense - Army

#### 3.0030, SURFACE TENSION

J.J. JASPER, Wayne State University, Graduate School, Detroit, Michigan 48202

The data on surface tension of pure liquids at ordinary temperatures will be compiled from the literature and critically evaluated. The surface tensions of liquids are needed for an understanding of all processes of liquid-liquid extraction, wetting of solids, adhesion and many meteorological processes. This project is in accord with the reference data mission of NBS.

Data on the surface tension of liquids at ordinary temperatures will be compiled from the literature and evaluated as to quality and presented in various useful ways.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

#### 3.0031, PROJECT EVAPORATION

C.C. EASTERBROOK, Cornell Aeronautical Lab. Inc., Buffalo, New York 14221

The main objective of this project is to determine the effect of wave action on the rate of evaporation from a free water sur-

face. Experiments carried out in an enclosed wave-tank as part of the initial contract showed that evaporation was actually reduced from 30% to 40% by well developed waves on the surface. Subsequent study of air flow over the waves indicated that this flow is modified in such a way as to retard the upward transport of water vapor.

The extension to the evaporation project carried the study into the real world where measurements were made in the free atmosphere over the surface of Lake Hefner in Oklahoma. This data was recorded on magnetic tape by a cooperating group from ESSA in Boulder, Colorado. The data is currently being analyzed and results will be reported in the final report.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

#### 3.0032, RADIANT ENERGY FLUX ACROSS THE AIR-SEA INTERFACE AND HEAT BUDGET OF THE OCEANS

R. HOLLMAN, New York University, School of Engineering, New York, New York 10003 (NONR)

Objective: The needs for environmental predictions of ocean thermal structure require knowledge of the factors controlling the heat budget of the surface layers of the ocean. The heat budget is controlled by radiation directly from the sun and indirectly from the sky as well as that radiated back to the atmosphere from the oceans. This research on the exchange of radiant energy at the sea surface is aimed to contribute to naval oceanographic forecasting services as well as marine meteorological forecasts.

Approach: The flux of radiant energy at the sea surface is being measured as a function of solar elevation and cloud conditions in order to determine the coefficient of reflectivity for sky radiation. The results are being used to derive prediction equations for the downward flux density of radiation under varying cloud amounts and types of air-masses. Infrared measurement techniques from spacecraft, aircraft and surface ships also are being studied to determine the reliability to which the longwave back radiation from the sea surface can be determined.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0033, TURBULENT PROCESSES AT AIR-SEA AND BOTTOM BOUNDARIES OF THE OCEAN

A.D. KIRWAN, New York University, School of Engineering, New York, New York 10003 (NONR)

Objective: The Navy requires knowledge of turbulent processes in the oceans in order to describe and predict the oceanic environment for the planning and execution of operations. A better understanding of the turbulent regime at the air-sea and bottom boundaries bears upon the prediction of thermal structure; on bottom currents and their variability affecting deep rescue vehicle operations, mining operations and the determination of loading forces on fixed underwater structures; and on surface wave and wind forecasts affecting the operations of surface ships.

Approach: Both theoretical and field experimental work on turbulence is being conducted. Earlier theoretical work by Erinigin is being extended and applied to flow between plates. Field measurements of the structure of turbulence in the lower levels of the atmosphere immediately above the sea surface are being made from ARGUS Island off Bermuda. The effects of sea surface roughness, the fetch of the wind field and the stability of the atmosphere on the transfer of energy from the atmosphere to the ocean is being determined. The program is being conducted jointly with NavOceanO. A paralleling study of the turbulence in the bottom boundary layer of the ocean is being conducted in a tidal channel off Long Island, N. Y., to determine the nature of the velocity field next to the bottom.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0034, PHYSICAL OCEANOGRAPHY

T. ICHIYE, Columbia University, Graduate School, Palisades, New York 10964 (N00014-67-A0108-0004)

This task is concerned with air-sea interactions and diffusion processes within the upper ocean, and with the micro-thermal structure of the oceans. The relationships between

### 3. METEOROLOGY

Langmuir type cellular convection in the surface layer and environmental factors such as surface currents and their shear, winds, and waves, are being investigated. Information on the heat exchange between sea and atmosphere also is being obtained using airborne infrared thermometer and humidity sensors. A joint program with the University of Hawaii using STD's is to be undertaken to determine the horizontal scales of the thermohaline microstructure present in the region of the Pacific immediately north of Hawaii.

Surface layer parameters and the ability to forecast them are important in fleet operations and in the dispersal of waste and contaminants. Oceanic thermal structure and its space and time variations strongly affect acoustic propagation. Naval capabilities in these areas will benefit from the results of this research program.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0035, RESEARCH IN AIR-ENERGY EXCHANGE

*W.V. BURT*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

The emphasis to date has been on measurement of radiation; short-wave radiation has been measured at sea and in port. These measurements will be critically examined with future concurrent measurements at the Marine Science Lab and at sea. Equipment is being prepared to separate diffuse from direct short wave radiation at the Marine Science Lab, and a pyranometer has been installed to be used with filters to study the spectral variation of incident solar radiation. An inverted pyrheliometer will be used at sea to measure reflected short wave radiation, and a specially vented radiometer has been built for measurement of long wave radiation at sea.

Heat stored in the waters is under intensive study; comparison will be made between the surface budget and the observed storage. Efforts will be made to explain the differences and then design direct sampling programs to test for the advective transport. Direct measurement of light in the sea has been begun in conjunction with experiments on biological productivity -- more effort will be expended on this part of the work. Experiments with lasers and other artificial light sources will be added in order to learn more about turbidity and other factors affecting light transmission in both sea and atmosphere. Preliminary studies of atmometers for estimating evaporation at sea have been made, and if these prove feasible, they will be used in conjunction with the mass transfer computations to study the evaporation from the sea off Oregon.

SUPPORTED BY U.S. National Science Foundation

#### 3.0036, ATMOSPHERIC EFFECTS ON INCOMING SOLAR RADIATION OVER TROPICAL OCEANS

*W.V. BURT*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

The objectives of this research are threefold: (1) to obtain a comprehensive understanding of atmospheric effects on incoming solar radiation over the tropical Pacific Ocean; (2) to develop suitable equations for computing incoming solar radiation over tropical oceans based on meteorological data; and (3) to compute incoming solar radiation over the tropical Pacific based on findings and equations developed.

To accomplish the above objectives it will be necessary to investigate the cloud distribution by type and amount at 5 selected sites (Canton Island, Wake Island, Johnston Island, Majuro Atoll and Kwajalein Atoll); to determine the effect of various amounts of atmospheric water vapor and clouds on incoming solar radiation; to determine the moist layer thickness at all locations during both disturbed and undisturbed weather conditions; to find suitable correlations between daily precipitation amounts and the occurrences of significant weather disturbances at the sites; to determine the variation in weather conditions and incoming radiation in the vicinity of the equatorial trough; to determine the most suitable cloud parameters to use in equations for computing incoming radiation in the equatorial trough zone and the trade-wind region; to determine what other parameters are essential to formulae for computing incoming solar radiation; to use Air Force and Navy summaries to extend study results in space and

time; and to develop suitable formulae for computing incoming solar radiation over the tropical oceans through use of hourly atmospheric and radiation data in conjunction with computer programs.

SUPPORTED BY U.S. National Science Foundation

#### 3.0037, FLUXES OF DISSOLVED GASES AND NUTRIENTS RELATING TO BIOCHEMICAL AND AERATION PROCESSES OFF THE OREGON COAST

*K. PARK*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

Research to date has been on the synoptics of the various chemical parameters in spatial and temporal coordinates. The parameters being investigated are salinity, oxygen, pH, alkalinity, phosphate, and less frequently, silicate and total carbon dioxide. Development of chemical techniques that can be used at sea, such as conductometric alkalinity analysis, gas-chromatographic determination of dissolved gases, and the reliability of conductometrically determined salinity has been studied.

It is proposed to study the air-sea exchange in different seasons of inert gases (argon and, for first approximation, nitrogen) and biologically active gases (oxygen and carbon dioxide). Such studies are essential to understand the mechanism of aeration in natural oceanic conditions, and it is quite feasible in this region, because a large annual surface temperature fluctuation, over 8 degrees C at 300 km, occurs off Newport, Oregon.

Quantities of the nutrient matters supplied to the euphotic zone of the ocean by Columbia River outflow and by the process of upwelling will be measured. It is calculated that each of these sources adds approximately one billion moles of phosphate to the euphotic zone off Oregon. The rate of addition of the nutrient by these sources affects the fertility of the euphotic zone.

SUPPORTED BY U.S. National Science Foundation

#### 3.0038, HEAT AND MOMENTUM EXCHANGE PROCESSES BETWEEN THE OCEAN AND THE ATMOSPHERE

*G.S. POND*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

Objective: Improvements in forecasting marine weather and sea conditions are extremely important to operation at sea. Such improvements will require a more accurate knowledge of the transfer of heat and momentum between the ocean and the atmosphere. This research, by providing a better understanding of the energy exchange processes, will help determine more accurate ways of estimating these exchanges from incomplete environmental data.

Approach: A field experiment using an instrumented tower located about one mile off the Oregon Coast will be carried out. Water vapor concentration, temperatures, wind velocities, and the vertical gradients of each of these variables will be made in the atmosphere immediately above the sea surface. From these data determinations will be made of (i) the amount of heat exchanged between the atmosphere and the ocean, (ii) the similarities and differences between the several physical mechanisms by which heat and momentum are transferred, and (iii) the relations between the amount of heat exchanged and the prevailing meteorological and oceanographic conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0039, SEA-AIR INTERACTION RESEARCH

*G.S. COOK*, U.S. Navy, Underwater Weap. Res. & Eng., *Newport, Rhode Island 02844*

Technical Objective: (1) Establish a working knowledge of the mean conditions and the variables involved in the dynamics of small scale processes in the air-sea interaction. (2) Make meaningful observations of the fluxes of momentum, heat, and salt in the air-sea interface region, and to correlate the dynamics of the sea surface with the generation of ambient sea state noise at the air-sea interface.

Approach: One or possibly two tower-type, spar satellite buoys will be implanted near the Buzzards Bay entrance light sta-

### 3. METEOROLOGY

tion. Instrumentation and appropriate sensors will be installed to measure mean air-sea conditions, including air temperature, wind velocity, water temperature, current velocity, wave conditions, and ambient noise. Measurements will be made of the space-time correlation structure and spectra of the wind speed above the air-sea interface and the ambient noise records. Studies will be conducted in the laboratory on turbulent convection in a stably stratified fluid heated from below.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0040, SEA BREEZE INVESTIGATION K.H. JEHN, Univ. of Texas, School of Engineering, Austin, Texas 78712

This work covers the third and final year of an investigation of the sea breeze along the Gulf Coast of Texas. The objectives of this year's work are to analyze and interpret the meso-scale observational data that have been collected during the summers of 1966 and 1967 and to make selected measurements during the summer of 1968.

The meso-scale analysis will center around the objective analysis program that has been made operational on the NCAR CDC-6600 computer. A study of the energy budget associated with the sea breeze will be started. A wind tunnel study and calibration of the liquid water content device used in cloud observations will be completed.

In June 1968 a small field effort will be mounted for the purpose of evaluating the surface input of energy into a sea breeze circulation. Measurements in the boundary layer will be made from several towers. In addition an airborne radiometer will be flown on an NCAR aircraft to determine the surface temperatures over the land and water. Extensive laboratory testing will be required of the instrumentation before going into the field in June.

SUPPORTED BY U.S. National Science Foundation

#### 3.0041, AIR-SEA INTERACTION G.A. FRANCESCHINI, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

The goal of this effort is to develop methods of predicting changes in conditions within the boundary layers of the sea and atmosphere from routinely available data. Of immediate concern is the exchange of sensible and latent heat and its relation to near surface gradients of temperature and humidity. An observational program is being planned and associate equipment designed and field site selected during the coming year.

This study should improve our knowledge of spatial and temporal variations of temperature in the ocean and thus work toward eventual systems for predicting environmental conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0042, AIR-SEA INTERACTION D.F. LEIPPER, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

The objective of this task is to develop accurate forecasting methods for oceanic phenomena which are dependent upon air-sea interactions using tools of synoptic oceanography. Particular attention is being paid to the currents and thermal structure in the eastern Gulf of Mexico and the ways in which they change seasonally and in response to weather conditions.

It is expected that these studies will contribute to the development of oceanic forecasting methods particularly the influence of large-scale weather systems upon ocean temperature.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0043, HYDROSPHERE-ATMOSPHERE RADIOCHEMICAL MEASUREMENTS A.W. FAIRHALL, Univ. of Washington, Graduate School, Seattle, Washington 98122

The excess carbon-14 introduced into the northern hemisphere stratosphere during the 1961-1962 USSR and US nuclear weapons tests provides a useful tracer for the study of atmospher-

ic mixing processes and exchange of carbon dioxide between the atmosphere and the surface of the sea. To study these processes the troposphere and the surface of the sea are sampled periodically, at various locations within both the northern and southern hemispheres, for carbon-14. The studies to date show that atmospheric dispersion of trace substances is well accounted for by eddy diffusion, the horizontal eddy diffusion coefficients being proportional to the variance of the wind speed. The exchange of carbon dioxide with the sea is shown to be proportional to the square of the average wind speed over the sea surface.

SUPPORTED BY U.S. Atomic Energy Commission

#### 3.0044, ENERGY TRANSFER NEAR THE EARTH'S SURFACE R.G. FLEAGLE, Univ. of Washington, Graduate School, Seattle, Washington 98122

The principal objective of this proposal is to complete the development of the capability for making reasonably accurate measurements of vertical turbulent flux. It is anticipated that during the period of time involved objectives will be formulated to take advantage of and contribute to the developing national and international programs involving energy transfer in the atmospheric boundary layer.

To complete the development work, it is planned to hold several comparative experiments between instruments for measuring turbulence statistics. Studies will be made analyzing the motions of the MENTOR buoy, measuring the vertical fluxes of heat and momentum simultaneously over different surfaces, determining the spectra of the fluxes and establishing the Kolmogoroff constant for momentum and temperature.

SUPPORTED BY U.S. National Science Foundation

### 3B. HURRICANES-STORMS

#### 3.0045, ATMOSPHERIC CONDITIONS ASSOCIATED WITH CUMULUS CONVECTION W.M. GRAY, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

To continue investigation of the wind speed, vertical shear, and baroclinicity in the inner areas of tropical storms and develop a model to fit the observed cumulus convection. To continue a statistical study of frictional turning of wind in the sub-cloud layers over the tropical oceans.

Most of the work will utilize RFF flight data since much of the area under study is over tropical oceans. In addition, large quantities of data supplied by Asheville, and special tower observations will be utilized.

During the period of previous support results indicated that most tropical disturbances from which storms form are generated from an environment in which a horizontal shearing zonal trade wind current is present with minimum tropospheric vertical shear.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0046, HURRICANES AND OTHER TROPICAL METEOROLOGICAL PROBLEMS R.C. GENTRY, Univ. of Miami, National Hurricane Res. Lab., Miami - Coral Gables, Florida 33124

The scientific objectives of NHRL are to acquire greater knowledge of tropical cyclones and their environment; to develop improved techniques for forecasting hurricane motion, formation, dissipation, and intensification; and to develop and/or evaluate hypotheses of tropical cyclone modification. Specially equipped research aircraft, weather satellites, and conventional surface and upper air networks will be used to obtain data to study the structure, dynamics, and high energy processes of the tropical cyclone. These data will also be used to determine interactions between the tropical cyclone and its environment in efforts to determine what are the factors involved in hurricane formation, intensification, dissipation, and movement. Tropical cyclone genesis and maintenance are being studied by the development of dynamical-numerical models of tropical circulations. Efforts to continue modification experiments on hurricanes

### 3. METEOROLOGY

will be intensified. Primary emphasis will be placed on the experiment to conduct multiple seedings of the eye wall of a mature hurricane. Second priority will be given to modification experiments on the rainband of a hurricane.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0047, TRITIUM IN HURRICANES

H.G. OSTLUND, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

To use the radioactive hydrogen isotope tritium, T, as a tool in air/sea interaction studies. Since the exchange of molecules at the interface is closely related to the flow of latent and sensible heat, the results could give experimental verification to hitherto only vaguely known exchange coefficients, and the energy budget of the system.

Using aircraft, take separate samples of liquid water and water vapor for analysis of tritium content. Relating points where samples were taken to positions in the hurricane or tropical storm. From the analysis, the total exchange of water at the air/sea interface may be deduced.

Some preliminary experiments were conducted in 1964, 1965, 1966. These experiments indicate that the total exchange of water at the air/sea interface is intense. Also the radial distribution of inflow into a hurricane was deduced, along with the air/sea exchange coefficients for water vapor.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0048, TROPICAL STORM INVESTIGATIONS IN THE ATLANTIC, CARIBBEAN, AND GULF OF MEXICO

N.E. LASEUR, Florida State University, Graduate School, Tallahassee, Florida 32306

Objective - Lack of conventional meteorological data has hindered a complete analysis of disturbances in the tropical oceans during the course of a typical season. Project objectives are: (a) to produce a sequence of analyses tropical oceanic areas extending from the Gulf of Mexico eastward to 10 degrees E., and investigate characteristic features of waves, anticyclonic centers, major convergent lines and other significant systems. (b) The development, extension and testing of hypotheses based on comparisons of satellite,

Approach - All data are being incorporate into complete analyses using both forward and backward time continuity. Wave and vortex systems will be tracked to gain information on size, intensity and speed of motion. During periods of concurrent coverage, satellite data will be used to investigate the intensity of disturbances and their vertical motion field.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0049, TROPOSPHERE METEOROLOGY IN THE TROPICAL ATLANTIC AREA

N.E. LASEUR, Florida State University, Graduate School, Tallahassee, Florida 32306

It is intended that the work remaining in the preparation and analysis of derived quantities (divergence, vorticity, deformation) and auxiliary fields (clouds and precipitation) will soon be completed. The problems of anomalous anticyclone gradient balance between the wind and pressure fields will be pursued.

The approach will be to solve the balance equation in its usual elliptic form in regions of cyclonic flow and normal anticyclonic gradient balance plus the solution of the hyperbolic form of this equation in regions of anomalous anticyclonic gradient balance.

Analysis of surface and upper tropospheric charges over the Tropical Atlantic region has been carried out over the past five years. In addition analyses have been made of cloud and precipitation information collected for the IGY period. Work continues on the problem of anomalous wind cases associated with subtropical westerly and easterly jet-streams.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0050, RESEARCH ON DYNAMICS OF LOW LATITUDE CIRCULATIONS

H.L. KUO, Univ. of Chicago, Graduate School, Chicago, Illinois 60637

Objective - At low latitudes, particularly over the oceans, conventional meteorological observations are scarce and atmospheric circulations are poorly understood. Project objective is to continue theoretical studies currently underway directed primarily to the formation of easterly waves and hurricanes. This involves the development of numerical models to simulate hurricane formation, and includes theoretical investigation of convection and low latitude wave perturbations.

Approach - Increasingly more complex and complete models will be designed to study hurricane formation. Effects of diurnal heating and vertical wind shear will be incorporated in the studies of convection motions. Results will be described in a comprehensive Final Report.

Progress (to June 30, 1967): Little progress this period because of problems with the multi-level hurricane model. Grant has been extended six months.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0051, DYNAMIC STUDY OF THE TEMPORAL

A.J. PALLMAN, Saint Louis University, School of Engineering, Saint Louis, Missouri 63103

Technical Objective: To continue the study of the 'temporal' in terms of a dynamic-energetic model incorporating earlier findings to establish the important characteristics of the temporal at maturity as well as at its formation. Comparison to major tropical storm characteristics will then be possible.

APPROACH: By use of Nimbus II radiation data, AVCS photographs and conventional data, another 'temporal' case of June 20-27, 1966 will be studied. Results will be presented in a written report.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0052, LAKE EFFECT SNOWSTORM STUDY

V.J. SCHAEFER, State University of New York, Atmospheric Sciences Res. Ctr., Albany, New York 12203

The primary objective of this research is to conduct studies on the effects that the Great Lakes have on lee side snow fall.

The approach will be focused on continuous monitoring of atmospheric nuclei and of snow crystal types during the snowstorms which occur and relate these to snow fall, wind direction and related phenomena. In addition, patterns of convergence, generation of clouds, snow distribution will be studied. Until these features are well established, it will be difficult to develop an engineering design to properly modify these storms. Orographic phenomena also will be studied.

Work accomplished under the grant has been the establishment of a mesoscale observation network downwind of both Lakes Erie and Ontario.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0053, HURRICANE DYNAMICS FOR ARTIFICIAL MODIFICATION STUDY

K. OYAMA, New York University, School of Engineering, New York, New York 10003

This grant provides support for the third and final year of research carried out formerly under GP-5192 and GA-623 on the activities of K. Ooyama in studying the structure and behavior of hurricanes using mathematical models on high speed electronic computers. The first objective of the project to construct a simple model of a hurricane to understand the basic hurricane dynamics has now been achieved. This extension will permit work to be initiated on a numerical model which would be accurate enough to predict the behavior of real hurricanes. The restrictive assumptions in the present model, such as gradient wind balance and axisymmetry, will have to be replaced by more realistic boundary conditions.

SUPPORTED BY U.S. National Science Foundation

### 3. METEOROLOGY

#### 3.0054, SEVERE STORM CLIMATOLOGY

*W.H. HAGGARD*, U.S. Dept. of Commerce, Natl. Weather Records Ctr., Asheville, North Carolina

To investigate the spatial and temporal variations in 1) the synoptic patterns associated with the subsequent development as well as non-development of tropical cyclones; 2) the contribution of the storms to the precipitation distribution patterns over specific land areas; and 3) the low-level meteorological phenomena associated with severe frontal passages and to relate satellite cloud photos to time and degree of recurvature of hurricane paths. Climatological models will be developed to provide the probable distribution of significant parameters such as wind and moisture.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3C. GENERAL METEOROLOGY-CLIMATOLOGY

#### 3.0055, AN EXPERIMENTAL AND THEORETICAL STUDY OF THE MARINE AND CONTINENTAL CLIMATES OF POINT CONCEPTION TO THE MORRO BAY REGION OF CALIFORNIA

*J.A. ROBERTS*, Meteorology Research Inc., Altadena, California

Technical Objective: An improved scientific understanding of the marine elements of coastal climates and of the effects of topography on micrometeorology of the coast and a more complete basis for predicting environmental conditions affecting military landing and beach clearance operations.

Approach: Micrometeorologic and marine data on the California coast from Point Conception to Morro Bay will be collected and analyzed. This portion of the coast has been classified as a single climatic type and contains a variety of coastal land forms. Data will be collected from three instrument ranges, eleven coastal reporting stations, and a series of seasonal aircraft operations. The data will be reduced and analyzed with respect to the general synoptic situation and related to seasonal climatic conditions.

Progress: Three mechanical weather stations were sited around each of the three headlands, Pt. Arguello, Pt. Sal and Pt. Buchon, for a total of nine installations. Each station consists of wind direction and speed, air temperature and precipitation gauges. Atmospheric soundings are made by an MRI aircraft instrumented to take continuous measurements of temperature, humidity and turbulence as a function of elevation. Intensive field observations were conducted during two periods, 31 May to 3 June and during the week of 22 August, including special measurements of wind and observations of cloud cover, in addition to wind data being measured by the network of mechanical weather stations.

SUPPORTED BY U.S. Dept. of Defense - Army

#### 3.0056, MESO WIND PATTERNS IN THE CENTRAL CALIFORNIA VALLEY

*W.E. YATES*, Univ. of California, School of Agriculture, Davis, California 95616

The proposed research has emerged from studies on drift of herbicides and insecticides, air pollution, and wind erosion. Exploratory surveys on a modest scale in parts of the Central Valley of California resulted in the discovery of some peculiar wind patterns in the lower Sacramento and lower San Joaquin Valleys. Spraying schedules in parts of this area could be established for agricultural aircraft operators, and suitable wind protection devices could be designed in another part.

The study is carried out by establishing several portable climate recorders that include wind registering in various sites of the Valley. A further observation tool is a 1,500 ft. TV tower, which was equipped also with six or these recorders at various heights. Furthermore, pilot observations and airplane cruises are employed. The data will permit obtaining basic knowledge of the particular wind patterns, and generally about the interaction of the phenomena of sea breeze and continental pressure systems about 100 miles from the coast.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

#### 3.0057, PACIFIC OCEAN INFLUENCE UPON CALIFORNIA RAINFALL

*J. BJERKNES*, Univ. of California, Graduate School, Los Angeles — U.C.L.A., California 90024

In project research for the National Science Foundation carried on by the principal investigator it has been found that the Pacific Ocean temperature varies more from year to year near the equator than it does in adjacent areas to the north and south. It has also been demonstrated that the inter-annual variation in heat and moisture input from the equatorial belt of the oceans in the few instances investigated does influence the global pattern of the atmospheric circulation. On the basis of this experience it is tentatively assumed that the variation of rainfall from year to year in California, and other areas around the Pacific Ocean, primarily results from the variability of the water temperature at the equator.

It is planned to test this hypothesis by assembling maps of the atmospheric circulation for all winter seasons during which equatorial water temperature measurements were carried out. Next, the map types will be correlated on the one hand with equatorial water temperatures and on the other with the historical rainfall record in California.

The problem of estimating the yield of a rainy season on the basis of atmosphere and ocean data, available before the rains start, will be investigated.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

#### 3.0058, CLIMATE CHANGE OVER THE POLAR OCEAN

*S. ORVIG*, McGill University, Graduate School, Montreal - Quebec, Canada

Orvig proposes to continue studies of climatic effects resulting from heat transfer process in the Arctic. The objective is to attain numerical values for all the terms in the heat balance equation for the surface and the atmosphere over the Polar Ocean. This work will supplement the U.S. work by making available to the large numerical projects, hand computed input values of areal values of conditions, radiative energy fluxes, cloud conditions, etc.

SUPPORTED BY U.S. National Science Foundation

#### 3.0059, ATMOSPHERIC PROCESSES IN THE TROPICS

*W.M. GRAY*, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The objective of this research is to study the tropical atmosphere through a continuation of observational studies of atmospheric processes using data collected from satellites, aircraft, surface ships and conventional synoptic observations.

The objective is to be achieved by studying three primary physical processes. They are: (1) the mutual variation of wind, shear and baroclinicity in tropical storms and disturbances; (2) a statistical treatment of the Ekman or frictional turning of the wind in the sub-cloud layer within the tropics; and (3) the association, movement and conservatism of the satellite-observed 'cloud blob' areas in and surrounding the Inter-Tropical Convergence Zone for a better understanding of the dynamics of this system.

The proposed work is part of a continuing mutual research effort with Professor Yanai of the Department of Geophysics at the University of Tokyo. All of this work is related directly to the Tropical Meteorological Experiment (TROMEX) to be carried out in the early 1970's and to the Global Atmospheric Research Project (GARP) to be carried out in the mid or late 1970's.

SUPPORTED BY U.S. National Science Foundation

#### 3.0060, WEATHER PROGRAM - STATION T-3

*V. ROCKNEY*, U.S. Dept. of Commerce, Weather Bureau, Washington, District of Columbia

Standard Weather Bureau methods are utilized to provide a program of surface and upper-air weather observations on Drift Station T-3, an ice island research station in the Arctic Ocean Basin. Surface observations are made on a minimum of 6-hour basis and Rawinsade probes of the upper atmosphere are made two times daily.

### 3. METEOROLOGY

Routine standard weather observations contribute to a climatology of the Arctic and will provide background for all future Navy operations in Arctic seas. Daily observations and forecasts are necessary for air support of the drifting station itself as well as international aviation. Upper air data are of special importance to investigations of the Arctic Ocean energy balance which is studied on a continuing basis on T-3. It is especially important that the polar atmospheric circulation be known in detail and that its relation to world weather and ice distribution and behavior be better understood.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3.0061, TROPICAL ANALYSIS AND FORECASTING

L.W. VANDERMAN, U.S. Dept. of Commerce, Natl. Meteorological Ctr., Washington, District of Columbia 20233

Objective - Tropical numerical analysis and forecast programs are being developed for an integrated operational analysis and forecast program as a part of NMC's support to the World Meteorological Center (Washington).

Approach - Tropical analyses for five pressure levels are being computed twice per day and primitive equation barotropic forecasts to 36 hours for two pressure levels are being computed once per day on an experimental-operational basis. Efforts at meshing a tropical belt forecast with a high latitude forecast have continued. A two-layer primitive equation baroclinic forecast model for the tropical belt has been developed and run. Considerable effort has been given the development of a global forecast grid and equations. This grid includes the tropics as a sub-set of the grid points.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0062, MESO AND CONVECTIVE SCALE SYSTEMS IN THE MARITIME TROPICAL ATMOSPHERE

M. GARSTANG, Florida State University, Graduate School, Tallahassee, Florida 32306

The primary objective of this research is to conduct studies which will lead ultimately to the construction of a model of convective scale systems in Maritime tropical atmospheres. This model will be developed both theoretically and by extensive observations in the field.

The approach will be based on a computer model of the heated island, determining the characteristics of the velocity field over a heated island, and extensive field experiment to test the model and hypothesis.

Work accomplished under the grant has been the near completion of a numerical (computer) model of the heated island and the development of instrumentation necessary to gain the above objectives.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3.0063, LINE ISLANDS EXPERIMENT

C.S. RAMAGE, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822

The objective of this work is twofold: (1) to collect and process observations made during the Line Island Experiment for use by all participants in the experiment and any other interested parties and (2) to investigate synoptic and sub-synoptic weather processes and climatology in the region of the Line Islands during the operation of the ATS-B satellite.

To accomplish the first objective all routine weather observations made over the Pacific (130 degrees E-80 degrees W and 40 degrees S) during the Line Island Experiment will be collected, processed, plotted, analyzed and listed in a publication put out by the University of Hawaii.

The second objective will be accomplished by independent investigations under the following topics: LaGrangian dynamics, ocean-atmospheric momentum exchange, climatology of the Line Islands, Line Islands weather in the context of the total tropics, and atmospheric tides.

SUPPORTED BY U.S. National Science Foundation

#### 3.0064, MESOSCALE WIND SYSTEMS AROUND THE GREAT LAKES

E.W. HEWSON, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

The research to be undertaken is concerned with the structure and dynamics of lake and land breeze systems around Lake Michigan. The field program will conduct measurements during May and June near the eastern shore of Lake Michigan between Holland and Muskegon. The field measurements are several pilot balloon observations of winds aloft to be taken along a line extending eastward from the shore, and at distances of 0, 5, 10, and 15 miles from it. Pilot balloons will also be taken from a vessel over the lake. Lapse rate measurements of temperature and moisture will be obtained over land and lake using an instrumented manned aircraft.

The above measurements will be used for comparison with a theoretical model of a lake-land breeze system. Numerical analysis using a digital computer will be employed to achieve the required solutions.

The results will be of substantial value in the analysis and control of interstate air pollution problems.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

#### 3.0065, GREAT LAKES RESEARCH - LAKE PRECIPITATION

J.A. DERECKI, U.S. Army, Lake Survey, Detroit, Michigan 48226

Purpose is to determine the precipitation over the large water areas of the Great Lakes and to derive methods to calculate the overwater precipitation from the overland records.

In cooperation with U. S. Weather Bureau, the lake precipitation is being recorded on selected small islands. In Lake Michigan precipitation recording started October 1963 on South Manitou, North Manitou, South Fox, Beaver and Ile aux Gallets Islands. In Lake Erie precipitation recorders were placed on West Sister and East Sister islands during May 1964. Field program will continue through October 1968. Hourly precipitation data are available in tables and on punch cards.

SUPPORTED BY U.S. Dept. of Defense - Army

#### 3.0066, EQUATORIAL CIRCULATIONS IN THE STRATOSPHERE

A.D. BELMONT, Control Data Corporation, Minneapolis, Minnesota (AT(11-1))

The object of this study is to help understand the nature of the field of motion in the tropical stratosphere. The results will be applicable to problems of atmospheric transport in this region.

As a continuation of earlier studies, selected aspects of the tropical stratospheric wind flow patterns from January 1961 - December 1964 as functions of height, latitude and longitude, will be described. Emphasis will be placed on estimating cross-equatorial flow both on a planetary scale and on the local scale at selected stations. As the winds at these base levels in tropical latitudes do not follow normal seasonal or monthly patterns, but are mainly dependent on the irregular quasi-biennial oscillation, multi-year mean monthly or seasonal statistics are of no significance, and all data must be presented for individual months and years. Studies of the diurnal variation of the meridional wind and its effect on computations of cross-equatorial transport will also be made.

SUPPORTED BY U.S. Atomic Energy Commission

#### 3.0067, THREE-DIMENSIONAL GLOBAL CLIMATOLOGY

H.L. CRUTCHER, U.S. Dept. of Commerce, Natl. Weather Records Ctr., Asheville, North Carolina

To determine: 1) the static structure of the atmosphere from the surface to as great height as is feasible; 2) the dynamic structure of the atmosphere by spectral analysis which is expected to provide preferred modes of motion in the atmosphere in the three dimensions, latitude, longitude, and altitude; and 3) the various time scales indicated to be important by the spectral analysis.

### 3. METEOROLOGY

To study geophysical data generally with respect to accuracy and representativeness and with a view to practical applications of these disciplines singly or in combinations.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 3D. SEA ICE-GLACIOLOGY

##### 3.0068, CARBON MONOXIDE CONTENT OF GLACIAL ICE AND THE NATURAL ATMOSPHERE

R.C. ROBBINS, Stanford Research Institute, Menlo Park, California

Carbon monoxide is one of the gases found in trace amounts in the earth's atmosphere. A very approximate estimate of the background concentration of carbon monoxide, based on information available to date, is 0.2 ppm or less. The total global emissions in automobile exhaust and other combustion processes is so large that carbon monoxide lifetime in the atmosphere cannot be more than a few years. The object of this research is to study the travel, distribution, and fate of atmospheric carbon monoxide by determining concentrations in remote areas having no combustion sources. Carbon monoxide concentrations in the Atlantic and Pacific, and in the northern and southern hemispheres will be measured. Examination of the concentration data will provide a much more comprehensive estimate of carbon monoxide lifetime in the atmosphere as well as improved ideas regarding the principal sink or sinks.

The assistance of Military Sea Transport Service will be requested to carry our CO analyzer with a technician on Atlantic and Pacific Ocean crossings. Also, we plan to make airborne measurements of CO concentration from an aircraft to an altitude of 25,000 feet in the vicinity of the California coast to obtain vertical carbon monoxide concentration profiles.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

##### 3.0069, MEASUREMENT OF COMMON LEAD IN THE EARTH'S HYDROSPHERE

C.C. PATTERSON, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109

The purpose of this investigation is to determine the change as a function of time in the concentration of lead in snow from polar regions. In order to understand the significance of the observed lead concentrations, it is necessary to determine the concentration of some other elements as well, such as chloride, sulphate, sodium, potassium, silicon, vanadium, calcium, magnesium and aluminum. It is hoped that we can detect lead originating from industrial sources, and those other elements can be used as indices for lead originating from both industrial and non-industrial sources. Sodium and potassium can be used as an index for the contribution from sea salts, for example, while chlorine can be used to estimate contributions from volcanic contaminations. Silica and aluminum can be used to estimate contributions from soil dusts. Sulphate, when combined with sulphur isotopic analyses, can be used to estimate the possible extent of industrial contributions.

During 1965 summer field season, a large number of snow samples were collected from Greenland. The analyses of these samples for lead and the other elements listed above will involve approximately 880 determinations using the following techniques; isotope dilution, flame spectrophotometry, atomic emission spectrography, colorimetry and nephelometry. The amount of work involved here is extensive and it is expected that these investigations will extend through 1967.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

##### 3.0070, ARCTIC UNDERSEAS RESEARCH, PHYSICAL AND CHEMICAL PROPERTIES OF SEA ICE

W.K. LYON, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine environmental factors affecting undersea uses of the ocean in Arctic areas. To determine the physical and chemical properties of sea ice. To model sea ice growth and break-up in the Laboratory Arctic Research Pool.

Approach: A large pool, completely insulated, has ice weather-makers above the water. The pool has been modified by installation of monel piping to reduce ferric ion. The capability of the pool to grow laboratory sea ice equivalent in chemical and physical structure to sea ice is being evaluated. Programmed inputs of weather cycles are approximated from actual Arctic conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 3.0071, ARCTIC UNDERSEAS RESEARCH, JOINT USA-CANADIAN HEAT BUDGET STUDY

W.K. LYON, U.S. Navy, Undersea Warfare Center, San Diego, California 92140

Objective: To determine environmental factors affecting undersea uses of the ocean in Arctic areas; determine and test theory of heat exchange adjusted to climatological observations.

Approach: Fundamental to ocean-cryological processes, is an understanding of energy transfer between the atmosphere, sea ice and sea beneath. Very large capacity, high speed data logging systems and many new, precise sensors are required and have been designed to permit direct processing of field data by computer. Precise measurements are made of temperature, wind speed and direction, turbulence, heat flow, water vapor, water transport, radiation, etc. The system includes cabling, buoys, towers, generators. After check-out of circuitry and calibration, as a joint USA-Canadian research project, the two barges and shore equipment will be installed in Jesse Harbor on Banks Island of the Canadian Arctic Archipelago. Installation is planned for FY 1969 if preliminary buoy installations last out the winter.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 3.0072, ELECTRICAL PROPERTIES OF ICE

E.R. POUNDER, McGill University, Graduate School, Montreal - Quebec, Canada

Systematic investigations are to be extended to include the electrical parameters of saline ice with salinity typical of natural sea ice at selected audio frequencies in the temperature ranges minus 20 degrees C to minus 100 degrees C to look for the effect of the phase changes in the composition of sea ice. These are expected to have significant results only at relatively low audio frequencies. To carry out similar measurements at a single temperature (minus 20 degrees C) over the frequency range 40 to 3000 HW.

This task will contribute to the ice reconnaissance operations employing radar and other electromagnetic techniques, as well as a greater understanding of propagation phenomena associated with radio communications, under, through and over sea ice.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 3.0073, HF AUDIO ABSORPTION IN ICE

E.R. POUNDER, McGill University, Graduate School, Montreal - Quebec, Canada (NONR)

An experimental study of high frequency audio adsorption in ice to investigate systematically the acoustic attenuation of sea ice as a function of frequency and salinity; to make reverberation measurements on sea ice at selected frequencies (100, 200, 500, 1000 KC); to measure reflection coefficients of sound waves incident from the water on the ice-water interface at selected frequencies and for a wide range of angles of incidence.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 3.0074, ARCTIC SUB-ICE STUDY

R.C. FAYLOR, Arctic Inst of North America, Washington, District of Columbia

The contractor will provide coordination, liaison and focal point for the conduct of a multidiscipline, multiagency program of under-ice acoustic, marine biological and sea ice investigations from the deep submersible vehicle PISCES. A series of dives throughout the Arctic Archipelago and Arctic Ocean under ice will be made to investigate marine biology, marine mammal acoustics, sub-ice acoustic regime and sub-ice oceanography.

### 3. METEOROLOGY

Investigations supported by this task provide the Navy with new information on sub-ice underwater sound.

SUPPORTED BY U.S. Dept. of Defense - Navy

**3.0075, SATELLITE SEA ICE STUDIES USING HRIR**  
*E.P. MCCLAIN, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Washington, District of Columbia 20235*

**OBJECTIVE:** To determine the usefulness of HRIR data in the 3.5- 4.1 micron water vapor 'windows' region for Arctic sea ice surveillance.

**PROBLEM ADDRESSED BY STUDY:** Knowledge of polar ice distribution and characteristic is essential for understanding large-scale, long-range climatic changes in the atmosphere. In addition, flight operations, shipping interests, exploratory petroleum-drilling efforts, and eventually manned space activities, all require knowledge of sea ice conditions in polar regions, particularly as these conditions affect, or are affected by, weather conditions. Very little definite knowledge of sea ice conditions in the polar regions is now available, and the task of acquiring such knowledge is enormous if attempted by surface or near-surface observation.

This study is aimed at determining the extent to which satellite HRIR data may be applied to determine sea ice characteristics in the Arctic Ocean and environs.

**APPROACH:** Nimbus I and II HRIR pictorial and digital data will be compiled and examined to determine the amount and quality of sea ice information which can be extracted. Ice covered areas will be identified and differentiated from clouds primarily through recognition of terrestrial features. Ice boundaries and open water areas will be delineated. The frequency with which useful IR observations can be obtained will be estimated. A comparison of data obtained from both satellites will be made to determine whether the higher resolution (because of the lower altitude) of Nimbus I results in a significant improvement in the capability of the system for ice surveillance.

**PROGRESS:** Several studies have been made of the uses of Nimbus NRIR data for observing terrestrial features. Popham and Samuelson found that the HRIR could detect considerable detail over the polar regions, with cracks in the pack ice of the Weddell Sea being readily apparent. However, no detailed studies of HRIR observations over ice areas have been conducted.

**BENEFITS:** This study will determine the feasibility of using satellite IR observations for ice and weather surveillance in the Arctic regions.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

**3.0076, ICEBERG DRIFT AND DETERIORATION**  
*M.J. MOYNIHAN, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia*

The U. S. Coast Guard is continuing to improve the capability and effectiveness of its International Ice Patrol Mission. Data on iceberg drift and deterioration has been routinely collected by the Ice Patrol now more than fifty years. Since 1964, special observations of icebergs by drogue and current meter measurements and by photo mapping techniques have been conducted in order to develop an iceberg model to support the iceberg drift prediction mission of the Ice Patrol Service. These measurements will be correlated with hydrographic data collected at the same time.

The special data collection phase of this project has been terminated and a complete report will be published by the U. S. Coast Guard in the Oceanographic Report Series (CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

**3.0077, WEST GREENLAND GLACIER SURVEY**  
*M.J. MOYNIHAN, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia*

In July 1968, the U.S. Coast Guard conducted a comprehensive oceanographic and geological expedition to twelve tidewater glaciers of West Greenland. The purpose of these expeditions was to study the source of the iceberg menace to the North Atlantic Shipping Lanes. This was the first study in this area by the International Ice Patrol since 1940 and it constitutes the first phase of

a three year project to study the productivity patterns of these glaciers, which are estimated to discharge annually 5400 icebergs.

The objectives of this series of annual expeditions are: (a) To determine the present number of icebergs calved from the major West Greenland iceberg producing glaciers. (b) To survey the glacier fronts and compare these data with earlier records to ascertain the advance, or recession, of the glacier termini. (c) To study the environmental conditions affecting the discharge and drift seaward of icebergs from the parent glacier.

Observations include an inventory of iceberg size, type, distribution, and movement. Glacier fronts were charted and bench marks established wherever possible to aid future surveys. Oceanographic observations are made at selected sites within the fjords and in the offshore waters. Photography of fjord bottoms, and significant marine life with an underwater camera and of major glacier fronts from camera equipped Coast Guard aircraft are planned.

The scientific results of this expedition with contributions from invited scientists will be published by the U.S. Coast Guard in the Oceanographic Report (Series CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

**3.0078, PREDICTION OF POLAR ICE BEHAVIOR AND DISTRIBUTION**

*W.I. WITTMANN, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

**Objective:** Expand and improve sea ice data collection, prediction, and dissemination services. Special emphasis is on prediction of underice ridges and dynamics of water features and thin ice features. As a corollary objective, these studies improve estimates of the global mass budget of ice and consequently global weather prediction.

**Approach:** Continue collection of ice information on an Arctic Ocean wide basis for a bank of statistical data concerning distributions, sizes, and frequencies of water openings, ice ridges, stages of ice development and other variables affecting operations. Implement a program involving coincident observation and measurement, over a wide ice covered region (i.e. 10,000 nm<sup>2</sup>), of ice-water stresses, air-ice stresses, ice motions and deformations. This program will use airborne remote sensor support.

SUPPORTED BY U.S. Dept. of Defense - Navy

**3.0079, ARCTIC AND COLD WEATHER SUPPORTING TECHNOLOGY**

*M.M. KLEIMERMAN, U.S. Navy, Ordnance Laboratory, Silver Spring - White Oak, Maryland*

**Approach:** This effort comprises a series of studies and field experiments conducted in-house; by U. S. and Canadian activities, and by industrial activities. There is no underice range in existence at the present time. Naval Ordnance Laboratory, Naval Underwater Research and Engineering Station, and Canadian DRIF are engaging in a cooperative effort for establishment of such a range in Nova Scotia, Canada. Stevens Institute is conducting mode' tank studies of bottom pressure fluctuations under an ice cover. Acoustics of the ice-water interface are being investigated by McGill. Seismic acoustic transmission through ice is being developed by General Motors.

SUPPORTED BY U.S. Dept. of Defense - Navy

**3.0080, ARCTIC SUPPORT**

*M.M. KLEIMERMAN, U.S. Navy, Ordnance Laboratory, Silver Spring - White Oak, Maryland*

**Approach:** This task area, with the Naval Ordnance Laboratory, White Oak, Maryland Laboratory, consists of several basic studies of the effect of high latitude environment on systems and the ways and means of coping with difficulties imposed by sea ice and/or cold weather. These studies consist of analytic approaches, laboratory experiments, and field measurements. Included are ice impact and penetration dynamics and remote sensing of ice thickness.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 3. METEOROLOGY

**3.0081, GREAT LAKES RESEARCH - RIVER ICE JAMS**  
*S.J. BOLSENGA, U.S. Army, Lake Survey, Detroit, Michigan 48226*

The causes of ice jams in rivers and methods of possible elimination of destructive jams or reduction of their power are being studied.

In the first step of the study pertinent manuscripts from all areas of the world have been collected, examined, and summarized. Foreign language manuscripts account for a significant portion of the items and were translated as required. Report acquisition was through standard library sources, translation agencies, and by direct contact with investigators in the field.

The final results of the survey will be a narrative summary and selected bibliography prepared from the reports. Completion will be in June 1968.

SUPPORTED BY U.S. Dept. of Defense - Army

**3.0082, GREAT LAKES RESEARCH - ICE CHARACTERISTICS**

*E.W. MARSHALL, U.S. Army, Lake Survey, Detroit, Michigan 48226*

The investigation seeks to determine the physical characteristics of ice cover in the Great Lakes by field measurements and laboratory analysis of samples from representative localities.

Field investigations are conducted during the 1965-66 and 66-67 winters in the Whitefish Bay area of Lake Superior. Among the factors investigated were: ice thickness, structure, crystal size and orientation, floe characteristics, pressure ridge configuration and ice foot formation. Aerial photomapping provided control for selection of ice samples and a permanent record for additional investigations. Micrometeorological measurements were taken at Whitefish Point during the 1966-67 season with particular emphasis on global radiation in four spectral bands. Petrographic studies of the ice samples collected in the field are conducted in the cold laboratory.

During the 1967-68 winter season studies will be continued in Whitefish Bay and extended to other areas on and near Lake Superior.

SUPPORTED BY U.S. Dept. of Defense - Army

**3.0083, GREAT LAKES RESEARCH - ICE COVER DISTRIBUTION**

*E.W. MARSHALL, U.S. Army, Lake Survey, Detroit, Michigan 48226*

This investigation seeks to determine the changes that take place in the areal distribution, structure, and imagery of the Great Lakes ice cover throughout the winter.

Currently three methods and levels are employed: low level visual reconnaissance, up to 8,000 feet, medium altitude aerial photography, 23,000 feet, and high level satellite imagery, 400 to 800 nautical miles.

The visual aerial reconnaissance program provides the extent and relative concentration of ice. These observations are coordinated with those of the Canadian Department of Transportation which covers the Canadian portions of the Great Lakes. These observations provide a general synoptic view of ice conditions at 10-15 day intervals.

Aerial photomapping of the ice cover at the scale of 1:46,000 is carried out over eleven areas critical to Great Lakes shipping. Weather satellite imagery is monitored to aid in determining ice distribution and program planning.

SUPPORTED BY U.S. Dept. of Defense - Army

**3.0084, GREAT LAKES RESEARCH - GREAT LAKES DE-ICING**

*E.W. MARSHALL, U.S. Army, Lake Survey, Detroit, Michigan 48226*

This investigation will prepare three reports (1) Annotated bibliography based on the world's literature on the natural conditions of the formation and decay of freshwater ice on lakes, harbors, rivers and locks as well as scientific and engineering information on techniques used to aid the delay of ice formation and to accelerate the ice in both fresh and marine environments. (2) A

summary of the pertinent papers identified in the above and (3) A summary of information developed by the in-house projects of the Research Center on Great Lakes ice characteristics and areal distribution.

SUPPORTED BY U.S. Dept. of Defense - Army

**3.0085, PHASE RELATIONS OF THE HYDRATED CARBONATES OF CALCIUM AND MAGNESIUM**

*D.L. GRAF, Univ. of Minnesota, Graduate School, Minneapolis, Minnesota 55455*

The project is concerned with determining the equilibrium phase relations and crystal structures of the carbonates of calcium and magnesium. A knowledge of these phase relations will help one to understand the effect of surface reactions and solution structure upon the kinetics of nucleation, growth, and solution of both hydrated and anhydrous Ca and Mg carbonates in aqueous solutions. The broad understanding of interactions between carbonate solids and water afforded by the total program would be particularly relevant to the formation of dolomite and to the physical properties of sea ice.

SUPPORTED BY U.S. National Science Foundation

**3.0086, SPECIALIZED RESEARCH EQUIPMENT FOR SEA ICE STUDIES**

*K.O. BENNINGTON, Univ. of Washington, Graduate School, Seattle, Washington 98122*

The proposed research by the University of Washington will allow for the purchase of specialized equipment for a study of differential pressure and internal stresses that develop in sea ice as it freezes during the polar winter. The data that may be gained from this research is basically an understanding of the driving forces that are instrumental in the escape of brine from sea ice. A correlation will be attempted between temperature waves, the resulted pressure waves, and associated compositional changes during the formation and aging of sea ice. Such a correlation has not previously been made. This research project by the University of Washington was begun during the winter of 1966-67, and the equipment that is proposed to be acquired would allow the expansion in both data obtained and in the sophistication of the research. The study of sea ice is an interdisciplinary field between oceanography, glaciology, meteorology, and physics that is essentially restricted to the polar areas. It is expected that the results of this research will contribute to an understanding of one of the major surface features of both the Antarctic and the Arctic regions.

SUPPORTED BY U.S. National Science Foundation

**3.0087, SEA ICE MOVEMENT DYNAMICS**

*N. UATERSTEINER, Univ. of Washington, Graduate School, Seattle, Washington 98122*

Evaluation of an existing mathematical model of sea ice movement with special emphasis on the term in the equation of motion representing the eddy viscosity of ice, and an elaboration of a plan to obtain empirical data necessary for a basic improvement of the model.

This project will aid in developing knowledge of the environmental factors that affect the polar ice fields and that is necessary for ice and topographic charting; ice predictions and allied purposes. The application of the model in forecasting ice concentration and movement showing open leads and pressure ridges will assist in routing of ships.

SUPPORTED BY U.S. Dept. of Defense - Navy

**3.0088, ARCTIC AIR, SEA AND ICE**

*N. UENTERSTEINER, Univ. of Washington, Graduate School, Seattle, Washington 98122*

Coordinated micrometeorological investigations on shore at Barrow, Alaska, and on drifting stations establish qualitative and quantitative relationships of climate to the physical and biological phenomena it controls. Variables investigated are thermal, moisture and wind gradients, net radiation exchange and carbon

### 3. METEOROLOGY

dioxide of the atmosphere. Atmosphere and oceanographic factors are studied in their inter-relationships with the annual energy budget of ice, rate of ice formation and distribution information and drift and crystallographic structure.

This task contributes to knowledge of world-wide climatic circulation and specially to climatic patterns in the Arctic. Significant knowledge accrues on the earth's energy balance and the relationship of energy flux at water and atmospheric interfaces of ice to the growth, behavior and wastage of sea ice. Knowledge of total Arctic environments provide criteria for all Navy Arctic operations either by air, surface or water-ice approaches; safety and comfort of personnel; design of equipment; and for establishment of rational procedures. The interrelated studies furnish data essential for improved weather and ice forecasting.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 3E. WEATHER MODIFICATION

##### 3.0089, ION CLOUDS IN THE UPPER ATMOSPHERE

*J.W. COOPER*, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

Chemical seeding of the upper atmosphere with materials which form ion clouds has important military applications. The project aim is, as part of a cooperative effort involving scientists from a number of other installations, both in government and industry, (a) to investigate the feasibility of various proposals which have or are being made for chemical seeding and (b) to divide what areas of research and development are most likely to effectively improve the efficiency of chemical seeding processes. Both of these goals must be approached with specific applications in mind.

Work on this project consists mainly of maintaining a close contact with researchers who are actively engaged in chemical seeding technology or in closely related fields as well as those workers who intend to use such releases for specific applications. Detailed work consists in trying to determine what mechanisms are responsible for ionization in previously performed or proposed chemical releases.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 3.0090, PROJECT FOG DROPS

*W.C. KOCMOND*, Cornell Aeronautical Lab. Inc., Buffalo, New York 14221

The purpose of Project Fog Drops is to investigate natural warm fog properties and dynamics and to suggest and evaluate concepts for modification of warm fogs. The principal accomplishments to date are summarized below.

A generalized fog classification system has been evolved. Structural models have been established for the micro- and macroscopic properties of advection and radiation fogs and for sea fog. A fog climatology has been established for the Continental United States.

Measurements made with the thermal diffusion chamber indicate that the maximum supersaturation achieved in urban fog is substantially less than 0.1 percent and that sources of atmospheric pollution are not the major contributors to the fog nucleus concentration.

Theoretical and experimental investigations have shown that the growth rate of droplets can be decreased by treatment of the droplets with certain surface active monolayers. Ionic surfactants were shown to inhibit rather than promote coalescence.

We have demonstrated in the laboratory that it is impractical to attempt to modify fog by placing electrical charge on the fog droplets. A procedure is currently being tested in the field for suppressing dense natural fog. Experiments in a 600 cubic meter cloud chamber have demonstrated that visibility in warm fog can be improved by a factor of up to 10 by seeding with hygroscopic nuclei of carefully controlled sizes.

### 4. SURVEY AND PREDICTION

#### 4A. DATA NETWORKS

##### 4.0001, SATELLITE COMMUNICATION TESTS

*R.F. DEVEREUX*, General Dynamics Corporation, San Diego, California (NONR)

The purpose of this task is to evaluate the use of synchronous satellite communication for telemetering oceanographic and meteorological data from moored oceanographic buoys, and to compare the method with the high frequency radio telemetry system now in use aboard the ONR monster buoys. To accomplish this a VHF system will be installed as an additional communication link aboard an existing monster buoy which will be anchored in the middle of the North Pacific in the summer of 1968. The data collected by the oceanographic and meteorological sensors will be stored in the buoy and transmitted, on command, from shore, by both VHF and HF radio links. Interrogation will be made from San Diego, California.

The capability of the Navy to make reliable predictions of the ocean environment for operations will depend in large part on synoptic ocean-wide networks of data collecting buoys. This task will provide experimental data important to the communication links necessary to such systems.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0002, OCEAN SYSTEM TELEMETRY STUDY

*R.F. DEVEREUX*, General Dynamics Corporation, San Diego, California (NONR)

A comparative engineering and economic analysis will be made of the use of moored surface buoy/radio links and ocean floor cabled systems for telemetering at remote locations both near and far from land masses. Applicable modulation, coding, data compaction transmission frequencies, subsurface cable characteristics, mooring techniques, reliability and costs are included in the study.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0003, NATIONAL DATA PROGRAM FOR THE MARINE ENVIRONMENT

*J. SINGLETON*, System Development Corporation, Santa Monica, California

This is a comprehensive ocean data management study intended to identify, formulate, and evaluate problems of information and data management associated with a national program for the development of the potential of the marine environment. The study should provide overall delineation of a preferred National Marine Data Program, including policy and operational arrangements, and specific priority steps for implementation.

Phase I of the task, completed in November 1967, was a 5-month project definition phase to determine the scope and structure of marine environmental data activities in the Federal and State governments, industry and universities. The 14-month Phase II will evaluate marine data and means for handling it; and design plans for a National Data Program for the Marine Environment.

## 4. SURVEY AND PREDICTION

### 4.0004, STANDARD MONITORING SECTIONS (ATLANTIC AND PACIFIC OCEAN)

R.E. LENCZYK, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The oceanographic program on the Standard Monitoring Sections consists of the occupation (monthly and/or seasonal) of a line of oceanographic stations which are normal to a major current system. These sections, 7 in the Atlantic and 6 in the Pacific, were selected to include the most dynamic areas possible consistent with the normal tracks of the Ocean Station Vessels. The sections in the North Atlantic will provide considerable information about the Labrador and North Atlantic current systems. The North Pacific sections will provide information about the Kuroshio, North Pacific and California currents.

Serial observations are made of temperature and salinity to a depth of 1500 meters or to near bottom when the water depth is less than 1500 meters at each station and stations are taken at intervals that vary from 10 to 60 miles. Observations of temperature and salinity from each Nansen cast station are transmitted by radio teletype to the U. S. Coast Guard Oceanographic Unit for real-time processing, quality control and dissemination to users. During FY 69, the In Situ Salinity/Temperature/Depth electronic measuring system (STD) is being introduced aboard the Atlantic and Pacific Ocean Station Vessels. This instrument will produce a continuous record of salinity and temperature versus depth and will be calibrated with simultaneous Nansen bottle data.

Data from these cruises are available at the National Oceanographic Data Center approximately two months following the cruise. These data with analyses will be published by the U. S. Coast Guard in the Oceanographic Report Series (CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 4.0005, TIME-SERIES OBSERVATIONS OF TEMPERATURE AND SALINITY (NORTH ATLANTIC AND NORTH PACIFIC OCEAN STATIONS)

R.E. LENCZYK, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The oceanographic program on the Ocean Stations consists of time-series observations of temperature and salinity. Nansen casts are made daily to 1500 meters in depth and once during the three week patrol to near bottom, weather and other operations permitting. Observations are made at 14 standard levels, the levels dependent upon historical data at each station. The temperature data is transmitted by radio teletype to the U. S. Coast Guard Oceanographic Unit for real-time processing, quality control, and dissemination to users. Salinities are determined at sea by the use of inductive salinometers. Salinity data are also transmitted by radio to the U. S. Coast Guard Oceanographic Unit for quality control. Occasionally, other observations are made by the OSVs, upon request, including biological sampling, collection of samples for chemical analyses, bathymetry, wave height measurements and others.

During FY-69, the use of an electronic measuring system was initiated on the Atlantic Ocean Stations. This instrument, the In Situ Salinity/Temperature/Depth Measuring System (STD), produced a continuous record of temperature and salinity versus depth. Observations are made to 1500 meters in depth four times daily. The STD observations are calibrated by simultaneous Nansen bottle observations. By the end of FY-69, it is expected that 75% of the Ocean Station Patrols in the Atlantic will be made using the STD system. Also the Pacific OSVs will be phasing in the STD instrument by this time.

Data from these cruises are available at the National Oceanographic Data Center approximately two months following the cruise. These data with analyses will be published by the U. S. Coast Guard in the Oceanographic Report Series (CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 4.0006, COAST GUARDS COASTAL OCEANOGRAPHIC MONITORING NETWORK

M. LIGHT, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The Coast Guard presently maintains seven off-shore light stations and one large navigational sea buoy as replacements for

lightships along the East Coast. Eventually all of the remaining 13 lightships will also be replaced by fixed aids-to-navigation. These fixed off-shore stations proved unique facilities for the continuous monitoring of the ocean environment. During the past 12 years the lightships and the fixed light stations have been used to monitor water temperatures and salinities with relatively unsophisticated instruments.

A prototype automatic oceanographic sensing and recording system was installed in December 1966 aboard the Buzzards Bay Light Station off Cuttyhunk Is., Mass. This system consists of four oceanographic sensor modules that precisely define in digital form five ocean parameters, and telemeter them through an inductive link to on-deck programming and data storage unit. Parameters measured include temperature, salinity, current speed, current direction, and depth.

In February 1967, a prototype oceanographic meteorological monitoring system was installed aboard the SCOTLAND Large Navigational Sea Buoy off Sandy Hook. The oceanographic transducer package is located approximately 5 feet below the water surface and measures the same parameters as the Buzzards Bay system. Its meteorological system measures air temperature, wind speed, wind direction, and barometric pressure. Digitized data are telemetered over the remote control and monitoring system for the on-board navigational equipment. The data are recorded automatically at Coast Guard Station, Sandy Hook on an incremental tape recorder. Typewritten printouts for real-time monitoring of data are also obtained on command.

The U. of Rhode Island Institute of Ocean Technology has a contract to provide for high order processing, analysis, and interpretation of data from both systems.

Data tapes produced by the Coastal Oceanographic Monitoring Network will be lodged with National Oceanographic Data Center. Monthly data reports will also be made available to the oceanographic community when these systems become operational.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 4.0007, ENVIRONMENTAL MEASURING EQUIPMENT

R.P. COOK, U.S. Navy, Air Systems Command, Washington, District of Columbia

Objective: Develop environmental measuring equipment which will operate over extended periods and under adverse conditions to provide meteorological and oceanographic data over the now data-sparse polar and ocean areas. This equipment is designed to provide enough additional data to markedly enhance the techniques which are used to accurately predict those critical environmental factors which affect Naval operations.

Approach: Reduce the environment into arbitrary functional areas, such as: (1) Surface data for island and polar stations; (2) limited surface and subsurface data for marine stations; (3) full-range surface and subsurface data for marine stations, and (4) limited upper-air data for 2 and 3 above. Establish a best basic platform or mix of platforms for each functional area. Acquire, equip and test the platforms; and refine the various subsystems as necessary to show finite overall progress. Establish the best arrangement of marine platforms into a geographical array with the goal of achieving an operational network capable of acquiring and disseminating all of the environmental data affecting naval operations. Effort to be coordinated with the USCG National Buoy Study.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0008, DEVELOPMENT EXPERIMENTAL SYSTEM FOR AIR SEA INTERACTIONS

M. GARSTANG, Florida State University, Graduate School, Tallahassee, Florida 32306

Over a planned three-year period, Florida State University, with major support from SAIL, is developing a buoy system for measurement of meteorological and oceanographic parameters. With ESSA ship and SAIL staff support, field investigations will be made over extended time periods in the vicinity of Barbados.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

#### 4. SURVEY AND PREDICTION

##### 4.0009, ANALYSIS AND INTERPRETATION OF SATELLITE RADIATION DATA

UNKNOWN, U.S. Natl. Aero. & Space Adm., Goddard Space Flt. Ctr., Greenbelt, Maryland

Technical Objective: To investigate the physical processes of the Earth-atmosphere system which affect the outgoing radiance over the parts of the spectrum sensed by the TIROS, Nimbus, and ATS radiation experiments, leading to methods of interpreting the data to consolidate the results of the experiments with theoretical concepts of atmospheric processes.

Approach: Analytical methods to determine the transfer of infrared and visible radiation in the atmosphere, through clouds, and at the Earth's surface are developed and applied to radiation measurements from meteorological satellites. These measurements are then interpreted in terms of the composition of the atmosphere, the global heat balance, and the general atmospheric circulation. In accomplishing these studies approximately five National Academy of Sciences - National Research Council Post-doctoral Resident Research Associates are supported along with the in-house civil service scientific staff, totalling some ten scientists. Because of the nature of this Work Unit, involving a concentration of activity largely having to do with multiple analyses of vast quantities of satellite data and the subsequent documentation of results, about 90% of the funds are required for computer programming, data handling, graphic services, visual arts, photographic, and publication support.

Progress: As of 26 January 1968, more than 7,000 individual orbits of radiation and spin-scan camera data have been acquired from satellites TIROS II, III, IV, and VII; Nimbus I and II; and ATS I and III. Many in-house studies of both a theoretical and empirical nature have been carried out to demonstrate the capability and potential of the measurements. Several of these studies have been reported, or brought nearly to completion during this reporting period.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0010, WEIR, TRAP AND SEINE FISHERY

A.E. PETERSON, State Div. of Marine Fisheries, Boston, Massachusetts

Objective: To obtain landing statistics, including location and gear, from weirs, fish traps, and seines.

Procedure: Weir and trap fishermen are required to submit monthly catch reports to the Director of the Division of Marine Fisheries. Catch reports would be required from seine operators landing their catch in Massachusetts. Interview sampling will be used to validate these reports.

Part 3 of 6.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Massachusetts State Government

##### 4.0011, ANADROMOUS FISHERY

A.E. PETERSON, State Div. of Marine Fisheries, Boston, Massachusetts

Objective: To obtain accurate commercial landing statistics from the alewife fishways of the Commonwealth.

Procedure: All companies or individuals involved in commercial fishing for alewives in fishways of the Commonwealth will be required to submit weekly landing reports. It will be necessary to obtain a list of those individuals or companies involved in this fishery from the towns of the Commonwealth, since the leasing rights are vested in them. Interview sampling will be used to validate the catch reports.

Part 4 of 6.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Massachusetts State Government

##### 4.0012, SHELLFISHERIES

A.E. PETERSON, State Div. of Marine Fisheries, Boston, Massachusetts

Objective: To obtain accurate commercial landing statistics, including location, catch, effort, and gear of the shellfisheries of the Commonwealth.

Procedure: Commercial shellfishermen are required to have a 'bed certificate' issued by the Director of Marine Fisheries in order to sell shellfish. As a requirement for obtaining a 'bed certificate', the fisherman will be required to submit a monthly catch report, stating species, amounts, location, and gear. Town shellfish officers will also be asked to submit monthly reports on landings for their towns. Stimulations for such reports from the officers can be made under the Division of Marine Fisheries' shellfish assistance program. A random sample, utilizing interviews, will be used to verify fisherman catch reports.

Part 5 of 6.

Massachusetts State Government

##### 4.0013, OCEANOGRAPHIC DATA SYSTEMS

R.F. HILL, Univ. of Rhode Island, School of Engineering, Kingston, Rhode Island 02881

The development of techniques for the optimum design of total synoptic data systems on the basis of specific missions and under the constraint of cost.

SUPPORTED BY Raytheon Company

##### 4.0014, DESIGN OF SAMPLING PLAN AND PROCUREMENT OF CHARTER VESSEL

E.B. JOSEPH, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The objective is to design a plan for exploratory bottom trawling on the Continental Shelf between Cape May, N. J. and Cape Hatteras, N. C. and to charter a vessel capable of executing the plan. Trawl stations will be spaced so as to sample representative bottom types and depths and to indicate the kinds, numbers, and distributional patterns of the fishes available to bottom trawls, with emphasis on those of potential industrial importance. Information obtained by interviewing trawlermen familiar with the area and by observing catches of trawlers fishing in the area will contribute to the plan. The plan will be designed to facilitate statistical analysis and machine processing of the data. Work will be accomplished in November and December, 1965.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Virginia State Government

##### 4.0015, USES OF STATISTICAL INFERENCE AND EXPERIMENTAL DESIGN FOR EFFICIENT COLLECTION OF OCEAN DATA

J.C. KELLEY, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: In order to monitor and predict the environment, operational and research activities supported by the Navy must place measurement devices within and collect samples from the ocean. This research will provide the plan or design for a sampling program which meets, for minimal cost, the scientific and technological requirements stated as objectives by investigators directing Navy-sponsored ocean research.

Approach: This task makes extensive use of shore-based and shipboard digital computing equipment at the University of Washington. Under investigation are techniques to make available in easily understood graphical representations the state of available information at each state of a cruise. More efficient methods of data storage and retrieval are being developed. Using available field data and completed analyses of the data, estimates will be made of sampling error associated with a single data point. The results of the studies, together with state-of-the-art programming and statistical techniques, will be used to provide optimum sampling plans and costs for specific field experiments. The type of data to which this approach can be applied ranges from the mineral analyses of bottom samples to surface water temperatures.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 4. SURVEY AND PREDICTION

### 4B. DATA PROCESSING AND ANALYSIS

#### 4.0016, SYSTEM DESIGN STUDY FOR THE U.S. NAVAL OCEANOGRAPHIC OFFICE INTELLIGENCE DATA HANDLING SYSTEM

*J.D. LITTLE*, Planning Research Corporation, Los Angeles, California

PRC conducted a system analysis and design study for an automated data handling system for the U.S. Naval Oceanographic Office (NAVOCEANO) Mapping, Charting, and Geodetic Divisions. Current operations and future NAVOCEANO requirements were investigated in the areas of nautical and aeronautical charts and publications, and the handling and utilization of geodetic, gravimetric, magnetic, and hydrographic data.

The purpose of the study was to design a system which optimized the automation in handling both the source and reference information and materials used in graphic preparation. Data collection and reduction were performed, followed by the formulation of an operational concept and a time-phased system development plan. Interface requirements with all NAVOCEANO data interchange organizations were studied in order to maximize compatibility in information transfer and file formatting.

SUPPORTED BY U.S. Dept. of Defense - Air Force

#### 4.0017, DATA COLLECTION

*H. KLEIN*, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

This effort provides technicians trained to take observations independently, maintaining equipment, making measurements ashore of samples taken at sea, processing data, and producing data reports and charts. Procurement, calibration, and maintenance of much used instruments are carried on. Data processing is carried to the point of distribution as tables, charts, and diagrams adapted to the needs of different users.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 4.0018, EVALUATION AND STATISTICAL ANALYSIS OF ALL DATA

*T.P. RITCHIE*, State Comm. on Shell Fisheries, Dover, Delaware 19901

The data obtained from the first three phases of this project will be evaluated by a qualified statistician. The new data that is obtained will be compared with the data available from Moore's survey in 1910. The net loss or gain in natural seed bed area will be documented and mapped. The uncharted hard bottom areas will be mapped in order to permanently establish the areas where future rehabilitation projects should be conducted.

Part 4 of 4.

Delaware State Government

#### 4.0019, BIOMETRY

*E. LUKACS*, Catholic University of America, Graduate School, Washington, District of Columbia 20017 (NONR)

This task is concerned with the application of statistical methods to biological problems. The investigator and his staff consult with biologists in areas of mutual interest and provide advice and assistance on the design of experiments and the interpretation of mathematical results. Current emphasis is on new methods of statistical analysis of direction of movements and time periods involved in biological orientation. An attempt to develop new methods of multiple comparisons is being made where a sample range is used instead of ordered observations. This is especially useful in taxonomy and population variation.

This task is part of the program of oceanic biology and serves as a valuable analytic tool. It also serves in the translation of biological observations to mechanical and electronic equipment which the Navy requires for knowledge of such biological capabilities as homing, navigation, and avoidance and accurate integration of environmental clues.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 4.0020, AUTOMATIC DATA PROCESSING - SEABIRD DISTRIBUTION

*G.E. WATSON*, Smithsonian Institution, Washington, District of Columbia 20560

Numerical codes for computer analysis have been devised for at-sea bird observations made during the Pacific Ocean Biological Survey Program so that they may be computer analyzed. The International Seabird Committee has requested the Smithsonian Institution World Data Center and the Woods Hole Oceanographic Center to coordinate the storage and analysis of similar records on a world-wide basis. The first phase of this study will deal with adapting the POBSP codes for international use, devising a suitable nomenclature and code for seabirds of the world and establishing a uniform format for recording data. Later phases will deal with analyzing records.

SUPPORTED BY Smithsonian Institution

#### 4.0021, FOSDIC APPLICATION TO CURRENT-METER RECORDS

*M.L. GREENOUGH*, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

The output films of certain commercially-made underwater recorders should be reducible by Government-owned scanners such as FOSDIC. It is the goal of this project to program the MOBIDIC - FOSDIC VI combination to scan these films, and to make the necessary modifications to its film-handling mechanism. It is expected that the use of this equipment will greatly reduce the cost of handling these records. As a programmable film reader, FOSDIC VI should be able to sense the multi-track lines so as to determine the direction of water flow. Velocity indication should be derived from counting the number of dots in groups on the films.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

#### 4.0022, ANALYSIS AND DISPLAY OF HYDROGRAPHIC DATA

*R.L. WHEATLEY*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

Objective: Develop automatic cartographic compilation and reproduction techniques and equipment to reduce, by a factor of 2, the time required for base plant compilation and reproduction of charts in support of amphibious, port, and search/retrieve operation, as well as for general navigation purposes. Production of a chart presently requires six to nine months. This development will reduce the required lead time to three or four months for production of a chart. Coordinated development of components is scheduled through FY 73 to provide a logical sequential upgrading of functions. This effort is directed toward solving problems within the scope of mapping, charting, and geodetic functions as defined in the report, *Effective Use of the Sea*, June 1966, published by the panel on oceanography of the President's Science Advisory Committee.

Approach: In-house and contractual evaluation and studies of cartographic digital library functions, and of selected automatic digital compression and manipulation techniques and concepts for image and graphic data processing will be made. Hardware development will be directed toward automatic digitization of cartographic data and color separation functions and chart correction techniques. This will be followed by development of prototype automated correlation and mensuration techniques and equipment and a rapid graphic imaging and dissemination system. Evaluation of prototype components will provide the basis for development of an operational system.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 4.0023, OCEANOGRAPHIC PROCESSING TECHNOLOGY INFORMATION

*W.E. YERGEN*, U.S. Navy, Oceanographic Office, Washington, District of Columbia

OBJECTIVE: Develop a 'Live Atlas' consisting of highly compacted oceanographic data which are retrievable in real-time from a master file through use of computers and which allow man interaction through use of CRT displays.

#### 4. SURVEY AND PREDICTION

**APPROACH:** Compress voluminous National Oceanographic Data Center data files and unifying them into a master file using common geographical and chronological sorting parameters. Data are to be stored in binary format. The file will have an open end capability to allow addition of new data.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0024, ANALYZE AND PUBLISH BASIC DATA FROM PILOT STUDY

**G.R. SECKEL**, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

Heat, salt, and momentum 'budgets' are the study to determine the mechanisms which change the distribution of properties and water masses in the trade wind zone. Using pilot study data analytical studies are undertaken to develop the necessary water 'budget' techniques. The feasibility of the investigation will be demonstrated in publications of the analytical studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 4.0025, DIGITAL RECORDING AND PROCESSING OF IN SITU DEPTH-TEMPERATURE-SALINITY DATA

**V. GRAEFE**, Univ. of Hawaii, Hawaii Inst. of Geophysics, *Honolulu, Hawaii* 96822

A commercially manufactured depth-temperature-salinity recorder (DTS) is being used by the Department of Oceanography. It presents the measured data in the form of a graph of temperature and salinity versus depth. Digitizing equipment has been developed which transforms the telemetry signals produced by the DTS system into digital values of the three variables and records these on a teletypewriter. Simultaneously the values are punched on paper tape for later computer processing and they are also transmitted via a radio-teletypewriter link to the HIG for immediate processing. The data are then checked on an IBM 1401 computer for errors which might have been introduced by slipping noise or malfunction of the teleprinters. To some extent these errors are corrected automatically, while other errors have to be corrected by hand. The data are then smoothed, freed from systematic errors, and punched on cards in a standardized format on an IBM 360/50 computer. These cards contain one value each for temperature and salinity for every two meters of depth; the values are believed to be correct to plus or minus 0.002 degrees C (temperature) and 0.03% (salinity). Other programs have been written which use these cards to compute--among others--density, dynamic height, and sound velocity values--and which present derived as well as observed quantities in graphic and numerical form.

The two-meter data cards are made available to the NODC.

SUPPORTED BY University of Hawaii

##### 4.0026, PHYSICAL AND CHEMICAL ATLAS

**K. WYRTKI**, Univ. of Hawaii, Graduate School, *Honolulu, Hawaii* 96822

This grant is for continued preparation of the physical and chemical oceanographic atlas resulting from the International Indian Ocean Expedition. The atlas will be in two parts: Part I will contain the distribution of physical and chemical properties at selected levels and along specific sections of the ocean. Part II will consist of an analysis of all data submitted to World Data Center A, including property distribution, core layer analysis, oxygen, minima and maxima, phosphates, bottom temperature, depth of the mixed layer and intensity of thermocline.

SUPPORTED BY U.S. National Science Foundation

##### 4.0027, RESEARCH IN MARINE GEOLOGY

**A.F. RICHARDS**, Univ. of Illinois, Graduate School, *Urbana, Illinois*

The primary objective of this research is to complete the data reduction, interpretation, and publication of results obtained on the 1966 cruise of the OCEANOGRAPHER (OPR-470).

To analyze and prepare for publication the seismic profiles, magnetics and gravity data.

The bathymetry, magnetics, gravity, and reflection seismic profiles have been compiled in the form of charts and profiles.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### 4.0028, ANALYTICAL OCEANOGRAPHY

**R.B. MONTGOMERY**, Johns Hopkins University, Graduate School, *Baltimore, Maryland* 21218 (NONR)

The purpose of this work is to develop improved procedures for the analysis and presentation of serial oceanographic data and also to utilize these procedures in the analysis of existing data to attain better descriptions of oceanic structure. Sets of oceanographic statistics from the world's oceans are being summarized and graphic presented; temporal variations of temperature, salinity and oxygen from 1500 to 4000 meters as observed at Weather Station PAPA are being analyzed; and studies of the Gulf Stream and Mindanao Current are being made.

The proper analysis of oceanographic data and synthesis of a clear picture of oceanic structure is essential for a clear understanding of the environment. The results from this task contribute both to better description and understanding of the ocean environment and the development of techniques that are useful to survey programs.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0029, DISSEMINATION OF COMMERCIAL FISHERIES STATISTICS

**A.E. PETERSON**, State Div. of Marine Fisheries, *Boston, Massachusetts*

Objectives: To disseminate statistics in monthly bulletins in cooperation with the Bureau of Commercial Fisheries.

Procedures: The catch statistics will be compiled under the phases listed above. After evaluation and application of various descriptive statistics, the data will be submitted to the Bureau of Commercial Fisheries, to be published in cooperation with the monthly 'Massachusetts Landings' bulletin.

Location: Boston, Massachusetts, and throughout the Commonwealth as required.

Part 6 of 6.

Massachusetts State Government

##### 4.0030, GRAVITY AND MAGNETIC DATA COLLECTED DURING THE INTERNATIONAL INDIAN OCEAN EXPEDITION AND IN THE CARIBBEAN SEA

**C.O. BOWIN**, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts* 02543

A vast amount of geophysical data has been collected during the several cruises of the R/V CHAIN and R/V ATLANTIS II into the Indian Ocean. The purpose of this study is to analyze and interpret the gravity and magnetic data obtained on the geophysical cruises to the Indian Ocean, Red Sea, Mediterranean Sea, Atlantic Ocean and the regions around Hispaniola. The research will be conducted primarily by means of using new programming methods on digital computer equipment. Important steps in the analysis of the information are reduction of the raw data, reprocessing, testing, and plotting maps and profiles. The comparison of calculated gravity anomalies from model crustal structure profiles with observed values will also be undertaken as it has great promise as a means of exploring the oceanic crust.

SUPPORTED BY U.S. National Science Foundation

##### 4.0031, WOODS HOLE SHIPBOARD DATA PROCESSING

**E.E. HAYS**, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts* 02543 (NONR)

Objective: To carry out real time oceanographic data processing, computation, and plotting required for reporting oceanic phenomena.

Approach: Continue the development of a computer system aboard CHAIN centered about the Hewlett-Packard 2116A digital computer to produce a real time system for acquisition, reduction, recording, and display for navigation, gravity, and magnetic information.

## 4. SURVEY AND PREDICTION

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0032, ACQUISITION, REDUCTION AND INTERPRETATION OF MARINE MAGNETIC DATA

*J.R. HEIRTZLER*, Columbia University, Graduate School, New York, New York 10027

The purpose of this research project is to continue the acquisition, reduction and interpretation of marine magnetic data from one ship over a two-year period. Digital computer processing and plotting methods, operational since August 1964, now make it possible to keep pace with data acquisition.

It is important that area studies be continued. Large provinces with linear magnetic patterns have been found off the east and west coasts of North America. Long linear magnetic anomalies have been associated with the Atlantic mid-oceanic ridge system. As the density

interpretation in other areas such as the East Pacific-Antarctic Pacific mid-oceanic ridge system, the Argentine shelf and the West African shelf, becomes feasible.

SUPPORTED BY U.S. National Science Foundation

### 4.0033, ACQUISITION AND INTERPRETATION OF OCEANIC GRAVITY DATA

*J.L. WORZEL*, Columbia University, Graduate School, New York, New York 10027

The present analog cross coupling computer used to apply corrections to gravity values will be improved and studies of non-linearity of the gravity meter in the presence of large vertical ship accelerations will be carried out. An analog will be built and analog equipment to correct for slow response of gravity meter will be constructed. Also, under this grant, existing computer techniques for rapid data processing will be extended and improved.

Studies will be made of the crustal structure of Mid-Ocean Ridges, Deep Sea Trenches, Continental Margins, Seamounts, etc. The basic technique will involve combining gravity data with available magnetic and seismic information.

SUPPORTED BY U.S. National Science Foundation

### 4.0034, INDIAN OCEAN DATA REDUCTION

*EWING*, Columbia University, Graduate School, Palisades, New York 10964

The major objective of this study is to analyze in detail the data collected during the International Ocean Expedition. The Lamont Geological Observatory has gathered data in the Indian Ocean on the R/V VEMA and the R/V CONRAD during the field operations of the Expedition and the data recovered from these cruises have been worked up in a preliminary manner aboard the ship to assure that the data is of good quality. Upon returning to the laboratory, these data must be further reduced as the preliminary operations do not cover all the possible corrections and information. It is planned, insofar as possible, to analyze these data in conjunction with each other and not to attempt to analyze them as completely separate studies. The work will include studies on bathymetry, geophysics, geochemistry, sedimentology, physical oceanography, bottom photographs and biology.

The reading, plotting and profiling of soundings obtained by R/V VEMA, R/V CONRAD and R/V ANTON BRUUN of several detailed areas where data are particularly concentrated will be completed. The preparation of diagrams, profiles, maps, tables, etc., showing the distribution of the geological, geophysical and topographic characteristics of the Indian Ocean will be prepared for a monograph to accompany the physiographic diagram of the Indian Ocean. An emphasis will be placed on evaluation of the geophysical data, (gravity, seismic, magnetic and heat flow measurements) in conjunction with the bathymetry for the purpose of elucidating the structure of the Indian Ocean basin.

SUPPORTED BY U.S. National Science Foundation

### 4.0035, OCEAN BOTTOM EMPLACED GEOPHYSICAL STATION

*M. EWING*, Columbia University, Graduate School, Palisades, New York 10964

The principal investigators have been engaged in the design, development, and installation of an ocean bottom geophysical station since 1963. The present observatory was placed on the ocean floor approximately 200 km west of San Francisco at a depth of 3.9 km in May 1966 and has operated with a high degree of reliability since that time.

The primary elements of the ocean bottom instrument are: 1) a three-component set of pendulums with 15-sec natural periods; 2) a three-component set of pendulums with natural periods of 1 sec; 3) two hydrophones; 4) a vibrotrom pressure transducer; 5) a water temperature sensor; 6) a current magnitude sensor; and 7) a current direction sensor.

Data are transmitted by cable to the recording station at Point Arena, California. The demodulated signal is recorded on magnetic tape, strip chart recorders, and photographic drum recorders at the Point Arena station. A three-component set of short-period seismometers and a wave recorder are presently in operation at the Point Arena recording station.

The experiment has thus far returned 18 months of data from the ocean bottom at a total cost of 1.2 million dollars. While this expense may seem large, it must be weighed against the large number of important contributions which have been made in a variety of fields.

This proposal is for: 1) the operation and maintenance of the recording station at Point Arena, California, and 2) support of a data analysis program.

SUPPORTED BY U.S. National Science Foundation

### 4.0036, A SHIPBOARD DIGITAL DATA ACQUISITION SYSTEM

*R.A. BRODING*, Seismograph Service Corp., Tulsa, Oklahoma

Summary: A digital system was developed for shipboard acquisition of exploration data that makes use of a small, high-speed computer for formatting, compositing and system control. A 4,096-16 bit core and a 6 million bit disc are used for storage. Dual tape decks provide for continuous operation as well as auxiliary operations, such as tape-to-tape transfer, editing and off-line computing. Typically, 24 channels of seismic data are quantized at 1, 2, 4 or 8 millisecond sample rates. Computer input is via multiplexer, magnetic tape, paper tape or teletype keyboard. Output is on standard 1/2" magnetic tape 800 bpi 9 channel, paper tape or teletype print-out. A control panel for the system permits digit switch entry of certain operational parameters such as listen time, dead time and number of composites. Software includes programs for acquisition routines in a continuous mode or externally triggered from the ship's clock. Each data record contains a header that includes all the operational parameters. Monitoring of the system is by storage oscilloscope, 25-channel oscilloscope and section plotter. Twenty-four 13-bit DACs provide for monitoring the system either before or after recording. An on-line magnetic tape correlator provides the signal from any one seismometer station to the plotter. Thus, a continuous set of diagnostics provide for checking selected station. A complete set of diagnostics provide for checking all of the major elements in the system as well as the programs.

SUPPORTED BY Seismograph Service Corporation

### 4.0037, SURVEY, EVALUATION & SUMMARIZATION OF LITERATURE ON ENVIRONMENTAL REQUIREMENTS OF MARINE ORGANISMS LEVELS OF POTENTIAL TOXICANTS (ABBREV

*C.M. TARZWELL*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

It is proposed that each of the sections and the units within the section will deal with those parts of the literature which are pertinent to their work. All papers will be abstracted, a summary given as to the significance of the paper, and key words developed so that the paper and the abstract can be fitted into a data retrieval system. It is planned to do this for current literature, and to contract work on past literature in order to build up a library for use at the National Marine Water Quality Laboratory and elsewhere in the research program for the development of water quality criteria.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

#### 4. SURVEY AND PREDICTION

##### 4.0038, MARINE DIGITAL GRAVITY PROFILING SYSTEM

*J.K. PAWLEY*, Teledyne Incorporated, *Houston, Texas 77036*

Specify and implement a coordinated digital hardware-software system for gravity profiling at sea. The critical requirement of resolution of ship velocity to 0.1 knot is to be met by continuous recording of radiolocation data plus statistical processing.

SUPPORTED BY Teledyne Exploration Company

##### 4.0039, DIGITIZING SYSTEM FOR OCEANOGRAPHIC DATA

*J.S. CREAGER*, Univ. of Washington, Graduate School, *Seattle, Washington 98122*

Acquisition of a on-board graphical-to-digital data conversion system is needed to convert graphically recorded data including continuous seismic reflection profiles, in situ acoustic absorption records, precision depth recordings, and records for frequency spectral analysis of scattering layers. Also, even though a graphical-to-digital data conversion facility will soon be available on the University campus, the Department of Oceanography feels that previously recorded analog records are comparable to currently recorded records only if they are digitized on the same device. Quality control is possible only with the specified equipment.

SUPPORTED BY U.S. National Science Foundation

#### 4C. ENVIRONMENTAL PREDICTION

(see Also Chapter 3, Meteorology)

##### 4.0040, FIORD OCEANOGRAPHY

*J.B. MATTHEWS*, Univ. of Alaska, Inst. of Marine Sciences, *College, Alaska 99735 (NONR)*

The objective of this task is the prediction of oceanographic parameters of fiord type estuaries. This will be accomplished by evaluating field data in conjunction with the hydrodynamic equations and from this information form a numerical model which will predict the parameters. During the coming year a concentrated effort to sample those parameters necessary to establish a simple numerical model will be undertaken in Endicott Arm estuary. Measurement techniques will include moored current meters, tide gauges, and shipboard sampling.

This work is of interest to the Navy because very little is known about the oceanography of this region of the United States. In addition, the fiords of Southeast Alaska are typical of those throughout the world and our increased knowledge of the oceanographic processes taking place there will have universal application.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0041, NUMERICAL PREDICTION

*P.M. WOLFF*, U.S. Navy, Fleet Numerical Weather Facil., *Monterey, California 93940*

Objectives: The success of a military operation may well depend on intelligent understanding of the natural environment within which the operation takes place. The requirement exists for the determination and display of the expected values of critical environmental variable both in time and space. This must be accomplished for various projected (future) time periods. This task supports exploratory development of techniques to provide the navy with timely and accurate forecasts of weather, both oceanographic and meteorological.

Approach: To cope with the enormity of the problem and provide forecasts in a time frame to insure their maximum usefulness this task area is automating the complete forecasting cycle which consists of data processing, data analysis, preparation of forecasts, rapid dissemination and display of the final product. Automation is achieved through the use of computers and high speed communications networks.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0042, OBJECTIVE WEATHER ANALYSIS

*H.A. BEDIENT*, U.S. Dept. of Commerce, Nati. Meteorological Ctr., *Washington, District of Columbia 20233*

Objective - The objectives are to develop improvements to the analysis of data required for numerical weather prediction.

Approach - Work is being done to improve analysis on a tropical strip from 48 degree N to 48 degree S around the earth. Additional work will be done to incorporate heights in the tropical analysis as described by Bedient in NMC Office Note No. 21. The technique of Office Note No. 21 is being developed and tested for the NMC octagon grid. Tests are being made to incorporate the Offutt gradient wind system as an alternative to the preceding method. Work is being done on improvement of the 250 mb analysis.

Progress - Some tests were being made with the solution of the balance equation across the equator. The tests of Office Note No. 21 in the tropics have been combined with the high latitude analysis and will be done together. Complete coding was done on a procedure for the octagon to carry out the proposal of Office Note No. 21. One run was successfully made through the whole procedure. Results were encouraging but accumulation of integration errors cause a new look to be taken at the procedure. This is being reprogrammed and work will continue through the rest of the year. The 250 mb analysis was put into operation during the period; results seemed to be good. Further study is being made to determine improvements. The gradient wind analysis modification has been programmed and tests will be made on the procedure during the next period.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### 4.0043, LARGE-SCALE ATMOSPHERIC EVOLUTION

*J. NAMIAS*, U.S. Dept. of Commerce, Nati. Meteorological Ctr., *Washington, District of Columbia 20233*

Objective - The objective is to apply physical principles governing the evolution of the atmosphere and oceans to the prediction of sea temperature, storminess, and weather changes for periods of a month or longer.

Approach - The objectives are approached through study of the energy balance of the atmosphere, land and oceans, and the exchange of energy between them, in relation to such things as anomalies in ocean temperature, snow, and ice cover. Acquired knowledge is included in physical models for numerically predicting the evolution of monthly-mean states of the atmosphere and ocean. Access to electronic computers and close coordination with other research in numerical weather prediction is essential for progress.

Progress - In the year ending June 30, 1967, the study of the northeastern United States drought was concluded. It led to a more general study of seasonal precipitation in this region related to that in other states. New emphasis is on ocean-atmosphere interactions over the Pacific Ocean. Tests and evaluations continue on numerical models for predicting mean rainfall, and temperature in the atmosphere and ocean for a month in advance. Work now centers on developing an improved model which can incorporate already-formulated better estimates of the mean water budget of the atmosphere, horizontal heat transfer in atmosphere and ocean, and reflectivity of the earth's surface.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### 4.0044, MAGNETIC AND GRAVITY PREDICTION

*J.A. BRENNAN*, U.S. Navy, Oceanographic Office, *Washington, District of Columbia*

OBJECTIVES: Determine the affect of magnetic storms and micropulsation activity on present and future magnetic sensors. This effort is directed toward reducing or eliminating this source of noise.

APPROACH: A magnetic recording station will be established in order that very sensitive magnetic data can be acquired. Noise will be catalogued as to frequency of occurrences, amplitude, and coherence with effects on fleet equipment. The observed station data and fleet effects will be further correlated with standard geomagnetic 'K' and 'A' indexes. An attempt will be made to define magnetic activity in terms of a magnetic activity index.

## 4. SURVEY AND PREDICTION

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0045, WEATHER ANALYSIS AND FORECASTING TECHNIQUES

A.F. PYLE, U.S. Navy, Air Systems Command, Washington, District of Columbia

Objective: To develop new or more efficient techniques for analyzing and forecasting environmental factors; to establish the influence of these environmental factors on naval operations and to develop efficient systems for display and presentation of environmental data that will ensure optimum comprehension by the user.

Approach: Development of new and improved prediction techniques is largely based on new knowledge resulting from research in the atmospheric and oceanographic sciences. To bridge the process from research to exploratory development specially qualified personnel at the naval weather research facility and a few select contractors are employed. Developed techniques are tested and evaluated and if successful are either placed into operational use or, if required, go into advanced development.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0046, GLOBAL OCEAN FLOOR ANALYSIS

E.D. SCHNEIDER, U.S. Navy, Oceanographic Office, Washington, District of Columbia

OBJECTIVES: To improve Navy capability to describe, understand, predict and ultimately utilize geological and geophysical parameters of the ocean floor in support of NAVOCEANO's mission of providing pertinent and vital environmental information for the operating forces.

APPROACH: Collect geophysical and sub-bottom acoustic profiles; analyze them in reference to physical, particulate, and chemical properties. Integrate these data into a physiographic and structural charting program permitting predictive determination of limits and areal extent of specific acoustic absorption and attenuation characteristics. Correlate bottom current effects, magnetic and stratigraphic patterns, sediment properties, and physiographic features with respect to more rapidly collectable bathymetric data.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0047, INVENTORY OF THE GULF ESTUARY SYSTEM

N.G. VICK, U.S. Dept. of Interior, Bureau of Sport Fish. & Wlfe., Panama City, Florida 32401

The objectives of this study unit are to procure and document environmental and ecological data on the St. Andrew Bay System, Panama City, Florida. These data will include (1) area descriptions (2) hydrology of the bay system (3) sedimentology, and (4) samples of the biological materials available seasonally with emphasis on the sporting species of marine fishes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 4.0048, PREDICTION OF EXTREME ENVIRONMENTAL FACTORS

N. BUSKE, Ocean Science & Engin. Inc., Bethesda, Maryland 20014

Dimensional analyses of factors associated with extreme winds and extreme waves. Development of universal prediction method for extreme wind or wave occurrences.

SUPPORTED BY Ocean Science & Engineering Incorporated

### 4.0049, ARCTIC RESEARCH

K.L. HUNKINS, Columbia University, Graduate School, Palisades, New York 10964

The objective of this research program is to understand (1) the topography, crustal structure, and sediment regime within the Arctic Ocean basin, (2) the motions of Arctic ice and water, and (3) the acoustic properties of the Arctic Ocean. Measurements are made on a year-round basis from Fletcher's Ice Island, T-3, to provide information on geographic position, depth, sub-bottom reflections, bottom sediments, gravity and magnetic field strengths, currents, and sound-scattering layers.

Operations within the Arctic Ocean require information on bottom topography, ice and water motions, deflections of the vertical, magnetic anomalies, and acoustic propagation and scattering layers in order to navigate more safely and perform effectively. This program will provide pertinent information efficiently and economically in an area where surface ships cannot operate.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0050, OCEANOGRAPHIC PROCESSES IN ESTUARINE AND COASTAL WATERS

C.A. BARNES, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: In order to describe and predict the operating environmental conditions for its forces in estuarine and coast areas of the world, the Navy must have an understanding of the physical processes influencing and controlling these environments. This research effort is to produce a better understanding of the small scale variations in the physical characteristics and circulation of the waters in a variety of estuaries.

Approach: A field program is being conducted in the Puget Sound region and its approaches and in the waters of the Pacific Ocean bordering the State of Washington. A series of temperature, salinity, density, sound-velocity, oxygen and current velocity measurements are being made to assess the role of thin lens water parcels injected into Dabob Bay upon the properties and structure of the waters in that estuary. Analysis also will be made on the vertical oscillations of the depth of the region of maximum density gradient to determine the dependence upon tide height, mean water level, barometric pressure and wind stress.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0051, DISTRIBUTIONS OF CURRENTS AND PHYSICAL PROPERTIES WITHIN THE ARCTIC OCEAN

L.K. COACHMAN, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: A thorough knowledge of the Arctic Ocean and its adjacent seas is of fundamental importance to naval operations in the area. This research supports that objective. Among the aspects of this work which are of particular significance to the Navy are: (1) discovery and measurement of swift, time-dependent currents in the operational region of submarines; (2) distribution of super cooled water which may affect navigation and icing under surface ice; (3) the distribution of water which may affect navigation and icing under surface ice; (4) monitoring oceanographic literature (particularly Soviet) of the Arctic; (5) measurement of surface currents in Bering- Chukchi Sea, Greenland-Norwegian Sea and Baffin Bay, which are important to navigation and ice distribution in these peripheral areas; and (6) studies of heat exchange across the air-sea surface which are important to arctic meteorology and ice prediction.

Approach: The work is conducted by: literature monitoring; laboratory work continuing the analyses of water masses; the development of theoretical models; and field observations conducted from the ice island T-3 and available vessels. In the central arctic basin a program to study motions and water properties will continue from T-3. Utilizing ships of opportunity, in cooperation with the U. S. Coast Guard, and current meters suspended from buoys the flow through the Bering Strait will be measured as a function of time. Programs are underway to investigate numerically (1) the wind-induced circulation in the Greenland and Bering Seas, and (2) the effects of bottom topography on currents in the Arctic.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 4D. MAPPING, CHARTING, AND GEODESY

### 4.0052, LOCATING AND MAPPING HARD BOTTOM AREAS NEAR EXISTING NATURAL SEED OYSTER BEDS

T.P. RITCHIE, State Comm. on Shell Fisheries, Dover, Delaware 19901

The objective of this phase is to determine the location and acre extent of hard bottom areas which could be used to create

#### 4. SURVEY AND PREDICTION

new oyster seed beds. Preliminary surveys indicate that high salinities now prevail over many of our formerly productive seed oyster beds. Spat bags indicate that oysters will set and survive in areas where oyster shells are totally lacking on the bottom. Our objective is to determine the size and shape of hard bottom areas that we may have to use in the future.

Some indication of bottom hardness can be obtained by use of a fine-line depth recorder. Several oyster shell dredging companies routinely use these instruments to determine the extent of sub-surface oyster shell deposits. The actual bottom consistency will be determined by grab samples and by use of a sounding pole.

##### 4.0053, PHOTOGRAPHIC IMAGE EVALUATION

*D.R. LEHMBECK*, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

To study human evaluation and machine measurement of the qualities of photographic images.

Objective measures of photographic noise and photographic signals which will be useful correlates of subjective impressions of photographic quality are being explored, as are the interactions of photographic film with optical systems. The automation of measurements of acutance, granularity, and modulation transfer function and means of making such measurements more precise and repeatable are being considered.

The microdensitometers are undergoing modification, calibration, and repair. Output data is recorded in digital form on magnetic tape for use on a computer programmed to analyze the information. A program for acutance is in final form and needs to be checked using data from known acutance standards. A granularity program is being 'debugged'. Programs for modulation transfer function measurements and other forms of modern Fourier analysis are being considered. Once these well known measurements can be automatically made, it is planned to study the validity of the measurements, to attempt to isolate variables affecting interlaboratory comparisons, and to modify the methods to improve correlation with subjective judgements of quality. New image evaluation methods can then be explored. We are investigating the factors which affect the measurement of microdensity, particularly, the effects of numerical aperture of measuring optics.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0054, TEKTITE I

*H.E. CLIFTON*, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

This project is investigating the efficacy of pursuing geologic mapping of the sea floor and the study of geologic processes operating there, utilizing an undersea habitat and saturation diving techniques. A geologist, in company with several marine biologists, will spend 60 days continually submerged, working from a habitat at 60' depth off the coast of the Virgin Islands. This project is being carried out in cooperation with Bureau of Commercial Fisheries, Navy Department, NASA, Bureau of Mines and General Electric Corporation.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0055, BOTTOM TOPOGRAPHY AND SEDIMENTS--MIDDLE ATLANTIC SHELF

*F. STEARNS*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Washington, District of Columbia

Mapping of bottom topography and sediments of the Middle Atlantic Continental Shelf region of eastern North America. The principal source of data is the Coast and Geodetic Survey.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 4.0056, WORLD WIDE MARINE MINERAL RESOURCES

*F.H. WANG*, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

To prepare maps at various scales of the world's continental margins and deep oceans and ultimately to accumulate and computerize data on location and quality of marine mineral and related resources for evaluation of the world's real and potential mineral resources.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0057, OYSTER LEASE CONTROL MONUMENTS - BAY ADAM, BASTIAN BAY AND SANDY POINT BAY AREAS

*J.W. LAY*, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: The overall objective is to establish control monuments throughout the oyster growing areas of coastal Louisiana at 1/2 mile spacings on the land from which surveys of waterbottoms for oyster leases could be coordinated as a specific reference point. This work will be performed on a compartmental basis, working in each particular area until the job is completed as permitted by weather and tidal conditions. Each area will be selected on the basis of the greatest need; however, proximity of such areas will be carefully coordinated insofar as possible.

Procedure and Work Schedule - 1. Monuments are to be set in place around the bays at approximately 1/2 mile spacings. 2. A Traverse Line will then be run, beginning from a known point of a U. S. C. G. Triangulation Station and joining all monuments together, and then tied into another U.S.C.G.S. Triangulation Station. 3. All oyster leases will then be tied into the designated base line monument.

##### 4.0058, MARINE PHYSICAL GEODESY

*W. VONARX*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The objectives of this program are to (a) continue development of marine geodetic instrumentation, (b) define the geoid at sea, (c) measure departures of the physical sea surface from the geoid, and (d) interpret these departures in terms of the meteorological, tidal and ocean current forces which cause them. During this contract year VLF range rate information will be integrated into a satellite navigational receiver system. This is expected to improve geographic positioning accuracy to the astronomical positioning accuracy of about 6 seconds of arc presently available with GEON. Development of an improved theodolite for use on GEON will continue. Astrogravimetric arcs will be run in significant areas such as the Florida Straits as opportunities arise.

The accuracy of inertial navigation systems is limited by insufficient knowledge about the earth's gravity field and deflections of the vertical. In support of the Navy's effort to remove this limitation, this program is developing and evaluating new techniques and instruments in the fields of navigation and marine gravimetry; providing direct measurements of deflections of the vertical at sea; and obtaining marine gravity data.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0059, OCEANOGRAPHY ATLAS OF THE NORTH CAROLINA CONTINENTAL MARGIN

*O.H. PILKEY*, Duke University, Graduate School, Beaufort, North Carolina 28516

00NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY North Carolina State Government

##### 4.0060, DEVELOPMENT OF A PHOTOGRAPHIC SUIT FOR STEREOPHOTOGRAMMETRIC MAPPING BY SUBMERSIBLE

*G.F. BASS*, Univ. of Pennsylvania, Graduate School, Philadelphia, Pennsylvania 19104 (N00014-67-A-0216-0002)

The objective of this task is to develop, construct and evaluate stereophotogrammetric equipment for underwater mapping and to evaluate scanning sonar techniques and transponder navigation systems for underwater search. The evaluations will be

made during an underwater archeological expedition off the coast of Turkey.

The present efforts of the Navy to use deep diving submarines for search and rescue are hampered by our lack of ability to navigate and map underwater. The results of this study should improve our capability in this field.

SUPPORTED BY U.S. Dept. of Defense - Navy

**4.0061, FEASIBILITY STUDY FOR SYNTHETIC APERTURE ARRAY ACOUSTIC BOTTOM MAPPING SYSTEM**  
*G.M. WALSH, Unknown, Rhode Island*

The application of the synthetic aperture array principle to a high resolution, ocean bottom mapping system is shown to be feasible for practical and useful system operating parameters. The basic operating parameter relations for the synthetic array system are derived. The requirements for vehicle and propagating medium stability are defined. Experimental evidence, although not directly applicable, indicates that medium stability is adequate for practical system designs. Vehicle motion sensing can be adequately performed by a combination of an inertial platform and an acoustic doppler 'clutterlock' system. An important consideration is the signal-to volume reverberation level, which limits the maximum PRF. A system design is presented using a digital signal processor, and including budgetary cost estimates. Possible extensions to the basic system include narrow multiple beam coverage under the ship track, shallow sub-bottom profiling, and precision short term local navigation. The importance of other data inputs to the interpretation of the geological features of the imagery is discussed.

SUPPORTED BY Raytheon Company

**4.0062, GALVESTON BAY STUDY**  
*W.H. ESPEY, Tracor Incorporated, Austin, Texas 78721*

TRACOR, Inc. is responsible for the development of computer models and a data storage and retrieval system for the Galveston Bay Study. Computer models are being developed which describe the hydrologic, chemical, and biological responses of the estuarine system. The models will predict the water quality characteristics at various points in the bay as defined by various boundary and input conditions. The two-dimensional hydraulic model will predict spatial and temporal distribution of tides, velocities (magnitude and direction) and phasing between tides and velocities in response to tidal action, wind stress, fresh water flows, physiographic features, etc., by the numerical solution of the Navier-Stokes and continuity equations.

The transport characteristics of the bay system are being incorporated into the water quality models to allow the temporal and spatial variations of mixing and exchange of Gulf waters throughout the bay system. The models will be sufficiently flexible to permit evaluation of water quality and assimilative capacity under a variety of levels of waste treatment and methods of waste treatment.

Results of the evaluation of various alternative waste treatment systems will define the input to the optimization model. This model will provide a quantitative framework from which to determine the most cost-effective system in terms of design, operation, and various legal-institutional constraints to achieve optimum use of the Bay resources.

**4E. MODEL STUDIES**

*(General Construction and Application. Models of Specific Systems Found Under that Subject.)*

**4.0063, SIMULATION MODEL FOR THE ANALYSIS OF ADVANCED MARINE SHIPPING SYSTEMS**  
*UNKNOWN, Univ. of California, Graduate School, Berkeley, California 94720*

PURPOSE: To explore the applicability of modular transportation computer simulation, TRANSIM, for analyzing advanced marine shipping systems.

**4. SURVEY AND PREDICTION**

DESCRIPTION: The TRANSIM transportation system simulator was developed by the University of California to fill the need for a general purpose computer simulation method which is simple and economical to use in a wide variety of transportation problems. The objective was to develop a method by which problem formulation, model structuring, and setting up the simulation could be accomplished by individuals who are not necessarily familiar with programming and computers.

This research study will analyze a high speed shuttle ship system and a detachable power plant system. Results will determine: (1) the complexity of TRANSIM's use with problem formulation, model structuring, organization of data input, and in general, setting up the computer simulation; (2) the flexibility and type of computer output as to ease of analysis format, and altering; (3) the costs and manhours associated with the use of TRANSIM; (4) the applicability for future, more complex simulations.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

**4.0064, COMPETITIVE MERCHANT SHIP (BULK) TECHNICAL INNOVATIONS**  
*UNKNOWN, Litton Industries Incorporated, Culver City, California*

Purpose: To forecast the technical innovation climate for bulk carriers in support of preparation of a plan for producing advanced dry bulk shipping systems.

Description: Technical and economic analyses of innovations which could be included in new bulk carriers to maximize returns to the owners and to the Government will be carried out. The research will provide a means of evaluating; different ship sizes and types, advanced equipment, methods of construction, innovations in the design process, and the value of ship standardization.

An analytical model will be developed to evaluate technical concepts. The results will serve as input to the development of a Strategic Development Plan for producing competitive bulk carriers.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

**4.0065, MULTISPECIES FISHERIES MODELS**  
*W. LENARZ, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California*

The pelagic fisheries of California are based on a multispecies ecosystem. Because of the nature of the oceanographic climate, the ecosystem is unlikely to remain in a stable equilibrium, even in the absence of a fishery. To assist our understanding of the likely consequences of fishing effort and climatic change on such an ecosystem, we must be able to interpret our findings in terms of the theoretical multispecies fisheries models currently being developed elsewhere and to construct a model (perhaps by computer simulation studies) relevant to California fisheries.

This project was initiated in FY 1969 with the recruitment of the senior investigator. A general computer simulation model of a fishery on interacting species is presently being developed, in two major parts: a biological section and an economic section. The biological section will include interactions among the species at several stages of their life histories. The economic section will include capital and operating expenditures of the industry and management agency. Potential profit under various fishery and management policies will be investigated. Particular attention will be placed on the potential benefit of forecasting changes in the density and availability of the populations. Although the model will be general, studies on the fishing and management policies will be based on current knowledge of the population dynamics and fisheries of Pacific sardine, northern anchovy, and Pacific mackerel.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**4.0066, SIMULATION MODELS OF SHALLOW-WATER AND COASTAL ENVIRONMENTS**  
*J.W. HARBAUGH, Stanford University, Graduate School, Palo Alto - Stanford, California 94305*

#### 4. SURVEY AND PREDICTION

Versatile, general simulation computer programs are being developed to realistically imitate the major natural processes operative in coastal and shallow-water environments. These models are being modified and adapted to simulate selected specific localities such as Florida Bay, Mississippi Delta, and the barrier beaches of southern Texas, to assure their validity.

Environmental information is often inadequate on coastal and nearshore areas in which operations must be performed. One means of filling gaps in the data and of inferring the hydrologic and sedimentary processes responsible for the observable environmental features is through the use of mathematical simulations. A realistically performing model should reveal the magnitude and interrelations of local environmental variables and predict environmental conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0067, MODEL FOR PRELIMINARY EVALUATION OF TOTAL CARGO TRANSPORTATION TIME AND TRANSPORTATION COST FOR ADVANCED CARGO TRANSPORTATION SYSTEMS

J.G. GROSS, U.S. Dept. of Commerce, Maritime Administration, Washington, District of Columbia 20235

This computerized transportation analysis model is an approach to the determination of 'total system' costs involved in cargo movement, and 'Total' transportation time involved with this movement. The goal was to explore a method for determining transport cost and time on a comparable system basis, irrespective of the vehicles used in the system: and to have minimum input other than that required for the physical structure of the system.

The program was developed for a preliminary analysis of a broad range of vehicle types - aircraft to displacement ships, and the analysis of comparable transportation costs for each - shipper to consignee. It considers the vehicle is engaged in a hypothetical transportation system consisting of inland rail and truck operations, marine cargo consolidation and packaging, inland and port cargo handling, and prime vehicle line haul movements. The range cost considerations are prime vehicle line haul movements. The range of cost considerations are prime vehicle investment, cargo handling (inland and prime vehicle terminal), cargo characteristics (packaging, specific volume, value), type of handling equipment, packaging, insurance (vehicle and cargo), documentation, cargo claims (inland and port), vehicle operation, wharfage or terminal, vehicle handling, and inland line haul cost. Transportation time factors include the same areas, particularly vehicle port interfacing, vehicle speed variations, inland and terminal delays of cargo, and port cargo storage times.

The model output included one detail system time and cost breakdown and a less detailed output of speed, transport time, specific volume, transport costs for ratiations in cargo specific volume. The model is of the deterministic steady state type. It is written in FORTRAN IV for H200. As yet no model operating documentation exists.

Operation to date has been good when analyzing broad category of vehicles on a consistent basis. Such vehicles as hydrofoil, surface effect ships, various displacement ships types, and aircraft have been explored by the model. Estimating relationships and logic are still considered preliminary.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

##### 4.0068, ADVANCED MARINE TRANSPORTATION SYSTEM/ANALYSIS MODEL

J.G. GROSS, U.S. Dept. of Commerce, Maritime Administration, Washington, District of Columbia 20235

An overview study and project outline was made to determine the composition of models that could be used effectively to determine long range commodity demands for international transportation, and to analyze advanced marine transportation systems.

A Transportation Requirements Model is needed to provide the ability to identify and analyze major flows of commodity by sources, sinks and time frame. The input to this model will be records and statistics of government agencies charged with compiling information on industry production, raw material requirements, population level, area technology and social development

status. The algorithm output will include quantity and type of commodity, transportation demand at each source and sink during each time increment, and the transportation quality required.

An Advanced Ship Analysis Model is needed to consider the output of the Transportation Requirements Model, and reject or analyze advanced vehicle concepts as a part of the total system for future time frames. It has the function of providing a means of loading the demand into the optimum transportation network, and listing by ranked order the best choice of mode, next best, etc.

The study considers such factors as transportation market requirements, modal performance, selection of the best mode, transport system characteristics, route structures, level of operation and system constraints. The type of output that would result is total cost of transportation, demand deficiency, operators' financial analysis, vehicle manufacturers' financial analysis, route and vehicle analysis, commodity-route analysis, system summary of mode/vehicle type, system timing for new equipment in production and retirement, and time in transit.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

##### 4.0069, MODEL FOR THE PRELIMINARY EVALUATION OF TOTAL VALUE AND QUANTITY OF IMPORT AND EXPORT FOR WORLD TRADE AREAS

J.G. GROSS, U.S. Dept. of Commerce, Maritime Administration, Washington, District of Columbia 20235

This study is an attempt to idealize world trade flow into a mathematical model. The goal is to determine if, for two selected countries, such parameters as GNP, distance between countries, variables for neighboring countries, trade policy preferences, levels of industrialization, and population can be related so that value, tonnage, and transportation characteristics between the two countries can be determined. The rate of change of each variable with time is built into the model, thus giving some capability to forecast cargo flow for future years.

The model has been operated to the extent that measurement of trade value and tonnage between 36 trade nodes were determined in ten increments to the year 2010. A summation of the cargo flow to and from all trade areas to a selected trade area yields the import and export of that trade area.

The model is written in Fortran IV for IBM 7090. As yet, no model operating documentation exists and further analysis is needed to accurately determine model correction and performance.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

##### 4.0070, NUCLEAR FUEL COST ANALYSIS MODEL

P.B. MENTZ, U.S. Dept. of Commerce, Maritime Administration, Washington, District of Columbia 20235

A Nuclear Fuel Cost Analysis Model has been developed to analyze fuel costs for potential nuclear merchant ships. The model has been programmed in Fortran IV and is currently being run on a Honeywell 200 computer.

The model will calculate overall fuel cost for nuclear ship propulsion systems on a life-cycle basis. Included within the cost structure are components dealing with uranium inventory, enrichment, conversion, fabrication, refueling, and reprocessing. For convenience, the estimating relationships for each of these key economic parameters may be readily modified in order to assess the effect of a potential change in either technology or pricing.

The operational characteristics of a thermal, pressurized water reactor (PWR) are approximated by the use of a simplified nuclear fuel model, utilizing average values of conversion ratios, cross sections, and leakage probabilities. Output parameters, in addition to specific fuel cost, include initial and final enrichments, uranium inventory and burnup, and fission plutonium discharge.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

## 4. SURVEY AND PREDICTION

### 4.0071, ARGONNE MICROMETEOROLOGICAL MODELING FACILITY PROPOSAL

*H. MOSES*, Argonne National Laboratory, *Argonne - Lemont, Illinois*

Argonne National Laboratory is proposing to the Atomic Energy Commission a program for modeling micrometeorological phenomena, with special emphasis on atmospheric diffusion problems. This program will include basic research into the structure of turbulence and diffusion and applied research into such areas as flow patterns and dilution rates in the vicinity of buildings, reactor complexes, etc. Theoretical analyses and field experiments will be conducted in addition to and supplementing the modeling work. Turbulence and diffusion rates in areas of complex terrain are poorly understood; Safety analysis reports for reactors based on current knowledge are not very reliable and may lead to improper or overdesign of safety features. Modeling air flow in a large wind tunnel, with proper controls of turbulence intensity of vertical temperature and wind speed profiles, will result in more accurate hazard reports.

Results to Date: A feasibility study for the modeling facility has been completed by the Cornell Aeronautics Laboratory, Buffalo, New York. This study included: (1) a conference attended by fluid dynamicists and meteorologists to advise on design criteria for the wind studies including experimental tests on techniques for proper simulation of atmospheric motions, (2) literature and engineering studies including experimental tests on techniques for producing turbulence necessary for modeling atmospheric diffusion, (3) a literature and engineering study on techniques for controlling the temperature field with emphasis on maintaining a preset vertical temperature gradient over a range of turbulence intensities, and (4) development and analysis of tunnel design parameters.

SUPPORTED BY U.S. Atomic Energy Commission

### 4.0072, COMPETITIVE MERCHANT SHIP (BULK) DEVELOPMENTAL PLAN

*UNKNOWN*, Booz Allen Applied Res. Inc., *Washington - Bethesda, Maryland*

PURPOSE: To develop a plan for producing advanced nightly productive dry bulk cargo ship systems that best fulfill national requirements, and have multi-application and lowest life cycle costs.

DESCRIPTION: An investigation of the commercial and national requirements for American Flag dry bulk cargo ships and an evaluation of feasible shipping concepts will be made. This will include forecasts of the inbound-outbound movement of dry bulk commodities and other cargoes which might feasibly be carried in bulk form. Alternative levels of American Flag dry bulk shipping capacity will be studied to determine possible effects on strategic, economic and political national goals. An economic and technical analysis of all feasible shipping concepts will be conducted, along with investigations to determine the most effective financing method to employ, the technical innovations which would ensure lowest life time cost, and the trades in which these ships could compete most effectively. The results will be used as a basis for preparing a Strategic Development Plan that will most effectively produce competitive dry bulk carriers.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

### 4.0073, THE APPLICATION OF MATHEMATICAL METHODS IN CERTAIN OCEANOGRAPHIC PROBLEMS

*G.F. CARRIER*, Harvard University, Graduate School, *Cambridge, Massachusetts 02138*

OOONO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY John S. Guggenheim Memorial Foundation

### 4.0074, EFFECTS OF SCALE AND OPERATING TECHNIQUE ON HARBOR MODELS

*R.Y. HUDSON*, U.S. Army, Waterways Experiment Sta., *Vicksburg, Mississippi*

The objective of this project is to determine the effects of model scale and the techniques of model operation on the accuracy of model results. Tests will be conducted to establish the bases of model design, operation, and analysis of test results. Studies to be made are wave filters for harbor models and wave flumes, wave attenuation due to bottom friction, and design of ripple tank and appurtenances.

SUPPORTED BY U.S. Dept. of Defense - Army

### 4.0075, DYNAMIC MODEL STUDY OF LAKE ERIE

*R.R. RUMER*, State University of New York, School of Engineering, *Buffalo, New York 14214*

A rotating laboratory (11' x 18') is being used for a hydraulic model study of Lake Erie. The principal objective of this study is to determine the degree of usefulness of a rotating vertically distorted Froude model in the prediction of the response of Lake Erie to various physical inputs such as inflows, wind stress, etc. Analytical studies of others as well as of the investigators will be used in attempts to predict the dynamic behavior of the model lake. Field data taken during the GLIRB study and reports of other field studies will be used in the model verification process.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 4.0076, HYDROLOGIC SYSTEMS ANALYSIS OF THE GREAT LAKES

*W. BRUTSAERT*, Cornell University, School of Engineering, *Ithaca, New York*

The objective of this project is a preliminary study of the Great Lakes as a hydrologic system. In other words an attempt will be made to characterize the basin as a 'black box' from physical as well as from purely mathematical considerations.

The inflow-outflow and storage relationships will be investigated by means of different linear and non-linear models which are presently known in the literature. New runoff-routing models appropriate for the specific conditions of large water bodies - with or without regulated water levels - will be developed and tested.

The usefulness of the available hydrographic and meteorologic data will be assessed; this will in part dictate the direction of future studies.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Cornell University

### 4.0077, NUMERICAL OCEANOGRAPHIC MODEL DEVELOPMENT FOR ENVIRONMENTAL PREDICTION

*W.J. PIERSON*, New York University, School of Engineering, *New York, New York 10003 (NONR)*

Objective: Navy oceanographic forecasting services require improved numerical models of the ocean to support tactical and logistical operations of the fleet. The aim of this research is to develop a numerical model of the ocean and overlying planetary boundary layer of the atmosphere to contribute to the improvement of meteorological forecasts over oceanic areas as well as oceanographic forecasts.

Approach: A finite difference mathematical model of the Atlantic is being developed according to the 'Box Method' used previously by other investigators. A quasi-climatological model for typical monthly conditions will be generated first to develop water mass distributions and currents more realistically than is done presently by available models. Methods for altering the grid system within the model are being devised to account for moving shear zones, meandering currents, and varying depths of the thermocline. A computer program also is being developed to obtain the amount of solar radiation that hits the surface waters of the ocean.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0078, AIR-SEA INTERACTION AND PLANKTON ECOLOGY

*E.R. BAYLOR*, State University of New York, Graduate School, *Stony Brook, New York 11790*

#### 4. SURVEY AND PREDICTION

The project is to test the predictions of two models that relate the in situ abundance of plankton to the air and the water circulation patterns at the sea surface.

The first of the two models relates small-scale patchiness of plankton abundance to the water circulation patterns described by Langmuir (1938). The second of the two models related larger-scale (one kilometer) patches of plankton abundance to air circulation patterns such as those described by Woodcock and Wyman (1947).

The model that relates Langmuir circulation to small-scale patchiness of plankton predicts that localized increases of plankton abundance are correlated with the temperature perturbations produced by the Langmuir circulation pattern.

The kilometer scale model relates patchiness of plankton to the Wyman-Woodcock horizontal vortex air-circulation pattern and predicts large patches of plankton abundance beneath the parallel lines of clouds that mark the up-welling air from circulation convergences at the sea surface.

The sampling program was designed to ask whether plankton abundance (in situ high frequency sonar counts) was correlated with water temperature perturbations at Langmuir down-welling and whether air temperature and humidity (kite borne telemetry at cloud base level) were correlated with cloud lines and large scale patchiness of plankton.

SUPPORTED BY U.S. National Science Foundation

##### 4.0079, ESTUARINE SEDIMENTARY MODELS

G.S. VISHER, Univ. of Tulsa, Graduate School, *Tulsa, Oklahoma* 74104

The primary aims are to provide information for a general process-response model for the tidal-estuary-distributary environmental association, and to test the hypothesis that texture may be used directly in the identification of specific sedimentary processes. Work on fluid flow in natural stream channels has demonstrated the association of textures with specific flow regimes. In addition, recent textural studies of clastic sediments suggest the possibility that texture may be used directly in determining ancient sedimentary processes in a more specific manner than previously possible. An observation program to test these hypotheses will be carried out in the estuary of the Altamaha River.

The data will be used to develop a statistical model of the area for comparison to ancient rocks, and to evaluate the effects of differing sedimentary processes on grain size distributions.

SUPPORTED BY U.S. National Science Foundation

##### 4.0080, DELAY LINE COMPUTER

D.D. AUFENKAMP, Oregon State University, Graduate School, *Corvallis, Oregon* 97331

The purpose of this task is to apply modern computer techniques to oceanography on a real time basis. It is anticipated that this will be accomplished by first developing a mathematical model to describe the exchange processes taking place within a given volume of the ocean and then, using moored buoys and other platforms to measure the oceanographic and meteorological parameters, compare the model in a hybrid analog digital computer with the actual measurements correcting the model as necessary to fit the real environment.

The ability to predict acoustic conditions and water motions as they affect vehicle operations and underseas construction depends on a thorough knowledge of the energy exchange processes taking place within the ocean and between the ocean and the atmosphere. This task holds great promise for improving our understanding of these processes.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0081, USE OF ON-LINE COMPUTERS FOR ENVIRONMENTAL RESEARCH

D.D. AUFENKAMP, Oregon State University, Graduate School, *Corvallis, Oregon* 97331 (N00014-68-A-0148)

The purpose of this task is to apply modern computer techniques to oceanography on a real time basis. It is anticipated

that this will be accomplished by first developing a mathematical model to describe the exchange processes taking place within a given volume of the ocean and then, using moored buoys and other platforms to measure the oceanographic and meteorological parameters, compare the model in a hybrid analog digital computer with the actual measurements correcting the model as necessary to fit the real environment.

The ability to predict acoustic conditions as they affect Navy systems and water motions as they affect vehicle operations and underseas construction depends on a thorough knowledge of the energy exchange processes taking place within the ocean and between the ocean and the atmosphere. This task holds great promise for improving our understanding of these processes.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0082, COMPUTER SIMULATION OF THE PROPAGATION OF SURFACE WAVES

W.H. ESPEY, Tracor Incorporated, *Austin, Texas* 78721

The propagation of surface waves from deep to shallow water over composite or irregular slopes is an extremely difficult and complex fluid problem. In many cases, semi-empirical approaches have been used to solve practical problems because of the complexity of the basic Navier-Stokes equations which describe the flow field. In deep water these assumptions of irrational flow and small particle motion, which lead to linearized equations, are justified. However as the wave advances toward the shore, the wave form changes and becomes highly unsymmetrical and non-linear. Because of these effects, a true description of the propagation of surface waves from deep to shallow water over complex bottom geometry must be based on the complete Navier-Stokes equations. The problem approach used in this study is based on a combination of numerical computer simulation techniques to solve the complete Navier-Stokes equations.

The TRACOR Hydrodynamic Model, which solves the two-dimensional Navier-Stokes equation, has been expanded to simulate the propagation of surface waves in the Coastal Engineering Research Center large wave tank. The tank employs a flap-type wave generator. However, due to the rectangular grid representation of the fluid in the model, it is convenient to replace the flap-type wave generator for this study by an equivalent piston type wave generator. Model results are presented in the form of water surface fluctuations at various stations in the large wave tank for later comparison with actual field data collected in the CERC wave tank. Model results in the form of pressure and velocity profiles are also compared with small amplitude wave theory.

SUPPORTED BY U.S. Dept. of Defense - Army

##### 4.0083, NUMERICAL SIMULATION OF HYDRODYNAMIC PHENOMENA BY DIGITAL COMPUTER

C. LAI, U.S. Dept. of Interior, Water Resources Division, *Arlington, Virginia*

Purpose: To develop numerical methods for solving selected surface and ground water fluid dynamics problems; to develop new computer simulation techniques with which to model natural field phenomena.

Methods: Movements of wave-crest in open channels will be simulated, pictorial representations of surface profiles of wave-crest movements will be developed and results will be compared with field observations.

Free-surface, unsteady, gravity flow through porous media induced by transient open-channel flows will be simulated by digital models.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0084, UTILIZATION OF PHYSICAL AND MATHEMATICAL MODELS IN MARINE WATER RESOURCES RESEARCH AND MANAGEMENT

W.J. HARGIS, Virginia Inst. of Marine Sci., *Gloucester, Virginia*

Increased use of hydraulic and mathematical models in research, planning engineering and conserving estuarine and coastal environments is important. The proposed project will utilize VIMS hydraulic model of the tidal James system and

analogue, digital and hybrid mathematical modeling capabilities in a program of research designed to evaluate and improve the capabilities of each technique. Thus, the accuracy, precision and capabilities of all likely will be improved, or at least, clarified.

It is expected that improved ability to predict the changes which will result in such biologically, economically, socially and politically important environmental factors as salinity distribution, currents sedimentation, bottom scour and shore erosion will result.

This project is relevant to the projected Chesapeake Bay Hydraulic Model.

##### 4.0085, EARTH CURRENT STUDIES

V.P. HESSLER, Univ. of Alaska, Geophysical Institute, College, Alaska 99735

At Barrow and College, Alaska, and on drifting ice stations records are made of macro-telluric activity in a study of the relationships between the orientation and motions of auroral forms, as photographed by an All-Sky camera, and variations in the telluric vector in the sea. Geomagnetic micropulsation studies are made with perpendicular induction loops oriented in the H, D and Z coordinates with the primary objective of studying the polarization of both the electric (telluric currents) and the magnetic perturbation vectors. Data are analyzed for characteristic polarization with respect to diurnal variation, storm time and spectrum of the disturbance.

A close relationship exists between ionospheric auroral activity, geomagnetic micropulsations and earth current phenomena. Such relationships are relevant to the evolution and application of communication, navigation and detection systems and are of interest, therefore, to all Navy Bureaus and Laboratories having responsibilities in those areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0086, VISUAL LANDING AIDS FIELD

J.W. SIMEROTH, U.S. Dept. of Commerce, Natl. Bureau of Standards, Arcata, California

To study under service conditions the performance of visibility meters, the characteristics of fog, the threshold constants of the human eye, and the performance of the airfield lighting systems and components. Related to NBS Mission Component 1.6 Research and Development for another agency.

Reporting Interval February 1967-December 1967.

Four fog detectors/visibility meters developed by commercial firms have been installed at the NBS Arcata Field Laboratory for study. The instruments are 1) a near-infrared back-scatter meter developed by Hoffman Electronics, 2) a forward-scatter meter developed by Thomas A. Edison Industries, 3) a fog detector developed by the AGA Corporation of Sweden, and 4) a modified Frungel side scatter meter. Recordings of the outputs of these instruments are being obtained in a variety of weather conditions. Simultaneous recordings are being made of the outputs of the several transmissometers installed in the test area. Preparation of an airfield lighting maintenance manual has continued. Field tests have been made of various lighting fixtures.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0087, EVALUATION OF CONTEMPORARY PRECISION NAVIGATION SYSTEMS

K.E. TAYLOR, U.S. Dept. of Interior, Marine Min. Technol. Ctr., Belvedere - Tiburon, California 94920

The design, installation, test and evaluation of a RADIST plotter aboard the R/V VIRGINIA CITY, which will be used in conjunction with the RADIST navigating instruments that were procured during FY 1968.

To conduct feasibility studies for adapting the R/V VIRGINIA CITY to utilize the Satellite Navigation System presently scheduled to be operational by January 1970.

#### 4. SURVEY AND PREDICTION

The design, installation, test and evaluation of a recording fathometer aboard the R/V VIRGINIA CITY, which will be used in conjunction with the presently installed fathometer.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

##### 4.0088, A STUDY OF PROBLEMS RELATED TO WIND-GENERATED WAVES

R.L. STREET, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

This research will complement theoretical analyses and extend a previous investigation of wind-generated waves. Specific programs to be covered during the course of this research are: 1. Investigations of the characteristics of a turbulent boundary layer over a progressive wavy surface. 2. Investigations of the interactions between the perturbation velocity and natural free-stream (or background) turbulence. 3. Measurements of normal pressures over wind-generated waves.

SUPPORTED BY U.S. National Science Foundation

##### 4.0089, WWV BROADCASTS

R. CARLE, U.S. Dept. of Commerce, Time & Frequency Div., Boulder, Colorado 80302

To provide state-of-the-art accuracy High Frequency Time Signals.

Standard frequency and time broadcasts are being provided at six high frequencies, 2.5, 5, 10, 15, 20, and 25 MHz from the station located at Fort Collins, Colorado. These signals are maintained, as broadcast, within within 10 microseconds of the NBS-Boulder master clocks.

These broadcasts are received nearly worldwide and are used extensively as a timing reference in many navigation systems. A navigator can easily determine his position on the earth by utilizing WWV timing signal along with other observations.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0090, WWVB-WWVL BROADCASTS

R.F. CARLE, U.S. Dept. of Commerce, Time & Frequency Div., Boulder, Colorado 80302

To provide state-of-the-art accuracy Low Frequency Time Signals and to provide experimental Very Low Frequency Broadcasts. Continental U.S. is served by 60 kHz for precise signals suitable for automatic recording. Experimental 20 kHz signals are being used in quest of a world-wide timing system.

Standard frequency and time broadcasts are being provided at 60 kHz. Experimental low frequency transmissions are being provided at 19.9 and 20.0 kHz. These transmissions presently maintain a frequency accuracy better than 1 part in 10 to the 11th and time information within plus or minus 10 microseconds of NBS-Boulder master clocks.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0091, SATELLITE TIME DISSEMINATION

L.E. GATTERER, U.S. Dept. of Commerce, Time & Frequency Div., Boulder, Colorado 80302

The technical objective is to study, both theoretically and experimentally, the feasibility of disseminating time and frequency from an artificial earth satellite.

A literature survey has been conducted to determine what success various experimental satellite timing systems have had to date. Theoretical studies have been made to evaluate various atmospheric effects as a function of radio frequency and a small experimental program has been undertaken to evaluate the possibility of satellite range determination based upon Doppler frequency measurements.

The literature survey is being kept up to date and the theoretical studies are essentially complete and await further experimental data before significant additional progress may be made. Several satellites are being observed at the present time for Doppler data. Simple procedures have been developed for range determinations. Although these methods will not produce results which are attainable by more elaborate, sophisticated methods

#### 4. SURVEY AND PREDICTION

(which are not suitable for the average user of a timing signal), preliminary results indicate that, under good conditions, range determinations may be made to 100 km which correspond to a timing error of about 300 microseconds compared with 1 ms which is available, under good conditions, from WWV.

Navigation systems used in the oceans and over the oceans (air navigation) are particularly dependent on the accuracy of received time and frequency information.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0092, VLF TIMING STUDIES

G. KAMAS, U.S. Dept. of Commerce, Time & Frequency Div., Boulder, Colorado 80302

The project studies propagation characteristics of VLF signals as they apply to the dissemination of standard time and frequency signals. The main concern is the area of spectrum occupied by NBS station WWVL. The project deals mainly with phase velocity, group velocity, signal attenuation and total path delays.

The approach to the solution of the problem is to measure the phase path delay as a function of direction from the transmitter, frequency and distance. This is accomplished with precision clocks and stable receivers. The group velocity is computed by measuring several frequencies that are closely spaced.

To date, the project has been able to measure the phase velocity at 18.6, 19.9, 20.0, and 20.5 kHz. Directions used have been all except North. The measurements range from 100 to 5000 km from the respective transmitters. In addition to the field measurements, a theoretical model is being generated that will permit time and group delay predictions over continental paths. Also the measurement technique has been developed to a point where it is felt that useful group delay measurements can now be made.

Sea navigation systems are dependent on VLF transmissions which are unaffected by atmospheric disturbances. The received signal has little degradation compared to transmissions at higher frequencies.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0093, IMPROVED STANDARDS FOR RADIO AND ELECTRONIC EQUIPMENT

UNKNOWN, Radio Tech. Comm. Marine Serv., Washington, District of Columbia

PURPOSE: To investigate and recommend improvements in ship communications and electronic navigation.

DESCRIPTION: Cooperative efforts of government agencies and industry are undertaken to investigate ship communications, navigation and safety by special committees that are assigned on a problem and need basis. The technicians and scientists on these committees secure contributory research and investigation inputs on technical, economic, social and political matters within the best competence of their agencies and companies. Forecasts are made of most probable directions, importance, and timing of technical needs for future innovations. Special committees prepare reports on satellite communications, radar criteria, and navigation aids.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

##### 4.0094, MICRONESIAN NAVIGATION AND SAILING

S.H. RIESENBERG, Smithsonian Institution, Washington, District of Columbia 20560

This is an ethnographic study of Puluwat, in the central Caroline Islands, focused on Micronesian navigation and sailing. It includes studies of the technological, linguistic, and cognitive aspects of the sailing complex, and an examination of its ramifications through and functional interrelationships with the entire culture of Puluwat.

SUPPORTED BY Smithsonian Institution

##### 4.0095, AUDITORY DETECTION

E.L. CORLISS, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

To determine the optimum spectrum of fog signals for detectability against background of shipboard noise. To develop a description of the spectral and temporal characteristics of fog signals that would optimize their detection above the background of shipboard noise, for the use of the Coast Guard in setting up fog signals.

January 1 to December 31, 1967. Samples of shipboard noise provided by the U. S. Coast Guard have been analyzed by several filtering techniques. Durations of spectral features are such that analysis over tenth-octave bands does not impair observations of the temporal structure, whereas a wave analyzer having less than 3% bandwidth evidently integrates over features in the original signal. Equipment for gating brief signals of controlled character has been set up, for use in simulating fog signals.

Study time-varying spectral distributions of specimen fog signals and shipboard noise and reduce with regard to loudness-weighting behavior of ear. Evaluate, using signal-detection theory as applied to ear, in terms of engineering predictions of audibility. Devise improved spectral distributions and check against jury.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0096, DUPLICATE LIMIT STANDARDS FOR SIGNAL COLORS

K.L. KELLY, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

Traffic control for land, sea, and air transportation depends upon signal-light colors largely produced by plastic or glass filters combined with an incandescent lamp. The permitted range of chromaticities for each of the fifteen colors is specified in terms of the CIE (X,Y)-chromaticity diagram, but the practical control of these chromaticities is by means of eighteen limit standards in the form of two-inch glass squares. The problem is to obtain a supply of duplicate limit standards for issuance to manufacturers of glass and plastic ware, manufacturers of signal lights, and purchasers of such lights.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0097, APPLICATION OF ISCC-NBS CENTROID COLORS AND METHOD OF DESIGNATING COLORS

K.L. KELLY, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

The problem is the application of the ISCC-NBS centroid colors and ISCC-NBS Method of Designating Colors to the solution of problems in the fields of color charts, color codes, color standards, color communication and color designation. This project is closely related to NBS Mission Component 2, Physical Measurement Systems.

Reporting Period: February - December 1967.

The extent to which the application of ISCC-NBS centroid colors has grown and the diversity of the applications can be indicated best by listing a number of them for 1967. These are: colors of plastic-coated fencing; revision of Federal Standard 595 (Paint); IBM color standards and color programs; Science Fair projects; Army Map Service map colors; B. F. Goodrich color book on plastics; colors of HEW flag; colors of envelopes for auto sorting of P.O.; color in thermoplastics; color comparison methods; color and illuminants; representations of color blindness; Things of Science by Science Service; FAA color standards and tolerances; color in the building industry; centroid colors in fashion color communications in *Simplicity* Fashion Magazine; teaching color (Vienna, Austria); matching centroids in printing inks (Pantone Press); World Book of Knowledge; traffic sign color code; Central America Research Institute for Industry (Guatemala); Manual of American Society of Photogrammetry, Dr. I. M. Yeynmen (Turkey). To disseminate information about this method of designating colors, an NBS Staff lecture and five talks before technical organizations, ISCC Subcommittee on Color in the Building Industry; Color Marketing Bureau of Public Roads; were given on invitation during the year.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

##### 4.0098, DIVER-ASSISTED OCEANOGRAPHY

L.H. BRESLAU, U.S. Navy, Oceanographic Office, Washington, District of Columbia

## 4. SURVEY AND PREDICTION

**OBJECTIVE:** The investigators will develop a diver-assisted oceanographic surveying capability for determining the nature of the undersea environment with ultra-high resolution to a depth of 100 fathoms. They will integrate diver manned survey methods with conventional oceanographic methods to produce an optimum blend of techniques for any oceanographic survey mission. Research efforts will involve conducting diver-assisted oceanographic experiments which will include: (A) Determining the temporal and spatial variability of seafloor and water column features. (B) Directly observing and measuring the effects of the biocoenosis, and correlating their variability with the ocean environment characteristics.

**APPROACH:** Divers can provide the closest control obtainable on undersea investigation by performing direct observations, and by selectivity operating measurement devices, sampling devices, and photographic equipment. Scientifically trained personnel can make quick evaluations of undersea conditions to design and/or modify experiments on site, tailoring efforts to obtain desired results. Divers will make sea floor traverses to supplement, and test the resolution of conventional survey methods in continental shelf areas. Diving scientific personnel will experiment with and evaluate diver operated vehicles and instruments, in order to develop capabilities for advanced undersea studies. They will develop and test undersea surveying techniques for exact specification of undersea environment by providing methods for: (1) Bottom truth surveys (A) Exact mapping of seafloor topography, sediment types, and bedrock. (B) Characterization of seafloor slope stability, trafficability, and scour resistance. (2) Water column seafloor interaction--make firsthand observations and design instrument arrays and methods of measurement of water column-seafloor interactions including correct-topography relationships, sedimentation rates, and near-bottom current velocity profiles. (3) Detailed study of temperature-density structure and mass movements in the mixed surface layer. The investigators will develop techniques for specifying details of internal wave motion, thermal structure, and layer movements in the highly structural mixed layer.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0099, PRECISE RADIO NAVIGATION FOR SHIPS

*F.J. ROMANO, U.S. Navy, Ship Systems Command, Washington, District of Columbia 20360*

**Objective:** Develop improved surface references (including buoy, mooring, radar, target, light, and flags) required for navigation by radio frequency sensors, and time-controlled radio frequency positioning equipment.

**Approach:** The performance of buoyant components will be compared when size and shape are varied and tested. Mooring techniques will be investigated and compared. The value of secondary references on the bottom will be investigated. Improved adjuvants such as lights, flags, and radar reflectors will be developed. Techniques of anchoring will be investigated and small lightweight anchors with improved holding capability will be developed. Components will then be integrated.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0100, SONIC UNDERWATER NAVIGATION FOR SHIPS

*F.J. ROMANO, U.S. Navy, Ship Systems Command, Washington, District of Columbia 20360*

**Objective:** To develop a means for accurate navigation of ships utilizing acoustic techniques. The equipment should provide for guidance of the ships along a channel. The equipment should be portable and capable of rapid installation, and references should have a life of at least two months. Presently, traffic craft must utilize equipment normally carried on board for ocean navigation, and narrow channels cannot be navigated without pilots and visual references.

Portable shipboard equipment which can be installed on any ship which must traverse the channel will minimize the total equipment cost by allowing the same equipment to be used by more than one ship. Previous studies concluded that, when performance and development time and cost are considered, the acoustic approach ranks significantly higher than radio ranging, radar, visual piloting, leader cable, and visual beam guidance.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0101, NAVIGATION SYSTEMS FOR SURVEY APPLICATIONS

*W.M. SWARTWOOD, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

**Objective:** Provide 24-hour positioning and/or precise navigation capabilities, for survey vehicles under technical control of NAVOCEANO, on a worldwide basis to meet the requirements of hydrographic, oceanographic, bathymetric, and geophysical surveys. Provide precision navigation capabilities for positioning survey craft engaged in coastal operations without the use of land based equipment. Present capabilities for mid-ocean surveys are limited to areas serviced by relatively short ranged electronic positioning systems.

**Approach:** Testing and evaluation has begun on the VLF/OMEGA/NAVSAT system which should increase navigational control accuracies in the broad ocean areas covered by OMEGA, or VLF ranging.

Development will then be initiated to find an appropriate inertial, or other type sensor, which can be interfaced with the VLF/OMEGA/NAVSAT system to provide continuous control with accuracies on the order of the plus or minus 0.5 miles now possible in good Loran-C areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0102, ORIENTATION CUES AND PATTERNS OF LONG-DISTANCE TRAVEL OF MARINE TURTLES

*A.F. CARR, Univ. of Florida, Graduate School, Gainesville, Florida 32601 (NONR)*

The investigator is conducting research with regard to tracking marine turtles in their extensive migrations in the open ocean in an effort to determine their routes and the environmental cues that guide them to breeding and feeding sites. He is also examining the 'fine scale' homing abilities displayed by hatchlings in reaching the sea from inland nests.

The identification and analysis of biological mechanisms and systems are of considerable importance to the Navy. The implications to Naval operations made clear by increasing information about biological orientation are expanding, not only to include machine concepts, but also systems concepts and will ultimately relate directly to improved systems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0103, RADAR SCATTERING

*K. HASSELMANN, Univ. Hamburg, Hamburg, Germany*

**Approach -** Conduct theoretical research in radar scatter by ocean waves at radar wavelengths comparable to ocean wavelengths, and at radar wavelengths small compared to ocean wavelengths. Calculations will be made by back-scattered energy as a function of wave spectrum, radiation pattern, and position of the source.

**Objective -** The goal of this work is to guide development work in radar scattermeters for open ocean wave work, either from ships, aircraft or satellites.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0104, BARBERS POINT HARBOR MODEL STUDY

*H.P. HARRENSTEIN, Univ. of Hawaii, School of Engineering, Honolulu, Hawaii 96822*

This was a hydraulic model testing project. The purpose was to aid in the selection of the most suitable plan for design of a deep draft harbor at Barbers Point, Oahu. This project is being continued beyond June 30, 1968, but is expected to be completed by the end of the calendar year. A number of plans have been used, and a great number of tests performed. The selection of the final plan and additional tests were made after June 30, 1968.

SUPPORTED BY U.S. Dept. of Defense - Army

### 4.0105, VHF SATELLITE COMMUNICATIONS

*UNKNOWN, Westinghouse Electric Corp., Baltimore - Elkridge, Maryland*

**Purpose:** To evaluate the future potential of satellite relays for marine communications, ranging and ship control, using experimental data obtained from ship to shore tests.

## 4. SURVEY AND PREDICTION

Description: Experiments are being conducted with the NASA ATS- 1 and ATS-3 Synchronous Satellites. A shipboard satellite terminal has been installed aboard the Grace Line ship SS SANTA LUCIA and two test voyages have been completed. During these voyages, tests were conducted at a number of points along the ship's route from Newark, N.J., to Valparaiso, Chile, and return. Communications and tests are made between the ship and the three NASA ATS ground stations located at Rosman, North Carolina; Mojave, California; and Cooby Creek, Australia.

Particular emphasis is being given to certain areas pertinent to shipboard application: (1) propagation characteristics and signal yield; (2) transmission and reception of voice communications; (3) feasibility of obtaining accurate position fixes using the satellite ranging technique; (4) accurate time synchronization using time code signals; and (5) transmission and reception of teletype messages.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

### 4.0106, VLF/OMEGA NAVIGATION

J.J. STANBROUGH, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

The purpose of this study is to (1) provide high precision relative navigation for on station drift measurements, ship speed and course made, doppler corrections for the satellite navigator, and (2) assess Omega/VLF navigation for oceanographic vessels.

This study will contribute to the solution of problems in precise determination of position at sea and to precise navigation.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0107, MARINE GRAVITY

J.L. WORZEL, Columbia University, Graduate School, Palisades, New York 10964

The objective of this research is to investigate deflections of the vertical in areas of interest to the Navy. Use will be made of satellite gravity data and shipboard gravity and topographic data. Deflections of the vertical computed from these data will be thoroughly evaluated in terms of the data accuracy and distribution which are required to adequately map deflections of the vertical at sea.

The accuracy of inertial guidance systems which are used extensively by the Navy in ships and airplanes is presently limited by insufficient knowledge about the earth's gravity field and deflections of the vertical. In support of the Navy's efforts to remove this limitation, this program is (1) providing gravity data of increased accuracy over the world's ocean; and (2) developing and evaluating both the computational techniques and the data requirements for determining deflections of the vertical at sea.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0108, SENSORY BASIS OF NAVIGATION IN HOMING PIGEONS

C. WALCOTT, State University of New York, Graduate School, Stony Brook, New York 11790

The purpose of this project is to find out what sensory modalities are employed by some birds in responding to environmental cues. The Principal Investigator will continue his research on the orientational- navigational abilities of homing pigeons utilizing radio-telemetric devices. Flight pattern analyses are being made and air-borne tracking methods employed to find the basis for the homing phenomenon.

The ability of animals to navigate accurately over long distances without clues obvious to man is a phenomenon of particular interest to the Navy. Either the mechanism by which the bird navigates can provide information applicable to improved navigation and guidance equipment, or a discovery of environmental directional clues can suggest new concepts of navigation. Such studies may also bring to light human sensory abilities which are not being used.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0109, DISTANT GOAL ORIENTATION

L.C. GRAUE, Bowling Green State University, Graduate School, Bowling Green, Ohio 43402 (NONR)

The investigator is studying distant goal orientation in homing birds in an attempt to discover the internal and/or environmental conditions which influence their movements. Magnetic conditions, especially irregularities, are analyzed in relation to both long and short distance homing phenomenon. Electronic tracking devices have been used to determine the route of the homeward path under experimental conditions. In the final segment of this project, the navigation ability of the animals, when displaced across an ocean, will be studied.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0110, INTEGRATION OF DOPPLER SATELLITE AND LORAC NAVIGATIONAL SERVICES

E.H. MAHONEY, Seismograph Service Corp., Tulsa, Oklahoma  
OOONO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Seismograph Service Corporation

### 4.0111, ERROR ANALYSIS OF SEVERAL BOTTOM REFERENCED NAVIGATION SYSTEMS FOR SMALL SUBMERSIBLES

G. FAIN, Raytheon Company, Portsmouth, Rhode Island

As more and more work is being performed by small submersibles, a definite need has been experienced for an inexpensive and easily implemented local navigation system referenced to the ocean bottom. Such systems are required for search and survey operations and for return to site applications. Many such operations are at present performed by voice command to the submersible pilot from the surface support vessel which tracks the submersible with a directional hydrophone. Allowing the pilot to perform his own navigation with respect to the bottom will result in more efficient operations.

All the bottom referenced navigation systems proposed require the placement of one or more acoustic sources on the ocean bottom with respect to which range and perhaps bearing are determined. These sources may be either transponders or synchronous beacons. The proposed systems usually take either the form of a long base line, short base line or range bearing system.

These three systems have been analyzed in terms of their accuracy and precision considering both systematic and random errors. As accurate submersible navigation is usually important only near the bottom this analysis is limited to near bottom operations. Accuracy and precision in terms of radial and tangential errors are predicted for each system. It is shown that error is a function of bearing angle for the long and short base line system, that ships' roll and pitch increase the error for both the short base line and range-bearing systems, and that the long base line system is the most accurate.

SUPPORTED BY Raytheon Company

### 4.0112, NAVIGATION RECEIVER

D.M. CRISAFULLI, Amer. Machine & Foundry Co., Alexandria, Virginia

With the present hyperbolic navigation systems such as Loran, etc., accuracy in the order of one half to one mile are about the best obtainable in deep water areas. These accuracies are totally inadequate for most survey, search and exploratory operations. An acoustic transponder system is one way of achieving precise navigation in a local area. The normal technique is to deploy three transponders on the ocean bottom, survey them in, and then, using the slant range of each of these transponders the position of the ship can be determined relative to the transponder array. We presently have in our oceanographic equipment line of products the shipboard interrogation gear and the transponders. In order to have a complete range determining system, we have designed the three channel shipboard navigation receiver. This receiver works in conjunction with our present shipboard interrogation gear and provides the slant range from each of the three

## 4. SURVEY AND PREDICTION

transponders directly in the form of a digital display. This range information can then be fed into a computer for computation or the computations can be made manually.

A prototype has been built and manufacturing drawings are completed. The first production model will be built before the end of the year.

SUPPORTED BY Amer. Machine & Foundry Company

### 4G. SURVEYS-CRUISES

#### 4.0113, 146 D EASTROPAC

C.M. LOVE, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

This project has been designed to obtain oceanographic and fish distribution data from the eastern tropical Pacific and represents the Bureau of Commercial Fisheries contribution to a multiagency, international oceanographic survey and monitoring operation. The Bureau objectives are (1) to evaluate the potential of the oceanic tuna stocks; (2) to locate potentially rich areas of aggregation of these fish; and (3) to add to the basic knowledge of the oceanographic climate of the eastern tropical Pacific, particularly to assist in the understanding of seasonal changes. It is the latter phase of work whose results will be immediately applicable in forecasting the movements of tropical tuna on the present fishing grounds which lie generally to the east and inshore of the EASTROPAC area.

Collection of data at sea (the first phase of EASTROPAC) has been completed; the reporting phase, in which the material will be processed and analyzed, is just now beginning. Data will be summarized in three ways: (1) as published charts of vertical sections and horizontal plots of parameters to be used directly in the production of an atlas-type presentation; (2) as tabulated digital data which will form the basis of special studies of biological phenomena and of papers published by individual researchers; and (3) as digital data recorded in computer-compatible form, mostly from physico-chemical measurements, to be used for computer calculation of dynamic equations and for individually published studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

#### 4.0114, CALIFORNIA CURRENT SURVEYS

P.E. SMITH, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

Sea surveys have been conducted off the California coast from 1939-41 on a limited scale, extensively on a monthly basis, off California and Baja California, from 1949-60, and on a quarterly basis from 1961-65. The CalCOFI surveys were resumed in 1968 with two cruises and in 1969 it is planned to carry out a full-scale monthly survey, in cooperation with the University of California, Scripps Institution of Oceanography and the California Department of Fish and Game, of the entire area between San Francisco Bay and lower Baja California.

Data collections include oblique plankton tows, deepened to 200 meters, and hydrographic casts to 600 meters. Physical and chemical oceanographic observations are made at all stations. The processed data will include 1) determinations of depth fished, volume of water strained, etc. for each haul, 2) measurements and standardization of plankton volumes, 3) separation of all fish eggs and larvae from plankton samples, 4) identification and enumeration of fish eggs and larvae and standardization of data.

Information is provided for 1) distribution and numbers of the eggs and larvae of commercial valuable fishes and their ecological associates, 2) physical and chemical environment, 3) plankton volumes related to area, season, and year, 4) plankton constituents which serve as food for most pelagic fish at all stages of development, 5) plankton predators and competitors on eggs and larvae.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

#### 4.0115, SUPPORT OF RESEARCH VESSEL VELERO 4

J. SAVAGE, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The research vessel VELERO IV, 110-foot ship of tuna clipper design, owned and operated by the Allen Hancock Foundation of the University of Southern California, has served as the major marine facility in a productive research and training program in marine biology and geology since 1948. This ship contains extensive oceanographic and sampling gear, and has an endurance capability of from 30 to 40 days.

SUPPORTED BY U.S. National Science Foundation

#### 4.0116, DESCRIPTIVE OCEANOGRAPHY

W.S. WOOSTER, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The objective is to undertake a detailed investigation and interpretation of the boundary current areas in the eastern Pacific Ocean. During the coming year, the effort will continue to be an integral part of the systematic EASTROPAC investigation aimed at obtaining an understanding of the temporal variations in the circulation of the Eastern Tropical Pacific and of the large-scale air-sea interactions associated with the El Nino phenomenon. During this period, emphasis will be upon the processing and analysis of data collected during the 13 month, multiple cruise EASTROPAC investigation.

This work is of a reconnaissance nature. A considerable amount of such work is needed in relatively little known waters, in waters where there are steep gradients or in waters which change rapidly with time (as off Peru). Such work must be undertaken before other studies can be planned to investigate specific phenomena. Only when there is an adequate description of the overall distribution of properties of an area as well as the annual trend of conditions can meaningful observations be obtained.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 4.0117, SEA SURVEY INVESTIGATIONS

J.L. BAXTER, State Dept. of Fish & Game, Terminal Island, California

Objectives: To conduct research vessel surveys designed to assess the distribution, abundance and other vital statistics of the fish populations comprising the fishery resources of the California Current System.

Procedure: Conduct 10, 20-day sea survey cruises; eight echo-sounder and two combination intensive sampling-gear research cruises aboard the Research Vessel ALASKA. Data resulting from these cruises will be compiled and published in the form of data reports.

Location: Cruises will be conducted in coastal waters of California and Baja California, Mexico. Terminal Island for laboratory work and analysis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
California State Government

#### 4.0118, SCIENCE AND ENGINEERING GOALS FOR THE INTERNATIONAL DECADE OF OCEAN EXPLORATION

S.R. KEIM, Natl. Academy of Sciences, Washington, District of Columbia

The National Academy of Sciences and the National Academy of Engineering will jointly undertake to provide advice to the National Council on Marine Resources and Engineering Development on the scientific and engineering aspects of the U. S. participation in an International Decade of Ocean Exploration during the 1970's.

As an initial step, the Academies will conduct this contract study which will identify scientific and engineering goals, objectives, milestones, priorities, and timing. Included will be the identification of capabilities required to achieve the goals in terms of manpower, marine data, instrumentation, sea and shore facilities, and funds. The study will also identify end products which should result from the Decade such as charts, maps, research projects, and atlases. Benefits in terms of advances in science and engineering and in the Nation's increased capabilities to use the seas more effectively will be considered.

Dev.

#### 4. SURVEY AND PREDICTION

##### 4.0119, EAST COAST CONTINENTAL MARGIN WOODS HOLE OCEANOGRAPHIC INSTITUTE CONTRACT

*J.G. VEDDER*, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Reconnaissance study of the Atlantic Shelf is essentially complete; more detailed study of the geology of the Gulf of Maine at intermediate scale is now underway, as well as study of geochemistry of interstitial waters in marine sediments, and of hydrologic processes operating in marine and estuarine areas.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0120, EASTERN TROPICAL ATLANTIC COOPERATIVE SURVEY 12 SEPTEMBER TO 20 DECEMBER 1968

*R.B. ELDER*, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The U. S. Coast Guard and the Bureau of Commercial Fisheries are cooperating in a study of the Eastern Tropical Atlantic. Following are the objectives of the program: a. To investigate the distribution of surface schooling tunas in relation to oceanic physical, chemical, and biological parameters, and to sample such schools whenever possible to provide specimens for biological studies. b. To locate and investigate an oceanic front which is found about 1 degree - 3 degrees S. during June-August and apparently moves to about 15 degrees - 16 degrees. by the first of October. c. To study the region of the Angola Dome; a region having abnormally low temperatures in the near surface layers.

The Coast Guard Cutter ROCKAWAY and the Bureau of Commercial Fisheries research ship UNDAUNTED will conduct multi-disciplinary oceanographic investigation in the area. The physical oceanographic data will be published in the CG 373 series publications. Other data will be published by the Bureau of Commercial Fisheries.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### 4.0121, INTERNATIONAL WEDDELL SEA OCEANOGRAPHIC EXPEDITION

*R.B. ELDER*, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

On January 3 1969 the USCGC GLACIER (WAGB 4), CAPT Eugene E. McCrory, Commanding, will depart Punta Arenas, Chile to commence a two phase multi-disciplinary oceanographic survey of the Weddell Sea. Although primarily an icebreaker, the CGC GLACIER has been extensively modified for oceanographic research.

This will be CGX GLACIER's second oceanographic investigation of the Weddell Sea. This research, to be conducted in the austral summer of 1968-1969, will be a logical extension of that already completed during the previous summer. The duration of the survey will be approximately three months. The research will be conducted in cooperation with the Argentine icebreaker, San Martin.

The overall program is being coordinated by the Office of Antarctic Programs, National Science Foundation. The program will include the recovery of current buoys installed during IWSOE-1968, hydrograph, nutrient determination, primary productivity, chlorophyll analyses, bottom photographs, benthic biology, seal dynamic population studies and pest coring.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### 4.0122, EASTERN TROPICAL PACIFIC COOPERATIVE SURVEY

*R.B. ELDER*, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

EASTROPAC is a cooperative project by several groups to study the Eastern Tropical Pacific Ocean. The goals of this effort are to increase the harvest of fisheries in this region, to improve weather forecasting, and to improve shipping and navigation in the study area which ranges 20 degrees north and south of the equator. As far as the collection of data is concerned EASTROPAC is complete for the Coast Guard. Processing of the tremendous amount of information that has been gathered is not complete however. The primary interest of the past one and one-half years of EASTROPAC has been physical, chemical and biological

oceanography. In these efforts the Oceanographic Unit and CGC ROCKAWAY have been working in cooperation with various U.S. Institutions and those of other countries.

CGC ROCKAWAY participated in three surveys of the project area. In the course of her work CGC ROCKAWAY took a total of 1488 stations in which Nansen, STD, and expendable BT (XBT) casts were made. There were 383, 534, 571 stations respectively for the three cruises.

When all the data has been compiled by EASTROPAC Headquarters a complete oceanographic atlas will be published. Also, the Oceanographic Unit will publish their findings in their Oceanographic Report, CG-373 Series.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### 4.0123, OCEANOGRAPHIC STUDY OF NORTHEASTERN U. S. COASTAL WATERS FOR INTERNATIONAL COMMISSION FOR NORTHWEST ATLANTIC FISHERIES

*M. LIGHT*, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

This study consists of a series of oceanographic surveys conducted by CGC EVERGREEN (WAGO 295) in support of a research program planned by the International Commission for Northwest Atlantic Fisheries. The Bureau of Commercial Fisheries Biological Laboratory, Woods Hole, coordinates U. S. participation. This cooperative undertaking involves a study of the offshore fishery resources which are fished by the U. S. and other member nations. The aim of the international program is to seek an understanding of natural fluctuations in abundance of commercial fishes in the area and to assess the effect of fishing. The surveys are conducted 2 or 3 times a year in the coastal slope waters between Cape Cod and Nova Scotia, and the hydrographic data collected supplement data previously collected in the same area during a series of quarterly environmental survey cruises by BCF R/V ALBATROSS III. The purpose of these surveys is to determine the vertical and horizontal distribution of temperature, salinity, dissolved oxygen in these waters which support an intensive commercial fishery. These environmental factors are considered to have important effects on the distribution of pelagic and demersal species of fish and invertebrates.

Data from these cruises are available at the National Oceanographic Data Center approximately two months following each cruise. Complete reports on cruise data will be published by CG Oceanographic Unit in collaboration with the BCF in the Oceanographic Report series (CG 373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### 4.0124, OCEANOGRAPHY OF THE GRAND BANKS AND LABRADOR SEA

*M.J. MOYNIHAN*, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

The oceanographic program of the Grand Banks and Labrador Sea area is in direct support of the International Ice Patrol mission of the U. S. Coast Guard. The USCGC EVERGREEN (WAGO 295) makes several cruises annually during the ice season (normally February to July) to conduct a comprehensive current survey of the region. The data is processed by computer at sea and transmitted to the Commander, International Ice Patrol in New York for the forecasting of iceberg drift. Deep-moored oceanographic buoys for the collection of hydrographic and weather data have been used and are under further development.

Post Season cruises are made into the Labrador Sea region to study the characteristic circulation of the entire iceberg producing environment, particularly with regards to the sources and variations of the Labrador Current.

Data from these cruises are available at the National Oceanographic Data Center approximately two months following the cruises. These data with analyses are published by the U. S. Coast Guard in the Oceanographic Report Series (CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

#### 4. SURVEY AND PREDICTION

##### **4.0125, ARCTIC EAST OCEANOGRAPHIC PROJECT (OCEANOGRAPHY OF THE BAFFIN BAY REGION)**

**M.J. MOYNIHAN**, U.S. Dept. of Transportation, Oceanographic Unit, *Washington, District of Columbia*

The U. S. Coast Guard by virtue of its operation of all the icebreakers under the U. S. flag has a definite responsibility for the support and coordination of polar research. The oceanographic program in the Baffin Bay region has its emphasis on the description of the physical, chemical and biological features of Baffin Bay and water exchange through Narres Straits, Jones Sound, Lancaster Sound, and the Davis Strait. This work is designed to support and augment the research of the National Science Foundation, U. S. Navy and other groups working through the Arctic Institute of North America.

Observations from U. S. Coast Guard icebreakers are limited to special selected and scheduled projects and to other available times when these vessels are not engaged in their primary mission of the support of shorebased defense and scientific installation.

Data from these cruises are available at the National Oceanographic Data Center. The scientific results, with contributions from invited scientists, are published by the U. S. Coast Guard in the Oceanographic Report Series (CG-373).

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### **4.0126, ATLANTIC OCEANIC BIOLOGY**

**C.R. STEPHAN**, Florida Atlantic University, School of Engineering, *Boca Raton, Florida* (NONR)

The investigator is now integrating the results from the successful Research Ships of Opportunity cruise across the Atlantic Ocean with an evaluation of associated data received from Numerical Weather Facility, Monterey, California, and General Motors Research Laboratory that can lead to a system for rapid transmission of data from RSO's to oceanographic data centers. During the extension period, improved design studies for RSO Instrumentation Modules will be concluded.

The Research Ships of Opportunity concept serves as an implement to hydrobiological research by providing platforms for a broad coverage of the open ocean area, an area hitherto sampled only sporadically. The Navy's need to know about the characteristics of the surface waters might be served more expeditiously by this means. Such properties as water viscosity, color, and plankton density are especially important.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### **4.0127, DESCRIPTIVE PHYSICAL OCEANOGRAPHY OF THE EASTERN TROPICAL ATLANTIC**

**M.C. INGHAM**, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., *Miami, Florida*

Objectives: 1. To describe the oceanic circulation and the distribution of environmental variables in space and time in regions of interest in the eastern tropical Atlantic Ocean. 2. To locate and describe oceanic features in the physical and chemical environment which are significant to primary and secondary production and to the distribution of commercially significant pelagic fishes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### **4.0128, THE EVALUATION AND USE OF SUBMERGED RESEARCH VESSELS IN STUDYING CONTINENTAL SHELF ENVIRONMENTS**

**H.G. GOODELL**, Florida State University, Graduate School, *Tallahassee, Florida* 32306

Two submarines have been constructed by Lutjens; one of which is completed and is under evaluation as a one-man reconnaissance vehicle, the other a five-to six-man diver lockout vessel which will hopefully be completed by June 1969, and it too will undergo evaluation as a research and reconnaissance vehicle.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### **4.0129, PILOT STUDY OF LIMITED PORTION OF TRADE WIND ZONE OCEANOGRAPHY (DATA AND DESCRIPTIVE REPORTS)**

**G.R. SECKEL**, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

The Trade Wind Zone Oceanography investigation deals with the mechanisms which change the distribution of properties and water masses in the area bounded by latitudes 10 degrees N., 30 degrees N., and longitudes 130 degrees W. and 180 degrees.

A pilot study to test the feasibility of the investigation is in progress and sampling and processing techniques using a single ship are to be developed. Results of this development are presented in data and descriptive reports.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### **4.0130, INTERNATIONAL INDIAN OCEAN EXPEDITION PHYSICAL AND CHEMICAL ATLAS**

**K. WYRTKI**, Univ. of Hawaii, Graduate School, *Honolulu, Hawaii* 96822

When the International Indian Ocean Expedition was originally planned, it was proposed that atlases containing the distribution of all data accumulated during the Expedition would be prepared. This grant will support the production of the oceanographic atlas which will be in two parts and amenable to research use. Part I will contain the distribution of physical and chemical properties at selected levels and along specific sections of the ocean. Part II will consist of an analysis of all data submitted to World Data Center A, including property distribution, core layer analysis, oxygen, minima and maxima, phosphates, bottom temperature, depth of the mixed layer and intensity of thermocline.

SUPPORTED BY U.S. National Science Foundation

##### **4.0131, DEEP OCEAN RESEARCH AND DEEP OCEAN ENGINEERING**

**S.C. DAUBIN**, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts* 02543 (NONR)

Objective: This research is part of the long range program to utilize the deep ocean. It is based on the use of a system centered about the Deep Research vehicle Alvin. This submersible will take scientists into the ocean to depths of 7500 ft. for observation and sample collection. The studies are divided among geology, biology, geophysics, and engineering. The results will contribute to the ability to use the deep ocean and the sea floor in support of the National Purpose.

Approach: The Deep Research Vehicle Group at Woods Hole will operate the system composed of ALVIN and LULU to make scientific observations to depths of 6500 ft. The biologic studies will encompass life forms and benthic animals that will affect sea floor structures. Additional work on a coherent long range investigation of the geological structure of the continental margin and geophysical studies of slope stability and sediment composition and stability will be undertaken. The moorings of a deep buoy will be examined. Revisits to sites will provide long term observations and tests in the various disciplines of ocean science and ocean engineering.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### **4.0132, MEDITERRANEAN OCEANOGRAPHY**

**A.R. MILLER**, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts* 02543 (N00014-66-C0241)

The purpose of this task is to permit Woods Hole research scientists to participate in a survey in the Eastern Mediterranean aboard the Federal Republic of Germany research vessel PLANET. The primary task will be to determine advective oceanographic processes taking place in the area. Secondly, observations from cloud camera, pyroheliometer, net radiometer, infra-red and surface microstructure measurements will be taken. Reduction, analysis and interpretation of the data will be accomplished as a part of the task.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 4. SURVEY AND PREDICTION

**4.0133, ANTARCTIC PHYSICAL OCEANOGRAPHY**  
*A.L. GORDON*, Columbia University, Graduate School,  
*Palisades, New York 10964*

Lamont Geological Observatory of Columbia University proposes to collect data on physical and geological oceanography of the southern Pacific and southern Indian Oceans during the period from approximately December 30, 1967, to August 31, 1968. These data would be taken at hydrographic stations from on board the Antarctic Research Vessel USNS *Eltanin*. They would include the salinity and temperature of the sea water at known depths, between the surface and the bottom, using both bathythermographs and a salinity-temperature-depth continuous recorder. An expendable bathythermographic system would, also, be used to yield continuous temperature measurements to 700 meters while the ship is under way. A structural framework would lower to the bottom at selected stations. It would incorporate equipment to produce oriented bottom photographs, make measurements of bottom currents, and take readings on the light-scattering characteristics of the near-bottom water. Lamont Geological Observatory would process and analyze these data for distribution to other interested scientists and institutions and for deposit in the National Oceanography Data Center. This research is a continuation of LGO work on the *Eltanin* Cruises 4 to 27.

Five technicians would be on the *Eltanin* for each cruise during the period of the grant.

SUPPORTED BY U.S. National Science Foundation

**4.0134, WATER MASSES, CURRENTS AND ORIGIN OF THE ATLANTIC BOTTOM WATER IN THE WEDDELL SEA, ANTARCTICA**

*L.R. CAPURRO*, Texas A & M University System, Graduate School, *College Station, Texas 77843*

Research will be continued by Texas A & M on the physical oceanography of the Weddell Sea, Antarctica, in the summer of 1968-69, as part of the International Weddell Sea Oceanographic Expedition-1969. The research will be carried out on the Argentine icebreaker, *General San Martin*, and at Argentine Antarctic research stations. Hydrographic casts will be made at each ship station for water samples and temperature. In addition, continuous salinity, temperature, and depth measurements, in the upper part of the water column, will be made with an STD instrument. The water samples will be analyzed for salinity, pH, and nutrients. Current measurements will be repeated at the Argentine station, *General Belgrano*, for about seven days in 1000 meters of water.

Capurro will join the *General San Martin*, in Argentina, with two research scientists from the United States and two marine technicians from Argentina. They will stay with the ship throughout the expedition, until it returns to Argentina. Capurro and the other two research scientists will then return to the United States.

SUPPORTED BY U.S. National Science Foundation

**4.0135, OCEANOGRAPHIC SURVEY OF CONTINENTAL SHELF WATERS OFF CHESAPEAKE BAY**

*J.J. NORCROSS*, Virginia Inst. of Marine Sci., *Gloucester Point, Virginia 23062*

Purpose: To acquire a body of data sufficient to describe in general terms the physical processes which occur in Continental Shelf waters.

The Institute has been actively engaged in surveys of Continental Shelf waters since December, 1959. The first surveys were directed toward determination of the distribution of eggs and larvae of fish. Oceanographic data were collected during the three years of the biological survey and the present program is an outgrowth of the initial surveys.

We occupy a total of 36 stations located on four transects. The east west transects are positioned on parallels 37 degrees 10'N, 37 degrees 00'N, 36 degrees 50'N and 36 degrees 40'N. Nansen bottles and bathythermographs are used to obtain measurements of temperature and salinity distributions.

We are working toward development of computer programs which will plot isopleths from the data collected during the cruises.

This is a continuing program.

SUPPORTED BY Virginia State Government

## 4H. REMOTE SENSING-SPACE OCEANOGRAPHY

**4.0136, ENVIRONMENTAL APPLICATIONS OF PASSIVE MICROWAVE SENSORS**

*A.T. EDGERTON*, Aerojet General Corporation, *El Monte, California 91734 (NONR-4767(00))*

Research is being conducted into the applications of passive microwave radiometers to the remote sensing of earth surface and near-surface environments. Laboratory and field studies are relating the microwave brightness temperatures of many environments, including snow and ice, sea ice, soils and sediments, and beach and near-shore localities to a variety of frequencies and observation conditions.

By evaluating the effectiveness of this type of terrain sensor, progress is being made toward exploitation of the high potential of passive microwave radiometers to operate in day/night, all weather conditions, to detect anomalous materials below the earth's surface, and to discriminate between materials of differing dielectric constants such as ice, water, or soil.

SUPPORTED BY U.S. Dept. of Defense - Navy

**4.0137, APPLICATION OF METEOROLOGICAL SATELLITE SENSING TO GENERAL CIRCULATION MODELS**

*Y. MINTZ*, Univ. of California, Graduate School, *Los Angeles - U.C.L.A., California 90024*

Objective: To determine which of the sensing devices presently used on Minbus and ATS and proposed for future spacecraft will give the best numerical weather prediction when used to determine the initial conditions, and the utility of non-synoptic data in the numerical prediction procedures.

Approach: A program of testing various types of input data from hypothetical satellite instrumentation in large computer runs of numerical atmospheric models will be carried out. This will include the preparation of a numerical weather prediction procedure and program for experiments with non-synchronous wind and temperature data from such sources as the horizontal sounding balloon systems of the FR-2 (Eole) and Nimbus IRLS Experiments and the Nimbus Infrared Interferometer Spectrometer (IRIS) inferences of vertical temperature profiles in the atmosphere. Simulation runs will be made on a computer prior to the actual satellite launches, and real data from FR-2 and other meteorological systems will be used in the future.

During this period, the Mintz-Arakawa numerical model for simulating atmospheric experiments was revised to include more complicated processes and, thus, more closely reflect the behavior of the true atmosphere. Of the many revisions, two are especially notable: (1) the evaporation of water from the oceans and the condensation of water vapor in the atmosphere have for the first time been treated explicitly, thereby improving the simulation of these important thermodynamical effects and (2) the horizontal grid spacing of the two level model has been reduced from 1 degree latitude to 9 degrees longitude to 4 degrees latitude x 5 degrees longitude, thus improving the model's ability to represent smaller scale atmospheric disturbances.

The new model was used to investigate the dispersion of constant level balloons in a simulated satellite-balloon horizontal sounding system. The results show that the unrealistically strong Hadley cells which swept the balloons out of the tropics in the former model no longer predominate, resulting in a more nearly random distribution of balloons everywhere for a period of the order of one month. These investigations are encouraging in the development of such systems as the Nimbus IRLS and International FR-2 satellite-balloon experiments.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

**4.0138, CLOUD PATTERNS RELATED TO SELECTED CIRCULATION SYSTEMS IN EASTERN PACIFIC**

*S.M. SEREBRENY*, Stanford Research Institute, *Menlo Park, California*

Technical Objective. Certain characteristic cloud patterns seen in satellite photographs tend to accompany circulation pat-

## 4. SURVEY AND PREDICTION

terns such as frontal systems, pressure systems vorticity centers and jet streams. Project objective is to establish relationships between cloud patterns and selected circulation systems and synoptic situations over the eastern Pacific and western United States, to obtain increased competence in photo-interpretation for use in weather analysis.

Approach. Satellite cloud photographs used in this study cover the area defined by 15 degrees N-40 degrees N and 95 degrees W-145 degrees W, but conventional analyses relating to these photographs will extend well outside these limits. Results under this extension will be based on 10 cases (days). Analyses and data reductions, using the surface, 500mb, 300mb, 200mb charts and 1000-500mb thickness charts, will be based on all available data, including pilot reports, satellite data, radarscope photographs and upper air soundings. The very heavy rainstorm of January 20-21, 1967 over southern California, and the persistent pronounced thunderstorm activity over the western states in June 1967 form the subject of most of this study. Distinctive cloud patterns in the satellite photographs will be systematically examined and related to the corresponding weather data from conventional sources. Ten selected case studied will be prepared under this contract.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

### 4.0139, HYDROLOGIC OPTICS - SPACELIGHT SPECTROSCOPY

J.E. TYLER, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

It is proposed, by means of spectroradiometric measurements of the space light generated by multiple scattering of natural light underwater, to determine the spectral composition, absolute magnitude and band width of the radiant flux available for photosynthesis underwater; to measure spectral values of vector and scalar irradiance underwater; to determine spectral values of the distribution factor, the reflection factor, and the absorption coefficient for ocean water; to determine spectral values of the diffuse attenuation coefficient; and to employ these data for the purpose of describing and comparing water masses, studying the interrelation between radiant energy and biological activity underwater, the monochromatic contrast between contiguous water masses and the effect of surface reflections on this contrast.

SUPPORTED BY U.S. National Science Foundation

### 4.0140, DETECTION AND CLASSIFICATION OF FISH AND MINERAL OIL SLICKS BY REMOTE SENSING FROM ORBITAL ALTITUDE

A.R. BARRINGER, Barringer Research Limited, Rexdale - Ontario, Canada

Oil slicks are caused by schools of fish, pollution and under-sea oil deposits. For ocean resource evaluation and pollution control purposes, it is desirable to classify oil slicks.

The study was confined to the ultraviolet region of the spectrum because of the interesting ultraviolet absorption properties of the fish and mineral oils. We measured the ability of optical instruments to detect and differentiate different types of oil films. The polarization reflection effects were computed of the air-oil-water interface with the effects of absorption in the oil taken into account. The effects of the sea's surface was investigated in order to determine what angular effects were caused by the waves with respect to the polarization effects and the reflection qualities.

The results of the study show that the fish oils can be readily classified by a multi-band photometric system based on the absorption spectra when the oil sample is viewed in transmission. In reflection the oils are not readily detected or classified in the ultraviolet region of the spectrum. Fish oil slicks are not always discernible in the visible region, as is the case for mineral oil slicks. Mineral oil slicks are readily detected and identified by their increased reflectivity whereas the fish oil slicks which do not have a large increase in reflectivity over that of sea water, are not as detectable. The ultraviolet reflection properties of the fish oils make detection and identification very difficult. The most promising area for remote sensing appears to be the thermal IR due to the expected temperature differences in the region of fish oil slicks. Further work should investigate the energy exchange

mechanisms at the fish oil ocean interface and make experimental measurements with IR thermal sensors over the ocean.

It is believed there is a good possibility for developing an infrared scanner incorporating spatial filtering which will be able to discriminate fish oil slicks on the surface of the ocean from orbital altitudes.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 4.0141, RESEARCH NEEDS FOR REMOTE SENSING OF THE ENVIRONMENT

E.M. RISELY, Natl. Academy of Sciences, Washington, District of Columbia

A general study of the field of remote sensing of environment is being conducted by the NAS-NRS Committee, to determine the status of sensor technology and its application to research on the earth's environment, to provide guidance for the development of a stronger national program of research in this field, and to concentrate effort on specific problem areas.

Needs for large quantities of information on a wide range of earth environments are greater than ever. While techniques of multispectral sensing, e.g. visible, infrared, radar, and passive microwave sensing systems, are advancing very rapidly, there is a serious lag in the applications of these techniques that provides coordination of efforts at the highest scientific and governmental levels, and points the way to the fastest and most effective achievement of the required research objectives.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0142, REFLECTIVITY AND EMISSIVITY STANDARDS

J. RICHMOND, U.S. Dept. of Commerce, Natl. Bureau of Standards, Washington, District of Columbia

The technical objectives of this project are (1) to develop accurate and precise procedures for measuring thermal radiation properties of materials, particularly over the wavelength range of 0.2 to 40 microns, and (2) to select and calibrate standards of reflectance and emittance over the same wavelength range, and at temperatures from room temperature to 2000 K or above. The most important thermal radiation properties to be worked on are reflectance and emittance (emissivity). Such methods and standards are needed for radiant heat transfer computations, particularly in the space program, and in connection with infrared reconnaissance, particularly by D.O.D., and for remote infrared sensing as used by the Weather Bureau and Geological Survey. Major effort will be concentrated on (1) adapting existing equipment to use an available interferometer spectrometer as the monochromator-detector in thermal radiation property measurement, and (2) studying materials in an effort to find suitable standards of diffuse reflectance in the desired wavelength ranges.

The interferometer spectrometer has the potential of greatly increasing the precision of measurement and extending the wavelength range of thermal radiation property measurements. The spectrometer will be evaluated with existing auxiliary equipment, modified if necessary to overcome its limitations, or new equipment will be designed and built to exploit its advantages and overcome its limitations.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 4.0143, RELATION OF SATELLITE DATA TO LARGE SCALE ATMOSPHERIC CIRCULATION AND ENERGETICS

J.S. WINSTON, U.S. Dept. of Commerce, Meteorology Satellite Lab., Washington, District of Columbia

Technical Objectives. (a) Study of the temporal and spatial variations in long and short-wave radiation. (b) Examination of the relationship of the radiation patterns to the state of the large-scale circulation in the Northern Hemisphere; e.g., it is important to determine quantitatively how radiation patterns vary with the latitude and strength of the zonal Westerlies, within the planetary waves and also within the smaller scale waves. (c) Where extensive temperature data are available (i.e., the Northern Hemisphere) computation of the generation of available potential energy on various scales and for various regions using observed distributions of infrared and reflected solar radiation. (d) In-

#### 4. SURVEY AND PREDICTION

vestigation of the strength, location, and time variations in the intertropical convergence zone the subtropical anticyclones, and other large-scale circulation features of tropical and extratropical regions in both hemispheres, through utilization of satellite data as indicators of broad-scale dynamic processes in the circulation. From such studies more can be learned about the interactions of the circulation between the hemispheres.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### 4.0144, REMOTE SENSING OF ESTUARINE WATER AND VEGETATION, MARYLAND

R.R. ANDERSON, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

Purpose: To determine which film or film-filter combinations will provide the most information in aerial reconnaissance of estuaries ecosystems.

Methods: Correlate physical and chemical aspects of the estuarine environment with photographic and imaging characteristics on various types of films. The ultimate goal of the project is to be able to identify major plant communities associated with estuaries and evaluate water quality conditions both directly and indirectly using indicator plant species as a guideline.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0145, OIL LEAKS AND SLICKS

W.A. FISCHER, U.S. Dept. of Interior, Fed. Water Pol. Contr. Adm., Washington, District of Columbia

Objective: Purpose of the study will be to determine the feasibility of detecting oil escaping from sunken wrecks and being discharged from other vessels in inland and near-shore areas by the use of remote sensors in aircraft and in spacecraft, and to apply knowledge gained toward the modification and design of equipment to perform the required tasks.

Approach: Studies will be performed based on data to be acquired in the ERA Program from Gemini and from other past and future missions for data by earth pointing space observational systems. Primary instruments will be photographic cameras with varied film and filter combinations, ultraviolet and infrared scanning spectrometric and imaging systems, and absorption spectroscopy instruments.

Success in these studies would be of vital importance toward the protection and preservation of human life against explosion and fire hazards, the protection of recreation areas, fisheries, shore and marine birds, and sources of water supply against contamination and ruin.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0146, APOLLO TEST SITE EXPERIMENT

C.J. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Objective: Determine the use of sensors in Apollo applications experiments for hydrologic uses such as estuarine hydraulics, lake development, ground-water exploration, snow-field hydrology, and water pollution.

Approach: Based upon the results of aircraft testing of sensors and use of aircraft data in the above fields of hydrology, selected testsite investigators will extrapolate their results to larger areas of the United States and other countries and will design data-use experiments for support of selected sensors in the Apollo Applications Program. The data-use experiments will also include requirements for spatial and spectral resolution, frequency of target coverage, and other instrument and mission parameters constraining the use of the data.

Status: Previous data-use experiments submitted to NASA (i.e., photographic, radar, and infrared) will be updated in their requirements, new test sites will be chosen, and new investigators will be selected. Success of this effort will depend upon both the success of aircraft data-use experiments and future plans of NASA in the Apollo Applications Program.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0147, WATER PHYSICS AND CHEMISTRY

C.J. ROBINOVE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Approach: Conduct theoretical, laboratory, and empirical (test-site) investigations of the responses of water bodies to active and passive remote sensing. For example, 1) determine the use of infrared radiometry and imagery for measurement of evapotranspiration, 2) determine the extent to which quantitative measurements of thermal pollution can be made by use of infrared imagery, 3) evaluate the use of photography and imagery for mapping the hydrodynamics of estuaries and lakes, 4) assess the use of lasers in water-quality data collection and 5) investigate the use of simulated luminescence detectors in hydrodynamic mapping.

Status: Several projects are in operation in '68 FY; one report is being transmitted to NASA, several others are in preparation. Basic infrared imagery investigations have been successful and are leading to more detailed investigations of the use of infrared imagery. Combinations of photography and imagery are proving to be highly useful in mapping current patterns and hydrodynamic features in water bodies.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0148, AERIAL SEA SURFACE TEMPERATURE SURVEYS OF U.S. COASTAL WATERS

M. LIGHT, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

Since 1963, the U. S. Coast Guard has furnished aircraft services to the Bureau of Sports Fisheries and Wildlife in support of monthly sea surface temperature surveys of U. S. coastal waters. Temperature data collected during these surveys are utilized in ecological studies; specifically to help explain the influence of temperature on the distribution of migratory fishes and upon seasonal cycles of ocean productivity. Charts are issued at the end of each series of flights, depicting the flight paths and contours of surface isotherms.

The standard U. S. Coast Guard search and rescue aircraft, the Grumman HU16E is being used for these operations. Surface water temperatures are detected with a Barnes infrared thermometer sensor aimed through a small hatch in a rear window. A moving strip chart recorder is used to record temperature readouts.

Monthly survey flights are made over coastal waters along the East Coast between Cape Cod and Miami, and along the West Coast between the Vancouver Islands, British Columbia and Northern Baja California, Mexico.

During FY-1970, plans are for the U. S. Coast Guard to assume primary responsibility for the program. Eventually, it is planned to expand the present monthly flight coverage to include Sable Island to Key West along the East Coast, Aleutian Islands to Baja California, Mexico along the West Coast, the Bering Sea, the Gulf of Mexico, and the Great Lakes.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

##### 4.0149, FISHERIES RESOURCES IDENTIFICATION AND ASSESSMENT

J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia

OBJECTIVES: (1) To develop the applications of remote sensors to locate (directly or indirectly) and quantify commercial fisheries stocks and (2) determine the methods for integrating these results into a fisheries research, development, and forecast program.

APPROACH: (1) Obtain and analyze color photography by color separation techniques for locating fish schools and/or fish environments, (2) Study the applications of multi-spectral photography aerial fishery surveying, (3) Study the feasibility of spectroscopy and spectrophotometry for locating fish and fish oil slicks, and (4) Determine the effectiveness of three color microdensitometry to assess aerial photographs of fish schools. Sensors - a. Color Photography; b. Multi-band Photography; c. Spectrometers; d. Spectrophotometers; e. Infrared Scanner; f. Multi-spectral Scanner. Proposed Contractor - Bureau of Commercial Fisheries - Sub-Contracts: Philco-Ford (Ross) - Barringer

#### 4. SURVEY AND PREDICTION

**PROBLEM ADDRESSED:** There is evidence that fish schools can be detected from aerial and space photography. The use of spectrometers and spectrophotometers to detect fish, fish oils, chlorophyll, and water color correlation need to be tested and evaluated. The techniques of optimum analysis by color enhancement, color slicing, densitometry, and spectral correlations needs to be studied. Specifically, spectral bands need to be determined for: a. maximum contrast of fish schools and background; b. optimum depth penetration; c. spectral reflectance difference for various species and surrounding media, and d. target to background contrast for different water masses.

**BENEFITS:** The demand for fish and fish products is dramatically increasing each year. Per capita consumption based on population and income projections indicate the demand will increase 134% by the year 2000. The constraints of shipboard and airborne searching can be reduced using space as a search tool to supplement present methods.

**OTHER SUPPORT:** 1. NASA aircraft - photography and infrared data; 2. Shipboard Ground Truth (BCF ships);

**OTHER EFFORTS:** 1. TRW Systems Spectrophotometer; Philco-Ford color photography enhancements; 3. MIT color photo work; 4. WHOI studies; 5. NAVOCEANO Research Aircraft studies.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

#### 4.0150, FISHERIES OCEANOGRAPHY AND ENVIRONMENTAL ASSESSMENT AND PREDICTION

J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia

**OBJECTIVES:** (1) To determine the effectiveness of presently available remote sensing instruments to supply pertinent data on marine fisheries; (2) to evaluate those remote sensing techniques which have the ability to indirectly locate, identify, and quantify fisheries stock.

**APPROACH:** (1) To define ocean environmental features pertinent to fisheries using ground truth measurements concurrent with aircraft and/or spacecraft overflights of the following oceanic phenomena: (a) wind slicks, (b) bioluminescence, (c) oceanic fronts and productivity, (d) thermal-biological aspects, (e) upwelling, and (f) divergence/convergence zones. (2) Compilation of comprehensive bibliographies related to remote sensing of fisheries environments and automated handling of space and aerial acquired data. (3) Analyze ATS and APOLLO imagery for oceanic phenomena related to fisheries. (4) Study telemetering of environmental data related to fisheries.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

#### 4.0151, SPECTRAL SIGNATURES OF FISH SCHOOL IDENTIFICATION

J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia

**Approach:** Lab tests over known fish samples will continue to be tested. In addition an airborne version of the spectrometer will be flown in the NASA aircraft concurrent with surface vessels taking surface fish and oil slick samples. Spectrometer signatures of fish oils and vapors will be cataloged. Feasibility for spaceborne application of spectrometer will be studied. a. Sensors - Airborne adaptation of absorption spectrometer. b. Proposed Contract - Barringer Research Ltd., Toronto, Canada. c. Allocation of Resources - Professional Manpower, 35%; Equipment, 35%; Overhead, 30%.

**Problem Addressed:** A previously funded NASA (SPOC) study has indicated a unique application of Barringer's correlation techniques for identification of various fish and mineral oil on water surfaces. The work was confined to the UV portion of the spectrum but should be expanded to include the near IR. The remote detection and identification of fish oil slicks needs to be tested from aircraft to establish possible feasibility from space.

**Benefits:** Remote determination of fish vs. mineral oil slicks and subsequent delineation of fish schools.

**Other Support:** a. Shipboard 'Ground-Truth' Equipment - work in conjunction with Bullis at BCF, Pascagoula, Mississippi. b. 2-3 test flights with NASA aircraft during FY 69-70 likely.

**Other Effort:** Final report from FY 67 studies received in February 1968. Support for UV measurement of major reflective differences in fish and mineral oils supported by 45K NASA (SPOC) contract will continue thru 1968 and 1969 with emphasis toward airborne testing of spectrometer.

**Length of Time for this Study to Provide A Spacecraft vs Aircraft Capability:** Determination of feasibility should be completed within two years.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

#### 4.0152, FLIGHT TESTING OF HIGH PERFORMANCE WIDE-RANGE IMAGE SPECTROPHOTOMETER (WISP) SYSTEM

J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia

**OBJECTIVE:** (1) To develop an optical system expressly to perform objective remote water color measurements, (2) to gather data via airborne flight tests to proceed with the development of the WISP (Wide-Range Image Spectrophotometer) into a space qualified system, (3) To gain experience in the operation of the WISP system and associated data collection and reduction, (4) To perform an experimental investigation of ocean color measuring requirements.

**PROBLEM ADDRESSED:** Accurate charting of ocean color can be correlated to depth plankton content, chlorophyll, sediment, pollution, etc. The TRW study is addressed to developing the instrument, operation, and data processing requirements needed to give the oceanographer an analytical tool to observe and assess the ocean by color mapping.

**BENEFITS:** The color of ocean water in the past has not been measured objectively. Secchi disks and a 10-point Forel color scale have been used to describe ocean color. These methods are highly subjective and dependent on various human eye estimates to delineate a broad color band in the visible spectrum. An objective method of accurately noting ocean color numerically in narrow bands opens up a whole new field for correlating ocean color to ocean properties. Furthermore, TRW proposes to plot and contour ocean color via computer techniques with 'surface truth' available; the study of chemical, biological and sediment content; depth slicks, water mass delineation; fresh/saline water ratios and other ocean properties to ocean color could be a major ocean measurement tool. The color of water is known to be applicable to fisheries locations (water mass boundaries, upwelling, etc.) Rapid global assessment of water color in oceanography should advance knowledge thru color correlations--the applications to oceanography seem particularly appropriate because its dynamic and changing character require the rapid, broad, and repetitive coverage afforded by space vehicles.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

#### 4.0153, INFRARED RADIOMETRY FOR SURFACE HEAT FLOW

J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia

**Objective:** (1) To determine a technique of measuring the total heat flux from the sea using two-wavelength infrared radiometry. (2) To establish the feasibility of using this technique on an airborne platform.

**Approach:** a. Sensors - A two-wavelength infrared radiometer system owned by Scripps Institution of Oceanography 3.5-4.05 microns; 4.45-5.1 microns. b. Contractor - Scripps Institution of Oceanography. c. Allocation of Resources - This effort is supported by the Office of Naval Research (1/3), the National Science Foundation (1/3), and the NASA ERS Spacecraft Oceanography Project.

**Problem Addressed:** Prominent oceanographers such as Pierson and Neumann (NYU) and M. Timofeev (USSR) recognize the importance of establishing a direct method of measuring heat flow from the ocean surface. Pierson and Neumann note 'the work of McAlister and others who have contributed to the development of this (infrared radiometry) technique has profound implications in both oceanography and meteorology.' Timofeev says 'The use of infrared techniques in the determination of the temperature gradient in a surface water layer was first suggested and realized by McAlister.'

#### 4. SURVEY AND PREDICTION

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0154, REMOTE SENSOR SYSTEMS INTERGRATION AND PRESENT OPERATIONS DESCRIPTION

*J.W. SHERMAN, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

OBJECTIVE: (1) To describe and analyze the present commercial method in the mission of searching for and capturing fish; (2) To evaluate the role of air and spaceborne remote sensors and define their optimum applications for this mission.

APPROACH: A thorough study of operational procedures and techniques of commercial and other fishermen in locating and capturing fish will be made. The role of the environment and its prediction will be carefully analyzed. The optimum applications of remote sensing systems to the fishing environment and fishing operation will be evaluated and defined. a. Sensors - a. Infrared Radiometry; b. Photography; c. Spectrophotometry; d. Spectroscopy.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

##### 4.0155, AIRBORNE REMOTE SENSING OCEANOGRAPHY PROJECT

*J.C. WILKERSON, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

Objective: Develop and implement Navy-wide plan to produce improved remote sensors for all-weather airborne and spacecraft-borne ocean surveys. Convert NAVOCEANO aircraft to multi-purpose oceanographic/hydrographic and geophysical aircraft. Conduct airborne remote sensing experiments.

Approach: Evaluate DOD, NASA, ESSA oceanographic satellite programs; conduct laboratory and field experiments in conjunction with the above programs to acquire and interpret ocean data from spacecraft and aircraft. Identify potential methods for integrating ocean data from spacecraft and aircraft into Navy systems. Conduct experiments from aircraft on an opportunity basis to evaluate oceanographic applications of remote sensing techniques for use in Navy ocean projects. Collect, analyze, and disseminate acquired data and publish scientific and technological conclusions.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0156, EXPERIMENTAL SEA ICE OBSERVATIONAL TECHNIQUES

*W.I. WITTMANN, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

Objective: To develop and apply airborne/satellite remote sensor systems, observation procedures and imagery interpretation techniques, surface telemetering sensors, and data acquisition methodology for observation of sea ice features, motion, deformation, and related environmental parameters.

Approach: Continue development, test, and evaluation of: (1) remote sensing systems, observation procedures, data collection methodology, and imagery interpretation techniques; (2) Interrogation, Recording and Location System (IRLS) by agreement with ONR, in conjunction with NASA NIMBUS satellite.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0157, SPACECRAFT OCEANOGRAPHY

*H.J. YOTKO, U.S. Navy, Oceanographic Office, Washington, District of Columbia*

Objective: To provide manpower for managing and conducting research studies in the use of remote sensing techniques applicable to oceanography and marine technology. To define suitable instrumentation and air and/or spaceborne platforms for oceanographic observations and measurements through research and experimentation.

Approach: The Spacecraft Oceanography Project provides a small highly trained scientific management staff to plan and direct in-house and contractual studies to carry out the objectives of this work unit. In addition to research studies by nationally known specialists, a program to conduct and coordinate laboratory and field experiments using NASA, DOD, university, and industrial remote sensing aircraft and laboratory facilities is carried out.

The Project documents the results of studies and experiments funded by NASA/Navy SPOC Project as well as related work not funded through the SPOC Project.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0158, RESEARCH FLIGHT FACILITY

*H.J. MASON, U.S. Dept. of Commerce, Research Flight Facility, Miami, Florida*

Specially instrumented aircraft consisting of two DC-6's, one C-54, and one Martin B-57 are maintained and operated to obtain in-flight measurements of meteorological parameters in support of the research of the Research Laboratories, other government agencies, and non government organizations whose research is government supported. Much of the flight activities is in support of the research of the National Hurricane Research Laboratory, the National Severe Storms Laboratory, and the Experimental Branch of the Atmospheric Physics and Chemistry Laboratory. The Facility also develops meteorological instruments for measurements from aircraft in response to research requirements of the above groups, and has the responsibility for installation of special equipment used by the various research groups.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

##### 4.0159, REPRODUCTION AND FECUNDITY OF TUNAS

*W.J. RICHARDS, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida*

This study will attempt to gain knowledge of the spawning behavior of the Atlantic tunas through analysis of the growth of ova after the methods developed by Thompson, Clark, Shaefer, and June. Randomized samples of the ovary are weighed, the mature ova present are then enumerated, and the fecundity computed.

This study was begun in FY 1966 with the study of gonad samples from yellowfin and skipjack tuna captured on GERONIMO and UNDAUNTED tuna-oceanography surveys and from shore-based sampling at Puerto Rico and West Africa.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 4.0160, REMOTE SENSING, GULF COASTAL AREA, CENTRAL FLORIDA

*R.N. CHERRY, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida*

Purpose - To develop criteria utilizing remote sensing techniques to identify areas where fresh water is likely to occur in an aquifer in near-shore areas.

Methods - An aerial survey will be conducted to sense the thermal contrasts of aquifer and sea water under at least four conditions- during high and low tides in a period when fresh water stages are high and during high and low tides when fresh water stages are low.

Water temperatures, water velocity, and specific conductance of water from submarine springs previously located will be determined. The water stages of fresh water and sea water will be recorded. These determinations will be compared with remote sensing data which indicate submarine discharge and the relative position of the zero piezometric contour.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0161, REMOTE SENSING, EVERGLADES AREA, FLORIDA

*M.C. KOLIPINSKI, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida*

Purpose: To determine the relations between water conditions and biological populations in the Everglades by interpretation of airborne data and to develop new applications in natural resources research for data from remote sensors.

Methods: Spectral reflectance measurements of floral communities and water will be obtained using an airborne 18-channel optical-mechanical scanner. The data will be accumulated in a form that will allow use of a computer to identify and map the dis-

## 4. SURVEY AND PREDICTION

tribution and amount of selected communities. Remote sensing data will be examined for potential in: detecting plankton blooms, locating alligator holes, and estimating populations of large animals.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

### 4.0162, EXCITED STATES MECHANISMS IN PHOTOBIOLOGY

*W.D. MCELROY*, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218

Technical Objective: To expand level of support of photobiology into mechanism of bioluminescence, chemiluminescence involving molecular oxygen; fluorescence polarization in analysis of protein and polypeptide structure, quenching, investigation infra-red emission of highly conjugated molecules; biological reactions initiated by light.

Approach: Design and construct specialized high sensitivity photon detection equipment for visible and infrared regions of the spectrum; investigation evolutionary aspects of bioluminescence. Studies of energy transfer and oxygen photochemistry; construction equipment to measure excited state lifetimes (1-10 nanoseconds).

Progress: a. b. d. e. of the formation of excited states of molecules as the result of chemical transformation of energy, with particular attention to mechanisms of bioluminescence, chemiluminescence, quantitative measurement of quantum yields and emission spectra of fluorescence and bioluminescence.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 4.0163, AIR OCEANOGRAPHY

*G. EWING*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (N00014-66-C0241)

This task is concerned with the development and utilization of aircraft and satellites in studies of oceanic phenomena. This year emphasis is upon the development of a free floating buoy system for the Nimbus IRLS experiment to be flown in spring 1968. The feasibility of tagging and monitoring daily the location of an eddy shed from the Gulf Stream by satellite will be determined. This also will complement work concerned with the dynamics of such eddies.

The capability to obtain environmental data from airborne sensors has potential for providing such information to Naval operations rapidly and in areas where it might not otherwise be available.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0164, SENSING OF ENVIRONMENT

*G. ZISSIS*, Univ. of Michigan, Institute of Sci. & Technology, Ann Arbor, Michigan

This task consists of research on remote sensing environment determination of state-of-the-art, and dissemination of knowledge and techniques through interdisciplinary symposia where progress in the field of remote sensing is facilitated by exchange of information among environmental scientists, physical scientists, engineers, and instrument specialists.

The increased understanding of emission and reflection of electromagnetic energy from the earth's surface, when coupled with the vast quantities of environmental data which can be obtained with remote sensing systems, will greatly improve our ability to rapidly assess actual ground conditions in land, water, and air environments.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0165, EFFECT OF TEMPERATURES AND CIRCULATION OF CONTINENTAL SHELF WATERS ON THE DISTRIBUTION OF FISHES

*R.B. STONE*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Description of Work: Conduct monthly aerial sea surface temperature surveys over Atlantic Shelf from Cape Cod, Mass., to Cape Fear, N.C. in Coast Guard aircraft. Additional flights will be

made when necessary to compliment game fish research in other areas of the Atlantic shelf. Flights will be coordinated where possible with cruises of research vessels to obtain reference surface and subsurface temperature data. Monthly isotherm charts will be produced and will include observations of fishing vessels, surface schooling fishes, large pelagic fish, marine mammals and other marine animals. An attempt will be made to correlate the catches of migratory game fish by sport and commercial fishing vessels with observed sea surface temperature patterns. Surface and bottom current drifters will be released at 10-mile intervals along transects normal to the coastline.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 4.0166, MULTISPECTRAL SENSING OF COASTAL ENVIRONMENTS

*E.P. YOST*, Long Island University, Graduate School, Brookville, New York (N00014-67-C-0281)

A four-band airborne multispectral photographic system is being tested for its ability remotely to determine shallow water depths, bottom characteristics, and other aspects of coastal and near-shore environments. Films and filters have been selected so that blue, green, red and infrared portions of the spectrum are being sampled for the remote sensing tests. Camera, instruments and test targets have been calibrated, prior to ground and air borne field testing of the system over controlled coastal test sites.

The improvement of multispectral sensing techniques resulting from this research has direct application to a wide range of remote environmental investigations. Faster, more accurate methods of determining beach characteristics, presence of underwater obstacles, and depth of shallow water will assist operations in coastal environments.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 4.0167, PROJECT AQUA-MAP - DEVELOPMENT OF AERIAL PHOTOGRAPHY AS AN AID TO WATER QUALITY MANAGEMENT

*G.J. NEUMAIER*, Cornell Aeronautical Lab. Inc., Buffalo, New York 14221

In this program, laboratory experiments were performed to determine the feasibility of using aerial photographic techniques for water resources research; in particular, for detecting, classifying and measuring concentrations of effluents. The spectral reflectance characteristics of several effluents were measured and suggestions were made for optimizing the detection and identification of these discharges. In addition, factors influencing the selection of sites for aerial photographic experiments were analyzed. The Finger Lakes and Lake Chautauqua were considered as well as the Niagara Frontier. The study indicated that it is feasible to enhance the photographic contrast of discharges with respect to their backgrounds, and with appropriate controls, to use spectral signatures for classifying types of discharges and for measuring concentration over certain ranges.

Phase II: In this phase of the AQUA-MAP program, aerial photographic flights are being conducted in the Buffalo area over the Niagara River and Tonawanda Creek. The types of discharges being studied in the laboratory under controlled conditions. Additional laboratory measurements have been made of the spectral reflectance characteristics of water samples taken from the Niagara River and Tonawanda Creek to supplement the data obtained during Phase I on discharges.

Theoretical investigations into the mechanics of scattering by polluted aqueous solutions are being examined. Laboratory and aerial validation of the theory are being performed, the intent being to allow a realistic model of the polluted bodies of water to be created. Such a model will serve to aid the identification of pollutants via aerial photographs and also indicate the limitations of remote sensing analysis.

SUPPORTED BY New York State Government

### 4.0168, REMOTE SENSING OF DELAWARE ESTUARY

*R.W. PAULSON*, U.S. Dept. of Interior, Water Resources Division, Harrisburg, Pennsylvania 17104

#### 4. SURVEY AND PREDICTION

**Purpose:** To determine effectiveness and feasibility of remote sensing devices in estuarine hydrologic investigations.

**Methods:** A series of remote sensing data collection missions will be flown over the Delaware estuary by NASA and USGS aircraft. Sensitivities of sensors to water quality variations will be treated initially. Subsequent missions will be based on initial findings.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0169, COORDINATION OF ESTUARINE REMOTE SENSING IN ATLANTIC COAST REGION

*R.W. PAULSON*, U.S. Dept. of Interior, Water Resources Division, Harrisburg, Pennsylvania 17104

**Purpose:** To provide an overview of Atlantic Coast estuaries, now that it is practical to photograph or sense at frequent and regular intervals large areas of the earth's surface from space. To develop a program and modi operandi for studying estuaries and groups of estuaries from space.

**Methods:** Photographs, remote sensing data and other information from individual remote sensing projects will be compiled, collated, and coordinated to formulate an optimal synoptic approach to the study of the hydrology of estuaries from space.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

##### 4.0170, REMOTE SENSOR OCEANOGRAPHY

*L.R. CAPURRO*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

The basic areas of research of this task are: (a) to develop techniques whereby oceanographic features peculiar to the Mississippi Delta area may be investigated by using remote sensors; (b) to develop techniques for making conclusions about the character of the sea surface utilizing aerial and space photographs of clouds as well as other imagery of them including NIMBUS, IR and TV; (c) to develop methods of determining sea surface temperature patterns from IR imagery and radiometry in the presence of random, transitory cloud systems partially interfering with the field of view.

The sensing and interpreting of oceanographic and other environmental data from satellites is of significant potential value for acquiring such data on a global basis or in remote areas for environmental prediction purposes. The results of this task are expected to contribute to this developing capability.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0171, REMOTE SENSING

*G.L. HUEBNER*, Texas A & M University System, Graduate School, College Station, Texas 77843 (NONR)

The objective of this task is to determine the microwave characteristics of sea water and ultimately the optimum frequencies for oceanographic radiometry. Laboratory measurements are being made too over the frequency range of 1,000 to 30,000 megahertz. Aside from examining sea water over various salinity and temperature values, contaminants such as surface oil films, dissolved clay particles and dissolved gases are being studied to determine their effects on the microwave properties of sea water.

The possibility of using infrared remote sensing devices has been examined extensively but never fully resolved. The fundamental mechanisms are not understood. These studies should contribute to that understanding and, in addition, are necessary to the successful use of remote sensor determinations of ocean currents upwelling, and other oceanic processes reflected in surface temperature measurements.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 4.0172, SPACE APPLICATIONS TO FISHERIES OCEANOGRAPHY (GULF OCEANOGRAPHY PROGRAM)

*J.S. BAILEY*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

It is necessary to know what combinations of remote sensors suitably delineate known oceanic features and to establish the uniqueness of these instruments in the various combinations. A

catalog of the spectral 'signatures' in terms of the recorded energy distributions must be acquired so that conditions measured can be related directly, and quantitatively to the structure of the surface layers (top 400 meters) of the ocean.

Project goals are to (1) delineate those ocean features, in space and time, that are significant to the support of given fisheries; (2) accumulate and synthesize historical data to provide the basis of a computer program to relate catch to oceanic condition; (3) develop programming techniques to implement oceanic (fishery) survey systems aboard satellites (unmanned orbiting vehicles); and (4) accurately forecast, in an appropriately workable time frame, fishery dynamics for the proper exploitation of these fisheries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 4.0173, UTILIZATION OF SYNCHRONOUS SATELLITE DATA

*V.E. SUOMI*, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

**Objectives:** Develop methods of utilizing meteorological data from synchronous satellites and the conception of new techniques for observing and interpreting the state of the atmosphere to meet the requirements for global atmospheric research and prediction.

**Approach:** The geostationary satellites provide an opportunity to exploit the quantitative imaging of weather patterns on the Earth. ATS-I and ATS-III images of the Earth and cloud cover offer opportunities to determine wind velocity by cloud displacement analyses, cloud height estimates, and develop methods of utilizing the observation of sun glint upon the ocean surfaces. The analyses of these phenomena will lead to the extension and interpretation of the presently available observations and the development of new techniques for determining the status and structure of the atmosphere.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

#### 4I. ECONOMIC ANALYSIS

(General Studies. Specific Economic Analyses Found Under Subjects Being Studied.)

##### 4.0174, ANALYSIS OF THE EFFECT ON OPERATING COSTS AND RETURN ON INVESTMENT OF VARIATIONS IN OPERATING PARAMETERS

*M.J. CRUICKSHANK*, U.S. Dept. of Interior, Marine Min. Technol. Ctr., Belvedere - Tiburon, California 94920

To evaluate the importance of individual components in a mining system, their effects on the system must be known. Operating costs and return on investment are both important measures by which the efficiency of a mining system is evaluated. By analysis of the cash flow for an operation, the effects of variations in environmental or technical components may be determined. Computer will be used for these determinations.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

##### 4.0175, 149A FISHERY SYSTEMS ANALYSIS

*R.E. GREEN*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

The objective of this project is to determine what management practices may be most efficient in increasing the cost effectiveness of the wetfish fishery, consisting of a fleet of small fishing vessels working the coastal region of California and the distant-water tuna purse seine fleet, both presently economically unsound.

Analysis of the cost/earnings structure of the tuna purse seiners recently completed, has been useful in understanding the economics of that fishery; it is proposed to apply similar techniques to the wetfish fishery. Computer simulation studies will also be made on these fisheries to determine effects of various predictable factors on the efficiency and profit of the fisheries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 4. SURVEY AND PREDICTION

### 4.0176, STUDY OF OCEANOGRAPHIC MARKETS

J. GOLDEN, Planning Research Corporation, Los Angeles, California

In this project, PRC conducted a developmental study of oceanographic markets for a large industrial manufacturer of specialized equipment and chemicals.

PRC reviewed all oceanographic markets -- military and commercial -to provide rough-cut forecasts of future potential for the client's advanced equipment, services, and consumables; and to identify project areas of potential interest to the client.

Client capabilities, interests, and limitations were assessed in order to determine projects that would be especially suitable, and to select action for implementing specific projects. Detailed recommendations for project implementation were included.

SUPPORTED BY Industrial Manufacturer

### 4.0177, MARKET STRUCTURE OF THE COMMERCIAL FISHING INDUSTRY

R.C. SMITH, Univ. of Delaware, Agricultural Experiment Sta., Newark, Delaware 19711

Objectives: 1) To determine the product flow and existing characteristics for the commercial fishing industry and its relative importance in the Northeast, 2) To analyze the dynamic aspects of the supply and demand situation for the major species of finned fish and shellfish of the Northeast, and 3) To assess implication of potential changes in the market structure and its performance on the fishing industry, poultry and livestock producers and consumers.

Description of Work Proposed: The Delaware station will concentrate primarily on studying menhaden and other fish used in animal feeds. The first procedural step will require the compilation of data related to the distribution of menhaden fish including the primary markets, marketing channels and product use by poultry and livestock.

Estimates of supply and demand parameters for menhaden fish will be obtained. Statistical procedures including linear programming and single equation regression models will be used to evaluate the relationship of fish meal to poultry and livestock production.

SUPPORTED BY U.S. Dept. of Agriculture  
Delaware State Government

### 4.0178, ECONOMICS OF NUCLEAR FUEL

UNKNOWN, N U S Corporation, Washington, District of Columbia 20036

Purpose: To establish a frame of reference for assessment and projection of the costs of nuclear fuel for merchant ships.

Description: A detailed investigation has been made of the economics of nuclear fuel as a source of energy for merchant ships. The initial studies made under this contract have been re-evaluated and updated to incorporate latest cost estimates. The research consists of evaluation of currently proposed pressurized water maritime reactor core design; identification of significant costs; projection of costs based on past and present levels; and comparison of cost trends with selected central station reactors that employ similar fuel technology. The results will be put in a form that can be used in making an economic assessment of commercial nuclear ships.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

### 4.0179, MARINE TRANSPORTATION ECONOMIC ANALYSIS

P.B. MENTZ, U.S. Dept. of Commerce, Maritime Administration, Washington, District of Columbia 20235

With the objective of outlining a formalized approach to selection of appropriate economic criteria and use of realistic costs of capital in the conduct of marine transportation analysis, this study reviews the available economic criteria for financial decision making. Among those considered are the internal rate of return, life cycle cost, required freight rate, net present value, and net cash flow indices. Use is made of the concepts of 'opportuni-

ty-limited' and 'capital limited' corporate environments in reaching the application-oriented conclusions.

This is followed by a discussion of the cost of capital for corporate investment in shipping operations. An in-depth corporate model is developed and results presented for various sets of input parameters describing the components of such financial structures. The model has been programmed in Fortran IV and is being run on a Honeywell 200 computer.

SUPPORTED BY U.S. Dept. of Commerce - Maritime Admin.

### 4.0180, DETERMINATION OF THE STRUCTURE & ECONOMIC IMPORTANCE OF THE VARIOUS SEGMENTS OF THE SEAFOOD INDUSTRY

D.H. CARLEY, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

Objectives: To determine the structure and economic importance of the various segments of the seafood industry of Georgia including: a. Volume, trend and seasonality and value of landings of fish and shellfish. b. Number employed, and wages and earnings in various segments of the industry. c. Capital investment in facilities and equipment. d. Expenditures for supplies and services.

Procedures: Secondary and primary data, including personal interviews of fishermen, processors and industry representatives, will be used to fulfill the objectives. Budgetary and other quantitative techniques will be used in this phase of the study.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Georgia State Government

### 4.0181, FISHING VESSEL CONSTRUCTION COSTS AND THE U.S. FISHING VESSEL CONSTRUCTION DIFFERENTIAL SUBSIDY

C. HAMLIN, Ocean Research Corporation, Kennebunk, Maine 04043

The purpose of this study was to establish valid, directly comparable, fishing vessel construction costs, to review the present system of setting fishing vessel construction subsidies paid by the Federal government, and to make recommendations for improvements to this system. Direct shipyard costs of building fishing vessel were obtained, by personal visit, from yards in the U.S., Japan, W. Germany, Norway, Netherlands, and U.K. Cost comparisons on the basis of cubic number (LWL x Beam x Depth), vessel type, construction material, and country of build, were established, and a formula devised for suggested use in establishing subsidy percentages at the preliminary design stage.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 4.0182, ECONOMIC ANALYSIS OF THE MARKET STRUCTURE OF THE COMMERCIAL FISHING INDUSTRY IN THE NORTHEAST

UNKNOWN, Univ. of Maryland, Agricultural Experiment Sta., College Park, Maryland

1. To determine the product flow and existing characteristics of the commercial fishing industry and its relative importance in the Northeast, 2. To analyze the dynamic aspects of the supply and demand situation for the major species of finned fish and shellfish of the Northeast. 3. To assess the implications of potential changes in the market structure and its performance on the fishing industry, poultry and livestock producers, and consumers.

DESCRIPTION OF WORK PROPOSED: The Maryland contribution will relate to all three objectives. Secondary data will be compiled related to the product flows and structure of the fishing and seafood processing industries in the Chesapeake Bay Area. Factors effecting the supply of both fresh and processed fishery products from the Chesapeake Bay Area and the factors effecting the demand for these products will be

oysters, and clams. In the third phase the effects of expected structural changes and probable changes in selected exogenous variables on the employment, output, other economic variables in the industry will be assessed.

#### 4. SURVEY AND PREDICTION

##### 4.0183, ECONOMIC ANALYSIS OF THE MARKET STRUCTURE OF THE COMMERCIAL FISHING INDUSTRY IN THE NORTHEAST

UNKNOWN, Univ. of Massachusetts, Agricultural Experiment Sta., Amherst, Massachusetts 01003

Objectives: 1. To determine the product flow and existing characteristics of the commercial fishing industry and its relative importance in the Northeast. 2. To analyze the dynamic aspects of the supply and demand situation for the major species of finned fish and shellfish of the Northeast. 3. To assess implication of potential changes in the market structure and its performance on the fishing industry, poultry and livestock producers, and consumers.

Massachusetts will determine consumer demand for haddock, cod, redfish, whiting, and flounder using cross-section data obtained from a sample of consumers.

Massachusetts State Government

##### 4.0184, SECOND HAND PRICES FOR TANKERS

P.A. EMBIRICOSCOUMO, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

The purpose of this thesis is to describe the mechanics of the second hand market in oil tankers. Since the value of an oil tanker depends upon the value of its flow of services, the market for tanker transportation services is examined in detail. This examination reveals that although the oil companies have enough market power to maintain stable rates under normal conditions they hedge against unexpected market changes by engaging in a substantial portion of the available tonnage under long term contract. This results in a very thin market for the tonnage that is free of long term commitments. This latter market, called the spot market, is thus subject to fluctuations which, in turn, are responsible for large fluctuations in the value of tonnage free of long term contract.

In order to clarify the movements of the market for used oil tank ships a theoretical model was developed through which first, the conditions for equilibrium of the market were derived and second, the adjustment behavior of the market was traced. Expectations were explicitly introduced into the model. A time series of prices and transactions was compared to the theoretical conclusions, and found to compare favorably.

The importance of short run expectations having been confirmed, the influence of long term expectations was investigated. It was determined that the increasing change in technology has resulted in the greater importance of long term expectations of transportation rates on the level of oil tank ship prices.

##### 4.0185, FINANCING OF FISHING VESSELS

A. HOLMSEN, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Availability of funds at reasonable terms for financing of fishing vessels seem to be one of the most important factors responsible for the slow growth of the R. I. fishing fleet. At the present time the commercial banks charge a 6 1/2% compounded interest while in other fishing ports in New England commercial banks lend at 5 1/2% of the outstanding balance. Most banks in Rhode Island refuse to finance fishing vessels. The primary reason seems to be lack of knowledge of the risk involved and of the returns to capital in the industry.

This project will, by use of the interview questionnaire method, determine the return to capital for the various kinds and sizes of commercial fishing vessels in Rhode Island, determine how vessels are financed and the difficulties involved. A sample of vessels in Stonington, Connecticut and New Bedford, Massachusetts will also be studied to determine whether significant differences occur. The policies of the various financing institutions will be studied with respect to fishing vessel financing.

SUPPORTED BY Rhode Island State Government

##### 4.0186, MARKET STRUCTURE OF COMMERCIAL FISHING INDUSTRY IN THE NORTHEAST

H.C. LAMPE, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objectives: 1) To analyze the dynamic aspects of the supply and demand situation for the major species of finned fish and shellfish of the Northeast. 2) To assess implication of potential changes in the market structure and its performance on the fishing industry, poultry and livestock producers, and consumers.

One existing simultaneous equation model of the haddock market will be revised. Major revision will be affected in the wholesale and import equations. Particular efforts will be made to obtain measures of the transactions associated with cold storage holdings and the prices at which transactions are made. In addition the revision will seek to avoid the problems associated with movements of cold storage holdings from one location to another within a firm. A model of fish population will be coupled with the market model above to provide the basic simulator of the market population system. The dynamic properties of the system will be evaluated in successive simulator runs on a computer. The influence of changes in parameters of the markets and populations on the equilibrating properties of the system will be presented and evaluated. A preliminary simulator has been developed and will be improved.

##### 4.0187, ECONOMIC IMPACT OF MARINE-ORIENTED ACTIVITIES IN THE SOUTHERN NEW ENGLAND MARINE REGION

N. RORHOLM, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objectives: 1. To determine the present and estimate the future amounts of human economic resources employed in marine-oriented activities of commercial, educational, research, defense and recreational nature. 2. To analyze the relationship between the marine-oriented activities and the general economy of the area including estimates of economic and employment impact.

Procedures: The initial work (Phase I) will concentrate on a detailed study of the marine-oriented activities. On the general economy only secondary data will be collected. Later phases will deal with the remaining parts of the regional economy and the region's population. Data on human resources employed, investment, costs, sales and future plans will be gathered through personal interviews. Secondary data from Sales Tax Divisions, Census of Manufacturers, Census of Business and Department of Labor will also be utilized.

##### 4.0188, CONFERENCE ON THE FUTURE OF THE U.S. FISHING INDUSTRY

R. VANCLEVE, Univ. of Washington, Graduate School, Seattle, Washington 98122

A conference on the U.S. fishing industry was held in Seattle in March, 1968, under the sponsorship of the University of Washington. Its purpose was to identify the problems that beset the U.S. fisherman; the causes for the economic decline of some portions of the fish catching industry in the face of growing world markets; and the rising percentage of imported fish. Attendance represented a cross-section of U.S. fishing interests, university faculties, and government agencies. The contract provided for a summary report which analyzed the conference, developed conclusions of the General Committee, and presented a consensus of recommended corrective actions. This report was completed in August, 1968.

#### 5. LIVING SYSTEMS (NON-HUMAN)

(see Also Chapter 7 For Engineering Aspects)

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5A. FISH POPULATIONS

#### 5.0001, STOCKING AND SURVIVAL OF STRIPED BASS FINGERLINGS

*E.W. SHELL*, Auburn University, Graduate School, Auburn, Alabama 36830

Objectives: To determine if the periodic stocking of striped bass (4 to 6 inch group) into river systems connecting estuarine areas of Alabama would establish this species at a sufficient level to allow the development of a commercial fishery.

Procedure: Large striped bass fingerlings (4 to 6 inches group) produced under job II of the study will be stocked in selected areas determined under Job I. Fingerlings will be suitably marked so that they can be identified on subsequent recovery. Fishermen will be interviewed, and sampling will be done by seining, trawling, and by rotenone or other chemical methods to determine the survival of striped bass stocked.

#### 5.0002, KVICHAK RIVER TOTAL SMOLT

*S. PENNOYER*, State Dept. of Fish & Game, Anchorage, Alaska

A long term declining trend in the important Kvichak River fishery at Bristol Bay coupled with extreme annual fluctuations in run size demand that research be undertaken to accurately predict returning run size and estimate the annual escapement levels needed to sustain maximum yield. The present index sampling of smolt abundance has not fulfilled this need. This project will seek to estimate total annual smolt outmigration eliminating many of the sources of error in the index method and allowing quantitative evaluation of production from escapement and mortalities at various life history stages.

This phase of the study will consist of the following steps: 1) location of suitable sampling site, 2) recording of physical properties of the site, e.g., depth, width, flow, water clarity, that might affect smolt migration patterns and behavior, 3) establishment of a field camp at the site, 4) a single fyke net or similar capture device covering the same water areas as the present index net will be fished on a twenty-four hour basis at the site for comparison with present index catches. Some modifications in counting gear and fishing apparatus will be tested, 5) smolt distribution across the channel(s) will be sampled by fishing at intervals across the river with some form of mobile sampling gear and comparing counts with those of the stationary gear, 6) experimentation with various forms of capture and counting gear will be initiated to develop counting units that can be placed at intervals across the river (photo-electric grids are contemplated). The use of louvers and light for smolt guidance will also be investigated, 7) smolt behavior and reaction to various forms of gear will be studied by use of SCUBA and underwater photographic equipment.

#### 5.0004, BRISTOL BAY ESTUARINE ECOLOGY

*C.J. DICOSTANZO*, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

During the past few years intensive work has been done on the freshwater and the high seas phases of the life history of the sockeye salmon. Recent work has indicated that the ocean survival rates may not be nearly as constant as formerly thought and that estuarine conditions strongly influence these rates. Thus it seems necessary to supplement the freshwater and oceanic studies with investigations into the ecology of the sockeye salmon in estuarine areas.

The early phase of this study will be largely exploratory in nature. The objectives are: 1. To delineate the water masses within the Bristol Bay area and determine the physical and chemical features of the estuarine and adjacent coastal waters. 2. To determine the pattern of movement and distribution of smolts from the parent river into the estuary and ocean waters. 3. To determine the growth and survival of smolts as they pass through this transitional phase of their life cycle.

The first full season of study will utilize aircraft and radiometer to delineate water masses in Bristol Bay.

More specific oceanographic studies will be conducted from a surface vessel. It is expected that much time will be spent in assembling gear and developing standard stations and technique. Sampling of juvenile salmon will be accomplished with various kinds of gear, including tow net, trawls, seines, and gill nets.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

#### 5.0005, NAKNEK SYSTEM RED SALMON STUDIES

*C.J. DICOSTANZO*, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The Naknek River system is composed of several large nursery lakes, connected by short streams. Each lake receives stocks of adult red salmon which utilize various types of adjacent spawning grounds. Juvenile salmon migrate ocean-ward from lake to lake at various times of the year.

The objectives of this program are to obtain an understanding of the various factors influencing the abundance, distribution, survival, growth, and movement of adult and juvenile sockeye salmon in the system. The expanded program includes all studies of the former Brooks Lake research program. Several related studies are currently in progress concerning the following: 1. Determine vital statistics of red salmon adult and young fish populations through systematic collection of data pertaining to length, weights, sex fecundity, and abundance at successive life history stages. 2. Determine the direct causes of mortality and the nature of their effects. 3. Determine required population densities for optimum utilization of available spawning gravels and nursery areas. 4. Determine morphological and physiological characteristics and behavior patterns that distinguish spawning colonies. 5. Determine the effects of intra and interspecific competition. 6. Identify what measures involving manipulation of the spawning or lake nursery environments or the salmon populations themselves may result in maximizing freshwater production.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

#### 5.0006, KARLUK LAKE RESEARCH STATION

*C.J. DICOSTANZO*, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The broad objective of the Karluk research program is to determine the cause(s) of the long-term decline in the spawning run of red salmon and to try to reverse this downward trend. To this end, investigations are directed toward identifying, enumerat-

## 5. LIVING SYSTEMS (NON-HUMAN)

ing, and determining productivity of subpopulations and calculating mortality rates at various stages of the red salmon life cycle.

Size, age, and fecundity of subpopulations are being studied as well as their timing, distribution, and abundance on various spawning grounds.

Adult escapement and smelt outmigration sizes are being determined and sampled to obtain vital descriptive data. We are using these data to calculate mortality rates during the ocean phase of the red salmon life cycle.

Potential egg deposits and fry productions are being determined for diverse spawning grounds so that mortality rates during that stage of the freshwater life cycle may be calculated.

Methods of indexing abundance of juvenile red salmon have been developed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0007, CHUM SALMON INVESTIGATIONS

C.R. MATTSON, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Salmon research by the Chum Salmon Investigation is centered at the Traitors Cove field station, which is located on Revil-lagido Island approximately 25 airline miles north of Ketchikan, Alaska. Original research emphasis, the station was established in 1960, was upon the freshwater and early marine life phases of the chum salmon, *Oncorhynchus keta*, life cycle. In 1964 research emphasis was shifted to the early marine life history stage of the young chum and pink, *Oncorhynchus gorbusha*, salmon. This change was made because intensive freshwater and intertidal salmon research was being conducted at other field stations in Alaska. Additional factors justifying the change was the availability of two connected, enclosed marine basins ideal for estuarine salmon research, and pink salmon were included as they were available in even greater abundance than chum salmon.

General research objectives include the following: Determine relative abundance and timing of juvenile pink and chum salmon migrants from Traitors River and within the two marine basins forming Traitors Cove; study food habits of the salmon and determine availability of food organisms; determine salmon growth rates within an estuarine environment; and study estuarine environmental factors such as water temperatures, salinities, currents, and turbidities and relate these to juvenile salmon abundance and behavior.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0008, MARINE BIOLOGICAL INVESTIGATIONS - TAXONOMIC COLLECTION OF THE FRESH AND SALTWATER FISHES OF ALASKA

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The fish collection comprises approximately 250 species of Alaskan marine and freshwater fishes. Eventually nearly all fish species inhabiting Alaskan waters will be represented. Scientific uses include collection of growth series so that juveniles, larvae, and eggs may be identified, the accurate identification of specimens taken in research activities, and recognition and definition of new species, the accumulation of series for racial work and variation analyses, and the construction of faunal lists and keys. Museum facilities are available to investigators, and specimens are available on loan to research institutions.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0009, GULF OF ALASKA DEMERSAL FISH INVESTIGATIONS

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Goals of the long-term projects are (1) to assemble all available data, published and unpublished, on the physical ecology, faunal assemblages, and population parameters of the demersal fishes of the Gulf of Alaska; (2) to classify this information on the basis of the statistical grid for the North Pacific Ocean in current use by the International North Pacific Fisheries Commission and store the information in suitable form on IBM cards to allow: (3)

the retrieval of information in the form of geographic and bathymetric distribution and density charts of species, the detection of faunal assemblages, the delineation of areas of high and low fish production, the assessment of future stock deterioration with fishing, and general correlation analysis to bring out salient relationships between biological, physical, and fishery factors and demersal fish production.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0010, MARINE BIOLOGICAL INVESTIGATIONS - ANALYSIS OF HERRING FISHERY DATA

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Analysis of data on catch per unit effort and age frequencies of Alaskan herring in the fishery. Data extending from the present to 1929. Analyses of data on herring movements in Southeastern Alaska as revealed by radioactive tagging experiments in 1960 and 1961. Preparation of manuscripts.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0011, MARINE BIOLOGICAL INVESTIGATIONS STUDIES PROJECT (FISHES)

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Quantitative studies of the complete fish faunas of selected bays of Southeastern Alaska. Goals: to identify the fishes and determine the ecology, density, growth, and mortality of their populations in the present nearly natural state. Such data to serve as benchmark information for comparison with future surveys of the same or similar bays of the region when these bays have been changed by man-made or natural causes. Ancillary objectives include the determination of possible faunal gradients that occur from the coast eastward in the inside waters and from north to south.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0012, MARINE BIOLOGICAL INVESTIGATIONS - JAPANESE FISHERY OBSERVERS PROJECT

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Goals are to monitor the take of Pacific halibut by Japanese fishery vessels in the Gulf of Alaska and to obtain catch information for possible use by the U.S. fishing industry. Project started in 1964. Approximately 300 hours of trawling observed each year.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0013, INVESTIGATION OF ANADROMOUS DOLLY VARDEN POPULATIONS IN HOOD BAY DRAINAGES, SOUTHEASTERN ALASKA

R. ARMSTRONG, State Dept. of Fish & Game, Juneau, Alaska

Objectives: (1) Determine the number and timing of Dolly Varden leaving Hood Bay Creek on their first migration to sea. (2) Determine the number and timing of Dolly Varden entering and leaving Hood Bay Creek. (3) Determine the number and timing of salmon entering Hood Bay Creek. (4) Determine the size, sex ratio and age of Dolly Varden migrating to sea for the first time from Hood Bay Creek. (5) Determine the size, sex ratio and age of Dolly Varden entering and leaving Hood Bay Creek. (6) Determine the homing tendencies, within the year, of Dolly Varden leaving Hood Bay Creek on their first migration to sea. (7) Determine the homing tendencies, within the year, of immigrant Dolly Varden displaced from Hood Bay Creek. (8) Determine the homing tendencies of Dolly Varden entering Hood Bay Creek. (9) Determine the number of mature (potential spawners for the year) and non-spawning Dolly Varden entering Hood Bay Creek. (10) Determine the frequency of spawning, by sex, of Dolly Varden spawning in Hood Bay Creek. (11) Determine if mortality of char occurs after spawning and obtain an estimation of mortality rate of spawned-out char by sex. (12) To locate spawning areas of Dolly Varden in Hood Bay Creek. (13) Estimate Dolly Varden egg deposition and over-winter survival of

## 5. LIVING SYSTEMS (NON-HUMAN)

the eggs in a selected area of Hood Bay Creek. (14) Evaluation of hydraulic sampling techniques in providing a deposition index. (15) Determine the distribution of Dolly Varden and salmon in Hood Bay Creek on a weekly basis. (16) To obtain information on the physical and chemical conditions of Hood Bay Creek. (17) Determine the food of Dolly Varden migrating to sea for the first time from Hood Bay Creek. (18) Determine a tag suitable for use on Dolly Varden less than 150 mm in fork length. (19) To evaluate the effectiveness of the Hood Bay Creek weir to stop and trap Dolly Varden on their first migration to sea.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0014, COOK INLET CATCH AND ESCAPEMENT AGE AND SEX COMPOSITION STUDIES

A.S. DAVIS, State Dept. of Fish & Game, Juneau, Alaska

The purpose of this phase of a long range sockeye study is to separate the returning adult runs by age and sex groups. The obtained information is necessary for evaluating optimum escapement indices and marine survival evaluations. Attempts to separate catch samples by river systems by scale characteristics will also be investigated.

Sampling of characteristics of the salmon caught in each of the several gill net fishing areas of the Inlet, along with spawning ground sampling for the same characteristics will be conducted at selected points.

A two-man crew will begin sampling July 1 in the set net fishery in the Ninilchik to Kasilof River area. Sampling will be conducted at the Columbia Wards Cannery at the mouth of the Kenai River when fish are available in sufficient numbers. The crew will sample set net catches on Kalgin Island, Kalifonsky Beach, Salamatof Beach, and Harriet Point on the west side of Cook Inlet. The drift net fishery will be sampled on two separate fishing days, July 21 and July 24. Spawning ground sampling will begin August 5.

Part 2 of 3

Alaska State Government

### 5.0015, COOK INLET SMOLT ENUMERATION STUDY

A.S. DAVIS, State Dept. of Fish & Game, Juneau, Alaska

The purpose of this phase of a long range sockeye salmon study is to enumerate the smolt production from the Kenai River. This will allow the establishment of index values which can be related to total smolt run size and will enable estimates of fresh water production under different escapement levels. It will also provide a better means for predicting future spawning run size other than current escapement indices.

Starting May 10 or as soon after as ice conditions permit, downstream migrant trapping will commence on the Kenai River. The trap site will be located at the sonar unit installation. Downstream migrant fyke nets, with detachable cod ends will be utilized for the sampling. Lengths, weights, and scale samples will be taken to establish freshwater life characteristics of these sockeye salmon runs. The Kenai River adult-counting sonar installation will be tested for its possible application to smolt enumeration. The annual outmigration of smolts will be sampled on the Kenai River until early June when the smolt migration will be over. A preliminary investigation of smolting sites and some test fishing will also be attempted on the Kasilof River.

Part 3 of 3.

Alaska State Government

### 5.0016, SOCKEYE SALMON MIGRATORY BEHAVIOR AND BIOLOGICAL STATISTICS COLLECTION, SOUTHEASTERN ALASKA

C. ENGELKING, State Dept. of Fish & Game, Juneau, Alaska

Objectives: A. Delineation of migration routes. Determination of the migration routes utilized by sockeye salmon approaching their home streams has been indeterminate in Southeast Alaska for a number of years. One portion of the run

will be identified by tagging in the Sumner Strait and North Clarence Strait approaches and subsequent recovery of the marked fish in (1) the commercial fishery, (2) at canneries, weirs on the spawning streams and (3) by teams of men conducting foot surveys on the spawning grounds of sockeye stream without weirs.

B. Biological Statistics Collection. The collection of biological statistics in the fishery, at canneries, weirs and in the estuarial areas at the mouths of the streams without weirs will greatly enhance the knowledge required to properly manage the sockeye salmon resource of Southeast Alaska. This will be accomplished through collection of scale and length data to assess the age classes in the fishery and in the total run; the rate of exploitation by the fishery and the timing of the various races comprising the run.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0017, PRE-EMERGENT FRY PINK SALMON FORECAST (KODIAK, ALASKA)

D.P. HENNICK, State Dept. of Fish & Game, Juneau, Alaska

This phase provides for the expansion and refinement of pink salmon forecast research in the Kodiak Island area. Objectives are egg and pre-emergent larva sampling of sufficient size to assure reliable forecast of the island runs and to assure a gradual accumulation of optimum escapement data in the major streams.

Essentially we are excavating random plots in important and accessible spawning streams in a manner which should give reliable year-to-year comparisons of larva survival and relative abundance. Approximately 22-25 streams are sampled annually using a standard hydraulic sampling tool. This is accomplished very near the end of freshwater life when many causes of population fluctuations have passed. With proper selection of streams about 80 percent of the escapement can be monitored.

During the early fall sampling is conducted in several selected streams for egg deposition, October through November. During the winter months analysis of data and reports are completed. In March a crew of five temporary aides are hired and arrangements are made to charter a vessel and helicopter. Pre-emergent sampling of 22-25 streams is conducted from March through April, usually a 6 week period. Throughout the summer and spawning period the streams to be sampled are traversed on foot and via light plane to access escapement and distribution of spawning populations and permanent markers are installed to pinpoint the location of the sampling areas.

Part 2 of 2

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0018, EXPANSION OF CURRENT AND DEVELOPMENT OF ADDITIONAL COMMERCIAL FISHERIES CATCH, PRODUCTION AND GEAR STATISTICS

B. HILL, State Dept. of Fish & Game, Juneau, Alaska

Objectives of the study are to (1) increase the accuracy and reliability of current state fishery statistics through the coordination of proper sampling methods, and (2) to compile and publish statistics on an area and individual fishery basis rather than on a regional or statewide basis. Procedures will consist of the following: (1) Establish uniform sampling techniques in the various areas throughout the State in order that adequate and reliable weight, number and value data can be collected. (2) Compile the catch in number and weight on a weekly or suitable time period basis for each fishery in each area of Alaska. (3) Compile the value to the fishermen of the various fisheries in each area of the State. (4) Compile effort statistics for each fishery in each area of the State. (5) Compile the volume and value of manufactured fishery products on an area basis. (6) Publish detailed annual catch, production, and effort statistics for each fishery on an area basis.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0019, PRE-EMERGENT FRY PINK SALMON FORECAST - SOUTHEASTERN ALASKA

*T.C. HOFFMAN, State Dept. of Fish & Game, Juneau, Alaska*

The objectives of this phase of a long range pink salmon study is to compliment and extend the presently established pre-emergent fry pink salmon forecast program in Southeastern Alaska with the long range goals: (1) develop useful predictions to provide for more efficient means of harvesting existing runs, (2) to see if the same sampling methods can be utilized with chum salmon.

Previous sampling activities, because of access problems, have been primarily located in intertidal and adjacent spawning areas. Distribution of sampling effort is made randomly within the total area included in a base stratum. This yields fry abundance from sixty plus streams in Southeastern Alaska which is projected statistically to the total area of the base stratum.

Fry production information for areas considerably removed from tidal influence especially in very large streams is an unknown factor and the primary emphasis of this phase is to fill that knowledge gap.

Fry production estimates will be made in upstream areas of twenty formerly inaccessible streams in Southeastern Alaska. These estimates will be integrated with the existing program in attempting to arrive at an estimate of returning pink salmon runs.

Sampling will be conducted with a hydraulic pump and the procedures are essentially as described in McNeil, William J. 1962. Mortality of pink and chum salmon eggs and larvae in Southeast Alaska streams.

Alaska State Government

### 5.0020, POPULATION STUDIES OF ANADROMOUS FISH - UPPER COOK INLET DRAINAGES

*S.W. KUBIK, State Dept. of Fish & Game, Juneau, Alaska*

Objectives: (1) To determine the sport fish catch of king salmon and evaluate angling pressure in the selected freshwater areas of Upper Cook Inlet. (2) To determine the distribution, abundance, time of arrival, age, size classes, sex ratios and spawning areas of adult king salmon and silver salmon in the various streams of Upper Cook Inlet. (3) To investigate Ship Creek and associated areas on Upper Cook Inlet as a source for the procurement of king salmon eggs for experimental hatching and rearing. (4) To evaluate the contribution of artificial ponds to the stocks of anadromous fishes to Ship Creek. (5) To conduct silver salmon harvest studies in selected tributaries of the Susitna River Drainage.

Procedures: (1) Creel census efforts will be directed towards obtaining information on numbers of king salmon caught, angling effort, lengths, weights, and sex of an adequate sample of fish caught. Scale samples will be collected for age analysis as appropriate. Data obtained from the return of the special king salmon punch cards will be evaluated in terms of total harvest, individual stream harvest, and angler success and participation

### 5.0021, IDENTIFICATION OF RED SALMON STOCKS TAKEN IN THE CAPE KUMLIK-ANIACHAK BAY FISHERY (CHIGNIK AREA)

*J. LECHNER, State Dept. of Fish & Game, Juneau, Alaska*

A red salmon Cape fishery has developed at Cape Kumlik on the south side of the Alaska Peninsula, since 1960. This study will determine the origin of these red salmon stocks, so that an established management basis may be determined for this Cape fishery. Indications from a limited tagging study in 1963, suggests that these stocks are bound for the Chignik River red salmon system, which is presently closely managed for obtainment of desired escapement goals. A building return of red salmon has escaped into the Aniachak system, which must be evaluated for the degree of contribution to the building Cape fishery. The location of the work will require tagging of red salmon at the Cape Kumlik fishery with Pedersen type disc tags, which will be in number sequence and the recovery of these tags by method of tag reward from the commercial fishery and spawning ground tag

recovery from the two major red systems within the area. Red salmon scales will be taken for morphological differentiation, from the Cape fishery and the major red salmon's systems within the area. A temporary field camp will be established for the Aniachak spawning ground survey. One Fisheries Biologist IV, one Fisheries Biologist I, and six temporary Fish and Game Aides will conduct the study.

### 5.0022, BRISTOL BAY INTERMEDIATE HIGH SEAS-INSHORE TEST FISHING

*K.R. MIDDLETON, State Dept. of Fish & Game, Juneau, Alaska*

A) OBJECTIVES - 1) To provide annual forecasts of the magnitude and age composition of the Bristol Bay sockeye runs after the runs have been exposed to the high seas fishery and just prior to the time they reach the inshore fishery. These forecasts will be used in conjunction with the existing high seas and inshore forecasts. 2) To obtain information regarding the annual timing and pattern of entry of the Bristol Bay sockeye into Bristol Bay.

B) PROCEDURES - 1) A large fishing vessel equipped with sonar fish-finding equipment will be used to fish standard 5-3/8' stretch measure gillnet north of Port Moller during the period 6/10-7/10 to obtain an index of abundance of red salmon migrating to Bristol Bay. The basic procedures will be designed after existing high seas procedures. 2) Fish captured will be sampled for age-weight-length data to provide an estimate of the age composition of the returning run. This will provide a second check on previous forecasts which provide estimates of return by age class. Differentiation of the stocks according to river system may also be possible on the basis of scale characteristics. 3) Information will be radioed daily to the King Salmon management office to aid in the management of the returns.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0023, BRISTOL BAY OFFSHORE TEST FISHING PROGRAM

*K.R. MIDDLETON, State Dept. of Fish & Game, Juneau, Alaska*

The objective of this program is to annually monitor the Bristol Bay adult sockeye run as it passes north of Port Moller enroute to Bristol Bay in an attempt to estimate the magnitude, age composition and pattern of entry.

Test fishing will be conducted nightly with 5-3/8' gill net as utilized by the Bristol Bay inshore commercial fishery. Approximately five test drifts will be made nightly at different stations along a 50-mile northerly transect originating at Port Moller. The data from the five drifts will be combined to obtain a nightly index of fishing success. Fish captured will be sampled for age composition.

Test fishing on the 1967 sockeye run will be completed during the period July 1-10, 1967. During the period July 10 to June 30, 1968, reports will be completed on the 1967 season. Sampling plans will be revised if necessary for the 1968 season. Test fishing on the 1968 run will be conducted during the period June 10-30, 1968.

In addition to the five-man crew for the charter fishing vessel, two biological aides will be aboard the fishing vessel during the test fishing period.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0024, ARCTIC-YUKON-KUSKOKWIM AREA ANADROMOUS FISH INVESTIGATIONS

*R.I. REGNART, State Dept. of Fish & Game, Juneau, Alaska*

Salmon research studies in this area prior to 1961 are almost non-existent. Recent studies by the Alaska Department of Fish and Game have been encouraging but accurate estimations of the sizes of runs and escapements have yet to be determined. Also much basic life history information is still lacking for some species of salmon.

## 5. LIVING SYSTEMS (NON-HUMAN)

The long range objectives of this project are to determine the population sizes and escapements, destination and timing of different segments or races and life histories of Arctic-Yukon-Kuskokwim area salmon runs. Procedures will consist of the following: (1) gill nets will be operated for the capture of salmon which will be tagged and released. Cash reward for recoveries will be offered. (2) Commercial- subsistence catches and carcasses from several 'key' tributaries will be sampled periodically. (3) Aerial surveys and boat or ground surveys will be made of 'key' tributaries in order to determine escapements.

**Sheefish** - The sheefish or inconnu, *Stenodus leucichthys* is a member of the whitefish family and is abundant in northwestern Alaska, e.g. Kuskokwim, Yukon and Kotzebue Sound drainages. Recently there have been numerous requests on the part of area residents and interested processors relative to the feasibility of establishing commercial fisheries for sheefish. The habits, life histories and productivity of sheefish are virtually unknown. The objectives of this phase of the project are to acquire the necessary population dynamics, life history and other pertinent information needed to determine the feasibility of developing a sheefish commercial fishery. Procedures are to include the following: (1) research of existing literature and interview of fishermen, buyers, pilots, etc., (2) operate various types of fishing gear on a year-round basis, (3) tag and release sheefish in selected areas and offer rewards for tag recoveries. (4) conduct surveys of subsistence fisheries by distribution of catch calendars and actual counts and, (5) sample test net and subsistence-commercial catches for age, size, sex and fecundity information.

**Subsistence fishery** - Subsistence utilization of salmon and sheefish will be documented by personal interviews, direct counts, and catch questionnaires from August through September.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0025, COPPER RIVER SOCKEYE SALMON INVESTIGATIONS

R.S. ROYS, State Dept. of Fish & Game, Juneau, Alaska

**A. OBJECTIVES:** 1) To determine the qualitative and quantitative Copper River sockeye salmon escapement immediately following exploitation by the commercial gill net fishery and on the upstream migration.

**B. LOCATION:** Copper River and its tributaries of Southcentral Alaska. Base of operations - Glennallen and Cordova.

**C. PROCEDURES:** 1) Delta Investigations a. Test fishing will be employed as an immediate index of escapement. Four chartered gill net boats utilizing standard gear will fish during closed fishing periods. Relative abundance per time of set, timing of runs, and migration patterns will be obtained. b. Scales for age determination and other biological statistics will be obtained by sampling the canneries and from the test fishing operations.

2) UPPER RIVER INVESTIGATIONS - a. Tagging will be employed to separate the different stocks of fish. Fishwheels at Woods Canyon will be used in a cooperative effort with the River Basins Branch, BCF, tagged to untagged ratios will be investigated as a means of obtaining a population estimate of the run. b. Biological statistics will be collected for stock identification and separation at the tagging and recovery sites and surveys of the spawning escapement will be made. c. Possible selectivity of the gill net fishery will be investigated by comparing upriver and delta lengths and possible sites for electronic counters will be conducted.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0026, COPPER RIVER SOCKEYE SALMON INVESTIGATIONS

R.S. ROYS, State Dept. of Fish & Game, Juneau, Alaska

**Objectives:** 1. To determine the qualitative and quantitative Copper River sockeye salmon escapement immediately following exploitation by the commercial gill net fishery and on the upstream migration.

**Procedures:** 1. Delta Investigations: (a) Test fishing will be employed as an immediate index of escapement. Four chartered gill net boats utilizing standard gear will fish during closed fishing periods. Relative abundance per time of set, timing of runs, and migration patterns will be obtained. (b) Scales for age determination and other biological statistics will be obtained by sampling the canneries and from the test fishing operations. (2) Upper River Investigations: a. Tagging will be employed to separate the different stocks of fish. Fishwheels at Woods Canyon will be used in cooperative effort with the River Basins Branch, BCT. Tagged to untagged ratios will be investigated as a means of obtaining a population estimate of the run. (b) Biological statistics will be collected for stock identification and separation at the tagging and recovery sites and surveys of the spawning escapement will be made (c) Possible selectivity of the gill net fishery will be investigated by comparing upriver and delta lengths and possible sites for electronic counters will be conducted.

Alaska State Government

### 5.0027, SOCKEYE SALMON MIGRATORY BEHAVIOR AND BIOLOGICAL STATISTICS COLLECTION, SOUTHEASTERN ALASKA

UNKNOWN, State Dept. of Fish & Game, Juneau, Alaska

**Objectives:** A. Delineation of Migration Routes: Determination of the migration routes utilized by sockeye salmon approaching their home streams has been indeterminate in Southeast Alaska for a number of years. One portion of the run will be identified by tagging in the Sumner Strait and North Clarence Strait approaches and subsequent recovery of the marked fish in (1) the commercial fishery, (2) at weirs on the spawning streams and (3) by teams of men conducting foot surveys on the spawning grounds of sockeye streams without weirs. B. Biological Statistics Collection: The collection of biological statistics in the fishery, at the weirs and in the estuarial areas at the mouths of streams without weirs will greatly enhance the knowledge required to properly manage the sockeye salmon resource of Southeast Alaska. This will be accomplished through collection of scale and length data to assess the age classes in the fishery and in the total run; the rate of exploitation by the fishery and the timing of the various races comprising the run.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0028, OFFSHORE SALMON ABUNDANCE INDEX

UNKNOWN, State Dept. of Fish & Game, Juneau, Alaska

**Objectives:** A. To establish an index of abundance of salmon (primarily pink salmon) in the immediate offshore waters of Southeastern Alaska prior to the appearance of the runs in the commercial fisheries. B. Stock identification and timing as the runs approach the coast, the fishery and their home streams.

**Procedures:** Gill nets and long line gear will be fished on a predetermined schedule. All viable salmon will be tagged and released after a scale and length measurement are taken.

Tag recovery will be effected in the commercial fishery, at weirs on streams and by foot survey crews on the salmon streams.

The area to be fished is a 50 mile band off the coast of Southeastern Alaska from Yakutat to Dixon Entrance from approximately June 1 to July 31.

The program is designed to operate a minimum of five years. All data collected will be processed by electronic data processing methods and will be available for correlation with previous and current programs of the United States and Canada in this area of work.

Personnel will involve two temporary biological aides on each vessel and a permanent biologist in charge of the program.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0029, FISH POPULATIONS IN THE CHENA RIVER F. VANHULLE, State Dept. of Fish & Game, Juneau, Alaska

## 5. LIVING SYSTEMS (NON-HUMAN)

Objectives: (1) Become familiar with the Chena River watershed and test various methods of sampling the fish populations. (2) Establish techniques for determining the following population dynamics of the fish in the Chena River: a) Species composition. b) Age and sex composition of grayling, pike and whitefish. c) Trends and extent of natural movements. d) Spawning locations. (3) Determine the present utilization of the recreational fishery on the Chena River.

Procedures: (1) Initial investigations will be directed toward becoming familiarized with the Chena River watershed. The river will be arbitrarily sectioned off to provide a number of basic reference points for the different aspects of the study program. Fish will be collected from the Chena River by those means which are deemed most efficient at the time. (2) In conjunction with Objective (2), the following procedures will be followed: a) Location and time of capture will be noted for all fish taken. Fish released will be marked; in addition all grayling and pike over 6 inches will be tagged. b) Scale samples, length and weights will be taken of all tagged fish. In addition, random samples of grayling, pike and whitefish will be sacrificed for sex identification. c) Periodic surveys and sampling will be conducted throughout the year to determine, as far as possible, the movements of the fish within the river system. Investigations will be conducted to determine possible overwintering areas and their utilization by the various fish populations. d) An extensive stream survey will be initiated. Basic chemical and physical data will be collected with special emphasis placed on the location of active and potential spawning areas. (3) Periodic fishermen interviews will be conducted on the Chena River. Aerial and ground counts of the number and location of fishermen will be made to determine present utilization of the sport fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0030, BOTTOMFISH EXPLORATIONS

*B.F. JONES*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Juneau, Alaska 99801

Bottomfish exploration is primarily concerned with benthic vertebrate populations. The objectives are to define, on a seasonal basis, the quantitative and qualitative distribution of aquatic benthic vertebrate resources having a potential for commercial utilization, and to provide an appraisal of those resources. In its full extent, bottomfish exploration is a cataloging of benthic vertebrate fauna in time and space.

Area stressed is the Northeastern Pacific primarily the Gulf of Alaska and Bering Sea. The explorations are carried out by the Juneau-based vessel John R. Manning and chartered vessels.

Sampling has been conducted along the Continental Shelf with a standard commercial otter trawl. New trawling grounds and new commercial concentrations of bottomfish have been discovered. Sampling will be continued on the continental slope and a reevaluation of the shelf with different types of fishing gear including pelagic trawls will be done. Biological observations will be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0031, TECHNICAL ASSISTANCE TO INDUSTRY

*B.F. JONES*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Juneau, Alaska 99801

This program is structured to provide the services and skills of a specialist (or specialists) in the field of commercial fishing to serve as a consultant, advisor, and instructor to fishermen and processors. The staff also provides similar services to other disciplines of the Bureau of Commercial Fisheries in this region - including biological, oceanographic and technological research. The project leader acts as liaison between the Bureau and segments of the commercial fishing industry as the need arises. In specific situations, and under proper control, assistance may be provided in the form of loaned fishing gear and equipment to permit individuals or processors to pursue new methods or developments in potential or established fisheries.

Objectives: To furnish the fishing community with current information relative to new developments in their industry and pro-

vide assistance in the development and/or introduction of new fisheries to specific areas of Alaska.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0032, FISH POPULATION OFF THE ISLAND OF TUTUILA, AMERICAN SAMOA

*J.R. HOLLOWAY*, Amer. Samoa Dept. of Agric., Pago Pago - Tutuila, American Samoa

Objectives: Locate banks and fish concentrations as well as determine availability and abundance of bait species. Collect specimens for taxonomic study and identification of potentially commercially valuable species.

Procedures: Scout for fish concentrations and banks areas using small skiff and Furuno gear. Collect specimens by handlines and trolling. Survey accessible in-shore areas for bait species.

Location of Work: Around Island of Tutuila, American Samoa.

Part 2 of 4.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
American Samoa Government

### 5.0033, FISH POPULATIONS OF AMERICAN SAMOA

*J.R. HOLLOWAY*, Amer. Samoa Dept. of Agric., Pago Pago - Tutuila, American Samoa

Objectives - Intensely fish banks and areas of fish concentration located in Phase I and other potential areas not within range of the skiff. Determine numbers and kinds of potentially valuable fish and shell fish, and maintain records of seasonal and areal variation.

Procedures - With a small sampan from Hawaii, use various gear including handlines, traps, lobster pots, seines and trolling gear to determine species available and abundance. Records will be kept of date of catch, total catch, gear and personnel used, special conditions noted and other factors likely to be important in the intelligent utilization of off-shore stocks or marine fish and shellfish species.

Work Schedule - Initial period - from approximately February 1, 1967 to June 30, 1967. Phase to be extended for at least 1 year for accurate records of seasonal and areal variation in abundance.

Part 3 of 4.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
American Samoa Government

### 5.0034, TAXONOMIC STUDIES

*E.S. HOBSON*, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

Taxonomic studies (a continuous program considering material incidently becoming available in the course of the other projects). a. Revision of the family Scaridae in the eastern Pacific. b. Revision of the family Labridae in the eastern Pacific.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0035, LIFE HISTORY OF CLUPEA HARENGUS PALLASI

*G.B. TALBOT*, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

Experiments will be undertaken to artificially fertilize the eggs of Pacific herring (*Clupea harengus pallasii*) and to raise them in captivity. When competence is developed in this procedure, experiments with these fish will be carried out to determine the effects of varying temperatures and salinities on their meristic characters.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0036, TAGGING PROGRAM WITH WOODS HOLE AND INTERNATIONAL GAME FISH ASSOCIATION FOR MARLIN, SAILFISH AND OTHER GAME SPECIES MIGRATION STUDIES

*G.B. TALBOT*, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

## 5. LIVING SYSTEMS (NON-HUMAN)

Objective -- To determine the population distribution and amount of inter-migration between oceanic areas for many of the marine game species.

Procedure - Develop a cooperative sportsman tagging program by encouraging participation by active sportsmen. Tagging and record deeping equipment shall be furnished, and records of all Pacific area game fish tagging shall be maintained by the Tiburon Marine Laboratory. Analyses will be made of tagging recoveries for species currently under study (marlin and sailfish). Program expected to be expanded to include sharks and other pelagic and demersal marine game species common to the eastern Pacific.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0037, SPECIES LIFE HISTORY AND DISTRIBUTION

*E.H. AHLSTROM*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

This program deals with the identification, geographic distribution, and estimates of abundance of the younger stages of fishes--eggs, larvae, metamorphosing specimens, and juveniles--which are collected in quantitative plankton hauls. The area of principal concern is the California Current region off California and Baja California, but pelagic fish larvae are being studied from all parts of the eastern Pacific, including the eastern tropical Pacific (EASTROPAC cruises). We are concerned with descriptions of the younger stages of pelagic fishes and their zoogeographic distributions as related to water masses. We have developed the use of systematic surveys of ichthyoplankton as a fundamental means of assessing our pelagic fish resources. The ultimate objective is the description of the developmental stages of all common pelagic fishes in the eastern North Pacific.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0038, SCHOOLING BEHAVIOR

*J.R. HUNTER*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

The purpose of this project is to obtain information on the internal structure of adult fish schools (anchovy, sardine, mackerels, etc.) important to the commercial fisheries of California. Research underway concerns study, under varying environmental and physiological conditions, of the manner in which fish react to one another, thereby altering the structure of the school. This work is based on experiments performed in large holding tanks and various experimental containers in the laboratory ashore.

In order to test whether these experimental models of fish school structure and behavior are applicable to fish under natural conditions, it is planned to observe the behavior of wild schools of the same species of fish at sea by aerial and underwater photography. Extensions of this same project will include investigations of the manner in which the adult schooling behavior patterns are developed during the larval stages of the same species and motor system development in larvae.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0039, FISH POPULATION PARAMETERS

*J.S. MACGREGOR*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

A knowledge of the life histories of the various fish populations is necessary in order to understand the population dynamics of marine fish stocks. It is especially important to discover which factors are critical in determining year-class size. The purpose of this project is to describe the spawning cycle of the northern anchovy, of various rockfish, and of saury and to compare and contrast fish spawning patterns in time and space. These data in conjunction with estimates of stock abundance from egg and larval surveys will be used to inventory species biomass in the California Current.

Related work in this project includes a continuing analysis of the age and length composition of the anchovy population in cooperation with the California Department of Fish and Game, and the monitoring of the Ensenada wetfish landings to supplement information gathered by the State from the commercial landings of this species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0040, FEEDING BEHAVIOR

*C.P. OCONNELL*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

The ingestion of food by an individual fish is the climax of a complicated and plastic behavior pattern. This project is planned to describe this behavior pattern, particularly for the northern anchovy and Pacific sardine, and to determine the effects of environmental and physiological variables on the nature of the feeding pattern.

Work in progress includes observation and experimentation upon captive schools of adults in the laboratory which will later be extended to larval and juvenile forms, and a study of the sensory mechanisms upon which the feeding behavior pattern is based in these species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0041, REARING MARINE FISH

*G.O. SCHUMANN*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

This project has as its primary goal the development of techniques to hold larval fish throughout their development in a healthy, normal condition under controlled conditions of temperature, light, food, etc. in experimental containers. Because of the excellent experimental aquarium facilities now available in the Fishery-Oceanography Center, more than 30 species of marine fish, including the sardine, anchovy, and Pacific mackerel, have been successfully reared by empirical methods, from the egg through the juvenile stage. When these techniques are standardized and quantified, it is planned to measure the effect of environmental variables on feeding, growth, survival and morphology of larval fish by experimental work in the laboratory.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0042, SUBPOPULATIONS

*A.M. VROOMAN*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

The purpose of this project is to study the subpopulation structure of commercially important fish species, i.e., to determine if a species is made up of a single homogenous population or of several, genetically distinct subpopulations, each of which may have different characteristics of growth, mortality, longevity, fecundity, migration, and availability. Initial attention was centered on the Pacific sardine and three subpopulations have been recognized in this species by the frequency of occurrence of the C-positive antigen in the red blood cell.

Similar methods of analyzing genotypes are now being applied to the northern anchovy, Pacific hake, and Pacific mackerel. The study of each species may be divided into three parts: 1) the development of methods to identify subpopulations such as immunological techniques, 2) delimiting the geographical range of each subpopulation, and 3) supply data to determine the contribution of each subpopulation to the commercial catch.

When techniques have been worked out which will permit satisfactory shipment to laboratories in Japan and Oceania, a study will also be undertaken on the albacore which has been tracked across the Pacific.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0043, DISTRIBUTION OF THE MID-WATER FISHES OF THE GULF OF CALIFORNIA

*B.H. ROBISON*, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

The study is being based on collections made in the Gulf of California by the research vessel TE VEGA during its Cruise number 16, September 15, 1967 to December 1, 1967.

Sampling gear consisted of a Tucker Trawl with an opening-closing device, a depth recorder and an attached meter net. Collections were made from Latitude 29 degrees 59' N. to Latitude 22 degrees 42' N. in the Gulf. Seventy collection stations resulting in the capture of over 10,000 fish were made.

## 5. LIVING SYSTEMS (NON-HUMAN)

Hydrographic stations were made adjacent to the trawling sites where environmental parameters such as temperature, salinity, oxygen concentration, and water mass structure were measured.

At the Hopkins Marine Station, the fishes are to be identified and the collection data coordinated with environmental factors to provide an outline of distribution. Vertical distribution relative to light and the deep scattering layer is also being studied.

SUPPORTED BY U.S. National Science Foundation

### 5.0044, FOOD HABITS STUDY OF ORGANISMS OF THE CALIFORNIA CURRENT SYSTEM

P.M. ROEDEL, State Dept. of Fish & Game, Terminal Island, California

Objectives: To determine the food habits and requirements of as many of the significant fishes and cephalopods inhabiting the California Current System adjacent to California as can be accomplished.

Procedures: Stomachs of such economically important and potentially important organisms as hake, bonito, rockfish, albacore, jack mackerel, salmon, yellowtail, barracuda, squid, etc., will be systematically collected throughout their range and the contained food items will be identified to species, their number determined per stomach, and their original sizes determined from such component parts as can be found (fish otoliths, cephalopod beaks, crustacean legs, etc.). Sampling will take advantage of departmental investigation, both routine and exploratory, programs of other agencies and institutions, and commercial and sport fishing at ports and places of landing.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
California State Government

### 5.0045, SPORT FISH BEHAVIORAL STUDIES

C.H. TURNER, State Dept. of Fish & Game, Terminal Island, California

Objective: To further our knowledge of sport fish behavior in rocky subtidal areas with particular emphasis being placed on sculpin (*Scorpaena guttata*), kelp, sand, and spotted sand bass (*Paralabrax clathratus*, *P. nebulifer*, and *P. maculato-fasciatus*, and sheephead (*Pimelometopon pulchrum*).

Procedures: At every opportunity, diving observations will be made, photographs taken and analyzed, and fish movements studied. In addition, an average of 2 days per month is scheduled for behavioral studies in promising areas where feeding, breeding, defensive schooling, and other aspects of social life can be observed and documented. Study emphasis is being placed on the five species listed because they are known to be important 'reef-dependent' fishes (Turner, Ebert, and Given, Artificial Reef Ecology, unpublished ms; Carlisle, Turner, and Ebert, Calif. Fish and Game Fish Bull. 124; and Turner, Ebert, and Given, Calif. Fish and Game Fish Bull. 140, in press) which are actively sought by sportsmen, and because additional life history and behavior information is needed to permit their more effective management.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
California State Government

### 5.0046, A STUDY OF THE RATE AND PATTERN OF SHAD MIGRATION IN THE CONNECTICUT RIVER UTILIZING SONIC TRACKING APPARATUS

W.C. LEGGETT, Essex Marine Laboratory Inc., Essex, Connecticut

Objectives: To investigate rate of movement of American shad from the mouth of the Connecticut River upstream to include movement through the area of heated effluent outfall of an atomic power plant before operation and through non-channeled and major spawning area of the river.

Procedures: Shad, taken with monofilament gill nets and/or beach seine will be tagged with sonic tags and tracked as individuals and/or loose schools through the above areas of the river. Tagged shad will be held in live cars to check tag operation and delayed handling mortality. Hand held and boat mounted hydrophone receivers will be utilized to track shad as long as

possible. Daily trips will be made to locate tagged fish. Data will be processed automatically and compared with other available tagging data.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Connecticut State Government

### 5.0047, SHARK RESEARCH

J. OLIVE, Amer. Inst. of Biolog. Sci., Washington, District of Columbia (NONR)

Under this work unit, the Shark Research Panel, the International Shark Tagging Program, and other coordinating activities in relation to shark studies are supported. These activities include a determination of the seasonal and geographic distribution of all species of sharks on a world-wide basis and guidance for a scientific campaign of research and education regarding shark and shark repellents and a cooperative effort toward these goals with similar efforts in other countries.

This is part of the Noxious Marine Animals Program and is concerned specifically with the biology of sharks. These primitive fishes have adapted with great success to life in the sea and have evolved a wide variety of physiological and behavioral responses to marine environmental factors. These facts make the sharks a particularly difficult animal to control. They represent a physical, as well as a psychological, hazard to personnel operating in the water and to survivors of plane or ship disasters. The search for an effective control or repellent must be based on accurate information regarding their diverse habits and their distribution.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0048, STUDIES ON ANACANTHINE FISHES

D.M. COHEN, Smithsonian Institution, Washington, District of Columbia 20560

Much work remains to be done on the taxonomy of anacanthine (cod-like) fishes. Some projects under way are: (1) A monograph on Anacanthini (exclusive of Macrouridae) of the western North Atlantic. (2) A taxonomic revision of the family Moridae (mostly fishes of the continental shelves and slopes).

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0049, SYSTEMATICS AND BIOLOGY OF EPIPELAGIC AND BATHYPELAGIC FISHES

R.H. GIBBS, Smithsonian Institution, Washington, District of Columbia 20560

Studies on the systematics and biology of epipelagic and bathypelagic fishes will comprise the following units: systematics of Scombroidei, copepod parasites as indicators of scombroid phylogeny, zoogeography of the midwater fishes of the western Indian Ocean, ecological analysis of epipelagic fishes in the western North Atlantic, ecological analysis of the midwater fishes of a single water column in the western North Atlantic, systematics and biology of Atlantic flyingfishes, systematics of the Lancetfishes, and anatomy and histology of gonads as indicators of relationships in deep sea fishes.

SUPPORTED BY Smithsonian Institution

### 5.0050, SYSTEMATIC REVISION PLATYCEPHALIDAE (PISCES)

L.W. KNAPP, Smithsonian Institution, Washington, District of Columbia 20560

The systematics of the Indo-Pacific fishes of the family Platycephalidae are poorly understood. This benthic group includes approximately 115 nominal forms, a number of which have some importance as food. Several species have been reported to be protandrous hermaphrodites but others appear to be gonochoristic.

Results of several recent regional studies indicate the need for a comprehensive family revision to untangle existing problems in nomenclature and phylogeny. A moderate amount of material for such a revision is available in this country. Specimens from the International Indian Ocean Expedition are currently under study and material at various U. S. museums will be examined during fiscal years 1969 and 1970.

## 5. LIVING SYSTEMS (NON-HUMAN)

As the majority of the types and a considerable amount of additional material must be studied in several European museums, a two-month trip for this purpose is planned for fiscal year 1971. Other important holdings of types and additional material are located in several Australian museums and a trip to these institutions is planned during fiscal year 1972.

SUPPORTED BY Smithsonian Institution

### 5.0051, SYSTEMATICS AND ZOOGEOGRAPHY OF THE BLENNOID FISHES

V.G. SPRINGER, Smithsonian Institution, Washington, District of Columbia 20560

The ultimate purposes of this project are: the completion of systematic revisions of all the members of the superfamily Blennioideae with emphasis on variation, distribution, and relationships; the determination of the nature of the extra-superfamilial relationships; and the application of the derived results towards an understanding of the percoid fishes in general. Present studies center on the osteology of the Blenniidae and a revision of the genus *Atrosalaria*.

SUPPORTED BY Smithsonian Institution

### 5.0052, STUDIES OF FISH FAMILIES ARIIDAE AND ASPREDINIDAE

W.R. TAYLOR, Smithsonian Institution, Washington, District of Columbia 20560

To study the systematics, relationships, and zoogeography of the tropical marine catfish family Ariidae and the South American marine species of *Aspredinidae*.

SUPPORTED BY Smithsonian Institution

### 5.0053, OSTEOLOGY AND EVOLUTION OF ISOSPONDYLOUS AND OSTARIOPHYSAN FISHES

S.H. WEITZMAN, Smithsonian Institution, Washington, District of Columbia 20560

This project consists of several smaller research efforts all contributing to the understanding of the morphology and evolution of recent, relatively primitive teleost fishes.

SUPPORTED BY Smithsonian Institution

### 5.0054, STUDIES ON OPHIDIOID FISHES

D.M. COHEN, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

There are perhaps 500 species of this group. Problems are: (1) Definition and relationships of Ophidioidea. (2) Families of Ophidioidea. (3) Anatomical studies which will allow definition of genera. (4) Description of species. (5) Studies on depth and areal distribution.

This group is an important part of the abyssal benthic fauna, and studies on general biology of abyssal fishes will be made as appropriate.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0055, TAXONOMIC REVISION OF BATHYLAGIDAE

D.M. COHEN, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

Taxonomic revision of the oceanic fish family Bathylagidae. These are small midwater fishes found in all major temperate and tropical oceans. About 20 species have been described. Keys, illustrations, description and distribution charts will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0056, SYSTEMATIC STUDIES ON THE FAMILY SCOMBRIDAE

B.B. COLLETTE, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

The family Scombridae is comprised of some 40-45 species of medium to large-sized fishes found in all the oceans. Many are of great commercial importance. The classification, both at the generic level and the species level, is confused in spite of the large

amount of time and money that has been spent trying to solve the problems in the group. The search for characters useful in defining taxa within the family has led to the use of internal characters such as the osteology, circulatory system, and position of the viscera. This project is a long-term study that will redefine all the genera and species and provide keys for identification, figures, distribution maps, and summaries of the biology. A preliminary review of the family, an illustrated key to the species of the Indian Ocean, and anatomical and systematic revision of the great tunas, genus *Thunnus* have been published. Studies of *Euthynnus*, *Katsuwonus*, and *Allothunnus* are under way. Skeletal material of all forms is being accumulated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0057, DESCRIPTIONS OF NEW SHARKS

S. SPRINGER, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

Collections of sharks made by research vessels over the past few years are being studied. These appear to contain at least 10 new species which will be described for publication. Continuing.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0058, A REVISION OF THE CAT SHARKS, SCYLORHINIDAE

S. SPRINGER, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

The work to redefine the family Scyliorhinidae, its genera, and the 50 to 60 included species. The last general revision (1908) and a partial revision (1948) were brief and were based on examinations of small numbers of specimens with attention to only a few morphological details.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0059, SYSTEMATIC STUDIES OF FISHES

F.H. BERRY, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Objectives: To improve upon our knowledge of the taxonomy of the orders, families, genera, and species of marine fishes, principally those of the Atlantic Ocean. To facilitate the ready identification of these fishes, especially those of commercial or potentially commercial importance. To determine data on the morphology and ontogeny of these fishes that will assist in early development and in life history studies. In the study of selected fish groups, to develop principles of morphology and ontogeny that will relate to the resolution of knowledge of other similar but unstudied groups.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0060, TAXONOMY AND BIOLOGY OF CLUPEOID FISHES

F.H. BERRY, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

To discriminate between the various species of Clupeidae and Engraulidae, especially those of tropical and subtropical marine waters, with emphasis on the Atlantic Ocean. To do this by study of their comparative morphology, and to a lesser degree with biochemical, behavioral, and certain life history studies. To prepare a field guide of these species that will facilitate their identification by ichthyologists, fishery biologists, and fishermen.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0061, SYSTEMATICS OF CARANGID FISHES

F.H. BERRY, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

To obtain additional specimens of carangid fishes and appropriate field data to allow resolution of the taxonomic problems concerned. To prepare scientific accounts in the field guides that will define the various species and growth stages.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0062, BEHAVIOR OF LARVAL FISHES

*W.J. RICHARDS*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Objectives: 1. To rear fish larvae for confirmation of identification. 2. To study the growth, feeding habits, and tolerance of the larvae to temperature, salinity, oxygen, light and other environmental variables. 3. To study the general ethology of larvae and, in particular, their behavior in relation to thermal stratification and other simulated environmental barriers. 4. To study the feasibility of rearing fishes from the eggs on a commercial basis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0063, DISTRIBUTION AND ECOLOGY OF ATLANTIC TUNAS

*J.P. WISE*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Objectives: To determine the effect of environmental parameters on the geographical and temporal distribution of Atlantic tunas in sufficient detail to be able to predict such distributions from knowledge of the environment so as to increase the efficiency of fishing effort.

Fishery-oceanography surveys of the tropical Atlantic have been and will continue to be carried out by research vessels of this laboratory. Such surveys will yield data that will allow comparison in space and in time of the ecology and life history, as well as the population dynamics of the tunas in the areas surveyed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0064, MIGRATION OF ATLANTIC TUNAS

*J.P. WISE*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

We have made explorations into the possibilities of initiating a tagging program in cooperation with ORSTOM, and other West African activities. Operations probably will start in the West African tuna fishery. A staff member has investigated the possibilities of such an arrangement during a trip to African tuna ports. Present thinking lies along the lines that the BCF (TABL) coordinate and finance most of such a cooperative program, and that the other participating agencies provide the majority of the field personnel.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0065, POPULATION DYNAMICS OF ATLANTIC TUNAS

*J.P. WISE*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

The most essential need is for a reliable estimate of the magnitude of the fishery, i.e., the total catch and landings.

Second in importance is to obtain reliable figures on the catch-per-unit effort involved for at least representative portions of the fishing fleets, in order to estimate relative abundance and changes in abundance of the fishable stocks.

Third is the biological sampling of the fishery--collection of data on length, weight, state of gonad development, stomach contents, etc., from the landed fish. Some of this information also is essential to other projects within this program.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0066, ICHTHYOFAUNA OF THE FLORIDA CURRENT

*C.R. ROBINS*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The studies are on the fish faunas of the Florida current have emphasized seasonal and depth distribution and ecological parameters otherwise influencing numbers and abundance. Sampling of the fishes and photographs of the sea bottom has enabled many distribution abundance questions to be answered. The overall aim is to identify the populations of fishes at all depths and latitudes in the Florida Current area, and to determine what ecological factors are responsible for differences in numbers and distribution.

SUPPORTED BY U.S. National Science Foundation

### 5.0067, SHORE FISHES OF ANNOBON AND FERNANDO POO

*C.R. ROBINS*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Objective: To study comprehensively the collections of shore fishes collected at 18 stations at Fernando Poo and Annobon and to report on them in a series of short papers plus a comprehensive terminal report. The study will emphasize description and characterization and will not attempt (as part of this effort) to fill the more long term need for detailed comparisons of transatlantic populations, etc.

Drawings will be made for the new species or for those previously unfigured or poorly illustrated. In some instances photographs will suffice, but in most, particularly the smaller forms, drawings are desirable.

The collections are now in alcohol but they must be sorted and processed. Most material ultimately will be deposited in either the National Museum, the Academy of Natural Science, or in both.

SUPPORTED BY U.S. National Science Foundation

### 5.0068, OCEANIC FISHES OF THE TROPICAL ATLANTIC

*C.R. ROBINS*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

This investigation is for the continuation of the research initiated under GB-1350 and GB-4389 for long-range exploration of the oceanic fish fauna of the tropical Atlantic.

The ichthyological program of the Institute of Marine Science has aimed since its inception at the delineation of the fish fauna of the Tropical Atlantic and at understanding the various community structures. Two aspects have been considered at the same time. One, to determine what species occur in various regions, has led to and continues to involve systematic studies of the fishes. The second aspect is to pick certain areas and to work them thoroughly and repeatedly so that information can be gained on the biology and ecology of oceanic fishes and their varied environmental roles.

The primary objectives of the present project are: 1) to complete the initial survey from 10 to 2000 fathoms along the Central American Coast and around Yucatan and into the western Straits of Florida, 2) to survey the hump of Brazil and the Fernando Noronha Archipelago, 3) to work along the coast of Colombia eastward from Cartagena and as time permits along the Antillean Arc, and 4) to continue the detailed studies of the fishes of the Straits of Florida with attention to seasonal, geographic, and bathymetric aspects and to the stages of the life history of the fishes involved.

SUPPORTED BY U.S. National Science Foundation

### 5.0069, STUDIES ON THE SPORT FISHERY FOR BILLFISHES AND TUNAS IN THE WESTERN ATLANTIC AND SOUTHEASTERN PACIFIC OCEAN.

*D.P. DESYLVA*, U.S. Dept. of Interior, Bureau of Sport Fish. & Wife., Panama City, Florida 32401 (14-16-0008-775)

Objective: To carry out a survey of the sport fishery for billfishes and tunas in the western hemisphere.

Information will be obtained on: (a) what species of sailfish, marlins, swordfish, and tunas are caught by anglers in the western hemisphere; (b) their seasonal distribution; (c) size composition of catch; (d) an estimate of the number of anglers engaged in the sport fishery; (e) the economic value of the fishery; and (f) the effect, if any, on the sportfish catch by commercial fishermen as reflected in either decrease in size of fish landed by sportsmen or decrease in catch per unit of effort.

Questionnaires will be mailed to anglers, charterboat captains, angling clubs, marinas, and bait and tackle dealers who might be able to supply the above information. Personal logs and records will be borrowed or copied, and the data reduced for IBM processing.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0070, ENVIRONMENTAL EFFECTS ON ISTIOPHORID FISH DISTRIBUTION

*N.G. VICK*, U.S. Dept. of Interior, Bureau of Sport Fish. & Wile. , Panama City, Florida 32401

The objective of this study is to establish and test relationships between the seasonal distribution and appearance of istiophorid game fishes in the northeastern Gulf of Mexico and seasonally hydrographic features producing quasi-stationary eddies. Twenty-four cruises are planned to test previously determined relationships through the cooperative efforts of the Texas A & M Research Foundation, the Office of Naval Research, and the Bureau of Sport Fisheries and Wildlife. Predictive techniques will be tested and information made available to sportsmen. Technical data secured to aid in management recommendations for these particular species will also be tested. Certain biological materials, i.e., eggs, larvae, serum samples, and juveniles of these pelagic species will be collected for distribution to other laboratories.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0071, INVENTORY OF LARVAL FISH

*L.G. MCBAY*, State Game & Fish Commission, Atlanta, Georgia

Objectives: To identify the types of marine or brackishwater larval fish available for fishing into the public fishing area.

Procedures: A large number of the samples have been taken in conjunction with this project which have not been analyzed. Several additional samples include larval species which have not been positively identified.

A considerable period of time will be necessarily allotted to this phase of the project. A collection of keys and references is partially complete. Others will be reviewed and utilized whenever possible in identifying the larval fish on hand from previous sampling

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Georgia State Government

### 5.0072, FISHES TAKEN INCIDENTAL TO SHRIMP TRAWLING

*W.W. ANDERSON*, U.S. Dept. of Interior, Biological Laboratory, Brunswick, Georgia

During the course of studies conducted on the white shrimp, *Penaeus setiferus*, along the south Atlantic coast of the U. S. during the period of 1931 to 1935, records were made on the numbers of the various species of fish taken incidental to trawling for shrimp.

Objectives are to make available in processed form, both tabular and graphic, the information on relative abundance of families and species of fishes, seasonal abundance of the species by regions, and related information, as revealed from shrimp trawling operations.

These records contain valuable information on relative abundance of the various families and species of fish, seasonal abundance of species in the various regions, and depict the average fish catch of a shrimp trawler during the period of operation. Information from this study will contribute much to the broader estuarine studies planned for future years.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0073, YOUNG FISHES OF A TIDAL ZONE

*J.W. GEHRINGER*, U.S. Dept. of Interior, Biological Laboratory, Brunswick, Georgia

During a 7-year period (1953-1960) a systematic collection of larval and juvenile fishes was obtained from three types of habitat in coastal Georgia; an outer beach on St. Simons Island--a favorite habitat for the young of many species; the marshes which lie between the barrier islands and the mainland--a rich habitat serving as nursery grounds for the young of many species of fish and shrimp; and about tidewater limits in the fresh water Altamaha River--the young of some marine species are frequently taken under such conditions.

Objectives are to determine the species and size groups of fish occurring in the several habitats, their seasonal distribution, apparent hydrographic preferences and related facts. Many of the

series will be incorporated into life history studies on individual species--some of which are spawned in the open ocean but utilize coastal and estuarine waters during part of their early development. This study will contribute heavily to the broad estuarine studies planned for future years.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0074, IDENTIFICATION AND DESCRIPTION OF FISH LARVAE

*J.W. GEHRINGER*, U.S. Dept. of Interior, Biological Laboratory, Brunswick, Georgia

Project objectives are to identify to the most finite taxon possible (be it species, genus, or family) the fish larvae from collections of the M/V Theodore N. Gill made between February 1953 and December 1954 over the area from Cape Hatteras to the Bahamas and southern Florida, and from the beaches to beyond the Gulf Stream; seine collections; and other sources. Whenever possible, ontogenetic series which may be positively identified with larger fish to species are assembled and may be incorporated into early life history and other studies.

Knowledge of the fish occurring off the south Atlantic coast of the U. S. is limited; abundance of the various species is poorly known; and the life history has been determined on only a few species. We must be able to identify the fish larvae of the area if the early life histories are to be determined. With this accomplished, we can then determine the dispersal and abundance of many of the species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0075, INTRODUCTION OF MARINE GAME FISHES FROM AREAS IN THE PACIFIC

*R.K. KANAYAMA*, State Dept. of Land. Nat. Res. , Honolulu, Hawaii 96813

Objectives: 1. To conduct follow-up observations and to document information relating to the probable establishment of exotic marine fish species introduced during previous segments and to ascertain if these species are established well enough to permit sport fishing for them.

Procedures: 1. For purposes of gathering data on the status of the exotic marine fish introductions released to date: (1) SCUBA dives will be conducted at sites known to harbor the exotic species or in areas where they have been reliably reported as having been sighted, and (2) commercial and sports fishermen will be interviewed in order to gather information on possible inadvertent capture of the exotics. 2. Sampling of the exotics may be attempted by use of fish toxicants, traps, seines, spears, angling or other suitable methods. 3. The feasibility of importing additional stocks of groupers, especially matapu (Epinephelus fasciatus) and pukokoo (E. spiniger), and the snappers, tuhara (Lutjanus gibbus) and aaravi (Lethrinus sp.) should be investigated. The apparent failure of these species to establish themselves in Hawaii, thus far, is believed to be due mainly to insufficient numbers that were released originally.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Hawaii State Government

### 5.0076, INVESTIGATE TUNA SUBPOPULATIONS THROUGH THE USE OF BLOOD GROUPS AND INHERITED PROTEINS

*K. FUJINO*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

The objective of this project is to determine whether certain tuna resources are represented by a single ocean-wide population unit or are made up of smaller units, or subpopulations, of which the distribution of each is confined to smaller geographical area.

Such knowledge is important in understanding the effects of the fisheries on the resources and the development of proper management techniques for these resources.

Inherited characteristics of red blood cells, serum proteins and enzymes have been found in skipjack, yellowfin, bigeye, bluefin, and albino tunas.

## 5. LIVING SYSTEMS (NON-HUMAN)

A series of extensive Pacific-wide population studies of skipjack tuna has indicated (1) that skipjack tuna taken from the western Pacific (Palau, Mariana, Okinawa, and Japan coast) belong to a subpopulation (or subpopulations) which does not appear in the central Pacific (Hawaii, Line, and Society Islands) and eastern Pacific (Baja California) and (2) that skipjack tuna appearing in the central and eastern Pacific do not constitute a homogeneous population unit. Relations of skipjack that appear in the central, north and south Pacific and eastern Pacific are now being studied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0077, INCREASE EFFICIENCY OF HAWAIIAN SKIPJACK FISHERY

*T.S. HIDA*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Skipjack tuna fishermen in Hawaii spend a substantial amount of their time fishing for the live bait necessary for skipjack fishing. It is generally agreed among members of the fishing industry and scientists that elimination of the baitfishing operation would result in a significant increase in the yield of skipjack from Hawaiian waters.

The present project is designed to establish a pilot scale bait-fishing and baitfish-holding facility to determine if the separation of the baitfish activity from the actual skipjack fishing operation will result in an economical gain to the fishermen. The expected increase in catch would have to be large enough to compensate for the cost of operating the baiting facility. The establishment of a baitfish handling facility, then, will eliminate the need for a fishing boat to devote time and effort to a non-fishing activity. If successful, a full scale baiting facility could result in an additional 5-7 million pounds of skipjack landed per year. The present average annual catch is 10 million pounds.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0078, DEVELOP TECHNIQUES FOR CAPTURING JUVENILE TUNAS

*B.E. HIGGINS*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Despite the many and intensive investigations during the past half century on the biology of the commercially valuable tunas of the Pacific Ocean, basic information of the younger stages is meager. Significant progress has been made in recent years on the identification, distribution, and abundance of larval tunas caught in plankton nets. Problems in identification of tuna larvae continue to exist, however, partly because large specimens needed to complete the size series necessary for identification are seldom captured by conventional sampling methods.

Juvenile tunas must be collected in large numbers in order to facilitate (1) the identification of immature specimens of each species and (2) the comparison of the immunogenetic affinities of skipjack and other tunas from different parts of the Pacific Ocean. Such information is required to delineate spawning areas and for an understanding of the relative contributions of the various subpopulations of skipjack and other tunas to the fisheries of the Pacific Ocean.

The objectives of the proposed investigation are (1) to develop techniques for capturing large numbers of juvenile skipjack and other tunas with a midwater trawl, (2) to investigate the feasibility of obtaining blood samples from juvenile skipjack and other tunas, and (3) to provide information on the bathymetric and areal distribution and abundance, ecology, morphology, and subpopulations of juvenile skipjack and other tunas. A 3-month trawling cruise was completed in summer 1967 in Hawaiian waters. A total of about 1000 juvenile and prejuvenile tunas was collected in 83 six-hour hauls. Blood typing at sea was found to be feasible for 10-15 cm. tunas. Future plans are to extend trawling effort to the equatorial central Pacific, the area which, by hypothesis, supplies the 70,000 metric ton per year eastern Pacific skipjack tuna fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0079, INVESTIGATE SYSTEMATICS AND ECOLOGY OF TUNA LARVAE AND JUVENILES

*W.M. MATSUMOTO*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Close resemblance among the young of various species of tunas renders their identification difficult. Differing results obtained by various workers have yet to be resolved. Resolution of the identification problem will enable a better definition of spawning areas and seasons for the various species of tunas.

All available characters--morphometric measurements, meristic counts, sequence of pigment changes, etc.--are utilized to arrive at definitive identifications. Greater emphasis is being placed in artificial fertilization methods to obtain larvae of known identity. Of those species whose identity is more definite, particularly skipjack, delimitation and definition of spawning areas in the equatorial central Pacific are being investigated.

Other methods of identifying young tunas are being investigated. Preliminary work has been initiated on the study of adult eye lens protein of various tunas using the starch gel electrophoresis methods to determine if species separation is possible. This study is being pursued further under contract and, if successful, the method will be used to identify the young.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0080, DETERMINE ALTERNATE LIVEBAIT SPECIES

*E.L. NAKAMURA*, U.S. Dept. of Interior, Behavior & Physiol. Prog., Honolulu, Hawaii 96812

The Hawaiian fishery for skipjack tuna is believed to be capable of yielding more than double its present yearly landings. Since the fishery is dependent upon the use of live bait, live bait can be and often is a limiting factor in the landings. Of the combined time fishermen spend fishing for skipjack and catching bait, as much as 50 percent may be spent catching bait. If an alternate bait, one that is acceptable to fishermen and one which is as effective as that presently used by the fishermen, can be found and cultured, the amount of time spent catching natural bait could be greatly reduced. This in turn would greatly increase the amount of time spent fishing for skipjack. The live bait used by the fishermen is the nehu, *Stolephorus purpureus*, a small Hawaiian anchovy. It is a species which is not too hardy and often suffers high mortalities after capture. Thus, a substitute bait, one which is as good as the nehu in attracting skipjack to the stern of a vessel and which will withstand handling and which will be acceptable to the fishermen would be a great boon to the industry.

The objectives of this project are to identify and quantify the qualities of a good live bait, find one or more species possessing these traits, test them at sea in the fishery, and determine the best means of culturing those that are efficacious.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0081, INVESTIGATE POPULATION DYNAMICS OF ALBACORE

*T. OTSU*, U.S. Dept. of Interior, Tuna Ecology Program, Honolulu, Hawaii 96812

Information on the vital statistics of the albacore populations is necessary in order to estimate the maximum sustained yield of this resource. Furthermore, studies on the population dynamics of the albacore are required in anticipation of possible international discussions on management problems.

The tuna longline fishery based in American Samoa has grown rapidly since its start in 1954. There is now a sizeable concentration of Korean, Chinese, and Japanese fishermen based in American Samoa. There are nearly 200 vessels in the fleet. The landings of albacore, the principal species landed by the fleet, have increased from 338 metric tons in 1954 to about 26,000 metric tons in 1966. The South Pacific albacore, which seems to be the only longline-caught tuna that is not now being fished at the maximum rate, may not enjoy this distinction for very long, however. With the continually increasing fishing effort, it is vitally important that developments in this fishery be followed closely.

Excellent data from the fishery, obtained through the voluntary cooperation of the Japanese, Korean, and Chinese vessel operators, as well as biological data collected by our staff members stationed in Samoa, are being placed on IBM cards for

## 5. LIVING SYSTEMS (NON-HUMAN)

analyses. Some analyses have been made and the results have been prepared for publication. These data will play an invaluable part in our study of the population dynamics of the species; to learn the responses of the albacore to environmental and to fishing pressure, and to determine the effect of each on the population size.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0082, ASSESSMENT OF CENTRAL PACIFIC TUNA RESOURCES

*B.J. ROTHSCHILD*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

The central Pacific is a vast area that contains many fish stocks that undergo varying degrees of exploitation. Some of these stocks, such as the tunas, are quite valuable commercially.

The objective of this project is to determine the location and abundance and population dynamics of the tuna fishery resources in the central Pacific and to develop techniques for optimum exploitation of these resources. In order to demonstrate these we need to know the expected apparent abundance and size distribution of each commercially important tuna species in the central Pacific.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0083, INVESTIGATE POPULATION DYNAMICS OF SKIPJACK TUNA IN HAWAIIAN WATERS

*B.J. ROTHSCHILD*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

The basic problem in this project is to evaluate the methods by which skipjack tuna (*Katsuwonus pelamis*) fishermen in Hawaii can obtain the maximum production of skipjack in terms of the amount of effort expended. This knowledge is closely tied in with the dynamics of the skipjack population, the environment, and the response of skipjack to variations in the environment and to exploitation by man. To evaluate these continuing population changes, we have used quantitative measures such as catch and effort data.

An approach to the problem is the OPERATIONS ANALYSIS project whereby observers are placed aboard the local skipjack fishing vessels during the peak fishing season to obtain detailed data of all aspects of the fishing operations, including baiting, scouting, and fishing. This project was implemented during the summer of 1967 and plans are to continue it over several seasons. The data will be analyzed and used as a basis for developing an optimum fishing strategy for the Hawaiian skipjack fleet.

In addition to fishery data, environmental data are also collected by the observers, in order that studies can be made of the relationship of skipjack tuna to the environment. The purpose is to improve fishing strategy by eliminating much of the unproductive scouting effort necessary under present operations.

There are other broad problems that bear on the specific problem. Since the Hawaiian skipjack fishery depends on livebait, the variation in availability and abundance of the bait is but one of these highly important problems. Size of vessel, fishing areas, the effectiveness of the fishing effort, and gear competition are other factors that need to be evaluated. Finally, there is a need to examine these problems using different types of data in order to refine our estimates.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0084, DEVELOP HIGH-SEAS TUNA FISHERY

*R.S. SHOMURA*, U.S. Dept. of Interior, Fishery Development Prog., *Honolulu, Hawaii* 96812

There is a growing body of scientific evidence which suggests that there is a large underutilized skipjack tuna resource in the central tropical Pacific Ocean. The potential annual yield has been estimated conservatively to exceed 150,000 metric tons. Present indications are that these skipjack cannot be caught with existing conventional fishing gear. The objective of this project is to develop a method of catching skipjack tuna in commercial quantities in the high seas of the central tropical Pacific Ocean. From present indication this will involve the design and develop-

ment of a new fishing gear and technique or a modification of existing fishing gears and techniques.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0085, INVESTIGATE TUNA RESOURCES OF THE TRUST TERRITORIES

*R.N. UCHIDA*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

In the Pacific the annual landings of skipjack tuna have consistently ranked first among the commercially important tuna species. Despite the importance of skipjack, the total knowledge of its biology is limited and relatively little is known of its movements, growth, population size, etc. The objectives of this program are: (1) collect biological and environmental data which will aid the U.S. fishing industry in the Trust Territory in understanding the resource and developing the industry to its maximum potential and (2) collect biological and environmental data which will add to our knowledge of the skipjack tuna and eventually lead to understanding the dynamics of the skipjack subpopulations. A skipjack sampling station in the Palau Islands has been initiated to (1) obtain data on the size composition of the tuna catch, (2) obtain catch and effort data of tuna fishing, (3) obtain samples of baitfish species for taxonomic studies, (4) obtain catch and effort data on baitfish catches, and (5) obtain through tagging, data on growth and movements of skipjack and yellowfin tunas in the Trust Territory region.

The Palau fishery is expected to be one of a number of fishing centers in the Trust Territory. Ecological studies of skipjack tuna will extend out on a broad scale to include at least the areas of Palau, Truk and Saipan.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0086, DEVELOP FISHERIES FOR NON-TUNA RESOURCES

*H.O. YOSHIDA*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

With the exception of the tuna fisheries, the commercial fishing effort in the Hawaiian Islands is restricted to the shallow waters near shore. The only fishing done in waters exceeding 50 fathoms in depth is bottom handline fishing for snappers.

The objective of this project is to evaluate the fishery resources of the deeper waters of the Hawaiian Islands chain by using various types of conventional fishing gears. If latent or underutilized resources are located, effort will be directed to encouraging the development of a commercial fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0087, MECHANISMS AFFECTING THE VERTICAL AND HORIZONTAL DISTRIBUTION OF TUNAS AND RELATED SPECIES

*H.S. YUEN*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, *Honolulu, Hawaii* 96812

Information on the vertical distribution of tunas and related species has been obtained in the past mostly from sampling by longlines and deep trolling. Because of the time-consuming nature of these techniques information has been collected at a very slow rate resulting in an incomplete picture of vertical distribution and limited to the depth range of the gear used. To increase ability to study horizontal and vertical distribution of tuna, behavior of subsurface schools, and movement of tuna schools, an especially designed high-resolution sonar was built and installed on the TOWNSEND CROMWELL. This instrument will provide the means of not only increasing the rate of collecting data but collecting data unobtainable by other methods, for example, the depth limits of occurrence, size of school, the rate at which depth changes are made, swimming speeds at various depths, shapes of schools, the pattern of depth changes which may be investigated in relation to other variables such as fish size, time of day, salinity, temperature, light, features of the ocean bottom, presence of other organisms, etc. The need for data on vertical distribution and the factors which control the vertical distribution is particularly acute for the Hawaiian fishery for skipjack.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0088, TAXONOMY AND DISTRIBUTION OF CLUPEOIDS AND REVISION OF THE GENUS *ILISHA* OF THE FAMILY CLUPEIDAE

R.V. SESHAIYA, Annamalai University, Porto Novo, India

The objective of this project is to collect and to preserve for study large series of the various kinds of clupeoid fishes from the estuaries and marine waters of India - with emphasis on the coastal area south of 13 degrees North latitude, as time and facilities allow. To study, compile and analyze data from, and to assess the taxonomy of the fishes of the clupeid genus *Ilisha* from the Indian Ocean; and to prepare this revision for inclusion in the 'Field Guide to the Clupeoid Fishes of the Indian Ocean.'

Specimens of clupeoid fishes will be collected from Indian waters by seine and other gear, and specimens not available elsewhere will be purchased from commercial fishermen. Descriptive field data will be recorded, especially on coloration of live and fresh specimens, and on schooling habits and behaviour. Coincident to this, small synoptic series of other families of fishes will be collected for other taxonomic studies. The specimens collected will be preserved in 10 percent Formalin. Specimens of the genus *Ilisha* will be sorted from the collections and retained for study; specimens of the remaining families will be made available to research workers studying those families in collaboration with the Field Guide. Counts, measurements and morphological data will be recorded from the specimens of *Ilisha* following procedures established for the Field Guide. The taxonomy of the clupeid genus *Ilisha* in the Indian Ocean will be revised. Illustrations of each species and a manuscript guide to their identification will be prepared; these will be incorporated into the manuscript on the 'Field Guide to the Clupeoid Fishes of the Indian Ocean.'

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0089, ECOLOGICAL INVESTIGATIONS OF SOME COMMON MARINE FISHES OFF THE MEDITERRANEAN COAST OF ISRAEL

L.B. ZISMANN, Israel Sea Fisheries Res. Sta., Haifa, Israel

The objectives of this project are: 1. To find what forms enter the food web of fish on the continental shelf of Israel's Mediterranean coast and their relationships. 2. To find the distribution and range limits according to depths, bottom structure, and distance from shore of the more common species of fishes. 3. To assess the relative abundance of the fish species. 4. To collect general biological data such as: spawning period, seasonal fluctuations, size-range, etc., on those fishes important in the food web for which such data is not yet available. 5. To consider which factors may influence population fluctuations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0090, MOVEMENTS OF FRESHWATER CATFISH IN THE ESTUARIES OF SOUTHWEST LOUISIANA

W.G. PERRY, Rockefeller Wildlife Refuge, Grand Chenier, Louisiana 70643

Freshwater catfish will be collected, their total length and weights recorded, and the chemistries of the water from which they are obtained analyzed.

Recaptured fish will again be measured, weighed and water chemistry analyzed.

Objectives: 1. Determine if the freshwater catfish migrate in accordance with the salinity fluctuation. 2. Determine which of the catfish species present to be more tolerant to salinity.

SUPPORTED BY Louisiana State Government

### 5.0091, LAKE BORGNE-CHANDELEUR SOUND SYSTEM

J.G. BROOM, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. Determine the distribution and density of the fauna of the phase area. 2. Determine the hydrography of the phase area. 3. Process the data.

Procedures and Work Schedule: 1. Weekly plankton sampling in the major passes and throughout the system with a 6-foot beam plankton net. 2. Weekly sampling throughout the major nursery areas with a 6-foot 1/4' mesh trawl. 3. Bi-weekly sampling

throughout the major nursery and near offshore areas with trawls. 4. Bi-weekly seine sampling at selected sites. 5. Monthly benthic sampling at selected sites. 6. Collection of selected hydrographic information at each sample station and continuous recordings of salinity temperature and tidal movements at selected stations. 7. The processing, tabulating and summarizing of collections and raw data which are to be transmitted to the project leader at the marine laboratory for compilation, analysis and interpretation.

Location of Work: This area is defined by the Mississippi State line on the east and Bayou Terre aux Boeufs on the south. The area includes the following major bodies of water: Chandeleur Sound, Mississippi Sound, and Lakes Borgne, Pontchartrain and Maurepas.

### 5.0092, TIMBALIER - TERREBONNE BAYS SYSTEM

J.G. BROOM, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. Determine the distribution and density of the fauna of the phase area. 2. Determine the hydrography of the phase area. 3. Process the data.

Procedures and Work Schedule: 1. Weekly plankton sampling in the major passes and throughout the system with a 6-foot beam plankton net. 2. Weekly sampling throughout the major nursery areas with a 6-foot 1/4' mesh trawl. 3. Bi-weekly sampling throughout the major nursery and near off-shore areas with trawls. 4. Bi-weekly seine sampling at selected sites. 5. Monthly benthic sampling at selected sites. 6. Collection of selected hydrographic information at each sample station and continuous recordings of salinity temperature and tidal movements at selected stations. 7. The processing, tabulating and summarizing of collections and raw data which are to be transmitted to the project leader at the marine laboratory for compilation, analysis and interpretation.

Location of Work: This area extends from Bayou Lafourche on the east to Bayou Grand Caillou on the west, and includes Timbalier and Terrebonne Bays, Lake Pelto, and the intricate marshes north of these bodies.

Part 3 of 6.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0094, VERMILION - CALCASIEU - SABINE SYSTEM

J.G. BROOM, State Wildlife & Fish Comm., New Orleans, Louisiana

## 5. LIVING SYSTEMS (NON-HUMAN)

Objectives: 1. Determine the distribution and density of the fauna of the phase area. 2. Determine the hydrography of the phase area. 3. Process the data.

Procedures and Work Schedule: 1. Weekly plankton sampling in the major passes and throughout the system with a 6-foot beam plankton net. 2. Weekly sampling throughout the major nursery areas with a 6-foot 1/4' mesh trawl. 3. Bi-weekly sampling throughout the major nursery and near off-shore areas with trawls. 4. Bi-weekly seine sampling at selected sites. 5. Monthly benthic sampling at selected sites. 6. Collection of selected hydrographic information at each sample station and continuous recordings of salinity temperature and tidal movements at selected stations. 7. The processing, tabulating and summarizing of collections and raw data which are to be transmitted to the project leader at the marine laboratory for compilation, analysis and interpretation.

Location of Work: This area extends from Point Chevreuil on the east to the Texas State Line. It includes East and West Cote Blanche Bays, Vermilion Bay, White, Grand, Calcasieu and Sabine Lakes, and the associated marshes.

Part 5 of 6.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Louisiana State Government

### 5.0095, ATCHAFALAYA RIVER - GAILOU LAKE SYSTEM

J.G. BROOM, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. Determine the distribution and density of the fauna of the phase area. 2. Determine the hydrography of the phase area. 3. Process the data.

Procedures and Work Schedule: 1. Weekly plankton sampling in the major passes and throughout the system with a 6-foot beam plankton net. 2. Weekly sampling throughout the major nursery with a 6-foot 1/4 inch mesh trawl. 3. Bi-weekly sampling throughout the major nursery and near off-shore areas with trawls. 4. Bi-weekly seine sampling at selected sites. 5. Monthly benthic sampling at selected sites. 6. Collection of selected hydrographic information at each sample station and continuous recordings of salinity temperature and tidal movements at selected stations. 7. The processing, tabulating and summarizing of collections and raw data which are to be transmitted to the project leader at the marine laboratory for compilation, analysis and interpretation.

Location of Work: This area extends from Bayou Grand Caillou on the east to Point Chevreuil on the west, including Lakes Caillou, Mechant, DeCade, and Bays Caillou, Four League and Atchafalaya, and the lower Atchafalaya River swamp.

Part 6 of 6

### 5.0096, TRAMMEL NET SAMPLING IN ESTUARINE AREAS

J.T. DAVIS, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. Determine fish population present in the areas of Lakes Maurepas, Pontchartrain and Borgne near the mouths of tributary streams. 2. Determine possible competitor species with estuarine species in these areas. 3. Establish data on relative densities of anadromous species at different seasons of the year.

Procedures: 1. Monthly trammel samples will be taken at 30 designated stations. These include but are not limited to stream mouths, shoreline areas and passes. 2. Circle haul sets will be made with trammel nets of 1 inch mesh, six feet deep and 100 yards long. 3. All fish captured will be identified, weighed and measured. All data will be recorded for ADP.

### 5.0098, DETERMINATION OF THOSE MARINE SPECIES HAVING THE GREATEST KNOWN POTENTIAL FOR THE COMMERCIAL FISHERY

F.T. BAIRD, State Dept. of Sea Shore Fish., Augusta, Maine

Objective: To determine those species having the greatest known potential.

Procedures: Only a limited portion of the overall objective will be accomplished during the initial period covered by this proposal. Depending upon the expressions of industrial interest and cooperation, concentration will be given to a limited group of species that indicate the greatest promise for successful commercial development. As this program develops, this limited list will be changed to fit existing demands or potentials.

During the first year, marine plants, primarily *Fucus vesiculosus* and *Ascophyllum nodosum*, will be collected seasonally, from areas along the coast, and furnished the Research Laboratory of Marine Colloids of Rockland, Maine, and other industrial users, for their industrial evaluation of alginic content and other products.

We will act during the first year on recent industry requests that we investigate the potentials for an expanded industrial fishery. The first year will be spent in assembling data on inshore fishing craft having a potential for this type of fishery, their capabilities, what industrial fish are being caught, where they are being caught, and what equipment is being used, with a view to the further exploitation of underutilized species for fish meal or marine protein concentrate. Also considered will be how an industrial fisheries operation can fit into the vessels present operations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Maine State Government

### 5.0099, BIostatistics OF HERRING

V. ANTHONY, U.S. Dept. of Interior, Biological Laboratory, Boothbay Harbor, Maine 04538

Immature herring (*Clupea harengus harengus*) of the Maine commercial fishery are being studied. Otoliths have been validated for aging the fish and are a basis for three studies: Growth, stock separation, and age structure of the fishery.

Basic parameters of population dynamics are being estimated from a combination of catch, sample and tagging data. Catch data of sardines collected since 1947 are being analyzed for changes in abundance by year class according to effort, growth, and time. These data are being compared with environmental conditions for long-term trends in connection with a parent-progeny relationship. Sardine sample data collected since 1963 provide information on meristic counts, morphometric data, age and growth. These data show a relationship of stock abundance and growth at age 1. Meristic counts and growth parameters of herring indicate stock differences and growth rates have been estimated for Maine, Nova Scotia, and Georges Bank.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0100, IDENTIFICATION OF WINTER FLOUNDER SUB-POPULATIONS

A. PETERSON, State Div. of Marine Fisheries, Boston, Massachusetts

To define the limits of the winter flounder populations or subpopulations and analyze the effect of present regulations on the fishery. Past tagging studies will be evaluated, experimental otter trawling will be analyzed, and the effect of regulations on exploitation based on the above data will be studied. Work will be conducted on this phase from July 1, 1966 through June 30,

## 5. LIVING SYSTEMS (NON-HUMAN)

1967. Most of the work will be done at the Sandwich office of the Division of Marine Fisheries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0101, ATLAS OF MARINE FAUNA

*E.D. MCRAE*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Gloucester, Massachusetts 01930

Preparation of a series of atlases is being undertaken to graphically illustrate the seasonal commercial fishing grounds for various marine species in the area north of Cape Hatteras, N. C. A limited summary of supplemental or associated information concerning each species of fish (or shellfish) is included on text pages. Initial atlases will be concerned with the New England fisheries. Atlases on the fisheries of other sections of the general area will follow the New England series.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0102, EXPLORATION OF LATENT RESOURCES ON THE CONTINENTAL SHELF/SLOPE

*E.D. MCRAE*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Gloucester, Massachusetts 01930

Exploratory trawling explorations are conducted on the Continental Shelf and Slope in the area of Cape Hatteras, N.C. The purpose is to investigate the possible commercial potentials of unused fishery resources. Cruises to make a winter survey of the partial area between Cape Hatteras and Hudson Canyon are planned as initial field activity; other surveys of this area during different seasons are to be conducted later. With data on hand from completed seasonal surveys for the entire area, a logical utilization of total area productivity can be planned.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0103, POPULATION DYNAMICS OF NEW ENGLAND GROUND FISH

*R.C. HENNEMUTH*, U.S. Dept. of Interior, Biological Laboratory, Woods Hole, Massachusetts

These studies are designed to determine the sustainable harvest in relation to effort of the more important groundfish that support the New England fisheries, and to conduct basic research on the population processes which control abundance and harvest. The more important species are haddock, cod, redfish, silver hake, flounders, and sea scallops. Data are obtained from analysis of the landed catch and from research vessel collections.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0104, BIOLOGICAL STUDIES OF NORTHWEST ATLANTIC GROUND FISH

*J.A. POSGAY*, U.S. Dept. of Interior, Biological Laboratory, Woods Hole, Massachusetts

These studies are designed to provide basic information on the biology of groundfish of the Northwest Atlantic pertinent to management of the commercial fisheries. These studies yield information on the discreteness and degree of mixing of the different stocks of each species, the growth rates, the seasonal and secular changes in abundance and the relation of these changes to changes in environmental conditions. The species concerned are haddock (*Melanogrammus aeglefinus* (L)), cod (*Gadus morhua* (L)), silver hake (*Merluccius bilinearis* (Mitchill)), red hake (*Urophycis chuss* (Walbaum)), ocean perch (*Sebastes marinus* (L)), yellowtail flounder (*Limanda ferruginea* (Storer)), sea scallops (*Placopecten magellanicus*), and several other species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0105, FACTORS AFFECTING HORIZONTAL DISTRIBUTION OF MESOPELAGIC FISHES

*R.H. BACKUS*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

This project is attempting to determine the patterns of horizontal distribution of mesopelagic fishes in the North Atlantic

Ocean and to understand why these fishes are distributed the way they are.

SUPPORTED BY U.S. National Science Foundation

### 5.0106, POPULATION STRUCTURE OF THE ALEWIFE AND COREGONIDS

*E.H. BROWN*, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Study the population structure of the alewife and the deep-water coregonids of the Great Lakes with emphasis on conditions in Lake Michigan. Describe short- and long-term changes in abundance; areal and bathymetric distributions; relative discreteness of stocks; recruitment and mortality rates; age and sex composition and growth rates; and environmental effects, including intensity of the commercial fishery. Design and apply sampling procedures for use with trawls, gill nets, and other devices. Analyze data according to appropriate statistical and biometrical procedures, including use of electronic data processing.

This work and parallel studies on physiology and behavior and early life history are aimed particularly at understanding the changing ecology of Lake Michigan.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0107, LAKE SUPERIOR EXPLORATIONS

*N.J. REIGLE*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Ann Arbor, Michigan

The decline of high-value, food fish species and increases in populations of low-value fish stocks have left the Lake Superior fishermen with little chance to earn satisfactory incomes with traditional gill nets, trap nets and pounds nets. Systematic exploratory fishing operations are being conducted for locating and assessing the potential commercial yield of additional or alternate fish stocks; introducing existing gear from other areas or improved or new methods and equipment to allow efficient and economical harvest of these populations; surveying the physical characteristics of Lake Superior to ascertain suitability for various types of fishing gear; and determining the seasonal availability of various species in order to stabilize production and counteract the effects of seasonal gluts.

Otter trawls are being evaluated to determine the effectiveness of this gear for more economical exploitation of the abundant species such as chubs, smelt and suckers. Continuing studies will provide the basis for sound management of the available resource and permit economical, year-round utilization of underutilized species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0108, GREAT LAKES EXPLORATIONS

*N.J. REIGLE*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Ann Arbor, Michigan

Recent change in species composition and lack of technological progress in harvesting and handling populations of underutilized, low-value species have placed the Great Lakes commercial fishing industry in a poor economic position. Systematic exploratory fishing operations are being conducted for locating and assessing the potential commercial yield of additional or alternate fish stocks; introducing existing gear from other areas or improved or new methods and equipment to allow efficient and economical harvest of these crops, surveying the physical characteristics of the Great Lakes to ascertain suitability for various fishing methods; and determining the seasonal availability of various species in order to stabilize production and counteract the effects of seasonal gluts.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0109, ESTABLISHMENT AND PERPETUATION OF STOCKS OF EXPERIMENTAL FISH

*G. WASHBURN*, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

This project is concerned with the development and application of techniques for the establishment and perpetuation of

## 5. LIVING SYSTEMS (NON-HUMAN)

stocks of experimental fish primarily for studies of fish physiology and behavior at the Ann Arbor Biological Laboratory. Most fish are species present in the Great Lakes but which are not ordinarily maintained under artificial conditions. Studies are in progress to determine the most desirable type of closed water systems and to provide suitable environmental conditions to successfully complete all life-history stages. The project also requires studies of the development of special foods, treatment and prevention of diseases, the conditions that induce maturation and spawning, and the requirements for the production of viable eggs and young for a variety of species with a wide range of characteristics and requirements.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0110, EARLY LIFE HISTORY OF COREGONIDS

L. WELLS, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Little or nothing is known about the early life history of coregonids, and of related ecological events and requirements. This study is exploring means of locating and collecting juvenile coregonids from hatching through their second year. Only recently has it been possible to collect larvae and fry in limited numbers, but methods to locate and catch young from the middle of their first year until the start of their third year have not been found. Once satisfactory means of collection have been developed, studies will be directed to their distribution, growth, and mortality in relation to the physical, chemical, and biological characteristics of the environment. The results of this study will be used in making estimates of recruitment and early mortality in population studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0111, INTERRELATIONS OF ALEWIVES AND ASSOCIATED SPECIES

L. WELLS, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The recent invasion and subsequent population explosion of alewives has prompted a comprehensive investigation into the interrelations of this species and others in Lake Michigan. The project represents the field phase of a broad study involving species interactions, behavior, and physiology. Current studies include food competition between alewives and associated species, effects on species composition and distribution of major food items (zooplankton), host-prey relationships, seasonal and depth distribution of alewife larvae and associated species, and other factors which may provide information on the mechanisms which permitted the alewife to dominate fish stocks of Lake Michigan with an apparent detrimental influence on endemic species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0112, ECOLOGY OF COMMERCIAL FISH SPECIES IN NORTHERN LAKE MICHIGAN

E.W. ROELOFS, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Objectives: 1. To study the distribution of economically important fish species in northern Lake Michigan. 2. To determine the factors influencing the abundance of successive year-classes of fish. 3. To identify the number and distribution of subpopulations of certain species.

Methods: 1. Study catch records provided by commercial fishermen to the Conservation Department. 2. Determine age distribution, growth rates and morphometric characteristics of fish taken from various localities.

SUPPORTED BY Michigan State Government

### 5.0113, INVESTIGATION OF COMMERCIAL FISH POPULATIONS IN WESTERN LAKE SUPERIOR

UNKNOWN, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

This project is designed to (1) investigate the causes of declining herring stocks and (2) the relation of this and other

commercial species to changing ecological conditions and types of exploitation. It is proposed to sample larval stocks, concurrently caught predatory fish, and food sources in the Duluth and Apostle Island areas to determine the inter-relationship of the different species. These samples will be taken during spawning seasons and throughout the season during various life history stages. Samples will be taken with ground trawls, mid-water trawls, larval nets and naturalists' trawls from research vessel Siscowet. Simultaneous physical and chemical observations will be made. Program is designed to extend over a four-year period.

SUPPORTED BY Minnesota State Government

### 5.0114, A STUDY OF THE SEASONAL ABUNDANCE, DISTRIBUTION AND SPECIES COMPOSITION, WITH DEPTH, OF NEKTON FAUNA, WITH PARTICULAR EMPHASIS ON FISHES

C.E. DAWSON, State Marine Conserv. Comm., Biloxi, Mississippi

Objectives: To provide information on growth rates, morphological development and life histories of various species in the north-central Gulf and possibly leading to the development of methods for predicting year-class success of certain economically important species.

Procedures: 1) Monthly and, when possible, semi-monthly quantitative sampling with meter nekton nets and neuston nets at 10 fathom depth intervals to 30 fathoms will be made off the Mississippi coast. Course tracks and station locations would be plotted from radar and Loran fixes. 2) Day and night collections would be included to make most effective use of ship time and to allow for analysis of diurnal variations in collections. 3) Standardized drags would be made with 40 ft. trawls for qualitative and quantitative analysis of the bottom fish and invertebrate fauna. 4) Concurrent salinity and temperature determinations would be made at each collection site. 5) Laboratory studies would include identification of fishes and larger invertebrates. Meristic and morphometric observations on dominant organisms for developmental and growth rate studies. Species would be analyzed for variations in seasonal abundance with depth, salinity, temperature, etc.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Mississippi State Government

### 5.0115, SYSTEMATICS AND DISTRIBUTION OF WORMFISHES (MICRODESMIDAE)

C.E. DAWSON, Gulf Coast Research Laboratory, Ocean Springs, Mississippi

Wormfishes (Microdesmids) are a little known group of burrowing or inhabiting, elongate, marine and estuarine fishes which are apparently restricted to lower temperate, sub-tropic and tropic environments. They are presently recorded to a maximum depth of about 50'. Although poorly represented in museum collections, wormfishes may be locally abundant, with as many as fifty or more being taken in a single sample. Aside from a brief description of swimming behavior in one species, there is little or no information on their behavior, life history or biology.

The Investigator's current studies on the morphology and osteology of the wormfishes have resulted in the discovery of a number of heretofore unknown or unrecognized characters of systematic value which permit definitive approach to the phylogenetic systems within the group as well as some insight into its higher relationships within the Gobioidae. He has, with minor exceptions, examined all known specimens, but a number of problems of distribution, species divergence and variation cannot be solved until more study material is available. Thus, the proposed research will be for the continuation of these studies and intensive collecting in all known areas of distribution of the family of these studies and intensive collecting in all known areas of distribution of the family Microdesmidae. This work will result in a revision of the family supplemented with detailed accounts of distribution and ecology together with life history notes for each of the twenty-seven fishes now recognized as comprising the Microdesmidae.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0116, EXPLORATORY COLLECTION AND CARE OF FISH FOR TESTING AT TIBURON

T. LANE, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objectives of the work are to survey the sources of experimental fish for use in pesticide bioassay work and to develop an efficient means of harvesting and holding the fish at Tiburon, California. Examination of areas in San Francisco Bay and in the Sacramento-San Joaquin Delta, commercial sources, and culture of fish at Tiburon will be explored. Fishes will be collected, brought to the laboratory, and held under various conditions of water flow, time, feeding, and space conditions to measure the best procedure for each species and size group.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0117, DISTRIBUTION AND MIGRATION OF CENTRAL AMERICAN FRESHWATER ELASMOBRANCHS

UNKNOWN, Univ. of Nebraska, Graduate School, Lincoln, Nebraska 68508 (N00014-66-C-0161)

This is a continuation of an existing study for the clarification and documentation of the problematical movement of the freshwater or bull shark (*Carcharhinus leucas*) and the sawfish (*Pristis perotteti*) from the marine environment of the Caribbean Sea into the freshwater system of Lake Nicaragua, Nicaragua, as well as of the pattern and duration of these movements. The adaptation in osmoregulation for this shark from roughly saline sea water to the low salinity lake waters represents a phenomenon of wide biological interest. The program sets up tagging and recording stations along the river outlet of Lake Nicaragua to determine whether or not this migration actually occurs. Trials will be made of a promising new sonic emission tag by which fish movements can be followed from a boat or passively recorded from shore monitoring stations.

The study of sharks and other potentially dangerous fishes, such as the sawfish, is of prime interest to the Navy in light of the growing incidence of lightly protected Naval personnel in swimming, diving, and emergency operations. The freshwater shark is regarded as a dangerous member of this group, and there are authenticated records of its attack on humans in the ONR-supported publication, 'Sharks and Survival.'

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0118, TEMPERATURE TOLERANCE OF MARINE ANIMALS THROUGH BEHAVIORAL RESPONSES

D.W. BRIDGES, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Introduce acclimated and non-acclimated marine organisms into waters of various temperature regimes; observe and measure behavioral patterns such as rate of feeding of fishes, cirral activity of barnacles and pumping rate of bivalves. Diagnose range of temperature in which experimental animals are able to maintain normal behavior as well as determine the thermal death point(s) for these organisms.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0119, DISTRIBUTION OF YOUNG STAGES OF COASTAL FISHES

J. CLARK, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

A survey is to be made of the continental shelf from Cape Cod, Mass. to Cape Lookout, N.C., utilizing the research vessel Dolphin. The goal is to determine relative abundance of young of the major game species in the open estuaries, along the coast, and seaward onto the continental shelf. A series of 14 transects will be established; each extending from the shore to at least the 50-fathom contour. Eight cruises will be made at approximate 1-1/2 month intervals throughout one year. Collecting stations will be spaced along the lines at approximate 10 mile intervals; somewhat closer near shore. At each station along the survey transects a 30-minute oblique tow will be made with 1) a modified Gulf III sampler for larvae and 2) a special 30 foot mid-water trawl for juvenile fish. All fishes taken will be identified to species and isometric charts of abundance of eggs, larvae, and juveniles will be drawn.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0120, TRACKING MIGRATIONS OF BLUEFISH POPULATIONS ALONG ATLANTIC COAST TO LEARN BIOLOGY OF THE SPECIES (MIGRATORY HABITS OF BLUEFISH)

J.R. CLARK, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

It is the purpose of this project to determine population structure of the bluefish species, abundance of the populations, times and routes of migrations of the different populations and rates of mortality of the different populations.

The plan of work is to carry out strategic tagging of 5000 bluefish from southern Florida to Cape Cod. Phase One will be to develop methods, determine suitability of various tag types and tagging methods, and to conduct limited tagging trials. Phase Two will be to conduct field tagging to test hypotheses regarding major populations of bluefish, which will be carried out at seasonal centers of abundance of bluefish in Florida, North Carolina, New Jersey and Cape Cod.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0121, LIFE HISTORY AND BEHAVIOR OF FISHES ON ARTIFICIAL REEFS

L. OGREN, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Determine the species composition, relative abundance, and temporal distribution of fish on artificial reefs and compare results with fish populations occupying natural reefs and areas devoid of reef habitat. Observe and describe the specific attraction to artificial reefs by fish in terms of nutrition, protection, reproduction, growth, and other life needs. Make direct observations of the fish fauna with SCUBA and correlate these observations with similarly conducted dives on natural reefs and barren bottom areas. Make underwater transects with a towed sea sled in each study area to aid in establishing the general faunal features of the locality. Quantitatively sample the reef sites and adjacent study areas with standardized fishing gear, i.e., fish traps. Record results and release fish at place of capture. Periodically sacrifice a sub-sample to study food habits and gonad development.

Relate biological observations to the physical characteristics of the environment and to the artificial habitat.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0122, INFLUENCE OF UNLIMITED FOOD SUPPLY ON RHYTHMIC ACTIVITY OF BLUEFISH

B.L. OLLA, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To learn what effect an unlimited food supply has on rhythmic activity of bluefish: introduce several thousand live prey fish into the experimental tank. Measure rhythmic activity as well as time and intensity of feeding throughout the day and night for a seven to ten day period. Tabulate, plot and analyze resulting data to bring out statistically significant tendencies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0123, HYPOTHETICAL DISTRIBUTION OF 14 SPECIES OF ATLANTIC COASTAL GAME FISHES

L.A. WALFORD, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Description of Work: 1. Assemble, tabulate and plot all available records of occurrence and catch data regarding the following species: Bluefish, bonito, cod, red drum, croaker, red hake, mackerel, porgy, black sea bass, spanish mackerel, spotted sea trout, spot, tautog, bluefin tuna. 2. Collate plotted records with monthly maps of average sea temperatures resulting from work unit 2512-03. 3. Using all existing information and logical assumptions regarding responses of these fishes to temperatures, construct monthly hypothetical total distributions. Report the results in the graphic and written presentation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0124, CREEL CENSUS OF SUMMER FLOUNDER SPORT FISHERY IN GREAT BAY, NEW JERSEY W.S. MURAWSKI, State Div. of Fish & Game, Trenton, New Jersey

A. Project Objectives: To study these aspects of the life history of the summer flounder, *Paralichthys dentatus*, which are pertinent to the management of its fisheries, such as migration, spawning, distribution of the young and growth. Job Objective: The job objective is to conduct a creel census of a segment of the small boat fishery in Great Bay, N.J. during the summer months in order to provide an index to the quality and quantity of the summer flounder sport fishery catch for New Jersey waters.

B. Procedures: A complete creel census will be made at one small boat livery and ramp on Great Bay every Wednesday, Thursday and Saturday during the months of June, July, and August. Direct interviews will be made at dockside by a creel census technician to determine the catch per effort and the size composition of the catch.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
New Jersey State Government

### 5.0125, SCHOOLING BEHAVIOR IN FISHES

E. SHAW, Amer. Museum of Nat. History, New York, New York

Brief description of research project: Schooling in fishes represents a biosocial behavior which exhibits several distinctive features: movement of individuals in the same direction, parallel orientation to one another with more or less equal spacing, and synchronized turning in a manner that still has not been fully analyzed.

The principal investigator has been studying schooling under previous grants, her current grant being C-1083. Further studies on schooling are planned along the above lines of investigation. School structure will be analyzed three-dimensionally. The role of the visual and lateral line sensory systems in parallel orientation will be evaluated. The development of schooling and the influence of experiential factors will be observed and experimental procedures will be extended. A synthesis of these lines of investigation should provide a more comprehensive understanding of bio-social phenomena at this phylogenetic level, and should also provide a greater understanding of the factors that give rise to the formation of schools and to their maintenance in characteristic geometric patterns.

SUPPORTED BY U.S. National Science Foundation

### 5.0126, COLLECTION, COMPILATION, AND ANALYSIS OF GULF CATCH STATISTICS AND LOGBOOK DATA R.B. CHAPATON, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

To furnish basic information for interpreting the results of the biological investigations of the gulf menhaden fishery, the historical and current landing records by vessel, date, and locality and logbook records of fishing activities are required. Current records and historical records are being obtained from the reduction plants. Automatic data processing will be used for tabulations and analyses. Logbooks and fishing charts will be introduced in the fishery beginning in April 1964.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0127, TAGGING

R.L. DRYFOOS, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Results from size and age comparison, morphology and population studies, and estimating year class strength need confirmation from tagging and subsequent recovery. In addition, reliable information on movements, migrations, and mortalities often can be obtained only from the direct results of marking and recovery data.

The mass catching, handling, and processing of menhaden require marking of large numbers of fish and the automatic recovery of those marked. Initial inquiries into marking with stains or pigments and subsequent recovery with an electronic device proved unsuccessful for field use.

Preliminary experiments have shown that marking with ferromagnetic, internal tags and magnetic recovery during the reduction process are feasible. These findings completed the first phase of the study. The project is inactive at the present time, pending allocation of funds with which to conduct a field experiment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0128, INVESTIGATION OF THE BIOLOGY AND POPULATION STRUCTURE OF GULF MENHADEN P.L. FORE, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Measure of the species composition of the landings and related information on the distribution and abundance of three species reported in the Gulf of Mexico are needed to understand the Gulf menhaden resource. Whether one or more populations of gulf menhaden supports the fishery and the biological characteristics of each also must be known to fulfill the objectives of the program and furnish the industry the information they need.

Species identification by external characters, vertebral counts, and other internal structures is an early objective. Collections of gulf, yellowfin, and finescale gulf menhaden were obtained from 1959 to date. These were examined to provide a field guide for the identification of the species.

An analysis of vertebral numbers of gulf menhaden collected from Florida to Texas in 1960 was made to determine the range in morphological variations and for indications of population differences. No conclusions of population heterogeneity were made, although there were significant differences in the mean numbers of vertebrae from the eastern and western gulf.

Juveniles were collected in 10 selected estuaries during September 1963 for a study of morphological variations during successive years.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0129, SAMPLING OF THE ATLANTIC COMMERCIAL CATCH

M.A. JUDY, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Determination of length, weight, sex, sexual maturity, and age composition of the Atlantic menhaden catch by geographical locality is accomplished by daily sampling of the landings at the principal ports throughout the range and season of the purse seine fishery. Landings, by vessel, for each day's fishing are obtained from reduction plant records. Logbook records of date, time, locality, and estimated catch for each purse seine set is kept by fishermen aboard a representative number of vessels. These data are used to provide calculated numbers and weights for each year class contribution to the fishery.

Fish are measured, weighed and stage of sexual maturity, designated by gonad weight, are recorded. Age is determined by annular marks on the scales. Distances between annuli are recorded. At present the information is analyzed and stored on hand-sorted punch cards. Automatic data processing with machine-punched cards is proposed. Cards on hand document the Atlantic menhaden fishery from 1952 to 1963. Summaries for 1952-58 are published, with 1959-60 in press, and 1961-63 under preparation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0130, POPULATION STUDIES

J.H. KUYKUH, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Knowledge of the identity and distribution of species sub-populations is needed to understand the extent of the Atlantic menhaden resource and the effects of environmental factors and fishing upon it. Species identity and indications of population structure can be obtained from studies of the morphology and biology of the fish over their range. Occurrences of larvae, juveniles, and adults help determine the distributions of populations.

## 5. LIVING SYSTEMS (NON-HUMAN)

Variation in vertebral numbers of juveniles from localities along the Atlantic Coast have shown consistent differences between populations north and south of Long Island. Spawning adults from nearby localities also show similar differences. In addition, the hypothesis of an additional southern subpopulation from Cape Hatteras southward is being investigated.

The first phase of a study of the distribution and abundance of two or more species of menhaden in Florida has been completed. Yellowfin menhaden, *Brevoertia smithi*, occurs in Florida but is being little utilized at present. Continuing studies are concerned with determining population structure and identity of this species complex. Methods will include a detailed structural and serological comparison of the species and experimental cross-fertilization for possible hybridization.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0131, ESTIMATION OF JUVENILE ABUNDANCE IN ESTUARINE NURSERIES

*W.F. TURNER*, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Yearling fish provide a substantial portion of the menhaden landings in the Gulf of Mexico. Estimation and prediction of the incoming year class abundance can be made from measures of the relative abundance of juveniles in the estuaries in the preceding year. Methods employed will be the same as for the Atlantic menhaden and will include catch per unit of effort, measures with standard haul seine and trawl gear, fin clipping and recovery, and ground and aerial school counts.

Aerial counts of schools from Florida to south Texas were made in October 1962 and 1963.

Catches by haul seines and trawls were made in selected estuaries during September 1963. These observations mark the beginning of the project for gulf menhadens.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0132, SYSTEMATICS, ZOOGEOGRAPHY, AND ECOLOGY OF ELASMOBRANCHS OF THE WESTERN ATLANTIC OCEAN

*F.J. SCHWARTZ*, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

All aspects of the systematics, zoogeography, biology, and ecology of Western Atlantic elasmobranchs are being investigated. Studies are aided through local tagging efforts.

SUPPORTED BY University of North Carolina

### 5.0133, FISH COLLECTION OF NORTH CAROLINA AND WESTERN ATLANTIC FISHES

*F.J. SCHWARTZ*, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

A curated and catalogued collection of fishes is maintained for research, teaching and systematic work. Species consist of freshwater and Western Atlantic fishes with emphasis on those now occurring in North Carolina.

SUPPORTED BY University of North Carolina

### 5.0134, LAKE ERIE INVESTIGATIONS - LIFE HISTORY AND ABUNDANCE OF THE YELLOW PERCH

*H.D. VANMETER*, U.S. Dept. of Interior, Biological Station, Sandusky, Ohio

The abundance of year classes, rate of growth, and the effects of exploitation are determined from data collected from fish captured in experimental and commercial nets. Information on food, spawning habits, distribution, competition with other species, and other life history aspects are obtained from collections of fish taken in experimental gear. Environmental factors--oxygen, water temperature, bottom organisms, plankton, water currents, seiches, and the interrelations with other species of fish are determined from limnological and fish-population data obtained with the fish collections.

Current studies nearing completion include the age and growth, abundance, and history of the commercial fishery for this

species from 1949 through the calendar year 1966, spawning and fry development, age and size at maturity, fecundity, and food habits. Studies of the effects of environmental conditions upon this species are described elsewhere as separate projects.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0135, FLUCTUATIONS IN SPECIES COMPOSITION AND YEAR-CLASS STRENGTH OF COMMERCIAL LANDINGS

*H.D. VANMETER*, U.S. Dept. of Interior, Biological Station, Sandusky, Ohio

This investigation requires the collecting, in spring and fall, of scale samples and mensural data from the species available in the commercial landings at fish houses at representative ports in the western, central and eastern basins of the lake. Species composition of the catches becomes evident from what is available for sampling. Examination of the scales of walleyes and yellow perch is kept current and year-class contributions to the catches of these species are summarized annually.

Scale samples and data for the remaining commercial species are made available to other investigators or are filed for future studies.

Reports summarizing major segments of these data for the walleye, sheepshead, and yellow perch are currently in preparation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0136, PRELIMINARY STUDY TO DETERMINE ABUNDANCE AND RECRUITMENT OF BOTTOMFISH OFF OREGON

*R.L. DEMORY*, State Fish Commission, Astoria, Oregon 97103

This study will undertake to determine the factors associated with and responsible for the variations in abundance and year-class strength of Dover sole and other groundfish species supporting the commercial trawl fishery of Oregon. Dover sole data from past years will be reviewed and combined with data from the current sampling program. Collections of juvenile groundfish will be examined and identified, fish stomachs examined for larvae and juvenile fish, and collection trips taken aboard commercial shrimp vessels and chartered trawl vessels to collect juveniles. These collection and sampling procedures will be part of an overall assessment program to determine year-class strength, survival rates of juveniles, and juvenile abundance.

The work will take place at the ports of landing along the coast of Oregon and on the trawl fishing grounds along the adjacent Oregon coastline. Laboratory work will be handled at the Research Laboratory, Astoria, Oregon.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Oregon State Government

### 5.0137, OREGON FISHES - THEIR CLASSIFICATIONS, DISTRIBUTIONS AND LIFE HISTORIES

*C.E. BOND*, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: In general, to provide basic information concerning Oregon's fish fauna. Immediate objectives involve compilation of faunal lists, keys to Oregon marine fishes and studies of the Zoogeography and speciation of freshwater fishes. A special investigation will assess populations of certain estuarine fishes.

Work Proposed: A. Freshwater studies: Collection, cataloging, and ecological analysis will be continued in order to provide faunal lists and Zoogeographical Information. Collections of lampreys from inland as well as coastal areas must precede studies of speciation in this group. B. Marine studies: For lists and keys, additional collection, cataloging and taxonomic studies will be necessary. Populations of bay fishes will be studied by mark-and-recapture methods.

SUPPORTED BY Oregon State Government

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0138, OREGON FISHES - THEIR CLASSIFICATION, DISTRIBUTION AND BIOLOGY

*C.E. BOND*, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

The object of this project is to provide basic information relating to Oregon's fish fauna, including both marine and freshwater species. Considerable effort has gone into field work and the maintenance of a reference collection. Studies of the biologies of several species have been carried out. Keys and lists are being prepared and distribution records kept.

SUPPORTED BY Oregon State Government

### 5.0139, EARLY LIFE OF BOREAL FOOD FISH AND SHELLFISH

*W.J. MCNEIL*, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. Determine the time and place of occurrence of eggs and larvae of food fish and shellfish off the Oregon coast. Systematic collections will be made at sea and taxonomic descriptions in the laboratory. 2. Determine time and place of high and variable mortality of selected species. 3. To associate mortality of selected species with biological and physical-chemical factors in the environment. 4. To elucidate the nature of mortality processes through experimentation.

SUPPORTED BY Oregon State Government

### 5.0140, EVALUATION, COORDINATION, AND PLANNING OF PACIFIC SALMON AND STEELHEAD RESEARCH AND MANAGEMENT ACTIVITIES

*L.A. VERHOEVEN*, Pacific Salmon Inter. Agcy. Co, Portland, Oregon

To promote more efficient use of research and management efforts through better determination of needs, coordination of activities, evaluation of projects, dissemination of information and planning of programs-both short-and long-rang.

Present objectives are to compile an annual bulletin of coast-wide commercial and sport fishery catch statistics, update inventories of current salmon and steelhead research work, formulate long-range plans to maintain and enhance the resource, update assessments and compilations on the status of Pacific Coast salmon and steelhead stocks, review and evaluate major fishery problems and recommend solutions or procedures for dealing with these problems, sponsor and stimulate workshops in connection with these problems, and update the Salmon Compendium by including literature from 1960 to the present.

There is no precise timetable for the accomplishment of objectives but certain broad limits can be established for some items. The Salmon Compendium should be updated for the period 1960-64 by December 1968. Research inventories will be updated in 1968 and again in 1970. Catch statistics will be compiled annually. Major fishery problems will be dealt with at the estimated rate of five problems per year. Longrange planning will continue through the term of this program. Compilation of statistics, updating of inventories and status reports will be accomplished from information received from various state and federal agencies. The updating of the Salmon Compendium will be done through library research contracted to the Fisheries Research Institute at the University of Washington. The resolution of major fishery problems will be undertaken by the Technical Committee of the Pacific Salmon Inter-agency Council with the assistance of experts in various fields through workshops, sub-committees, and other forms of communication.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Oregon State Government

### 5.0141, INVESTIGATE THE FEASIBILITY OF INTRODUCING SOCKEYE SALMON INTO RESERVOIRS

*L. KORN*, State Fish Commission, Portland, Oregon 97201 (14-17-001-1429)

Determine the ability of juvenile sockeye to survive and rear in and emigrate from reservoirs. Catalog reservoirs in Oregon as to their physical, chemical, and biological properties; evaluate these with respect to the potential for rearing sockeye.

### 5.0142, SURVEYS OF SPAWNING SALMON

*R.E. LOEFFEL*, State Fish Commission, Salem, Oregon

Purpose: To establish trends of abundance for spawning salmon in Oregon.

Methods: Designated index areas of many streams are surveyed during spawning periods to determine peak counts of salmon. The counts are refined into a composite fish per mile index for each species and all stream areas surveyed.

Results: The trend in spawning populations of the various species aids in determining management policies.

Reports: Annual unpublished reports are prepared and maintained on file.

SUPPORTED BY Oregon State Government

### 5.0143, ALBACORE TUNA

*R.E. LOEFFEL*, State Fish Commission, Salem, Oregon

Purpose: To monitor the landings of albacore in Oregon fishery and collect information on the life history, behavior and environment of the albacore.

Methods: To conduct fishermen interviews and examine log-book data. To conduct a pre-season exploratory and oceanographic cruise annually in early July. Do limited tagging to learn more about migrations, age and growth of the albacore.

Results: The success of the albacore fishery fluctuates widely from year to year and is closely related to the ocean environment. The annual cruise enables us to gather environmental data to compare with catch and effort data. The cruises have enabled us to catch fish for tagging and have resulted in the early start of the commercial fishery on several occasions when we located quantities of tuna. The limited tagging work done to date shows that fishermen in Oregon waters and Japanese fishermen in the central and western north Pacific fish on the same stocks of albacore.

Reports: Annual reports, cruise reports and catch and effort data reports. A summary report of pre-season cruises (1959-67). A summary report of all OFC tag recoveries (in preparation).

SUPPORTED BY Oregon State Government

### 5.0144, POPULATION ESTIMATES OF JUVENILE COHO SALMON IN SIX COASTAL STREAMS

*R.E. LOEFFEL*, State Fish Commission, Salem, Oregon

Purpose: To determine if annual fluctuations in abundance occur in juvenile coho populations and if the abundance can be related to parent abundance, returning adults and environmental conditions.

Methods: Stream sections have been identified. Each year the population of juvenile salmon in these sections is estimated. Results are compared to changes in temperature, flow, adult spawning populations, etc.

Results: Data suggest that abundance of juveniles during summer low-flow period not related to numbers of parent spawners but indicative of success of brood year.

Reports: Annual unpublished reports of population estimates.

SUPPORTED BY Oregon State Government

### 5.0145, MANAGEMENT OF THE OREGON TRAWL FISHERY

*J.M. MEEHAN*, State Fish Commission, Salem, Oregon

Purpose: Monitor and regulate the fishery to obtain optimum yield and prevent over exploitation.

Methods: Interview fishermen for catch and effort data. Collect and analyze market samples for length-frequency, sex, and age. Estimate mink food and rockfish composition. Make periodic flights to survey foreign trawl fleets.

Results: We maintain continuous records of landing by species or groups, where these fish are caught and effort expended. Results are used for coast-wide management purposes such as the recent removal of the restriction of winter petrale sole landings.

SUPPORTED BY Oregon State Government

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0146, MONOGRAPH OF THE FISHES OF THE ORDER PLECTOGNATHI

J.C. TYLER, Acad. of Nat. Sci. of Phila. , Philadelphia, Pennsylvania 19103

This investigation is a continuation of research initiated under GB-5102. The Plectognathi are widely, but not unanimously, recognized as one of the major orders or phyletic lines of teleostean fishes derived of a perciform ancestry. The primary reason that there is any doubt about the naturalness of the Plectognathi is that it is a highly diversified order which has not yet been adequately defined. There are only about 320 Recent species of plectognaths, but the order is much more diversified than the majority of fish groups of a comparable number of species.

The investigator will systematically describe and illustrate the osteology of representatives of each of the presently envisioned 12 families of plectognaths, and of additional species of especially distinctive subfamilies when necessary, in order to compare the diversity of structural types within the order and to arrive at a meaningful classification that is in accord with what re-examination of the fossil record indicates. The usually reductive trends in the evolutionary pattern leading to the diversity of the plectognaths will be analyzed, and the osteology of acanthuroids surveyed in order to re-evaluate the probability of their close relationship to the plectognaths.

SUPPORTED BY U.S. National Science Foundation

### 5.0147, MIGRATORY HABITS OF LARGE SHARKS

J.G. CASEY, U.S. Dept. of Interior, Marine Game Fish Research Lab. , Narragansett, Rhode Island 02882

To determine the migratory patterns of sharks occurring in North Atlantic coastal waters from Maine to North Carolina.

The plan of work is to: (1) tag sharks in the course of longline fishing operations conducted by the Sandy Hook Marine Laboratory under an additional shark study project; (2) supply tagging materials and instructions to cooperating sportsmen and sporting clubs who have volunteered assistance; (3) continue tagging through October, 1966, at which time tag return data will be collected and analyzed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0148, FAMILIAL RELATIONSHIPS IN TELEOST FISHES

C. HUBBS, Univ. of Texas, Graduate School, Austin, Texas 78712

It has recently been proposed that classification of teleost fishes should be based on phyletic lines. This philosophy has resulted in extensive rearrangement of families. Use of phyletic trends emphasizes parallel evolution of morphology. The absence of fossil evidence makes it difficult to determine which feature is a parallelism and which represents convergence. The interaction of two sets of chromatin in a single cytoplasmic environment is not likely to be influenced by parallel or convergent evolution, so it can be used to determine which alternative is actually parallel and which is actually phylogeny.

SUPPORTED BY U.S. National Science Foundation

### 5.0149, LIFE-HISTORY AND BIOLOGICAL WORK IN THE RESTORATION AND MANAGEMENT OF SPECIES OF IMPORTANCE TO THE FISHERIES OF THE VIRGIN ISLANDS

A.E. DAMMANN, Virgin Isls. Off. of The Gov. , Saint Thomas - Charlotte Amal. , Virgin Islands

Phase 03: An analysis of the observed and collected materials from each station should eventually yield data related to species composition, population size, reproduction, feeding, and other biological functions related to fin fish and shellfish populations.

In addition to plankton collections, nets, traps, hook and line, poisons, spears, snares, and other collecting techniques will be employed to obtain and observe specimens.

It is believed that the catamaran research vessel with its glass-bottomed well, large live well, provisions for SCUBA, and all its communications gear, will play an important role in this phase of

the project. We anticipate much direct observation that could not readily be achieved by any other equally economical means.

Arthur E. Dammann and personnel to be hired or used on a collaborative basis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Virgin Islands Government

### 5.0150, BIOLOGY OF ANADROMOUS ALOSIDS

J. DAVIS, Virginia Inst. of Marine Sci. , Gloucester, Virginia

OBJECTIVES: 1. To obtain a collection of data on which to base estimates of the composition of the spawning run of alosids in 1967 and the mortality rates of the species. 2. Estimation of the catch of each species of Alosa in each river system. 3. Finding the spawning sites of alosid fishes in the York River system and in some of the tributaries to the Potomac River.

PROCEDURES: 1. Age and spawning history will be determined by counting rings and spawning checks on scales. 2. Catch records will be obtained from a sample of each type of gear in each river and the total number of gears of each type will be counted monthly. Total catch will be estimated by multiplying the average catch of the sample gears by the total number of units of gear. 3. The mainstream and its tributaries will be sampled for eggs, ripe fish, and newly hatched larvae. Presence of any of these will indicate a spawning area. Areas in which young fish are caught will be considered to be nurseries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0151, ESTIMATION OF PARAMETERS OF STRIPED BASS POPULATION AND DESCRIPTION OF THE FISHERY OF LOWER CHESAPEAKE BAY

E.B. JOSEPH, Virginia Inst. of Marine Sci. , Gloucester Point, Virginia 23062

The objectives of this research are three-fold: 1. To obtain an estimate of the age composition of the stocks of striped bass in lower Chesapeake Bay, with special reference to seasonal variation, 2. To determine the age selectivity of the major types of fishing gear that are removing striped bass from the population, and 3. To measure the relative strength of the incoming year class by means of young fish surveys.

The segment of the research covered by this contract period extends from 1 May 1967 - 30 November 1967. Since there are seasonal aspects to the above mentioned objectives, this research will not be completed in this period, but will be carried into future contract time segments.

Age composition will be based on samples of catch obtained from pound-nets and fyke-nets in the James, the York and Rappahannock Rivers. Age determination will be based on the scale method.

Age selectivity will be determined for all major types of fishing gear, including hook and line, in use in the lower Chesapeake Bay area and compared to non-selective gear operating in the same river.

Young fish surveys will utilize both trawl and seine collections in all Virginia rivers supporting spawning populations.

The scientific personnel on this project will include, in addition to the principal investigator, Mr. Clarence Richards, Mr. Victor Burrell, and one PhD level biologist to be added. This staff will be assisted by technical and clerical help.

Virginia State Government

### 5.0152, THE DETERMINATION OF THE AVAILABILITY OF SEA ROBINS

E.B. JOSEPH, Virginia Inst. of Marine Sci. , Gloucester Point, Virginia 23062

The objective of this phase will be to determine whether or not sea robins are equally available to bottom trawls in day and night. We anticipate that two species of sea robins *Prinotus carolinus* and *P. evolans* will comprise a significant portion of the total benthic industrial resource in the area under investigation. The diel availability of those species will be determined from

## 5. LIVING SYSTEMS (NON-HUMAN)

analysis of catches from a series of experimental trawl tows conducted at frequent intervals through 24 hour periods. For consistency, the tows will be made in the same depth range, and so far as is possible on the same concentration of fish. This experiment will be done from the R/V Pathfinder working as close to Chesapeake Bay as concentrations of fish will permit. This work will be performed in November, 1965.

The information obtained in this phase will be used in formulating a sampling program to be described in a separate phase.  
Part 1 of 6.

### 5.0153, WINTER DISTRIBUTION OF FISHES

*E.B. JOSEPH*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The objective is to determine the pattern of distribution in winter of ground fishes of potential industrial importance on the Continental Shelf between Cape May, N. J. and Cape Hatteras, N. C. Trawl tows will be made at predetermined stations and temperature and salinity of the bottom waters will be determined.

The quantity of each size category of each species caught will be recorded on IBM cards with the associated physical data. Correlations between physical features of the environment and distribution of fish will be sought. Data gathering will extend from 1 January to 15 March 1966. Analysis will follow. Part 4 of 6.

### 5.0155, DISTRIBUTION, AGE GROWTH, AND MORTALITY STUDIES OF SALT WATER FISHES OF IMPORTANCE TO SPORT FISHERMEN

*C.E. RICHARDS*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

Data on *Pogonias cromis* (black drum), *Sciaenops ocellata* (red drum), *Leiostomus xanthurus* (spot), *Rachycentron canadum* (cobia), and other fishes is obtained by various sampling methods carried out in Chesapeake Bay and the waters off Eastern Shore Virginia and from tagging studies. Analysis includes analog computer studies of age and growth and population dynamics. Studies began in 1960 and are continuing.

SUPPORTED BY Virginia State Government

### 5.0156, INTERVIEW AND OBSERVATION

*E.B. JOSEPH*, State Comm. of Fisheries, Newport News, Virginia

The objective of this phase is to obtain information concerning the distribution of species of ground fish of potential industrial importance in the shelf waters between Cape May, N.J. and Cape Hatteras, N.C. Information will be obtained by interviewing trawlermen who have fished the area and also by placing observers aboard trawlers fishing in the area. Data obtained will be stored on IBM cards to facilitate retrieval and analysis. Hampton, Virginia will be the primary interview site.

Information obtained by interview and observation will supplement data on distribution of fishes obtained by our exploratory trawling. Both sources of information will contribute to our understanding of the biology of fishes of the Continental Shelf. Time schedule: November 1965 - June 1966.

The technical personnel participating in this phase will be: Edwin B. Joseph, Ph.D., (Project leader), John J. Norcross, M.S., Jackson Davis, Ph.D., Peter Eldridge, M.S., James Sterling, B.S., a technician and a graduate student assistant.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Virginia State Government

### 5.0157, TAG LOSS

*P.K. BERGMAN*, State Dept. of Fisheries, Olympia, Washington

Tagged coho smolts now in storage at the Department's Minter Creek Hatchery will be weighed, measured, tags excised, and decoded. Data will be placed in a computer program so that differential tag loss can be studied, particularly in relation to fish size. Additionally, fish will be tagged under improved techniques and equipment adjustments to determine means of achieving more positive tag retention. X-ray techniques will also be used to study tag placement. Phase 1 will include lake poisoning where 1964 brood coho were reared and residualism occurs. Work will commence in June 1966.

Existing data coming from the first full cycle (1962 brood) of tagged coho in storage at Minter Creek will be programmed and analyzed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0158, TAGGING ENGLISH SOLE, PETRALE SOLE, AND PACIFIC COD

*E.K. HOLMBERG*, State Dept. of Fisheries, Olympia, Washington

The objectives under the tagging phase will be to provide information relative to the migrations and status of English sole, Petrale Sole, and Pacific Cod stocks, on which the Washington bottom fishery operates. The stock used for tagging will come from catches made from chartered commercial fishing vessels, during the normal fishing seasons for the respective species. Charters will include in addition to the vessels, crews, gear, supplies, and meals. Technical staff conducting the tagging will be assisted by the charter crews. Charter tagging trips will vary in time from 10 to 15 days according to conditions.

English Sole - Approximately 5,000 fish will be tagged with serial numbered Peterson disc tags. Tagging will commence as soon after October (1966) as possible, located off the N. W. Washington coast. Fish will be sexed and measured.

Petrable Sole - Approximately 5,000 fish will be tagged with serial numbered Peterson disc tags. Tagging will occur during November (1966), in the Estevan Deep. This work will provide information on the efficacy of the present winter closure regulations. Condition of the fish will be observed and measurements taken as above.

Pacific Cod - Approximately 5,000 fish will be tagged with serially numbered large plastic darts. Tagging will occur during January 1967, in the Strait of Juan de Fuca, offshore from Port Angeles. Untagged fish will be random sampled for a determination of sex ratios. Measurements as above will be taken.  
(Part 1 of 3)

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0159, TAG RECOVERY, ENGLISH SOLE, PETRALE SOLE, AND PACIFIC COD

*E.K. HOLMBERG*, State Dept. of Fisheries, Olympia, Washington

The objective of the tag recovery phase will be to ascertain the fate of fish tagged earlier, and in turn, interpret and relate the tagging results to questions of migration, rates of exploitation and mortality which recovered tags may reveal alone, or in conjunction with other biological data collected both on the tagging grounds and through sampling. Tags will be a means of determining the identity of stocks and their population.

## 5. LIVING SYSTEMS (NON-HUMAN)

Scheduled daily port visits at which tags will be recovered, will be at Seattle, Everett, Bellingham, and (or) Blaine. These visits will be in conjunction with the Department's fisherman interview and biological sampling program now in its 13th year.

Rewards of up to one dollar (\$1.00) will be paid for tags recovered, as follows: Fifty cents (\$.50) for each tag returned, twenty-five cents (\$.25) for each tag with accurate fishing information provided, twenty-five cents (\$.25) for each tagged fish in a frozen condition.

For purposes of data analysis, Walford's method will be used for asymptotic length, Von Bertalanffy's Growth method will be followed and Peterson's Population Estimate will be attempted. The experiments are designed for data treatment by computer analysis methods.

Part 2 of 3.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0160, SAMPLING OF GROUND FISH STOCKS

*E.K. HOLMBERG*, State Dept. of Fisheries, *Olympia, Washington*

The objective of sampling will be to provide background information to complement the tagging studies. Samples of 400 fish of each species involved in Subproject 1 will be taken at approximately fourteen day intervals throughout the season, as fishing conditions dictate. Fish will be sexed, measured to the nearest mm., and weighed to the nearest gram. Sampling will occur at landing ports of Bellingham and Seattle.

English Sole - The opercular bones will be taken for age determination. Catch curves (weighted) of age composition will indicate recruitment and total mortality rates.

Petrale Sole - Otoliths will be collected for age determination. Other biological data will be treated as above.

Pacific Cod - Age determinations will utilize length measurements using Harding's Method. Other data will be treated as above.

Detailed examinations of biological material and data treatment will be conducted at the Department's University of Washington Laboratory. During those sampling trips, where time will not permit sampling a full 400 fish without delaying processing plant operations, fish will be purchased and returned to the laboratory for detailed examinations.

Part 3 of 3

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0161, COHO MARKING

*H. SENN*, State Dept. of Fisheries, *Olympia, Washington*

Coho marked under this phase will ultimately contribute to a better knowledge of the contribution of hatchery propagated coho to the several fisheries of Washington, Oregon, and Canada.

Marking of 1965 brood Puget Sound hatchery coho will commence in June. These will include four double-fin marks established at a meeting of the Pacific Marine Fisheries Commission.

Marking procedures will be those previously established for marking fall chinook under the Columbia River Fishery Development Program.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0162, SAMPLING OF MARKED COHO

*H. SENN*, State Dept. of Fisheries, *Olympia, Washington*

Coho of 1965 brood, previously marked at the Department's Columbia River hatcheries, will be sampled during October and November to determine the numbers of marked and non-marked which will be released in the spring of 1967. This sampling procedure is one established and in use for fall chinook under the Columbia River Fishery Development Program.

Part 2 of 4.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0163, RECOVERY OF MARKED COHO

*H. SENN*, State Dept. of Fisheries, *Olympia, Washington*

During the late summer and early fall of 1966, marked coho of the 1964 brood, liberated from Puget Sound hatcheries, will be returning to hatchery racks as jacks. Where possible, these will be recovered by hatchery crews. Others of the same brood year will appear in the fishery, where they will come within the scrutiny of existing catch sampling programs. Recovery data will be forwarded to the Oregon Fish Commission Data Processing Laboratory at Clackamas, Oregon, under procedures now followed in the recovery of marked fall chinook for the Columbia River hatchery evaluation program. Additional mark recovery data will be supplied by Canada, from similar sampling conducted in the British Columbia fishery. Procedures for reporting will conform to those established between the state of Washington and British Columbia for the mutual exchange of marked and tagged fish data.

Part 3 of 4.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0164, MARKED COHO LIBERATION

*H. SENN*, State Dept. of Fisheries, *Olympia, Washington*

Coho of the 1965 brood, at both Puget Sound and Columbia River hatcheries, will be liberated at the hatcheries' sites in the customary manner for yearling coho, during early spring months of 1967. These will comprise both marked and unmarked fish. Marked to unmarked ratios will be established for each hatchery.

Part 4 of 4.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0165, MANAGEMENT OF COLUMBIA RIVER COMMERCIAL FISHERY

*A.L. OAKLEY*, State Dept. of Fisheries, *Seattle, Washington*

Purpose: Regulation of commercial fishery to obtain maximum sustained yields from the resource.

Methods: Predict run size and timing for certain anadromous species, monitor commercial catch and escapement and compile detailed landing statistics for purposes of evaluating commercial fishery. Analyze escapement-production data to establish optimum escapement levels for important runs.

Results: Columbia River fish runs are being harvested commercially on a biological basis. Declines in certain stocks can be evaluated, based on data collected in this program, and corrective action suggested.

Results: Annual progress reports. Publications have been completed on fecundity of Columbia River chinook, timing of Willamette River spring-run chinook in the Columbia River, racial timing of chinook salmon in the lower Columbia River, trends in production rates for upper Columbia River runs of salmon and steelhead and a compensatory process based on the concept of hunger. A manuscript relating to the effect of environmental changes on reproductive curves was submitted for publication. Several reports relating to fish passage and spill patterns at Ice Harbor Dam were submitted to the U. S. Army Corps of Engineers.

SUPPORTED BY Washington State Government  
Oregon State Government

### 5.0166, ANALYSIS OF JAPANESE CATCH STATISTICS

*R.A. FREDIN*, U.S. Dept. of Interior, Biological Laboratory, *Seattle, Washington 98102*

The Japanese high seas salmon fishery annually operates about 370 catcher boats over several hundred square miles of ocean during a 60 day fishing season, exploiting major salmon runs of both Kamchatka and Alaska.

The work of this project consists of collating and analyzing fisheries statistics and biological data from the Japanese high seas salmon fishery and Japanese research vessels in the North Pacific Ocean to (1) determine annual fluctuations in abundance of the 5 species of salmon in the high seas fishing areas and causes of same, (2) ascertain seasonal and intra-seasonal changes in the temporal-spatial distributions of the 5 species of salmon and re-

## 5. LIVING SYSTEMS (NON-HUMAN)

late these to oceanographic conditions, maturity schedules, timing of inshore runs or other factors, (3) assess effects of high seas salmon fishing on the conservation and productivity of Bristol Bay sockeye salmon and northern Alaska chinook salmon runs, (4) provide background information for predicting the size and high seas rate of exploitation of Bristol Bay sockeye salmon runs, and (5) determine potential effects of expanded high seas salmon fishing operations on U.S. salmon stocks.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0167, POPULATION DYNAMICS (BIOMETRICS) OF EXPLOITED FISH GROUPS OF THE NORTH PACIFIC OCEAN AND PACIFIC COAST

R.A. FREDIN, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Research on the population dynamics of exploited fish stocks of the North Pacific Ocean and Pacific Coast of North America is conducted for the purpose of evaluating the current status of the stocks, measuring the degree of utilization, and determining the conditions necessary for achieving maximum average yields. Fishery statistics and biological data on Pacific salmon, Pacific halibut and other exploited fish stocks, such as king crab and bottom fish, are analyzed for fluctuations in abundance and changes in composition and characteristics of the stocks.

Classical and newly developed or modified analytical techniques are used to estimate population parameters, including stock sizes, fishing and natural mortality rates and growth rates, and to measure the reliability of such estimates.

Various statistical methods and mathematical population models are employed in studying causes of fluctuations in abundance of stocks, estimating the effects of fishing on sustainable yields for single and mixed stocks, determining yield per recruit and stock-recruitment relationship, and estimating optimum stock sizes and maximum average yield.

Oceanographic and meteorologic observations and measurements might contribute significantly to the interpretation of biological information on population sizes and changes.

Most of the data compiled and analyzed in this research project are recorded on punched cards or magnetic tape and processed by electronic computers.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0168, BOTTOMFISH EXPLORATIONS

C.R. HITZ, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Seattle, Washington 98102

Bottomfish exploration is primarily concerned with benthic vertebrate populations. The objectives are to define, in time and space, the quantitative and qualitative distribution of aquatic benthic vertebrate resources having a potential for commercial utilization, and to provide an appraisal of these resources.

In FY 68 a cruise is scheduled to develop new techniques in the use of rollers on the footrope of a bottom trawl to permit trawling on rough bottom, and to explore rough-bottom areas off the Washington coast. Also proposed is a cruise to assess deep-water sablefish resources off Washington and Oregon.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0169, ADULT SALMON BEHAVIOR STUDIES IN RIVERS AND AT DAMS (SONIC TRACKING)

J.H. JOHNSON, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

This project seeks information which will contribute to a sound assessment of the effect of reservoirs and dams on anadromous fish runs, specifically on adult salmonids returning to Columbia River system spawning areas. Such an assessment requires an accurate knowledge of migration timing and spawning area locations before dams are constructed, and of the amount and nature of mortality resulting directly from fish passage over dams.

The project's primary research tool at present is the sonic fish tag, a miniature high frequency sound transmitter attached directly to the fish. Sonic tagged fish can be tracked individually

from boats, their continuous movements noted in precise detail, or their progress and dispersion upstream can be measured by means of automatic recording monitors placed at intervals along the shore above a tagging site.

Studies in progress are attempting to pinpoint the causes for losses of adult salmon between Bonneville, Priest Rapids, and Ice Harbor dams using sonic tracking devices and automatic recording monitors placed at strategic intervals along the Columbia River and tributary streams.

Studies are planned on the behavior of adult salmonids in estuaries, using sonic tracking techniques to examine migration in relation to tides, freshwater inflow, salinity, and other environmental factors.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0170, OCEAN GROWTH AND MORTALITY OF SALMON

J. LALANNE, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Tagging studies have demonstrated that it is not presently feasible to obtain reliable estimates of short-term natural mortality for salmon. Consequently, these mortality studies are being deferred with a report on 'Tagging Experiments on the Natural Mortality of Bristol Bay Sockeye Salmon (*O. nerka*) during their last few weeks at Sea.' Growth work will continue and includes a study of the marine growth of chum salmon (*O. keta*) based on periodic sampling at sea and a study of the relationship between the scale growth-body growth of chinook salmon (*O. tshawytscha*).

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0171, GROUND FISH INVESTIGATIONS (POTENTIAL YIELD OF UNDERUTILIZED GROUND FISH STOCKS)

H. LARKINS, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Program objectives: short-range, to determine maximum sustainable yield for fish stocks that are currently underutilized or are being endangered by foreign fishing; long-range, to predict year-class fluctuations and distribution patterns allowing maximum harvest of Pacific Northwest groundfish stocks, and to develop the scientific background necessary for sound international management of such stocks.

Recent increases in program funds and personnel will allow many of the planned research phases to be started earlier than anticipated or operated at an accelerated level. Along with the biological work already in progress with Pacific hake and Pacific ocean perch (size, age, maturity, growth, mortality, and recruitment) we are beginning: a groundfish tagging research and development project; a biological survey of latent fishery resources; an evaluation of economic conditions that affect the groundfisheries and resultant catch per unit of effort statistics; an egg and larval fish identification study; and a cooperative age reading unit with the Washington Department of Fisheries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0172, PELAGIC FISH EXPLORATIONS

M.O. NELSON, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Seattle, Washington 98102

Pelagic fish exploration is concerned with pelagic vertebrate populations. The objectives are to define, in time and space, the quantitative and qualitative distribution of aquatic pelagic vertebrate fish resources having a potential for commercial utilization, and to provide an appraisal of these resources.

Emphasis during FY 68 will continue on hake. Extensive use will be made of acoustical counting equipment to quantify hake populations.

A new project to assess the offshore saury resources was initiated in FY 68. One three-week cruise was conducted using various colored lights to attract the saury to the vessel, and lift and gill nets were employed to harvest them.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0173, ADULT MIGRATION RATES

*H.L. RAYMOND*, U.S. Dept. of Interior, Fish Passage Res. Program, *Seattle, Washington*

The environment in the Columbia River has been changed from a free-flowing stream to a series of dams and impoundments. In a few short years a similar change will take place on the lower Snake. How will this progressive change in environment affect the populations and timing of the many races of salmon migrating upriver to spawn? Data obtained from this program would be helpful in: (1) planning adequate fish facilities, by knowing numbers and time of arrival at planned dams; (2) managing the fishery by knowing time of arrival and expected numbers of the major races of chinook salmon in the commercial fishing area; (3) identifying spawning basins in areas soon to be inundated by new dams; and (4) planning rehabilitation of depleted runs by seeding these runs with other races having similar timing.

The technique involves sonic tagging a specific number of salmon at Ice Harbor Dam on the lower Snake River and monitoring their progress upstream to their spawning ground by means of recorders at intervals up the main river and in the major tributaries. Gradual expansion of the program would follow until the entire Columbia River System is under study.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0174, FISH POPULATION STUDY

*R.P. SILLIMAN*, U.S. Dept. of Interior, Biological Laboratory, *Seattle, Washington* 98102

This is a study of the response of fish populations to fishing and to environmental changes. It will be conducted by two means: (a) Experimental laboratory fish populations (b) Mathematical models of populations.

Initial experiments are testing the interaction effects of holding populations under three different food levels and three levels of fishing intensity (3 x 3 table). An analog computer is being used for the simulation of fishing yields through the continuous solution of differential equations. Future experiments will study the effect of other variables, such as temperature and water chemistry.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0175, FISH POPULATION STUDY

*R.P. SILLIMAN*, U.S. Dept. of Interior, Biological Laboratory, *Seattle, Washington* 98102

The purpose of this work is to study the detailed responses of fish populations to varying fishing rates and environmental conditions. Work is being performed with experimental laboratory populations in aquaria, and with mathematical models. Experimental animals include *Lebistes reticulatus*, *Xiphophorus helleri*, *Tilapia macrocephala* and *T. mossambica*. An analog computer is employed in constructing mathematical models.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0176, MARINE FISH BEHAVIOR

*R.B. THOMPSON*, U.S. Dept. of Interior, Biological Laboratory, *Seattle, Washington* 98102

Researchers will conduct basic and applied behavior studies on currently exploited and potentially exploitable marine species.

The objective is to improve the efficiency of harvesting and managing marine fishery resources through the better understanding of the continuous behavior patterns of the target species. Fundamental principles of fish psychology will be developed; patterns of behavior will be investigated, analysed, and described so these can be used to best advantage by the fishermen and the resource managers. Studies will be made of the biological and exploitative significance of the different behaviour patterns; especially the controlling stimuli and physiological mechanisms involved in feeding, individual and group movements and migrations, reproduction, and the reactions of fishes within the zone of influence of fishing gear.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0177, DROPOUT OF SALMON FROM GILL NETS

*R.B. THOMPSON*, U.S. Dept. of Interior, Biological Laboratory, *Seattle, Washington* 98102

The objectives are to study the effects of gill nets on adult salmon in the commercial fishery in terms of dropouts and mortalities.

1. Within the artificial environment of a salt water pond observe the dropout ratio, mortality rates, behavior patterns, external injuries, and measure fatigue of salmon exposed to gill nets.

2. Determine the effects of gill nets on adult salmon in the inshore commercial fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0178, ESTUARINE WATER QUALITY AND FISH DISTRIBUTION

*D.E. BEVAN*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

Increasing demands upon the water resources of the estuary of the Nooksack River threaten alteration in water quality. The project will develop measures of 'fishes well-being' in areas of dispersal of pulp and paper effluents. Patterns of feeding and the physiological condition of juvenile salmon moving through the estuary will be related to environmental conditions. Quantitative measures of the fishes distribution and their condition will be related to chemical and hydrographic monitoring of the estuary.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res. University of Washington

### 5.0179, FORECAST OF KODIAK ISLAND PINK SALMON RUNS FROM ABUNDANCE OF JUVENILES IN ESTUARIES

*D.E. BEVAN*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

The objective of this work is to develop a method of predicting the returning runs of pink salmon to Kodiak Island based on the relative numbers of juvenile salmon migrating seaward. The annual variations in abundance of juvenile salmon are estimated from the results of surface trawling in 4 bays which are representative of most streams on Kodiak Island. Since the sampling gear and methods developed for this work are new and have potential for widespread use, it is essential that the dynamics of the sampling be determined in order to achieve its most efficient use. Such a study will be accomplished by analysis of performance tests of the net to be conducted at Kodiak Island in conjunction with the trawling surveys. These tests will enable us to determine the variability and efficiency of the tow net.

Commensurate with the need for improving this forecast technique, the recent development of a method for mass marking salmon fingerlings by means of sprayed fluorescent pigment promises to be a valuable aid in determining mortality, migration, and quantitative abundance of young salmon. A feasibility test will be conducted at Kodiak Island to determine whether a marking program successfully can be integrated with juvenile salmon indexing studies.

Association of Pacific Fisheries  
U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0180, TAGGING SALMON IN THE OFFSHORE WATERS OF THE NORTH PACIFIC

*R.L. BURGNER*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

The main objective of the research is to study the distribution, abundance, migrations, and general ecology of the principal stocks of salmon, both Asian and North American throughout the North Pacific Ocean and Bering Sea. The tagging is part of a large scale research program being pursued by the International North Pacific Fisheries Commission (Canada, Japan, and the United States) in order to provide data to implement the terms of a tripartite treaty between the three countries. The research is coordinated with similar research by Canada, Japan and the United States. The work is also coordinated with a number of other approaches to the problem including research on methods

## 5. LIVING SYSTEMS (NON-HUMAN)

of identification by means of serology, meristic counts, morphological features and parasites. Methods used are to catch salmon of all species and age groups at sea with purse seine gear and longline gear, tag them and later recover them from the commercial fisheries around the Pacific rim. Scales are taken for age determination, and some specimens examined internally for parasites, maturity, and stomach contents. Oceanographic data on temperature, salinity and currents are collected at all fishing stations. Operations in 1967 will be directed at the migration and ecology of juvenile salmon during their early ocean residency.

The work is being performed in the Gulf of Alaska and in the Bering Sea from the United States and Canadian coast westward to 180 degrees. The project started in fiscal year 1955 and the termination date is indefinite.

SUPPORTED BY University of Washington  
U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0181, A PROGRAM FOR THE TRAINING OF STAFF MEMBERS FROM THE SCHOOL OF FISHERIES OF THE CATHOLIC UNIVERSITY OF VALPARAISO CHILE

J. LISTON, Univ. of Washington, Graduate School, Seattle, Washington 98122

In many of the protein-deficit countries of the world, the food potential of the sea has remained largely untapped because of lack of technical proficiency. Chile's 2,900-mile coastline represents a valuable fisheries resource, insufficiently exploited because of the shortage of trained manpower. To build the necessary scientific competence, the School of Fisheries, founded at the Catholic University of Valparaiso about ten years ago, has made constant efforts to develop its facilities and strengthen its curriculum. Scientific and technological studies at the School are combined with practical experience, in a four-year course leading to a bachelor's degree. In addition to academic work in fisheries technology, food processing, biochemistry, marine biology, and oceanography, its students spend at least three semesters on fishing boats and in fish canneries and a processing plant.

SUPPORTED BY Rockefeller Foundation

### 5.0182, INTERRELATIONS OF SMELT WITH NATIVE SPECIES

M.M. BAILEY, U.S. Dept. of Interior, Research Station, Ashland, Wisconsin

The smelt, which was first observed in Lake Superior in 1930, is now perhaps the most abundant species in the lake. Life history studies have shown that the smelt occupy the same areas and utilize the same food as juvenile lake trout, lake herring, and some species of chubs. Evidence also exists that the smelt has all but replaced the coregonines as the major food of the adult lake trout. The habits of the lake herring appear to be affected by concentrations of smelt in certain areas of the lake.

Present research is directed toward the interrelations of smelt and the early life history stages of lake trout, whitefish, lake herring, and chubs. Inquiry is made into the extent of predation upon eggs and larvae of other species and the degree of competition for food and space. Using commercial fishery statistics and data collected by the Bureau's research vessel Siscowet, comparisons are made between fluctuations in abundance of smelt and other species. This study may lead to other areas of research regarding the feasibility of introducing desirable species which would utilize the abundant but yet commercially unimportant smelt.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0183, CHARACTERISTICS OF LAKE SUPERIOR WHITEFISH

M.M. BAILEY, U.S. Dept. of Interior, Research Station, Ashland, Wisconsin

The drastic decline of the lake trout in Lake Superior has made the whitefish of prime importance to the economy of Lake Superior commercial fishermen. Critical examinations of the several populations in the lake are maintained to provide data for sound management and rational utilization of the species.

Periodic examinations are made of commercial landings and data are collected on size, age, sex distribution, and maturity. Assessment studies of spawning populations in western Lake Superior are conducted annually by the Bureau's research vessel Siscowet. Tagging studies currently in progress are designed to yield information on exploitation rates and homing instincts of the spawning population. Information gained from these studies may lead to recommendations for adjustments in the legal size limit for optimum utilization.

Future plans call for a comprehensive study of the early life history of the whitefish. Data will be collected on factors affecting year-class strength, survival of eggs and fry, and the distribution and habits of O- and I-group whitefish. Special emphasis will be given to the interrelations between whitefish and other species, both native and exotic.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0184, LIFE HISTORY OF THE BURBOT AND LONGNOSE SUCKER

M.M. BAILEY, U.S. Dept. of Interior, Research Station, Ashland, Wisconsin

An understanding of the biology of Lake Superior requires knowledge of the life histories of fish inhabiting the lake. The burbot and longnose sucker are abundant in Lake Superior but little is known of their role in the biological community.

Present research is directed toward life history aspects of the species--distribution, age, growth, maturity, fecundity, and food--and their interrelationships with other species. The data and materials are collected in western Lake Superior by the Bureau's research vessel Siscowet.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5B. FISH HABITATS

*Physicochemical and Biological Properties; Effects of Environment. Including Pollution, on Fish.)*

### 5.0185, PINK SALMON INVESTIGATIONS - FRESH-WATER ECOLOGY

W.R. HEARD, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Total freshwater mortality of pink salmon (*Oncorhynchus gorbuscha*) has been measured in Sashin Creek since 1940. For the average brood year, only 6 percent of the total eggs potentially available for deposition produce fry migrating to the estuary, but survival may vary between 0.2 and 23 percent. Since 1943, odd year runs have consistently produced a greater magnitude of spawners and higher freshwater survival than even year runs. Most mortality occurs between the time of egg deposition and fry emergence.

One of the goals of this research is to identify the factors causing mortality in spawning beds, determining which are density dependent and which are non-density dependent. Environmental factors including water flow and temperature, dissolved oxygen supply, gravel composition, permeability of the stream-bed, rates of oxygen removal due to decomposing organic matter and the mechanics and kinetics of spawningbed siltation, are studied in relation to mortality rates. Biological factors, including density, temporal and spatial distribution, fecundity and size of spawning adults are also measured in Sashin Creek and related to mortality rate.

Four experimental spawning channels in nearby Lovers Cove Creek provide similar natural environments where spawner density is controlled. Factors studied here, as related to spawner density, include distribution and other behavior patterns on the spawning beds, efficiency of egg deposition, egg retention and total freshwater mortality.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0186, PINK SALMON INVESTIGATIONS - INTERTIDAL ECOLOGY

J.H. HELLE, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

## 5. LIVING SYSTEMS (NON-HUMAN)

The life history and ecology of pink and chum salmon spawning in stream intertidal zones has been under study at Olsen Creek, Alaska since 1960. Olsen Creek is located in Prince William Sound where intertidal spawning by these two species is of major importance.

Research during the first four years was aimed at describing the physical changes which occur within the streambed during tide cycles; assessing the magnitude, timing, distribution and biological characteristics of spawners; and measuring rates of development and survival of eggs deposited in the various ecosystems of the intertidal zone.

On March 27, 1964, the Great Alaska Earthquake caused drastic changes in stream elevations in Prince William Sound through uplift or subsidence of large areas of land. Stream channels within the intertidal zone were most vulnerable to the effects of land changes associated with the earthquake. Olsen Creek was uplifted about four feet, resulting in a removal of 1/4 of a mile of stream channel from tidal influence and creating a new intertidal zone in a previously unexposed area.

Present research includes a continuation of the observations initiated during the first four years of study and an evaluation of the ecological changes brought about by the earthquake. In addition, laboratory research on the effects of salinity on the growth and survival of pink and chum salmon eggs and larvae is in progress.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0187, PINK SALMON INVESTIGATIONS - EARLY SEA LIFE OF SALMON

J.W. MARTIN, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Studies of the early sea life of pink and chum salmon were initiated in Auke Bay in 1962; in lower Chatham Strait in 1963; and extended throughout southeast Alaska in 1964 and 1965 as part of the Bureau's long-range pink and chum salmon research program.

Operations are based from the 58-foot research vessel M/V Heron which makes 8 to 12 day cruises throughout southeast Alaska from May to September. The M/V Heron serves as a mother-ship for Blue Boat, a 20-foot high-speed reconnaissance-catcher and has a laboratory for processing biological specimens and instruments for monitoring the sea-surface environment. Blue Boat, is equipped with a bow steering station for observations and fishing with a 100-fathom small fish round haul net. It ranges through study areas at high speed, while Heron proceeds between stations.

Additional biological investigations include: investigation of the relation of sea temperatures to survival of salmon fry; studies of the effects of water temperature on growth of salmon by raising fry in controlled saltwater temperature tanks in the laboratory; and investigation of the life histories of parasites which infect juvenile pink salmon in the sea.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0188, PINK SALMON INVESTIGATIONS - FRESH-WATER ECOLOGY

W.J. MCNEIL, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Total freshwater mortality of pink salmon (*Oncorhynchus gorbuscha*) has been measured in Sashin Creek since 1940. For the average brood year, only 6 percent of the total eggs potentially available for deposition produce fry migrating to the estuary, but survival may vary between 0.2 and 23 percent. Other studies have revealed that mortality occurs mostly between the time of egg deposition and fry emergence.

One goal of research conducted at Little Port Walter is to identify the factors causing mortality in spawning beds, determining which are density dependent and which are nondensity dependent. (Environmental factors including water flow and temperature, dissolved oxygen supply, and gravel composition and permeability are measured and related to mortality rate.) Biological factors, including density, temporal and spatial distribution, and size of spawning adults are also measured and related to mortality rate.

Another research goal is to develop a better understanding of the factors responsible for ecological change in spawning beds. In this regard, we are investigating rates of oxygen removal due to decomposing organic matter and the mechanics and kinetics of spawningbed siltation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0189, SILVER SALMON STUDIES IN THE RESURRECTION BAY AREA

S.M. LOGAN, State Dept. of Fish & Game, Juneau, Alaska

Objectives: (1) To collect and analyze biological data concerning the distribution, abundance and timing of adult and out-migrant silver salmon smolts in the Resurrection Bay area. (2) To determine the age composition of adult and juvenile silver salmon smolts. (3) To determine the sport harvest of silver salmon in Resurrection Bay and natural mortality in salt water. (4) To investigate the fresh water environmental limitations on juvenile silver salmon in this area. (5) To determine the methods and means of increasing or extending the fresh water spawning and rearing areas of the watershed and mitigating fresh water mortality. (6) To determine the reinfestation rate of non-salmon species in rehabilitated Bear Lake. (7) To provide recommendations for the management of silver salmon in these waters and direct the course of future studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0190, INVESTIGATION OF SPAWNING GROUND POTENTIALS AND GROWTH AND SURVIVAL OF JUVENILE SOCKEYE SALMON IN FRAZER LAKE SYSTEM

W.R. MEEHAN, State Dept. of Fish & Game, Juneau, Alaska

The objectives of this phase of the project are:

- 1) To evaluate spawning ground potentials of Frazer Lake in terms of quantity and quality of available gravel.
- 2) To determine present utilization of spawning areas by tagging upstream-migrant sockeye adults at Dog Salmon weir, and observing their distribution on spawning tributaries of Frazer Lake.
- 3) To enumerate and sample downstream-migrant sockeye salmon to obtain data regarding age, size and timing of smolts in the system.
- 4) To obtain preliminary limnological information concerning productivity of the lake itself, in terms of physical characteristics and plankton abundance and distribution.

A weir will be installed in the Dog Salmon River (outlet of Frazer Lake) in early May 1965. Smolt sampling and enumeration will continue until the migration ceases.

Adult spawners will be enumerated and tagged as they enter the system, from early June through their migration, and spawning ground surveys will be made during July and August of 1965 to determine utilization of spawning areas and related factors.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0191, RESTORATION AND REHABILITATION OF EARTHQUAKE DAMAGED PINK AND CHUM SALMON STUDIES IN PRINCE WILLIAM SOUND

P.S. ROYS, State Dept. of Fish & Game, Juneau, Alaska

Major Overall Objectives: (1) Restoration of earthquake destroyed pink and chum runs in Prince William Sound. (2) Rehabilitation of spawning areas where production has been seriously curtailed.

Initial Objectives: (1) Biological and Engineering studies on 12 major streams in the subsided zone and 43 major streams in the uplifted zone. (2) Monitor streams to which restorative measures were applied during June 1967.

Procedures: (1) Engineering studies of priority streams to determine drainage area; maximum-minimum volumes of flow; flow velocities; bottom composition; bed load; contours; profiles; cross-sections; silt content; and rate of erosion followed by topographic mapping of study sections. (2) Biological studies of pri-

## 5. LIVING SYSTEMS (NON-HUMAN)

ority streams to determine spawning areas utilized by brood distribution within predetermined zones; measurements of spawning areas utilized; lost and gained; sex ratios; egg retention; scale samples; temperature; pH; subsequent egg deposition; and sequential fry production.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0192, MONITORING THE EFFECTS OF LAND USE ON SALMON PRODUCTION

T.C. HOFFMAN, State Div. of Comm. Fisheries, Juneau, Alaska

Objectives: To compliment and extend the presently established joint monitoring effort of the U.S. Forest Service and the Alaska Department of Fish and Game in order to determine if stream changes due to logging and other causes occurred and to what extent these changes effected the potential of these streams to produce salmon fry.

Characteristics Monitored: (1) Composition of streambed spawning areas. (2) Streamflow and water temperature. (3) Stream channel configuration and amount and kind of debris in the stream. (4) Classification of soil types in the watershed. (5) Sources of sediment. (6) Production of salmon fry and survival. (7) Assessment of adult salmon escapement.

Characteristics studied prior and subsequent to land use and observations taken yearly.

The studies to date have been a cooperative venture between the U.S. Forest Service and the Alaska Department of Fish and Game with each agency responsible for part of the work. The study is primarily to establish a base for management action and is presently being conducted in one important salmon producer in Southeastern Alaska and will be extended to three with special reference to logging and road building.

Procedures: For those characteristics monitored by the Alaska Department of Fish and Game as described in Fisheries Research Institute, University of Washington Field Manual dated 17 February 1964.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Alaska State Government

### 5.0193, THE ROLE OF THE SENORITA, OXYJULIS CALIFORNICA, AS A CLEANING ORGANISM

E.S. HOBSON, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

In the investigation of this cleaner fish, an attempt is being made to assess its role in maintaining the health of inshore sport fishes. It has been widely contended that most of the better inshore fishing locations in southern California are, in fact, cleaning stations, where sport fishes, and other species, are concentrated to have ectoparasites and diseased tissue removed by this cleaner. Our work is designed to better understand this phenomenon, and to evaluate its significance to the sport fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0194, ECOLOGY OF THE KELP FORESTS

E.S. HOBSON, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

This program attempts to determine relationships between sportfishes and their environment in this extremely important, but rapidly diminishing California marine habitat. Emphasis is on feeding and other aspects of behavior in relation to time of day and night.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0195, LIFE HISTORY OF BILLFISHES

G.B. TALBOT, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

OBJECTIVE: To determine age, growth rate by sexes, food habits, spawning period and spawning location, and catch statistics of striped marlin and Pacific sailfish.

PROCEDURE: Biological data will be collected from sport catches at Mazatlan, Baja California, and southern California.

Early life history data will be obtained from plankton samples and night lighting from oceanic cruises. Data on catches and catch per unit of effort will be obtained from resorts and charter boat operators.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0196, PELAGIC SHARKS OFF SOUTHERN CALIFORNIA

G.W. BANE, Univ. of California, Graduate School, Irvine, California 92664

This equipment will be utilized as the primary research vessel for a study of the pelagic sharks off Southern California. The objectives of this project are: the identification of those species found in this offshore region of the Northeast Pacific Ocean; the seasonal and annual population variations; and the environmental factors influencing the abundance and distribution of these pelagic species. Detailed life history studies will also be undertaken for the more prevalent sharks encountered.

As a personnel menace, sharks constitute a severe morale problem. By studying the fundamental factors that effect and/or govern the distribution of sharks and other animals, one can gain knowledge that can be used to develop more effective techniques and concepts of personnel protection.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0197, FISHERY FORECASTING - TEMPERATE FISHERIES

G.A. FLITTNER, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

This continuing project seeks to gain an understanding of the relation between fish stocks and their environment which will serve as a basis for predicting time and space fluctuations in the availability of fish resources.

Sea-surface temperature charts for the eastern Pacific have been issued monthly since January 1960 and 15-day charts for the region adjacent to the U.S. west coast have been issued from April through October every year since 1960. Source of the temperature data is the ESSA-Weather Bureau's marine synoptic weather observations collected from cooperating ships at sea; about 12,000 individual observations are obtained monthly. The charts have been highly successful and useful to tuna fishermen and to oceanographers and other marine scientists studying circulation features in the Pacific.

By-products of the weather summary program derived by using the computer at the University of California at San Diego, include the following: average sea temperatures (degrees F) by 2-degree squares; average sea temperatures (degrees C) by 5-degree squares; barometer averages (mb) by 1-degree squares; average meridional and zonal wind vectors (kts) by 1-degree squares; average wind velocity (kts) by 1-degree squares; and oceanic heat budget data (cal/sq cm/day) by 5 degree square.

The present system acquiring real-time oceanographic and meteorological data from other Federal agencies has worked well and we plan to improve this system further by use of automatic data processing equipment. Future plans are to extend the forecasting service to other fisheries in the temperate fisheries zone--the salmon trolling fishery off northern California and the wetfish fishery out of southern and central California ports.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0198, LOCAL FISHERY SYSTEMS DEVELOPMENT

F.H. HESTER, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

The purpose of this project is to identify and develop new or underutilized fishery resources in California. Presently underway is a new basking shark fishery for the extraction of squalene from their livers. Investigation is continuing of the pandalid shrimp resources of the continental slope and of the canyons across the continental shelf in southern California in cooperation with the California Department of Fish and Game. Also under investigation is the possibility of introducing the small floating longline for broadbill and other swordfish to the California fishery, presently worked by small harpoon boats.

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0199, SPORTFISH YIELD OF NATURAL REEFS *D.J. MILLER*, State Dept. of Fish & Game, *Menlo Park, California*

Objectives: To determine the yield in numbers and by weight of all species of fish taken by sport fishermen from two heavily fished reefs in Monterey Bay. Additional data on the movement by species, time of year, and size of fish from these reefs to adjacent reefs will be gathered. Effects of kelp canopy removal on fish density and distribution will be determined on the Monterey Reef area.

Procedure: Reef yield procedures will include an intensive sport catch sampling program at Monterey and Capitola as well as tagging and trapping procedures on the reefs under study. The catches at these ports will be separated as to reef area of origin. Rewards will be given for fish returned with the tag intact. All species will be captured by hook-and-line or with traps using the project's 18-foot skiff. Scale samples will be taken from all fish released, for supplemental age and growth information.

Work Schedule: Effects of kelp canopy removal of giant kelp (*Macrocystis*) and bull kelp (*Nereocystis*) on resident fish populations (both juvenile and adult) will be determined on the reef area under study near Monterey. Underwater observations by SCUBA divers, photography, and trapping procedures will be used to determine density, distribution by species, and size of fish.

Comparisons of fish density-distribution will be made before and after cutting operations. Continued periodic observations will be made over several seasons in this experimental area.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
California State Government

### 5.0200, SCRIPPS TUNA OCEANOGRAPHY RESEARCH PROGRAM

*M. BLACKBURN*, Univ. of California, Graduate School, *San Diego - La Jolla, California 92038*

The Scripps Tuna Oceanography Research program has received practically all of its support from the Bureau of Commercial Fisheries through a continuing contract beginning in 1957. The purpose of this investigation is to increase the knowledge and understanding of physical, chemical, and biological conditions in the eastern tropical Pacific; to use this information to understand changes in availability of tuna in areas where a fishery now exists; and to identify areas into which the fishery for skipjack tuna might expand.

Since tuna spend their entire life on the high seas, their behavior is greatly influenced by changes in the oceanic environment. Research in this program, therefore, has centered on such subjects as the relation between tuna and temperature, between tuna and the distribution of their food organisms, primary production, and wind-caused upwelling. The STOR group has described and charted oceanographic properties and features of the eastern tropical Pacific which have been shown to be tuna-connected and has begun the charting of chemical nutrients and micronekton samples taken on the EASTROPAC expeditions (1967-68). Other accomplishments of the program in tuna ecology are as follows: Experimental studies on the effects of various physical and chemical conditions affecting the growth of phytoplankton, generalized summaries of oceanographic information of regions of present or potential tuna catch, analysis of time series of property measurements, studies of the El Niño current system, evaluation of galatheid crabs as a potential fishery resource, studies of the distribution of pelagic mysid shrimps, and food chain studies.

From the beginning of the program to the present time, STOR members have published 70 scientific papers; in addition 7 are in press or have been submitted for publication.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0201, LOCATION OF INSHORE SPAWNING AREAS *W.A. LUND*, State Board of Fish. & Game, *Hartford, Connecticut*

Objective: To determine the location of inshore spawning areas.

Procedure: Ripe bluefish are found in Long Island Sound during the latter part of July, and the spawning area for these fish is not known. A concentrated plankton sampling program should determine whether bluefish spawn in the sounds off Connecticut.

The problem of ctenophores clogging the nets might not exist in future tows. If it does, samples can still be obtained in Block Island Sound and perhaps in the western end of Long Island Sound. Last year no attempt was made to sample these areas or to attempt to determine the extent of ctenophore abundance. A concentrated effort was made in the offshore area where positive results were being obtained.

It is proposed to begin sampling the inshore areas during the first week of July. Sampling will continue on a biweekly basis until bluefish larvae are obtained. Once positive evidence has been gathered, a concentrated effort will be made to determine the extent of inshore spawning. Samples will be taken, when possible, throughout Block Island and Long Island Sounds.

The nets to be used will be the type which have proved to be successful in catching larval bluefish in offshore waters.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Connecticut State Government

### 5.0202, POTENTIAL FISHERY FOR RIVER HERRINGS IN CONNECTICUT RIVER

*W.A. LUND*, State Board of Fish. & Game, *Hartford, Connecticut*

During 1966, basic information will be gathered on the time and duration of the run of each species of *Alosa* (with the exception of *Alosa sapidissima*) which enters the Connecticut River. Physical data will be gathered and temperature will be constantly monitored near the mouth of the river. The entering adults will be sampled with gill nets and lengths, weights and sex will be recorded. Scale samples will be taken for age determination. This sampling will continue periodically during the entire run. The techniques worked out and the basic data gathered at this time will be used to plan a more intensive study to be conducted in 1967 and 1968.

A survey will be made to ascertain the major spawning areas of each species. This area will be sampled with gill nets, seines and plankton nets to determine the species present and if spawning has occurred. Physical and chemical data will also be collected at this time.

This preliminary survey augmented by information gathered on the other sub-projects should enable us to design an intensive survey which will be carried out in 1967 and 1968.

The laboratory facilities of the University of Connecticut, Marine Research Laboratory will be utilized for this sub-project.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Connecticut State Government

### 5.0203, FARMINGTON RIVER SHAD STUDIES

*W.R. WHITWORTH*, Univ. of Connecticut, Agricultural Experiment Sta., *Storrs, Connecticut 06268*

Objective: To determine the ability of a section of the lower Farmington River (1) to provide a migration route for American shad and anadromous salmonids, and (2) to hatch and rear eggs and young of the above fishes.

Procedure: Various points will be periodically sampled for plankton, bottom fauna, fish (eggs, larvae, and adults), selected chemical and physical characteristics, and a water-sample taken back to the laboratory for routine bioassay. Data will be compared by analysis of variance and graphically.

SUPPORTED BY Connecticut State Government

### 5.0204, FEEDING HABITS OF ATLANTIC TUNAS AND NEKTON ECOLOGY

*A. DRAGOVICH*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., *Miami, Florida*

Objectives: 1. To investigate and describe the feeding habits of Atlantic tunas. 2. To describe the distribution of components of the nekton community of the tropical Atlantic upon which tunas prey. 3. To investigate and describe the dynamics of the tuna forage nekton community and the ecological relationships

## 5. LIVING SYSTEMS (NON-HUMAN)

between these organisms and measurable environmental variables. 4. To investigate how environmental variables relate to, and have an effect upon the distribution of tuna forage nekton.

Once the important food species are identified, attempts will be made to sample them by an adequate sampler and synoptically observe environmental features. Through this synoptic approach the ecological relationships between the organisms and their environment will be studied and described.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0205, STRUCTURE OF THE FISH FAUNA OF A FLORIDA CORAL REEF

W.A. STARCK, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The project involves three phases. The first is preparing maps of the topographic features and bottom types of the study area. The dominant sessile organisms associated with each bottom type will also be described. The second phase is a phylogenetic presentation of the fish species found in the area. Information on general behaviour, habitat, size, color pattern, feeding habits, nocturnal behaviour, and various other information when available will be given for each species. The third and final phase involves putting together information from the first and second phases. Various characters of the fish species involved will be related to the distribution of the species in the environment and will also be related to the presence or absence of other associated characters. This work is the culmination of eight years of past effort in the study area and varying portions of the three phases are already complete.

SUPPORTED BY U.S. National Science Foundation

### 5.0206, EFFECTS OF MARSH MANAGEMENT STRUCTURES UPON FISHES

W.G. PERRY, Rockefeller Wildlife Refuge, Grand Chenier, Louisiana 70643

More and more people are trying to get maximum yield from their lands. This has led to gradual draining, channelization and drying of many acres of prime marsh land. It is a known fact that these estuaries are not only valuable for waterfowl but are important nursery areas for the bulk of our fish and shell fish. Three of the most commercially involved species are menhaden, shrimp and crabs. In order to slow down this steady draining of water from our marsh, various water management structures have been devised. Among the most common are dams, weirs, and controlled flow gates.

This project is intended in order to be able to better understand the effects of the continued use of these structures upon our fisheries.

SUPPORTED BY Louisiana State Government

### 5.0207, CHEMICAL AND PHYSICAL DATA

W.J. LORIO, State Wildlife & Fish Comm., New Orleans, Louisiana

Objective: 1. To determine if any correlation exists between the abundance of various game fish populations and the salinity of the water. 2. To determine the abundance of fish present with relation to tides, turbidity and water temperatures.

Procedure: When fish populations are sampled, salinities will be taken with the aid of a field hydrometer kit. Other field chemistries will include determinations for carbon dioxide and carbonate and bicarbonate alkalinity. At the same time, secchi disc reading will be made at each station and a water sample collected to be read later using a Jackson Turbidimeter in the New Orleans Laboratory. Chloride determinations will be made. This procedure will be followed in each fish population sampling area. Tide direction will be noted and recorded at each sampling station.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Louisiana State Government

### 5.0208, ABUNDANCE AND AVAILABILITY OF PRE-RECRUIT HERRING

J.J. GRAHAM, U.S. Dept. of Interior, Biological Laboratory, Boothbay Harbor, Maine 04538

This project is concerned with the ecology of larval and juvenile herring, *Clupea harengus* (Linnaeus), in the coastal waters of the Gulf of Maine. The purpose of the study is to determine trends in the distribution and abundance of the early life history stages of herring and their relation to variations in the environments. Biological and physical observations are to be taken concurrently along the coast from Cape Ann to Grand Manan Island, and the Sheepscot-Boothbay Damariscotta region of Maine. Biological collections involve larvae, small fishes, adult fishes, and plankton. The corresponding collecting gears are Gulf III sampler, Boothbay Depressor trawls, and otter trawls. Physical measurements are to be made of temperature, salinity, transparency, and currents involving bathythermograph and Nansen bottle casts, photometer lowerings, and release of drift bottles and sea bed drifters. To ascertain the movements and migration of pre-recruit herring, exploratory cruises will include estuarine situations and some gear development will be undertaken for specialized sampling.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0209, THERMAL PREFERENCES OF MARINE FISHES AND INVERTEBRATES

D.W. BRIDGES, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Introduce marine fishes and invertebrates into experimental aquaria or tanks having temperatures similar to the natural environment of the organisms. By altering substrates, lighting, etc., attempt to determine normal patterns of behavior and response in a particular temperature regime; compare the activity in experimental aquaria with that observed in the field. Then manipulate temperature so that vertical and horizontal gradients or thermal regimes are established; observe behavior which occurs concomitant with alteration of established temperature in order to determine if thermal preferences or optimal temperatures exist.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0210, EFFECTS OF HOT WATER MASSES ON MARINE FISHES

D.W. BRIDGES, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

After conditioning a group of fish to approach a feeding station on cue, introduce different hot water strata between the fish and the food source to determine the effect of water temperature on modifying their behavioral responses.

We will measure the rate of fish passage through heated water to determine at what level temperature may act as a barrier. Experimental animals will include forms commonly found in the Cape Cod area. Techniques will be developed which can be adapted to similar studies for evaluating effects of thermal effluents anticipated in other coastal areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0211, INFLUENCE OF THE PHYSICAL ENVIRONMENT ON DISTRIBUTION OF YOUNG STAGES OF COASTAL GAME FISH

R. STONE, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

The fate of critical young stages of coastal migratory fish is governed largely by conditions of the physical environment. Physical measurements of the continental shelf waters will be concurrent with the collection of ichthyoplankton (see 2541-01- in an attempt to relate the distribution of young stages of fish to physical conditions in the environment. Hydrographic stations will be made on each of eight cruises from Cape Cod, Mass., to Cape Lookout, N.C., along 14 transects. Observations will include temperature, salinity, oxygen content and turbidity. Drift bottles and bottom drifters will be released at each station.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0212, HYDROGRAPHY, SEDIMENTATION AND CHEMICAL ASPECTS OF THE REEF ENVIRONMENT

R.B. STONE, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Measure selected parameters of the physical environment surrounding the reef materials to determine how these factors relate to the distribution of fish on the reef site. Divers will determine and record the following: speed and direction of current flow, rate of scouring or sedimentation, alignment and height of ripple marks, bottom type and water transparency at surface and bottom. Standard shipboard methods for measurement of temperature and salinity will be used to determine vertical and horizontal gradients of temperature, salinity and density.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0213, ESTUARINE BIOLOGY--RESPONSE OF LARVAE TO TEMPERATURE AND SALINITY

R.M. LICHTENHEK, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Atlantic menhaden hatch in the ocean and migrate into shallow estuarine nursery areas as larvae. The effect of temperature and salinity on survival may be a determining factor in year class size. Field observations have shown that low temperatures delayed entry of larvae into the estuary from the ocean and after establishment in the nurseries, caused massive mortalities. Laboratory experiments were conducted to determine the lethal temperatures. Preliminary findings confirmed the field observations that 3 degrees Centigrade may be the lower limit at estuarine salinities.

Plans are underway to continue the laboratory work when larvae become available in January 1964. Methods consist of holding larvae at various temperatures and salinities, with and without acclimatization to lower temperatures, to determine the lethal limit of chilling.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0214, ROUTINE SAMPLING AT SEVEN INDEX STATIONS

V.C. APPLGATE, U.S. Dept. of Interior, Biological Station, Sandusky, Ohio

Early work conducted by the R/V Cisco in Lake Erie in 1957 indicated the desirability of establishing regular sampling stations in the western basin of the lake for collecting both fishery and limnological data. Relatively rapid changes in both the environment and the fisheries that were known to be occurring could only be identified and defined on a long-term basis by such a program.

In 1958 and 1959, seven stations in the western end of the lake were visited in the spring, summer, and fall. Since 1960, only the summer visit to each station has been made due to limitations of funds, personnel, and equipment.

At each visit to each station, physical and chemical limnological data and plankton and bottom samples are collected by conventional procedures. Larger fish are collected by trawling and fry are sought with tow nets. Limnological data and plankton and bottom samples are turned over to the Biological Laboratory's Environmental Research Unit for analysis. Fish and fry collections are retained at the Sandusky Biological Station for current and future studies. Ultimately, all fishery and limnological data will be integrated by the two groups to demonstrate relationships that may exist between them.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0215, EVALUATION OF ESCAPEMENT OF ADULT SALMON TO OREGON COASTAL STREAMS

D.G. SKEESICK, State Fish Commission, Charleston, Oregon 97420

Numbers of chinook, coho and chum salmon in spawning runs in Oregon coastal streams are counted at times of peak of activity in standard survey units to record trends of abundance of these salmon. Analysis of this information is expected to show relations of biological and environmental factors to numbers of spawning fish in these streams.

SUPPORTED BY Oregon State Government

### 5.0216, ECOLOGY OF RECREATIONALLY IMPORTANT ESTUARINE FISHES IN OREGON

H.F. HORTON, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

The first objective of this project is to provide fundamental understanding of the ecological factors which influence the abundance and well being of the recreationally important fish species in Oregon estuaries. The second objective is to develop the understanding of the ecology of the various species into recommendations for management practices for the conservation of populations of estuarine fishes. Immediate objectives are: (1) To study the movements and migrations of Oregon's estuarine fishes in relation to the factors of their environment. (2) To estimate the periodic abundance and angler yield of the various populations of estuarine fishes. (3) To study the growth and mortality factors which may influence the maintenance of populations of estuarine fishes.

Intra-estuarine and coastal movements of the recreationally important fishes will be determined by the analysis of recoveries of tagged specimens. Estimates of population size and angler yield will be determined by use of the capture-mark-release-and-recapture technique. Growth rates will be determined by scale analysis, length-frequency distributions and empirical data on length recorded at periodic intervals. Mortality factors will be determined by fecundity, longevity and angler yield data. Environmental factors as temperature, salinity, tidal cycle and associated fauna will be recorded and related to the factors listed above. Based on the relationships developed, recommendations for management will be made.

SUPPORTED BY Oregon State Government

### 5.0217, INVENTORY SURVEYS OF OREGON COASTAL STREAMS

R.E. LOEFFEL, State Fish Commission, Salem, Oregon

Purpose: To assess the value of streams for spawning and rearing of salmon and to locate fish passage obstructions.

Methods: Salmon and steelhead habitat are evaluated on coastal river systems. Records are kept of bottom composition, obstructions, observations of fish, condition of the watershed and accessibility.

Results: Approximately 2,600 miles of coastal streams have been surveyed. These surveys have provided information for stream clearance, laddering projects and planting fish.

Reports: Unpublished reports prepared and maintained on file.

SUPPORTED BY Oregon State Government

### 5.0218, SPRING CHINOOK SALMON ECOLOGY STUDY

A.L. OAKLEY, State Fish Commission, Salem, Oregon

Purpose: To study production and ecology of spring chinook salmon in an eastern Oregon stream.

Methods: Trap and enumerate upstream-migrating adult spawners and downstream-migrating juveniles to measure production. Monitor physical factors affecting production. Study behavioral activities of juvenile chinook at various stages of development in their natural environment.

Results: Trapping facilities have been constructed for capturing upstream and downstream migrants. A detailed inventory of the physical environment was accomplished for each 100-foot section in 15 miles of the study stream. Downstream-migrating juvenile salmonids have been marked for recapture at locations below the trapping facilities. The efficiency of the downstream-migrant trap is being evaluated at various stream flows by marking the fish at the trap and recapturing them after release upstream. Length and weight data were obtained from juveniles collected in the study stream by seining and electro-fishing. Spawning ground surveys are conducted annually to determine potential egg deposition and the relationship of physical factors to choice of spawning locations.

Reports: Annual Progress Reports.

SUPPORTED BY Oregon State Government

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0219, MEASUREMENT OF BIOLOGICAL FACTORS OF VARIOUS HABITATS, AND THEIR RELATION TO THE BIOLOGY OF THE COMMERCIALY IMPORTANT SPECIES

A.E. DAMMANN, Virgin Isls. Off. of The Gov., Saint Thomas - Charlotte Amal., Virgin Islands

Phase 02: Particulate matter from water samples at each station will be collected by filtration and centrifugation. Chlorophyll content of a given water volume will be determined, and incubation techniques, using C14 tags, will help determine the basic productivity at each station. Planktonic organisms will be preserved and preliminary analysis undertaken. Extensive analysis will have to await the attention of specialists at some later date. It is hoped that a relationship between physical-chemical and biological properties of water samples from the various stations can be demonstrated and related to fin fish and shellfish populations.

Arthur E. Dammann and personnel to be hired or used on a collaborative basis.

### 5.0220, STREAM IMPROVEMENT PLANNING

R. KRAMER, State Dept. of Fisheries, Olympia, Washington

OBJECTIVES: It will be the objective to catalogue river and stream obstruction which prohibit full utilization of upstream by anadromous fish. To detail site correction procedures and provide benefit-cost reports concerning feasibility of undertaking specific improvement projects.

LOCATION: Various streams in Western Washington exclusive of the Columbia River watershed, per listing provided in proposal.

WORK PLANNED: 1. Stream and river obstructions will be appraised and catalogued through the means of on site inspections. 2. Various seasonal stream flow data, photographs and necessary elevations and measurements will be utilized to provide criteria on which specific correction planning and design can proceed. 3. Biological reports will be prepared concerning species of fish to be benefited and quantities of naturally produced fish to be realized through improvements. 4. Benefit-cost evaluations will be conducted for each site. 5. Site access problems will be defined and preliminary site and functional sketches of required improvements will be provided for those sites where improvement work is recommended.

Washington State Government

### 5.0221, EFFECT OF SUPERSATURATION OF DISSOLVED NITROGEN ON MIGRATING SALMONIDS

W.J. EBEL, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Supersaturation of dissolved nitrogen in the Columbia River can be a significant factor in the survival of migrating salmonids. Measurements of nitrogen levels from the estuary to the upper Columbia River have indicated that highest levels were reached in the spring when large volumes of water were being spilled at dams. Nitrogen concentrations, which were sufficiently high to produce gas bubble disease in fish, did not equilibrate in reservoirs between dams. Migrant salmonids using fishways or passing through shallow areas that force them near the surface may suffer mortality from high nitrogen levels.

In conjunction with current fish behavior studies on the Columbia River, experiments are in progress to examine the effect of nitrogen levels on survival of migrating adult salmonids. Salmon in fishways are being inspected for evidence of gas bubble disease, and systematic searches of the river system are being made to obtain samples of moribund fish for clinical examination. Laboratory experiments are planned to determine the effects of nitrogen saturation at different pressures and temperatures on survival of young and adult salmon.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0222, RELATION OF RIVER-RUN IMPOUNDMENTS TO SALMON PRODUCTION

A.J. NOVOTNY, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

This program seeks to develop a self-sustained, mobile field laboratory, designed for maximum flexibility, which will provide a working base for unlimited aquatic environmental studies in navigable impoundments, and eventually in marine bays and estuaries. Primary emphasis is being placed on studies related to changes in the environment induced directly or indirectly by human activities and the effects of these environmental changes on salmon. These studies will include on-site experimental control of water quality to determine the feasibility of 'carrying' salmon through critical phases of their life cycle in river-run impoundments. Parameters of control include temperature, filtration, sterilization, dissolved gases, and waste products.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0223, JUVENILE MIGRATION RATES

H.L. RAYMOND, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

This project is aimed at assessing the effects of dams and impoundments on the timing and survival of juvenile salmonids migrating to the sea. Extensive marking of fish is being done in tributary streams of the Columbia and Snake Rivers, using thermal brands. Recovery of marked fish from turbine intake gateways at dams in the Columbia and Snake Rivers and from the estuary by purse seines and beach seines is providing data on rates of movement, timing of migration, and survival of young fish in relation to the changing environment.

Information being gathered will be used to identify areas in which delays and mortalities are occurring as the result of environmental changes. These findings would then be applied to implement management practices designed to enhance survival of seaward migrating salmonids.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0224, SALMON PRODUCTION IN AREAS MADE INACCESSIBLE BY DAMS

G.R. SNYDER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Researchers will assess available spawning and rearing areas, condition of gravels, productive capacity of lakes and reservoirs, availability of re-seeding stock with desired racial characteristics, existing predator-competitor species, and demonstrate productive potential experimentally.

Prospects for successful reestablishment of salmon runs in areas blockaded by dams are to be evaluated in the light of expanding Indian fisheries and industrial developments in the Columbia Basin.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0225, PREDICTION OF ENVIRONMENT

G.R. SNYDER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

A chain of reservoirs is rapidly replacing the remaining free flowing areas of the Columbia and Snake Rivers. Freshets and floods which played a major role in the transport of fingerling salmonids to the sea are being controlled. Temperature regimes that govern rates of growth and maturation are being modified, and in the changed environment, new predator-competitor and disease relationships are being established that greatly affect the survival of the migrant salmon. Studies are in progress to predict future environments in rivers and reservoirs. Work is nearing completion on the prediction of the physical and biological environment of John Day Reservoir in the Columbia River.

Studies are under way and planned to determine the feasibility of lowering water temperatures in the Upper Columbia and Middle Snake Rivers by tapping cool waters at the bottom of lakes and reservoirs. If thermal controls carry into downstream areas of these rivers, environmental conditions for survival of salmon could be measurably improved during the hot summer

## 5. LIVING SYSTEMS (NON-HUMAN)

months. Potential benefits from timed releases of stored waters also are being evaluated in the light of proposed thermal-nuclear power developments in the Columbia Basin.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0226, EFFECTS OF INDUSTRIAL EXPANSION ON THE AQUATIC ENVIRONMENT OF ESTUARINE AREAS

G.R. SNYDER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

The Lower Columbia River and its estuary plays a critical role in the life cycle of anadromous salmonids. Each year millions of young fish move downstream from native rearing areas and artificial propagation facilities. These fish all pass through the lower river and estuary where they undergo physiological transformations in preparation for their movement from fresh to salt water. The estuary also is an important nursery area and the transition zone for marine species of fish.

Industrial expansion in this area by the thermal electric power, aluminum, and pulp and paper industries can drastically modify the environment. Forecasts indicate that over 2000 MW. of electricity (possibly 4000MW.) could be produced in the Columbia estuary by 1985. The effects of waste heat discharged from these plants could be detrimental to the overall aquatic ecology and specifically to the production of commercial species of fish. Limnological studies are planned to determine the existing ecology at sites known to have potential for industrial expansion. The effects of increases in water temperature on aquatic organisms at specific sites will be studied. Predictions of physical and biological changes will be made. The effects of the environmental changes on fish and on secondary organisms necessary for their survival and growth will receive initial emphasis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0227, WATER QUALITY AS RELATED TO SURVIVAL OF SALMON EGGS AND LARVAE

D.E. BEVAN, Univ. of Washington, Graduate School, Seattle, Washington 98122

One of the major uses of water resources in the Pacific Northwest is the reproduction of salmonid fishes. Previous work has shown that water quality is of major importance in the success of salmon reproduction. The project will investigate the suitability of spawning areas in the Snohomish River drainage and measure the mortalities of eggs and larvae. Observations will be made to relate other uses of the water resource to water quality and water quality changes will be directly related to salmon embryo mortality. Water quality will be measured both in the stream flow and the sub-surface flows within the gravel by observing flow rate, oxygen content, pH, alkalinity, and the presence or absence of some of the more common insecticides.

### 5.0228, STUDIES OF SOCKEYE SALMON, ONCORHYNCHUS NERKA, IN THE NUSHAGAK DISTRICT, ALASKA

R.L. BURGNER, Univ. of Washington, Graduate School, Seattle, Washington 98122

The project is a long-range comparative study of the sockeye producing lake systems in the Nushagak District of Bristol Bay in Southwestern Alaska. Studies are made of the spawning and nursery area capacities of the lakes, the growth, abundance and survival of young salmon in relation to parent population density, the ecological and interspecific relationships, and the limnology and food chain dynamics of the lake systems. Effects of the selective commercial gill net fishery on the salmon population dynamics are also under study.

Association of Pacific Fisheries

### 5.0229, MEASUREMENT OF SPAWNING SUCCESS AND FRY QUALITY OF CHUM SALMON UTILIZING A SPAWNING CHANNEL AT BIG BEEF CREEK, WASHINGTON

E.O. SALO, Univ. of Washington, Graduate School, Seattle, Washington 98122

The proposed work will include the improvement of the existing spawning channel, dikes, ponds and laboratory. The improvements include (1) additions to the walls of the channel, (2) addition of selected gravel, (3) reinforcement of dikes, (4) improvement of instrumentations and techniques in the laboratory for the measurement of fry and fingerling quality.

The schedule calls for the channel and ponds to be completed by August 1, 1968 to accommodate the early spawners. The work will be contracted. The location is the same as described in the original proposal. Principal and co-investigator are (1) Professor Ernest O. Salo and, (2) Predoctoral Associate, K. Victor Koski. Additional biologists include one Master of Science candidate.

## 5C. FISH PHYSIOLOGY-BIOCHEMISTRY

### 5.0230, DIURNAL-NOCTURNAL ACTIVITY OF THE QUEENFISH, SERIPHUS POLITUS

E.S. HOBSON, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

The habits of this croaker provide insight into factors influencing schooling, vocalizing and other behavioral characteristics of inshore fishes. Work is limited to the months May-September, when this fish is present inshore. During this period underwater observations made at all hours of day and night, along with analysis of digestive-tract contents and recordings of vocalizations by the croaker and incident-light measurements provide the data upon which this study is based.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0231, MOTIVATIONAL ANALYSIS OF COURTSHIP BEHAVIOR

G.W. BARLOW, Univ. of California, Graduate School, Berkeley, California 94720

This grant is for the continuation of studies conducted under GB-5314. For the past decade, the investigator has been interested in the behavior of the cichlid fish, with the general approach being ethological in nature. An important part of the present proposal is to analyze aggressive, and courtship behavior in this species. An interrelationship between the two behavior patterns is noted in that aggressive behavior of the male toward the female first takes place followed by courtship and mating. Animated models will be used, with early work devoted to an examination of the role of basic variables involved in the presentation of the model itself. Subsequent studies will examine those stimulus conditions which influence aggressive as well as courtship behavior. Physiological indices, i.e., tissue changes found in the gonads and pituitary, will be correlated with behavioral changes.

SUPPORTED BY U.S. National Science Foundation

### 5.0232, EXPERIMENTAL STUDIES OF BEHAVIOR IN A CICHLID FISH

G.W. BARLOW, Univ. of California, Graduate School, Berkeley, California 94720

Brief Description of Research Project: This grant is for the continuation of studies conducted under GB-2210 at the University of Illinois.

Cichlid fishes are ideally suited for studies relating sexual and parental behavior. Pair bonds persist, facilitating joint parental care. The female may be active in courtship, permitting a precise comparison of male and female behavior. Furthermore, cichlid fishes have relatively indeterminate growth. Sexually mature animals are thus available over a wide size range (up to four fold

## 5. LIVING SYSTEMS (NON-HUMAN)

in weight in the orange chromide), affording a unique opportunity to separate the influences of sex and size (dominance).

Under the current grant some information will be sought to clarify earlier findings on the effect of size on courtship, using artificial fishes to determine the specific parameters involved. Particular attention will be directed toward the parental phase. Egg-fanning will be resolved into its components and related to hostile, digging, and retrieving activities. To facilitate the analysis of retrieving, bubbles will be substituted for the eggs and larvae. The bubble carrying response will also be investigated to clarify the role of experience in developing the response, and to analyze the build-up and decay of a partially inborn response to a stimulus to which the fish do not habituate.

SUPPORTED BY U.S. National Science Foundation

### 5.0233, FUNCTION OF THE INTERRENAL GLAND IN TELEOST FISHES

H.A. BERN, Univ. of California, Graduate School, Berkeley, California 94720

This study is a continuation of work on the pituitary-interrenal axis of *Tilapia mossambica* and its regulation to osmoregulation. The effects of various experimental manipulations on quantitative and qualitative aspects of in vitro corticosteroid production by the interrenal-containing head kidneys of *Tilapia* are being studied, this work being directed toward eventual utilization of in vitro secretion as an index of in vivo interrenal activity. Analyses of corticosteroids in *Tilapia* plasma and of possible steroidal secretory products of the Stannius corpuscles are also being carried out.

Morphologic responses of interrenal, adenohipophysis and Stannius corpuscles to changes in environmental salinities and other conditions are being investigated, using mean nuclear diameter as an index of activity. Osmoregulatory responses of *Tilapia* to hormone administration or deprivation are also under study. The effects of prolactin and of hypophysectomy on osmolality of *Tilapia* plasma under conditions of osmotic stress are being examined, and parallel experiments using interrenal hormones or ACTH alone and in combination with prolactin are being undertaken.

Comparative studies in these areas are being conducted on other teleosts. In particular, analysis of steroids and measurements of interrenal and adenohipophysial activity in relation to environmental salinity are being carried out in *Mugil* species at the Stazione Zoologica of Naples.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0234, CELL TRANSFORMATIONS, DIVISION, AND MOTION

D. MAZIA, Univ. of California, Graduate School, Berkeley, California 94720

In summarizing this program by 3 faculty members and 27 predoctoral and postdoctoral associates, only the main lines of study can be indicated. These are (1) the investigation of the subunits of microtubules and their assembly; (2) the interaction of colchicine and other antimitotic agents with structure proteins; (3) the structure proteins of motile systems other than cilia and the mitotic apparatus, especially amoeboid systems; (4) the active role of surface processes in cell association in very early development; (5) nucleoproteins as primers for nuclear DNA polymerase; (6) characterization of an RNA that turns over rapidly in the nuclei of sea urchin embryos during early development; (7) structure of chromatin in sea urchin embryos; (8) the role of cell interaction in the control of hemoglobin synthesis in the chick; (9) the regulation of d-amino levulinic acid synthetase in the activity of the chick embryo; (10) biochemical changes accompanying muscle cell fusion and differentiation, including studies of (a) synthesis of myosin, (b) synthesis of DNA, (c) levels of DNA polymerase, (d) levels of RNA synthesis.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0235, EXPERIMENTAL ANALYSIS OF HEARING AND ACOUSTIC ORIENTATION IN SHARKS

D.R. NELSON, Calif. State College, Graduate School, Long Beach, California 90804

The objectives of this project are the determination of hearing thresholds in sharks and the accuracy of directional hearing at different frequencies, as well as an experimental analysis of the parameters and receptive system employed in this directional hearing. Precise acoustic pressure and displacement measurements will be utilized in conjunction with conditioned response methods in both the laboratory and field portions of these studies. The natural behavioral patterns of unconfined sharks in their responses to sounds will also be investigated by means of a field playback and observation system, and related to the controlled laboratory segments of the project.

Knowledge of the environmental clues perceived by and used by marine animals in their orientation, food and mate hunting, and obstacle or enemy avoidance can provide valuable information of use in Naval operations. Additionally, in order to develop an effective shark repellent and in order to develop survival techniques for protection in shark infested waters, it is necessary to learn as much as possible about the factors in the sharks' environment to which it responds.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0236, GERMFREE FISH

M.D. APPLEMAN, Univ. of Southern California, Graduate School, Los Angeles, California 90007 (NONR)

The objectives of this work are the maintenance and expansion of transient germ-free colonies of tropical fish *Xiphophorus helleri*, and the possible establishment of a permanent colony. Investigation of physiological, anatomical, and immunological characteristics of the germfree vs. the conventionally reared fish will be continued. Determination of specific modes of microbial pathogenesis by selective contamination of the germfree environment will be sought.

This research in marine host-parasite relationships will increase our knowledge of the anatomical, physiological, and immunological responses of poikilothermic animals, contribute to our basic knowledge on (1) the effect of the germfree state on the individual animal as well as the group of animals and (2) the possible role of marine vertebrates as vectors in the transmission of human parasites.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0237, STUDIES IN THE PHYSIOLOGY AND BIOCHEMISTRY OF DEEP-SEA FISHES

M.S. GORDON, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The question under study is: What is the nature of the effects of high hydrostatic pressures, such as occur in the deep oceans, on the metabolism of deep-sea, as compared with shallow-water, marine fishes? Deep-sea fishes are hard to keep alive, hence work is presently centered on tissue studies -- primarily muscles and liver. Measurements of oxygen consumption are being made on tissue preparations from a wide range of warm and cool water shallow-water species, and on a number of mesopelagic species. These measurements take into account interactions between several factors: hydrostatic pressure (to 800 atmospheres), temperature, phylogenetic position of species, body size, activity patterns of species, environment of species. The project has required development of new equipment for high pressure respirometry.

SUPPORTED BY U.S. National Science Foundation

### 5.0238, VISUAL PROJECTION IN SUBMAMMALIAN VERTEBRATES

L. KRUGER, Univ. of California, School of Medicine, Los Angeles - U.C.L.A., California 90024

The organization of the retinal projection in a variety of vertebrates is being explored in topographic terms. Studies in several simple and specialized teleosts have been completed as well as in one species of reptile. Current investigations are concerned with

## 5. LIVING SYSTEMS (NON-HUMAN)

properties of single units in the reptilian optic tectum. Parallel studies have been initiated for comparing the superior colliculus of mammals, and to date, studies of the rat colliculus and pretecal group have been completed. Current emphasis is being placed on the binocular projection in the primate colliculus.

Microscopic studies of the visual pathway are being pursued along two lines. One series of experiments deals with axonal degeneration with silver and electron microscopic methods. This study establishes conclusively the purely afferent nature of the reptilian optic nerve. Other studies involve autoradiographic techniques employing thymidine-<sup>3</sup>H in regenerating optic pathways of teleosts.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0239, BLOOD CHEMISTRY OF FISHES

M.R. URIST, Univ. of California, School of Medicine, Los Angeles - U.C.L.A., California 90024

Investigations will continue into the skeleton and body fluids of the Elasmobranchii with special attention being given to species taken in deep water of 200 to 600 fathoms. Analyses of the serums of cyclostomes and teleosts taken in the same locations in deep water will be made for controls. By use of X-ray and fluorescent examination techniques, research will be conducted on the secretion of enamel and the basic biology of vertebral formation in deep water sharks, as well as the morphology and identification of different types of vertebra. Complementary studies will be continued on tissue transplants and bone repair in sharks, as well as blood calcium studies in cyclostomes, sharks, and bone fishes.

This is part of the program in Hydrobiology concerned with the adaptations of marine organisms to life in the sea. Naval problems caused directly or indirectly by biological organisms, such as fouling forms, sonic forms, and other pests, require for their solution a thorough knowledge of the natural conditions of life of the organisms necessarily acquired for life in the sea.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0240, BIOLOGICAL TRANSPORT OF GASES AND OTHER SUBSTANCES

T. ENNS, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Transport of dissolved CO<sub>2</sub> and bicarbonate ions in cells and across cell membranes, particularly the facilitation of such transport by carbonic anhydrase, is being measured. Studies are being extended from mammalian red cells to other animal and plant cells. In vitro studies of the carbonic anhydrase facilitation of CO<sub>2</sub> transport are also being conducted.

Relative renal excretion patterns of urea, creatinine, water and electrolytes in kidneys of elasmobranch fishes are being obtained. These will yield new information regarding the renal handling of urea. This will be correlated with the handling of CO<sub>2</sub> and bicarbonate ions in an attempt to examine the possible role of carbonic anhydrase in kidney function.

Transport of labeled water, electrolytes, and other substances across the gills of elasmobranch and teleost fishes is being studied. The data will be compared with those obtained in mammalian lungs by the same methods.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0241, PHYSIOLOGICAL STUDIES ON FISHES LACKING HEMOGLOBIN

E.A. HEMMINGSEN, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The University of California, San Diego, proposes to continue investigating the physical adaptation of animals inhabiting polar regions by extending studies begun under GA-272 at McMurdo Station, Ross Sea, to the region about Palmer Station, Antarctic Peninsula.

The work involves catching fish of the family Chaenichthyidae which are characterized by an absence of hemoglobin for live specimens which will be needed in laboratory experiments to be conducted in the biolaboratory at Palmer Sta-

tion. Experiments include metabolic and respiratory studies to determine the oxygen consumption in terms of environmental oxygen tension and temperature. Attention will be given to the efficiency of the gills and importance of cutaneous respiration. The oxygen-carrying capability of the circulatory system will be assessed by measurements of arterial and venous oxygen tensions of blood volume, heart rate and capillarization of skin and tissue. Comparative measurements will be carried out on other fishes possessing hemoglobin.

The field work will be completed at Palmer Station during austral 1967-68 by the principal investigator and one assistant. Assistance of USCGC Southwind's small boat in fishing operations is required. Laboratory facilities at the station are suitable to the experimental requirements of this proposal.

SUPPORTED BY U.S. National Science Foundation

### 5.0242, CYTOTAXONOMIC STUDIES OF TELEOST FISHES

A.W. EBELING, Univ. of California, Graduate School, Santa Barbara, California 93018

This investigation is for continuation of the research initiated under NSF grant GB-4277 for studies on the cytology of deep-sea fishes.

Recent comparative studies of shallow marine and freshwater fishes have strengthened hypotheses to be further tested during the proposed investigation: that even closely related teleosts are karyotypically distinguishable both numerically and morphologically; that most diploid numbers approximate or equal 48 with lesser numbers being the more specialized; that cytologically expressed heterogamety is widespread among teleosts and is especially prominent in deep-sea species; and that deep-sea fishes have longer, more heterochromatinized chromosomes, possibly relating to decelerated mitosis and therefore an 'economy of life' in the cold, impoverished depths. Also, as time permits, special studies of cytological sex heteromorphy in the genetically well known freshwater cyprinodontiform minnows will broaden the more general investigations of teleost heterogamety.

Generally, the aceto-orcein method of squashing hypotonically pretreated colchicized tissues will be continued in observing karyotypes of additional deep and shallow species and of the female tissues neglected in the previous investigation. Tissues other than gonadal will be more intensively treated, staining techniques will be expanded, and live specimens will be variously colchicized. Tissue culture of blood cells will be included in the regular program. Also, densitometric measurements of nuclear DNA content will be made of selected deep-sea fishes and their conordinal shallow relatives.

SUPPORTED BY U.S. National Science Foundation

### 5.0243, PARASITISM IN DEEPSEA FISHES

E.R. NOBLE, Univ. of California, Graduate School, Santa Barbara, California 93018

The aim is to characterize parasitism in a deepsea environment thru a study of a few species of fishes selected from the several faunistically distinct zones. Three hundred and thirty five hosts were examined, mostly from the mesopelagic zone. The midwater fishes have fewer parasites than epipelagic and bathypelagic species. The most common parasites are larval nematodes, and most of the protozoa (predominantly Myxosporida in the gall bladder) are found in bathypelagic fishes. Very few adult helminths are present, and most of these are hemiurid trematodes. In addition to Myxosporida the only other protozoa seen were Cryptobia in the stomachs of 4 species of hosts, and Trichodina in the stomachs of 1 species of host. The primary parasitological function of mesopelagic fishes appears to be for vertical transport of larval helminths to and from the upper pelagic and lower bathypelagic zones. The distribution of hosts and parasites is apparently independent but is influenced by the characteristics of the water masses in which they are found.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0244, REPRODUCTIVE ISOLATING MECHANISMS IN PANAMANIAN INSHORE MARINE FISHES

I. RUBINOFF, Smithsonian Institution, Balboa Heights, Canal Zone

Pairs of closely related species of fishes occur in Panama separated by the Isthmus. The ancestral populations have been separated only since emergence of the Isthmus probably in the Pliocene. This project is designed to investigate the reproductive isolating mechanisms that have evolved since this separation. The ecology and behavior of the fish is being observed in nature. Reproductive behavior is being observed in the laboratory and tests of interbreeding potentials of species pairs are being made. Artificial hybridization will be attempted in all pairs.

SUPPORTED BY Smithsonian Institution

### 5.0245, STUDY OF THE RIVER PHASE OF THE LIFE HISTORIES OF ALOSA PSEUDOHARENGUS AND AESTIVALIS

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

To study the life histories of *Alosa pseudoharengus* and *aestivalis* under the most ideal field conditions available and then utilize the results in large river systems, like the Connecticut River, where an intensive study such as this would be extremely difficult to do.

In general, it is proposed to construct a weir at a narrow section of the brook to obtain: a. The range in temperature when the fish enter the stream. b. The size composition, sex ratio and age structure of the entering groups. c. The effects of illumination on the movements of the fish to the spawning grounds. d. An estimate of the total numbers of fish entering the brook. e. An estimate of the total numbers of fertilized eggs which might be produced. f. An estimate of the mortality rate of adults on the spawning grounds by estimating the total number of fish returning to the sea. g. Fish for marking. The objectives of the mark are: 1. To establish whether it is possible to estimate total numbers of fish on the spawning grounds by a mark and recapture study. 2. To determine length of time fish remain on the spawning grounds. 3. To determine the degree of homing, and 4. if a high degree of homing is found, estimate the mortality at sea.

Part 2 of 2.

### 5.0246, STUDIES OF FISH ENDOCRINOLOGY

G.E. PICKFORD, Yale University, Graduate School, New Haven, Connecticut 06520

The objectives of this research are to enlarge our knowledge of endocrinological functions in the euryhaline teleost, *Fundulus heteroclitus*. Specific attention will be paid to the role of hormones in fresh-water adaptation, with special reference to the regulation of the blood; the regulation of thyroid function and characterization of the teleostean thyrotrophin; the separation and characterization of the teleostean growth hormone (in collaboration with Dr. A. E. Wilhelmi, Emory University); hormonal stimulation of the regressed testes of hypophysectomized fish and the nature of teleostean gonadotrophin(s); and a study of hormonal mechanisms regulating the stress response to cold shock.

SUPPORTED BY U.S. National Science Foundation

### 5.0247, EVOLUTION OF ALL-FEMALE FISHES

R.J. SCHULTZ, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The genus *Poeciliopsis*, a viviparous fish found along the Pacific slope of Mexico, is made up of approximately 16 species. In addition to these, there are 5 forms of *Poeciliopsis* that give birth to exclusively female progeny. These all-female 'species' do not reproduce without benefit of males but must rely on other species for fertilization. The mode of reproduction and the appearance of the offspring depends upon the species that provided the sperm. In some cases the young are identical to the mother suggesting that the sperm merely served as a stimulus to embryonic development; in others, the progeny share characteristics

of both parents and are true hybrids. All five forms are believed to have arisen through hybridization. It is the purpose of this investigation to determine the evolutionary pathway of these all-female fishes and to verify it by laboratory synthesis.

SUPPORTED BY U.S. National Science Foundation

### 5.0248, MARINE SPORTS FISHES RESEARCH

F.C. DAIBER, Univ. of Delaware, Graduate School, Newark, Delaware 19711

This project has been divided into different parts which include studies on the effects of temperature and salinity on the striped killifish, an analysis of the fish populations in Delaware Bay and an analysis of the hogchoker population in Delaware Bay.

The general objectives of the study on the striped killifish, *Fundulus majalis*, are to determine the salinity death point at high and low temperatures; to observe egg hatching time under varying temperatures and salinity conditions; to study the food intake; and to study the growth rate. The data is incomplete but there is evidence that this animal has a wide tolerance to temperature and salinity conditions.

Length-frequency distributions have been determined for the hogchoker, *Trinectes maculatus*, and other teleost fishes in Delaware Bay. Species, areas of concentration, variations in abundance as influenced by depth, salinity and season were recorded for different sectors of Delaware Bay.

SUPPORTED BY Delaware State Government

### 5.0249, OSMOTIC COMPONENTS IN ELASMOBRANCH BLOOD

K.S. PRICE, Univ. of Delaware, Graduate School, Newark, Delaware 19711

Levels of the major osmotic components (urea and sodium chloride) in elasmobranch blood are being determined from specimens collected from the lower Delaware Bay region. Samples will be collected in the field from fish taken from waters of naturally varying salinity over the entire range of salinity and temperature that the particular species normally experiences. Additional specimens are being subjected to controlled salinity and temperature conditions in the laboratory in order to determine the changes which occur in plasma levels of the major osmotic components due to 1) changes in external salinity and 2) changes in water temperature.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0250, BIOLOGY, MORPHOLOGY, AND EVOLUTION OF THE DISK-FISHES OR SHARKSUCKERS

E.H. LACHNER, Smithsonian Institution, Washington, District of Columbia 20560

The objectives of this study are: 1. To determine characters contributing to an understanding and interpretation of the nominal families and genera in the Order. 2. To determine the diagnostic characters in the analysis of the living and fossil species. 3. To determine the extent of differentiation of the various oceanic populations. 4. To study the hosts and the degree of specificity and association of the sharksuckers with other marine animals. 5. To correlate morphology with behavioral evolution among the species.

SUPPORTED BY Smithsonian Institution

### 5.0251, PARASITES OF PHILIPPINE FISHES

C.C. VELASQUEZ, Smithsonian Institution, Washington, District of Columbia 20560

(1) Preparation of manuscript of completed studies on trematodes and nematodes of freshwater and marine fishes. (2) Collection of more specimens for intraspecific variation. (3) Life cycle studies will be done when materials are available. (4) Studies on distribution, ecology and host-parasite relationships will be done when feasible.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0252, STOCK IDENTIFICATION OF ATLANTIC TUNAS J.P. WISE, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

An investigation of tuna population genetics by biochemical or serological means is being undertaken in the Atlantic. This study is an investigation of the genetic composition of tuna populations in the Caribbean and the tropical Atlantic by means of electrophoretic analysis of selected enzymes in tuna tissues.

Lactic dehydrogenase, malic dehydrogenase, and esterases are being studied because of their universal distribution in fish tissues, their multi-gene control, and the allelic forms of the genes, which may render these enzymes excellent tools for studies of tuna population genetics.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0253, BEHAVIOR AND SENSORY PHYSIOLOGY OF SHARKS

A. MYRBERG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (NONR)

Objective: Sharks pose a physical, as well as psychological, hazard to personnel in the sea for operational or recreational purposes. They may also cause the loss of moored and floating equipment since they are capable of biting through thick armored cable and of puncturing flotation gear. In order to develop effective shark repellents and survival techniques, it is necessary to determine the factors in the environment which the shark can perceive and which it may use in locating and identifying sources of food.

Approach: The investigator is studying and measuring the sensitivity and range of vision and audition of a variety of shark species. He utilizes behavioral, as well as physiological responses obtained by electrocardiogram, respiration rate measurements as indicators of stimulus reception. Additional mechanisms are being used to detect responses, especially to sound and light which may be more accurate and quantitative than gross behavior patterns. The Acoustic-Video Array is being used to conduct sound playback experiments with free-swimming sharks.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0254, RENEWAL RESEARCH PROPOSAL FOR HEARING AND ALLIED SENSES IN FISHES

A.A. MYRBERG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

This work will be a continuation of research begun under grant GB-8 on hearing and allied senses in fishes. The principal and immediate objective of the proposed investigation is to obtain basic information about the quantitative aspects of hearing in fishes and on the physiological mechanisms of their hearing. Such information, when accompanied by appropriate behavioral studies, should be helpful in understanding how these animals utilize acoustic energy for the detection and location of moving objects and for orientation and communications. It is expected that major emphasis will be placed on measuring the acuity and sensitivity of these senses in the initial phases of the investigation and that later phases will deal with the significance of various sounds of animal origin to fishes as well as their ability to orient to sounds of underwater origin.

SUPPORTED BY U.S. National Science Foundation

### 5.0255, IMMUNE MECHANISMS AND RESISTANCE FACTORS IN MARINE FISHES

M.M. SIGEL, Univ. of Miami, School of Medicine, Miami - Coral Gables, Florida 33124

Immunological and immunochemical studies are being conducted in fishes at several phylogenetic levels. All of these animals are capable of responding to primary stimulation with a variety of antigens. They differ, however, in immunologic memory. So far, all antibodies, regardless of the duration of immunization, have been predominantly or exclusively associated with IgM, but a search for IgG in certain species is continuing. In some of these fishes, but not in all, antibody activity is associated with a 7S moiety of IgM which is believed to be the monomer of the 19S pentamer. Although these fishes lack certain of the components of the immune mechanism of higher vertebrates their im-

mune mechanism is not readily depressed by factors and conditions known to suppress immunity in higher animals. Suppression of the primary, but not secondary, response has been obtained with 6-MP. The thymus and pronephros of two marine teleosts are directly involved in antibody synthesis. Studies on antigen metabolism and clearance are in progress.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0256, ARTIFICIAL SELECTION - FISH

D.L. COPPAGE, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

The objectives of this project are: (1) to determine if fish that survive lethal concentrations of pesticides possess some genetic factor that can be intensified in succeeding generations, and (2) to determine whether immature but rapidly developing ova concentrate proportionately more pesticide than mature ova, and to what extent pesticides affect embryonic development and hatching, or growth and vigor of the fry.

Fish surviving pesticide tests will be selectively bred to drastically alter the gene pool in favor of these individuals. We will continue this selection for as many generations as are necessary to achieve our objectives. We will also expose mature fish to radioactively-labeled pesticides to trace transport of these chemicals to specific tissues, especially reproductive. Fertilized eggs of several species of estuarine fishes will be exposed to various pesticides at different stages in embryonic development, and the responses of different age fish to toxicants will be studied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0257, LIFE HISTORY STUDY OF THE MOI, POLYDACTYLUS SEXFILIS

R.K. KANAYAMA, State Dept. of Land. Nat. Res., Honolulu, Hawaii 96813

Objectives: To study various aspects of the ecology and life history of the moi, *Polydactylus sexfilis*, with the ultimate objective of obtaining sufficient scientific information necessary for the proper management of this highly important salt water game species.

Procedure: 1. Assistance from selected sport fishermen and fishing clubs will be enlisted for the gathering of moi gonad samples and length-weight data. 2. A short manuscript on the hermaphroditic condition of the moi gonad will be prepared. Completion of the study on most aspects of the reproductive habits of this species is anticipated. 3. To obtain information on growth and migration, an intensive tagging program will be undertaken which will entail the capturing of moilii, tagging with an internal anchor tag, and the immediate release of the tagged fish. (Previously moilii were captured and reared for several months before being tagged and released). 4. Supplemental growth data will be acquired by releasing tagged moilii in several commercial fish ponds.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Hawaii State Government

### 5.0258, PROVIDE FOR ACTIVITIES OF TUNA BLOOD GROUP CENTER

K. FUJINO, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Since tunas are distributed in wide geographic areas, cooperation between national and international institutions and agencies is essential to accomplish population studies by immunological techniques. The Tuna Blood Group Center established at the Bureau of Commercial Fisheries Biological Laboratory, Honolulu, will serve as a focal point to foster this cooperative study. The Center will serve as a medium to standardize blood typing reagents and techniques thus making comparison of results produced by different institutions possible.

Recent exchange of serum specimens of skipjack and yellowfin tunas, already typed, between Tuna Blood Group Center and the Inter-American Tropical Tuna Commission, has made the identification of a genetic system in the serum transferrin component possible.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

**5.0259, INVESTIGATE PHYSIOLOGY OF TUNAS**  
*E.L. NAKAMURA*, U.S. Dept. of Interior, Behavior & Physiol. Prog., Honolulu, Hawaii 96812

The physiology of tunas is poorly understood. Knowledge of the functions of body processes of these fishes is essential to understand better the relationship of the distribution of tunas to environmental factors, their responses to variations in these factors, and the sensory mechanisms involved in these responses. Studies on the inorganic constituents of muscles and blood, on the role of red and white muscles, and on oxygen consumption by red and white muscles have been made. Some work has also been done on olfaction and on schooling behavior. Other physiological studies such as those on digestion rates, visual acuity, and auditory acuity have been made under other project titles. These studies have been made by university personnel under contract with the laboratory, by visiting investigators who were provided space and materials, and by laboratory personnel. Physiological studies in the immediate future will be made on oxygen consumption and body temperatures of tuna.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0260, STUDY OF THIAMINASE IN HAWAII FISH**  
*D.M. HILKER*, Univ. of Hawaii, Agricultural Experiment Sta., Honolulu, Hawaii 96822

1. To test for thiaminase activity in various species of fish found in Hawaiian waters. 2. To study physical properties such as pH and temperature optima, enzyme inhibitors, and separability into apo and coenzymes. 3. To carry out biological studies of thiaminase activity in fish using rats and human subjects.

This study involves the determination of thiaminase activity in fish caught in Hawaiian waters and the physiological significance of the ingestion of fish containing this enzyme by rats and human subjects.

SUPPORTED BY Hawaii State Government

**5.0261, ISOLATION OF ANTI-THIAMINE FACTORS IN HAWAII FISH**  
*D.M. HILKER*, Univ. of Hawaii, School of Agriculture, Honolulu, Hawaii 96822

The principal objectives of this project include: 1. The isolation and identification of anti-thiamine factors in the muscle and viscera of Hawaii fish. 2. The study of the stability of anti-thiamine preparations to various treatments including ionizing radiation. 3. The study of the mechanism by which anti-thiamine agents inactivate thiamine.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0262, FACTORS AFFECTING THE BEHAVIOR OF SHARKS**  
*A.L. TESTER*, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

The proposed research will include continued studies on the identification, distribution, morphology, histology, innervation, and function of superficial neuromasts and lateralis, system of sharks. As more knowledge is gained with regard to innervation and function of the sensory organs, selected stimuli will be employed in order to conduct comparisons of resting potentials as opposed to action potentials resulting from the applied stimuli.

As a personnel menace, sharks constitute a severe moral problem. By studying the fundamental factors that effect and/or govern the behavior of sharks and other animals one can gain knowledge that can be used to develop more effective techniques and concepts of personnel protection.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0263, RATE OF ABSORPTION OF ENDRIN BY BLUEGILL SUNFISH**  
*H.J. BENNETT*, Louisiana State University, Graduate School, Baton Rouge, Louisiana 70803

The purpose of this research is to determine the effects of sublethal and lethal concentrations of endrin on bluegill sunfish, *Lepomis macrochirus*, and to study the rate of absorption by the entire fish and by selected organs.

The rates of absorption will be determined by exposing bluegills for varying time intervals in a constant flow system. This system has been used in our laboratory for several years and has given more valid results than a static system. Bioassay studies have been conducted by this laboratory since 1948 with the support of the Louisiana Wild Life and Fisheries Commission and the Louisiana Petroleum Refiners Waste Control Council. Until approximately five years ago all research was conducted with a static system. Holden (1962) stated that brown trout absorbed in less than 24 hours 90% or more of the <sup>14</sup>C-labeled DDT to which they were exposed in a static system. Mount and Putnicki (1966) have also questioned the validity of the TLm values determined for insecticides in a static system. Hebert, Dowden and Bennett (in press) have shown that there is a significant difference between TLm values obtained in a static system and those obtained in a constant flow system.

In this study the fish will be exposed to the 24 hour TLm concentration and to one-tenth of this concentration for known periods of time. The entire fish and/or selected organs will be analyzed by electron capture gas chromatography, and, if necessary, by thin-layer chromatography.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0264, COMPARATIVE BEHAVIOR OF HATCHERY-REARED AND WILD SALMONIDS**  
*W.H. EVERHART*, State Inland Fish & Game Dept., Augusta, Maine 04330

This grant is for the continuation of research initiated under GB-3859, dealing with the behavior of hatchery-reared and wild juvenile salmon (*Salmo salar*). The purpose of the study is to determine whether or not young salmon raised in an artificial environment have behavioral deficiencies which may affect their survival beyond that normally expected in a wild population. The hatchery fish used in the experiments are the progeny of wild parents, and any departure from the behavior of wild salmon is considered a result of behavior modifications imposed by the hatchery environment. Observations are made in a 50-foot artificial stream approximating the natural stream environment in which long-term observations could be made. Aquaria are used to supplement field observations when experimentally controlled conditions are necessary.

Under the new grant the investigators will complete several phases of the study of salmon. They also plan to initiate a comparative behavior study of hatchery and wild brook trout (*Salvelinus fontinalis*), an investigation of the behavior of salmon and trout in the hatchery environment, and an investigation of the physiological effects of stress on the endocrine system of salmon and trout reared under different environmental conditions.

SUPPORTED BY U.S. National Science Foundation

**5.0265, RACIAL STUDIES OF HERRING**  
*G.J. RIDGWAY*, U.S. Dept. of Interior, Biological Laboratory, Boothbay Harbor, Maine 04538

The stocks of herring in the areas of coastal Gulf of Maine, Georges Bank, and Nova Scotia are being studied with a variety of serological and biochemical methods to find genetically variable characters that can be used to identify and discriminate between reproductively isolated populations. Proper management of these stocks requires that the reproductively isolated segments be recognized, since they are being harvested by several domestic and foreign fisheries. The serological approaches to the problem include work on blood groups and serum differences. Biochemical methods include a variety of electrophoretic methods coupled with methods which stain specifically for various enzymes. The data are analyzed by population genetic methods.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0266, COMPARATIVE ETHOLOGY OF FISHES OF THE GENUS MACROPODUS**  
*C.H. SOUTHWICK*, Johns Hopkins University, School of Public Health, Baltimore, Maryland 21218

Brief Description of Research Project: The proposed research involves comparative ethological studies of wild-trapped

## 5. LIVING SYSTEMS (NON-HUMAN)

strains of the anabantid fishes *Macropodus opercularis*, *M. cupanus*, *M. chinensis*, and *M. davi*. The locomotory, feeding, resting, sexual, agonistic, parental, and communicative behavior of these species will be analysed in detail.

The greatest emphasis will be placed on qualitative and quantitative analysis of aggressive behavior. This will include data on normal ontogeny, on releasing and causative mechanisms, and on the influences of social variables on aggressive behavior.

In conjunction with the study of social influences, experiments will be carried out to determine the relationships between sociality, water conditions, and survival of young fish.

SUPPORTED BY U.S. National Science Foundation

### 5.0267, RESPIRATORY EXCHANGE IN FISH GILLS

*C.F. BROWN*, Hydronautics Incorporated, *Laurel, Maryland*

The purpose of this project is to provide a quantitative understanding of the mechanisms involved in the respiratory exchange of gases across fish gills. The study is designed to provide both detailed information on the counterflow system, and computer analyses of the exchange process. Attention will be given to the computation of gaseous losses in the lamellae, the ability of gill systems to recover oxygen and eliminate carbon dioxide with special consideration of the dissociation characteristics of these gases in respect to the sea water - Blood Media, and a complete analysis of the gill structure and pumping mechanism.

The increased incidence of Naval personnel in submerged oceanic situations, for example, free diving operations, excursions from underwater habitats, and other facilities, and the increasing utilization of submersibles of all types, emphasizes the need for detailed understanding of systems for gas exchange already successfully employed in the oceanic environment.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0268, PHYLOGENETIC SIGNIFICANCE OF SOUND-PRODUCING MECHANISMS OF OPHIDIID AND RELATED FISHES

*W.R. COURTENAY*, Boston University, Graduate School, *Boston, Massachusetts 02215*

This project is concerned with the phylogenetic significance of sound-producing mechanisms in ophidiid and related fishes. The work is anatomical, investigating the structure of the sonic mechanisms in these fishes. It seems, provisionally at this time, that the morphology of these structures can be grouped into two basic patterns; if these are indications of relationships, some of the fishes in three formerly distinct families of fishes cross over presently-established phyletic lines. The significances of these indications are being studied.

SUPPORTED BY U.S. National Science Foundation

### 5.0269, REGULATION OF AMMONIA EXCRETION IN FISH AND AQUATIC AMPHIBIA

*L. GOLDSTEIN*, Harvard University, School of Medicine, *Boston, Massachusetts*

Investigations will be conducted on the regulation of ammonia production and excretion in fish and aquatic amphibia. Pathways of ammonia synthesis will be examined in teleosts and other fishes. Activities of amino acid deaminating enzymes will be assayed in tissue homogenates and optimal assay conditions will be defined. Substrate, cofactor and product levels will be measured in frozen sections of fish tissues and these values will be used to assess the rate of amino acid deamination in vivo. The adaptation of nitrogen metabolism (ammonotelism to ureotelism) that occurs in the lungfish (*Protopterus dolloi*) during estivation will be investigated. Levels of amino acid deaminating enzymes, substrates, cofactors and products and the activity of the ornithine cycle will be determined in estivating and nonestivating fish.

The adaptation of nitrogen metabolism (ammonotelism to ureotelism) that occurs in *Xenopus laevis* during water deprivation will be studied. The mode of ammonia excretion will be examined in artificially perfused kidneys. Changes in renal function

during water deprivation will be assessed. The levels of amino acid deaminating enzymes, substrates, cofactors and products will be determined in both kidneys and livers from normal and dehydrated animals. The activity of the ornithine cycle will be measured in liver slices from both groups of animals.

SUPPORTED BY U.S. National Science Foundation

### 5.0270, BEHAVIOR IN EMBRYOS AS IT RELATES TO ENCEPHALIZATION

*P.B. ARMSTRONG*, Marine Biolog. Laboratory, *Woods Hole, Massachusetts 02543*

This investigation will be concerned with the correlation of neuroanatomical mechanisms responsible for the negative phototaxis in developing *Ictalurus nebulosus*. Negative phototaxis appears when the rods and cones first show a development of the receptor elements. Throughout the major part of embryonic development this reaction persists. However, toward the end of embryonic development the photomechanical mechanisms characteristic of the adult eye appear and the embryos are able to adapt to light and darkness. The projection of the optic nerves to the lateral geniculates and the optic lobes is currently under investigation and the behavioral responses are being followed with partial and complete ablation of the optic lobes by electrocautery. Further extension of this work involves a study of the lateral line system and the Mauthner cells in the mechanism.

A subsidiary problem concerns the comparative physiology of the intridial muscles involving these in the eel, goosefish and toad which show direct contractility to light.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0271, FURTHER STUDIES ON A FLUORESCENT COMPOUND IN THE DOGFISH LENS

*J. TUTTLE*, Marine Biolog. Laboratory, *Woods Hole, Massachusetts 02543*

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY National Council to Combat Blindness Inc.

### 5.0272, THE PHYSIOLOGY OF TUNA AND OTHER PELAGIC FISH

*F.G. CAREY*, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts 02543*

The main objective of this work will be the further study of the heat conservation mechanisms used by certain sharks and tuna to maintain body temperatures above their environment. We hope to get quantitative data to demonstrate how effectively the heat exchange mechanisms in these animals function and information on how they regulate their temperatures and make use of their ability to stay warm. When opportunity permits we will also carry out experiments with blood physiology and other aspects of the physiology of these fish.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0273, ENERGY REQUIREMENTS OF MARINE ORGANISMS

*J.M. TEAL*, Woods Hole Oceanographic Inst., *Woods Hole, Massachusetts 02543*

Part of the work was devoted to studying the body temperature of warm bodied fishes, tunas, and Lamnid sharks, all of which possess countercurrent heat exchangers in the blood supply to their body muscles. We measured the distribution of internal temperatures in fish caught in fish traps, on long lines, and by sports fishermen. Body temperatures indicated that at least Blue Fin Tuna and Mako Shark have some mechanism for control of their body temperature and tend to remain at about 30 degrees and 28 degrees respectively. We also found high body temperatures associated with a poorly developed heat exchanger in Big-eyed Thresher Sharks. Maintenance of high temperature required high metabolism. Further work is being directed toward measurement of metabolic rates in some of these species.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0274, DEVELOPMENTAL MORPHOLOGY OF COREGONIDS

L.E. CABLE, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Study of the morphology of young coregonids of the Great Lakes was begun to determine what differences exist between the several indigenous species. To date, seven species, one hybrid, and one *Prosopium* have been reared from the egg to adulthood in the laboratory. Some specimens of each species were preserved at intervals as development progressed. This phase of the work is completed.

Since completion of the first phase, from 20 to 60 morphometric characters have been measured or counted on many of the specimens at 10 mm. intervals of total length in search of one or more characters that can be used in the field to distinguish the young of one species from those of the other species. This morphometric data is being transferred to punch cards and programs written for electronic data processing to determine the potent independent variables and their reliability in multiple regression and/or discriminant analyses.

A paper in preparation will describe laboratory methods, food, growth, diseases, survival, and reproduction in the laboratory, also the morphometry of the first and second generation whitefish reared in captivity. The morphometry of the other species being analyzed along with that of the whitefish will be reported in separate papers.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0275, SIMULATED WEIGHTLESSNESS IN FISH

R. VONBAUMGARTEN, Univ. of Michigan, School of Medicine, Ann Arbor, Michigan (NGR)

Objective: a. Problem: To surgically produce a condition simulating weightlessness in fish. b. Applications: Elucidate the function of gravity receptors using the fish as an experimental organism. c. To collect information about aspects of weightlessness in an organism which permits elimination of the effects of gravity force on the cardiovascular system, and proprioceptive antigravity reflexes.

Approach: Iron particles will be implanted into the utricular statoliths, bilaterally. Strong magnetic fields will be applied at different directions, thus altering orientation, and behavioral observations made. Additional studies will be made using microelectrode recordings in marine organisms.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 5.0276, FISH HOLDING AND LIFE STAGE SENSITIVITY STUDIES

C.M. TARZWELL, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

All fish of importance in the upper Great Lakes area will be collected and brought into the laboratory for sensitivity studies. As the work progresses, feeding and other procedures will be developed so that selected species can be kept through the winter for sensitivity studies. Species which comprise a significant portion of the total fish population will be used in the sensitivity studies to determine those species which are most sensitive to a particular material or waste. Not only will the adult, but the fingerlings and fry will be studied, as well as the eggs and sperm to determine the most sensitive development stage of these fishes. As with the other projects, the most sensitive form will be used in the Toxicological Unit for the determination of safe levels of a particular toxicant under conditions of long-term exposure.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0277, PESTICIDE RESISTANT FISH IN NATURAL ECOSYSTEMS

D.E. FERGUSON, Mississippi St. University, Graduate School, State College, Mississippi 39762

The applicant and his students first reported pesticide resistance in natural populations of fish in 1963. Since that time, our studies have concerned the extent and nature of resistance in vertebrates, and little effort has been directed to an assessment of the significance and potential of resistance to natural ecosystems.

Recent findings indicate that the ecological impact of resistant populations of fish may be so great and macabre as to stagger the imagination. For example, large numbers of highly resistant mosquitofish are able to survive as 10-day exposure to 2000 ppb endrin. If a medium-sized predaceous fish eats just one of these survivors, death ensues in about 6 hours. We suspect that the same would be true of an egret, snake, turtle or any other predator. What about man?

In a paper now in press, we show that a single resistant fish exposed to 1000 ppb endrin will release sufficient toxicant into 10 liters of tapwater to kill 5 susceptible fish in 38.5 hours.

How much pesticide are resistant fish able to tolerate? How much do they actually contain in heavily contaminated areas? What predators eat them? What is the consequence? Are humans eating them? These are some questions we hope to answer, and it is a matter of urgency that they be answered quickly! Our objectives are to attempt to assess the actual and potential significance of the presence of resistant fishes in natural ecosystems.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0278, TOXICANT TOLERANCE STUDIES-SCREENING OF PESTICIDES AND FISH AT TIBURON

T. LANE, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The objective is to obtain acute toxicity information on marine and estuarine fishes with insecticides, herbicides, and other pesticides at Tiburon, California. Fish and toxicants will be tested in continuous-flow systems in the laboratory, according to a standard method, and the later will be treated by probit analysis to obtain LC50 values under various time schedules.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0279, MECHANISMS OF HOMING AND ORIENTATION OF SALMO CLARKI IN YELLOWSTONE LAKE AND ITS TRIBUTARIES

C.J. BROWN, Montana State University, Graduate School, Bozeman, Montana 59715

Since 1964 the principal investigators have been studying the movement behavior of mature, migrating cutthroat trout displaced from their homestreams to the open water of Yellowstone Lake, Yellowstone National Park, Wyoming. Evidence of within-season homing has been presented as a result of tagging experiments. It has also been demonstrated by float and ultrasonic tracking that cutthroat trout have oriented movement patterns, probably responsive to visual cues. Under the present grant the investigators will continue their research to determine: (1) some of the sensory mechanisms (particularly visual) of homing and orientation in open water particularly by the use of ultrasonic tracking; and (2) the extent, specificity, and sensory mechanisms of homing within a tributary system primarily by mark-and-recapture methods.

SUPPORTED BY U.S. National Science Foundation

### 5.0280, OSMOREGULATION

T.B. THORSON, Univ. of Nebraska, Graduate School, Lincoln, Nebraska 68508

Marine fish and fresh-water fish are usually able to cope with only one external medium, but certain species are able to make the change successfully from one medium to the other. These euryhaline fish are especially appropriate subjects for osmoregulatory studies. Such species are the bull shark, *Carcharhinus leucas*, and the sawfish, *Pristis perotteti*, both of which occur in substantial numbers in the Lake Nicaragua-Rio San Juan System of Nicaragua and Costa Rica. I am studying the chemical anatomy of the serum, cranial fluid, perivisceral fluid, pericardial fluid, urine and rectal gland secretion of these elasmobranchs (1) taken from salt water, (2) taken from fresh water, (3) following transfer from fresh water to salt water and vice versa. These species appear to be marine animals that make their way into fresh water, but there are other elasmobranchs that are permanent residents of fresh water rivers and probably have been for thousands of generations. These are the river rays of the family Potamotrygonidae found in

## 5. LIVING SYSTEMS (NON-HUMAN)

rivers of South America and Africa. The chemical anatomy of their body fluids will also be analyzed to determine whether they have retained the urea-retaining habitus of the marine elasmobranchs.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0281, MORPHOGENETIC MOVEMENTS IN FISH EMBRYOS

*W.W. BALLARD*, Dartmouth College, School of Medicine, Hanover, New Hampshire 03755

**BRIEF DESCRIPTION OF RESEARCH PROJECT:** Analysis of development must be based upon precise and full descriptions of the events and processes to be analyzed. The publication of 'fate maps' and charts of the patterns of movement of cells in gastrulation and early differentiation is a necessary prerequisite for the planning of further experiments. Although much work has been done on amphibian and chick embryos, very little attention has been focused on fish embryos. There are questions on interpretation of the function of the edge of the teleost blastodisc and evidence is available to show that the structures through which gastrulation is accomplished in fish are completely different from those in the amphibian and the chick.

The movements of the inner cells of the blastodisc of representative taxa of fishes are being explored and reliable 'fate maps' of the late pregastrula stage will be completed. Other questions to be answered are the source and method of gathering of the notochord and endoderm, the role of the embryonic shield as a growth center, the segregation of the germ layers out of the massive shield, the origin and fate of Kupffer's vesicle and the source and organization of the trunk-tail bud.

SUPPORTED BY U.S. National Science Foundation

### 5.0282, RETINAL RHYTHMS UNDER CONTROLLED LIGHT

*B.L. OLLA*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To determine whether photomechanical changes occur in the retinas of young bluefish and to measure the extent to which they are affected by internal controls. A group of bluefish will be kept under constant light and dark for three days. Fish will periodically be enucleated, and the eyes sectioned and stained. Measurements of the pigment and sensory layers will reveal the degree of internal control.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0283, LIGHT AND DARK ADAPTION IN THE RETINAE OF YOUNG BLUEFISH

*B.L. OLLA*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To determine the degree of photomechanical response in the retinæ of young bluefish. Bluefish will be subjected to varying periods of light and darkness and their retinas will be removed, sectioned and stained. Measurements of the pigment and sensory cell layers will be taken to establish the degree of response and length of time required for complete light-and-dark-adaptation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0284, RELATION OF TEMPERATURE TO RHYTHMIC BEHAVIOR

*B.L. OLLA*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To observe the effect of low water temperature on adult bluefish. Gradually lower the water temperature in a large sea tank while measuring swimming speeds. Determine the level which disrupts normal behavior.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0285, RHYTHMIC ACTIVITY OF BLUEFISH IN RELATION TO NORMAL LIGHT REGIME

*B.L. OLLA*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To determine whether a rhythmic pattern of activity is present in a group of bluefish residing in a tank under a 24 hour artificial day-night cycle: (1) measure average speed of swimming each hour of day and night as an index of activity; (2) tabulate, analyze, and plot resulting data to bring out statistically significant tendencies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0286, RHYTHMIC ACTIVITY OF BLUEFISH UNDER EXPERIMENTALLY VARIED LIGHT REGIMES

*B.L. OLLA*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To test whether the rhythmic activity of bluefish held in an experimental tank: (a) persists under low constant illumination, and (b) adapts to a change of phase in the day-night cycle: Measure activity of the fish under (a) constant illumination over varying lengths of time, and (b) an artificial day-night cycle which is seven hours out of phase with the original cycle. Analyze and compare the data with measurements collected under a normal light regime.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0287, AGE AND GROWTH OF BLUEFISH

*L.A. WALFORD*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

To measure growth rates and determine age composition of bluefish populations occurring from Cape Cod to Southern Florida. Sample, measure and take scales from bluefish caught by commercial and sport fishermen and by research biologists, to represent full range of size along entire Atlantic coast. Study lengths and scales, and interpret their significance using standard techniques.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0288, ENDOCRINE REGULATED PROCESSES IN TELEOST FISHES

*M.P. SCHREIBMAN*, City University of New York, Graduate School, Brooklyn - Brooklyn College, New York 11210

Diverse mechanisms for osmoregulation are operative in fishes. How these mechanisms are interrelated is not well understood - undoubtedly their relative importance varies in the major groups of fishes. Some species must be maintained in dilute sea water following hypophysectomy. They will die if placed into fresh water, even though this may be their natural environment, unless injected with mammalian prolactin. In their natural freshwater survival is independent of hypophysial control. The distribution of these two mechanisms may have considerable evolutionary significance. The aim of the proposed research is to determine the distribution of the two mechanisms along phylogenetic lines and to study the nature of the control.

To clarify the taxonomic picture, eight to ten species, belonging to several families and orders, will be hypophysectomized each year and tested for freshwater survival. The mechanisms involved will be investigated by the use of hypophysectomized fish, hormone replacement, and transplantation of endocrine organs. All organs that may be concerned with osmoregulation will be examined histologically for sites of hormone action. Cytological studies of pituitary glands, including cytochemical, autoradiographic, and ultrastructural methods, will be employed to ascertain the site of production of the hormone(s) involved with freshwater tolerance.

SUPPORTED BY U.S. National Science Foundation

### 5.0289, ACOUSTICO-LATERALS FUNCTION IN FISH ORIENTATION AND COMMUNICATION

*P.H. CAHN*, Long Island University, Graduate School, Brookville, New York

The research constitutes a many-pronged attack on the problem of the fishes' perception of his environment. The overall aim of the proposed study is to assess the relative importance of hydrodynamic and acoustic stimuli in fish orientation. Data is obtained by the following principal approaches: a. The behavioral

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

analysis of pressure signal detection (auditory thresholds) and velocity/displacement signal detection (lateral-line thresholds) is being continued with concentration on the lower frequencies, between 10-100 Hz., in an effort to understand the way in which the two related detection systems are coupled. b. Neurophysiological, behavioral and histological analysis of the effects of environmental pollutants on the function of the ear and lateral-line sensory systems will be undertaken. c. Three-dimensional analysis of the hydrodynamic structure of a fish school is being tried, and the importance of fish generated vortices for fish-to-fish orientation during schooling examined.

SUPPORTED BY U.S. National Science Foundation

### 5.0290, VISUAL CAPACITIES IN TELEOST FISHES

*W.N. TAVOLGA*, Amer. Museum of Nat. History, New York, New York

The investigator proposes to extend his research, now in progress under GB-4364, to study the visual capacities of teleost fishes. Avoidance conditioning techniques will be used to determine psychophysical thresholds for those aspects of the visual process clearly important in the behavior of fish. Among these, the perception of brightness, color, distance, movement and form should be included. In the first stage of this program of investigation measurements will be made on a number of species for each of these visual dimensions. The species chosen will differ morphologically and ecologically so that differences in behavior can be correlated with differences in structure.

SUPPORTED BY U.S. National Science Foundation

### 5.0291, AUDITORY CAPACITIES OF TELEOST FISHES

*W.N. TAVOLGA*, Amer. Museum of Nat. History, New York, New York

Brief Description of Research Project: This is a continuation of work begun under grant GB-1574.

Previous studies have shown the feasibility of determining auditory thresholds in fishes by the use of the avoidance conditioning technique. This method will be applied to a broad investigation of auditory capacities in teleost fishes of various groups, including those that possess specialized hearing mechanisms such as the Weberian apparatus. Thresholds for pure tones, complex sounds and masked sounds will be determined, as well as tests for frequency and intensity discrimination. Phyletic comparisons and anatomical differences in auditory receptors will be correlated with differences in auditory capacities. Operative and other procedures will be used to separate lateral line, swim bladder and direct bone conduction as auditory channels. Positive reward and other instrumental conditioning techniques will be used to study the effects of different testing methods on response thresholds to auditory stimuli.

SUPPORTED BY U.S. National Science Foundation

### 5.0292, CYTOLOGY OF VIRAL NEOPLASMS OF FISH

*R. WALKER*, Rensselaer Polytechnic Inst., Graduate School, Troy, New York 12181

This is a continuing study of virus-associated skin lesions in fish, including lymphocystis disease (virus-induced hypertrophy) and various epidermal or dermal neoplasms.

Lymphocystis disease is being studied for viral ultrastructure, and for growth, chromosomal ploidy, and ultrastructure of the enlarging host fibro-blasts; and for structural, physiological, and immunological differences of virus or of the cytoplasmic DN-protein inclusions in different species. Studies are being initiated on the interaction of virus with gut cells, and phagocytes, with or without various adjuvants. Though arthropod vectors may not be necessary, they are being sought. With the help of Dr. Forney of Cornell we hope to get seasonal correlates of incidence and rate of growth in *Stizostedion* of *L. Oneida*.

Virus-like particles are consistently found associated with patches of hyperplastic epidermis in *Stizostedion*, but histologically similar lesions in *Perca* have shown no similar virus. Likewise no virus is seen by electron microscopy in a very different epidemic of epidermal hyperplasia ('fish-pox?') of *Lepomis*, the bluegill.

### 5.0293, ACCUMULATION OF RADIONUCLIDES BY VERTEBRATES (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

*J.P. BAPTIST*, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

Estuaries and brackish water areas provide a nursery ground and habitat for many commercially important fish. They also provide receiving waters for waste products, including radioactive effluents from power reactors, hospitals, and laboratories. Marine vertebrates can concentrate radioactive elements which could be harmful to them and render them useless as seafood for man. Since the marine environment is complex and each estuary is different, in some way, from all the others, various factors influencing accumulation must be studied under laboratory conditions.

The objectives of this project are to measure under controlled laboratory conditions, the accumulation and retention of radionuclides by marine fish; to study the importance of various factors which may affect accumulation; and to observe the feeding processes of commercially important fish through the use of radioactive tracer techniques.

Experiments are conducted with several marine fishes such as croakers, *Micropogon undulatus*; mummichog, *Fundulus heteroclitus*; pinfish, *Lagodon rhomboides*; bluefish, *Pomatomus saltatrix*; and flounder; *Paralichthys* sp. Accumulation of radionuclides both from sea water and from natural food containing radioactivity in known concentrations is determined.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0294, THE EFFECTS OF RADIATION ON THE PHYSIOLOGY OF MARINE ORGANISMS (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

*D.W. ENGEL*, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

Ionizing radiation has always been a part of the natural environment; however, the advent of the atomic age has increased the amount of radioactivity in the environment. The marine environment is subject to possible radioactive contamination from the growing numbers of reactors as well as from fallout and waste disposal. Though it is known that marine organisms tend to concentrate radionuclides, very little is known about the effects of ionizing radiations on these organisms. A more complete understanding is needed of species sensitivities to radiation and specific physiological effects of acute and chronic exposures. This information will aid in predicting effects from radioactivity in the environment and in applying controlled irradiation to eradicate undesirable species or to breed desirable species that are more resistant to environmental stresses. The purpose of this project is to describe the effects of acute and chronic doses of radiation from both internal and external sources on the physiology of marine organisms.

The effects of radiation may be death or alteration in some physiological or metabolic activity. In this investigation, LD-50's will be used to describe species sensitivity to radiation under varying conditions; while blood components, hematopoietic tissues, and respiration rates of whole organisms of tissues will be used as indices of radiation effects.

Sources of radiation will be by Cobalt-60 irradiators, an x-ray machine, labeled food, and administered radionuclides. Standard hematological and manometric techniques will be used to measure the various parameters. The marine teleost fishes used in this project will include *Opsanus tau*, *Paralichthys* sp., *Pomatomus saltatrix*, and *Scomberomorus maculatus*. The project will also encompass representatives of other groups of marine organisms.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0295, THE EFFECTS OF RADIATION ON THE MORPHOLOGY OF MARINE ORGANISMS (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

*J.C. WHITE*, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

## 5. LIVING SYSTEMS (NON-HUMAN)

Little is known about the effects of ionizing radiation on marine organisms. There is no information available on which to predict possible effects from accidental or purposetul irradiation. Due to the possibility of radiation being used as a tool in the management of the marine environment, it is essential that more knowledge of its effects be gathered. This project has been undertaken to help evaluate the effects of radiation on marine organisms by investigating comparative radiation sensitivities and morphological changes due to radiation.

Marine organisms may be exposed to radiation from both external and internal sources. Such irradiation may be chronic or acute and may cause either the death or an alteration in the morphology of the organism. Since the embryological and larval stages of marine organisms are more sensitive to radiation than mature forms, these stages, as well as mature organisms, will be exposed to various doses of radiation to determine LD-50's. Irradiated organisms will also be observed for any morphological changes that might develop as a result of acute or chronic doses.

Organisms will be irradiated by either Cobalt-60 sources, an x-ray machine, radioactive food and medium, or force fed radionuclides. The organisms being used presently are marine teleost fishes which include *Fundulus heteroclitus*, *Paralichthys dentatus*, *P. albigutta*, *P. lethostigma*, *Menidia menidia*, and *Eucinostomus* sp.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0296, STUDIES ON MOLTING, GROWTH, AND DEVELOPMENT IN ACORN BARNACLES AND LARVAL DECAPODS

*J.D. COSTLOW*, Duke University, Graduate School, *Durham, North Carolina 27706* (NONR)

Objective: The problem of barnacle fouling on Naval vessels and underwater structures involves a complex sequence of endogenous biological activities which are largely endocrinological in nature. A clearer understanding of the endocrine mechanisms involved in the barnacle life cycle may facilitate prevention of their occurrence in the future.

Approach: The origins of endocrine systems are being investigated in the developmental stages of barnacle (larvae) in an attempt to localize the regions and time of appearance of areas of endocrine activity. Additionally, the functional period of these sites of endocrine activity is being studied and the effects of experimental extirpations, injection, and implantation documented. Due to the minute size of the sites of endocrine activity, micro-laser techniques will be used to selectively destroy endocrine sites.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0297, SUBCELLULAR REACTION TO INJURY IN THE KIDNEY

*B.F. TRUMP*, Duke University, School of Medicine, *Durham, North Carolina 27706*

The principal research objective is the delineation, at the subcellular, supramolecular, and molecular levels, of the response of kidney cells to lethal as well as sub-lethal injury. The principal emphasis is on the structural and functional modulation of cellular membranes as they relate to modification of energy transduction by these systems. Complementary objectives include an understanding of the ultrastructural characteristics of human renal disease, methods of ultrastructural and cytochemical analysis, and the ultrastructural basis of active transport. Particular attention has been given to the study of systems such as isolated, perfused flounder tubules and toad bladders in Ussing chambers, where correlations between alterations of structure and function can be made.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0298, THE INFLUENCE OF ENVIRONMENTAL FACTORS UPON DEVELOPING MERISTIC STRUCTURES IN THE MARINE FISH, *FUNDULUS MAJALIS* (WALBAUM)

*W.E. FAHY*, Univ. of North Carolina, Institute of Marine Science, *Morehead City, North Carolina 28557*

Physiologically ripe ova, developed naturally or induced by administration of chorionic gonadotropin hormone, are fertilized artificially with sperm from wild males in the laboratory at night using indirect fluorescent light. Embryos and larvae are reared in a unique salt-water circulating apparatus at recorded constant temperatures or alternating temperature regimes. Transfer of embryos and larvae from one temperature to another at different morphological stages are made to determine periods of response of the different structures (vertebrae, fin rays, basal support of fins, scales), those periods in development when response is greatest, and the extent and direction of responses. Fish are sacrificed at about 25 millimeters total length, fixed, cleared, stained in alizarinred and preserved in glycerine. Counts of different structures are made under a dissection microscope and these counts are subsequently treated with appropriate statistical procedures that permit identification of means drawn from heterogeneous statistical populations. These experiments, utilizing temperature at first, will be expanded to include salinity, light, and dissolved gases, to obtain a fuller knowledge of the mechanisms involved in radiation among fish species.

### 5.0299, THE EFFECTS OF ENVIRONMENTAL CONDITIONS ON THE SPAWNING AND SURVIVAL OF FRY OF THE WALLEYE

*V.C. APPLGATE*, U.S. Dept. of Interior, Biological Station, *Sandusky, Ohio*

The recent decline of walleye stocks in Lake Erie following a man induced acceleration of the eutrophic process in the lake demands investigation of the many environmental factors which might influence the survival of young walleyes. Temperature monitoring stations have been established on three known walleye spawning grounds (reefs) in the western basin with the object of determining the effect of temperature regimes during spawning and fry development in the success of walleye hatches. These records will also be used to determine the effects of temperature on the timing and abundance of food organisms that may be essential to the survival of walleye fry when they first begin feeding.

Walleye fry have proved elusive and difficult to capture during their first 6 weeks of life. Measurement and recording of the direction and velocity of water currents on these reefs during the walleye spawning season have been instituted with the objective of casting some light on the dispersal of the fry.

Subsequently, automatic devices for the regular and periodic sampling of plankton organisms on and near the reefs will be devised and incorporated into this experiment. Qualitative and quantitative examination of these samples will be compared with the planktonic diet of fry captured during their first weeks after hatching.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0300, THE EVOLUTION AND CAUSATION OF SOCIAL BEHAVIOR IN ANABANTOID FISHES

*R.J. MILLER*, Okla. St. Univ. of Agr. & Sci., Graduate School, *Stillwater, Oklahoma 74075*

Brief Description of Research Project: This grant is for continuing and expanding studies on the social behavior of anabantoid fishes, currently being supported under GB-1989. Under the present grant, qualitative descriptions of the courtship and reproductive behaviors of *Trichogaster trichopterus*, *T. leeri*, *Macropodus opercularis*, and *Betta splendens* have been completed, and a comparative paper is being prepared for publication. A quantitative description and causal analysis of the reproductive behavior of *T. leeri* is in preparation, and data for similar analyses in the other species are still being collected. Long-term fluctuations in behaviors of several functional types are being compared in *T. trichopterus* and *M. opercularis*, and studies attempting to correlate such fluctuations with environmental cues are in progress.

Under the new grant several lines of work will be initiated as soon as possible. Descriptive and quantitative studies on several new species will be undertaken. Experimental work using models and test fish will be carried out to test hypotheses based on observational studies already completed. Mathematical indexes will be

## 5. LIVING SYSTEMS (NON-HUMAN)

developed for comparing activity levels within and between species and individuals. These studies should provide objective data for evaluating the nature of evolutionary changes in behavior patterns in the group, and contribute to our knowledge of causation of aggression, reproductive actions, and parental behavior.

SUPPORTED BY U.S. National Science Foundation

### 5.0301, IONOCYTE FORMATION IN GILL EPITHELIUM OF FISHES

F.P. COTE, Oregon State University, Graduate School, Corvallis, Oregon 97331

The proposed study is concerned with the developmental pattern of proteins and nucleic acids involved in the cellular differentiation of salt secreting cells in the gill epithelium of fishes. Kinetic studies by Conte and Lin (1967) have shown that increased salinities of the environment induces a rapid turnover of epithelial cells in gill tissue. Ultrastructural studies by electron microscopy (Newstead and Conte, 1967) support the hypothesis that the mitochondria-rich cells are the type of cells which are undergoing rapid synthesis and degeneration. Immunochemical study (Conte and Morita, 1967) of the gill filaments from saltwater and freshwater adapted fish have shown that levels of antigenic proteins are higher for the saltwater environment. Tripp, (1967) investigating the succinic acid dehydrogenase-cytochrome-C-reductase in gill tissue found no change in enzymatic activity between the two types of environments. Current experiments with labeled substrates are being performed in order to determine the casual relationships between protein and nucleic acid synthesis with salt secretion.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0302, INFECTIOUS DISEASES OF SALMONID FISHES

J.L. FRYER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objective: (1) Study the epidemiology and transmission of infectious diseases in populations of fishes with emphasis on certain bacterial agents. (2) Investigate the use of immunological methods for both prevention and diagnosis of fish diseases. (3) Determine the source of infection, life history and means of transmission of infectious protozoa.

Description of Work: This investigation is funded by the Fish Commission of Oregon and is designed to furnish information required for improved operation of their fish culture program. The objectives listed above cover the three key areas currently covered in the project and are believed to represent some of the most important disease problems related to fish hatcheries. The research will contain both basic and applied experimentation. The detection, prevention and control of fish diseases will be emphasized in all studies.

SUPPORTED BY Oregon State Government

### 5.0303, CRYOGENIC PRESERVATION OF VIABLE FISH SPERM

H.F. HORTON, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

The investigation has four objectives: 1) to develop a suitable diluent(s) and a life protector(s) for fish spermatozoa; 2) to perfect a freezing and thawing procedure for the live preservation of fish sperm at temperatures of liquid nitrogen; 3) to compare the reproductive capacity of sperm cells stored at cryogenic temperatures to that of fresh spermatozoa; 4) to compare the vitality of progeny produced from stored spermatozoa to that of progeny produced from fresh spermatozoa.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0304, NUTRITION OF SALMONID FISHES

D.K. LAW, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: (1) To investigate the fundamental nutrition of hatchery salmonids. (2) To further develop and improve, both nutritionally and economically, the Oregon Moist Pellet. (3) To

develop a nutritionally adequate and physically available starter diet for young salmonids.

A completely purified diet for salmonid which will produce growth responses as good or better than the Oregon Moist Pellet (OMP) for investigation of the fundamental nutritional requirements of salmonids will be developed. Experiments will be conducted to expand the body of knowledge about the vitamin, mineral, amino acid, and fatty acid requirements of salmonids. The purified diet will be used to evaluate new, more nutritional and economical sources of protein for use in formulating the O.M.P. Modifications in the composition of the O.M.P. to enhance its manufacturing, feeding, and nutritional qualities will be investigated. Means of preserving the O.M.P. by methods other than freezing will be investigated. Basic methods of evaluating nutritive value and quality will be investigated to provide a more critical criteria for evaluating the quality of the OMP. A nutritionally sound and physically available starter diet for juvenile salmonids will be developed.

SUPPORTED BY Oregon State Government

### 5.0305, BIOCHEMISTRY AND PHYSIOLOGICAL ECOLOGY OF POISONED FISH

S.D. LU, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1) The manner in which particular nerve enzymes are altered by selected toxic substances and how and to what extent this restricts the nervous performance of fish in terms of change resulting in patterns of social behavior will be determined. 2) The manner in which particular enzymes involved in muscular function are altered by selected toxic substances and how and to what extent this restricts the work performance of fish in terms of maximum short term swimming speed and length of time that this speed and also the maximum sustained swimming or 'cruising' speed can be maintained will be determined. 3) The manner in which particular digestive enzymes are altered by selected toxic substances and how and to what extent this restricts the utilization of food or energy resources in terms of growth and maintenance of fish will be determined. 4) The manner in which particular respiratory enzyme molecules are altered by selected toxic substances and how and to what extent this restricts the 'scope for activity' (expressed as the difference between standard and active metabolism) or capacity for nervous, work and growth performance of fish will be determined.

Description of Work: This investigation is concerned with the long term exposure of the organism to sub-lethal levels of toxicant. The nervous behavior and physiological function of the organism will be followed following exposure and the effect of the toxicant on specific enzymes assayed and related to the response. Studies on the long term effect of chemicals on the ecology of the fish will be evaluated. The mechanism of action of the poisons will be investigated.

SUPPORTED BY Oregon State Government

### 5.0306, EPIDEMIOLOGY OF SALMON POISONING DISEASE

R.E. MILLEMANN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

To determine the natural definitive host(s) for the fluke and rickettsiae; and to determine whether animals, other than canids, experimentally infected with the trematode also harbor the rickettsiae. By examination of wild animals trapped in the field; and by controlled infection experiments in the laboratory.

To determine if fluke eggs and miracidia carry the rickettsiae and are capable of transmitting the disease to susceptible dogs; and attempt to locate the rickettsiae in various fluke stages. By injection of various stages of the fluke parasite into susceptible dogs; and by use of the fluorescent antibody technique.

To study the relationship between the parasite and fish with emphasis on: a. the effect of changes in salinity on retention of the parasites and rickettsiae by anadromous salmonid fish; b. the susceptibility of non-salmonid fish to infection; and the comparative susceptibility of native and introduced species of salmonids; c. the effect of various levels of infection on the growth and swimming performance of salmonids under controlled conditions.

## 5. LIVING SYSTEMS (NON-HUMAN)

By examination of ocean-caught salmon and other fish; and by controlled infection experiments in the laboratory.

SUPPORTED BY Oregon State Government

### 5.0307, EPIDEMIOLOGY OF SALMON POISONING DISEASE

R.E. MILLEMANN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Studies on the effects of different infection levels with the 'salmon poisoning' trematode *Nanophyetus salmincola* on the growth and swimming performance of salmonid fishes under controlled conditions are being continued. The chemical and physical factors necessary for development and hatching of the trematode eggs will be determined. Studies on the mechanism of pathogenicity of the trematode for its fish host are being continued. Studies on the in vitro cultivation and characterization of the 'salmon poisoning' disease agent *Neorickettsia helminthoeca* are being continued.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0308, OCCURRENCE OF THE PROTOZOAN PARASITE CERATOMYXA IN ADULT PACIFIC SALMON AND STEEL-HEAD TROUT

K.S. PILCHER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objective: To determine the best technique for diagnosing this disease in salmonids. By means of a survey determine the species of fish involved at selected locations and obtain an estimate of the number of animals infected at each. Describe the pathology and causative agent.

Description of Work Proposed: Experimental procedures, sampling techniques and study areas will be determined in consultation with Drs. Fryer and Pilcher, Department of Microbiology, O. S. U., and the graduate student working on this project. This survey is to be conducted from a prearranged schedule which will indicate the species, location and sample size. Techniques for detection of this agent in fish tissue will also be examined. Tissue smears will be used initially until better methods are developed.

SUPPORTED BY Oregon State Government

### 5.0309, FISH GENETICS AND ECOLOGY

R.C. SIMON, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

To conduct original research in fish genetics and ecology. To apply findings of research toward clarification of existing problems of race identification, hatchery improvement, evolution of fishes, and study of estuarine ecology. To incorporate graduate instruction and research into each of the above objectives. Life history studies of marine and estuarine fishes. Population genetics. DNA homology studies. Cytogenetic and Mendelian genetic studies. Graduate level instruction in fish genetics.

SUPPORTED BY Oregon State Government

### 5.0310, CRYOGENIC PRESERVATION OF VIABLE FISH SPERM

UNKNOWN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: (1) To develop a suitable diluent(s) and a life protector(s) for fish spermatozoa. (2) To perfect a freezing and thawing procedure for the live preservation of fish sperm at temperatures of liquid nitrogen. (3) To compare the reproductive capacity of sperm cells stored at cryogenic temperatures to that of fresh spermatozoa. (4) To compare the vitality of progeny produced from stored spermatozoa to that of progeny produced from fresh spermatozoa. The long-term goal is to develop a method for the preservation of viable fish spermatozoa so that the costs of fish cultural operations can be reduced and research into fishery genetics and disease can be advanced.

Description of Work Proposed: The development of a suitable extender will require the empirical testing of a number of

promising chemicals. Sperm cells will be collected in the field, placed on ice, and brought to the laboratory. 'Slow' to 'rapid' rates of freezing the spermatozoa samples will be tested to determine the best procedure. The ampules of frozen semen will be stored at minus 196 C in a liquid nitrogen refrigerator. When a procedure has been developed that will yield a satisfactory percentage of active spermatozoa, the refrigeration time will be extended to 7, 30, and 90 days. Sperm cells which have survived 2 or 7 days of freezing should endure indefinite cryogenic preservation. In the second general phase of the research, the reproductive capacity of sperm cells that have been frozen for 7 days at minus 196 C will be compared to that of fresh spermatozoa. Techniques of fertilization and comparative vitality of offspring will also be studied.

SUPPORTED BY Oregon State Government

### 5.0311, EFFECTS OF KRAFT PULP MILL EFFLUENTS ON THE GROWTH AND PRODUCTION OF FISH

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objective: The general objective of this work is to determine how and to what extent concentration of kraft pulp mill wastes that are neither acutely toxic nor severely oxygen depleting may influence the production of fish populations.

Description of Work: (1) Determine the influence of effluents from kraft pulp mills on the growth of juvenile salmonids in the laboratory when food consumption rates and metabolic requirements of the fish are similar to those of fish in nature. (2) Determine the influence of effluents from kraft pulp mills on the food consumption, growth, and production of salmonids and on the production of their food organisms in simplified biological communities in laboratory streams. (3) Determine the influence of kraft mill effluents on the food habits, food consumption, growth, and production of salmonids, and on the biological communities of controlled experimental streams in which the concentrations of these wastes are controlled at levels below those known to be toxic or seriously oxygen depleting. (4) Determine through sampling studies above and below the points of entry of kraft pulp mill effluents into rivers the food habits and growth rates of salmonids and other fish.

SUPPORTED BY Oregon State Government

### 5.0312, THERMALMETABOLIC RELATIONSHIPS OF STENOTHERMAL FISHES

R.W. MORRIS, Univ. of Oregon, Graduate School, Eugene, Oregon 97403

This renewal of GA-422 is for the purpose of investigating the otoliths of fishes to determine if otoliths function as pressure transducers. Preliminary anatomical studies of Antarctic fishes reveal that they lack a gas bladder or compressible vesicle that might serve as depth indicators. Observations of the effect of temperature and light gradients in depth stratification indicates that these are of minimal importance. X-ray diffraction of otolith structures prove that they are composed of aragonite, a centrosymmetric crystalline and nonpiezoelectric substance. The proposed extension will continue studies and experiments to develop surgical techniques for making experimental preparation of the labyrinth; development of means for stimulating and monitoring activity on the otoliths and eighth nerve; and develop pressure chambers and sound transducers essential for the experimental work.

SUPPORTED BY U.S. National Science Foundation

### 5.0313, PHOTOBIOLOGY OF MARINE ANIMALS

J.A. NICOL, Univ. of Oregon, Graduate School, Eugene, Oregon 97403

The tapeta lucida of fishes reflect light passing through the retina and are important in vision. Organization of the reflecting layers is being studied and fine structure of the reflecting cells is being revealed by light and electron microscopy. Reflectance is produced by constructive interference in stacks of guanine crystals; arrangement, spacing and thicknesses of the crystals are

being determined. Values for reflectivity of the tapetum lucidum, spectrum reflectance curves, and transmission of the dioptric structures and of the retina are being sought to evaluate the complementary role of the tapetum lucidum in vision. Changes in all variable components during light and dark adaptation are being measured, using photo electric recording. The pigments - purines and others - in the tapetum lucidum are being extracted, isolated, identified and measured by mechanical, enzymatic, spectrophotometric and chromatographic methods now being explored and developed. The investigation embraces selachians, chimaerids, and sturgeons, whose tapeta lucida exhibit interesting divergences related to habits and habitats.

**5.0314, EPIDERMAL PAPILLOMAS IN PLEURONECTID FISHES**

*S.R. WELLINGS, Univ. of Oregon, School of Medicine, Portland, Oregon*

The general purposes of the project are: (1) determine the distribution of epidermal papillomas of pleuronectid fishes in Puget Sound, and relate this distribution to qualitative and quantitative features of the local ecology; and (2) establish in so far as possible the primary and secondary etiological factors involved, including a search for a possible viral agent.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0315, ANALYSIS OF SALMONID SCALES**

*A.L. OAKLEY, State Fish Commission, Salem, Oregon*

Purpose: To determine age of salmon and steelhead by analysis of scale samples collected throughout the state. To identify different races of salmon and steelhead in the Columbia River.

Methods: To interpret the age, from scale samples, of important anadromous salmonid species, and determine if racial identification is possible by using scale characteristics.

Results: An individual has been hired and trained for this work and has remained with the project since its beginning. Enlarging equipment, utilizing a microprojector and viewing screen, was constructed. The ages of over 75,000 salmonids caught by commercial fishermen have been interpreted from scale impressions. A study to determine racial composition of spring-run chinook salmon is in progress. Growth characteristics during freshwater residence have also been used to determine hatchery or wild origin.

Reports: Annual Progress Reports.

SUPPORTED BY Oregon State Government

**5.0316, DEVELOPMENTAL ANALYSIS OF FUNDULUS**

*J.M. OPPENHEIMER, Bryn Mawr College, Graduate School, Bryn Mawr, Pennsylvania 19010*

Two projects will be undertaken: 1) transplantation of portions of the fish, fundulus, embryonic shield after dis- and reaggregation of their cells at gastrula stages; and 2) characterization and localization of lipids and phospholipids in the developing central nervous system of Fundulus.

Thirds of the embryonic shield of Fundulus, obtained by dividing the shield along its anteroposterior axis, developed when grafted to extraembryonic membrane after being minced mechanically. The grafts resulted in the formation of surprisingly well-organized heads, trunks, or tails. It is proposed to extend these observations by grafting pellets of cells consisting of dis- and then reaggregated cells of portions of the embryonic shield. The portions of the shield to be tested will be 1) anterior, middle and posterior thirds of the shield, and 2) each germ-layer of the whole shield insofar as these have been separated at the stages at which the experiments are to be performed.

It is also proposed to study the lipid, especially the phospholipid, composition of the developing brain of Fundulus at specified stages.

Studies will be qualitative and quantitative, and will include attempts to localize particular components. The major source of nutrition for the embryo during the stages to be studied is the yolk; this too will be examined to determine changes in its lipid

**5. LIVING SYSTEMS (NON-HUMAN)**

and phospholipid spectrum. If time permits isotopic studies will be made to elucidate the transport of inorganic and organic phosphate from yolk to embryo.

SUPPORTED BY U.S. National Science Foundation

**5.0317, NUTRITION AND PHYSIOLOGY OF MARINE FISH IN CONTROLLED GNOTOBIOTIC ENVIRONMENTS**

*H.A. DYMSZA, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881*

Since natural ecosystems are extremely complex and not readily unraveled, the objective of the gnotobiotic approach of this project is to study the nutritional ecology of simple marine systems as integrated wholes. The advantages of gnotobiology are an ability to create ecosystems of known composition and the control of important variables. To this end, a modular 3-tank recirculating artificial sea water, germfree-gnotobiotic aquarium has been constructed. The system has provision for control of temperature, light, water circulation, water filtration, oxygenation and air filtration and flow. Parameters which can be measured include temperature, pH, oxygen, sodium, chloride and nitrate contents. Concurrently, while the gnotobiotic system was being built, *Artemia salina* was reared under various environmental and gnotobiotic conditions. In these studies, sterile natural diets were found to be superior to sterile semi-purified diets. Additional experiments were concerned with incubating and hatching 'clean' fish eggs. Procedures for egg decontamination and for sterility testing were also standardized.

SUPPORTED BY U.S. National Science Foundation

**5.0318, ACOUSTICAL COMMUNICATION IN AQUATIC ORGANISMS**

*H.E. WINN, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881*

It is proposed that we concentrate on several problems that have been explored to date. One is the detailed functional properties of the calls of toadfish and squirrelfish. Playing back sounds organized in various ways will be emphasized. Hearing studies, both electrophysiological and behavioral, will be carried out. Through brain anatomical studies and brain stimulation, both fixed and under free conditions, certain of the areas that control sound production can be delineated. In this way sound communication in several species of fish can be better understood.

Also, in navigation the properties of the sun-compass will be studied and an attempt will be made to find the cues that allow eels to leave fresh water and locate the distant spawning grounds in the southern Atlantic.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0319, BLOOD TYPES AS INDICATORS OF BLUEFISH RACES**

*P.H. EDMUNDS, U.S. Dept. of Interior, Marine Game Fish Research Lab., Narragansett, Rhode Island 02882*

Blood types in fishes, as in higher vertebrate classes, are hereditary traits and are not subject to environmental modification.

The work plan is to use normal or immune animal sera, saline extracts of selected leguminous plants, or combinations of the three to detect red blood cell antigenic difference (blood types) among individual bluefish; to characterize and statistically compare bluefish populations separated in space of time with respect to proportions of populations exhibiting specific types; to classify related types into blood group systems and attempt to deduce genetic basis for their control; to evaluate results in light of existing hypotheses about bluefish population structure, attempting to differentiate reproductively isolated groups.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

**5.0320, HEMOGLOBIN VARIATIONS AS INDICATORS OF BLUEFISH RACES**

*P.H. EDMUNDS, U.S. Dept. of Interior, Marine Game Fish Research Lab., Narragansett, Rhode Island 02882*

## 5. LIVING SYSTEMS (NON-HUMAN)

Hemoglobin commonly occurs in multiple forms, each of which may have its own distinctive physical and chemical properties. In some species all individuals have the same forms, although modification of the series may occur during ontogenetic development. In other species certain individuals possess hemoglobin variants which other individuals lack. Since individual differences of this kind generally are genetically controlled, they may be useful in differentiating reproductively isolated subpopulations (races).

The work plan is to analyze bluefish hemoglobins with electrophoretic, chromatographic, spectroscopic, or immunochemical techniques; to detect differences in hemoglobin assemblages among individual bluefish and to deduce genetic basis for differences; to characterize and statistically compare bluefish populations separated in space or time with respect to proportions of populations exhibiting various hereditary forms; to evaluate results in light of existing hypotheses about bluefish population structure, attempting to differentiate reproductively isolated groups.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0321, BLOOD TYPES AS INDICATORS OF WHITE MARLIN RACES

*P.H. EDMUNDS*, U.S. Dept. of Interior, Marine Game Fish Research Lab., Narragansett, Rhode Island 02882

Blood types in fishes, as in higher vertebrate classes, are hereditary traits and are not subject to environmental modifications.

The work plan is: 1. To use normal or immune animal sera, saline extracts of selected leguminous plants, or combinations of the three to detect red blood cell antigenic differences (blood types) among individual white marlin (*Tetrapterus albidus*); 2. To characterize and statistically compare marlin samples separated in space or time to determine the geographical distribution of blood types; 3. To evaluate, on the basis of these comparisons, existing hypotheses about white marlin population structure.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0322, HEMOGLOBIN VARIATIONS AS INDICATORS OF WHITE MARLIN RACES

*P.H. EDMUNDS*, U.S. Dept. of Interior, Marine Game Fish Research Lab., Narragansett, Rhode Island 02882

Hemoglobin commonly occurs in multiple forms, each of which may have its own distinctive physical and chemical properties. In some species all individuals have the same forms, although modification of the series may occur during ontogenetic development. In other species certain individuals possess hemoglobin variants which other individuals lack. Since individual differences of this kind generally are genetically controlled, they may be useful in differentiating reproductively isolated subpopulations (races).

The work plan is: 1. To analyze white marlin hemoglobins with electrophoretic techniques; 2. To detect any differences in hemoglobin assemblages among individual marlin and deduce the genetic basis for differences; 3. To characterize and statistically compare marlin samples separated in space or time with respect to proportions of populations exhibiting various hereditary forms, thus attempting to differentiate racial groups; 4. To evaluate, on the basis of these comparisons, existing hypotheses about white marlin population structure.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0323, HISTOPATHOLOGIC EFFECTS OF POLLUTANTS ON CELLS AND TISSUES OF MARINE FISHES

*P.P. YEVICH*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

Histopathologic studies will be conducted on various species of marine fishes after exposure to pollutants. Studies presently are being conducted on mummichogs being exposed to Cd and Pb.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0324, PHARMACOLOGY OF METAL POISONING IN ESTUARINE FISHES

*R. EISLER*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Pilot bioassays were conducted under laboratory conditions with mummichogs, *Fundulus heteroclitus*, against various metals abundant in solid wastes dumped off shore. Analyses by atomic absorption, and other methods, of mummichogs that died during exposure to high concentrations demonstrate measurable changes in elementary chemical composition. Tissues from fishes surviving sublethal exposures were also significantly different from controls in levels of one or more of the 25 metals measured. The significance of these changes in terms of environmental stress and metabolic pathways is being studied.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0325, HEMATOLOGICAL CHANGES IN *F. HETEROCLITUS* UPON EXPOSURE TO TOXIC METALS

*E. JACKIM*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Killifish are exposed to various toxic metals for 96-hr. and 30-day periods. The fish are killed and hematological tests conducted to observe and change in the differential blood count. Hematocrit and blood cell morphology are also compared to that of control fish. Normal seasonal, sex and size variations are also correlated to changes in the blood picture. Cadmium and lead are now under investigation. Cadmium shows a marked eosinophilia while the effects of lead are more subtle. Cadmium also appears to increase the hemoglobin and hematocrits in *F. heteroclitus*.

The blood morphology in other species of salt water fish is also being studied.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0326, COMPARATIVE BIOCHEMISTRY OF PROTEINS FROM GULF FISH

*A.H. BARTEL*, Univ. of Houston, Graduate School, Houston, Texas 77004

Hemoglobin and serum proteins of individual croaker (*Micropogon undulatus*) and spot (*Leiostomus xanthurus*) are being investigated to determine whether variations in properties can serve as biochemical markers of breeding populations. Electrophoretic patterns of the proteins from croaker differ significantly from those of spot, even though these two fish resemble one another morphologically and belong to the same family. Hemoglobin polymorphism occurs in these species. On the basis of different electrophoretic behavior of hemoglobin polymorphs, at least two, and possible three, populations of croaker occur in Galveston Bay. Present work is directed towards the isolation of these molecular forms of hemoglobin to determine the nature of the variations, and whether these variations reflect genetic variations. Croaker hemoglobin has a sedimentation coefficient of 4.4S and appears to be homogeneous in sedimentation behavior even though electrophoretic heterogeneity is observed. Observed decreases in sedimentation coefficient in 2M-NaCl suggests that fish hemoglobin dissociates in strong salt solutions.

A major problem facing the commercial fisheries is the identification of larval shrimp. Therefore, a comparison of proteins from various species of shrimp was initiated this summer to determine if biochemical taxonomy could be useful. The best extraction procedure found so far is to grind shrimp abdomens with alumina in 10% solution of NaCl. Analysis of extracts of shrimp by gel electrophoresis shows the presence of 15-20 components, but results are too preliminary to form any conclusions concerning the variation observed.

During the course of this research, staff members of The Bureau of Commercial Fisheries Biological Laboratory and the Texas Parks and Wildlife Department have greatly assisted us in collecting and identifying the fish and shrimp.

SUPPORTED BY Robert A. Welch Foundation

### 5.0327, PHOTOBIOLOGY OF MARINE ANIMALS

*J.A. NICOL*, Univ. of Texas, Graduate School, Port Aransas, Texas 78373

## 5. LIVING SYSTEMS (NON-HUMAN)

Introduction - Photobiological studies of marine animals now being actively pursued deal with: (a) Photoreception: the structure and function of photoreceptors; light perception and vision (Crescitelli, 1958; Clarke & Denton, 1962; Nicol, 1963). (b) Bioluminescence: the structure and function of luminous tissues and organs (Harvey, 1952; Nicol, 1955a, 1960d, 1962a, b; Boden & Kampa, 1964; Johnson & Haneda, 1966). (c) Pigmentation and structural coloration: the means by which the tissues of animals affect incident light, by

The present proposal is for an investigation of the tapetum lucidum of fishes. The grosser aspects of the structure and the functioning of this structure have recently been examined by light microscopy and optical means. Further work is to discover the submicroscopic organization responsible for the reflecting, and its significance.

### 5.0328, ECOLOGICAL EFFECTS OF ENVIRONMENTAL & LOW LEVEL POLLUTION STRESSES ON METABOLIC REQUIREMENTS FOR GROWTH OF GULF COAST FISHES D.E. WOHLSCHLAG, Univ. of Texas, Graduate School, Port Aransas, Texas 78373

The purpose of this portion of the continuing study is the evaluation of the effects of low-level, sublethal natural and man induced stresses on the metabolic and growth characteristics of Gulf Coast fishes. Von Bertalanffy and Ivlev-Winberg models relating metabolism, feeding and growth are used in conjunction with multiple regression experiments, which relate oxygen consumption rates (respiration) to body size, swimming activity, salinity, oxygen depletion (pollution), and temperature. Field experiments and growth data collection are underway for the striped mullet (*Mugil cephalus*), the pinfish (*Lagodon rhomboides*) and the spotted sea trout (*Cynoscion nebulosus*) over a wide natural range of salinities and over all seasons. The construction of models for quantitatively predicting sublethal, but deleterious, stress effects from thermal, salinity, oxygen depletion (pollution) or other aberrancies will be attempted.

### 5.0329, PHYSIOLOGY AND ASSAY OF PROLACTIN IN FISH

J.N. BALL, Univ. of Sheffield, Sheffield, United Kingdom

Prolactin from teleostean pituitary glands appears to be involved in electrolyte regulation and possesses only minimal and atypical pigeon crop and mammatrophic activities, and so cannot be assayed by the usual pigeon crop technique. We are engaged in developing and applying a bioassay for fish prolactin based on the unique ability of ovine prolactin to maintain plasma sodium in the hypophysectomized teleost *Poecilia latipinna* in freshwater, having demonstrated a linear relationship between log dose of prolactin and plasma sodium levels, and having also established that teleost pituitary homogenates produce a similar and parallel response. We plan to use this assay to determine the prolactin content of *Poecilia* pituitary in seawater and freshwater fish, and in fish transferred between the two media, and we shall relate our findings to morphological changes in the pituitary cells that secrete fish prolactin. We shall also attempt to allocate this biological activity to electrophoretically separated fractions of teleost pituitaries, and to determine whether immunologically active putative fish prolactin preparations possess biological activity, an essential step in the eventual isolation of fish prolactin. We plan to determine whether the *Poecilia* sodium-maintaining activity of bovine prolactin and of fish prolactin is separable from immunological activity, a point of great importance for considerations of the evolution of the structure and functions of prolactin.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0330, COLLECTION OF MATERIALS AND DATA FOR AGE-GROWTH ANALYSIS

E.B. JOSEPH, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The objective is to obtain hard parts (scales, otoliths, etc.) from ground fish of potential industrial importance in the area between Cape May, N. J. and Cape Hatteras, N. C. The hard parts will be obtained from fish that are caught in other phases of the project. Attempts to determine age and rate of growth by counting annual rings and measuring increments will be begun immediately but the analysis will be incomplete at the end of the fiscal year. This phase will be continued in subsequent fiscal years.

Age-growth data will supplement information on seasonal distribution and abundance of fishes in assessing the feasibility of industrial utilization of the ground fishes of the Continental Shelf. These analyses must precede any attempt to derive mortality rates, which will be a subject of a later sub-project.

Part 6 of 6.

### 5.0331, FISH BEHAVIOR AND PHYSIOLOGY

A.B. GROVES, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

The essential purpose of this work is to acquire a knowledge of intrinsic physical and sensory abilities of fish which relate to specific environmental factors encountered in migration and fish passage situations: A broader purpose is to assess the adaptive ranges of these capacities in different migratory fish stocks. This information will be applied to help predict or anticipate the effects on migrant fish of various river and estuarine development programs which are creating numerous changes in the environments of native stocks of commercially valuable species.

Specifically the work is with salmonids and involves measurements of fish capacities against selected environmental variables. This includes measurements of swimming performance abilities of juvenile and adult fish and activity patterns and responses of salmonid species. Studies also are made of sensory responses which may relate to migration and homing behavior, of physical and hydraulic factors that can injure fish in power turbines, of responses that may aid in diverting fish away from dangerous areas in turbines, and of effects on migrants of thermal shock such as that encountered by passing through heated effluents from thermal power plants.

The work is now in the laboratory but is directed to the idea that the derived information can be applied directly to field problems.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0332, PACIFIC FISH PHYSIOLOGY AND BIOCHEMISTRY (SALMON IMMUNOCHEMISTRY)

H.O. HODGINS, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Biochemical and immunochemical methods are being applied to identification of populations of Pacific salmon and other economically important Pacific fish species.

The process of maturation in Pacific salmon, particularly *Oncorhynchus nerka*, is under study, using specialized biochemical techniques to extract and purify hormones, certain immunochemical procedures to examine maturity-related antigens, and histochemistry and bioassays to correlate structure with function.

Limited studies on the physiology of stress in fish are also in progress. Particular emphasis will be on cause, effects, and significance of certain enzyme and hormone levels.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0333, IDENTIFICATION OF SOCKEYE SALMON STOCKS BY BONE MINERALS

R.L. MAJOR, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

A major objective of the Bureau of Commercial Fisheries' Seattle Biological Laboratory is to develop a basic knowledge about Pacific Salmon (*Oncorhynchus* spp.). Because no two stocks of a particular species of salmon have identical life histories, it is important to first identify the various stocks and then to

## 5. LIVING SYSTEMS (NON-HUMAN)

collect the biological data for each stock. The objectives of this project are (1) to identify the important stocks of sockeye salmon by the chemical composition of their bony structures and (2) to use the chemical characters alone or together with other characters to quantitatively divide catches containing mixed stocks into their component parts.

To date we have collected samples from inshore areas spanning the Pacific Coast of North America and explored various methods of sample preparation and analysis. X-ray diffraction analysis and emission spectro-photometry appear to be promising methods of analysis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0334, GULF OF ALASKA SOCKEYE SALMON SCALES, PROTOCOL AREA SOCKEYE SALMON SCALES, AND GULF OF ALASKA PINK SALMON SCALES

R.L. MAJOR, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

A major objective of the Bureau of Commercial Fisheries' Seattle Biological Laboratory is to develop a basic knowledge about Pacific Salmon (*Oncorhynchus* spp.). Because no two stocks of a particular species of salmon have identical life histories, it is important to first identify the various stocks and then to collect the biological data for each stock. The objectives of this project are (1) to identify the important stocks of salmon by their scale patterns and (2) to quantitatively divide catches containing mixed stocks into their component parts.

To date, differences noted in inshore samples of sockeye salmon from Asia and Western Alaska have been used to identify fish taken on the high seas as either Asian or Western Alaskan providing that the fish are maturing and that they are taken west of 175 degree W. longitude. We continue to study scales as a means of identifying the great number of sockeye salmon stocks inhabiting the Gulf of Alaska (East of 175 degree W.) and immature salmon in all areas.

Similarly, differences noted in the scale patterns of pink salmon from several North American areas have been used to classify samples taken in the Gulf of Alaska to their area of origin.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0335, BLOOD PARASITES OF NORTHWEST FISHES

M. KATZ, Univ. of Washington, Graduate School, Seattle, Washington 98122

This study is divided into two major sections. One section is devoted to the blood parasites of freshwater fish, primarily cottids found in various streams in the Green River watershed. At some stations certain cottids are infected with *Cryptobia*, *Trypanosoma* and *Haemogregarina*, while at other stations in the same stream the same fish species have no blood parasites or are infested with only one species. The ecological requirements of these fish, their food habits, behavioral patterns and migrations will be studied in an effort to determine the factors responsible for the variation in parasite infestation. It is hoped that an understanding will be gained of the life history of the parasite.

The second section of the project is a study of the life history, distribution of the blood fluke of the hake, *Oportocotyle marginosi*. The incidence of infection is being correlated with the age, sex, and size of the host fish. Large collections of hake from various locations in Puget Sound are being collected to determine the differences in distribution which may give some understanding of the life history of the parasite.

The food preferences of the hake are being studied to determine the invertebrates which may be the intermediate hosts of the nematode.

Blood smears of the hake are being examined for the presence of blood protozoans. In addition, the other helminth parasites of the hake are being enumerated to see if there is any correlation between the infestation of the blood with, and the numbers and kinds of other parasites.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0336, EFFECTS OF IRRADIATION, TEMPERATURE AND OTHER ENVIRONMENTAL FACTORS ON SALMONID EMBRYOS

A.D. WELANDER, Univ. of Washington, Graduate School, Seattle, Washington 98122 (AT(45-1))

This is a study of the combined effects of acute doses of X-rays on developing salmonid embryos held at various temperatures. Fish surviving to juvenile and adult stages will be examined for morphological changes in characteristics and alterations in reproductive capacity. Macroscopic as well as microscopic examinations, especially of chromosomes, will be made. Changes in meristic characters, body proportions and color are expected to occur at certain sub-lethal doses of x-irradiation. The 'stimulation' effects of low doses will be investigated. The effects of light on embryos, which are similar in some ways to temperature and irradiation, will also be investigated.

Results to date: A study of the synergistic effects of ionizing radiation and temperature on salmonid embryos was started October 1, 1967. Four developmental stages were irradiated in duplicate, one at ambient temperature and one 3.5 F above ambient temperature. Doses of 100 r or more caused proportionately higher mortalities at the elevated temperature. Differences in mortalities were much less after lower doses. Fish raised at the elevated temperature were 50 percent heavier and 18 percent longer. All irradiated lots raised at ambient temperatures were significantly larger than the non-irradiated controls.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0337, DISTRIBUTION OF C. BOTULINUM IN COMMERCIAL SMOKED FISH

E.M. FOSTER, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Outbreaks of type E botulism in 1960 and 1963 have been traced to smoked fish processed in the Great Lakes area. The purpose of this study is to determine the source of *C botulinum* type E on the fish.

Samples of water, mud and fish from various places in the Great Lakes will be tested for the presence of the type E organism to see if it occurs commonly and, if so, where it exists on or in the fish. Various species of fish will be tested to see if there is a difference in incidence between species. Efforts will be made to determine the natural habitat of the organism if it is found commonly. Concurrently, experiments will be run to evaluate methods of detecting *C botulinum* type E in natural materials.

SUPPORTED BY Wisconsin State Government

### 5.0338, SPATIAL ORIENTATION OF FISHES AND ITS SENSORY BASES

A.D. HASLER, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The investigator will determine the environmental cues and the sensory mechanisms utilized by fish to direct their migrations. An intimate understanding of the characteristics of fish movements as they occur in nature is prerequisite to critical testing of specific hypotheses. The basic approach will be to conduct research in regions of known migration and to accumulate large numbers of detailed maps of the migration pathways of the fish as they are moving through these areas. This will be accomplished through the use of the technique of ultrasonic tracking. Simultaneously several environmental factors which might be used as cues in the orientation process will be monitored during the tracking. Tracking experiments conducted under a wide variety of environmental conditions, and through the manipulation of several of the basic sensory systems of the fish, should give indications of the most important environmental cues and sensory modalities used by fish in their orientation. Laboratory experiments, concentrating on what appears to be the most important senses and mechanisms will then be initiated, along with specific field experiments, to test the most promising hypothesis of orientation.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0339, SPATIAL ORIENTATION OF FISHES AND ITS SENSORY BASES

A.D. HASLER, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

Brief description of research project: The investigator proposes to continue his studies on orientation of migratory fishes being conducted currently under grant GB-606. These studies have as their objective an understanding of directed movements of fishes with special emphasis upon the sensory bases of spatially oriented behavior of those fishes which undertake extensive migrations in rivers and at sea. He will extend these studies by: 1. migration of the salmon at sea, based on detailed information and techniques which were developed from a model situation in Lake Mendota, Wisconsin. 2. Continuation of studies of orientation in pond and lake fishes. 3. Studies of physiology of vision and olfaction as it relates to orientation.

SUPPORTED BY U.S. National Science Foundation

### 5D. MOLLUSKS - CRUSTACEA

(see Also Food and Food Sanitation in Chapter 6a.)

### 5.0340, ADULT SHRIMP STUDIES

L. BARR, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

This project began in July 1962. The shrimp industry in Alaska has increased greatly and expanded from the traditional Southeastern Alaska fishing grounds to the Seward-Kodiak area of Central Alaska. There is also a growing foreign fishery being prosecuted by Japan and USSR. There is an almost complete lack of information on the ecology of the various commercial species of shrimp in Alaska.

The commercial shrimps in Alaska all belong to the family of Pandalidae. The pink shrimp *Pandalus borealis* is the most important species but *Pandalopsis dispar*, *Pandalus goniurus*, *Pandalus hypsinotus*, and *Pandalus platyceros* are also harvested to some extent. The U. S. harvest of shrimp was about 30% larger in 1966 than during 1965.

The life histories of the commercial Pandalids are being studied in the Kachemak Bay area, Cook Inlet, Alaska. Sampling with 1/2 meter nets and Miller hi-speed samplers for larval shrimp and the associated zooplankton has been carried out every other week since the program began, except for times when the research vessel was inoperative. Temperature and salinity data are being taken in the bays and estuaries where the biological samples are taken.

The objectives of the current study are: (1) To determine the life histories of Pandalid shrimps in the Cook Inlet area. (2) To determine the diel behavior pattern of shrimps. (3) To determine the seasonal variation in abundance of Pandalid shrimps within restricted bays. (4) To determine the habitats of Pandalid shrimps. (5) To determine the role of nursery areas in the early life history of the spot shrimp, *Pandalus platyceros*.

Most of the field work will be done in Kasitsna Bay, but some research will be conducted at Little Port Walter in Southeastern Alaska and at Auke Bay, Alaska.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0341, BERING SEA KING CRAB STUDIES

J.F. HEBARD, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The intensified fisheries of Japan and USSR have affected the stock of king crab in the Bering Sea. During recent years, according to Japanese and Soviet catch statistics, catches per unit of effort have decreased and catches are made up of smaller crab. Currently, U. S. fishermen harvest few crabs from this area because fishing is better elsewhere. However, as the stocks south of the Alaskan Peninsula and the Aleutian Islands become fully utilized, we expect U. S. fishermen to move their operations to the Bering Sea, if the stock there is not in a depleted condition.

Systematic sampling and proven tagging methods are being employed to estimate population parameters and the effects of fishing. These will be used to determine optimum sustainable yield. Since there is some evidence that the abundance of har-

vestable sized male crabs fluctuates from year to year, a major portion of our research effort is directed towards determining the causes of these fluctuations. We are therefore concerned with the ecological factors that may affect growth, migrations, etc. Therefore systematic oceanographic sampling procedures are being utilized to determine water temperatures, salinities, currents, etc.

Objectives of the program include: (1) To determine the maximum sustained yield which the stock can support. (2) To develop a method of forecasting stock size. (3) To determine the distribution of the Eastern Bering Sea king crab stock with respect to abundance, shell condition, sex, and size during the period of the study. (4) To determine reproductive rates, growth rates, mortality rates, and migration patterns. (5) To determine the effect of environmental conditions on distribution, abundance, reproduction, growth, mortality, and migration on the Bering Sea king crab. (6) To compare results obtained during this study with results obtained during the previous study in 1954-1962.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0342, GULF-PENINSULA KING CRAB STUDIES

D.T. HOOPES, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

The rapidly increasing harvest of king crabs south of the Alaska Peninsula and Aleutian Islands has continued for several years. The effect of this harvest, by U.S. fishermen, on the various stocks of king crabs is unknown, partly because the geographic ranges of the separate stocks have not been determined.

Systematic sampling and proven tagging methods are being employed to estimate population parameters and the effects of fishing. The first step is to delimit the distribution of king crabs in waters of the study areas. This distributional information will then be used to define stock units. Finally, the stock units will be individually studied to make estimates of optimum yield.

Objectives of the program include: (1) To determine the relationships among inshore-offshore (national-international) populations of king crabs. To define the offshore limits of inshore stocks and to determine if completely offshore stocks exist. (2) To determine the effect of the commercial fishery on such king crab stocks and to estimate optimum fishing intensity. (3) To collect comparative data on population parameters and biology of king crabs from different geographical areas. (4) To collect oceanographic data for correlation with crab distribution and abundance information.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0343, EARLY LIFE HISTORY DECAPOD CRUSTACEANS

D.T. HOOPES, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Most of the research on pandalid shrimps and lithodid crabs by the Bureau of Commercial Fisheries has been concerned with the population dynamics and biology of adult animals. The information available on the biology, ecology, and dynamics of the early life stages of the commercially important species of king crabs and shrimps is extremely limited. It is important that we understand these early life history stages in order to predict abundances of harvestable sized crabs and shrimps.

The objectives of this project are: (1) To describe the early life history stages of *Pandalus goniurus*, *P. Hypsinotus*, *P. platyceros*, and *Pandalopsis dispar*. (2) To determine the distribution of larval and juvenile king crab and pandalid shrimp species in respect to bottom types, depth of water, and other environmental factors. (3) To determine growth and age and size and maturity of young king crabs. (4) To determine reproductive potential of lithodid crab and pandalid shrimp species. (5) To relate environmental factors such as temperature, salinity, sediment types, associated species, etc., to abundance, growth, and natural mortality of larval and juvenile crabs. (6) To determine the energy requirements for growth, respiration, molting, and regeneration of larval and juvenile crabs; and reproduction of adult crabs. (7) To develop a method of marking small crabs.

Not all of the objectives included in this project will be worked on during any particular year because of limited funds and personnel but, since all of the objectives are important, the

## 5. LIVING SYSTEMS (NON-HUMAN)

first objectives to be included in the field work and laboratory experiments will be those that mesh best with other Shellfish Investigation programs.

The environmental measurements such as salinity and temperature and the zooplankton data which will be collected on this project may serve as background data for other fishery or oceanographic research in the laboratory.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0344, ORGANISMS RESPONSIBLE FOR TOXICITY OF ALASKAN CLAMS

*M.B. ALLEN*, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The aims of this project are: (1) to identify the organism(s) responsible for toxicity of clams and mussels in Southeast Alaska. (2) To isolate these organisms in axenic culture and study the effect of environmental variables on their growth and toxicity, with the aim of being able to predict when clams might or might not be toxic, or hopefully, eventually to control toxicity in the shellfish population.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0345, INVESTIGATION OF ECOLOGICAL FACTORS LIMITING PRODUCTION OF THE ALASKAN PANDALID SHRIMP

*J.B. BEALS*, State Dept. of Fish & Game, Juneau, Alaska

The objectives of this study are to provide life history information, ecological data, growth rates, periods of sexual reproduction, sex and species composition, bottom distribution, bottom types, length frequency data, size weight relationships, etc. of the commercially important Pandalid shrimp of Alaska. Additional collection of non-commercial species will be collected incidental to the regular sampling and will be incorporated into a key for the identification of these species. Information of fishery factors, e.g., sizes of mesh, type of trawl, duration of drags, bottom type, depth and location, etc., will also be obtained.

Sampling will consist of extracting a two to four pound sample directly from the commercial trawls after completion of a drag. Sampling will be conducted by Fish and Game Aides and Supervisory Project Leader.

Sampling will be conducted throughout the year in the Wrangell-Petersburg area and in the Kodiak Island area.

Technical personnel will include James B. Beals, Jerry McCrary and Fish and Game Aides.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0346, DUNGENESS CRAB POPULATION DYNAMICS STUDY

*C.W. LEHMAN*, State Dept. of Fish & Game, Juneau, Alaska

Objectives: To determine the effects of log rafting practices on dungeness crab grounds (preliminary investigations).

Starting in 1965 crab fishermen will be interviewed for their opinions on the effect of log rafting on crab grounds, with reference to specific instances of crab ground damage.

On the basis of these interviews, specific areas will be checked for gross changes through the use of SCUBA gear. These areas will be compared to adjacent untouched areas to assess possible damage to existing crab grounds by future log booming activities.

### 5.0348, KODIAK KING CRAB ENVIRONMENTAL ZONE SURVEY

*G.C. POWELL*, State Dept. of Fish & Game, Juneau, Alaska

The foremost objective of this phase of a long range study of the reproduction of king crab in the Kodiak Island area is to delineate the major environmental zones of the continental shelf near the island. The various zones will be plotted using marine charts and available trawling records so that the relative composition of the continental shelf can be related to a sampling program to facilitate the determination of possible breeding relationships. Each of the major environmental zones will be sampled so that true king crab distribution indices can be obtained. Non-feeding, non-migrating crabs will be collected as well as those actively feeding and migrating.

### 5.0349, OCEAN ENGINEERING

*B.F. JONES*, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Juneau, Alaska 99801

Preliminary Planning or Research: Exploratory Fishing and Gear Research general shrimp surveys have indicated substantial populations of Pandalid shrimp throughout Alaskan waters. To date, expansion of the shrimp fishery has been primarily for the pink shrimp *Pandalus borealis*. In southeastern Alaska, expansion of the pink shrimp fishery has been restricted primarily by the market demand, as most of the shrimp are hand-peeled for a limited high price specialty market. In other areas, the economics and processing problems are probably the most significant limiting factors. Up to this time, only minor emphasis has been placed on the development of fisheries for the prawn shrimp - *Pandalus platyceros*, *Pandalus hypsinotus*, and *Pandalopsis dispar*.

Utilization of Alaska shrimp stocks to date has been concentrated on small shrimp for canning and frozen 'logs' - products of low relative value having severe technological limitations. These quality problems are under study at the Bureau's Technological Laboratory at Ketchikan. Finally, quality defects resulting from vessel handling and preservation techniques are responsible for the limited scope and acceptance of present Alaska shrimp products.

Objectives: 1. To promote and assist in the development of a prawn fishery in southeastern Alaska. 2. To develop specific shrimp gear which more effectively selects and harvests the several species of Alaska shrimp. 3. To publish and release, to the fishing industry, all pertinent information as it becomes available. 4. To develop shipboard handling and preservation techniques for larger Alaska shrimp species -- shrimp primarily destined for frozen market and usually used individually. 5. To develop shipboard handling and preservation techniques for smaller Alaska shrimp species -- shrimp primarily destined for canned, block, or log products and usually used in bulk.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0350, PROCESS-INDUCED CHANGES IN CRUSTACEAN MUSCLE TISSUE

*R.W. PORTER*, U.S. Dept. of Interior, Technological Laboratory, Ketchikan, Alaska

A unique feature in processing many shellfish as contrasted with processing vertebrate animals is that the meat is cooked in the first stage to facilitate removal of the shell. Consequently, the normal post-mortem changes in the bio-chemical and physical properties of raw meat do not occur in processed shellfish. Instead, the cooked shellfish meat undergoes other changes, mainly in flavor and texture. These result from losses in flavor con-

## 5. LIVING SYSTEMS (NON-HUMAN)

stituents, moisture, and many water soluble constituents. These losses are affected by pre-processing handling (crabs are held alive in salt water tanks before processing) and the initial cooking process (time and temperature).

The nucleotides of king crab have been characterized and the results will soon be published. The next phase of this study will be to alter processing conditions to allow maximum accumulation of IMP, a known flavor enhancing compound and correlate this with flavor panel scores. If these factors are directly correlated the king crab quality could benefit by incorporation of these changes into commercial processing of king crab.

In addition, cooking time and temperature will be varied to assess their effects on the losses of muscle tissue constituents following freezing and thawing. In particular we are going to check the amount of nucleotides, free amino acids and undenatured protein which is lost in the fluids freed after thawing as influenced by prior cooking time and temperature. King crab (*Paralithodes camtschatica*) will be used as the experimental animal, however, the principles involved will be applicable to most crustacean tissue.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0351, PREDATOR PREY RELATIONSHIPS BETWEEN ECHINODERMS AND MOLLUSCS

A.S. MARGOLIN, Phoenix College, Undergraduate School, Phoenix, Arizona 85013

The recognition of predators by prey species and the reactions of the prey, which in many cases, appear to function as escape mechanisms, is an aspect of the behavior of marine invertebrate animals which has not been well studied. The occurrence of a considerable number of such behavioral patterns among molluscs in the presence of echinoderms presents excellent opportunities.

It is planned to work with animals from the northern end of the Gulf of California. Molluscan and echinoderm species will be collected and checked for reactions. Field observations will be made to learn whether interacting species live together, and whether there is evidence of significant predation. The collected specimens will be maintained alive in a recirculating seawater system at Phoenix College. Responses will be observed, descriptions written, and records made by still and motion pictures. Experimental situations will be planned to determine whether actual contact is necessary or whether stimulation can occur at a distance. The nature and source of the stimulating material will be studied.

During the summers, work will be done at the Friday Harbor Laboratories to determine whether the seastar *Pisaster ochraceus* is repelled by the raised mantle of *Diadora aspera*, and if so, what the nature of the repelling substance is. Work will also be done on the effect of extracts of the seastar *Pycnopodia helianthoides* on the snail *Buccinum plectrum*.

SUPPORTED BY U.S. National Science Foundation

### 5.0352, TEMPERATURE NEEDS FOR GONADAL DEVELOPMENT AND SPAWNING OF DIFFERENT PHYSIOLOGICAL RACES OF THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA

V.L. LOOSANOFF, Univ. of The Pacific, Graduate School, Dillon Beach, California 94929

Chief aim of the proposed studies is to evaluate the differences in temperature requirements for maturation of gonads and some aspects of the spawning behavior of different physiological races of the American oyster, *C. virginica*. These studies will be based on the results of experiments designed to ascertain the number of days required for oysters of different geographical races, kept at different but constant temperatures, to develop the first mature sex cells, and the number of days before these oysters can be induced to spawn.

Studies are based on large samples of oysters which originated in the waters of Long Island Sound, Connecticut, New Jersey, Virginia, South Carolina and Florida.

SUPPORTED BY Society of The Sigma Xi

### 5.0354, PORCELLANID CRABS OF AUSTRALIA

J.S. GARTH, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The Porcellanidae, a family of marine crabs belonging to sub-order Anomura, are found in the littoral and sublittoral zones of all but the coldest seas. As part of a long-term revisionary study of the Porcellanidae of the world, the Co-Investigator has become involved in a series of projects dealing with Indo-west Pacific members of the family with assistance from grant NSF GB-3225.

Thirty-three species of Porcellanidae have been reported from Australia, but at least ten more, not recorded in the literature, are known to occur there; a thorough survey may reveal the presence of still others. The relationships of the porcellanid fauna of Australia with that of other areas are not fully understood, and the status of a few species is doubtful. Very little attention has been paid to the Australian Porcellanidae from the standpoint of habits and ecology. Even routine identifications are difficult in many cases because of inadequate descriptions, lack of illustrations, and scattered literature.

The object of the proposed research is to attempt to solve the problems relating to this fauna, through review of the literature pertaining to Porcellanidae of Australia, examination of Porcellanidae in several Australian museums, and collection and study of fresh material.

### 5.0355, GROWTH LAYERING IN BIVALVED MOLLUSKS - AN AID IN PALEOBIOGEOGRAPHIC INTERPRETATION

C.A. HALL, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

A systematic study of the microtexture of the same or similar year classes of *Tivela stultorum* will be made throughout its range. The presence of annual growth bands or rings on this species has been documented by others. (A) The mean thicknesses of the 'daily' or fourth-order layers in the second to fourth annual band will be determined. (B) The number and kind of growth layers in (i) the summer and (ii) winter (second-order layers) will be counted. The following questions will be asked: (1) Are there 360 to 365 daily or fourth-order growth layers present between the annual bands or in the first-order layer in *Tivela* collected at different sites and latitudes. (2) Are there differences in the thicknesses of fourth-order layers that can be correlated with latitude or some other factors. (3) Other than *Tivela*, which taxa have annual or seasonal growth layers and at what latitudes and in what temperatures of water do those forms with such bands occur? (4) Do taxa from high polar latitudes have slow shell growth, are there 360 to 365 'daily' growth increments as have been noted in taxa from temperate and outer tropical latitudes? (5) Do taxa from near-equator latitudes have seasonal growth bands or layers.

SUPPORTED BY U.S. National Science Foundation

### 5.0356, PORT SAMPLING - CRESENT CITY, BROOKINGS, PORT ORFORD

H.G. ORCUTT, State Dept. of Fish & Game, Menlo Park, California

The work planned for this project (January 1, 1966-June 20, 1966) is the continuation of the monitoring and sampling of landings of crab, shrimp, and bottomfish initiated in January, 1966. The work includes collecting and analysing catch and life history data for the Ports of Crescent City, Port Orford, and Brookings. The data and observations are necessary to determine changes in population size, age composition, and stock status as prerequisites to proper management of the crab, shrimp, and bottomfish resources.

1. During the period January through April, the work is primarily with the crab fishery. 2. During the period May through

## 5. LIVING SYSTEMS (NON-HUMAN)

June, work is primarily with the shrimp fishery. 3. During the entire period, the second priority is to monitor the otter trawl fishery at Crescent City and Brookings.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
California State Government

**5.0357, SHELLFISH AND BOTTOMFISH DATA**  
*H.G. ORCUTT*, State Dept. of Fish & Game, Menlo Park, California

Using crab resource data, the effects of continually increasing fishing pressure, the efficiency of saving gear, the adequacy of size limits and seasons, the values of harvesting males only, the recruitment and mortality rates, the wide variations in landings, and the extended period of low yield will be studied to determine how to improve commercial fishing.

From shrimp data, the methods of population estimation, the optimum catch per shrimp bed, the season for greatest return for effort, the exhaustion of shrimp beds in one season, and recruitment and mortality rates will be studied to evaluate the fishing methods.

By study of bottomfish data, the trends of a fishery developing from one based on a few flatfish species to one of many flatfish, rockfish, hake, sablefish, and other species will be traced. The possible inter-relationships of sub-populations disclosed by tagging data will be examined. The value of savings gear in the multiple species fishery and economical means to increase the catch per unit of effort will be studied. Evidences of latent resources and discarded fish will be examined to determine need of more full utilization of fish readily taken.

The work schedule for July 1, 1966-June 30, 1967 is for the study of crab, shrimp, and bottomfish data at the Fish & Game Laboratory at Menlo Park. This includes: (1) Compilation of data on hand (2) Key-punching data for computer use and (3) Design a program for electronic data computers.

**5.0358, SHELLFISH EMBRYOLOGY AND LARVAE DEVELOPMENT STUDY**  
*P.M. ROEDEL*, State Dept. of Fish & Game, Menlo Park, California

Objectives: To study the techniques of previous investigators of shellfish culture: To attend training sessions in shellfish culture methodology and procedures: To initiate laboratory and equipment designs for a shellfish laboratory.

Procedure: Research of shellfish culture and shellfish embryology literature will be initiated and continued. The biologist in charge will be sent to the Milford, Conn. laboratory of the U.S. Bureau of Commercial Fisheries for training in methodology and procedures. Work on laboratory design and plans for obtaining necessary equipment will be initiated.

**5.0359, SYSTEMATICS OF THE ANTARCTIC AND SUB-ANTARCTIC GAMMARIDEAN AMPHIPODA**  
*J.L. BARNARD*, Beaudette Fdn. Trust, Moss Landing, California

The primary purpose of this study is to interrelate abyssal and bathyal Amphipoda of antarctic and subantarctic seas to those of other ocean basins and to those of sublittoral antarctic depths. Sublittoral collections at hand were obtained in the Magellanic area of South America by R/S Vema and deep-sea collections were obtained from South America westward and southward by Vema and R/S El Tanin. Most of the funds are to be devoted to illustration and description of new and poorly known species in the deep-sea collections. Only benthic Gammaridea will be studied. Interrelationships will be studied particularly with those amphipodan faunas that have been well-studied: bathyal California, abyssal and bathyal north and south Atlantic, northwestern Pacific and subarctic. A secondary purpose is to determine the extent of bipolarism in Amphipoda; this is a question that is presently controversial.

SUPPORTED BY U.S. National Science Foundation

**5.0360, INVESTIGATE THE CAUSE OF MORTALITY OF PACIFIC OYSTERS ALONG THE CALIFORNIA COAST**  
*P.M. ROEDEL*, State Dept. of Fish & Game, Sacramento, California (14-17-0001-1382)

To conduct studies of normal and abnormal oysters to determine pathological conditions and causative factors and relate these factors to mortalities.

The first phase of the project will include three weeks of specialized training to the project leader at the Bureau of Commercial Fisheries Laboratory, Oxford, Md., and at the Oyster Disease Laboratory at the University of Washington.

The next and continuing phase is the establishment of a sampling and study program. Oyster producing areas of California will be sampled monthly to determine endemic diseases, causes of mass mortalities, and survival of oysters in varying environmental conditions. This study will include the marine bays and species as indicated below: Morro Bay-*Crassostrea gigas*; Elkhorn Slough-C. *gigas*; Drakes Estero-C. *gigas*; Tomales bay-C. *gigas*, *C. virginica*; Humboldt Bay-C. *gigas*, *O. lurida*

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0361, ECOLOGICAL, EXPERIMENTAL AND COMPUTER STUDIES OF ENDOGENOUS RHYTHMICITY**  
*J.T. ENRIGHT*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This proposal requests support for research on endogenous physiological rhythmicity in marine crustaceans. The research involves three general lines of approach: 1) laboratory experimentation designed to evaluate the sensitivity of tidal and circadian rhythms of crustaceans to phase-shifting by mechanical stimuli, light and chemicals; 2) laboratory and semi-controlled field experimentation to determine the relationships between rhythmicity in locomotor activity and orientation to light stimuli; and 3) computer studies to extend, refine and test a mathematical model for endogenous rhythmicity in locomotor activity, a model which is based on the hypothesis that simple couplings between elements of the central nervous system underlie the rhythms.

SUPPORTED BY U.S. National Science Foundation

**5.0362, STUDIES IN MICRONEUROPHYSIOLOGY**  
*S. HAGIWARA*, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038

Membrane mechanisms as well as excitation contraction coupling in giant muscle fibers in a barnacle will be studied by using voltage clamp technique, ion flux measurement, etc. Similar lines of work will also be done in multi-ionic mechanisms of Aplysia ganglion and photo receptor cells in a barnacle.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0363, THE STRUCTURE AND FUNCTION OF CRUSTACEAN EYES**  
*E.M. KAMPA*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The eyes of crustaceans that inhabit the open ocean and undertake extensive diurnal vertical migrations differ vastly in structure, developmental pattern, photomechanical changes, pigments and spectral sensitivity from those of inshore bottom-dwellers. In certain pelagic crustaceans, development is an outward growth of reticular cells which secrete a hyalin filament distal to the rhabdom. This filament acts as a light guide and ommatidia. Other pelagic forms examined recently have structures homologous with the bottom-dwellers, but show no photomechanical changes in screening pigment. Examination of histological preparations indicates that in these a light guide may be occasioned by a modification of the proximal section of the cone stalk. All of the Crustacea that have so far yielded to spectral sensitivity studies (by electroretinograms) or to visual pigment extraction show a marked adaptation to photoenvironment. During September-December, 1965, we examined intensively the photoenvironments, vertical distribution and spectral sensitivities of animals in the upper 1000 meters of water in a selected small area of ocean. Specimens were also preserved for histological analysis. It is the purpose of the proposed project to correlate the various facets of

the investigation and to evaluate critically the hypothesis that environment may exert as considerable an influence on the structure and function of crustacean eyes as do phylogenetic relationships.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0364, RESEARCH ON THE BIO-SYSTEMATICS OF THE CIRRIPIEDIA**

*W.A. NEWMAN*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The proposed research concerns aspects of the biosystematics of the thoracic Cirripodia. Four areas of inquiry are to be followed, dealing with 1) recurrent setation patterns in larval forms, 2) development and significance of interlaminar figures, 3) function of primordial plates in the Lopodomorpha during metamorphosis, and 4) a possible functional relationship between the eyes of balanomorphs with certain so-called ornamentations of the shell.

SUPPORTED BY U.S. National Science Foundation

**5.0365, GENETIC REGULATION OF HEMOGLOBIN SYNTHESIS IN ARTEMIA**

*S.T. BOWEN*, San Francisco State College, Graduate School, San Francisco, California 94132

The long-term goal of this research is to elucidate the role of structural and regulator genes in the synthesis of hemoglobin in the brine shrimp, *Artemia salina*. This may be an excellent system for the study of regulator genes in a metazoan because *Artemia* hemoglobin is an inducible protein which can be readily isolated and characterized and it occurs in a species which is suitable for intensive genetic studies. Shrimps mature in two weeks, making it possible to obtain more than 12 generations in one year. Females produce broods of about 50 nauplii every 6 days throughout their life span of 4-6 months. Of the nine single-locus mutations reported in this species, six have been found in our laboratory. Because *Artemia* races, when reared in the laboratory, initiate hemoglobin synthesis at different levels of oxygen deprivation, it is possible that they differ in regard to regulator genes.

There are three specific objectives: 1) We plan to determine which environmental factors are needed for maximum synthesis of each of the three hemoglobins. 2) We will determine the mode of inheritance of the three hemoglobins commonly found in wild populations in salters on San Francisco Bay. More than 100 shrimps have been examined and it is evident that the hemolymph of one shrimp may contain any one hemoglobin, a combination of any two, all three hemoglobins, or none at all. There is a sex difference in the distribution of hemoglobins in the wild population. Hemoglobin synthesis will be studied in the progeny of single pair matings in our laboratory stocks which carry a marker on the sex chromosome and in which crossing over is suppressed between the sex chromosomes. 3) We will characterize the hemolymph chromoproteins by dissociation into subunits, determination of molecular weights, and (if time permits) by fingerprinting and amino acid analyses.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0366, THE PROCESS OF DEMINERALIZATION-BORING IN BIVALVES**

*E.H. SMITH*, Univ. of The Pacific, Graduate School, Stockton, California 95204

The proposed research would involve a detailed morphological and ecological study of the species which employ a process of chemical demineralization to aid in boring into calcareous substrates. After the initial morphological study the demineralization research program would be divided into three parts. First, the actual demineralization process used in softening calcareous rocks or shells would be investigated. This would include the histology and histochemistry of the organ or organs systems involved, along with a functional interpretation of the actual process. The histology and histochemistry of the secretion and formation of the periostracum would be studied in detail. Lastly, the process of lining the burrow with a calcareous matrix would be investigated.

**5. LIVING SYSTEMS (NON-HUMAN)**

This proposed research program would shed light on the mechanisms used in demineralization and decalcification by marine organisms, calcification mechanisms and make up, and the role of the protective periostracum.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0367, SYSTEMATICS, BIOLOGY, AND HYDROGRAPHIC RELATIONS OF SOME SPECIES OF CALANUS (CRUSTACEA, COPEPODA)**

*B.M. BARY*, Univ. of British Columbia, Graduate School, Vancouver - British Columbia, Canada

This research is concerned with a definitive analysis of the distribution and morphological variation of the copepod genus *Calanus*, an animal which occupies a primary position among planktonic populations; often dominating a community and covering large areas of the upper sea layers. The investigator is attempting to determine the hydrographic water mass factors which support and/or limit the distinct populations of this animal.

An understanding of the biological and ecological factors that influence distribution of organisms is essential in hydrobiological studies. With information gained from these kinds of studies predictions can be obtained relating to the dispersal and occurrence of pelagic forms of boring and fouling organisms, those capable of acoustic interference and/or luminescence, and those forms which constitute toxic hazards to personnel.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0368, COPEPOD CRUSTACEANS PARASITIC ON FISHES**

*A.G. LEWIS*, Univ. of British Columbia, Graduate School, Vancouver - British Columbia, Canada

The purpose of the project is to study the collections of copepod parasites from Eniwetok Atoll and from Indian Ocean fishes both from a taxonomic and a zoogeographic standpoint. The hydrographic data from cruise 2 of the Anton Bruun will be used in the discussion of the distribution of the copepod parasites of the pelagic fishes collected during this cruise. The distribution of these copepods, as well as others collected during cruise 2, will be compared with their distribution throughout the world.

SUPPORTED BY U.S. National Science Foundation

**5.0369, ION TRANSPORT MECHANISM IN GIANT AXON**

*E. ROJAS*, Univ. De Chile, Santiago, Chile

I. A parallel study between biochemical properties of the enzyme system ATP-ase isolated from cell membrane fraction of the squid giant axons and transport of sodium, potassium and calcium ions by giant axons under continuous intracellular perfusion.

II. A parallel study between ion-exchange properties of the cell membrane fraction and ion-exchange properties of the axonal membrane under continuous intracellular perfusion.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0370, ECOLOGY OF MARINE BIVALVE MOLLUSCAN LARVAE**

*T.A. GAUCHER*, General Dynamics Corporation, Groton, Connecticut (N00014-66-C-0302)

This program is a study of the causative mechanisms which may explain why larval molluscs, specifically *Mya arenaria*, are found in clustered, discontinuous distributions. The ecosystem of which the larval mollusc is a part is being examined for the possible effects of intraspecific behavior, mass mortality, and hydrographic factors upon the site of attachment of these molluscs. In addition, the hypothetical exhibition of preference by molluscs of one substratum type over another on which to set is being examined and evaluated.

One of the most interesting biological problems faced by Navy planners concerns the ability of artifacts placed in the sea to attract organisms. The proposed study explores the problem and relates especially to the behavior of sessile and burrowing animals, including boring, fouling, and the undercutting of bot-

## 5. LIVING SYSTEMS (NON-HUMAN)

tom sediments on which equipment is resting. Since the Navy is moving more and more towards operations requiring long-term submergence, it is desirable to examine this attraction in an attempt to avoid or control it.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0371, LARVAL STUDY OF THE LOBSTER

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

Plankton tows will be taken in Long Island, Fishers Island, and Block Island Sounds in the Atlantic Ocean off Block Island and Long Island in an attempt to locate larval lobsters. A few tows taken during 1965 have been examined for larval lobsters. Some larvae were collected in the Sounds, but better results were obtained in the Atlantic off Montauk.

Information available from the former Lobster Hatchery at Naank, Connecticut, indicates that the majority of lobster eggs hatched in June and early July. It is proposed to closely observe egg development on buried females during the spring. This can be accomplished by fishing our own pots or by sailing with certain commercial lobsterman.

Weekly plankton tows will be initiated in the inshore waters during the latter part of May. The periodicity and duration of the tows will be increased as information is gathered. Day and night tows will be made to evaluate which is the better time to sample. Only surface tows will be made during 1966.

Offshore plankton tows are believed to be necessary if we hope to delineate the population to which the Fishers Island and Long Island Sound lobsters belong. It will be necessary to determine the areas of origin, the transport of the larvae and the probable areas of settlement before we are able to understand the ecology of this animal in this area. An off-shore cruise made on August 5, 1966, yielded six lobster larvae (three 1st stage, one 3rd stage and two 4th stage). The area sampled is approximately 40 to 55 miles SSE off Montauk, Long Island. This is the only evidence we have on the occurrence of larvae in the Atlantic off Block Island and Long Island. Periodic cruises will begin in June and continue until additional positive evidence is gathered on the off-shore occurrence of the larvae.

### 5.0372, TAGGING PROGRAM

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

The major emphasis on this phase will not take place until 1967 and 1968. It is believed that basic information of the size composition and distribution of the population is needed prior to the initiation of this phase.

The type tag to be used will not be selected until other researchers have completed their evaluation of tags and methods of attachment.

Objective: 1. Determine the movements of lobsters in and from Long Island and Fishers Island Sounds. 2. Define the population to which these lobsters belong. 3. Determine the rate of exploitation.

Procedure: It is planned to use three procedures for securing lobsters. These are: 1. Scuba divers collecting and tagging under water. 2. Fish our own pots. 3. Buy directly from the lobster boats.

It is believed that divers will be able to collect lobsters more efficiently than with any type gear. Experience to date indicated that smaller lobsters are easily found in daytime, but larger lobsters are more accessible at night. The additional advantage of using divers is that more accurate information can be gathered on local movements by revisiting areas previously worked.

We plan to fish a rather limited number of pots in an attempt to evaluate the most efficient method of catching lobsters. These pots must be unbuoyed and checked by divers. Experience has shown that the probability of buoyed pots being disturbed is extremely high.

Several lobster fishermen have promised complete cooperation in this program. It is planned to secure lobsters, tag and release them in areas not accessible to divers. These areas are, in general, deep and have fast currents. This procedure will be discontinued if returns indicate extensive movements of lobsters from shallow to deep waters.

Part 3 of 3.

### 5.0373, PHYSIOLOGY AND BEHAVIOR OF LARVAE (PHYSIOECOLOGY OF SHELLFISH PROGRAM)

H.C. DAVIS, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

The development of routine methods for rearing bivalve larvae has enabled us to determine the effect of various ecological factors on larvae of the American oyster, *Crassostrea virginica*, and the hard clam, *Mercenaria mercenaria*. Studies have been made of the effect of the type and quantity of food, salinity, temperature, turbidity, pH, and of various pesticides and detergents on embryonic development and on growth of the larvae of these two species. In some studies we have observed the combined effect of varying two or more of these factors simultaneously.

We are currently experimenting to determine the pH range for spawning of oysters and the effect of the pH at spawning on viability of the sperm and eggs. We are also currently studying the effect of keeping oysters at lowered salinities, during gonad development and spawning, on subsequent embryonic development and larval growth at different salinities. We expect to soon have methods developed for studying the behavior of larvae and the effect of light, gravity, temperature, salinity and currents on the behavior of larvae of different ages and sizes. Such studies are urgently needed to develop an informational basis for field work on distribution of larvae.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0374, ECOLOGICAL FACTORS AFFECTING REPRODUCTION OF SHELLFISH (PHYSIOECOLOGY OF SHELLFISH PROGRAM)

H.C. DAVIS, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

This project has developed largely in an attempt to discover the origin and distribution pattern of the oyster larvae that set in Long Island Sound. Studies of the intensity of setting in the Bridgeport-Milford-New Haven area have shown that, while certain sections are more likely to get a heavier set than others, setting is usually very spotty, i.e., some sections may get a heavy set while nearby sections receive almost none at all. Plankton samples have shown that, even during the spawning season, oyster larvae are not numerous and that the earlier stages, 75-250 microns in length, are rarely encountered. The 250-325 micron larvae appear suddenly in the plankton samples and setting starts immediately.

At present we are attempting to locate the 'nursery areas' where these larvae develop to the 250-325 micron stage before they appear in Long Island Sound. Once these 'nursery areas' have been discovered, we shall attempt to determine the attributes that enable the larvae to develop there and to increase recruitment by replenishing the spawning stock in these areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0375, HYBRIDIZATION STUDIES ON THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA (GENETICS OF SHELLFISH PROGRAM)

A.C. LONGWELL, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

It might be expected that the effects of heterosis in the American oyster, *Crassostrea virginica*, would be inversely proportional to the additive gene variance of different traits. Such estimates of heritability are underway.

Trial hybridizations between numerous local and non-local American oyster populations are being made as tests for heterosis, and for desirable combinations of characteristics displayed by oysters from different ecological conditions. Numerous inbreeding lines shall be test-crossed in the F3 for heterosis. Breeding plans have been made for determining the merit of reciprocal selection for developing the combining ability of parent oysters used for making hybrids. By selection of each generation of oysters on the ability of individuals to cross well with each

## 5. LIVING SYSTEMS (NON-HUMAN)

other oyster group, strains of oysters might be improved in their ability to produce hybrid vigor when crossed with each other.

The similarity of the chromosomes of six species of oysters of two different genera indicate that there may be no gross chromosome barrier to the production of fertile species hybrids. Chromosome analysis of hybrid eggs could provide important clues as to the evolutionary relationships of our present-day commercial and non commercial oysters.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0376, SELECTIVE BREEDING OF THE AMERICAN OYSTER, *CRASSOSTREA VIRGINICA* (GENETICS OF SHELLFISH PROGRAM)

A.C. LONGWELL, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

Sexual reproduction in the American oyster, *Crassostrea virginica*, occurs with the usual genetic recombination and crossing-over. There are ten gene linkage groups. Its outbreeding system can be affected by protandry, hermaphroditism, alteration of sex and parthenogenesis. Experimental lines of American oysters are being bred by sib-matings for, among other purposes, estimating the amount of inbreeding in the wild.

Heritability estimates are being made of commercially important traits with attendant predictions of annual progress by selection. Phenotypic and genetic correlations are to be made between commercial characters with the ultimate intention of establishing a selection index. Current emphasis is on growth rate for which two-way selection experiments are to be set up. Outcrosses to increase genetic variance are being made prior to long-range selection of commercial strains.

Mutation studies have been initiated in *C. virginica* using ionizing radiation and chemical mutagens. The purpose of this work is to (1) obtain useful, marker gene and chromosome mutants, and commercially valuable mutations; (2) test the value of mutation breeding in the mollusks; (3) establish background information essential to future work, such as the transposition of chromatin following radiation-induced chromosome breakage for transfer of specific characters from a non-commercial to a commercial oyster.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0377, NATURAL HISTORY OF PREDATORS AND COMPETITORS (PREDATOR CONTROL PROGRAM)

C.L. MACKENZIE, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

Because of a scarcity of seed oysters in Long Island Sound, more efficient control of predators and competitors becomes imperative.

Control of oyster drills and starfish has been achieved. To make control methods more efficient, however, we are presently studying various aspects of the biology of both predators. Particular emphasis has been placed on studying feeding rates of each at various salinities and temperatures, and also on the behavior of these and other enemies on oyster beds as observed by SCUBA divers.

Divers have observed that young starfish hid underneath shells during the day. We are presently attempting to determine the reason they do this.

To better equip the shellfish producer to apply more efficient control methods for *Stylochus*, *Crepidula* and barnacles, the principal competitors of oysters, we plan to study various stages of their life cycles.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0378, METHODS OF CONTROL OF PREDATORS AND COMPETITORS (PREDATOR CONTROL PROGRAM)

C.L. MACKENZIE, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

In Long Island Sound, the chemical Polystream is now used routinely by oyster companies to control oyster drills on their seed beds. Losses owing to predation by oyster drills have been reduced to less than 2 percent a year. Companies using lime to

control adult starfish and Polystream to control oyster drills lose less than 10 percent of their oysters a year to these predators.

We have discovered that there is no 'winter kill' of oysters. Actually, a layer of silt which settles over a bed during the winter smothers oysters near the bottom when they become active in April and May. Losses range from 0 to 50 percent. In 1968, most oyster companies transplanted their seed in March and early April to avoid silting losses.

By controlling predators and avoiding spring silting losses, companies have reduced overall losses of young seed oysters from 99% to 70%, and of one-year-old oysters from 90% to 30%, thereby increasing yields from 1 to 1, to 10 or 15 to 1.

Presently, we are studying ways to reduce losses even further. The largest losses result from (1) *Crepidula* which smother young oysters, (2) smothering against the bottom, and (3) mechanical breakage while dredging.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0379, STRUCTURE AND FUNCTION OF EYES

W.H. MILLER, Yale University, School of Medicine, New Haven, Connecticut 06520

The proposed investigation is to study the neural structure of primitive eyes and its relation to their function where that function is known. Where it is unknown the functional organization will be investigated using electrophysiological means.

In particular, for the anatomical part of this study, synaptic interrelations between neural elements will be investigated (1) in the compound eye and optic ganglion of the horseshoe crab, *Limulus*, where the relations between structure and the inhibitory interaction in the eye and structure and the complex neural responses of the optic ganglia will be investigated; (2) the eyes of the scallop, *Pecten*, where the relation between structure and the 'off' response will be explored; and (3) the frontal organ (third eye) of the frog, *Rana*, where the relation between structure and the excitatory and inhibitory optic nerve responses will be studied. For the physiological studies the electrical responses of single ganglion cells of the frog's frontal organ will be investigated to determine as yet unknown functional properties of the receptive fields of these cells.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0380, CALORIC STUDIES OF SPARTINA AND THE MARSH CRAB *SESARMA RETICULATUM*

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: To evaluate the energy transfer from the marsh grass *Spartina alterniflora* through the marsh crab *Sesarma reticulatum*.

Procedures: For the past several summers we have been gathering life history information on one of the important inhabitants of our tidal marshes, the marsh crab *Sesarma*. These studies have included food habit studies and estimates of population densities. The marsh grass *Spartina* is an important item in the diet of this crab. We have estimates of production of this grass during the growing season.

The individual crabs that are not carrying egg masses and preferably males will be weighed and then placed in containers where they can keep their gills moist but can get out of the water. Temperature will be maintained at 20 degrees C. Each crab will receive weighed portions of fresh grass. Each 24 hour period the grass remaining in the container will be weighed and replaced with fresh grass. The fecal pellets will be collected each 24 hour period, dried, weighed and prepared for the bomb calorimeter.

Subsamples of the crabs will be weighed, sacrificed, dried to constant weight and prepared for the bomb calorimeter shortly after returning from field collecting. Those crabs that have been fed grass in the laboratory will be reweighed after one week of feeding, sacrificed and prepared for the bomb calorimeter.

This procedure will yield the following information -- (1) total energy in the grass, (2) energy ingested, (3) energy consumed in respiration, (4) energy egested in the feces and (5) energy going into new crab flesh. This data will give a measure of gross growth efficiency new protoplasm per unit time energy consumed as well as net growth efficiency energy consumed - energy egested per unit time for the crab.

### 5.0381, LOCATING AND MAPPING THE EXISTING SEED OYSTER BEDS IN DELAWARE BAY

T.P. RITCHIE, State Comm. on Shell Fisheries, Dover, Delaware 19901

The excellent report and map of the seed oyster beds which was prepared by Moore in 1910 will be used as a guide in locating and evaluating the extent of the existing seed oyster beds in Delaware Bay. The peripheral boundaries of each existing natural oyster bed will be located and marked with the aid of a commercial oyster dredge boat. Sextant and/or radar hearings will be taken at several locations on each natural oyster bed. The outline of each natural oyster bed will be ascertained by stakes and buoys. Accurate measurements of the total area of each oyster bed will be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Delaware State Government

### 5.0382, BIOLOGICAL EVALUATION OF EACH EXISTING SEED OYSTER BED IN DELAWARE BAY

T.P. RITCHIE, State Comm. on Shell Fisheries, Dover, Delaware 19901

The objective of this phase is to make a thorough biological examination of each individual natural seed oyster bed. Bottom samples will be collected by using a special oyster sampling dredge of measured width. The sampling dredge will be pulled along selected transits for a specified distance or time. All of the material dredged up will be examined in order to determine the ratio of oysters to shells. The total number of the various sized oysters in each sample will be counted. The relative abundance of oyster predators and fouling organisms will be noted. Relative oyster density per square yard and per square acre can be determined by simple calculation.

Part 2 of 4.

### 5.0383, SHELLFISHERIES RESEARCH

D.L. MAURER, Univ. of Delaware, Graduate School, Newark, Delaware 19711

The purpose of this investigation is to study the life history and fluctuations of commercially important shellfish, e.g., the oyster, blue crab, hard clam, etc. This research deals with those aspects of the biology, ecology, environment of shellfish, and methods of increasing the shell fisheries crop yields. Top priority has been given to research upon propagation of disease resistant strains of oysters. MSX disease and its relation to salinity has been studied, but at present there is insufficient data to be able to draw any conclusions. Studies to anticipate the time of maximum spawning of the oyster have also been started to determine the most opportune time to plant the oyster cultch. This information will be invaluable for local shellfishermen, but will take time to determine. An oyster survey of the Delaware Bay region has been undertaken to determine the extent and condition of natural oyster beds.

SUPPORTED BY Delaware State Government

### 5.0384, ABYSSAL AND BATHYAL SYNOPIIDAE OF WORLD

J.L. BARNARD, Smithsonian Institution, Washington, District of Columbia 20560

This project, supported originally by an NSF Grant (GB 3285), commenced as a taxonomic appraisal of this family (and many others) in Antarctic Seas. Synopiids (tironids) have proved to be a diverse deep-sea faunule poorly explored and worthy of extensive study. The family will be treated in its entirety including the few sublittoral species in order to illuminate general problems of deep-sea speciation, endemism and pandemism to whatever degree they prove to be determinable. Numerous materials (Antarctica, Mesoamerica, Oregon and Bermuda transects, New Zealand, IIOE) and others available through 1970 will be treated. In

1966 the family comprised 46 spp. in 11 genera. Revision of 14 genera at least is required and MS for 30 new spp. is already in hand and being amplified steadily.

SUPPORTED BY Smithsonian Institution

### 5.0385, OSTRACODA OF THE INDIAN OCEAN

R.H. BENSON, Smithsonian Institution, Washington, District of Columbia 20560

Taxonomic description and biogeographic mapping of the Recent podocopid ostracode fauna of the Indian Ocean as a basis for future exploration of the fossil faunal provinces.

SUPPORTED BY Smithsonian Institution

### 5.0386, ABYSSAL OSTRACODES OF THE WORLD

R.H. BENSON, Smithsonian Institution, Washington, District of Columbia 20560

Description and biogeographic mapping of the Cytheracean ostracodes occurring below 500 meters in the world ocean and their history as recorded as fossils in sediment cores.

SUPPORTED BY Smithsonian Institution

### 5.0387, HYPERIID AMPHIPODS FROM THE GULF OF GUINEA

T.E. BOWMAN, Smithsonian Institution, Washington, District of Columbia 20560

Analysis of hyperiid amphipods collected by Crosnier in the Gulf of Guinea and the relationship of distribution patterns to oceanographic variables.

SUPPORTED BY Smithsonian Institution

### 5.0388, RELICT COPEPODS FROM LAKE TUBORG, ELLESMERE ISLAND

T.E. BOWMAN, Smithsonian Institution, Washington, District of Columbia 20560

Identification and enumeration of 2 spp. of calanoid copepods collected in a plankton tow in partly brackish Lake Tuborg. Both species are not now known from coastal waters of the Canadian Arctic islands, and are believed to be relicts of a formerly more widespread brackish water fauna now restricted mainly to Siberian Arctic coastal waters. Suggestions concerning their origin in Lake Tuborg are given, using information on the age of the lake determined by C14 dating of the lake water carbonates.

SUPPORTED BY Smithsonian Institution

### 5.0389, COPEPODS PARASITIC ON NEEDLEFISHES

R.F. CRESSEY, Smithsonian Institution, Washington, District of Columbia 20560

In connection with a revision of the fish family Belonidae Dr. Collette has collected many parasitic copepods. In order to further understand the biology of needlefishes I am studying their copepod parasites for possible insights into the ecology and phylogeny of the hosts.

SUPPORTED BY Smithsonian Institution

### 5.0390, RELATIONSHIP BETWEEN WATER TEMPERATURE AND SIZE OF PARASITIC COPEPODS

R.F. CRESSEY, Smithsonian Institution, Washington, District of Columbia 20560

Preliminary evidence indicates a relationship between surface temperature of the water at the station from which parasitic copepods are collected and the size of the adult copepod when collections of the same species of copepod from the same species of host from different stations are compared. Possible implications as to the biology of the hosts are being investigated.

SUPPORTED BY Smithsonian Institution

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0391, COPEPODS PARASITIC ON SHARKS OF THE WEST COAST OF FLORIDA

R.F. CRESSEY, Smithsonian Institution, Washington, District of Columbia 20560

To collect the shark copepods of this region with their subsequent description and/or redescription as appropriate. The Cape Haze Marine Lab., Sarasota, Florida will serve as a focal point for this project.

SUPPORTED BY Smithsonian Institution

### 5.0392, SYSTEMATICS OF CALIGOID COPEPODS

R.F. CRESSEY, Smithsonian Institution, Washington, District of Columbia 20560

Systematic survey of all caligoid copepods with emphasis on revision of families and/or genera as appropriate. This is a long term project designed to continue for several years with special emphasis on those forms parasitic on pelagic fish (sharks and tuna like fishes).

SUPPORTED BY Smithsonian Institution

### 5.0393, LIFE HISTORY OF THE SHARK COPEPOD, KROYERIA DISPAR

R.F. CRESSEY, Smithsonian Institution, Washington, District of Columbia 20560

To rear and study in the laboratory the development stages of *Kroyeria dispar*. Laboratory rearing of this animal to be done at the Cape Haze Marine Lab., Sarasota, Florida. *Kroyeria dispar* is a common parasite on the gills of the tiger shark, *Galeocerdo cuvier*. Development stages of caligoid copepods are poorly known. The larval stages may reveal phylogenetic affinities within this group of parasites.

SUPPORTED BY Smithsonian Institution

### 5.0394, SYSTEMATIC STUDY OF MYODOCOPID OSTRACODS OF THE INDIAN OCEAN

L.S. KORNICKER, Smithsonian Institution, Washington, District of Columbia 20560

Description and illustration of myodocopid ostracods of the superfamily Cypridinacea (mostly benthonic forms) collected during the International Indian Ocean Expeditions by U. S. ships.

SUPPORTED BY Smithsonian Institution

### 5.0395, STOMATOPOD CRUSTACEA FROM THE WESTERN ATLANTIC

R.B. MANNING, Smithsonian Institution, Washington, District of Columbia 20560

To review the 67 species of stomatopod crustaceans occurring in the western Atlantic, with full accounts of each species.

SUPPORTED BY Smithsonian Institution

### 5.0396, NEPHROPID LOBSTERS OF THE WESTERN ATLANTIC

R.B. MANNING, Smithsonian Institution, Washington, District of Columbia 20560

To review 11 of the 12 species of lobsters known from the western Atlantic; the Maine lobster, *Homarus americanus*, will not be included. Material for the study is available from the extensive field collections of the Bureau of Commercial Fisheries from the Gulf of Mexico and the Caribbean. Collections now available include one new genus and species. All species will be illustrated in detail and compared with species from other areas. Biological records available from BCF data bank will be included.

SUPPORTED BY Smithsonian Institution

### 5.0397, STOMATOPOD CRUSTACEA OF THE EASTERN PACIFIC REGION

R.B. MANNING, Smithsonian Institution, Washington, District of Columbia 20560

A review of the approximately 35 species of stomatopod crustaceans occurring in the eastern Pacific region to accompany studies on the stomatopods of the eastern and western Atlantic.

SUPPORTED BY Smithsonian Institution

### 5.0398, A BIBLIOGRAPHY OF THE MARINE MOLLUSKS OF THE INDO-PACIFIC REGION

H.A. REHDER, Smithsonian Institution, Washington, District of Columbia 20560

This project, originally started as an integral part of my project on Polynesian malacology, is now listed as an independent project for obvious reasons.

Each publication dealing with Indo-Pacific mollusks - whether descriptive, faunal, taxonomic, morphological - is entered in a Royal-McBee Keysort Card, and the relevant information punched out on each card.

In addition to papers dealing strictly with the Indo-Pacific marine fauna publications dealing with the classification, morphology and physiology of molluscan groups found in the Indo-Pacific region are also included.

As this bibliography approaches completion, its value as a research tool will increase in that a worker can sort out the relevant literature for any geographical area and/or any particular group of mollusks. He will also be able to dig out with relative ease the information available on any phase of the physiology or morphology of any group of mollusks. It is planned to investigate the possibility of converting this card system to a more rapid scanning system.

The preparation of this bibliography is being carried out by a technical assistant under the supervision of the principal investigator.

SUPPORTED BY Smithsonian Institution

### 5.0399, THE CEPHALOPODS OF THE CENTRAL PACIFIC

C.F. ROPER, Smithsonian Institution, Washington, District of Columbia 20560

A faunistic study of the cephalopods of the Central Pacific is being conducted in conjunction with the Pacific Ocean Biological Survey Program. The distribution and the regional and seasonal abundance of the species in relation to oceanographic parameters are being worked out.

SUPPORTED BY Smithsonian Institution

### 5.0400, THE SYSTEMATICS AND DISTRIBUTION OF THE WORLD-WIDE SQUID FAMILY BATHYTEUTHIDAE

C.F. ROPER, Smithsonian Institution, Washington, District of Columbia 20560

The systematic problems in the Bathyteuthidae are worked out. The geographic and bathyal distributions in relation to biological and oceanographic parameters are presented. The regional and seasonal abundance and the life histories of the species are shown. This work is in the final stages of manuscript and will be submitted to the publisher (Anarctic Research Series) in FY67.

SUPPORTED BY Smithsonian Institution

### 5.0401, SYSTEMATIC REVISION OF THE FAMILY PERIPLOMATIDAE

J. ROSEWATER, Smithsonian Institution, Washington, District of Columbia 20560

The classification of the family Periplomatidae is being revised. Generic groups are being reconsidered and information will be given concerning the systematics and zoogeography of this group.

SUPPORTED BY Smithsonian Institution

### 5.0402, SYSTEMATIC STUDIES ON MOLLUSKS FROM WALTERS SHOALS, INDIAN OCEAN

J. ROSEWATER, Smithsonian Institution, Washington, District of Columbia 20560

## 5. LIVING SYSTEMS (NON-HUMAN)

During the International Indian Ocean Expedition 1964, a collection of mollusks was obtained from Walter's Shoals, south of Madagascar. This locality is essentially an isolated sea mount. The mollusks will be classified and studied to determine their systematic and zoogeographical relationships. In view of the unique locale, the results may yield interesting information on species distribution in the Indian Ocean.

SUPPORTED BY Smithsonian Institution

### 5.0403, EASTERN PACIFIC SHRIMPS OF THE GENUS PENAEUS

I.C. CANET, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

Investigations of the systematics and geographical and bathymetrical distribution of *Penaeus* shrimps from Pacific America, where 5 species are known to occur. This will include biometric studies to determine ranges of variations and their spatial distribution, full descriptions, and illustrations of each shrimp. Findings related to ecology and life history are being critically reviewed and summarized.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0404, BENTHIC PENAEID SHRIMPS (OTHER THAN PENAEUS) FROM THE WESTERN ATLANTIC

I.C. CANET, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

Investigations of the taxonomy and distribution of benthic penaeid shrimps (other than *Penaeus*) collected by the research vessels Oregon, Silver Bay and Calypso on the continental shelf of eastern North America, Central America and South America. The collections appear to contain at least 16 genera and 45 species. The work will include descriptions and those illustrations necessary for the proper understanding of each taxonomic category.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0405, DIAGNOSTIC CHARACTERS & DEVELOPMENT OF EXTERNAL GENITALIA IN JUVENILE GROOVED SHRIMPS OF GENUS PENAEUS FROM WESTERN ATLANTIC

I.C. CANET, U.S. Dept. of Interior, Systematics Laboratory, Washington, District of Columbia 20560

Studies of the characteristics and development of the external genitalia in juvenile 'grooved shrimps' (consisting of 2 species and 4 subspecies) of the genus *Penaeus* from the western Atlantic. Much attention has been accorded to juvenile growth ecology, habits, movements, and tolerances to temperature and salinity; however, little progress has been made in ascertaining their identification. The peculiar characters of the petasma of the males and the thelycum of the females of each taxon at various body lengths will be listed in Tables and illustrated. Continuing.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0406, AN ANALYSIS OF DEVELOPMENT IN ARTEMIA SALINA EMBRYOS

J.S. CLEGG, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

A study is being made of the regulation of protein and RNA synthesis in the embryos of *Artemia salina*, a crustacean. The emphasis is placed on analysis of polysomes and ribosomes by sucrose gradient density centrifugation, on the various species of RNA present, on the incorporation of radioactive precursors into RNA and protein, and on in vitro protein synthesizing systems. Some work is also being done on lactic dehydrogenase isozymes, and on ultrastructural changes which occur during development. Particular attention is being paid to a period in the development of these embryos during which embryonic differentiation occurs in the complete absence of cell division.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0407, IONIC REGULATION IN THE QUEEN CONCH, STROMBUS GIGAS LINNAEUS

C. LITTLE, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The proposed work is an investigation of the composition of the blood of the queen conch, and of the relations that this composition bears to that of the seawater in which the conch lives. When this basic knowledge is acquired, it is intended to examine the mechanisms by which these relations are maintained; or in other words to examine the various routes by which salt, water and possibly nitrogenous matter enter and leave the body, and to try to decide what factors exercise control over these exchanges. The three sites of exchange to be examined in detail are the kidney, the alimentary canal and the single ctenidium; but the possibility of exchange through the general body surface and through accretions will also be examined.

SUPPORTED BY U.S. National Science Foundation

### 5.0408, SYSTEMATIC STUDIES ON HERMIT CRABS AND OTHER DECAPOD CRUSTACEANS

A.J. PROVENZANO, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The marine decapod Crustacea constitute one of the most important orders of invertebrates in the sea. Many of them such as shrimps, lobsters and crabs are exploited directly by man as food species, but the group is vastly more important in the general economy of the sea as food for other organisms, especially fishes. Most decapod crustaceans have pelagic larval stages which serve to distribute the younger generation. It is these larval forms which play an important role in marine food chains, perhaps more important in some ways than the adults.

It is planned to continue studies on the taxonomy of hermit crabs (GB-1304 and GB-4888) with special reference to tropical Atlantic forms with a specific goal of attempting to complete our knowledge of this fauna; to continue studies on the larval development of pagurid anomura based on laboratory rearings in order to utilize ontogenetic information in evaluating phylogenetic relationships within the group; to continue studies on the larval development of other decapod crustaceans of particular importance in systematics with a view towards being able to utilize information on larvae to advance understanding of the systematics of decapod crustaceans; and to summarize the accumulated data on decapod life histories to make possible familial, generic, and for some groups, specific identifications for the West Indian faunal region.

SUPPORTED BY U.S. National Science Foundation

### 5.0409, LARVAL DEVELOPMENT OF SCYLLARIDEAN LOBSTERS

A.J. PROVENZANO, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The aims of this project include: identification and detailed description of the larvae of Western Atlantic lobsters of the families Scyllaridae and Palinuridae; the establishment of specific and generic characters of phyllosoma and early post-larval stages and evaluation of the significance of larval characters as indicators of natural relationships between species; the initiation of studies on the effects of nutritional and physical environmental factors upon growth and development of phyllosoma larvae in the laboratory.

Larvae will be reared from eggs hatched in the laboratory. Live material captured at sea will be returned to the laboratory to provide an opportunity to study pelagic forms hitherto not observed under laboratory conditions.

SUPPORTED BY U.S. National Science Foundation

### 5.0410, LARVAL DEVELOPMENT OF DECAPOD CRUSTACEA

A.J. PROVENZANO, Univ. of Miami, Institute of Marine Science, Miami - Coral Gables, Florida 33124

This is a continuation of a project to study the larval development of a wide variety of tropical marine decapod crustaceans. Most of the effort in the coming year will be devoted to preparing

## 5. LIVING SYSTEMS (NON-HUMAN)

for publication some of the extensive data obtained during the past four years on the development of brachyuran crabs, anomurans, lobsters and some other groups of decapods. A series of manuscripts describing the external morphology of larval stages especially from a comparative point of view and with regard to characters of systematic value will be furnished. Some analysis of data on effects of temperature, salinity and other environmental factors will be made. A cross-indexed bibliography of decapod larvae will be maintained and expanded to facilitate future work and to aid other workers. For a few groups in which there is sufficient information, an attempt will be made to compile illustrated keys for identification of larval forms.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0411, MONOGRAPH OF THE CEPHALOPODS OF THE NORTH ATLANTIC

G.L. VOSS, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124

This project is designed to review the cephalopods of the North Atlantic ocean as a whole and not by local areas as heretofore. The study is based upon very large collections of open ocean species supplemented by smaller but important collections in the major museums of both the U. S. and Europe. The approach is revisionary and monographic. Strong emphasis is placed upon the hydrographic features of the ocean and distribution of the organisms in relation to salinity, temperature, light and depth. Types of most of the species are being examined in the hope of clarifying the present difficult nomenclatural problems in this group of animals.

SUPPORTED BY U.S. National Science Foundation

### 5.0412, SYSTEMATICS AND ZOOGEOGRAPHY OF ANTARCTIC CEPHALOPODS

G.L. VOSS, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124

The research proposed by the University of Miami is a continuation of field and laboratory work which has been supported over the past four years under GA-103, GA-253 and GA-709.

The objectives of this proposal are basically unchanged from the earlier ones:- the completion of a monograph on the systematics of Antarctic cephalopods. The research entails collection of Antarctic specimens through participation on Eltanin cruises and for first hand observation of characteristics and behavior of fresh specimens. In addition to these materials, all cephalopod specimens obtained under the United States Antarctic Research Program are forwarded to the principal investigator through the Smithsonian Oceanographic Sorting Center. The shipboard studies on Eltanin and data analysis at the University are carried out by graduate assistants who apply their experience and knowledge toward graduate research.

The proposal requires Eltanin participation by one graduate assistant on Cruises 32 and 35, with the possibility of further participation in Tasman Sea and Indian Ocean cruises.

SUPPORTED BY U.S. National Science Foundation

### 5.0413, CYTOTAXONOMY OF SPECIES OF RELATED PELECYPOD MOLLUSKS

R.W. MENZEL, Florida State University, Graduate School, *Tallahassee, Florida* 32306

The taxonomic and genetic relationships of closely related species of pelecypod mollusks will be studied both by morphological comparisons of the shells from museums and field collections with the shells of laboratory-reared hybrids (when possible) and by investigations of chromosomal behavior at meiosis and mitosis in hybrids, F<sub>2</sub>'s and backcrosses. If it is possible to raise the F<sub>2</sub>'s they will be examined for genetic segregation. Particular emphasis will be given to species of the quahog (*Mercenaria*) and to oysters (*Crassostrea*).

### 5.0414, REPRODUCTIVE RELATIONSHIPS AMONG POPULATIONS OF A MARINE WOOD-BORING ISOPOD

R.J. MENZIES, Florida State University, Graduate School, *Tallahassee, Florida* 32306

Most biologists now accept the genetical species concept (Mayr, 1940, et seq.) which defines a species as 'groups of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups.' This concept has not been extensively applied in systematics due to the practical difficulties involved in testing the reproductive relationships of populations. Therefore, almost all species of marine organisms have been distinguished solely on the basis of their morphological distinctness from other groups of populations.

Morphological distinctness, however, has been shown to be inadequate for the recognition of 'genetic' species in many organisms. On one hand, populations in some taxa have been shown to be reproductively isolated from each other although they differ only minutely in their morphology. Some knowledge of the reproductive relationships of populations is necessary for the recognition of 'genetic species' within a taxon.

The immediate objectives of this research are: 1) to evaluate the reproductive relationships among populations of a widely distributed marine species, *Limnoria tripunctata* Menzies; 2) to provide a relatively complete analysis of the geographic variability of this species; and 3) to establish criteria useful in the determination of species differences. It is hoped that the proposed research will also contribute toward the elucidation of criteria for the recognition of 'genetic' species in marine isopods.

SUPPORTED BY U.S. National Science Foundation

### 5.0415, THE OSTRACODA OF THE BAY OF NAPLES

H.S. PURI, State Geol. Survey, *Tallahassee, Florida*

G.W. Muller's classic monograph on the Ostracoda of the Gulf of Naples is also one of the basic works on the ecology of Ostracoda and has been extensively used by later workers. During the spring and summer months of 1961, 1962, and 1963 the principal investigator occupied Muller's Stations. The Zoological Station Naples obtained on loan Muller's syntype material deposited in the Zoological Museum of Greifswald, East Germany, for examination in Naples. Some Syntype material of Muller is deposited in Humboldt University, Berlin, and this material is also being utilized in preparation of a revised monograph on the sediments, ecology, and microfauna of the Bay of Naples. It is hoped that the monograph will include not only a revision of Muller's ostracods but also a study on the hydrography, sediments and ecology of the Bay of Naples based both on foraminifers and ostracods. It has been found that nomenclature and taxonomy of ostracods as described by Muller has undergone drastic changes and also that before species could be used in ecology they needed to be stabilized. It became increasingly obvious that both carapace morphology and soft parts are essential to a natural classification

environments were established and these environments have characteristic faunas. It is proposed to study these eight environments rather thoroughly and studies of the life cycles and morphology will produce a comprehensive and useful work.

### 5.0416, ESTIMATE OF STANDING CROP OF OYSTERS AND SURVEY OF OYSTER PREDATORS IN GEORGIA

T. LINTON, Univ. of Georgia, Graduate School, *Athens, Georgia* 30602

Objectives: 1. To initiate an inventory and standing crop estimate of oysters on the Georgia coast. 2. To survey the oyster predators, diseases, and competitors present in Georgia waters.

Procedures: A combined technique of statistical sampling and aerial photography will be utilized in estimating the standing crop of Georgia oysters.

Established field and laboratory procedures will be utilized in surveying oyster predators, diseases and competitors present in Georgia waters.

### 5.0418, ECOLOGICAL AND EVOLUTIONARY IMPLICATIONS OF THE ECOTYPES OF ESTUARINE CRUSTACEA

*W.D. BURBANCK*, Emory University, Graduate School, Atlanta, Georgia 30322

Estuaries are of unusual interest to ecologist because they represent tension zones between marine and freshwater environments. Organisms from adjoining communities may be found there along with the biota normally restricted to such zones. The burrowing isopod, *Cyathura polita*, a typical and very tolerant inhabitant of the Atlantic and Gulf Coast estuaries has been the subject of study by Dr. Burbank for many years (under grants NSF- G-7138 and G-21145). This organism is a key animal in food chains of tidal marshes and estuaries, and represents a large reservoir of potential energy in many of the estuarine ecosystems; however, our knowledge of *Cyathura* ecology and distribution and its role in the estuarine ecosystem still remains relatively incomplete.

The proposed work will pursue several lines of ecological investigation in an effort to distinguish ecotypes, to establish definitive characteristics of the taxa within the genus *Cyathura*, and to prove or disprove the theory of continuing evolution within the genus. *Cyathurans* from geographically separated populations will be tested for their tolerances and abilities to regulate their metabolism under conditions of external stress. Morphological variations will be noted, and chromatographic analysis is to be employed for delineation of ecotypes. Searches are to be made along the Atlantic Coast for new marine species of *Cyathura* and new locations of the recently discovered *C. burbanki*. Finally, museum specimens of *Cyathura* and animals associated with them are to be examined in order to develop an understanding of the degree to which the biocoenosis varies within the geographical range of *Cyathura* and how this may influence the occurrence of ecological races.

SUPPORTED BY U.S. National Science Foundation

### 5.0419, SEASONAL ABUNDANCE AND BIOLOGICAL STABILITY OF THE COMMERCIAL SHRIMP OF GEORGIA

*C.M. FRISBIE*, State Game & Fish Commission, Atlanta, Georgia  
Objectives: 1) To determine seasonal and relative abundance of adult and postlarval shrimp populations. 2) To secure general life history data such as size distribution, maturity, sex ratios, apparent growth, etc. 3) To collect ecological data throughout the shrimp's habitat. 4) To determine relative abundance of competing vertebrates and invertebrates.

Procedures: Adult and juvenile shrimp will be sampled by trawls and cast nets from 21 sampling areas, covering a wide range of habitats. Relative and seasonal abundance of these populations will be determined as well as other aspects of their life history such as sex ratios, stages of sexual maturity, size ranges, and species composition.

Post larval abundance will be monitored with plankton net sampling in order to evaluate spawning success. Environmental parameters will be studied in relation to shrimp populations, to include salinity, temperature, and presence of competitors.

Georgia State Government

### 5.0420, SURVEY OF A POTENTIAL HARD CLAM FISHERY

*W.F. GODWIN*, State Game & Fish Commission, Atlanta, Georgia

Objectives: 1. To determine the distribution and density of hard clams in Georgia waters. 2. To test several existing techniques for hard clam harvesting, such as small towed dredges,

hydraulic rakes, and others 3. To publicize the results of the project to include distribution data, harvesting techniques, expected harvesting cost, and returns.

Procedures: Estuarine areas of Georgia will be surveyed, primarily with a towed dredge, to determine the extent and distribution of hard clam beds. Clam density data and habitat requirements will be determined, as well as estimates of potential reproduction.

Various harvesting techniques will be reviewed and their applicability to the area will be determined. If a commercially feasible clam fishery exists, outfitting and harvesting costs will be developed and be made available to interested parties.

### 5.0421, CONTRIBUTIONS TO THE BIOLOGY OF THE ROYAL RED SHRIMP, *HYMENOPENAEUS ROBUSTUS*

*W.W. ANDERSON*, U.S. Dept. of Interior, Biological Laboratory, Brunswick, Georgia

Over the past ten years data on size frequencies by sex, stage of sexual development, and relative abundance of the royal red shrimp, *Hymenopenaeus robustus*, have been collected as opportunity occurred during cruises of the Bureau's exploratory vessels off the coast of the South Atlantic states. These data will be the basis of the first paper dealing with the biology of this deep-water, potentially important commercial species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0422, MANAGEMENT INVESTIGATIONS OF TWO SPECIES OF SPINY LOBSTERS *PANULIRUS JAPONICUS* AND *P. PENICILLATUS*

*D.E. MORRIS*, State Dept. of Land. Nat. Res., Honolulu, Hawaii 96813

The objective of this project is to compile biological information on two species of spiny lobsters, *Panulirus japonicus* and *P. penicillatus*, for the eventual scientific management of this resource.

Commercial catch statistics that have been accumulated for almost two decades will be analyzed for trends in fishing effort, catch per unit effort, catch by fishing area, and seasonal abundance.

Biological data collected during a tagging and sampling program, conducted from 1960 to 1962, will be analyzed for information pertaining to growth, movement, population estimates, reproductive habits, and length-weight relationships. Additional biological data needed to complete the study will be acquired through a tagging and sampling program.

Juvenile lobsters will be reared in tanks at the Keehi Fishery Station, Honolulu, in order to compile data on growth and molting and to test methods of tagging or marking small lobsters in the field.

Experimental trapping and tagging of deep water stocks of lobsters will be attempted for purposes of evaluating the composition and extent of these stocks. The successful development of suitable gear for sampling deep water lobster stocks may result in the expansion of the commercial lobster fishery into areas that are not presently fished.

### 5.0423, CONTINUED STUDIES ON THE INFLUENCE OF THE EGG CORTEX ON THE DEVELOPMENT OF THE MOLLUSCAN EMBRYO

*J.M. ARNOLD*, Univ. of Hawaii, Pacific Biomedical Res. Center, Honolulu, Hawaii 96822

Brief Description of Research Project: The role of the egg cortex in development and differentiation of the mollusc egg has been recently reemphasized. It appears that this layer, which is made up of a plasma membrane and a very thin layer of cytoplasm which lies directly over the yolk platelets, plays an important role in dictating the eventual fate of the cells which come to contain this cortex. Exactly how and where this 'developmental informa-

tion' is located and how it is transcribed is unknown. The molluscs, *Lymnea stagnalis* and *Loligo pealii*, are particularly well suited for such a study, in part because of their well-known mosaic nature and also because of the background information available on them. By using ultraviolet microbeam irradiation, centrifugation and antimitotic agents, it has been possible to demonstrate the egg cortex has definite locations which appear to be causally related to the eventual appearance of specific organs in the cephalopod embryo. Further mapping is being carried out.

#### **5.0424, CEPHALOPOD LENS DEVELOPMENT**

**J.M. ARNOLD**, Univ. of Hawaii, Pacific Biomedical Res. Center, Honolulu, Hawaii 96822

This investigation is concerned with the development of the cephalopod lens. The lens develops by fusion of many cytoplasmic processes which grow out into the optic vesicle from a group of specialized cells (lentigenic cells). The definitive lens material is elaborated in the lens primordium by fusion of Golgi derived vesicles. Apparently microtubules are in some way involved in the transport and outgrowth of the lentigenic processes. Currently a study is being made of the mechanism of outgrowth of the lentigenic processes, the chemical nature of the adult lens, the steps in synthesis of the lens substance and the causes of aggregation of the cellular processes.

## **5. LIVING SYSTEMS (NON-HUMAN)**

#### **5.0428, PHYSIOLOGICAL MECHANISMS UNDERLYING THE BEHAVIOR OF MARINE CRUSTACEA**

**E.S. REESE**, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

The behavior patterns of marine crustacea are studied in the field and in the laboratory. The general stimulus situations, the releasing stimuli, the time and sequence relationships of the movements constituting the behavior, and the resultant effects on the behaving organism and other organisms, when the behavior is in a social context, are measured utilizing direct observations, motion picture analysis, models and other experimental devices. A multiple channel event recorder operated by the investigator provides a record of the behavior in terms of frequency, sequence, and coincidence of occurrence. Analysis of these records permits the formulation of a quantitative statement of the behavior which can be treated with standard statistical methods.

Then by rearing the animals in the laboratory under various conditions of isolation and deprivation, the development of the behavior patterns is measured in terms of the same parameters and by the same means as indicated above. By comparing the quantitative expressions of the behavior of inexperienced young animals with those of wild experienced animals, it is possible to evaluate the role of early experience in the development of behavior.

To date the studies have dealt mainly with the shell selection behavior of hermit crabs, and it has been possible to demonstrate that the shell preferences of the adult animals are not dependent upon their having had past experience with the stimulus objects. Inexperienced, young animals are able to discriminate shells upon their first encounter with them. These studies are continuing with respect to aggressive behavior. In addition, studies on shrimps, particularly with respect to the specialized functions of the appendages, are beginning to develop very nicely. Some preliminary studies have been started on brachyuran coral commensals.

SUPPORTED BY U.S. National Science Foundation

#### **5.0429, POPULATION GENETICS AND LARVAL ECOLOGY OF HAWAIIAN LITTORINA**

**J.W. STRUHSACKER**, Univ. of Hawaii, Hawaii Inst. of Marine Biology, Honolulu, Hawaii 96822

The shell sculpture polymorphism in the periwinkle, *Littorina picta* Philippi, and variation in color and color pattern of *L. picta* and *Littorina scabra* (Linnaeus) from the Hawaiian Islands will be primarily studied. The research will be designed to study this polymorphism and to ascertain the relative influence of genotypic and environmental factors. Variation in the other Hawaiian species will also be examined in this manner. In approaching these problems, cytogenetic studies and breeding experiments will be combined with rearing and acclimation experiments under different environmental regimes.

The techniques developed for breeding, larval rearing and maintenance of *Littorina* in the laboratory should be of value to the development of marine larval ecology studies. The development of *Littorina* species as potential subjects for genetic experimentation could be of greatest importance to the field of marine genetics.

SUPPORTED BY U.S. National Science Foundation

#### **5.0430, VISUAL AND ACOUSTICAL COMMUNICATION IN CERTAIN MARINE CRUSTACEANS**

**M. SALMON**, Univ. of Illinois, Graduate School, Urbana, Illinois

This grant is for the continuation of studies conducted under GS 3430 at De Paul University.

The purpose of this study is to investigate the role of waving display and sound production as communicative signals in North Atlantic species of fiddler crabs. More specifically, the movements involved in waving display and sound production by males will be filmed and described under a variety of conditions found in the field. Waving display and sound production in populations found in Florida will be compared to that in populations in North Carolina and New York to determine if latitudinal variation in the signal systems exists. The stimuli critical in the elicitation of waving display and sound production will be determined from field observations and via experimental procedures. Sound playbacks,

## 5. LIVING SYSTEMS (NON-HUMAN)

introduction experiments, and other tests will be carried out with males and females at various times of the day and night and the response of the test crabs quantified. These tests will be designed to determine how the crabs respond to signals used in communication and to one another.

SUPPORTED BY U.S. National Science Foundation

### 5.0431, OIL CONTAMINATION OF OYSTERS FROM OIL WELL DRILLING MUDDS

A.F. NOVAK, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

Objectives: 1. To determine the amount of diesel oil present in contaminated oysters. 2. To determine the threshold amount of oil which can be detected by taste or organoleptically. 3. In what areas or organs of oysters the oil is concentrated. 4. The relationship between concentration of drilling mud in sea water to the oil concentration in the oysters.

At times drilling mud has been released into the surrounding areas. If oyster beds are in the vicinity where drilling muds are released such material can slowly settle over the oyster beds. This may cause the oysters to have an oily taste or if the concentration is high enough death of the oysters.

Oysters will be placed in tanks containing bottom mud mixed with oil drilling mud containing tagged hexadecane C14. Samples of oysters will be removed at regular intervals and the amount of oil from the drilling will be removed at regular intervals and the amount of oil from the drilling mud will be determined by liquid scintillation spectrometry. This is a cooperative project with the La. Wild Life and Fisheries Commission. The Grand Terre Laboratory will conduct the biological work. The extraction of the oil will be conducted in this Department. The spectrometry will be carried out in the Nuclear Science Center at La. State University.

SUPPORTED BY Louisiana State Government

### 5.0432, CULTURE OF RED SWAMP CRAWFISH, PROCAMBARUS CLARKI, IN BRACKISH WATER PONDS

W.G. PERRY, Rockefeller Wildlife Refuge, Grand Chenier, Louisiana 70643

The freshwater crawfish is a highly valued food source. Crawfish farms are springing up everywhere. However, persons in brackish water areas of our coastal states are a bit hesitant in investing money into such a venture not knowing if they will receive a profit.

It is the purpose of this project to evaluate crawfish production in saline waters and to determine the maximum salinities in which the crawfish may be cultured.

SUPPORTED BY Louisiana State Government

### 5.0433, ECOLOGICAL STUDIES OF THE BLUE CRAB, CALLINECTES SAPIDUS

W.G. PERRY, Rockefeller Wildlife Refuge, Grand Chenier, Louisiana 70643

This project is designed that we may better understand the life history of the blue crab in the estuaries of Southwest Louisiana.

SUPPORTED BY Louisiana State Government

### 5.0434, LAKE BORGNO - CHANDELEUR SOUND SYSTEM

J.G. BROOM, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: Develop, coordinate, and increase the knowledge about the Gulf shrimp fishery by: (1) postlarval shrimp sampling, (2) juvenile sampling, (3) sampling of over-wintering populations, (4) collection of hydrographic information and (5) processing of data.

Procedures and Work Schedule: (1) Weekly postlarval shrimp sampling in the major passes with 6-foot beam plankton net. (2) Weekly juvenile shrimp sampling throughout the major nursery areas with 6 foot 1/4 in mesh trawls on a seasonal basis.

(3) Periodic sampling of over-wintering stocks of shrimp in the coastal marshes and near offshore Gulf waters with shrimp trawls. (4) Collection of hydrographic information including salinity, temperature and tidal data by use of continuous recording meters and portable units. (5) The processing, tabulating and summarizing of collections and raw data, which are to be transmitted to the project leader at the marine laboratory for compilation, analysis and interpretation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish. Louisiana State Government

### 5.0435, SHRIMP PRODUCTION IN LOUISIANA SALT-MARSH IMPOUNDMENTS UNDER EXISTING AND MANAGED CONDITIONS

A.H. HARRIS, Francis T. Nicholls State Coll, Graduate School, Thibodaux, Louisiana 70301

This project is to determine the feasibility of shrimp farming in the impounded marshes and lagoons of Louisiana. The existing productivity of impounded nursery areas already producing shrimp is to be determined and then compared with another area operated under experimental conditions. Natural nursery areas will be encompassed with levees, and water control structures will be used to provide control over movement of tides and shrimp into and out of the impoundments. Both impoundments will be stocked by natural recruitment of the brown (*Penaeus aztecus*) and white (*P. setiferus*) young shrimp from flood tides.

The second phase of the program is to develop methods of management and harvesting that will determine the economic feasibility of shrimp farming in the Louisiana marsh. To do this, patterns of ingress and egress, population fluctuations, growth rates, natural mortality, and food habits of both species will be investigated. The effects of predators and parasites also will be determined. The Louisiana Land the Exploration Company, a private owner of extensive marshland acreage, is providing free of charge, the use of some of their land for this research and some of the financial support for the project.

SUPPORTED BY U.S. National Science Foundation

### 5.0436, LOBSTER RESEARCH

B.E. SKUD, U.S. Dept. of Interior, Biological Laboratory, Boothbay Harbor, Maine 04538

Two objectives: learn whether there are any biological connections between the inshore and offshore fisheries; determine the essential population characteristics and the environmental requirements for maintaining a maximum catch.

Approaches: 1) Obtain catch records. State of Maine has extensive present and past data on the inshore fishery, so our effort is concentrated on the offshore fishery which takes place along the edge of the continental slope. 2) Study lobster movements. Test a tag which will persist through several moults. Use to determine local, seasonal, and long-distance movements. 3) Develop means of distinguishing discrete groups of lobsters. Utilize studies of morphology, growth, blood-types, and parasites for this purpose. 4) Obtain first-hand and specific knowledge of lobster habitat and behavior through use of SCUBA divers. 5) Study lobster life history. Include studies of fecundity, larval and juvenile stages, growth, and mortality. Investigate relationships of various developmental states to harvestable population. 6) Determine environmental requirements of lobsters, including optimum levels and extremes of tolerance. 7) Utilize output of all studies to make abundance or availability predictions and to establish safe maximum levels of harvesting.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0437, TEMPERATURE AND SALINITY TOLERANCE OF THE SAND SHRIMP, CRANGON SEPTEMPINOSA

P.A. HAEFNER, Univ. of Maine, Graduate School, Orono, Maine 04473

This is a continuation of GB-5228. All organisms are subject to a complex of environmental variables. Their response is to the net effect of all stresses applied. The investigator is studying the

## 5. LIVING SYSTEMS (NON-HUMAN)

interaction of temperature and salinity stresses on non-genetic adaptation of an estuarine animal that normally encounters a wide variation in these factors. Laboratory studies have shown the limits imposed by various temperature-salinity interactions. Field studies now in progress will relate the laboratory findings to survival and distribution of the shrimp in nature.

SUPPORTED BY U.S. National Science Foundation

### 5.0438, EXCITATION-CONTRACTION COUPLING IN MUSCLE

H. GAINER, Univ. of Maryland, Graduate School, College Park, Maryland

This investigation will attempt to further analyze the mechanism whereby the excitation process in the surface plasma membrane of muscle fibers brings about the initiation of contraction even in the deepest myofibrillas layers. The hypothesis that a transverse tubular network with specific membrane properties is the site of the coupling mechanism, will be tested in several crustacean muscle fibers by various electrophysiological and physiochemical experiments. The crustacean species presently under study are the lobster (*Homarus americanus*) and the blue crab (*Callinectes sapidus*). Several other species of crab will also be studied with regard to their excitation-contraction coupling processes. It is hoped, that through a comparative approach to excitation-contraction coupling, further insights into the general problems of this process will be provided.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0439, A NON-DESTRUCTIVE METHOD FOR ESTIMATING POPULATION DENSITY AND DISTANCE TO NEAREST NEIGHBOR FOR ESTUARINE MOLLUSCS

A.J. MCERLEAN, Univ. of Maryland, Natural Resources Institute, College Park, Maryland

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Society of The Sigma Xi

### 5.0440, PARASITOLOGY

J.A. COUCH, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Systematic, epizootiological, and zoogeographical studies of significant parasites and commensals of commercial shellfish and associated species are being carried out. Several life history stages of parasites (*Minichinia nelsoni* and *M. costalis*) of oysters have been found and identified. A three-year study of the epizootics caused by both of these parasites has been completed for Chincoteague Bay, Virginia.

Oysters from estuarine waters of the Middle Atlantic and Southern States are being examined for *M. nelsoni* (MSX) and *M. costalis* (SSO) and other potentially pathogenic organisms. This study has given us an incomplete but valuable conception of the possible presence or absence of these parasites in significant oyster producing areas on the eastern coast. Thus far it has been learned that the range of *M. nelsoni* extends at least as far north as New Haven, Connecticut, and as far south as the New River, North Carolina. 036

Blue crabs are being examined from several areas in Chesapeake Bay and waters of the southeast United States where heavy mortalities have been reported. Parasites were identified and one gill commensal, *Lagenophrys* (a peritrichous ciliate), has been described and is being studied as a contributor to the mortalities. Further studies are planned on the 'Grey Crab disease' believed to be caused by an amoeboid organism.

The long-range goal of the project is to better understand the roles that parasites and commensals play as limiting factors in the abundance and utilization of shellfish.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0441, PATHOLOGY - EPIZOOTIOLOGY

C.A. FARLEY, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

The pathological, parasitological, epizootiological, and cytochemical relationships of diseases in oysters are being studied. Receiving greatest attention with regard to the above is the haplosporidan, *Minichinia nelsoni*, an oyster parasite associated with massive oyster mortalities in Delaware and Chesapeake Bays. With the repeated discovery of definitive life cycle stages, its life history within the oyster has now been proposed. A system for determining stages of infection has been developed and is being utilized for interpretation of epizootiological data. Comparative studies are being made of epizootiological patterns in four populations of oysters in Pocomoke Sound, Maryland. Methods are being developed for determining DNA-RNA patterns in hosts and parasites and is receiving intensive study. Studies are also being made of causes of mortality in oysters from the west coast of the United States, British Columbia, and France and are being compared with local mortality causes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0442, PACIFIC OYSTER MORTALITY STUDIES

A. ROSENFELD, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Efforts are being made to identify or discover those factors, particularly disease agents, responsible for shellfish mortalities on the west coast of the United States and Canada. Epizootic and pathologic studies are being conducted to determine timing, patterns, and possible causes of mortalities, and to determine pathogenicity of disease agents. Shellfish from exotic and domestic 'seed' supply areas are screened for micropathogens or disease organisms before introduction or importation of these shellfish into west coast growing areas.

Shellfish from several Far East potential 'seed' sources have been and are being examined microscopically for the presence of microparasites, micropathogens, and disease conditions. Many previously unobserved or unreported microparasites and disease conditions have been seen in these specimens. Reports and appropriate recommendations are sent to pertinent Pacific Coast state agencies, and when deemed necessary, recommendations for quarantines or embargoes on shipments are given.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0443, PROTOZOOLOGY

T.K. SAWYER, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Methods and procedures are being developed to establish protozoan parasites from oysters and other shellfish in xenic and axenic culture. Techniques such as enzyme dissociation, gradient centrifugation, and selective filtration for the isolation of protozoans from oyster tissue and the environment are being investigated. Isolates are grown on special nutrient media in the presence of various food sources to determine survival periods and 'growth' potential of the organisms. Nuclear division and morphology of trophic forms are being studied by phase contrast, and with the use of differential strains. Taxonomic studies are in progress using fluorescent antibody techniques.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0444, CULTURE OF SHELLFISH IN ARTIFICIAL AND NATURAL SALT PONDS

W.N. SHAW, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Early in 1964, four one-quarter acre artificial ponds were completed near the laboratory at Oxford, Maryland. Studies are being conducted on the growth and survival of oysters in these ponds. Studies are being conducted in one of the ponds for catching oyster set and fattening oysters. Attempts to fertilize the ponds to increase productivity are underway.

Studies are planned on the growth and survival of oysters suspended from a rigid structure on the Tred Avon River adjacent to the laboratory. Preliminary studies indicate that the river is favorable for good oyster growth. Strings of oysters will be suspended and their growth and survival studied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0445, POTENTIAL OYSTER SETTING CAPACITY - LOCAL AREAS

*W.N. SHAW*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

This project is concerned with the setting capacity of oysters in local waters, principally the Tred Avon River, Broad Creek, and Harris Creek, on the Eastern Shore of Chesapeake Bay in Maryland. Yearly, stations are established in each area, and during the oyster setting season (June to October) collectors in the form of oyster shells and asbestos flexboards are put out at each station. Total amount of setting and period of setting intensity are measured by counting daily and weekly the number of oyster spat on these collectors. In addition, the amount of fouling competitors for space is studied.

Studies on the rafting of shells to catch seed oysters are being conducted. Rafts are being placed in areas where setting intensity has been high. Shells on strings and in bags are being suspended from the rafts during the setting season. Once the seed is caught they are removed from the rafts and suspended from a rigid structure to grow to market size. The long line method to catch and grow seed oysters is to be tested in several areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0446, ECOLOGY AND DISTRIBUTION OF OYSTERS AND CLAMS

*W.N. SHAW*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

The natural populations of commercial shellfish in local areas have been delimited. Zooplankton and phytoplankton levels in shellfish producing areas are being determined and the organisms involved are being identified. The effects of physical and chemical factors on plankton, and on larval, juvenile, and adult stages of commercial shellfish are being determined. Qualitative and quantitative observations are being made on the invertebrate animals in local areas, and numbers and living habits related to effects on commercial species. Food webs, within the small estuarine tributaries of Chesapeake Bay, are being established. Ecological studies in large man-made salt water ponds have been undertaken, and all information, from natural and artificial situations, will be related to maintenance of shellfish in these ponds.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0447, GROWTH, CONDITION, AND SURVIVAL OF SHELLFISH

*W.N. SHAW*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

In recent years the oyster industry in Chincoteague Bay has been importing oysters from other regions into the bay to hold for future marketing. At present, studies are being conducted to see if these oysters adapt to this new environment. Oysters from low salinity waters are suspended in trays in Chincoteague Bay. Their growth, condition, and survival are monitored.

Monthly, a comparative analysis is made on the conditions, percentage of solids, of oysters on two natural bars--one in broad Creek and one in the Tred Avon River. At each locality the effects of crowding and fouling are being studied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0448, SURF CLAM POPULATION DYNAMICS

*R.M. YANCEY*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

The commercial hydraulic jet dredge has been modified to sample clams without bias in sizes larger than two inches.

Clam occurrence on the Atlantic coastal shelf between the Hudson Canyon and Cape Charles will be determined. Clam abundance in time and place will be described according to commonly understood measures.

The normal yearly recruitment of juvenile clams to the major populations will be determined. Variations in year class abundance will be estimated, with special attention to probable dominant year classes. The rate of clam survival before the size and age when they are harvested commercially (about four inches long) will be determined. The rate at which clams usually become

available to the commercial fishery as a function of their size (or age) will be estimated. Such availability will be related to mortality, including fishery removals. The effects of fishing upon population composition, natural survival, and natural recruitment will be determined. The rate of repopulation of depleted grounds will be estimated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0449, SURF CLAM BIOLOGY

*R.M. YANCEY*, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

As a part of the life history project, samples of surf clam, *Spisula solidissima*, gonads are routinely collected from New Jersey ports of landing and from other areas along the Atlantic Coast. The gonads are prepared for microscopic examinations of gametogenesis to determine the frequency, duration, and times of spawning. Since the gonad samples are taken from large mature clams, other gonads will be collected from smaller clams to determine sexual maturity. These observations will provide basic knowledge useful in studies of recruitment, repopulation, and the extent of the spawning population of this commercial shellfish.

Studies are being conducted to develop reliable aging techniques and to determine the growth rate of surf clams, since little is known about the length of time it takes for these clams to reach a marketable size. Frequency distributions of shell length measurements will be collected from samples taken at sea, port landings, and beaches. The feasibility of marking and tagging clams is being explored to provide direct evidence of clam age and growth.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0450, FREEZING AND DRYING OF LIVING CELLS

*H. MERYMAN*, U.S. Navy, Medical Research Inst., Washington - Bethesda, Maryland

Objective: a. Problem: To investigate the mechanisms whereby freezing and drying affects living cells. b. Application: Determination of methods of protection of cells under severe environmental conditions. c. Injury to cells subjected to freezing can be either mechanical (ice crystal edges cutting into cell components) or chemical (chemical reactions and/or concentrations of chemicals due to dehydration).

Approach: The work will include pertinent studies and completion of studies on the freezing resistance of nematodes. Further studies will begin on freezing resistance and sensitivity on intertidal mollusks. Other work will be conducted on thermal analysis as a means for observing the development of phase changes during temperature cycling. Work will also continue on the effect on survival of storage of evaluated temperature under varying equilibrium water vapor pressures and subjected to gamma radiation. Additional work will be performed to investigate reported degradation of biological materials in liquid nitrogen.

Progress: A close correlation has been found between the onset of injury in freezing and the proportion of water frozen for several biological materials with widely divergent temperatures of injury.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 5.0451, PARASITIC COPEPODA %CRUSTACEA FROM INVERTEBRATES AND FISHES

*A.G. HUMES*, Boston University, Graduate School, Boston, Massachusetts 02215

Large collections of copepods, all parasites or associates of marine fishes or invertebrates, will be studied with emphasis upon morphology and systematics. These copepods come from mainly the West Indies and Madagascar, those from the latter area having been collected during the International Indian Ocean Expedition in 1963-64.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0452, COASTAL LOBSTER FISHERY

A.E. PETERSON, State Dept. of Nat. Resources, Boston, Massachusetts

Objective: To obtain accurate lobster landing statistics, including location, catch, effort, and gear from the licensed Massachusetts lobster fisherman.

Procedure: All licensed lobster fishermen are required to submit annual reports before new licenses are issued. The license holders will be divided into commercial and non-commercial categories. The commercial lobster fishermen will then be required to submit monthly catch reports. The validity of these reports will be checked by interviewing a random sample of the license holders. This information will then be compared and correlated with individual, annual, and/or monthly reports. An attempt will be made to improve catch reports, and it is anticipated that it will be possible to utilize weigh-out slips when the fisherman sells his lobsters to the dealer. With both parties retaining a copy of this slip, further verification of reports can be made through comparison.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Massachusetts State Government

### 5.0453, OFFSHORE LOBSTER FISHERY

A.E. PETERSON, State Div. of Marine Fisheries, Boston, Massachusetts

Objective: To obtain accurate lobster landing statistics, including location, catch, and effort, from the otter trawl draggers catching lobsters.

Procedure: A survey of the Massachusetts ports where draggers land their catches will be made to ascertain the extent of lobster landings at each port. It is proposed that weigh-out slips will then be utilized as a source of catch statistics. Both the fishermen and the dealer would be required to submit monthly reports. Interview sampling will be used to verify the reports.

Time: This phase will not be initiated during the first year of operation, since the Bureau of Commercial Fisheries, Boothbay Laboratory, is currently engaged in a similar project under their offshore lobster investigations.

It is planned to perform this phase in subsequent sub projects.

Part 2 of 6.

### 5.0454, BIOLOGY OF THE ANTARCTIC BRACHIOPOD FAUNA

B. KUMMEL, Harvard University, Graduate School, Cambridge, Massachusetts 02138

Support is provided to Harvard University for the third and final year for the completion of quantitative and qualitative studies on Antarctic brachiopod taxa. This will complete studies of the soft part anatomy and sections of shell for taxonomic and evolutionary characters, determine skeletal support through x-ray techniques and utilize electron probe for information on elemental variations. The overall objective is to provide a modern biological study of Antarctic brachiopods, essential to an understanding of brachiopods in general, with information on the ecology and zoogeography of Antarctic genera and species. The support will assist in the preparation of a manuscript for publication.

Under GA-430, the investigators have incorporated data on 39 genera and 78 species reported in the literature of the Antarctic Region. These have been projected in a series of charts with appropriate text for publication in the marine biology volume of the Antarctic Map Folio Series. Specimens representing 12 genera and 78 species have been assembled on loan from foreign and domestic museums for study of regional differences. Visits have been made or are planned to New Zealand, Australian and British Museums for examination of type specimens. Material in excess of 10,000 specimens has been collected through participation in Eltanin cruises 27 and 32. This provided fresh specimens for observation on feeding and reproduction and for histological and systematical information on structure and function.

This data study will be conducted at Harvard University; there are no requirements for field work.

SUPPORTED BY U.S. National Science Foundation

### 5.0455, HISTOCHEMICAL STUDIES OF MUCOSUBSTANCES IN THE MANTLE OF THE NORTHERN QUAHOG, *MERCENARIA MERCENARIA*

R.E. HILLMAN, William F. Clapp Laboratories, Duxbury, Massachusetts 02323

The objective of this study is to localize and describe mucopolysaccharides and mucoproteins in the mantle edge of the quahog clam, *Mercenaria mercenaria*. These mucosubstances vary in vary in chemical composition from area to area within the mantle edge. It is reasonable to assume they are performing relatively sophisticated physiological functions because of the variations in structure and the fact that similar mucosubstances in higher forms have specific physiological roles. By localizing and identifying the various mucosubstances in the clam one might be able to correlate the functions of these substances in the clam with those in the higher forms. It might then be possible to learn more about the mechanism of action of these substances. For example, a comparison of the glycosaminoglycans aiding in shell deposition in the clam with similar organims might provide information as to glycosaminoglycans function in the overall mechanism of calcification.

SUPPORTED BY Battelle Memorial Institute

### 5.0456, SEA CLAM EXPLORATIONS

P.S. PARKER, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Gloucester, Massachusetts 01930

Detailed systematic area clam surveys along the North Atlantic coast of the United States are conducted. The purpose of the surveys are to gather information on the abundance, distribution and size of surf clams (*Spisula solidissima*) and other species found with a potential commercial use and to determine from this information if the surf clam and other species populations located are suitable for commercial exploration. It is anticipated that this information will be used by the surf clam industry to make future management plans for maintaining a healthy growing natural population.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0457, NORTHERN SHRIMP EXPLORATIONS

P.S. PARKER, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Gloucester, Massachusetts 01930

Seasonal exploratory fishing surveys are being conducted in Gulf of Maine and Georges Bank waters to locate and delineate populations of northern shrimp (*Pandalus sp.*) that may be available in sufficient quantities to support expansion of the commercial fishery for this species.

Special trawls and shrimp handling equipment are being developed to promote the most efficient harvesting of shrimp and rapid handling aboard ship.

### 5.0458, SYSTEMATICS MORPHOLOGY AND ECOLOGY OF THE GENUS *ERVILIA* (MOLLUSCA: PELECYPODA) IN THE WESTERN ATLANTIC

J.D. DAVIS, Smith College, Graduate School, Northampton, Massachusetts 01060

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Society of The Sigma Xi

### 5.0459, DEMINERALIZATION-BORING MECHANISMS OF MOLLUSKS

M.R. CARRIKER, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Continue studies of the degree of penetration of the ABO\* secretion into the surface of shell in the bore hole of *Urosalpinx* during boring by means of microradiography (titanium radiation), and by means of the scanning electron microscope.

## 5. LIVING SYSTEMS (NON-HUMAN)

Continue studies to elucidate the metabolic pathways in the Urosalpinx ABO which may control the action of carbonic anhydrase activity in decalcification.

Continuous preparation of manuscripts on (a) behavior of shell penetration by Urosalpinx cinerea follyensis, and (b) comparative functional morphology of the ABO of muricid gastropods.

Continue organization of international symposium on the penetration of calcareous substrates by invertebrates and lower plants for the AAAS Meetings in 1968 under major sponsorship of the American Society of Zoologists.

\*ABO is the accessory boring organ of the muricid boring snail Urosalpinx cinerea follyensis (Baker).

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0460, THE POPULATION ECOLOGY OF GEMMA GEMMA (PELECYPODA, VENERIDAE), A DOMINANT SPECIES IN BARNSTABLE HARBOR, MASS**  
*R.H. GREEN, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543*

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Whitehall Foundation

**5.0461, SYSTEMATIC STUDIES OF ANTARCTIC COPEPODS**  
*T.S. PARK, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543*

The definitive taxonomic treatment of Antarctic calanoid copepods from Eltanin zooplankton will be carried out at Woods Hole Oceanographic Institution. Preliminary sampling of zooplankton and mid-water trawls made on Eltanin Cruise 17 reveals 53 species; these have been analyzed for size variations, species composition and numerical abundance. Continuation of this systematic study, using materials from selected stations made by Eltanin in earlier cruises in the Southern Ocean, will permit a complete faunistic treatment of all samples. In addition, an attempt will be made to determine the biological significance of the Antarctic convergence and the hydrology of the entire Southern Ocean in the habit and distributional pattern of pelagic copepods. The calanoid copepods will be studied in terms of comparative anatomy, biometry, and distribution with the ultimate objective of producing a comprehensive monograph, including illustrated keys to species.

The samples required in this study will be provided through the Smithsonian Oceanographic Sorting Center where the zooplankton hauls and midwater collections are rough sorted and curated. Labelled specimens will be returned by the principal investigator at the conclusion of the work to the SOSC. All type specimens will be deposited at the U. S. National Museum. It is planned tentatively to participate in one Eltanin cruise.

SUPPORTED BY U.S. National Science Foundation

**5.0462, CUES INVOLVED IN VERTICAL MOVEMENT AND STATIC ORIENTATION OF GASTROPODS**  
*A. MCCLARY, Michigan State University, Graduate School, East Lansing, Michigan 48824*

Brief Description of Research Project: The relative importance of several potential cues to vertical movement of *Helix pomatia* and *Pomacea paludosa* will be investigated. This will be done by depriving various groups of snails of one or more of these cues and then testing their ability to travel upwards on slopes or vertical surfaces. Statocyst stimulation as a cue will be abolished by removing statocysts as done in previous work. Some snails will also be sham operated to provide a check for the effects of simple operative incision as compared to incision plus statocyst removal. Light as a cue will be abolished by blinding, shell muscle proprioceptors by floats or strings attached to shell apices. In the case of *Pomacea*, two other potential cues, namely oxygen gradients and lung gas, will also be abolished.

In a similar manner, substrate contact, statocyst stimulation, and light will be investigated as potential cues for static orientation.

SUPPORTED BY U.S. National Science Foundation

**5.0463, PHYSIOLOGY OF THE LIMULUS HEART**  
*R.A. PAX, Michigan State University, Graduate School, East Lansing, Michigan 48824*

The rhythmically active neural tissues of neurogenic hearts present simple systems for study of problems of initiation, maintenance, and regulation of neurogenic rhythms in general. The decapod crustacean heart has been intensively studied in recent years but the basic questions concerning neurogenic rhythms have not yet been answered.

It is proposed here that a neurogenic rhythm in a different class of animals be studied. The neurogenic rhythm proposed for this study is that of the heart of *Limulus*, the horse-shoe crab. This study, entailing histological, electrophysiological and pharmacological experiments, is expected to answer the questions of whether mechanisms by which neurogenic rhythms arise are the same in different animal groups and whether the *Limulus* heart is a more favorable preparation for an attack on the problem of how such rhythms are initiated, maintained and regulated.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0464, EFFECTS OF HIGH TEMPERATURE, LOW OXYGEN, AND PH EXTREMES ON THE SURVIVAL OF AQUATIC INSECTS AND CRUSTACEA IMPORTANT AS TROUT FOOD**  
*A.V. NEBEKER, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota*

To establish dissolved oxygen, temperature, and pH requirements for various species of aquatic insects and crustacea which have been found to be important in the food chain of brook, rainbow, and lake trout. Two species of Lake Superior crustaceans, *Mysis relicta* and *Pontoporeia affinis*, and five species of aquatic insects, *Acronuria lycorias*, *Taeniopteryx maura*, *Brachycentrus americanus*, *Hydropsyche betteni*, and *Ephemerella subvaria*, will be used as test organisms. The work will consist of determining the TL<sub>m</sub>(LD50) values for 96 hours and 30 days, and longer if possible, for high temperatures, low oxygen, and low and high pH.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

**5.0465, A STUDY OF COLIFORM BACTERIA AND ESCHERICHIA COLI ON POLLUTED AND UNPOLLUTED OYSTER BOTTOMS OF MISSISSIPPI**

*G. GUNTER, State Marine Conserv. Comm., Biloxi, Mississippi*  
Objectives: 1) To establish a regular sampling program on transects across Mississippi Sound and extending from fresh water to the Gulf of Mexico and on selected polluted and unpolluted oyster reefs. 2) To perfect technique for collecting comparable samples. 3) To complete bacterial analyses of collected samples. 4) To compare the bacterial flora from polluted and unpolluted areas of Mississippi Sound and adjacent waters, especially as it relates to sewage polluted oyster beds.

Procedures: 1) Field - (a) Surface, mid-water and bottom samples will be collected at established stations where there is sufficient depth of water. Additional samples will be collected as necessary. (b) Techniques to insure the collection of samples under sterile conditions will be established. (c) Temperature and salinity will be determined at all stations. (d) Collected samples will be refrigerated and returned to the laboratory for analysis. 2) Laboratory - (a) The Most Probable Number of coliform organisms and of *Escherichia coli* of presumptive human fecal origin will be determined by competent bacteriologists. (b) Additional studies will be carried out where feasible.

Mississippi State Government

**5.0466, POPULATION STUDIES OF HAUSTORIIDAE AND GAMMARIDAE FROM NEW ENGLAND AND ON INFAUNAL AND EPIFAUNAL MARINE AMPHIPODS AT ENIWETOK**

*R.A. CROKER, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824*

## 5. LIVING SYSTEMS (NON-HUMAN)

I. This research focuses on two families of marine amphipods: 1) Gammaridae, with epifaunal, boreal-subarctic species of wide ecological valence, that presently show different morphological and population characteristics when coastal and estuarine populations are compared, and 2) infaunal Haustoriidae from intertidal and subtidal sands showing more ecological specialization to their respective niches, less morphological variation, and more narrow reproductive periods. Objectives are to elucidate: 1) geographic and infraspecific variation as related to ecological specialization, 2) population structure, including clines, isolates, peripheral populations, fluctuations, intergradations, and dispersal, 3) breeding systems including ecological, reproductive and chromosomal factors, and 4) environmental factors acting on populations.

II. This research concerns studies on marine amphipods of tropical Pacific sand substrata and was designed primarily to provide knowledge concerning zoogeography and life histories of Micronesian species. The research emphasizes collecting in fine calcareous lagoon sediments of Pacific atolls to provide population data on: distribution, density, specific composition, reproductive cycles, fecundity, sex ratio, growth, and food. Particular stress is placed on life history aspects, distributional ecology and infra specific variation.

U.S. Atomic Energy Commission

### 5.0467, PURIFICATION OF HARD CLAMS FROM POLLUTED WATERS

*H.H. HASKIN*, Rutgers The State University, Graduate School, New Brunswick, New Jersey 08903

This project is designed to define optimal conditions for maximum hard clam activity. The activities of greatest interest are those which purify (depurate) the clams of bacterial and viral contaminants. Since purification experiments are lengthy and involved, other indicators of clam activity will be used in a study of such environmental parameters as temperature, salinity, turbidity, food levels, light, oxygen levels, etc. Uptake and disposal of bacterial and bacteriophage contaminants will be further studied in the laboratory and the results of these studies will be related to bacterial and, hopefully, enteric viral levels in the Raritan Bay estuary and its clam populations.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0468, BIOCHEMICAL CHARACTERIZATION OF CHOLINESTERASES IN THE BLOOD AND CENTRAL NERVOUS SYSTEM OF LIMULUS POLYPHEMUS

*R. VONBURG*, Montefiore Hosp. & Med. Ctr., Bronx, New York 10467

Acetylcholine-cholinesterase systems have been found in all arthropods studied. However, information is lacking on *Limulus polyphemus*. This organism has the additional interest of being considered a living fossil. Therefore, from a comparative as well as a phylogenetic point of view, an attempt is being made to characterize the pseudo and true cholinesterases in the blood and central nervous system of adult organisms. The technique involves the rate of enzymatic acid production as measured by an autoburette in response to specific substrates. Work is being conducted at Montefiore Hospital and should be completed by 1969.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0469, NEUROPHYSIOLOGICAL INVESTIGATIONS OF LIMULUS CENTRAL NERVOUS SYSTEM

*R. VONBURG*, Fordham University, Graduate School, New York, New York 10458

The circumesophageal collar, haemal nerves and ventral cord were investigated for controlling influences on the heart rate of *Limulus polyphemus*. Electrical stimulation and surgical lesioning were the principal techniques. Recordings were made by means of an oscilloscope and polygraph.

The forebrain was found to exert a contralateral driving force on the haemal nerves 7 and 8 which are known to control the heart rate. However, contrary to Pax and Sanborn (1964) the output of these nerves was found to be only inhibitory.

The ventral cord was also found to control cardiac rate.

The control resides within the abdominal ganglia and there appears to be a functional hierarchy that begins with the first abdominal ganglion and diminishes with each successive ganglion. Here again, there appears to be a contralateral driving influence on an inhibitory output. Several models of *Limulus* c.n.s. are possible. In an effort to eliminate some of these possibilities, single fiber analysis of the outputs of the abdominal ganglia will be attempted.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 5.0470, THE EFFECT OF SOME NEUROTRANSMITTERS ON THE CENTRAL NERVOUS SYSTEM OF LIMULUS POLYPHEMUS

*R. VONBURG*, Fordham University, Graduate School, New York, New York 10458

Acetylcholine bromide, gamma-aminobutyric acid, 5 hydroxytryptamine, 3 hydroxytryptamine, histamine, L-glutamine, epinephrine, nor epinephrine and the inhibitors, curare, atropine, reserpine, eserine and picrotoxin were studied.

Application of the drugs was accomplished by cannulating the ventral cord connective tissue sheath with a polyethylene needle. Cardiac rate and nerve firing rate were recorded by an oscilloscope and polygraph.

Acetylcholine bromide and gamma-aminobutyric acid at 0.01 molar concentrations appear to be the only substances tested that were able to produce consistent changes. Acetylcholine increased nerve activity and enhanced the heart rate while the reverse was true with gamma aminobutyric acid. Only eserine and picrotoxin were effective as inhibitors. Other agents are currently being tested.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 5.0471, MECHANISMS OF VENTILATORY CONTROL

*M. MENDELSON*, New York University, School of Medicine, New York, New York 10003

A system of interneurons and motoneurons in the suboesophageal ganglion of the hermit crab is to be studied further. This system, which controls the ventilatory appendage of the crab has been found to operate in essentially normal fashion in vitro for considerable periods. Interaction among the inter- and motoneurons are being analyzed.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0472, PHYSIOLOGICAL VARIATION AND ECOLOGY OF MOLLUSCS

*W.D. HUNTER*, Syracuse University, Graduate School, Syracuse, New York 13210

The proposed work continues and extends the field and laboratory studies on the physiological ecology of molluscs previously carried out by the principal investigator. The major long-term studies involve field investigations of respiratory behaviour, growth, reproductive pattern, and population dynamics in selected natural populations of fresh-water and marine littoral molluscs. There are two main objectives in these studies: (a) to determine the extent and nature of physiological variation between natural populations of the same species, for example, in respiration and in reproduction, and (b) to attempt to produce population 'balance sheets,' that is, assessments of population turnover in relation to total species biomass, including field estimates of metabolic rates and energy flow through the populations concerned. The long-term field work on natural populations is supplemented by cognate experimental studies, mostly short-term, on specific aspects of physiology or ecology in molluscs. Examples include studies on control of diapause and onset of breeding in snails, on respiratory adaptations, on locomotion, on water control, on methods of assessment of population density and dispersal, and on the ecology of closely related species.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0473, EFFECT OF ENVIRONMENTAL CHANGES ON BLUE CRAB ABUNDANCE

M.H. JUDY, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Under this project the following studies are planned or are in progress in North Carolina waters: (1) relative abundance and distribution of all life history stages. (2) migratory movements of adult blue crabs. (3) species composition of crab population. (4) development of methods to estimate adult crab population size (5) relationship between size of spawning population and resulting marketable size progeny.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0474, ACCUMULATION OF RADIOACTIVITY BY INVERTEBRATES (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

T.J. PRICE, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

The rapid growth of atomic energy industries and the increased use of nuclear reactors for power production have increased the possibility of the contamination of the marine environment with radioactive materials. Also, radioisotopes used in research and medicine may be disposed of in coastal waters, which are habitats for many species of commercial marine invertebrates.

Since many invertebrates are filter-feeders, omnivorous predators, and scavengers, it is probable that these animals come in contact with most components of the ecosystem. If one or more of these components contain radionuclides, it is probable that this radioactivity eventually would become associated with these animals.

Laboratory research is being done to determine the uptake, accumulation, and retention of specific radioisotopes (zinc-65, iron-59, iodine-31 and others) by marine invertebrates, including clams, oysters, scallops, and crabs. From these experiments, one can ascertain the importance of various factors which may affect accumulation; observe the metabolism of specific elements by invertebrates through the use of radioactive tracers; and study the foods and feeding activities of marine invertebrates.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0475, SURVIVAL REQUIREMENTS OF JUVENILE AND ADULT BLUE CRABS

M.E. TAGATZ, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

The project has three phases, which will be undertaken in the order in which they are listed. Phase 1. Determine the nature of, and the capacity for osmotic and ionic regulation in juvenile and adult blue crabs. Phase 2. Determine factors affecting length of intermolt period and percentage increase in size at time of molt. Phase 3. Analyze responses of juveniles and adults to environmental stresses such as salinity, temperature, pH, dissolved oxygen, etc., under controlled laboratory conditions, to establish parameters within which survival is possible. Within these parameters, determine optimum conditions for growth and reproduction.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0476, CONTROLLED ENVIRONMENTAL FACTORS ON THE DEVELOPMENT OF ESTUARINE AND OCEANIC CRUSTACEA

J.D. COSTLOW, Duke University, Graduate School, Durham, North Carolina 27706

The research program has the following objectives: 1. To study, under controlled laboratory conditions, the larval development of crabs which are found in estuaries and oceanic waters in the vicinity of Beaufort, North Carolina. 2. To determine the effect of temperature, salinity, and pressure on larval development. 3. To determine whether daily changes in temperature and salinity affect molting frequency, duration of larval life and survival in the same manner as when these factors are kept constant throughout larval life. 4. To study the larval development of a few

crabs which have a broad geographical distribution and determine whether larvae of the same species from different latitudes and longitudes of the geographical range exhibit the same or different tolerances to common environmental factors.

SUPPORTED BY U.S. National Science Foundation

### 5.0477, RELATIONSHIPS AMONG POPULATIONS OF LIMNORIA TRIPUNCTATA

R.J. MENZIES, Duke University, Graduate School, Durham, North Carolina 27706

Most biologists now accept the genetical species concept (Mayr, 1940, et seq.) which defines a species as 'groups of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups.' This concept has not been extensively applied in systematics due to the practical difficulties involved in testing the reproductive relationships of populations. It is especially difficult to evaluate marine species with respect to the interbreeding criterion, particularly those which are widely distributed or which come from the deep sea. Almost all species of marine organisms have been distinguished solely on the basis of their morphological distinctness from other groups of populations. Many marine organisms require stringent laboratory conditions for their cultivation. In most marine species even the culture requirements are not known. This is not the case with *Limnoria* which is among the easiest marine invertebrates to culture.

Morphological distinctness, however, has been shown to be inadequate for the recognition of 'genetic' species in many organisms. On one hand, populations in some taxa have been shown to be reproductively isolated from each other although they differ only minutely in their morphology. Some knowledge of the reproductive relationships of populations is necessary for the recognition of 'genetic' species within a taxon.

The immediate objectives of this research are: 1) to evaluate the reproductive relationships among populations of a widely distributed marine species, *Limnoria tripunctata* Menzies; 2) to provide a relatively complete analysis of the geographic variability of this species; and 3) to establish criteria useful in the determination of species differences. It is hoped that the proposed research will also contribute toward the elucidation of criteria for the recognition of 'genetic' species in marine isopods.

SUPPORTED BY U.S. National Science Foundation

### 5.0478, GAMETOGENESIS AND FERTILIZATION IN THE BLUE CRAB, CALLINECTES SAPIDUS RATHBUN, AND OTHER CRABS

E.P. RYAN, East Carolina University, Graduate School, Greenville, North Carolina 27835

The proposed research includes a detailed study of gametogenesis, fertilization and cleavage in the blue crab, *Callinectes sapidus*. Examination by light and electron microscopy will accompany cytochemical techniques to reveal the modifications of organelles in the maturation of the flagellate sperm. Of particular importance is the functional morphology of the elaborate acrosomal complex. Development of a technique of artificial insemination will permit an appraisal of changes of the varied organelles and their function in the fertilization process. Comparison will be made of these structures and processes in related *Brachyura* to reveal basic patterns in sperm morphology and function which indicate phylogenetic relationships within the Decapoda. The research will be conducted at East Carolina College and at the Duke Marine Laboratory.

SUPPORTED BY U.S. National Science Foundation

### 5.0479, MORPHOLOGY, PHYSIOLOGY AND ECOLOGY OF MARINE LAMELLIBRANCHS

A.F. CHESTNUT, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

Morphology, physiology and ecology of marine lamellibranchs. Studies are in progress of early development, setting behavior and feeding mechanisms.

SUPPORTED BY University of North Carolina

## 5. LIVING SYSTEMS (NON-HUMAN)

**5.0480, COLLECTION AND SURVEY OF NORTH CAROLINA MARINE AND ESTUARINE MOLLUSCA**  
*H.J. PORTER*, Univ. of North Carolina, Institute of Marine Science, *Morehead City, North Carolina 28557*

A curated and catalogued collection of North Carolina mollusks is being developed and maintained. Specimens are procured primarily from surveys conducted in North Carolina estuarine and marine waters. Purpose of the long term project is to document occurrence and extent of the North Carolina molluscan fauna, provide a permanent repository for examples of this fauna and provide an available systematic study collection for teaching and/or ecological research.

SUPPORTED BY University of North Carolina

**5.0481, CRUSTACEAN COLLECTION OF EAST COAST OF UNITED STATES**

*A.B. WILLIAMS*, Univ. of North Carolina, Institute of Marine Science, *Morehead City, North Carolina 28557*

A curated and catalogued collection of crustaceans is maintained for research, teaching and systematic use. Species consist of estuarine and ocean crustaceans with emphasis on the North Carolina coastal waters.

SUPPORTED BY University of North Carolina

**5.0482, ENERGETICS OF PALAEMONETES PUGIO AND THE WEEDBED COMMUNITY OF SOUTH CREEK ESTUARY**

*L.W. WOOD*, Univ. of North Carolina, Graduate School, *Raleigh, North Carolina 27600*

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

**5.0483, THE DEVELOPMENT OF HATCHERY TECHNIQUES TO AID IN THE PRODUCTION OF ECONOMIC MOLLUSKS**

*W.P. BREESE*, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

Objectives--(1) To develop methods for the culture of larval clams and oysters in hatcheries. (2) To determine the optimum conditions for artificial seeding of clam and oyster grounds. (3) To utilize the hatchery techniques developed for the propagation of exotic bivalves for introduction into selected habitats. (4) To train shellfish biologists for careers in the culture and production of economic mollusks.

Initially, attempts will be made to spawn, fertilize and rear native clams and oysters from the egg to the seed stage. Simultaneously, attempts will be made to isolate and culture exotic and native algal forms for food for the developing larval mollusk. When techniques for the mass production of molluscan seed have been developed, studies will be conducted to determine the best time, age, habitat type and density for planting each species of bivalve seed. Each planting procedure will be evaluated by survival and growth studies. In the conduct of this research, graduate students will receive training that will assist them in the preparation for careers as shellfish biologists.

SUPPORTED BY Oregon State Government

**5.0484, ECONOMICS OF MARKETING DUNGENESS CRAB**

*J.G. YOUDE*, Oregon State University, Agricultural Experiment Sta., *Corvallis, Oregon 97331*

Objectives: 1. Describe the marketing channels for Dungeness crab. 2. Recommend changes that would increase efficiency in Dungeness crab marketing. 3. Determine relations between the Pacific Coast Dungeness crab industry and the Alaska King crab industry. 4. Specify relations between levels of production, products marketed, and prices received by fishermen and processors. 5. Evaluate the potential for industry promotion programs.

Procedure: A descriptive study will be conducted to determine the salient characteristics of the Dungeness crab industry. Data from that industry and from the Alaska King crab industry

will be analyzed to determine relations between production prices, promotional activities, and other selected variables in the two industries.

SUPPORTED BY Oregon State Government

**5.0485, NEURAL MECHANISMS OF LEARNING AND BEHAVIOR**

*M.E. LICKEY*, Univ. of Oregon, Graduate School, *Eugene, Oregon 97403*

The project consists of a combined program of behavioral and neurophysiological experiments focused on the problem of learning. The strategy is to exploit the comparatively simple nervous system of the marine gastropod *Aplysia* for the purpose of achieving a fine grained analysis of neural systems mediating learned behaviors. In one group of experiments we are studying a circadian rhythm of activity in a single identifiable neuron in the parietovisceral ganglion. Of primary interest is the extent to which the rhythm can be entrained to various environmental photoperiods and the extent to which the rhythm is endogenous to a single cell. In another group of experiments we are attempting a synaptic analysis of a behavior which has been shown to be susceptible to modulation by past experience. Specifically it has been found that the food selection responses of *Aplysia* are governed to some extent by the animal's past experience. We are now trying to identify specific neurons which are involved in this response with the hope of eventually detecting changes in neuronal physiology which are the result of the training experience.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0486, CONTROLLED REARING OF DUNGENESS CRAB LARVAE**

*P.H. REED*, State Fish Commission, *Newport, Oregon 97365*

The objective of this phase is to develop methods for hatching and rearing crab larvae under controlled laboratory conditions and describing their larval stages. A trip to California will be made to view the systems used by California Department of Fish & Game biologists to raise both crab and shrimp larvae and problems will be discussed. Equipment will first be purchased and tested. Egg bearing female crabs will be obtained and held in aquaria. As the eggs near hatching stage and animals will be transferred to self-contained sea-water systems to avoid larvae loss. Antibiotics and ultra-violet light will be tried for control of bacteria. Separate groups will be fed brine shrimp larvae, mussel larvae, or barnacle larvae, and growth and survival compared. Each stage of crab egg and larval development will be photographed and described. This phase should be completed by June 30, 1966. The research will be done at the Oregon State University Marine Science Center, Newport, Oregon.

**5.0487, STUDY ON THE DISTRIBUTION AND ABUNDANCE OF PINK SHRIMP, PANDALUS JORDANI, IN THE PACIFIC OCEAN OFF OREGON**

*G. MILBURN*, State Fish Commission, *Portland, Oregon 97201*

This study will undertake to locate and define the major pink shrimp (*Pandalus jordani*) populations off the Oregon coast, to collect information on the biology and life history of these shrimp, and to develop techniques for studying population dynamics that will be usable in maintaining the maximum level of shrimp production compatible with sound management principles.

Offshore cruises of 30 days duration will be made during March of each year to delimit areas and numerical abundance of pink shrimp, and to collect biological data on age composition, fecundity, and sex composition prior to commencement of fishing. During the commercial fishing season, interviews and intensive sampling of catches will be made to monitor and correct any changes to the resource caused by fishing. Post-season cruises during October will be made to gather data to compare with the spring and summer samples and to use as a method of predicting abundance for the following year. Both commercial and experimental gear will be used to collect field data.

## 5. LIVING SYSTEMS (NON-HUMAN)

During the cruises and field season, fish stomachs will be examined to determine the extent of predation of the pink shrimp.

The project will take place off the coast of Oregon between the Columbia River and the Oregon-California border and at the ports of Astoria, Newport, Coos Bay, and Brookings. Personnel directly involved will be Jack Robinson, Aquatic Biologist 2, and an unfilled Senior Aquatic Biologist 1.

### 5.0488, MASS MORTALITY OF OYSTERS ALONG THE OREGON COAST

C.D. SNOW, State Fish Commission, Portland, Oregon 97201 (14-17-0001-1895)

Summary of Proposed Work: The Oregon Fish Commission is continuing the oyster mortality monitoring program begun in 1966 with slight changes to conform with the recommendations of the team of experts which reviewed the program in 1968. Sampling stations will be maintained in Tillamook, Yaquina and Coos Bays.

In Yaquina Bay, the number of sampling stations will be reduced from six to three to permit more intensive monitoring of both native and Pacific oysters. Observations will be made every two weeks, and samples will be collected every 4 weeks. Those and dead or abnormal oysters will be sent to the University of Washington for histological examination.

In addition to the sampling stations in Yaquina Bay, an observation station will be established at the dock of the Marine Science Center. Observations will be made each working day. Dead or moribund animals will be collected for histological examination.

There will be one station at Tillamook and Coos Bays. Sampling will be monthly with collections for histological examination from the control lots and the adjacent beds.

Water quality measurements at Yaquina Bay will include temperature, salinity, dissolved oxygen and turbidity plus supplemental information from the Federal Water Pollution Control Administration and Oregon State University. At Tillamook and Coos Bays measurements of temperature, salinity and dissolved oxygen will be taken during each sampling visit.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0489, MANAGEMENT OF OREGON DUNGENESS CRAB RESOURCE

C.D. SNOW, State Fish Commission, Salem, Oregon

Purpose: Regulation of commercial and personal-use fishery to obtain maximum sustained yield.

Location: Headquarters are at Newport, Oregon. Work is done along the entire Oregon coast.

Methods: Crab landings are sampled at all major ports for condition, size, landing trends and fishing effort. Small populations of adult and immature crabs have been tagged annually to obtain information on life history and migration of this species.

Results: Results are applied to regulating harvest and to increase our basic knowledge of life history of Dungeness crab.

Reports: Monthly and annual progress reports. Catch statistics are published in reports of the Pacific Marine Fisheries Commission.

Publications: Snow, C. D. and E. J. Wagner. 1965. Tagging of Dungeness Crabs with Spaghetti and Dart Tags. Fish Comm. of Ore., Res. Briefs, Vol. 11, No. 1, pp. 5-13.

SUPPORTED BY Oregon State Government

### 5.0490, NEUROPHYSIOLOGICAL MECHANISMS IN BEHAVIOR

S.B. BARBER, Lehigh University, Graduate School, Bethlehem, Pennsylvania 18015

The ultimate aim of this study is a complete analysis of a variety of mechanisms of arthropod behavior. Arthropod behavior is sufficiently complex for the analysis to be relevant to man yet largely stereotyped and thus more readily analyzed. The work will deal with all aspects of behavior: input mechanisms, in-

tegration, output and effector mechanisms. It will also probe structural and ultrastructural aspects as they are pertinent to the physiological analysis.

Initially the study will concentrate on two different organisms and on different aspects of the over-all problem in each. One of these will be the effect of walking leg proprioceptors on locomotory behavior in *Limulus polyphemus*, the horseshoe crab. Most of these proprioceptors were found and characterized by the senior investigator and his co-workers and this information will be the starting point for the investigation. The other study will be on mechanisms of flight in giant water bugs (Heteroptera, Belostomatidae). Because they are unusually large insects the flight muscles, nerves and ganglia are generally readily accessible for experimentation. This was found to be true in an earlier study of these organisms by the senior investigator.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0491, LEARNING IN OCTOPUS

M.E. BITTERMAN, Bryn Mawr College, Graduate School, Bryn Mawr, Pennsylvania 19010

Brief Description of Research Project: Learning in Octopus will be studied with improved techniques. One set of experiments will deal with the effects of certain drive and reward variables on the acquisition and extinction of a simple instrumental response. A second set of experiments will deal with habit-reversal and probability learning in choice-situations. The grant provides for two round trips of the principal investigator and his research assistant to the Stazione Zoologica in Naples.

SUPPORTED BY U.S. National Science Foundation

### 5.0492, A SYSTEMATIC STUDY OF ENTOCYTHERID OSTRACODS

C.W. HART, Acad. of Nat. Sci. of Phila., Philadelphia, Pennsylvania 19103

The investigators have been engaged on studies of entocytherid ostracods (grants NSF GB-1436 and GB-4197). Entocytherid ostracods, insofar as is known, inhabit the Noartic region, where they and branchiobdellid oligochaetes are epizoic on freshwater crayfishes; the Palaearctic region, where they are epizoic on freshwater isopods; Australian region, where they are found on crayfishes and isopods; and the coastal waters of India, where one new species has been found on wood-boring isopods. Little is known concerning the affinities of entocytherid ostracods with free-living ostracods. Four genera of the family have now been monographed and published.

It is anticipated that the proposed study will result in monographic treatments of the remaining genera of the family. Monographic revisions (although somewhat out of date) and several subsequent regional or generic studies have been published in crayfishes and branchiobdellids, but few comparable works exist for the commensal ostracods. In recent years, a number of investigators have described new entocytherids from various parts of North America, but most of these ostracods are known from fewer than a half-dozen localities, and the ranges of only four genera have been accurately delimited. In addition to collections already available, it is planned to obtain specimens from crayfish in South America, New Zealand, and Madagascar for comparative studies.

SUPPORTED BY U.S. National Science Foundation

### 5.0493, THE RHODE ISLAND HARD CLAM - QUAAHAUG - INDUSTRY

A. HOLMSEN, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

a) Determine the cost and returns in handraking and dredging, and analyze the labor force and its return per unit of effort. b) A study of dealers and wholesalers, their functions cost and returns, and marketing margins. c) An analysis to determine the price elasticity of demand at wholesale and ex-vessel by grade and season. d) Determine the cost of alternative methods of depuration and the cost of a hatchery program for seeding purposes.

## 5. LIVING SYSTEMS (NON-HUMAN)

Procedures: a) The purchase records for three medium-sized dealers in different locations of the Bay for the quahaug license year, 10/1/62 - 9/30/63, will be studied to determine the quantities delivered, price received, and number of days worked for individual handrakers and dredgers. An expected 130 records on handrakers and about 20 records on dredgers will be obtained and these fishermen will be contacted for information on cost, other occupation, etc. b) About 15 dealers in the state which handle significant quantities will be interviewed. The flow of quahaugs through the marketing channel will be followed to study the cost and returns on each level and the utilization of the catch. c) A price analysis will be carried out to obtain the price elasticities of demand for each grade of quahaug (chowders, cherry stones, little necks) at the wholesale and ex-vessel level for the winter and summer seasons. To obtain those by the use of secondary data will be tried, but some primary data for the analysis might have to be obtained through dealers and wholesalers. d) In cooperation with the Graduate School of Oceanography, budgeting of alternative biologically and technically feasible methods of depuration will be made, and information on the investment and cost of operation of presently existing, out-of-state quahaug hatcheries will be collected.

### 5.0494, EVALUATE THE RESEARCH TECHNIQUES WHICH WILL BE EMPLOYED TO STUDY THE BASIC LIFE HISTORY OF THE RED CRAB (GERYON QUINQUEDENS) G.W. GRAY, State Dept. of Nat. Resources, Providence, Rhode Island

The objectives of this phase of the red crab study are to evaluate the following techniques: (1) Measurements (2) Ageing of carapace (3) Holding studies (4) Marking experiments (5) Egg and larval studies (6) Sampling studies.

State of Rhode Island, Department of Natural Resources, Division of Conservation, Marine Fisheries Unit, 150 Fowler Street, North Kingstown, Rhode Island will be the location where most of this phase work will take place.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Rhode Island State Government

### 5.0495, PRELIMINARY MODIFICATIONS AND CONTROL OF NATURAL GROWING AREA ENVIRONMENTS S.B. SAILA, State Dept. of Nat. Resources, Providence, Rhode Island

Objectives: 1. Design and execute appropriate field plot designs to determine effects of mineral nutrients and substrate composition on the growth of juvenile hard clams (*Mercenaria mercenaria*), soft clams (*Mya arenaria*) and oysters (*Crassostrea virginica*). 2. Critically evaluate use of predator control fence, chemical predator control, and various culture techniques on survival.

Procedure: 1. Three factors, nitrogen, phosphorus and calcium are to be included in 8 treatment combinations in 3 replicates. 2. Plot size is 1/100 acrea for each 8 plots in 3 substrates. 3. All organisms will be individually marked for growth increment comparisons. 4. A complete analysis of various treatment combinations will be carried out.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Rhode Island State Government

### 5.0496, REARING AND SENSITIVITY STUDIES OF VARIOUS LIFE STAGES OF MARINE MACROINVERTEBRATES G. MORRISON, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

The goal of this project is to determine the relative sensitivity of various stages of marine macroinvertebrates to specific materials and the evaluation of marine invertebrates as indicators of extreme levels of known toxicants over extended periods.

This work will eventually be incorporated in broader areas of research to determine the effects of these toxicants upon growth, reproduction, activity, metabolism, and the activity of hormones and enzymes.

The organisms studied to date are the first larval stages of *Callinectes sapidus*, *Carcinus maenas*, *Uca pugnator* (?), and *Palaemonetes pugio* and their reaction to various levels of copper.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0497, HISTOPATHOLOGIC EFFECTS OF POLLUTANTS ON CELLS AND TISSUES OF MARINE INVERTEBRATES

P.P. YEVICH, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

Histopathologic studies will be conducted on various species of marine invertebrates: quahogs, soft shell clams, oysters, lobsters, shrimp, blue crab, etc. after exposure to various pollutants. Studies are presently being conducted in cooperation with the Northeast Marine Health Sciences Laboratory on quahogs (*Mercenaria mercenaria*) which have been exposed to 0.05 and 0.025 ppm of Cu, 0.2 ppm of Zn, 0.2 and 0.1 ppm of Cd and 0.05 and 0.1 ppm of Cr.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0498, STUDIES ON THE PROTISTAN CAUSING MALPEQUE DISEASE

J.G. MACKIN, Texas A & M University System, Graduate School, College Station, Texas 77843

Previous studies of the organism causing Malpeque disease of oysters have shown (1) that the causative agent is complex of species of *Labyrinthomyxa* Duboscq. (2) none of the species has been described, and (3) experimentation has shown that all are highly pathogenic to oysters and can be transmitted. Studies in progress now are aimed at development of knowledge of distribution, characterization of species, and studies on pathogenicity to the several oyster hosts.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0499, PREDICTING COMMERCIAL SHRIMP ABUNDANCE (SHRIMP DYNAMICS PROGRAM)

K.N. BAXTER, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Measures of the relative abundance of postlarval and juvenile brown and white shrimp have been obtained from Galveston Bay, Texas, since 1960. Analyses of these data have shown that predictions of commercial supplies are possible, but improvements in past measures are needed. Research objectives are to examine and define the relations between the density of postlarval shrimp, the abundance of juveniles, and the size of the mature crop available to the commercial fishery.

Studies are underway to (1) develop a pumping system that will obtain small samples of postlarvae at frequent intervals or continuously and, thereby, reduce the variability of postlarval indices; and (2) collect postlarval brown shrimp offshore in winter months in an attempt to develop an earlier index to the crop of adult shrimp available between May and July.

Laboratory studies include experiments to determine behavioral characteristics of postlarvae that may effect their vulnerability to sampling gear, including preferred bottom material for burrowing when temperatures are low, and vertical movements related to changes in temperature, light, and salinity.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0500, 131.116B - LARVAL CULTURE (SHRIMP AQUACULTURE PROGRAM)

H.L. COOK, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

There are four native species of penaeid shrimp--white, pink, brown, and the scabob--that appear suited for culture. All have been hatched and reared to the postlarval stage from females that were fertilized naturally offshore, but spawned in the laboratory. The principal problem remaining is that of growing algal food in sufficient quantity to feed vast numbers of larvae. Research is in progress that includes development of a technique to permit large-scale culture of algae used as food for larval shrimp.

## 5. LIVING SYSTEMS (NON-HUMAN)

Also, laboratory-hatched and reared penaeid larvae are being held under controlled conditions to determine the effects of various factors (i.e., food, light, temperature, and salinity) on their growth and survival.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0501, EXPERIMENTAL SEEDING (SHRIMP AQUACULTURE PROGRAM)

*T.J. COSTELLO*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Following a 3-year study of the ecology of the waters in Florida Bay and Keys, it is apparent that only a portion of the suitable nursery areas are used by shrimp. Project objectives are to rear large numbers of shrimp from eggs spawned in the laboratory and seed underutilized nursery grounds.

Selected areas will be enclosed and stocked with laboratory-reared postlarvae. By systematic measurements of shrimp populations and physical features, rates of growth and survival of shrimp in different population densities will be related to physical conditions. The ultimate goal will be to determine the carrying capacities of nursery grounds and maintain an optimum level of shrimp population by seeding.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0502, RECONNAISSANCE ECOLOGIC SURVEY OF THE CONTINENTAL SHELF AND UPPER SLOPE (GULF OCEANOGRAPHY PROGRAM)

*J.R. GRADY*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

To better understand the behavior of shrimp, their migration, and abundance, it is essential to acquire a thorough knowledge of the natural environment. Any ability to predict crop abundance and distribution depends not only on an extensive knowledge of the variables in the natural environment of the estuaries and the waters overlying the continental shelf, but also of the character of the sea floor.

It is the purpose of this project to define the fundamental properties of the physical and chemical sedimentary environment on the shelf, and to determine what features of the sediments and bottom water are relevant to the prediction of shrimp populations. Data will be correlated with all available information on shrimp distribution and abundance to evolve a formula, in conjunction with Circulation Dynamics Project and the Shrimp Dynamics Program, to aid in forecasting the marine environment over the shelf.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0503, POPULATION DYNAMICS (SHRIMP DYNAMICS PROGRAM)

*R. A. NEAL*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Present means for managing shrimp fisheries in the Gulf of Mexico have evolved without the benefit of a firm knowledge of the population dynamics of the species. Project objectives are to obtain direct measures of shrimp growth, mortality, and movements, by means of mark-recapture experiments, and to determine the feasibility of deriving indirect estimates of fishing mortality from measures of total mortality and fishing intensity. Additionally, the relation between the rates of fishing and stock size as well as the optimum levels of fishing are being investigated using commercial landing statistics.

Studies on the comparative fishing power of shrimp vessels are formulated to more accurately assess mortality generated by commercial shrimp fleets. The selective characteristics of commercial shrimp trawls and the comparative fishing mortality that would result from mesh regulations will be examined in an effort to develop models to predict short- and long-term effects of regulations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0504, JUVENILE AND ADULT CULTURE (SHRIMP AQUACULTURE PROGRAM)

*R.S. WHEELER*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

The rapid growth rate and high economic value of shrimp has led to considerable interest in the possibility of pond-type shrimp culture. Research is designed to determine the feasibility of growing shrimp economically under seminatural conditions. More specifically, studies are being made to determine those ecological factors that affect growth and survival of shrimp in ponds. Once determined, methods will be developed for controlling or modifying those factors to insure maximum production of shrimp.

Additional efforts are being made to determine and create conditions essential for mating and spawning of shrimp under laboratory conditions. The ultimate goal will be to initiate genetic studies that will result in a fast-growing, hardy shrimp suitable for pond culture.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0505, FOOD AND EXPERIMENTAL ENVIRONMENTS (SHRIMP AQUACULTURE PROGRAM)

*Z. P. ZEINELDIN*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

By means of controlled experiments, project objectives are to determine optimum conditions for growth, survival, and reproduction of shrimp in artificial environments. Activities include (1) development of a prepared food for use in shrimp culture; (2) determination of the digestive enzymes of shrimp; (3) documentation of which naturally occurring food organisms shrimp prefer; and (4) development of methods of culturing food organisms that support favorable shrimp growth.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0506, NITROGEN METABOLISM IN MOLLUSCS

*J.W. CAMPBELL*, Rice University, Graduate School, Houston, Texas 77001

An investigation of excretory nitrogen metabolism in terrestrial and aquatic pulmonate gastropods. In addition to acquiring basic information on the biology of these organisms, some of which are important vectors of parasitic diseases, the project has as an objective the elucidation of the basic metabolic adaptations that have occurred in the evolutionary transition between the terrestrial and aquatic environments. Of specific concern are the physiological roles of the pathways for purine biosynthesis, arginine biosynthesis and arginine degradation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0507, REAR AND DESCRIBE LARVAE OF BIVALVES

*P. CHANLEY*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The larval development of most bivalve species has never been described. The purpose of this project is to describe as many as possible. Thus far descriptions of 4 species (*Barnea truncata*, *Rangia cuneata*, *Noctia ponderosa*, *Lyonsia hyalina*) have been published. Descriptions of two more (*Cyrtopleura costata* and *Donax variabilis*) are in press. A detailed comparative description of 23 species is also in press. Laboratory culture of two more species (*Montacuta percompressa* and *Amygdalum papyria*) has been completed. Another species, *Brachidontes recurvus*, is currently being cultured.

Larvae of several other species have also been cultured but not successfully reared to metamorphosis (*Tagelus plebeius*, *Macoma tenta*, *Macoma phenax*, *Anadara ovalis*).

Future plans involve continued work with local species and also with selected exotic species that are of particular interest.

SUPPORTED BY Virginia State Government

### 5.0508, DISTRIBUTION AND ABUNDANCE OF OYSTER DRILLS (UROSALPINK CINEREA) IN THE JAMES RIVER, VIRGINIA

*D.S. HAVEN*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

## 5. LIVING SYSTEMS (NON-HUMAN)

Using drill traps, dredged samples, and caged drills, data have been obtained on distribution and mortality rates of oyster drills in relation to temperature and salinity, in the James River, Virginia.

SUPPORTED BY Virginia State Government

### 5.0509, ULTRASTRUCTURE OF EARLY CLEAVAGE STAGES IN THE EGG OF LYMNAEA SP

F.O. PERKINS, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The fine structural changes in fertilized eggs of *Lymnaea* sp. prior to and during first and second cleavages was investigated. Microtubular involvement in the cortical region and branching microtubules were observed. Yolk platelet biogenesis and degradation was described.

SUPPORTED BY Virginia State Government

### 5.0510, MASS MORTALITY OF PACIFIC OYSTERS ALONG THE WASHINGTON COAST

C. LINDSAY, State Dept. of Fisheries, Olympia, Washington (14-17-0001-1900)

The Department of Fisheries will conduct field and environmental studies on mass mortalities affecting Pacific Oysters as set forth in the following phases: Phase I. Monitoring of Mortality and Growth of Pacific Oyster Seed from 5 Source Areas. 1. Japan, Hokina (High mortality area). 2. Japan, Mongoku-ura (Low mortality area). 3. Washington, Dabob Bay. 4. Washington, Willapa Bay. 5. Canada, Pendrell Sound. Phase II. Float Studies, Eld Inlet. Mortality, growth, fatness, glycogen and histology of 1965 year class (planting) oysters from beds of LeRoy Patterson. Phase III. Transplant Study. Patterson 1965 year class (planting) oysters previously planted at Quilcene Bay, Eld Inlet (Matthews) and Eld Inlet (Brenners) will be transplanted from each station to the other two. Mortality, growth, fatness, glycogen and histology will be monitored. Phase IV. Mortality Monitoring. 1966 (planting) year class Patterson oysters at Case, Eld, and Totten Inlets and Oakland and Quilcene Bays. Phase V. Commercial Oyster-bed Mortality Monitoring. Northern, central, and southern Puget Sound, Grays Harbor, and Willapa Bay. Phase VI. Cultural Experiments to Circumvent Mortalities. 1967 Japanese year class seed planted and reared in Oakland Bay will be transplanted to North Bay. Commercial stocks (1967) reared in North Bay will be used for controls. Phase VII. Hydrographic Sampling. 1. Continuous recording of water temperature adjacent to oyster stocks at the sampling stations in Quilcene Bay, Eld Inlet (Matthews), and Eld Inlet (Brenners). 2. Eld Inlet. A. Center line of inlet. Vertical distribution of salinity, temperature, O<sub>2</sub>, chlorophyll and phosphate. B. Shallow oyster beds. Photosynthetic rate, chlorophyll, phytoplankton species, pH, temperature, salinity, O<sub>2</sub>, total and inorganic phosphates, nitrate, nitrite ammonia, soluble and particulate carbohydrates and organic nitrogen, lipids. 3. Quilcene Bay, Oakland Bay, Totten Inlet, and Case Inlet. Salinity, temperature, O<sub>2</sub>, chlorophyll, phytoplankton and phosphate. Phase VIII. Standardization of Data Collection Processing and Analysis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0511, INSPECTION OF OYSTER SEED - NEW ASIATIC SOURCES

C. LINDSAY, State Dept. of Fisheries, Olympia, Washington

Phase I - Objectives: Investigate possibilities of obtaining disease from Pacific oyster seed, where present Japanese sources are insufficient to maintain Washington's oyster industry at present levels.

Procedures: Investigator experienced in Japanese oyster seed inspection will proceed to Japan, Korea, and Taiwan, and ascertain prospects for obtaining seed from new sources. Prospects for quantity collection of oyster seed meeting Washington specifications will be reviewed with Asiatic oyster growers. Where likely seed sources are found, sample shipments will be made to Washington's Point Whitney Shellfish Laboratory for quarantine for further determination of disease status. Information on results and general overall prospects of new seed sources will be circulated to oyster industry of the Pacific Coast.

Work Schedule: Investigator will determine schedule of departure based upon available passage to Japan, obtain passports and inoculations against human Asiatic diseases. Departure will be shortly after July 1, 1966, and return approximately September 1, 1966.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Washington State Government

### 5.0512, OYSTER FATNESS STUDY

C.S. SAYCE, State Dept. of Fisheries, Olympia, Washington

The objective of this phase is the development of fat oysters thereby increasing the production of oysters, through supplemental feeding techniques. This phase will be a laboratory study using trayed oysters divided into two groups of experimentally fed and non-fed controls with two control stations of oysters on tidelands near the laboratory. Each experiment will use 400 oysters in the laboratory, 200 oysters at each of two outside control stations, and will be of 32 days duration. The experimental design was developed with the aid of Dr. Douglas G. Chapman, University of Washington, statistical consultant for the project. Data collections will include temperature salinity turbidity, pH, and concentrations of the supplemental food at inlet and outlet. Growth of oysters will be followed by volumetric observations every four days and condition of oysters will be determined by Condition Index, Total Solids and Glycogen content amply. Experiments will be run during summer, fall, winter, and spring periods of 1966-1967 to establish seasonal growth and fatness data.

The work will be done at the Willapa Shellfish Laboratory located in the community of Nahcotta, on Willapa Bay in Pacific County Washington.

### 5.0513, COLLECTION OF JUVENILE MIGRANTS FROM RIVERS AND STREAMS

D.W. BATES, U.S. Dept. of Interior, Fish Passage Res. Program, Seattle, Washington

Anticipating that certain types of hydro-electric developments may either destroy large numbers of young migrant fish or may be impassable, a major research effort is being made to find practical and economical methods of collecting these young fish from rivers and streams before they reach the areas of danger. Methods of fish guidance and collection presently in use are only partially successful, or not applicable to large projects, or overly expensive. Research will be directed toward improving the efficiency of guiding techniques that have shown promise in the past, such as electricity, louvers, and lights; exploring the possibilities of more effective combinations of techniques; and developing new concepts of fish guidance and collection that would use a minimum of structure in the water. Facilities and methods for holding, handling, and transporting fingerlings will be investigated.

Four field stations are now in operation for such testing. Primary features of these stations are the flume installations which provide flexibility, wide range of velocity control, ease of fish observations and enumeration, and the testing of wild fish in as near to natural conditions as possible. Since the beginning of this project considerable advance has been made in the deflection or guidance of young migrants by means of flow accelerations and decelerations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0514, SHELLFISH EXPLORATIONS

C.R. HITZ, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Seattle, Washington 98102

Shellfish exploration is concerned with benthic invertebrate populations. The objectives are to define, in time and space, the quantitative and qualitative distribution of aquatic benthic invertebrate resources having a potential for commercial utilization, and to provide an appraisal of these resources.

Preliminary work was begun in FY 1968 to develop a suitable clam dredge for assessment studies. Emphasis in FY 1969 will be

## 5. LIVING SYSTEMS (NON-HUMAN)

to continue to assist the gear research unit in developing a clam dredge which can be used in offshore areas. Assessment of clam stocks off Oregon and Washington will follow. Marine Invertebrate Explorations, FY 1969.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0515, BARNACLES OF THE EASTERN PACIFIC

*D.P. HENRY*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

This investigation is a continuation of the studies on the barnacles of the Panama Pacific Province initiated with assistance from NSF grant GB-1684. The Panamic-Pacific Province is now generally recognized as that region between the head of the Gulf of California and Cabo Blanco in northwestern Peru.

Of particular import are the proposed studies of the barnacle species of Costa Rica and Ecuador and the work on the complementary males in sessile barnacles. In conjunction with studies on complementary males in sessile barnacles, the life history of a related species with indications of aberrant sexual development will be pursued. The proposed research also includes provision for the completion of the study of the genus *Cithamalus* from the Eastern Pacific.

An attempt will be made to determine what, if any, relationship the barnacle fauna of the Panama-Pacific Province has with that of the Antillean and/or Indo-West Pacific Provinces.

SUPPORTED BY U.S. National Science Foundation

### 5.0516, SYSTEMATICS OF MARINE SYMBIOTIC CRUSTACEA FROM INVERTEBRATES

*P.L. ILLG*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

The parasitic forms of the Copepoda, running now to several thousand species described, present a significant systematic problem. The broad purpose of this proposal is to continue explorations in expanding approaches in the systematics of copepods. Basic monographic studies have been proceeding and it is proposed to continue these. Since all the forms studied are associated in symbiosis with various invertebrates and the assemblage shows a graduated series of interactions between the symbionts, some basic questions in symbiosis and parasitism are also raised. Extended studies of life histories are invoked and comparisons through all the types of taxonomic data are being accumulated with a long-range view to critical evaluation of taxonomic characters. A recently developed extension is similar study of a local member of the Cirripedia (Ascothoracica) with a principal objective evaluation of claims of higher levels of relationship, particularly between Copepoda and Cirripedia.

SUPPORTED BY U.S. National Science Foundation

### 5.0517, RESEARCH ON INDO-WEST PACIFIC MARINE MOLLUSKS OF THE FAMILY CONIDAE

*A.J. KOHN*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

The next three years of research on this long-term study of systematics of *Conus* will concentrate on natural populations of tropical Indian Ocean Islands, where large numbers of sympatric species occur, and on continuation of studies of the type specimens and identity of the described species. Field data and material derive from participation of the principal investigator in the Yale Seychelles Expedition and International Indian Ocean Expedition. The taxonomic studies will be pursued primarily at the U.S. National Museum.

The main aspects to be investigated are: 1) classification, population density, species and habitat diversity, relative abundance, and interspecific differences in ecological characteristics of *Conus* populations on Indian Ocean coral reefs; 2) comparative morphology and morphometry of radula teeth; 3) chronological study of type specimens and identity of species of *Conus* described during the 18th century; 4) application of objective methods to the taxonomic study of the genus; 5) taxonomic studies of material submitted for identification from collections of the International Indian Ocean Expedition and other sources.

61;gn;gen

SUPPORTED BY U.S. National Science Foundation

### 5.0518, COLUMBIA RIVER STUDIES

*A.H. SEYMOUR*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

Of the four studies greatest attention will be given to the effects of  $^{65}\text{Zn}$ ,  $^{51}\text{Cr}$ , and  $^{90}\text{Sr}$  on oyster larvae. Oysters are brought to the spawning condition in the laboratory by manipulation of water temperature. Upon fertilization the eggs are placed into containers each with two liters of water of various radionuclide concentration. The experiment is terminated two days after fertilization at which time the oyster is in the straight-hinge larvae state. Later the larvae are classified as normal and abnormal and counted. Information from this experiment is related to waste disposal, oyster growing and to the controversy concerning the effects of radionuclides upon pelagic eggs and larvae of marine fishes. In other studies the geographical limit of distribution of Columbia River water along the Washington coast will be determined by monitoring  $^{65}\text{Zn}$  in mussels; a compilation of Hanford produced radionuclides in marine organisms will be prepared; and, the biological half-life of zinc in oysters will be determined by use of  $^{65}\text{Zn}$  and a small animal whole body counter. After feeding  $^{65}\text{Zn}$  to the oysters for a day or two only at the beginning of the experiment  $^{65}\text{Zn}$  measurements will be made periodically of individual oysters living in a natural environment except for the time they are transferred to and from laboratory for whole body counting.

Although the above studies are a new program, prior work does provide some pertinent information. Mussels along the outer Washington coast have been monitored for  $^{65}\text{Zn}$  but now the sampling will be extended into the Straits of Juan de Fuca and Puget Sound. Much information from several sources is available on Hanford produced radionuclides in marine organisms. These data will be compiled and supplemented by a limited amount of new information. Also in the past the biological half-life of zinc in oysters has been determined by destructive sampling from lots of oysters transferred between  $^{65}\text{Zn}$  contaminated and non-contaminated waters, Willapa Bay and Puget Sound respectively. This time the loss of  $^{65}\text{Zn}$  in individual oysters will be followed as the oyster will not need to be sacrificed to make the  $^{65}\text{Zn}$  measurement.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0519, STUDIES IN OYSTER PATHOLOGY

*A.K. SPARKS*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122 (14-17-0001-1377)

The Oyster Pathology Laboratory of the College of Fisheries will process and examine tissue from the expanded field study of the Washington State Shellfish Laboratory and the Oregon Fish Commission oyster mortality field investigation in order to investigate the reaction of oyster tissue to various types of injury.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0520, EPIZOOTICS IN EXPERIMENTAL MARINE SHELLFISH POPULATIONS

*A.K. SPARKS*, Univ. of Washington, Graduate School, *Seattle, Washington* 98122

Maintenance of experimental populations of Pacific oysters, native oysters, and bay mussels in float and bed stations will be continued in California, Oregon and Washington for determination of mortality and growth rates in the various species at the different locations. Living and dying bivalves will continue to be fixed and processed for microscopic examination for the presence and pathological effects of possible pathogenic organisms and a more sophisticated computer program will be utilized to determine the relationships of possible pathogens and mortalities.

Attempts will be made to culture in vitro the microorganisms, probably *Vahlkampfia* sp., responsible for heavy mortalities of Pacific oysters in Humboldt Bay, California to elucidate its life history, facilitate specific identification, and enable us to initiate infection experiments. Life history studies, through in vitro culture, of *Mytilicola orientalis* will be continued, particularly to determine the infective stage.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5E. ANIMALS, OTHER

(Birds, Mammals, and Unspecified Invertebrates and Vertebrates)

### 5.0521, MARINE BIOLOGICAL INVESTIGATIONS - NEKTON OF INSIDE WATERS OF SOUTHEASTERN ALASKA

J.C. QUAST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

Goals are to identify the common nekton organisms and monitor the seasonal and geographic changes in density distribution of their populations in the Lynn Canal-Chatham Strait fjord. Eight stations along the fjord have been sampled with an Isaacs-Kidd trawl at the surface and at 100 meters each season over a period of 2-1/2 years. Data on fishes and invertebrates are now being processed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0522, SEAL BIOLOGY AND HARVEST

J.J. BURNS, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To obtain current information about the magnitude, species composition, and characteristics of the seal harvest in northwest Alaska as part of a continuing effort to determine status and trend of this resource. 2. To investigate the various aspects of reproduction in the ringed, harbor, and ribbon seals. 3. To continue obtaining as much information concerning the natural history of seals, as possible. 4. To attempt to identify the environmental conditions affecting abundance and distribution of the various seals (bearded, ringed, harbor and ribbon) when they occupy their winter range. 5. To investigate the interspecific relationships among the phocids of this area. 6. To continue with the work of locating harbor seal population centers and attempting to determine patterns of dispersal.

Procedures: 1. The magnitude and characteristics of the seal harvest will be determined by analysis of bounty records, examination of scalps submitted for bounty, observation at some of the major hunting sites (in conjunction with Job F-2), and collection of specimens for determining age composition. 2. Specimens collected during field work associated with other jobs will provide the material for a study of the various aspects of seal reproduction. 3. Information about the life history of seals will be obtained through observation of these animals, and consolidation of the results of other aspects of investigation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0523, WALRUS BIOLOGY AND POPULATION

J.J. BURNS, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To continue accessing walrus population status and trend in light of recent harvests which have been greatly affected by both hunting regulations and management efforts. 2. To obtain information on walrus herd composition, movements and distribution throughout the year, especially during the winter months, and attempt to more accurately determine the important factors affecting distribution. 3. To investigate the various facets of walrus behavior. 4. To investigate all phases of walrus biology that would enhance our present knowledge of the various aspects of reproduction. 5. To attempt to undertake aerial survey work which would augment and provide an invaluable check on the walrus population work undertaken during Fiscal Year 1967.

Procedures: 1. Information on the present walrus population status and trend will be obtained through observation of the herds at the major walrus hunting sites, by evaluating records of hunting effort and success, by obtaining information on the proportion of animals in the various age and sex groups, by selective sampling of walrus taken by the hunters, and by evaluating the results of the proposed aerial survey (Objective No. 5). 2. Observation throughout the year, at the different hunting sites, will provide current information about herd composition, distribution, movements, and the factors affecting movements. 3. Attempts will be made to analyze behavior of the various segments of the herd during 1) the spring migration of nursery herds through the Bering Strait area and 2) the adult male walrus utilizing the Walrus Islands during July and August. 4. Continued effort will be devoted to the study of walrus biology, especially reproduction. Information will be obtained from biological specimens acquired

## 5. LIVING SYSTEMS (NON-HUMAN)

at the field stations, in conjunction with Job F-2. 5. Pending cooperation from the U.S.F.W.S., an aerial survey will be undertaken during the late winter or early spring of 1968.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0524, BREEDING AND MATERNAL BEHAVIOR AMONG THE STELLER SEA LION

D.R. KLEIN, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To investigate aspects of the breeding biology and behavior of the sea lion with particular emphasis on the timing of breeding in relation to parturition. 2. To study the behavior of cows and pups on breeding rookeries as related to pup desertion and survival, frequency of nursing and development of pups.

Procedures: 1. Observations will be made on breeding rookeries prior to, during and following parturition to fulfill the above listed objectives. 2. Wherever possible, attempts will be made to determine the effects of commercial harvest of sea lions on breeding patterns, pup desertion and survival and general behavior at the rookeries.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0525, HAIR SEALS

E. KLINKHART, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To obtain information on the timing of the molt. 2. To determine patterns of dispersal and obtain known age specimens. 3. To determine the current abundance and location of major pupping areas. 4. To monitor commercial operations engaged in the harvesting of seals. 5. To maintain current information on the response of hair seal populations to harvesting.

Procedures: 1. Seal hunters and buyers will be interviewed to determine the general period of the molt and hide quality. Pelage samples will be collected from hunters and buyers and selective collecting will be employed to gain a better understanding of the molting process. 2. Seal pups will be tagged on specific rookeries to secure data on movements and known age specimen material for productivity and aging studies. This phase is of relatively long duration due to the tagging and recovery activities involved. 3. Aerial surveys and hunter and buyer interviews will be utilized to determine the current abundance and location of pupping areas and seal populations. Various aerial survey techniques will be investigated to establish methods for accurate population counts. 4. Harvest operations on pupping areas at Tugidak Island and along the Alaska Peninsula will be monitored. The harvest of adult seals will be monitored by accompanying seal hunters aboard sea going vessels. Specimens will be collected for breeding biology information. 5. Extent and location of harvest will be reconstructed from bounty records and buyer interviews and then related to present seal populations and current harvest trends.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0526, SEA LIONS

J. VANIA, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To determine factors relating to the breeding biology and productivity of sea lions. 2. To classify rookery and hauling out grounds in accordance with the type of animals frequenting them. 3. To obtain data on the movement of sea lions. 4. To obtain information on the timing of the first molt of pups. 5. To monitor all commercial operations engaged in the harvesting of sea lion pups and adults.

Procedures: 1. Reproductive tracts of females will be collected during commercial harvesting activities. Large numbers of pups will be tagged in order to obtain known age specimens. 2. Classifications of pupping rookeries, bachelor hauling grounds, nursery and breeding rookeries will be accomplished by ground and aerial surveys. 3. Detailed observations will be made on specific pupping rookeries where pups and adults will be tagged for the purpose of observing their subsequent dispersal. 4. Pelage specimens from pups will be collected at intervals during the year to determine the timing of the first molt. 5. Harvest operations on

## 5. LIVING SYSTEMS (NON-HUMAN)

rookeries will be monitored to assure wise utilization of the resource and to prevent overharvesting. Reproductive tracts and lower jaws of adult animals harvested will be collected for breeding biology information.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0527, BELUGA WHALES

*J. VANIA*, State Dept. of Fish & Game, Juneau, Alaska

Objectives: To study the reaction of belugas to various types of underwater sound transmissions. To gather basic life history data.

Procedures: 1. Tape recordings of killer whale sounds and ultra high frequency sounds will be transmitted under water to determine if the movement of belugas can be influenced by such transmissions. 2. Selective collections of reproductive tracts and stomachs will be made to provide information on age, breeding biology and food habits.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0528, SEA OTTER

*J. VANIA*, State Dept. of Fish & Game, Juneau, Alaska

Objectives: 1. To determine population abundance, distribution and trends of sea otter in the coastal areas from Prince William Sound to the Shumagin Islands. 2. To obtain information relating to the molt, breeding biology and food habits of the sea otter in selected parts of its range. 3. To refine techniques already developed for transplanting sea otters and to transplant animals to various sites in Southeastern Alaska.

Procedures: 1. Aerial surveys will be conducted to determine the general abundance and distribution of sea otter in the general areas indicated. Surface observations will be employed for more detailed studies in selected areas. 2. Direct observation and selective collecting will be employed. Pelt specimens will be collected to gain a better understanding of the time and nature of the molting process; and collections and examinations of the reproductive tracts will provide information on the breeding biology. Food habits will provide information on the breeding biology. Food habits will be studied by direct observations and by examination of stomachs. 3. Pens of various designs will be tested to determine the one best suited for holding sea otters while in transit. Several experimental releases of up to 30 animals will be made at selected sites in Southeastern Alaska.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Alaska State Government

### 5.0529, THE MORPHOLOGY, HISTOCHEMISTRY, AND MODE OF SECRETION IN THE VENOM GLAND OF SEA SNAKES

*C.E. MAYS* Arizona State University, Graduate School, Tempe, Arizona 85281

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Society of The Sigma Xi

### 5.0530, MORPHOLOGY AND PHYSIOLOGY OF THE HEART OF ECTEINASCIDIA TURBINATA

*J.C. JONES*, Bermuda Biolog. Sta. For Res., Saint George, Bermuda

The present proposal is for spending approximately 45 days per summer at the Bermuda Biological Station for Research in order to study the following problems in the ascidian *Ecteinascidia turbinata*: (1) the histology of the heart and pericardium with different fixatives and stains, with special reference to innervation, (2) the relationship of body size to heart rate, (3) the influence of time after captivity on the heart rate, (4) the effects of differential pressure on different regions of the intact heart, (5) the effects of strong body contraction and prolonged siphonal closure on the heart rates, (6) the effects of puncturing different regions of the heart, (7) the effects of selected drugs on the heart

rates, and (8) the effects of electrically stimulating the 'naturally' arrested hearts of otherwise normal and healthy tunicates.

SUPPORTED BY U.S. National Science Foundation

### 5.0531, TELEMETRY STUDIES ON MARINE BIRDS

*H.H. VOGEL*, Bermuda Biolog. Sta. For Res., Saint George, Bermuda

Our knowledge of the distribution, migration routes, homing ability, feeding areas, etc. of most of the marine birds is extremely deficient. During the past few years, the use of telemetry and radio-tracking of both birds and mammals has advanced considerably, both in instrumentation, electronics, and methodology. The Yellow-billed Tropic Bird is the only common marine birds nesting on the island of Bermuda. Last spring we studied this species, using radioactive bands, to determine nesting and incubation habits of the adults. The method proved successful and will be continued this spring in further studies on care and feeding of the young. The objective of the present study is to place small radio transmitters on a small sample of the adult birds and follow them from their burrows in the limestone cliffs, by boat and/or plane, to determine their distribution, feeding grounds, homing abilities, and time at sea away from the nesting area.

The telemetry method, together with the radioactive work, should provide much useful information for this and other species. This proposal is fundamentally ecological, but has important contributions in the problems of homing and communication.

If the method proves successful on the Tropic-bird, we plan to place a small, disposable, radio-transmitter on one or more young Bermuda Cahows, petrels that are now almost extinct (23 pairs living). These birds nest only on Bermuda. The young leave their burrows at night, after long incubation periods, and do not return to land to nest for a period of four years. Little is known of where they go or what they do during this long pelagic life. Wingate has been studying their species for many years. We hope eventually to save the cahow from becoming another extinct bird.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0532, ECOLOGY OF STORM PETRELS

*S. HARRIS*, Humboldt State College, Graduate School, Arcata, California 95521

A project involving the banding of various species of Petrels mainly on nesting islands off shore of Trinidad, California.

Included is a study of the recapture of previously banded birds at the same nesting site.

This project has been carried on for four years and will continue indefinitely.

SUPPORTED BY No Formal Support Reported

### 5.0533, SAND DOLLAR COMMUNITIES

*E.S. HOBSON*, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

This study concerns animal communities inhabiting the sandy bottom offshore from California beaches - one of the most widespread, but least studied California inshore marine habitats. The work is centered on aggregations of the sand dollar, *Dendraster excentricus*, the most prominent macro-organism in this region, and the main feature of a habitat supporting a rich and varied fauna of invertebrates and fishes, including many species important to the surf fisherman.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0534, AVIFAUNAL ECOLOGY OF LIMANTOUR ESTERO

*C.J. RALPH*, Point Reyes Bird Observatory, Bolinas, California 94924

To determine the overall importance of the Upper Limantour Estero, Point Reyes National Seashore, to the avifauna of the Drake's Bay area. Work to be carried out includes assessing the relative importance of habitat types to the different bird species and determining the nature and quantity of food available in the substrate in the estero.

SUPPORTED BY U.S. Dept. of Interior - Natl. Park Serv.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0535, EXPERIMENTAL AND BIOMATHEMATICAL ANALYSIS OF THE PHENOMENON OF ATTACK

*K.E. WATT*, Univ. of California, Graduate School, *Davis, California* 95616

We will continue research on warm freshwater fish predator-prey systems in large tanks and indoor ponds to determine how specific characteristics of the predators, prey and environment interact to determine the efficiency of attack. Many different physiological and ethological parameters are being measured using cinematography. Efficiency of attack will be measured in three ways: 1. the number of prey eaten per predator per unit time 2. the biomass of prey eaten per unit biomass of predator per unit time 3. the weight gain of predators per unit time.

A mathematical model is being developed from analytical experiments and computer simulation studies are being conducted to determine if we can mimic the history of populational experiments. Simulation will be conducted on the history of populational experiments. Simulation will be conducted on the computer to determine the factors most important in regulating attack efficiency. Finally, experiments will be performed to check on the findings from the computer sensitivity analyses.

The principal predators used are large-mouth bass and bluegill sunfish, the prey are guppies and minnows.

SUPPORTED BY U.S. National Science Foundation

### 5.0536, THE DISEASES OF INVERTEBRATE ANIMALS

*E.A. STEINHAUS*, Univ. of California, Graduate School, *Irvine, California* 92664

Studies are continuing in three principal areas coming within the framework of this project on the diseases of invertebrate animals. Immunological reactions of six widely separated species of marine invertebrates are being investigated using six different species of nonsporeforming bacteria. Some of the animals (for example, the sea hare and the sand dollar) have shown little, if any, bactericidal activity in their normal coelomic fluid. Others, such as the coelomic fluid of sipunculid worms, are lethal to the bacteria. The fluids of some animals, such as that of the sea urchin, fall somewhere in between as far as their natural bacterial inhibiting properties are concerned. Included in the study of the immune properties of these marine invertebrates is an electrophoretic investigation of the bactericidal substances involved.

In another part of the project, 'tumors' produced in the cockroach *Leucophaea maderae* by using the Scharrer techniques of severing the recurrent nerve, chemical carcinogens, strontium-89, X-irradiation, and decapitation are being intensively studied. Detailed histopathological as well as thorough electron-microscope examinations of the 'tumors' and 'inflammation' are being made. Attempts to confirm certain aspects of the work of the French scientist, Matz, who claims to have found an infectious tumor-inducing material in 'tumorous' locusts have as yet not succeeded. Histopathological studies, as well as studies of the endocrine system of wax-moth larvae (*Galleria*) treated with carcinogenic chemicals and irradiations, have yielded interesting results, the pathological significance of which has not yet been determined.

An extensive investigation of the teratologies of the beetle *Tenebrio molitor* is underway. Already discovered are some rather spectacular changes in ultrastructures (mitochondria, glycogen granules, etc.) of the deformed insects, which constitute over 20% of our continuing culture.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0537, PROTEIN SYNTHESIS DURING THE EARLY DEVELOPMENT OF THE SEA URCHIN EMBRYO

*H. TIMOURIAN*, Univ. of California, Lawrence Radiation Laboratory, *Livermore, California* 94551

To develop techniques for the study of the biological and physico-chemical changes in the ribosomes and polysomes during early development in order to determine whether damage by small doses of radiation to the machinery for protein synthesis can be detected in the sea urchin embryo. The first hours of development are ideally suited, for there is no dependence on the genetic material and any effects can be completely divorced from those imposed on the nuclear genome. Biological changes are monitored by the ribosome capacity to participate in protein synthesis;

and physico-chemical changes are monitored by density gradient centrifugation and by their capacity to bind metal ions and to be digested by various enzymes.

Changes that take place in eggs at the time of fertilization have been determined in ribosomes and supernatant fractions by comparison of subcellular fractions from fertilized and unfertilized eggs.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0538, WHISTLE CONTOURS IN ODONTOCETE CETACEANS

*D.K. CALDWELL*, Los Angeles Co. Museum, *Los Angeles, California* (N00014-67-C-0358)

The investigators will attempt to prove their hypothesis that individual porpoises of the group they are studying produce an identifiable whistle 'signature' which varies in only certain prescribed directions and which is different for each animal. They will study the information content and the behavioral significance of the whistles, as well as those other vocalizations under a variety of social situations, to determine to what extent the sounds are purposeful, and what degree of importance may be attached to vocalization in comparison with tactile, visual, and other means of communication.

Studies of signalling methods among schooling marine animals can provide valuable ideas for new and improved communication techniques based on evolved biological systems. In addition, acoustic signalling for training purposes must be thoroughly explored if the Navy is to utilize porpoises as aids to divers in such operations as SEALAB, rescue missions, and salvage activities.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0539, THE PORIFERA OF FANNING ISLAND, CENTRAL PACIFIC

*G.J. BAKUS*, Univ. of Southern California, Graduate School, *Los Angeles, California* 90007

The present research will complete a study of the marine sponges of Fanning Island, Line Islands, central Pacific. The major goals of this third year of work are:

1) To complete descriptions and identifications of the numerous species collected.

2) To determine the effectiveness of the East Pacific Barrier in preventing dispersal of sponges from Central America to the Line Islands, and the reciprocal.

3) To evaluate the effects of sedimentation (specifically siltation) on the distribution and survival of certain sponges at Fanning Island.

SUPPORTED BY U.S. National Science Foundation

### 5.0540, DEEP WATER BENTHIC POLYCHAETES

*O. HARTMAN*, Univ. of Southern California, Graduate School, *Los Angeles, California* 90007

Precise knowledge of benthic life in these depths remains almost unknown, and until a few years ago it was impossible to take, measure and identify the animals inhabiting these areas. A few studies have shown that the organisms differ wholly from those in shallower bottoms. Quantitative studies of oceanographic deep areas became realizable only where ocean floors had been sonically charted, and after adequate instrumentation had been devised. Deep sea photography has shown the abundance of hillocks, depressions, trails and other surface irregularities, believed made by subsurface animals. Submersible vessels and TV cameras have revealed the activity of such forms. Tens of thousands of photographs are available from widely scattered places; many clearly show the surface features presumably made by benthic animals. Unfortunately the organisms constructing these ripples and holes cannot be identified even to major group from surface features alone. The few quantitative biological programs which have been pursued have shown that benthic life is remarkably diverse and abundant, and that it differs from one place to the next, according to depth and other physical features; specific components within a sample are unpredictably diversified.

## 5. LIVING SYSTEMS (NON-HUMAN)

Analyses of quantitative samples off Southern California have shown the presence of a highly endemic fauna, existing at all depths examined, and varying measurably within narrow depth classes. Based on faunal composition the basins may be grouped according to latitude, proximity to land or open sea, and the animal kinds differ from one basin to the next, and from those in new basin areas.

SUPPORTED BY U.S. National Science Foundation

### 5.0541, SYSTEMATIC STUDIES OF CERTAIN MARINE PARASITIC WORMS

*W.E. MARTIN*, Univ. of Southern California, Graduate School, Los Angeles, California 90007

This investigation has three quite separate aims within the broad field of marine helminth parasitology. First, life histories of species of the taxonomically enigmatic trematode genus *Renicola* will be studied, and the results should provide a firm base for identifying species within this group.

The second aim concerns a nematode that is a spiruroid but with the habitat of filarioid. Spiruroids are obtained by ingesting infective stages in intermediate hosts, perhaps always arthropods, whereas filarioids are transmitted by the blood sucking activities of such hosts. Spiruroids localize in the vertebrate in places affording an exit for their eggs but the species in question seems to be an exception. The two groups form one order and helminthologists believe that the filarioids evolved from spiruroids in a manner paralleling that which apparently occurred in sporozoon and haemoflagellate protozoans. Hence the life history of the species in question would be of particular interest.

Thirdly, a new acanthocephalan worm from a marine fish will be studied from various approaches. Little is known concerning the life history of these thorny-headed worms.

SUPPORTED BY U.S. National Science Foundation

### 5.0542, THE SYSTEMATICS AND ZOOGEOGRAPHY OF THE BRYOZOAN FAUNA OF THE HAWAIIAN ISLANDS

*J.D. SOULE*, Univ. of Southern California, Graduate School, Los Angeles, California 90007

This investigation is concerned with the taxonomy and zoogeography of the Hawaiian fauna of Entoprocta (Bryozoa). The chief objectives of the study involve extensive collecting in the regions of the mid-Pacific area not previously collected or only poorly represented in existing collections, systematic study of the bryozoan fauna of the mid-Pacific area, correlation of data on the known distribution of tropical bryozoan species with those of the Hawaiian Island species, and the assembling of data relevant to the question of endemism among bryozoans.

### 5.0543, PROTEIN SYNTHESIS ACTIVATION IN SEA URCHIN EGGS

*P.C. DENNY*, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The broad objective of this research is to find out the sequence and kinds of regulatory events which are responsible for the initiation of development in the sea urchin egg. The protein synthesis system contained in these eggs will serve as the basis for the investigation. It is especially advantageous for this purpose because first of all its activity is fairly easy and accurate to measure and secondly its change in activity at fertilization parallels the general changes in the egg. Specifically, the objective is to follow step by step, beginning with sperm penetration, the events which result in the fully active protein synthesis system. On one hand, the response will be investigated at the molecular level, starting with the active system in the fertilized egg and from there determining the nature of the inhibition to the system in the unfertilized egg. On the other, the activation sequence will be investigated at the initial step, sperm penetration, by examining the pattern of activation of the protein synthesis system in the egg and the localization of activity at various intervals shortly after fertilization.

Another objective which now can be realized is the electrophoretic characterization of the proteins which are actually being synthesized in the periods immediately following fertilization or parthenogenetic activation of anucleate fragments. To do this a new approach has been developed which is based upon the in vitro synthesis and release of the proteins by polyribosomes taken from the eggs or fragments. Using this technique, the developmental stage in which a given protein is being synthesized can be easily pinpointed, and any interference in synthesis or characterization by the large amount of endogenous protein present in the egg can be avoided.

### 5.0544, CETACEA OF TIERRA DEL FUEGO

*K.S. NORRIS*, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

Under GA-1420 research plans for use of R/V Hero were approved for conducting a survey of the small cetaceans found in the waters of the Inland Passage, Chile, and in the Straits of Magellan, Chile- Argentina, and off-shore waters of Tierra del Fuego, Argentina-Chile. In reviewing field plans, the principal investigator found need for a number of unanticipated but essential items necessary for the normal development of the field work. Because these will not be provided as standard shipboard supplies, the items, as listed in the supplement budget, will be purchased in the United States for delivery to R/V Hero prior to her departure for South American waters.

International travel will be provided under USARP for five persons (Schevill, McFarland, Harvey, Schallenberg and M. Barrett); Norris, Bloome, and R. Barrett will be in Chile under the exchange program between the University of Chile and the University of California. There is an increase in the shipboard party from six (6) to nine (9) members plus a Chilean scientist. Otherwise, the basic plan of research approved under GA-1420, the shipboard arrangements, time schedules, and embarkation from Puerto Montt, Chile, remain unchanged.

SUPPORTED BY U.S. National Science Foundation

### 5.0545, STUDIES OF SOUND PRODUCTION

*K.S. NORRIS*, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

The program is designed to illuminate sound production and projection in the toothed whales, and the use of these signals in discrimination. In addition the structure of emitted signals and signal trains is to be studied. The integration of emitted signals and returned echoes is also to be studied by various means. In totality the object is to learn how porpoises emit and utilize clicks and click trains to determine features of their environment, what the limits of discrimination ability under various circumstances might be, and how sounds are received and transmitted to the inner ear.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0546, ECHO RANGING SIGNALS

*T.C. POULTER*, Stanford Research Institute, Menlo Park, California

The echo ranging signals of seals and sea lions are being studied in captivity and in their natural surroundings. Recording techniques have been developed for tracking animals under ice and laboratory facilities built for behavioral tests of pinniped sonar abilities.

Analyses of pinniped signals has included conversion to visual display allowing identification of some acoustic characteristics of the signals. Further studies will investigate the use of computer technology in fine analysis of these signals.

Maintaining a colony of captive animals for sonar and related experiments has lead to integrated research centered on the health and care of pinnipeds. Fur seal, California sea lion, Steller sea lion, elephant seal and harbor seal pups are being raised in the laboratory setting and insights have been gained into some health problem of infant and adult animals.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0547, PERCEPTUAL, VOCAL, AND ECHO-RANGING BEHAVIOR OF SEALS AND SEA LIONS

R.J. SCHUSTERMAN, Stanford Research Institute, Menlo Park, California

The investigator will continue work begun under earlier grants (GB-1437, GB-4349) on the perceptual, vocal, and echo-ranging behavior of seals and sea lions.

Earlier studies have pointed to the need of obtaining further data of a comparative nature concerning the avenues by which seals and sea lions gain information about their environment, and organize their information in a meaningful way for successful adaptation to both a marine and terrestrial existence. The investigator has outlined the following research problems: 1. The measurement of various aspects of aerial and underwater visual acuity under several conditions of illumination. 2. The discrimination and classification of shapes in different spatial orientations. 3. The determination of sound detection thresholds, and the degree to which sound patterns can be discriminated. 4. The types of vocalization, the conditions under which they occur, and the behavioral displays with which they are associated.

SUPPORTED BY U.S. National Science Foundation

### 5.0548, PHYSIOLOGICAL VARIATION IN SUBTIDAL AND INTERTIDAL MARINE INVERTEBRATES

E. SEGAL, San Fernando Valley State Coll, Graduate School, Northridge, California 91326

OOONO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Society of The Sigma Xi

### 5.0549, INFECTIONS IN MARINE MAMMALS USED AS LABORATORY ANIMALS

D.G. JOHNSTON, Saint Johns Hosp., Oxnard, California 3032

The objective of this research is to isolate, and characterize morphologically and biochemically, microorganisms obtained from various tissues of marine mammals. Standard microbiological techniques will be employed initially. When this primary objective is obtained, the response of sea mammals to human pathogens and to the use of antibiotic and chemical therapy will be studied.

The information derived from this study will be valuable in providing care for marine mammals kept in captivity for scientific purposes. Some of the infections of porpoises, for instance, have been attributed to *Erysipelothrix insidiosus*, *Diplococcus pneumoniae*, and *Pseudomonas aeruginosa*. This project is in support of the behavioral studies on porpoises at the U. S. Naval Missile Center, Point Mugu, California. The investigator will remain cognizant of the possibility that microorganisms infectious for marine mammals may also be hazardous to man under certain circumstances as for instance during prolonged periods of deep submergence involving frequent physical contact with ocean water.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0550, BIOCHEMISTRY OF FERTILIZATION AND EARLY DEVELOPMENT

D. EPEL, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

Brief Description of Research Project: Based on the premise that the activation of sea urchin eggs upon fertilization can be traced back to a primary biochemical reaction, studies are concentrated upon reactions involving TPNH (NADPH)\* His reason for choosing this substance is that the steps in protein synthesis seem to be intact in the unfertilized egg, except perhaps, for the activation of transfer RNA, and DPN kinase activity is increased 5-6 fold after fertilization.

Approaches to biosynthetic activation will concentrate on 1) the role of post-fertilization increases in TPNH in changing rate or pattern of biosynthesis and 2) the role of changes in energy production in regulating biosynthesis. The second phase of the investigation will be a comparative biochemical study of fertilization, using other invertebrate and vertebrate eggs.

SUPPORTED BY U.S. National Science Foundation

### 5.0551, MARINE WASTE DISPOSAL AND SEA URCHIN ECOLOGY

W.J. NORTH, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109

Southern California communities are growing rapidly and depend intimately on the ocean for food, recreation, and waste disposal. At times the varied human activities seriously interfere with each other and with the natural environment. Unless preventive measures can be developed, metropolitan growth will clearly disrupt nearshore ecology to the point where few marine biological resources will survive. Our broadest objective is to alleviate this situation to the greatest extent possible.

The principal area of our concern has been the California kelp beds because their great extent, high productivity, and richness of species and biomass plainly marks them as regions of singular importance. Our overall research program is divided into two sections; one section emphasizes development of techniques for controlling and improving kelp communities while the other concentrates on gathering basic ecological knowledge that provides the background for intelligent control. This proposal is in the second category. Interactions between these two sections are outlined in an addendum enclosed herewith.

One of the chief factors affecting the kelp communities adversely is apparently an imbalance resulting from overgrazing by sea urchins. We suspect that there is a nutritional link between discharged sewage and the dense urchin populations. The proposed investigation should confirm or disprove the existence of the suspected link. If such a relation is verified, future planning of many seaside municipalities will benefit from the information.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0552, CARDIOVASCULAR ADJUSTMENT TO DIVING ASPHYXIA

R. ELSNER, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This continuing support is for a second year of investigation of cardiovascular adjustment in Antarctic seals to diving asphyxia. The studies are of three types: (1) the determination of natural diving time in female and very young seals; (2) the elucidation of circulatory changes by instrumentation of female seals; and (3) the investigations of properties of seal fetal and maternal blood with particular reference to oxygen transport mechanisms. The first year of work provided familiarity with Antarctic field conditions. It established safe dosage of drugs used in tranquilization and immobilization of experimental animals; and techniques and safe use of surgical anesthesia. It permitted successful implantation of Doppler ultrasonic blood flow transducers using aseptic surgery; and the measurement of free-diving time and depths in seals. In addition, studies were begun on the respiratory properties of Weddell seals. It is proposed to extend these studies during the 1968-69 field season.

The field work will be conducted at McMurdo Station under the direction of the principal investigator, with three assistants from 1 September - mid-November 1968.

Winter flight participation is anticipated.

SUPPORTED BY U.S. National Science Foundation

### 5.0553, CIRCULATORY REACTIONS TO ASPHYXIA

R.W. ELSNER, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038

Some features of the circulation peculiar to marine mammals are under study. Profound alterations of cardiac output and blood flow distribution have been investigated during experimental underwater diving. These changes are adaptive in nature and lead to effective prolongation of diving time by circulatory redistribution ensuring adequate perfusion of myocardium and brain while other organs are made ischemic by widespread vessel constriction. Blood flow often fell to zero in renal, mesenteric, muscle and skin circuits. Cardiac output decreased, while arterial pressure was well maintained. Demonstration of similar, but not usually as profound, responses in terrestrial animals, including man, suggests that the reaction of diving mammals is a special instance of a more general response to asphyxia. On the basis of these findings new studies are being initiated in an attempt to clarify perinatal responses to asphyxia. Preliminary experiments have demon-

## 5. LIVING SYSTEMS (NON-HUMAN)

strated the feasibility of instrumenting fetal sheep in utero and subsequent recording of blood flow in the unanesthetized, unrestrained animal. Such measurements have been obtained from lambs during birth. Blood flow distribution and responses of both fetal and maternal circulations will be systematically investigated during birth and induced asphyxia in both sheep and seals. A primary long term goal of these studies will be the understanding of control mechanisms specifically involved in the cardio-vascular responses to asphyxia. Other investigations into special aspects of marine mammal circulation are being continued. These include X-ray angiographic and flowmeter studies of circulation as it relates to temperature regulation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0554, MARINE VERTEBRATES OF THE CALIFORNIA PENINSULA

C.L. HUBBS, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The research, on the marine vertebrate fauna of the 'California Peninsula' (Cape San Lucas to Pt. Conception) is to be done in systematics, zoogeography, oceanography, and ecology. Mapping of fish distribution is underway; systematic reviews of fishes are completed, being completed, or are underway. Studies of marine mammals, birds, and reptiles are also in progress, and these are being integrated with oceanographic work, particularly the analysis of inshore sea surface temperatures.

SUPPORTED BY U.S. National Science Foundation

### 5.0555, DEEP DIVING ANTARCTIC BIRDS AND MAMMALS

G.L. KOOYMAN, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This is a program in hyperbaric physiology on the deep diving behavior of bird and mammal species using restrained and unrestrained experimental animals. Because seals have tolerance for great hydrostatic pressures, they are valuable experimental subjects in elucidating mechanisms of adaptation to high pressure and rapid pressure changes. Less pressure-tolerant diving birds will be used for comparison. The Weddell seal and emperor penguin are the most suitable animals for the planned field experiments; preliminary testing of equipment and techniques will be made at the University with locally procured harbor seals. Physiological measurements will include heart rate, metabolic rate, total lung capacity, tidal volume, gas volume during the dive, and alveolar gas composition before and after the dive. Instrument packages have been developed and used for the unrestrained study techniques. Two portable high pressure chambers will be constructed at Scripps Institution of Oceanography for use at McMurdo Station.

This program will utilize the winter flight to McMurdo Station for field work, beginning September and completing mid-December 1968. The principal investigator will require scuba qualifications; he will be assisted at the biolab by Dr. Lenfant and one graduate student. Animal Lift required for two Weddell Seals.

SUPPORTED BY U.S. National Science Foundation

### 5.0556, THE COMPARATIVE IMMUNOLOGY OF LOWER ORGANISMS

J.E. CUSHING, Univ. of California, Graduate School, Santa Barbara, California 93018

The research objective of the present proposal is to investigate two areas concerned with the immunology of marine organisms. The first of these is the immune responses of marine invertebrates with the purpose of learning more concerning the background against which the immune mechanisms of higher vertebrates evolved. The second of these is concerned with the blood groups and related substance of marine forms with the view of learning more of the variations and evolutionary relationships of these substances among these forms. These objectives are of growing biological interest as the knowledge of the mechanism of antibody production increases and needs to be related to a general biological background.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0557, CYTOLOGICAL CHARACTERISTIC

T.L. SIMPSON, Univ. of Hartford, Graduate School, Hartford - West Hartford, Connecticut 06117

An initial study of marine, clathriid sponges has shown that cytological characteristics when employed as taxonomic criteria allow the development of a natural classification which cannot be arrived at solely by the employment of traditionally-utilized characteristics; the skeletal elements. The object of the present study is twofold. First, additional species of clathriid sponges will be examined cytologically and, where possible, by explanation in order to obtain a more complete picture of the evolution of genera within this group of sponges. Secondly, an intensive study of the functional and developmental physiology of *Microciona prolifera* will be initiated in order to develop methods whereby the functions and developmental roles of the mesenchymal cell types can be elucidated. If fruitful, this will add a new dimension to the use of cytological features for sponge systematics. Namely, it will make possible comparative studies based not only on cytological characteristics but also on the functional and developmental role of sponge cells.

SUPPORTED BY U.S. National Science Foundation

### 5.0558, SYSTEMATIC STUDIES OF SPONGES OF THE JAMAICAN FORE-REEF SLOPE

W.D. HARTMAN, Yale University, Peabody Museum of Nat. Hist., New Haven, Connecticut 06520

It is proposed to study the systematics of the rich sponge fauna living in the fore-reef slope environment of Jamaica by both classical morphological methods and biochemical techniques. The material available for the study was collected by SCUBA divers at depths ranging from 25 to 80 meters. In the more classical studies emphasis will be placed on revisions of large, difficult genera such as *Agelas*, *Xestospongia* and its relatives, and *Verongia*. Every attempt will be made to refer to original type material in an effort to clarify nomenclatural problems. The collections of such early authors as Duchassaing and Michelotti and Schmidt have already been studied, and it is hoped that Carter's material may be examined in Liverpool.

As a means of obtaining additional characters for a re-examination of sponge relationships at the familial and generic levels, application of a series of biochemical techniques will be undertaken on the keratosan sponges in the first instance, since they lack the sclerites that provide useful characters in other groups of sponges. These studies will include electrophoretic separation of soluble cell proteins and thin layer electrophoresis and chromatography applied to the free amino acid content of the organisms. Exploratory attempts at DNA hybridization experiments will be undertaken using sponge larvae as source material.

SUPPORTED BY U.S. National Science Foundation

### 5.0559, THE INFLUENCE OF DEPOSIT FEEDING BENTHOS ON THE STABILITY OF BOTTOM SEDIMENTS AND COMMUNITY TROPHIC STRUCTURE

D.C. RHOADS, Yale University, Graduate School, New Haven, Connecticut 06520

The spatial separation of deposit and suspension feeding benthos is a major ecologic phenomenon of the marine environment. Existing hypotheses relate the occurrence and relative abundance of these feeding types to food source availability, i.e. deposited or suspended. This hypothesis is inadequate, however, to explain low diversity of suspension feeding benthos on deposit feeder dominated muds in Buzzards Bay, Massachusetts that have an abundant food supply suspended over the bottom. An alternative exclusion mechanism is suggested. Intensive sediment surface reworking activities of deposit feeders produce a granular, uncompacted, high water content interface easily suspended by weak tidal currents. The physical instability of this reworked bottom type is effective in decreasing suspension feeder diversity and biomass by: 1) clogging filtering mechanisms, and 2) resuspending and burying settled suspension feeding larvae. Instability of the reworked interface is also limiting to sessile epifauna unable to maintain a firm connection with the bottom.

**5.0560, THE SPECTRAL SENSITIVITY OF THE GREEN SEA TURTLE (CHELONIA MYDAS)**

*P.J. OSHEA*, Univ. of Delaware, Graduate School, Newark, Delaware 19711

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY National Council to Combat Blindness Inc.

**5.0561, BENTHIC COMMUNITIES**

*G. THORSON*, Kobenhavns Universitet, Copenhagen, Denmark (F61052-67-C-0089)

The investigator is conducting research on the biology of organisms living in, on, and above the bottom level of off-shore waters with particular emphasis on those aspects of metabolism, behavior, and developmental cycles which affect and are affected by the community and environment. He is comparing data from similar localities throughout the world to detect any primary faults in his hypothesis regarding the internal control mechanisms in community relationships. The program includes studies of the microfauna, not only as food organisms of larger forms, but also as larval and other early stages of larger forms. Studies will be continued on the invertebrate predator-prey balance, including the role of parasites.

This research is part of the Oceanic Biology Program which provides the Navy with information concerning the natural activities of biological organisms that influence Naval operations. An understanding of the factors resulting in the formation of certain types of biological communities will permit the prediction of conditions such as fouling, modification of bottom sediments, consolidation or shifting of bottoms, and chemistry of the benthic areas. Since Dr. Thorson's work is based on data received from collaborators throughout the world, as well as his own research, predictability is much enhanced.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0562, RENAL SALT EXCRETION IN MARINE BIRDS**

*D.S. DOUGLAS*, George Washington University, Graduate School, Washington, District of Columbia 20006

Previous studies have shown that marine birds respond to salt loads with unexpected reductions in urinary salt excretion. This proposal requests support for study of three questions related to this finding: (1) What is the cause of the decreased salt concentration in the urine of marine birds which have received salt loads? (2) What is the cause of the decreased rate of urine flow in salt-loaded birds? (3) Are there habitat-related differences in the way the kidneys of different species of marine birds respond to salt loads.

In order to obtain answers to these questions, measurements of renal function (including glomerular filtration rate, osmolar clearance, tubular sodium transport, and tubular water reabsorption) will be made upon three species of gulls. The estuarine herring gull will be the principal bird studied since it is relatively large and more readily obtained than other gulls of comparable size. The ring-billed gull and the kittiwake will be used to provide a comparison between freshwater, estuarine, and pelagic species of gulls.

SUPPORTED BY U.S. National Science Foundation

**5.0563, FORAMINIFERA FROM HEDLEY HARBOR, MASSACHUSETTS**

*M.A. BUZAS*, Smithsonian Institution, Washington, District of Columbia 20560

The distribution and abundance of benthonic foraminifera in Hadley Harbor is being studied from two sampling times and an attempt to correlate measured environmental variables with faunal distribution is being made.

SUPPORTED BY Smithsonian Institution

## 5. LIVING SYSTEMS (NON-HUMAN)

**5.0564, PATTERNS OF SPECIES DIVERSITY - TERTIARY-RECENT**

*M.A. BUZAS*, Smithsonian Institution, Washington, District of Columbia 20560

The relative abundance and number of species of Foraminifera in Bay's, nearshore open ocean and offshore open ocean are being examined from Greenland to the Gulf of Mexico by means of the information function. Several Tertiary sections of the east coast are also being studied to examine the relationship between the recent pattern and patterns in the past.

SUPPORTED BY Smithsonian Institution

**5.0565, POPULATION DYNAMICS OF FREE-LIVING MARINE NEMATODES INHABITING THE BENTHOS OF HADLEY HARBOR COMPLEX, WOODS HOLE, MASS.**

*W.D. HOPE*, Smithsonian Institution, Washington, District of Columbia 20560

There is no detailed information available on the seasonal changes in the population structure and population density of free-living marine nematodes during an annual cycle in a given habitat. Such information will contribute to a better understanding of the ecological relationships of nematodes.

Specifically, this study was undertaken to determine the following: 1.) What changes, if any, occur in the numbers of individuals for each species of marine nematode inhabiting the sediment at two stations in Hadley Harbor during one annual cycle. 2.) How often and how long each species breeds. 3.) The time required for maturation of juveniles. 4.) Mortality rate for at least the dominant species. 5.) Whether or not there are correlations between changes in the populations of nematodes and changes in the physical and chemical parameters of the environment. 6.) Gut contents of macro-invertebrates from these stations will be examined to determine what organisms may be preying on nematodes.

SUPPORTED BY Smithsonian Institution

**5.0566, MARINE NEMATODES OF THE CAPE COD AREA**

*W.D. HOPE*, Smithsonian Institution, Washington, District of Columbia 20560

Marine nematodes of the Cape Cod Area are virtually unknown except for a few species described, but not illustrated, by Cobb (1933). Research on this group of animals in the Cape Cod area has been prohibitive because of taxonomic difficulties. Yet, they are a very important, if not the most important, constituent of the meiofauna.

For this reason, a survey of the marine nematodes of the Cape Cod Area was conducted during the winter and summer of 1965 which will lead to a series of publications describing and illustrating specimens that were collected. It is intended that keys and habitat data will also be included.

The specimens are presently being sorted and mounted for study and all type specimens of marine nematodes originally collected on mid and Northern shores of the East Coast of the United States have been gathered at the Museum of Natural History for comparative studies.

SUPPORTED BY Smithsonian Institution

**5.0567, COMPARATIVE MORPHOLOGY OF MARINE NEMATODES**

*W.D. HOPE*, Smithsonian Institution, Washington, District of Columbia 20560

Detailed anatomical studies of marine nematodes are limited to very few reports in which histological techniques for light microscopy have been employed and almost no information is available from electronmicroscope studies.

Histological studies of selected marine nematodes will be conducted to obtain more detailed information on the relationships of marine nematodes and functions of their various organs. Studies have been initiated on *Deontostoma californicum* Steiner and Albin, 1933 with particular emphasis on the nervous system, and during FY 1968 I will spend six months at Toronto Universi-

## 5. LIVING SYSTEMS (NON-HUMAN)

ty, collaborating with Dr. Wright on a comparative study of the musculature of nematodes.

### 5.0568, PACIFIC OCEAN BIOLOGICAL SURVEY PROGRAM

*P.S. HUMPHREY*, Smithsonian Institution, Washington, District of Columbia 20560

This program is a biological survey of the central Pacific islands, concentrating mostly on seabirds. Emphasis is on the pelagic distribution of birds in relation to oceanographic and meteorological factors.

SUPPORTED BY Smithsonian Institution

### 5.0569, THE TAXONOMY AND ZOOGEOGRAPHY OF THE POLYCHAETOUS ANNELIDS OF THE GULF OF MEXICO AND THE CARIBBEAN SEA

*M.L. JONES*, Smithsonian Institution, Washington, District of Columbia 20560

The basic purpose of this project is to make a study of the polychaete annelids of the Gulf of Mexico and the Caribbean Sea. Though widely distributed throughout this area and rather easily collected, it remains that the polychaetes of the Gulf and Caribbean are rather poorly known, and it is hoped that the present collections (approximately 450 localities from 17 general locations), as well as future collections, will, when processed, shed more light on this relatively neglected group.

Present collections come from or near Veracruz and Tuxpam, Mexico; Port Arkansas, Texas; St. Andrew Bay, offshore at Panama City, Alligator Harbor, Apalachicola Bay, Cedar Key, Tampa Bay, Cape Haze, Naples, Tavernier Key, Key West, and Biscayne Bay, Florida; Bimini and Andros, Bahamas; Jamaica and Barbados, West Indies; Puerto Rico; and Margarita Island, Venezuela. In the future, further collections will be made along the Antillean chain, through the Bahamas, and along the Central and South American coasts.

Ultimately, comparisons will be made with the polychaete fauna of adjacent areas and those of other tropical and subtropical regions.

SUPPORTED BY Smithsonian Institution

### 5.0570, THE TAXONOMY AND ZOOGEOGRAPHY OF THE MAGELONIDAE OF THE WORLD

*M.L. JONES*, Smithsonian Institution, Washington, District of Columbia 20560

The family Magelonidae (Polychaeta: Annelida) has been known for somewhat over 100 years. In this period of time, 26 species have been described, all of which have been assigned to *Magelona*, the only genus of the family.

Recent collections from Texas, Puerto Rico, and offshore from Georgia, suggest that there is reason for the erection of at least two new genera. Collections from Santa Catarina Island, Brasil, the type locality of the type species of the genus *Magelona*, have provided material of *M. papillicornis*, the original species of the genus; redescription of this species will necessitate the re-naming of certain European magelonids which have been erroneously referred to *M. papillicornis*, and the resurrection of a former synonym of *Magelona*.

On the basis of loans from the museums of the world and material presently in the collections of a number of marine laboratories of the world, it is intended that the family be monographed, both from a taxonomic, as well as a zoogeographic standpoint.

SUPPORTED BY Smithsonian Institution

### 5.0571, ECOLOGY OF ECHINOIDS

*P.M. KIER*, Smithsonian Institution, Washington, District of Columbia 20560

Study of the living habits of echinoids in particular relative to the bottom substrate.

SUPPORTED BY Smithsonian Institution

### 5.0572, A SYSTEMATIC REVISION OF THE HOLOTHURIAN FAMILY PSOLIDAE - ECHINODERMATA - HOLOTHUROIDEA

*D.L. PAWSON*, Smithsonian Institution, Washington, District of Columbia 20560

At present, 77 nominal species are known in this family of sedentary holothurians. Six genera are known, and the group is being revised genus by genus. Revision of two genera is now complete. Some species share important anatomical features with certain groups of Paleozoic echinoderms, and an attempt will be made to interpret the anatomy of the psolide in the light of the fossil record.

SUPPORTED BY Smithsonian Institution

### 5.0573, DISTRIBUTION MAPS OF ANTARCTIC HOLOTHURIANS AND ECHINOIDS - ECHINODERMATA

*D.L. PAWSON*, Smithsonian Institution, Washington, District of Columbia 20560

Under the aegis of the American Geographical Society, charts showing the distribution about the Antarctic and Subantarctic regions of echinoids and holothurians have been prepared. Approximately 80 species of holothurians and 50 species of echinoids are known from the area. Some attempt has been made to explain the patterns of distribution in relation to physical factors of the environment.

SUPPORTED BY Smithsonian Institution

### 5.0574, MARINE POLYCHAETE WORMS OF THE NEW ENGLAND REGION (GULF OF ST. LAWRENCE TO CHESAPEAKE BAY)

*M.H. PETTIBONE*, Smithsonian Institution, Washington, District of Columbia 20560

The polychaete worms of the New England region (or Gulf of St. Lawrence to Chesapeake Bay) are being worked up by Families, including synopses of the Families, Keys to the Families, Genera and Species. Included for each species are brief description, figures, notes on its biology, known geographic and bathymetric distribution, and selected synonymies and references. The first half of the study has been completed. Work continues on completion of the project. New species and revisions are worked up separately.

SUPPORTED BY Smithsonian Institution

### 5.0575, MARINE POLYCHAETE WORMS OFF THE COLUMBIA RIVER, OREGON

*M.H. PETTIBONE*, Smithsonian Institution, Washington, District of Columbia 20560

A collection of polychaetes, obtained by deep-water trawling operations off the mouth of the Columbia River, Oregon, during cruises carried out by the Bureau of Commercial Fisheries, aboard M/V Commando and M/V John N. Cobb, 1961 to 1964, is in process of being worked up. Included in the study are the following: a. A new genus of species of Aphroditidae, including a review of the genera of the family (completed). b. A new genus and species of bathypelagic Polynoidae, including a review of some related genera (completed). c. A study of a species of Polynoidae commensal with three species of sea stars.

SUPPORTED BY Smithsonian Institution

### 5.0576, CANADIAN ARCTIC AND SUBARCTIC POLYCHAETES COLLECTED BY E. H. GRAINGER

*M.H. PETTIBONE*, Smithsonian Institution, Washington, District of Columbia 20560

A large collection of polychaetes, obtained by E. H. Grainger on the Calanus Expeditions during 1953 to 1964, serve as a basis for a study on the Canadian Arctic and subarctic polychaetes. The collection has been separated to families. The species are being worked up by families.

SUPPORTED BY Smithsonian Institution

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0577, THE BIOLOGY OF ROCK-BORING SIPUNCULIDS

M.E. RICE, Smithsonian Institution, Washington, District of Columbia 20560

Species of Phascolosoma, Aspidosiphon, Lithacrosiphon, and Cloeosiphon are commonly found associated with coral reefs where they are known to burrow into coral rock and beachrock. Preliminary observations have been carried out on the coral reefs of the Maldives and it is hoped that these studies can be continued with the sipunculids of the Caribbean. The object of the study will be twofold: to determine whether the boring habit is associated with nutrition and to investigate the mechanism of boring. It is planned to begin work in the Caribbean in the spring of 1967.

In the study of nutrition, analyses would be made and compared of gut contents, fecal pellets, and the rock inhabited by the animal. Dr. Karl M. Wilbur of Duke University has tentatively agreed to cooperate in some of the chemical analyses.

An investigation of the boring mechanism would include observations on the behavior of living animals in the laboratory, an examination of the burrows, and a histophysiological study of the skin papillae in an attempt to determine the nature of their secretion.

### 5.0578, SYSTEMATICS OF ANTARCTIC SIPUNCULIDS AND ECHIURIDS COLLECTED BY THE ELTANIN EXPEDITION

M.E. RICE, Smithsonian Institution, Washington, District of Columbia 20560

This project involves a study of the systematics of the sipunculids and echiurids collected in the Antarctic by the Eltanin Expedition. Over 500 specimens have been received thus far and more are expected. The specimens were dredged from 300 to 5400 meters and many are from areas in which no previous collections have been made. The specific identification of the specimens is at present in progress; any new species will be described.

SUPPORTED BY Smithsonian Institution

### 5.0579, REPRODUCTIVE BIOLOGY, DEVELOPMENT, AND SYSTEMATICS OF THE SIPUNCULIDS OF THE CARIBBEAN

M.E. RICE, Smithsonian Institution, Washington, District of Columbia 20560

A comparative study of the development of several species of tropical sipunculids belonging to the genera Lithacrosiphon, Aspidosiphon, Phascolosoma, Sipunculus, and Siphonosoma will be started in the spring of 1967. Such information, not now available, is important both to an understanding of the phylogenetic relationships of the phylum, and to an insight into the zoogeographical distribution of these species.

Data will be accumulated on spawning and breeding seasons and on embryogenesis, organogenesis, larval morphology and behavior. This study will involve observations on living animals and embryos in field laboratories and, in addition, histological work, including the technique of embedding in epoxy resins and sectioning at 1 micron on a Porter-Blum ultramicrotome.

One of the considerations will be to relate the findings to those of Dr. Scheltema (WHOI) who, having collected sipunculid larvae of unknown species in great numbers in the North Atlantic Ocean, has proposed that they may be transported by currents from the Caribbean to the Azores and the West Coast of Africa.

Since the Caribbean sipunculids are not well known, the study will of necessity include an investigation of the systematics of the sipunculids of this area. Dr. F. M. Bayer and Dr. G. Voss (University of Miami), currently engaged in a faunal survey of the Caribbean, are interested in this aspect of the study and will make available to me their collection of sipunculids.

SUPPORTED BY Smithsonian Institution

### 5.0580, SYNECOLOGY OF CARIBBEAN SPONGES

K. RUTZLER, Smithsonian Institution, Washington, District of Columbia 20560

Studies are to be made on the interspecific relationships among sponges, competition for space, microanatomical and biochemical aspects of overgrowth, interspecific relationships between sponges and other organisms, and the biological and biochemical problems involved with symbiotic algae and epizoa.

SUPPORTED BY Smithsonian Institution

### 5.0581, COOPERATIVE SYSTEMATICS STUDIES IN ANTARCTIC BIOLOGY

I.E. WALLEN, Smithsonian Institution, Washington, District of Columbia 20560

The Smithsonian Oceanographic Sorting Center will continue the cooperative systematic program begun under GA-261 for the study, determination, and description of Antarctic Biological materials and particularly neglected marine invertebrate groups accruing from past and current United States Antarctic Research Programs. Non-staff, qualified taxonomists of unique competence will be considered for the analyses of biological specimens appropriate to their specialties. The SOSOC will make available all essential laboratory and library facilities; the proposal provides for stipends, travel expenses and necessary items of specialized equipment. In all instances, a completed and acceptable manuscript will terminate the successful cooperative systematic study.

With the exception of Heron (S.I.), all cooperating systematists will be provided with laboratory quarters, equipment and library facilities at their resident institutions, i.e., Bayer - University of Miami; Mather - University of Queensland; Newman - University of California, San Diego; Pawson - Victoria University; Clark - Dominion Museum; Marumo - Texas A&M.

SUPPORTED BY U.S. National Science Foundation

### 5.0582, SYSTEMATICS AND ECOLOGY OF MARINE BIRDS

G.E. WATSON, Smithsonian Institution, Washington, District of Columbia 20560

Various minor projects are underway to provide data on the systematics, ecology and distribution of seabirds. These include ecological studies of the rare Audouin's Gull in the Mediterranean, distribution of seabirds in the tropical Atlantic Ocean, and the systematics of Antarctic and Indian Ocean birds. Some of the results of this research will be fed into other existing projects and others to be developed. Under this category is also included preparation of the section of Sylviinae for Peters' Checklist of Birds of the World and the genus Alectoris for the Handbook of North American birds.

SUPPORTED BY Smithsonian Institution

### 5.0583, MOVEMENTS OF SEABIRDS IN THE HUMBOLDT CURRENT

G.E. WATSON, Smithsonian Institution, Washington, District of Columbia 20560

Little is known about the movements and abundance of marine guano birds in the Humboldt Current off Western South America. Through the use of micro-transmitters it will be possible to track the daily movements of individual birds on automatic receiving equipment placed on coastal mountains. Color marking large numbers of birds will reveal populations movements. The combined radio telemetric and observational approaches should yield much new data on both diurnal and seasonal movements of this commercially important bird.

SUPPORTED BY Smithsonian Institution

### 5.0584, FIELD STUDY - CAPE COD, MASS.

R.A. WALLER, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Washington, District of Columbia

Obtain information on the distribution, reproduction, and early development of sedentary and sessile marine animals in relation to bottom temperature, sediments, and other environmental factors. The study area is off Cape Cod (Highland) Light on the outer coast of Cape Cod, Massachusetts. The observations are

## 5. LIVING SYSTEMS (NON-HUMAN)

made along a line extending from shallow to deep water. Self contained temperature and temperature-pressure recorders are mounted in the mooring blocks of five large navigation-type buoys specially stationed by the Coast Guard at 5 different depths along this line.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0585, ANTIGEN DISTRIBUTION OF DEVELOPING SEA URCHIN EMBRYOS

J.W. BROOKBANK, Univ. of Florida, Graduate School, Gainesville, Florida 32601

The uptake of radio-phosphate by isolated ento-mesoderm and ectoderm of developing echinoid embryos is proposed, along with a serological analysis of the tissue associated antigens of these germ layers.

In addition, the time of appearance of paternal antigens in hybrid sea urchins (*Lytechinus X Tripneustes*) will be investigated during the early development of this cross. Subcellular fractions (various RNA's) will also be studied should the information on appearance of protein antigens warrant this investigation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0586, THE ECOLOGY, MIGRATIONS AND BEHAVIOR OF MARINE TURTLES

A.F. CARR, Univ. of Florida, Graduate School, Gainesville, Florida 32601

Description of the Research Project: The research has involved a group of related projects, all aimed at filling gaps in the life cycles of the five genera of marine turtles. A long-term tagging project has been under way continuously at Tortuguero, Costa Rica, since NSF-sponsored studies proved in 1955 that *Chelonia* is a migratory animal. Data accumulating there has allowed the increasingly refined delineation of the area served by the Tortuguero nesting grounds of *Chelonia*, and has shed light on changes in population size; on remigration and re-nesting cycles, on nesting-site tenacity, on the significance of clumped emergence on the nesting beach, and on the question of separate versus aggregated travel between nesting and feeding grounds. A detailed study of the latter was begun during the 1968 grant season and will be continued for three years. Grant personnel has carried out or collaborated in other projects which, together with the Tortuguero program, have tagged about eight thousand turtles in various parts of the world. Tag returns from these should continue to advance knowledge of the natural history of sea turtles for years to come. When the Ascension Island tagging project proved *Chelonia* to have an extraordinary capacity for open-ocean navigation the Office of Naval Research began furnishing support for tracking experiments to plot migratory courses as a basis from which to investigate navigation cues and senses. Facilities and personnel provided by NSF have been jointly involved in some of this work, and during the 1968 season successful tracking of female turtles in migration was carried out by both optical and radio tracking devices.

Field reconnaissance of nesting and feeding ranges of all the sea turtles has revealed that all the marine turtles are to some degree migratory, and is piecing out the still imperfectly known ecologic geography of the group. A continuing series of field studies of the comparative behavioral ecology of the genera and species is in progress.

SUPPORTED BY U.S. National Science Foundation

### 5.0587, COMMUNICATIONS STUDIES ON TURSIOPS TRUNCATUS AND OTHER DELPHINIDS

J.C. LILLY, Communication Research Inst., Miami - Coconut Grove, Florida 33133

Objective: This research is a segment of a continuing program of the vocalization and vocalization capabilities of the bottle nosed dolphin *Tursiops truncatus*. A study of the physical properties of their emissions is in progress. It is the intention of this study to explore the formal structure of vocal exchanges between two animals connected only by an acoustic path. These exchanges will be recorded on separate channels of high speed magnetic tape

which will then be fed into computers for auto-and cross-correlational analyses. It is expected that this and other studies on the communications between simpler forms of life will contribute much to our basic understanding of transfer and interpretation of information. Detailed analyses are being made of the communicative abilities of the dolphin. The understanding of the communication capabilities of a species other than man and one having such a large and complex brain as the dolphin is of great theoretical value for understanding human communication and forms a basis for relating such studies to brain structure and function.

SUPPORTED BY U.S. Dept. of Defense - Air Force

### 5.0588, PHYSIOLOGICAL STUDIES IN THE BOTTLENOSE DOLPHIN *TURSIOPS TRUNCATUS*

E.L. NAGEL, Communication Research Inst., Miami - Coconut Grove, Florida 33133

The Cetacea which include the great whales, dolphins, and porpoises, are highly specialized aquatic mammals which show many adaptations and specializations for life in the sea, including the ability to dive deeply and submerge for prolonged periods. The investigations in these animals have been and are concerned primarily with three major organ systems: central nervous, cardiovascular, and pulmonary. On the basis of the principal investigator's studies, to date, it appears that the dolphin's ability to adapt to the aquatic environment and function therein depends in large part on hemodynamic and cardiopulmonary specializations and the special functional relationship these systems establish with the brain via the rete mirabile system. For this reason, these system complexes and their relationships have received emphasis in their studies and in these proposed investigations.

SUPPORTED BY U.S. National Science Foundation

### 5.0589, GENERAL SYSTEMATIC STUDIES OF THE OCTOCORALLIA OF THE TROPICAL ATLANTIC

F.M. BAYER, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The proposed research deals with the systematics of tropical Atlantic octocorals. These coelenterates are one of the most important groups of sessile animals in the reef habitat and in many bottom communities of deeper water. Knowledge of the systematics of the West Indian forms has been put seriously out of date by rich collections obtained in the past five years by dredging, trawling and SCUBA diving, and the East Atlantic tropical fauna is very incompletely known. Material from the Straits of Florida, Bahamas, West Indies, Gulf of Mexico, Caribbean Sea, Brazil, and the Gulf of Guinea, now numbering about 900 lots and steadily increasing, will be studied systematically, described, and illustrated, toward two final goals: (1) a revision of the Octocorallia of the continental shelf and slopes of the tropical West Atlantic, and (2) a general account of the octocorals of tropical West Africa. These will include zoogeographical studies to reveal the degree and nature of the faunal relationship of the eastern and western Atlantic; information on geographical and ecological variation of individual species; and studies of the anatomy and histology of as many species as possible, in order to clarify basic questions of classification of higher taxa. The studies now undertaken are the first step toward a thorough modernization of the systematics of the Octocorallia in general, and are preliminary to the investigations of the more complicated (and taxonomically confused) Indo-Pacific fauna. In the two-year period of the present grant, research will be concentrated upon the West Atlantic fauna, and it is anticipated that approximately one-half of the revision of that area can be completed.

SUPPORTED BY U.S. National Science Foundation

### 5.0590, FERTILIZATION MECHANISMS AND GAMETE PHYSIOLOGY IN MARINE INVERTEBRATES

C.B. METZ, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Mechanisms involved in the initial events of fertilization including the sperm acrosome reaction, penetration of egg membranes, attachment of the sperm to the egg, membrane fusion and

activation of the egg are under investigation. Specifically, the following areas are under attack: 1) Dr. Hinsch is continuing her studies on *Libinia* with special attention given to ultrastructural aspects of egg and sperm morphology, sperm-egg interaction in naturally spawned eggs, some aspects of oogenesis and spermatogenesis and the nature of the 'skeletal fibers' in the arms of the spermatozoan; 2) a study on sperm and egg antigens in sea urchin fertilization; 3) a completion of the rabbit seminal particle study including the ultrastructure of the male accessory glands and the origin of the seminal particles. The uncapacitated, capacitated and decapacitated rabbit sperms will be compared immunologically. 4) Studies on the relation of non-nuclear (mitochondrial) RNA to DNA and protein synthesis in sea urchin eggs will continue. And, finally 5) an investigation of sea urchin egg antigens, particularly those released at fertilization, will be carried out.

**5.0591, UTILIZATION OF ENVIRONMENTAL NUTRITIONAL RESOURCES BY STARFISH**  
**J.C. FERGUSON**, Florida Presbyterian College, Undergraduate School, Saint Petersburg, Florida 33733

This is a continuation of GB-4994 in which it was shown that epidermal cells could take up free amino acids and glucose from dilute solutions in sea water. The investigator is now determining whether the epidermal cells can also take up dissolved proteins and suspended microorganisms. The importance of such nutritional sources is being evaluated. Special water-pumping responses have been noticed in the presence of dissolved materials. There will be further studies in relation to the concentration and kinds of materials that will stimulate pumping. The studies will be comparative for several species.

SUPPORTED BY U.S. National Science Foundation

**5.0592, ENVIRONMENTAL SIGNIFICANCE OF SABELLARIID REEFS**  
**W.F. TANNER**, Florida State University, Graduate School, Tallahassee, Florida 32306

A study of the influence of worm (Sabellariid) reefs on coastal morphology, erosion and sedimentation. Unlike corals (which require warm, clear, shallow, turbulent marine water), and vermetid (gastropod) reefs (which develop in warm, clear, shallow, quiet marine water), the sabellariids thrive in warm-to-cool, shallow turbulent marine waters in which an appreciable load of clastic sediment (sand, silt) is in transit. The sabellariids have a profound influence on lithification of beach materials (to make beach-rock), and hence on rates and processes of erosion and deposition. They incorporate sand-sized particles in their tube walls, and thus deplete the supply of sand in transit toward localities farther along the beach. Charts and formulae which were based on physical principles only, relating wave parameters to coastal erosion and sediment transport, must now be revised for use in areas where Sabellariids make reefs.

SUPPORTED BY U.S. National Science Foundation

**5.0593, MARINE ZOOGEOGRAPHY**  
**J.C. BRIGGS**, Univ. of South Florida, Graduate School, Tampa, Florida 33620

In September, 1962, work was begun on a study of the general distribution of marine fishes. The coverage was then broadened to cover other groups of marine animals and the manuscript entitled MARINE ZOOGEOGRAPHY. As the result of this enlargement of the original task, about two more years will be required for its completion. Eight chapters out of a projected total of twelve are now ready. Preliminary work of this nature has been done and, during the past three years, a total of twelve smaller papers was published. Several of the latter are of zoogeographic importance. National Science Foundation support has now been received for the final two years of the project.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

**5.0594, DEVELOPMENT IN ILYANASSA**  
**A.C. CLEMENT**, Emory University, Graduate School, Atlanta, Georgia 30322

The program deals with the regulation of early embryonic differentiation in the marine snail *Ilyanassa obsoleta* (*Nassarius obsoletus*). Interest centers around the polar lobe, an accessible cytoplasmic protrusion at the vegetal pole which has an important determining influence upon cell values and the general course of differentiation. Techniques to be employed include microsurgery, metabolic inhibitors, centrifugal force, and other appropriate procedures. The cytoplasmic basis of the polar lobe influence, as well as its mode of operation, is the problem of greatest interest.

SUPPORTED BY U.S. National Science Foundation

**5.0595, SENSORY PROCESSES**  
**G. VONBEKESY**, Univ. of Hawaii, Laboratory of Sensory Sciences, Honolulu, Hawaii 96822

The laboratory's broad interest is in the sense organs and transmission pathways of man and other animals, particularly the marine animals. Different sense modalities will be studied and compared for common general sensory principles as well as for principles specific to particular senses.

Initial investigations will study the amplifying mechanism in sensory transducers, the role of inhibition in localization and sensory magnitude, inhibition between point sources in the eye, nerve membrane permeability, the role of free radicals in nerve impulse conduction and sensory changes with neurological disease. A variety of experimental techniques will be employed, such as electrophysiological recording, electron spin resonance, psychophysical 'average error' matching and psychophysical localization.

The support requested for these initial investigations should provide the base for a continued program in each of these areas. It is hoped that the different approaches employed in the same laboratory will not only provide a broad analysis of sensory functioning but will also result in new interdisciplinary questions not easily conceived in 'single-discipline' laboratories. It is further hoped that the geographic location of Hawaii will attract investigators from various parts of the world, and the Pacific Basin area in particular, to mix their ideas and techniques in the same laboratory.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0596, BEHAVIORAL STUDIES OF CETACEANS**  
**K.S. NORRIS**, Oceanic Foundation, Oahu, Hawaii (N00014-66-C0339)

The principal investigator is studying the behavior of free swimming cetaceans with current emphasis on the Kiko porpoise, *Stenella attenuata*, and the Pacific pilot whale, *Globicephala scammoni*. The open-sea data will be obtained through the use of the unique Mobile Observation Chamber, a partially submerged 15-foot observation vessel designed and field tested by the principal investigator under this contract. Preliminary tests indicate that the animals are undisturbed by the 'insinuation' of the Chamber into their midsts, and the investigator is comparing reactions of wild and trained porpoises to a variety of stimuli. He will now attempt to determine the effect on the behavior of the wild population of a trained porpoise added to their school. The causes of schooling and school break up will also be studied.

Underwater communication by cetaceans has important Naval applications. Certain whales have been found by the investigator to possess echolocation capabilities of remarkable precision. The limits of this ability, the conditions under which it operates best, and in fact, the underlying mechanism remains undefined.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0597, AGING IN HYDROIDS**  
**E.E. PALINCSAR**, Loyola University, Graduate School, Chicago, Illinois 60611 (NONR)

The investigator is studying cell development, particularly senescence and death and the physical and chemical changes that

## 5. LIVING SYSTEMS (NON-HUMAN)

take place in the cell which result in or accompany aging. The animal under study, *Campanularia flexuosa*, is a colonial coelenterate, a group which includes the most long-lived animals known. To determine what factors initiate the aging process, the investigator is altering experimentally various internal and external environmental parameters and is making comparisons with other forms. He will also compare senescence and death of cells and tissues with that of entire organisms.

Effective attempts to eliminate or control biological pests that interfere with Naval operations by fouling and deterioration of equipment must be based on a thorough knowledge of the biology of the organisms involved. The determination of the death processes of these forms will provide clues to likely methods of attack for such pests. This information is also relevant to the development of cells of higher animals and will contribute to advances in medical science as well.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0598, STATOLITH DIFFERENTIATION IN AURELIA (JELLYFISH)

*D.B. SPANGENBERG*, Indiana University, Graduate School, Bloomington, Indiana 47405

To obtain valuable information concerning mechanisms that regulate cellular differentiation and factors which may alter normal differentiation of cells using the newly developed test system of metamorphosing Aurelia for investigation.

To relate wherever possible the data obtained from these studies to problems of cellular differentiation in growth systems of higher animals, including man and through this application, to provide new approaches, and new information which will be useful in understanding normal cellular differentiation and which will be of value in preventing atypical cellular differentiation in higher animals.

To use the differentiation of statocysts in Aurelia during metamorphosis as a model differentiation system to determine mechanisms by which differentiating or differentiated cells concentrate calcium during development.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0599, INITIATION OF METAMORPHOSIS IN AURELIA

*D.B. SPANGENBERG*, Indiana University, Graduate School, Bloomington, Indiana 47405

Research is in progress to determine the primary factors which are involved in the initiation of metamorphosis in Aurelia. Environmental factors being studied are the effects of low temperature preconditioning and light on this process. Chemical factors also under investigation are iodine and iodinated hormones. Additional research is planned to determine whether neurosecretory materials are involved in the initiation of strobilation. The results of these studies could lead to an understanding of the basic mechanisms involved in the initiation of new growth as polyps undergo extensive mitotic activity and cellular differentiation during metamorphosis. An understanding of such mechanisms in this simple organism could be important in understanding similar mechanisms which may control the initiation of new growth (often abnormal) in higher organisms.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0600, REPRODUCTION AND EMBRYONIC SURVIVAL IN ASCIDIA NIGRA (SAVIGNY)

*I.M. GOODBODY*, Univ. of The West Indies, Kingston, Jamaica

Previous studies on *Ascidia nigra* have illustrated the pattern of growth and survival in natural populations of adults and juveniles, and have shown that larvae are settling throughout the year in the tropical environment of Jamaica. The intensity of larval settlement varies at different seasons of the year and it is not clear whether this is due to differences in the intensity of spawning or is due to differences in the pattern of embryonic and larval survival.

The present program aims to study the patterns of spawning throughout the year in laboratory reared populations of ascidians and also to study the seasonal pattern of embryonic survival in

laboratory reared cultures. Weekly samples of eggs are fertilized and reared under constant conditions of temperature and in sea water from three different marine environments. *A. nigra* occurs naturally in two of these environments but not in the third. It is anticipated that it may be possible to show whether the absence of the ascidian from the latter may be related to poor survival of embryos in these conditions.

SUPPORTED BY U.S. National Science Foundation

### 5.0601, GROWTH, DIFFERENTIATION AND NERVE TRANSMISSION IN THE HYDROID, CAMPANULARIA

*C.R. WYTTEBACH*, Univ. of Kansas, Graduate School, Lawrence, Kansas 66045

**BRIEF DESCRIPTION OF RESEARCH PROJECT:** Studies of four related aspects of terminal elongation and differentiation in *Campanularia* colonies, a marine hydroid which exhibits a branching pattern, are continuing. Preliminary microscopic observations of living material indicate that stolon and pedicel elongation occurs in a cyclic manner, with alternating forward and backward surges (rather than in a uniform fashion) and that, associated with this, the epidermal cells at these growing tips undergo repeated, extensive changes in shape. The dynamics of this cyclic growth and the motive force behind it are being studied by determining the genetic and environmental effects on its pattern, as well as that of particular drugs. Phase and electron microscopy are being used to interpret the extensive structural changes which occur in the tip epidermal cells throughout the cycle. There is evidence that at or near these elongating tips there may be a zone in which cell destruction occurs. Tissue culture techniques are being used to study the time course of cellular differentiation during hydranth development by determining the developmental potencies of aggregates formed from completely disaggregated immature hydranths of successive developmental stages. Serotonin distribution will be followed in the hope of gaining insight into the nature and origin of neural coordination in these primitive forms.

SUPPORTED BY U.S. National Science Foundation

### 5.0602, CORRELATION BETWEEN ELECTRICAL PATTERNS AND MORPHOGENETIC PATTERNS DURING REGENERATION

*S.M. ROSE*, Tulane University of Louisiana, School of Medicine, New Orleans, Louisiana 70118

Isolated pieces of stem of the marine hydroid, *Tubularia*, can transform to hydranths. Pieces too short to form a whole hydranth can often form an anterior portion. The general rule is that all regions form the most anterior structures not forming anterior to them. The agents of control seem to be regionally specific repressors which move in a polarized field.

It has long been known that imposed electric fields can change the polarity of regenerating hydroids and worms. These two lines of approach to the problem, the electrical approach and the chemical, seem to be coming together. The natural repressors have been found to be positively charged in the pH range of 8.0 to 8.6 and move like histones.

The question under investigation is whether polarized control of differentiation results from the spread of regionally specific repressors in the bioelectric field. The control by repressors in applied fields has recently been demonstrated. Investigations are now directed to learn whether the various methods known to change morphogenetic polarity, including the induction of secondary structures, also change the bioelectric patterns.

SUPPORTED BY U.S. National Science Foundation

### 5.0603, POLYCHAETES AND ECHINODERMS IN THE LABRADOR SEA

*D. DEAN*, Univ. of Maine, Graduate School, Orono, Maine 04473

The initial scientific cruise of the research vessel *Hero* in northern Atlantic waters is proposed by the University of Maine as an opportunity to sample the poorly known benthic fauna of the region and to test certain biological concepts concerning the modes of reproduction of selected organisms. The particular in-

## 5. LIVING SYSTEMS (NON-HUMAN)

terest of the investigators is in the reproductive biology and systematics of polychaetes and echinoderms, especially asteroids and ophiuroids. Studies of the morphology and ecology of epibenthic and recently settled larvae of these two major groups will be conducted to evaluate Thorsen's ideas about reproduction in cold water benthic animals. Thorsen's hypothesis is that marine bottom invertebrates near the poles have non-pelagic development while those nearer the equator have pelagic larval stages. Emphasis will be placed on examination of adult gonads and larvae from epibenthic and midwater plankton samples. All biological samples will remain with the project pending completion of analysis and publication of results; all other materials will be referred to the Smithsonian Oceanographic Center for deposition in the U. S. National Museum.

This proposed research is one of two scientific programs planned for the shakedown cruise of R/V Hero during June and August 1968 in waters between North America and Greenland. Sampling during two crossings of these water masses will permit the use of trawling as well as vertical sampling gear at all points. Station work will include vertical temperature-salinity profiles, plankton casts, and bottom grabs, trawls and dredging. The University shipboard party will consist of four (4) persons. Overseas equipment will be provided by USARP.

SUPPORTED BY U.S. National Science Foundation

### 5.0604, LIFE HISTORY AND DEVELOPMENT OF POLYCHAETOUS ANNELID LARVAE

D. DEAN, Univ. of Maine, Ira C. Darling Ctr. For Res., Walpole, Maine 04573

This study continues work done in a more southerly located estuary under NSF GB-2179. Larvae of as many species of polychaetous annelids as possible from the region of the Damariscotta River Estuary are being reared and described. Larvae are obtained from plankton tows and from artificial fertilization. Data are being acquired on breeding seasons, estimates of length of larval life, facility of laboratory spawning, and various other phenomena concerned with reproduction. The behavior of polychaete larvae, offered various substrata during the period of larval settlement and metamorphosis, is also under study.

These data will aid planktologists in the identification of a significant component of the plankton community that has been categorized as 'polychaete larvae unidentified' by most workers. In addition, these data should expand our knowledge on animal-sediment relationships and on the methods of formation of marine benthic communities.

SUPPORTED BY U.S. National Science Foundation

### 5.0605, ENHANCEMENT OF RECREATIONAL USES OF ESTUARINE WATERS THROUGH STUDY OF POTENTIAL CONTROL METHODS FOR STINGING SEA NETTLES

D.G. CARGO, Univ. of Maryland, Natural Resources Institute, College Park, Maryland

Sea nettles, with trailing tentacles heavily armed with stinging cells, seriously interfere with swimming, diving and boating in the Chesapeake Bay and other estuaries. In years of abundance, they are seriously detrimental to the economy of the resort areas and to the recreational activities of the public.

Research will be undertaken by the Chesapeake Biological Laboratory to complete the imperfect knowledge of the principal species, evaluate the role of these organisms in the ecology of the estuaries, examine the relationships which appear to exist between water quality and nettle abundance, and develop and test potential chemical and biological methods for reducing their abundance and the damage they inflict on individuals and the economy of affected areas.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Maryland

### 5.0606, EVALUATION OF THE ATLANTIC FLYWAY SEA DUCK KILL

S.M. CARNEY, U.S. Dept. of Interior, Mig. Bird Population Station, Laurel, Maryland 20810

Objectives: 1. To determine the age, sex and species composition of the sea duck harvest. 2. To determine the distribution of the sea duck harvest and to gain some idea of the extent to which hunters south of New England are taking advantage of the vast sea duck hunting opportunity in this area. 3. To investigate a suspected age segregation in wintering flocks of sea ducks.

Procedures: Data has been gathered through the annual Waterfowl Parts Collection Survey from hunters throughout the coastal States of the Atlantic Flyway where sea duck hunting is permitted. The data will be analyzed by automatic data processing. Tables will be prepared to show species composition by area and time period, age ratios of each species by area and time period and the proportion of the total duck kill that was made up of sea ducks.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0607, THE BIOLOGY OF THE LAYSAN AND BLACK-FOOTED ALBATROSSES

C.S. ROBBINS, U.S. Dept. of Interior, Mig. Bird Population Station, Laurel, Maryland 20810

Objectives: In addition to testing effectiveness of scaring and repelling devices, studies include determining effects of habitat management in repelling or attracting birds; measuring repopulation in areas from which nesting birds have been removed; determining dispersal of birds whose nesting areas have been made unsuitable for nesting; determining the incidence of return of young to the place of origin to nest, the age when young return to land, and the length of time required for young to reach breeding age.

To determine age groups in the population, and to compute longevity. To determine the extent of movement of young, non-breeding and breeding birds between islands; and such related studies on the population dynamics, distribution, migration and behavior of the Laysan and Black-footed Albatross as will provide information needed for alleviation of the aircraft hazard without unduly jeopardizing the world population of these seabird species.

Procedures: 1. Band representative samples of the nesting population and of chicks. Through annual recaptures of birds in specific areas, study composition of breeding population, dispersal, relocation, repopulation, minimum and maximum breeding ages, and frequency of breeding. 2. Study bird distribution over the runways and records of bird strikes in relation to weather conditions, habitat, time of day and bird distribution. Test possible methods of reducing the strike rate.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0608, AN EXPERIMENTAL APPROACH TO THE GENETIC CONTROL OF MORPHOGENESIS IN ECHINODERMS

C.H. ELLIS, Amherst College, Graduate School, Amherst, Massachusetts 01002

The effects of various treatments, which induce morphological anomalies in sea urchin development will be examined. A study of these effects upon specific gene activities during development will be undertaken. Gene activities are inferred from the synthetic behavior of the several proteins which can be resolved chromatographically at various stages of embryonic development. Correlation between changes at this level and the appearance of visible anomalies will be made. In the case of the development of the larval skeleton, an effort will be made to trace the factors responsible for its absence following the release of prolonged inhibition of gene activity by Actinomycin-D. A careful biochemical analysis of the processes of skeletogenesis is planned, which it is hoped will lead to the elucidation of a complete pathway from DNA-genetic information, through specific protein synthesis, to a structural end-product.

SUPPORTED BY U.S. National Science Foundation

### 5.0609, ASCIDIAN SPECIES ON THE ATLANTIC CONTINENTAL SHELF

H.H. PLOUGH, Amherst College, Graduate School, Amherst, Massachusetts 01002

## 5. LIVING SYSTEMS (NON-HUMAN)

The Principal Investigator has undertaken the identification and clarification of specimens of Ascidiaceans collected by the Woods Hole Oceanographic Institution's Atlantic Continental Shelf Survey. This material along with other collected independently are accompanied by data which make it possible to plot accurate offshore geographic distributions for the more than forty species of Ascidiaceans found in the Northeastern Atlantic Continental Shelf area, the oceanic area from Nova Scotia to Long Island and out to the edge of the Shelf.

Study of the material shows that there are certain inaccuracies in the distribution currently attributed to some species collected along the shore. In addition, the fragmentary or spotty nature of collecting in the past has given inaccurate limits to the geographic ranges for a number of the offshore Ascidiacean species. It seems probable also that certain changes in Ascidiacean distribution have occurred within the recent past, and probably are still going on. Finally, there seem to be quite marked differences in the numbers of individuals of certain species in particular areas and in the same seasons over the past fifty or more years.

Accurate taxonomic identifications and reasonably precise plotting of geographic ranges for sedentary marine species are much to be desired as more effective collecting methods become available. Such data lead to better understanding for marine animals of the determinative factors in the origin of new taxa.

SUPPORTED BY U.S. National Science Foundation

### 5.0610, PRIMARY STRUCTURE OF INVERTEBRATE HEMOGLOBINS

*K.R. READ*, Boston University, Graduate School, Boston, Massachusetts 02215

A tentative scheme for the evolution of dimeric myoglobins in gastropod subclasses and orders has been worked out. Work is in progress on the characterization of chiton myoglobins and on the subunit structure of the dimeric myoglobin of the gastropod *Bufo canaliculatus*.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0611, RNA SYNTHESIS DURING SEA URCHIN DEVELOPMENT

*D.G. COMB*, Harvard University, School of Medicine, Boston, Massachusetts

On fertilization of sea urchin eggs, protein synthesis is initiated and much of this early protein synthesized is associated with the mitochondria. We have also demonstrated that a species of lysyl tRNA moves from the soluble fraction of the cell into the particulate fraction after fertilization. Experiments are underway to determine if this species of lysyl tRNA moves into the mitochondria after fertilization and if this may be involved in the activation of mitochondrial protein synthesis.

The second area of investigation is to determine the extent of transcription of mitochondrial and nuclear genes during pregastrula development. We wish to determine how much of the early messenger RNA that is synthesized during pregastrula development is coded for by mitochondrial genes as compared to nuclear genes. Furthermore, we wish to determine if mitochondrial DNA codes for a few or many species of tRNA.

SUPPORTED BY U.S. National Science Foundation

### 5.0612, COMPARATIVE PHYSIOLOGY OF RESPIRATORY MECHANICS IN MAMMALS

*D.E. LEITH*, Harvard University, School of Public Health, Boston, Massachusetts

We propose to study the physiology of respiration in mammals over a wide range of size, behavior, and habitat, with emphasis upon the mechanical properties of the respiratory system. Our objectives are, fundamentally, two: first, to provide more complete comparative physiological descriptions of respiratory mechanics than are now available for laboratory, domestic, game, and other mammals including groups of special interest such as diving mammals; second, to improve our understanding of general principles governing respiratory function through comparison of mechanical characteristics and response to experimen-

tal manipulation of species with different structure and functional requirements.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0613, REASSESSMENT OF TAXONOMY AND EVOLUTION OF ECHINODERMS

*H.B. FELL*, Harvard University, Museum of Comparative Zoology, Cambridge, Massachusetts 02138

The program aims at a reassessment of current views on the taxonomy and evolution of the echinoderms, utilizing modern methods of study of early Paleozoic and pre-Cambrian fossils, and direct comparison of these with living counterparts. The methods used depend upon detailed stereoscopic investigation of structure as preserved in negative moulds in lower Paleozoic and earlier sediments, and comparison of the structures with those of the internal skeleton of extant forms.

Collateral studies will include research on sea-floor photographs from the U.S. Bathyscap Trieste, and other sea-floor photographs and samples, their analysis for ecological information; systematic reports on expedition material, including U.S. expedition material previously referred to the principal investigator for study in New Zealand, and faunal analyses derived therefrom, leading to biogeographic inferences; and (on the part of the junior investigator) an extension of work and previously carried out by him in Antarctica, with the senior investigator's participation, to include taxonomic analyses of deep sea samples, especially those from the Vema expedition, and samples expected from the Eltanin and other cruises.

SUPPORTED BY U.S. National Science Foundation

### 5.0614, ANATOMICAL INVESTIGATIONS OF THE LOBODONTINAE

*B. LAWRENCE*, Harvard University, Museum of Comparative Zoology, Cambridge, Massachusetts 02138

Collection of specimens of seals of the genera *Lobodon*, *Ommatophoca* and *Hydrurga* involving embalming and latex injection of the blood visceral system. The specimens will be used for study of myological, anatomical and osteological characteristics essential to understanding phylogenetic relationships of Antarctic seal family Lobodontinae.

Collecting will necessitate use of ice breaker and helicopter support in the Ross Sea region and will be supervised by the principal investigator's Field Assistant (Wilson).

SUPPORTED BY U.S. National Science Foundation

### 5.0615, ECOLOGICAL STUDIES ON TROPICAL INTERTIDAL BRITTLESTARS

*A. SCHOENER*, Harvard University, Graduate School, Cambridge, Massachusetts 02138

No Summary has been provided for use of Science Information Exchange.

SUPPORTED BY Society of The Sigma Xi

### 5.0616, CILIA DIFFERENTIATION IN THE SEA URCHIN EMBRYO

*W. AUCLAIR*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

One of the first morphological manifestations of differentiation in a number of marine invertebrate embryos is the appearance of cilia during the early blastula stage. The primary objective of the proposed project is to gain an understanding at the molecular and cellular levels of the mechanisms leading to the differentiation of these organelles during early embryogenesis. More specifically, the work will deal with a study of the ciliary proteins to determine the number and types of proteins present in cilia, several of their properties, including their size and enzymatic activity, their organization into macromolecular components, and the underlying processes controlling their synthesis and organization to forming cilia. The possible relationship of some of the ciliary proteins with the mitotic apparatus proteins, based on preliminary serological work, also will be explored, with the possibility that

there may be a reutilization of proteins occurring. With this information it may be possible to gain a better understanding of cellular differentiation in general, and more knowledge of the sequence of overall protein synthetic and macromolecular aggregation events during early development.

SUPPORTED BY Lalor Foundation

**5.0617, CILIA DIFFERENTIATION IN MARINE EMBRYOS**

*W. AUCLAIR*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Ciliogenesis at the chemical and structural level is being studied during embryogenesis of several species of sea urchins and the marine annelid, *Chaetopterus p.* The objective is to gain understanding at the cellular and molecular levels of cell differentiation, using the mechanisms leading to the formation of cilia in blastomeres during the blastula stage of embryos.

An analysis of the ciliary protein components and several of their properties are being made in the hope of understanding the process of organization of these proteins and the initiation of this process. The relationship of ciliary protein synthesis to preformed pools of these proteins is also under study.

SUPPORTED BY Lalor Foundation

**5.0618, CELLULAR DIFFERENTIATION**

*L.G. BARTH*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Our studies continue with the examination of the mechanisms by which various ions can induce the presumptive epidermis of *Rana pipiens* gastrulae to form nerve and pigment cells. We plan to make an autoradiographic study of the distribution of  $Ca^{45}$  in the cells of the early, middle, and late gastrula as well as the early neurula. Parallel studies on the uptake of  $Ca^{45}$  by these stages of development will be made with a counter. In addition, we will determine the nature of the sodium dependency of induction by ions--by measuring the total sodium in cells which have been induced by  $Li^+$  plus ions as compared with uninduced cells. The processes going on in the period after induction by  $Li^+$  plus ions will be studied by means of inhibitors.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0619, INTESTINAL ADSORPTION AND TRANSPORT OF NUTRIENTS IN ECHINODERANS**

*A. FARMANFARMAIAN*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Intestinal epithelium of *Thyone* is unique in that it is adapted to  $Na^+$  plus levels of 500 mM/l or higher. Furthermore, while the absorption of sugars obeys Michaelis-Menten kinetics, and the  $K_m$  for glucose absorption closely resembles those reported for the mammalian intestine, contrary to the mammal, *Thyone* epithelium does not accumulate glucose. This system will be used to study some of the current problems in the area of membrane transport of sugars. Specifically, answers will be sought to the following questions: Does the carrier have an absolute sodium requirement similar to the mammalian intestine? Is the level of sodium necessary for the maintenance of normal adsorption rates comparable to those reported for mammals (90-150 mM/l) or is it higher for the *Thyone* intestine which is adapted to media containing approximately 500 mM/l of sodium? What is the stoichiometry of  $Na^+$ -sugar interaction? Is it 1:1 as has been suggested for the rabbit intestine?

SUPPORTED BY U.S. National Science Foundation

**5.0620, ISOLATION AND FUNCTION OF OVARIAN EXTRACTS CAPABLE OF INDUCING COCYTE SHEDDING AND OOCYTE NUCLEAR MATURATION IN STARFISH**

*A.W. SCHUETZ*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Experimental evidence indicates that shedding of oocytes and oocyte nuclear (germinal vesicle) maturation can be mediated by an ovarian extract. It is proposed to prepare and iso-

**5. LIVING SYSTEMS (NON-HUMAN)**

late sufficient amounts of ovarian extract in order to determine physical and chemical properties of the active components and to assess whether one or more ovarian substances are responsible for the different biological effects. Isolation, desalting and purification will be attempted with the physical-chemical methods of electro dialysis, chromatography and filtration. Biological assays will be utilized to trace the biological activity during the process of purification. Changes in oocyte DNA and RNA synthesis prior to and during germinal vesicle breakdown will be investigated in an effort to determine the site of action of the ovarian extracts on the oocyte. The possible existence of a gonadal intermediate (similar to that present in ovarian extracts) in testicular tissue will be investigated.

SUPPORTED BY Lalor Foundation

**5.0621, AMINO ACID & PROTEIN METABOLISM IN SCHISTOSOMES**

*A.W. SENFT*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Research into the biochemistry and physiology of the parasitic worm *Schistosoma*, directed toward finding a more effective treatment of the disease Schistosomiasis, and a greater understanding of this and other parasitic infestations.

SUPPORTED BY U.S. National Science Foundation

**5.0622, THE ROLE OF CALCIUM IONS IN THE MOTILITY OF SEA URCHIN AND OTHER SPERMATOOZOA**

*J. TIBBS*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

The effect of calcium ion concentration on the adenosine triphosphatase activity of tails isolated from sea urchin and other spermatozoa will be examined by the use of the complexing agent EGTA as a calcium buffer. Attempts will also be made to see whether or not such sperm tails show structural changes during adenosine triphosphate hydrolysis similar to those which have been observed by the author in fish sperm tails (*Perca fluviatilis*) and whether these changes are dependent on calcium ions.

SUPPORTED BY Lalor Foundation

**5.0623, STUDIES OF THE BENTHIC INVERTEBRATES OF THE ATLANTIC CONTINENTAL SHELF**

*R.L. WIGLEY*, U.S. Dept. of Interior, Biological Laboratory, Woods Hole, Massachusetts

These studies are designed to describe the communities of benthic invertebrates on the Atlantic Continental Shelf primarily between Nova Scotia and New York; to determine their importance in the ecosystem especially in relation to groundfish predators; and to determine the dynamics of the more important populations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0624, PHYSIOLOGY OF MARINE MAMMALS**

*J.W. KANWISHER*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Some of the thermal and respiratory problems faced by mammals living in the sea have been outlined in the previous application, (GB-1198). It was shown that water is, at best, a hostile environment for mammalian life and presents obvious difficulties for meeting such needs as air-breathing and the maintenance of a high constant body temperature. In spite of this, several groups have reinvaded the sea and, in the process, evolution has produced some impressive respiratory and thermal capabilities. We know, for instance, that a sperm whale can dive to at least a half-mile and stay down an hour. Just as impressive thermally is the degree to which small seals and porpoises, without access to the efficient air insulating layer of land forms, are at home in freezing water. Due perhaps to the elusive nature of the experimental material, we know only part of the means by which such performances are accomplished. Dr. Kanwisher proposes to extend his studies of such physiological problems in these water-living mammals. Thermal and respiratory physiology will be

## 5. LIVING SYSTEMS (NON-HUMAN)

discussed separately although in any consideration of the living animal they are intimately interrelated. His past work has been on whales and porpoises so most of his thinking centers on the cetaceans. But the seals and sea lions have common physiological problems. And man, for compelling military and economic reasons, is entering the sea with increasing frequency. This research has been supported by NSF Grant GB-1198.

SUPPORTED BY U.S. National Science Foundation

### 5.0625, ACOUSTIC RECORDING OF MARINE MAMMALS OF NOVA SCOTIA AND NEWFOUNDLAND W.E. SCHEVILL, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Woods Hole Oceanographic Institution proposes to conduct a reconnaissance study on the R/V Hero during her shake-down cruise along the continental shelf off Nova Scotia and to St. John's, Newfoundland, via Cabot Straits off Bell Island.

The plan of work calls for a constant look-out during daylight hours for sighting of porpoises, whales, and seals along the cruise track. Sighting will require changes in ship course and speed to close in on the animals as needs dictate. The ship will either lay-to and go on silent conditions for hydrophone recording, or approach for photography or harpooning. In either case, the operation which may entail the launching of the whale boat, would consume from one-half to several hours of work per operation. The research is planned to obtain details on the distribution, seasonal and geographic, of marine animals at sea and particularly to obtain specimens and/or sound recordings of their calls which will enlarge on present pelagic records of cetacean and pinniped species. This work will, in addition, subject the R/V Hero and whale boat to rigorous requirements for underwater acoustic studies which will help in determining possible modifications or other necessary changes prior to the vessel's transfer to Antarctic water.

The principal investigator will be assisted by an acoustic analysis and electronics research associate from WHOI; and, by the Curator of Mammals, Harvard University, who will be responsible for anatomical dissections and photography.

SUPPORTED BY U.S. National Science Foundation

### 5.0626, RESEARCH ON THE MACROBENTHOS OF THE GREAT LAKES

J.K. HILTUNEN, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The objective of this project is to determine the kinds of bottom dwelling invertebrates and their ecology in offshore areas of the Great Lakes.

Research on freshwater macrobenthos can yield data on the availability of fish food organisms and provide insights into the relationships between species and water quality. Studies of bottom fauna currently undertaken include Lakes Ontario and St. Clair and the Apostle Islands region of Lake Superior. In Lakes Michigan and Erie benthological research is confined mostly to taxonomy and ecology of microdrile oligochaetes. Among aquatic invertebrates, populations of oligochaetes are generally the best indicators of pollution.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0627, REVISION OF GENERA AND SUBGENERA OF WATER MITES OF THE WORLD

D.R. COOK, Wayne State University, Graduate School, Detroit, Michigan 48202

This is in a sense three projects grouped administratively under the above title. (1) The presently known water mite genera and subgenera are being reviewed. Many of these are inadequately described and illustrated. Type material in Europe will be examined. A monograph, including illustrated keys, diagnoses, habitat and distribution, will be published in approximately three years. (2) Work on the taxonomy of North American water mites has been impeded by inadequate descriptions of many of the earlier species, especially those from standing water. Recollection of type localities plus work with the types will lead to published

studies on several genera in which positive species identifications are now impossible. (3) Work on the taxonomy of water mite larvae will also be carried out. Gravid females of known species are isolated to obtain identified larvae. The lack of good illustrations has made almost all previous work on water mite larvae useless for taxonomic work. Many genera, subgenera and species, in which the larvae were previously unknown, will be illustrated and described. Also the redescription of known larvae will be carried out. Work on larvae should be of interest not only to Hydrachnologists, but to those working with aquatic insects which are so often parasitized by immature water mites. A knowledge of larvae is of great importance in the higher classification of water mites.

SUPPORTED BY U.S. National Science Foundation

### 5.0628, LAKE SUPERIOR CHEMICAL CONTROL OF SEA LAMPREY

R.A. BRAEM, U.S. Dept. of Interior, Biological Station, Marquette, Michigan

The Bureau of Commercial Fisheries, under the direction of the Great Lakes Fishery Commission, is using selective larvicides as an experimental method of control for sea lampreys in Lake Superior. The study is designed to eliminate all generations present in the streams tributary to the lake by treatment of these streams with chemical, and to determine if such action will control effectively the parasitism on lake trout and other fish.

The control method requires a thorough knowledge of: the presence and distribution of ammocete populations in tributaries; physical characteristics and flow data of infected streams; accurate bioassays and chemical analyses of the water; precise metering of the chemicals; and posttreatment surveys to measure and analyze the effectiveness of individual treatments.

There are 75 streams tributary to the U.S. shore of Lake Superior containing sea lampreys. The initial treatment of these streams was completed in 1961. The second application was finished in 1961. The second application was finished 1964. Since then treatments have been repeated at intervals determined from observations on the rate of reestablishment and growth of sea lamprey ammocetes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0629, SEA LAMPREY AMMOCETE REESTABLISHMENT STUDIES

P.J. MANION, U.S. Dept. of Interior, Biological Station, Marquette, Michigan

The Bureau of Commercial Fisheries and the Fisheries Research Board of Canada, under contract with the Great Lakes Fishery Commission, are using specific larvicides in the experimental control of the parasitic sea lamprey in the Great Lakes. A complete and thorough knowledge of the larval life stage of sea lampreys is essential for the successful and efficient undertaking of this control program.

The ammocete studies represent a discrete research project designed to provide important life history data. The investigation includes a study of populations reestablished after chemical treatment; magnitude and timing of downstream drift of ammocetes and newly metamorphosed individuals; deep-water populations inhabiting bays, estuarine waters, and inland lakes; and a known-age class of ammocetes isolated in a river free from interference from other age groups or species.

Specifically, the study should provide information on the size of reestablished populations; rate of growth of larvae; minimum duration of the larval stage; downstream drift or movement as influenced by physical and ecological characteristics of given streams; and the relative abundance and distribution of deep-water populations (currently uncontrollable) and some knowledge as to their contribution to the parasitic stocks.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0630, ELECTRIC BARRIER OPERATIONS

H.H. MOORE, U.S. Dept. of Interior, Biological Station, Marquette, Michigan

## 5. LIVING SYSTEMS (NON-HUMAN)

The Bureau of Commercial Fisheries and the Fisheries Research Board of Canada, under contract with the Great Lakes Fishery Commission, are using specific larvicides in the experimental control of the parasitic sea lamprey in the Great Lakes. A means of securing immediate and positive data for evaluating and assessing the effectiveness and progress of the chemical control is essential. A system of electric barriers and traps installed on tributaries to Lakes Superior and Michigan is available for this purpose. These devices are operated during the upstream spawning migration.

The study is designed to provide data measure and abundance, or changes in the population, or sea lampreys; determine geographic distribution of mature adults; and to determine the biological characteristics of the spawning runs. The study also can provide data by which a precise measure of the progressive levels of suppression can be made as well as the best estimate of the final level of control that can be reached.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0631, EFFECTS OF CHEMICALS ON THE PHYSIOLOGY OF SEA LAMPREY AMMOCETES (PETROMYZON MARINUS)

J.H. HOWELL, U.S. Dept. of Interior, Hammond Bay Biolog. Sta., Millersburg, Michigan

Little is known of the physiology of the larval stage of the sea lamprey and still less of the effect of toxic principles on various physiological systems. The basic aims of research in this area are to define physiological norms, determine the mode of function of physiological systems, discover and define systems which are unique in the sea lamprey larvae and correlate this information with observable effects of various toxic principles. Studies are concerned mainly with the amount of physiological disruption which is necessary to produce a lethal response and the relationship of this response to the concentration of a toxic material in the environment. Information is also obtained on the acute and chronic effects of sublethal exposure and the possible role this may play in the development of defensive mechanisms. Where the physiology of sea lamprey ammocetes can be demonstrated to be unique from that of other animals inhabiting the same environment an attempt is made to take advantage of this uniqueness in developing methods for the selective control of these animals.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0632, BIOASSAY

J.H. HOWELL, U.S. Dept. of Interior, Hammond Bay Biolog. Sta., Millersburg, Michigan

Research is directed toward the discovery of chemicals which, when a stream environment, will be selectively toxic to larval sea lamprey (*Petromyzon marinus*). The procedure consists of bioassaying a wide variety of organic compounds, representing most of the basic structural classes, under standard conditions against larval sea lamprey and rainbow trout (*Salmo gairdnerii*). The discovery of a chemical possessing the desired biological activity (toxicity and selectivity for larval lamprey) results in the testing of structurally related compounds. The relation between molecular structure and biological activity are studied and compounds custom synthesized to produce the best possible biological activity. Chemicals selected for field use are tested to determine what effect environmental factors such as water chemistry, temperature, turbidity and light have on their biological activity. Tests are run on promising compounds to determine their toxicity to a variety of game and nongame fish species as well as aquatic invertebrates. Methods are devised for preparing concentrated stock solutions of compounds being considered for field use. Analysis techniques, which are fast and accurate are developed. A chemical's potential as a sea lamprey control agent is evaluated under simulated stream conditions and in carefully controlled experimental stream treatments.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0633, BIOLOGY OF THE LARVAL SEA LAMPREY

A.J. SMITH, U.S. Dept. of Interior, Hammond Bay Biolog. Sta., Millersburg, Michigan

A complete knowledge of the biology of larval lampreys is necessary to take full advantage of control techniques which are directed toward this life history stage of the sea lamprey. Evaluation of control methods requires a thorough knowledge of the factors which control the size, growth and transformation of larval populations. Studies are being conducted or planned to determine the effect of environmental factors such as temperature and water chemistry on developing sea lamprey embryos. Also being investigated is the effect of biologically active chemicals on the sequence and success of embryological development. Taxonomic studies are under way on young-of-the-year ammocetes of the five species found in the Great Lakes. These studies utilize individuals of known parentage. The effects of environmental factors such as temperature and food on ammocete growth and transformation are being studied. This information is vital to an understanding of ammocete distribution and their reaction to an abnormal or hostile environment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0634, POPULATION DYNAMICS OF ANTARCTIC SEALS

A.W. ERICKSON, Univ. of Minnesota, Graduate School, Minneapolis, Minnesota 55455

This proposal is a five-year study on the status of the leopard, crabeater, Ross and Weddell seals of Antarctica. The objectives are to: (1) determine abundance, distribution and migrational characteristics of the four seal species; (2) determine their present population dynamics; (3) obtain basic information on sex ratios, age structure, discreteness of population boundaries and breeding biology for determining corrective management adjustments.

Preliminary review and evaluation of existing data, development of methodology, particularly of census procedures applicable to Antarctica and its environmental conditions, and devising and testing statistically valid procedures of Antarctic seal species will be carried out in a systematic manner. Experimentation will be carried out with aerial photographic methods, utilizing low and high altitude aircraft; infra red sensing systems with possible satellite applications will be investigated when appropriate to this research.

Two participants will conduct ship and aerial census experiments on USCGC Glacier during the International Weddell Sea Oceanographic Expedition of 1967-68; four participants will begin general reconnaissance and individual species studies in the Ross Sea in 1968-69.

SUPPORTED BY U.S. National Science Foundation

### 5.0635, STUDIES ON INTEGRATIVE MECHANISMS OF NEURONS

R.L. PURPLE, Univ. of Minnesota, School of Medicine, Minneapolis, Minnesota 55455

Studies on integrative mechanisms of neurons will be pursued on neurons which process visual information within the brain of *Limulus*, on the receptor field organization (extent and nature of overlapping visual fields) of vertebrate retinal ganglion cells, and on the effects of central feedback (efferent control) on the vertebrate retina. The broad goal of these studies is to provide information on neuronal organization and mechanisms underlying pattern recognition in sensory systems. To this end the above projects will concentrate, where possible, on approaches developed in systems analysis, communication theory, etc., for defining temporal and spatial signal processing capabilities of the units studied.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0636, TREMATODES OF FISHES OCCURRING ON THE WEST COAST OF NORTH AMERICA.

M.H. PRITCHARD, Univ. of Nebraska, Graduate School, Lincoln, Nebraska 68508

This project proposes first to complete the study of a collection of trematodes from South African marine fishes. Later, there are plans for a new collection from the southern California-Baja California region of the Pacific Ocean. Comparative and zoogeographic

## 5. LIVING SYSTEMS (NON-HUMAN)

graphical studies will be made with trematodes from many parts of the world which are available in the H. W. Manter Collection at the University of Nebraska.

SUPPORTED BY U.S. National Science Foundation

### 5.0637, APPLICATION OF BIOTELEMETRY TO THE STUDY OF MARINE VERTEBRATES

H.R. SKUTT, Univ. of New Hampshire, School of Engineering, Durham, New Hampshire 03824

Members of the Engineering Design and Analysis Laboratory are working on a research project involving telemetry of electrical activity from the brain of a free-swimming fish. This research project involves the perfection of the physiological technique of implanting electrodes within the gustatory centers of the brains of fishes, and the perfection of an underwater biotelemetry system.

It is possible to record from the unanesthetized fish by means of a direct wire connection. Such techniques produce technical problems. Direct wire recording with moving animals produces distorting of the recording of neutral activity. Movement of the animal also produces an entanglement of his leads. It is for these reasons that telemetered signals from the animals are desirable.

Physiological progress to date centered around two problems: the establishment of a stereotaxic atlas, and the development of techniques to allow surgery in the fish.

Progress in the engineering aspects have included construction of miniature biotelemetry units, investigation of encapsulation techniques, investigation of methods of attaching telemetry units to fish and successful transmission of physiological signals from a fish in a tank of water.

SUPPORTED BY New Hampshire State Government  
University of New Hampshire

### 5.0638, SUCCESSION, SPACIAL AND TEMPORAL DISTRIBUTION, AND BIOLOGY OF BENTHIC ORGANISMS

J. PEARCE, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Measure rate of larval settlement, colonization and succession of invertebrate epifauna and flora on various surfaces of artificial and natural reefs; the effects of such reef communities on the distribution and ecology of bottom-dwelling infaunal organisms and finfish, and the variations in distribution of invertebrates at latitudinally separated reef sites. The investigation will employ traditional sampling gear such as the Smith-McIntyre Bottom Grab, various dredges, and plankton collecting devices as well as the 'Multiple Disc Sampling Apparatus' recently developed at Sandy Hook Marine Laboratory. The latter consists of a frame supporting concrete, metal, glass, rubber and wood discs to measure settling rates on different materials. Standardized collecting, preserving and laboratory procedures have been established to insure highly quantitative results.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0639, CARDIOVASCULAR STUDIES ON DIVING MAMMALS

F.L. FERRANTE, New Jersey Coll. Med. & Dent., School of Medicine, Jersey City, New Jersey 07304

The present proposal is based on the hypothesis that vagally mediated bradycardia is an essential component of the cardiovascular pattern of adaptation to protracted apnea displayed by diving mammals such as the seal. The present proposal describes experiments designed to establish the nature and extent of hemodynamic disadvantage produced during submergence apnea when the heart is prevented from slowing. Unanesthetized nutria will be tethered to a platform and apnea will be produced by tilting the assembly enough to completely immerse the head under water. Nutria tolerate this procedure since submergence is a natural event for this species.

The normal pattern of onset and intensity of inotropic and chronotropic cardiac changes during submergence apnea will be established as well as the concurrent alterations in aortic flow and resistance. The degree of derangement of the normal pattern by thoracic vagotomy will be established. In other animals the vagi

will be left intact and bradycardia will be reversed by electrical pacing of the SA node. The following criteria will be employed to signify hemodynamic disadvantage: a) a more rapid rate of decline of arterial pO<sub>2</sub> than normally found during submergence. b) a marked rise in right atrial pressure concurrent with a fall in cardiac output. c) marked cardiac dilation concurrent with a reduced force of contraction.

Shifts in the onset and intensity of the selected criteria will be noted.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0640, ULTRASTRUCTURE OF VARIOUS MARINE AND BRACKISH WATER ORGANISMS

F.L. SCHUSTER, City University of New York, Graduate School, Brooklyn - Brooklyn College, New York 11210

Investigations have and are being carried out, using the electron microscope, on ultrastructure of various marine and brackish water organisms. Particular emphasis is being placed on various aspects of development and differentiation, both at the organismic and cellular level.

SUPPORTED BY Brooklyn College

### 5.0641, THE CETACEAN BRAIN - A COMPARATIVE STUDY

M.S. JACOBS, New York Zoological Society, New York, New York

Continuing studies of the cetacean brain will be based on a series of gross dissections, on the analysis of five serially sectioned and stained delphinid brains, on additional quantitation of fibers in peripheral nerves and on an investigation of the visual system in Tursiops truncatus, the bottlenose dolphin, using Nauta fiber degeneration staining methods.

Such continuing investigations constitute a variety of approaches to substantiating, in terms of the brain of present day Cetacea, the concept that the brain - through an evolutionary process of addition of new structure upon previously existing structure - has come to consist of, in primates, rhinic, limbic and supralimbic lobes. Having already completed an investigation of the rhinic lobe (paleocortex and archicortex) in Cetaceae in general and in the bottlenose dolphin in particular, the next subdivision of the forebrain that will be concentrated on is the limbic lobe.

In the dolphin, as in primates, the limbic lobe consists of a series of lobular configurations whose rostro-caudal trajectory is grouped in an arch that coincides with the course of the corpus callosum (parolfactory lobule, supracallosal lobule, retrosplenial lobule and parahippocampal gyrus). The relationship of limbic lobe structures to the surrounding cortical formations will be evaluated chiefly by cyto- and myelo-architectonic means.

### 5.0642, SYMBIOSIS OF TROPICAL ZOANTHIDEA AND ZOOXANTHELLAE

T.F. GOREAU, State University of New York, Graduate School, Stony Brook, New York 11790

This investigation deals with the metabolic interactions between *Zoanthus sociatus* (Zoantharia, Anthozoa) and its endosymbiotic zooxanthellae. *Z. sociatus* is abundant and widespread in Jamaican coral reefs. The species has five major ecovariants, or physiological races, which differ from each other in habitat distribution, size, colour and extent of nutritional dependence upon their contained zooxanthellae. The zooxanthellae themselves may be of more than one species. Biochemical investigations have shown that the zooxanthellae from *Z. sociatus* secrete between about 30 and 90 per cent of their total photosynthetic production the form of organic compounds that are incorporated into the metabolic system of the animal host. The quantitative and qualitative composition of the xanthellar photosynthetate differs consistently according to the type of *Zoanthus*.

Among the substances produced by the zooxanthellae are nucleoside polyphosphates, which raises the question whether the phenotype of *Z. sociatus* is under partial control of the algal as-

## 5. LIVING SYSTEMS (NON-HUMAN)

sociates through genetic information passed to the animal host by means of complex nucleoside 'messengers'. A reverse feed-back could occur in the event of the endo-symbionts becoming dependent upon the host for certain metabolites. One such case has been found: the zooxanthellae of *Z. sociatus* cannot synthesize glycine which they obtain from the animal host. Investigations on the metabolite exchanges between the various *Zoanthus* types and their zooxanthellae are being continued to elucidate their effect on morphological, physiological and ecological diversification of the host species.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0643, THERMAL ACCLIMATION PATTERNS IN PARASITES AND HOSTS

*W.B. VERNBERG*, Duke University, Graduate School, *Beaufort, North Carolina 28516*

One of the basic problems in biology is to understand the mechanisms by which organisms adjust and survive fluctuations in their environment. During the evolution of parasite-host interrelationships, both species have had to be able to adjust to each other as well as to survive fluctuations in physical factors. The comparative influence of temperature on metabolism and enzymatic activity is being studied in both the hosts and different stages in the life cycle of the trematode, *Zoogonus lasius*. The first intermediate host is the mud-flat snail, *Nassarius obsoleta*, the second intermediate host is the polychaete, *Leanereis culveri*, and the definite host is the toadfish, *Opsanus tau*. It appears that while the parasite does markedly influence the response of the two intermediate hosts, the response of the parasite is distinctive from that of any of the hosts. Although the thermal lethal limits of the parasite in all stages is approximately the same as that of the definitive host, there is much physiological variation in the response to temperature in different stages of the life cycle.

### 5.0644, STUDIES ON MOLTING, GROWTH, AND DEVELOPMENT IN ACORN BARNACLES AND LARVAL DECAPODS

*J.D. COSTLOW*, Duke University, Graduate School, *Durham, North Carolina 27706 (NONR)*

Objective: The problem of barnacle fouling on Naval vessels and underwater structures involves a complex sequence of endogenous biological activities which are largely endocrinological in nature. A clearer understanding of the endocrine mechanisms involved in the barnacle life cycle may facilitate prevention of their occurrence in the future.

Approach: The origins of endocrine systems are being investigated in the developmental stages of barnacle (larvae) in an attempt to localize the regions and time of appearance of areas of endocrine activity. Additionally, the functional period of these sites of endocrine activity is being studied and the effects of experimental extirpations, injection, and implantation documented. Due to the minute size of the sites of endocrine activity, micro-laser techniques will be used to selectively destroy endocrine sites.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0645, STRUCTURAL ANALYSIS OF CELL DIVISION

*P.J. HARRIS*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

The main focus of work now in progress is the study of structural changes occurring in the sea urchin egg between the time of the maturation divisions and the first cleavage division. The object is to identify those changes which are involved with larval development as opposed to those which are primarily concerned with cell division, and to relate these changes with biochemical events during this period. If time permits, these studies of nuclear, nucleolar and cortical changes will be extended to cover the development of the blastula up to the time of gastrulation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0646, SYSTEMATICS OF DEEP SEA TREMATODES

*J.E. MCCAULEY*, Oregon State University, Graduate School, *Corvallis, Oregon 97331*

A study is being made of the trematode parasites of fishes from the deep sea. Although three-fifths of the surface of the earth is covered with at least 1000 meters of water we know almost nothing about the trematode parasites from this region. A preliminary investigation suggests that the deep-sea trematode fauna may be almost as diverse as that from shallower waters. More than 2300 specimens are already in the collection, and more will be collected. Systematic, distributional, and evolutionary studies will be made.

SUPPORTED BY U.S. National Science Foundation

### 5.0647, PYCNOGONIDA OF THE ANTARCTIC REGIONS

*J.W. HEDGPETH*, Oregon State University, Graduate School, *Newport, Oregon 97365*

This systematic research on Pycnogonids continues earlier studies of one of the more numerous elements of the benthic Antarctic fauna. The major effort is to taxonomically treat 2,000 specimens accumulated through United States Antarctic Research Program and New Zealand collecting activities. The result of this work will appear in a revisionary monograph. This supplement will provide for unanticipated costs to work at Palmer Station and Hero.

The principal investigator and two assistants (McCain and Stout) will join Hero at Palmer Station for collecting enroute to and at Deception Island during the period December - March 1968/69. Scuba collecting will be carried out by the two assistants.

SUPPORTED BY U.S. National Science Foundation

### 5.0648, WATER AND SALT REGULATION IN NEREID POLYCHAETES

*L.C. OGLESBY*, Reed College, Graduate School, *Portland, Oregon 97202*

The proposed study will be concerned with the mechanisms involved in water and salt regulation (osmotic and ionic regulation) in certain nereid polychaete annelids which seem to be in the evolutionary process of developing the ability to live in waters of low salt concentration. Emphasis will be placed on the investigation into three processes of osmotic regulation which are known to occur in certain other organisms, but which so far are only postulated in the polychaetes 1) reduction of the permeability of the body surface to salts and to water; 2) active transport of salts from the medium; and 3) the production of a urine hypo-osmotic to the blood or coelomic fluids, by the nephridia. Radioisotope techniques will be the most used. Comparisons will be made among species of nereids in which osmoregulatory ability is differently developed, in order to determine which features of the experimental results are of importance in osmotic regulation in low external salt concentrations, and which are more generally present. The study of comparative aspects of water and salt regulation may illuminate basic mechanisms of osmoregulation, a phenomenon found in most higher organisms.

### 5.0650, SYSTEMATIC AND DISTRIBUTIONAL STUDY OF DEEP-SEA ECTOPROCTA (BRYOZOA)

*T.J. SCHOPF*, Lehigh University, Graduate School, *Bethlehem, Pennsylvania 18015*

The proposed study is directed toward obtaining a better understanding of the biogeography, special environmental adapta-

## 5. LIVING SYSTEMS (NON-HUMAN)

tions, and phylogeny of deep-sea ectoprocts (Bryozoa). Most of the material needed for the study is presently available and has been partly analyzed. It includes approximately fifty species; this is the largest collection of ectoprocts from the deep-water of the North Atlantic yet made. The species occur in both erect, foliaceous forms that live on soft bottoms (Gay Head - Bermuda transect) and in encrusting, lamellar types that are limited to hard bottoms (Blake Plateau manganese nodules and rocks of the submarine canyons of the continental slope and continental rise). The goal is to analyze these collections and the literature from the points of view of biogeography, special adaptations for the deep-sea environment and the origins of the deep-sea ectoproct fauna.

SUPPORTED BY U.S. National Science Foundation

### 5.0651, COMPUTER SIMULATION OF HYDROID COLONIES

*M.H. BRAVERMAN*, Allegheny General Hospital, Pittsburgh, Pennsylvania 15212

This is an attempt to analyze growth regulation in a hydroid colony and to utilize the biological mechanisms involved as a recursive computer program which will generate a pattern which can then be compared with the real hydroid colony. It is an exercise in model building designed to elucidate and to identify possible mechanisms for the expansion of genetic specifications.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0652, BIOGRAPHIC STUDY OF THE BENTHOS OF PUERTO RICO AND THE VIRGIN ISLANDS

*M. CERAMEVIVAS*, Univ. of Puerto Rico, Institute of Marine Biology, Mayaguez, Puerto Rico

The investigator proposes to study the biological community distribution of the bottom organisms to a depth of 200 fathoms in the area around Puerto Rico, and the Virgin Islands, and analyze this distribution in terms of the movements of the water currents. Since most benthic species are dispersed by planktonic larva, he will put special emphasis on the measurement of surface circulation in the area. Temperature patterns at the surface and at mid-depths will be examined to determine whether a suspected cool sub-surface current extends into the tropical environment of the study area from temperate areas and whether this accounts for the presence on the bottom, of certain species of algae not previously known to occur in tropical latitudes.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0653, WATERFOWL FOOD STUDIES

*UNKNOWN*, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

Objectives: 1. To determine specific plants that are being used by wintering waterfowl. 2. To determine the extent that each plant is used and the abundance of each species of plant. 3. To present a description (photograph included) so that plants can be easily identified. 4. To increase the production of these food plants so that adequate wintering waterfowl will be maintained.

Description of Work Proposed: The study is to be both qualitative and quantitative. It is proposed that the following steps will be initiated: 1. A food habits study will be made of waterfowl killed at selected areas along the coastal areas. 2. From these studies plants that are of most value will be selected. The extent and range of abundance of these preferred plants will be determined. Then illustrations of these plants by use of photographs/drawings will be prepared so that they may easily be identified. These illustrations will be made during the growing season, during bloom or flower period, the fruit seed or tuber if consumed and of the ecological growing conditions. 3. A narrative report of each important plant will be prepared to include its importance, its distribution and means of management if known or can be obtained.

SUPPORTED BY South Carolina State Government

### 5.0654, ENZYME STRUCTURE AND ITS RELATION TO TAXONOMY

*G.B. KITTO*, Univ. of Texas, Graduate School, Austin, Texas 78712

The long-term research objective of this project is to delineate the applicability of biochemical techniques to taxonomic problems. As a starting point we have chosen to study the taxonomic relationships within a single phylum, the echinodermata. Although this group of organisms, which includes starfish, brittle stars, sea urchins, sea cucumbers and sea lilies, has been the subject of considerable investigation by classical taxonomic techniques such as morphological comparisons, little has been firmly resolved of their relationships to one another. It is hoped that a comparison of enzyme properties and structure may prove useful in clarifying the relatedness of these organisms.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0655, DEEP SEA BENTHOS IN THE GULF OF MEXICO

*W.E. PEQUEGNAT*, Texas A & M University System, Graduate School, College Station, Texas 77843

The purpose of this project is the characterization and qualification of the zoo-benthonic organisms comprising the assemblages found at and below 2000 meters in the Gulf of Mexico. Collections will be made primarily by a newly designed epifaunal skimmer which allows for a quantitative sampling of the upper 5 cm. of the sediments over an area of seven square meters. Further definition of the physico-chemical environment of the benthonic communities will be attained through the use of a wide variety of deep-sea sampling and recording equipment, including specially designed current monitors and high pressure cameras. The semi-annual cruises will cover the depth regimes from 2000 meters to the greatest depth in the Gulf of Mexico, 3800 meters, in 300 meter increments.

As protracted operations from fixed facilities in the oceanic depths become more feasible, so does the need for knowledge of the nature and organization of marine biota in this unknown environment become more crucial. Present concepts are based largely on predictions and extrapolation from shallower waters and from very few actual samplings. Although historically thought to be a biological desert, the depths are now known to be populated by a moderate number of organisms, but representing a relatively large number of species and displaying many bizarre characteristics.

### 5.0656, STUDY OF LIFE HISTORY AND ECOLOGY OF SERPULIDAE IN TEXAS COASTAL WATERS

*BEHRENS*, Univ. of Texas, Graduate School, Port Aransas, Texas 78373

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY University of Texas

### 5.0657, REFERENCE COLLECTION OF GULF MARINE ANIMALS

*D.E. WOHLISCHLAG*, Univ. of Texas, Graduate School, Port Aransas, Texas 78373

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY University of Texas

### 5.0658, PARASITES OF ANTARCTIC VERTEBRATES AND INVERTEBRATES

*W.J. HARGIS*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The Virginia Institute of Marine Science proposes to conduct laboratory studies for the determination of ecto- and endoparasites collected from Antarctic vertebrate and invertebrate hosts. The collections were made over the austral winter at Palmer Station, Antarctica under GA-684, and GA-684.1. The follow-up laboratory research will consist of curating the materials, and selection of appropriate specimens which will be fixed, stained and sectioned in preparation for morphological studies essential for the completion of the systematic reports.

There is no Antarctic field work planned; the research will be conducted at the Virginia Institute of Marine Science by Staff and graduate assistants.

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. National Science Foundation

### 5.0659, FINE STRUCTURE OF JELLYFISH (CHRYSAORA QUINQUICERA) TENTACLE MUSCLE

F.O. PERKINS, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The fine structural changes which occur during relaxation and concentration of jellyfish tentacle muscle are being investigated. N-butanol is being used to mechanically and chemically relax the tentacles. The musculature of the ectoderm is under special consideration.

SUPPORTED BY Virginia State Government

### 5.0660, BENTHIC MARINE FAUNA OF THE UPPER SHELF OFF VIRGINIA

M.L. WASS, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

A total of 70 samples were taken with a 1/5 sq. m. Van Veen grab off the Eastern Shore of Virginia in October, 1967. Sorting, identification and enumeration of fauna was completed in June, 1968. Several communities were sampled and much new information was added to that obtained from four earlier cruises in which a much smaller grab had been used.

SUPPORTED BY Virginia State Government

### 5.0661, INFAUNA OF LOWER CHESAPEAKE BAY

M.L. WASS, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

Study of composition and dynamics of communities, based on about 630 grabs from the Bay proper, 30 from the Rappahannock River, 200 from the York, 200 from the James and 100 from the Eastern Shore. Work began in 1960, with the most recent effort being in the James. Species encountered up to 1965 are included in a checklist. A student thesis by James Feeley on distribution and ecology of 36 species of amphipods was done in 1968.

SUPPORTED BY Virginia State Government

### 5.0662, EVOLUTIONARY DIVERGENCE OF DEEP WATER MARINE ANNELIDS

C.P. MANGUM, Coll. of William & Mary, Graduate School, Williamsburg, Virginia 23185

The proposed research is designed to elucidate basic aspects of the biology of deep-water marine polychaetes. Quantitative measurements of population density, temperature sensitivity, oxygen consumption, lethal limits of temperature and salinity, and the spontaneous activity of the whole animal will be compared to similar measurements on closely related intertidal species. Qualitative aspects of feeding will be examined, as well as the nature of stimuli which elicit the feeding response. It is believed that the comparison will indicate the course of evolutionary divergence of deep water animals from their shallow water ancestors.

SUPPORTED BY U.S. National Science Foundation

### 5.0663, EVOLUTIONARY DIVERGENCE OF ONUPHID POLYCHAETES

C.P. MANGUM, Coll. of William & Mary, Graduate School, Williamsburg, Virginia 23185

Aspects of the biology of onuphid polychaetes from the continental slope of North America are being compared with those of closely related shelf species.

The range of thermal tolerance by *Hyalinoecia artifex*, which lives in an extremely stable environment, is somewhat narrower than that of the shelf species *H. tubicola* and *Diopatra cuprea*; however, the divergence is not sufficient to explain patterns of distribution. Moreover, the effects of temperature change on metabolism reflect several compensatory mechanisms which would promote adaptation to thermal instability, which the slope species never experiences. We have found similar adaptations in arctic-boreal species (both annelids and crustaceans).

Population density of both *H. artifex* and *D. cuprea* is more highly correlated with current velocity than with the nature of the

substratum. Since the worms feed by trapping particulate food particles, higher current velocities must increase the availability of food. The feeding response to chemical stimuli emanating from trapped food particles is currently under investigation.

SUPPORTED BY U.S. National Science Foundation

### 5.0664, OPERANT OSMOTIC REGULATION IN A MARINE ANIMAL

M.E. MEYER, Western Washington State Coll., Graduate School, Bellingham, Washington 98225

Investigations indicate that rats are capable of regulating internal physiological homeostasis by various operant behaviors (Teitelbaum, 1966). For example, behavioral control by rats for food, water, and drugs has been reported (Epstein, 1960; Epstein & Teitelbaum, 1962a, b; Clark, Schuster & Brady, 1961). On the other hand, animals are capable, by means of an operant, of maintaining optimal environmental conditions such as thermoregulation (Weiss & Laties, 1961) and oxygen regulation (Weinstein, 1966). A parallel to the above research involves osmotic or salinity regulation in marine invertebrates. The octopus is a very appropriate organism in that it has a very narrow range of salinity tolerance. Gunter (1950) reports that for the octopus vulgaris of the Atlantic Ocean and the Mediterranean Sea, the range of salinity tolerance is 30-35 g/kg. An additional feature of the octopus is the apparent ease of this animal to learn. Several studies utilizing the octopus have been reported but the research interest has focused mainly upon the visual, tactile and chemotactile senses (Boycott, 1965; Sutherland, 1959, 1961; Wells, 1962, 1964), and upon the neural basis of memory (Young, 1964). This study is concerned primarily with the concurrent operant regulation of salinity level by the octopus, and with a preliminary investigation of the physiological basis of this regulation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0665, PHYLOGENETIC RELATIONS OF FOSSIL AND LIVING GYMNOLAEMATES

J.P. ROSS, Western Washington State Coll., Graduate School, Bellingham, Washington 98225

The evolutionary development of the gymnolaemates, one of the major groups of the Ectoprocta (moss animals) will be investigated. The moss animals, one of the main fouling organisms on the hulls of ships, have a long geologic history and a wide distribution along ancient and recent shore lines. The early fossil representatives, found in stratified rocks deposited 500 million years ago, evolved during the succeeding 300 million years into many diverse groups. At the end of this period widespread extinction greatly reduced the different groups, and in the succeeding 200 million years new groups evolved to give rise to the abundant and diverse recent bryozoans. By determining relationships of these different groups, based on comparative anatomical studies of recent and fossil forms from many parts of the world, the various lines of evolution within the moss animals will be delineated.

SUPPORTED BY U.S. National Science Foundation

### 5.0666, CELL DIVISION AND MITOTIC APPARATUS PROTEINS

H.A. WENT, Washington State University, Graduate School, Pullman, Washington 99163

The proposed work will encompass two aspects of the mitotic apparatus in sea urchin and sand dollar eggs. One is the molecular origin and fate of this complex and transient structure. This involves examination of the temporal relationship between the synthesis of certain molecular constituents of the mitotic apparatus and their assembly into the definitive structure. It is also expected that some of the constituents will not be synthesized since they will already be on hand in adequate quantities in the unfertilized egg. The second aspect involves the reproduction of centrioles. Some work has already been done on this, but a number of hypotheses must be tested and serious thought and effort must be given to isolation and electronmicroscopical studies of this organelle.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0667, FUR SEAL RESEARCH, PELAGIC INVESTIGATIONS

*C.H. FISCUS*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

Pelagic research on fur seals by the Bureau of Commercial Fisheries is part of the program of the North Pacific Fur Seal Commission. Results are coordinated by the Commission. Research at near the current level is expected to continue until about 1970-during the term of the existing treaty.

The objectives are to determine the ocean distribution, by age and sex, of fur seals and the extent of intermingling of the populations from various islands, and the food habits with as much information as possible on their effect on other living resources. Pelagic sampling also gives the best data on the reproductive condition of seals by age and on bio-economic questions such as comparison of pelagic and land sealing.

Several hundred fur seals will be collected annually at sea by shooting. The ages, sex, presence of marks, measurements (size), reproductive condition, stomach contents, place of capture, and other details are determined, and tabulated or charted. From these data migration routes, intermingling rates, mortality rates, age of sexual maturity, pregnancy rates, food habits, predators, and related information are determined or estimated.

Collecting is done from chartered fishing vessels over the range from central California to the Bering Sea. Food organisms are collected simultaneously and the food species are identified from a comparative collection. Small boats, shoulder-held guns, 50 mm. harpoon guns, nets, and other equipment are used.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0668, ADMINISTRATION OF WHALING ACT, COMMERCIALLY UTILIZED WHALES

*D.W. RICE*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

Research on commercially utilized species includes studies on blue, fin, sei, humpback, sperm, and bottlenose whales. Data are collected primarily at commercial whaling stations in California and are directed toward studies of age, growth, reproduction, food, and parasites. In addition whale marking is conducted off California and Mexico to obtain information on whale movements. Data from whaling stations and from marking will both contribute to population dynamics studies. These, in turn, will lead to recommendations of management practices intended to maintain the populations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0669, ADMINISTRATION OF WHALING ACT, PROTECTED AND NON-COMMERCIAL WHALES

*D.W. RICE*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

Research on protected and non-commercial whales will include studies of anatomy, growth, and reproduction of gray whales from small samples of the animals taken during both the northward and southward migrations and periodic counts from land of migrating gray whales to follow population changes.

Incidentally, or when funds permit, studies of the bowhead whale in arctic Alaska, the killer whale, and other small cetaceans will be pursued.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0670, ADMINISTRATION OF WHALING ACT - DEVELOPMENT OF RESEARCH TOOLS

*D.W. RICE*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

This project is directed first toward development of marks that are suitable for young nursing whales without excessive injury. Age studies of whales are handicapped by a total lack of known-age animals which must be marked as calves. Marks used for adult whales are not suitable. Secondly, it is directed toward accumulation of information and development of tools that will improve the efficiency of collecting specimens such as ear plugs, ovaries, testes, etc., from whales at whaling stations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0671, FUR SEAL RESEARCH, POPULATION DYNAMICS

*A.Y. ROPPEL*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

Fur seal research on the Pribilof islands has the objective of searching out and bringing the Pribilof population to the level of maximum sustained yield.

By means of large scale marking experiments, age classification of the commercial kill, tag recoveries, and mortality and pregnancy rate determinations the number of pups born are estimated. Other estimates are made from marked to unmarked ratios among pups, adjusted by sample counts. Sources of error in estimates, such as mortality from tags, are investigated and the results are incorporated in succeeding estimates.

Related studies on body growth, molt and fur growth, behavior, embryology, and development of dentition in fur seals range from beginning to near completion. Studies of the reproductive status of young females and of males will be intensified.

Assistance in statistical analysis of population data is obtained by contract with the Laboratory of Statistical Research, University of Washington, Seattle, Washington.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0672, FUR SEAL RESEARCH, ANATOMY-BEHAVIOR-MORTALITY

*V.B. SCHEFFER*, U.S. Dept. of Interior, Marine Mammal Biol. Lab., Seattle, Washington

Hair follicle patterns of pinnipeds to be studied by photographing plastic impressions of sheared skin. Hair fiber number per follicle of various species to be counted. Patterns and fiber number may identify genera.

Effect of different sealskin processes to be tested by determining number of hair follicles per unit area and number fibers per follicle.

Fur seal physiology, anatomy, and pathology, with emphasis on nutrition of the newborn and bacteriology. Assistance in food analysis given by Washington State University.

Data from three seasons of behavior observations to be analyzed and reported on. Some marked animals observed during three seasons.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0673, PHYSIOLOGY OF FERTILIZATION AND NUCLEOCYTOPLASMIC INTERACTIONS IN SEA URCHIN DEVELOPMENT

*A.H. WHITELEY*, Univ. of Washington, Graduate School, Seattle, Washington 98122

Brief Description of Research Project: A study of the chemical events in the early development of sea urchin eggs is underway. Two interrelated lines of research are proposed; one has to do with the change in the cortex of the egg upon fertilization whereby a carrier with enzymatic properties appears which carries orthophosphate into the egg, and the second has to do with messenger RNA appearance and assay during development. Experiments will be done to see if mRNA is involved with the appearance of the phosphate carrier and to see if this carrier is related to another carrying uridine into the egg and phosphorylating it.

One major section of the research, done in collaboration with Dr. Ozaki, is concerned with nucleocytoplasmic interactions in the control of genetic expression during development. Using interspecies hybrid sea urchin embryos where genetic information flow is interrupted at some level, the appearance of specific isozymic forms of certain enzymes will be examined. Enzymes specific for one species of sea urchin fail to differentiate in hybrid embryos. A detailed study is underway to determine whether the failure of these paternal enzymes to be formed is a result of failure in the conversion of the genetic information to active enzyme protein.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0674, CARDIOVASCULAR ADJUSTMENTS IN DIVING MAMMALS

M.P. SPENCER, Virginia Mason Research Center, Seattle, Washington

(1) To explore special mechanisms of adaptation in comparative physiology and (2) applications of biomedical engineering. Out of these areas we hope to contribute to the broad field of physiological understanding and to find and develop clinically useful ideas.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0675, CARDIOVASCULAR ADJUSTMENTS IN DIVING MAMMALS

M.P. SPENCER, Virginia Mason Research Center, Seattle, Washington

(1) To explore special mechanisms of adaptation in comparative physiology and (2) applications of biomedical engineering. Out of these areas we hope to contribute to the broad field of physiological understanding and to find and develop clinically useful ideas.

## SF. PLANTS

### 5.0676, ECOLOGY AND NITROGEN CYCLE IN A MARINE PLANT COMMUNITY

J.J. GOERING, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

The physiological ecology of eelgrass (*Zostera marina*) communities will be examined in concurrence with the dynamics of the nitrogen cycle in a lagoon on the Bering Sea coast of Alaska. A comparison of natural conditions will be made with an area receiving untreated sewage. This will include an examination of the relationship between the primary producers and nitrogen cycle, with emphasis on the role played by nitrogen in the total productivity of the community. Also to be included is the control of the environment on the growth and morphology of the dominant primary producer, eelgrass. The contribution of organic matter, particulate and dissolved, from the eelgrass communities to near-shore oceanic food webs will also be investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0677, ECOLOGY OF EELGRASS

C.F. MCROY, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

Eelgrass (*Zostera marina*) meadows form an important portion of the food web in the lagoons and inlets of the Alaska Peninsula on the Bering Sea coast of Alaska. Research has included a geographical and quantitative comparison of benthic plants in the eelgrass communities along the coast of Alaska, and intensive studies on the ecosystem of Izembek lagoon near Cold Bay on the Alaska Peninsula. The work at Izembek has monitored the annual cycle of eelgrass production and hydrographic features of the lagoon. This work began several years ago under the sponsorship of the Bureau of Sport Fisheries and Wildlife. More recently we have studied cycling of inorganic nutrients, especially nitrogen, in the lagoon and of the primary productivity of the phytoplankton associated with the eelgrass community. In addition to the research on the lagoon, the portion of the Bering Sea adjacent to the lagoon has been surveyed for general oceanographic parameters.

SUPPORTED BY Artic Institute of North America

### 5.0678, FILM PROJECT (KELP FORESTS)

E.S. HOBSON, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

A film is being made that will provide the public with a better understanding of the marine life associated with the kelp forests of California, and the importance of this endangered habitat to the sport fishery.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0679, GROWTH LAYERING IN BIVALVED MOLLUSKS - AN AID IN PALEOBIOGEOGRAPHIC INTERPRETATION

C.A. HALL, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024

A systematic study of the microtexture of the same or similar year classes of *Tivela stultorum* will be made throughout its range. The presence of annual growth bands or rings on this species has been documented by others. (A) The mean thicknesses of the 'daily' or fourth-order layers in the second to fourth annual band will be determined. (B) The number and kind of growth layers in (i) the summer and (ii) winter (second-order layers) will be counted. The following questions will be asked: (1) Are there 360 to 365 daily or fourth-order growth layers present between the annual bands or in the first-order layer in *Tivela* collected at different sites and latitudes. (2) Are there differences in the thicknesses of fourth-order layers that can be correlated with latitude or some other factors. (3) Other than *Tivela*, which taxa have annual or seasonal growth layers and at what latitudes and in what temperatures of water do those forms with such bands occur? (4) Do taxa from high polar latitudes have slow shell growth, are there 360 to 365 'daily' growth increments as have been noted in taxa from temperate and outer tropical latitudes? (5) Do taxa from near-equator latitudes have seasonal growth bands or layers.

SUPPORTED BY U.S. National Science Foundation

### 5.0680, RESTORATION, PROPAGATION, AND MANAGEMENT OF MARINE ALGAE

W.J. NORTH, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109

The project proposes to develop techniques for establishing commercially valuable kelp beds in barren areas, starting with introduction of kelp spores. Preliminary investigation indicates that such techniques can be developed. Once feasibility is demonstrated, the project will attempt to extend the techniques to other useful algal species, with emphasis on species flourishing in relatively warm water so that such species may be available for growth in areas affected by thermal pollution.

The proposed project is an extension and expansion of work conducted with success under Dr. North's Kelp Habitat Improvement Project, which resulted in re-establishment of significant kelp beds off Southern California by transplantation of mature plants and control of grazing organisms. The Habitat Improvement Project will continue under other sponsorship with the added Sea Grant elements clearly identifiable within the total effort.

To aid in the training of qualified persons for future work in this field, the project includes provision for a teaching program under Dr. North for students retained as research assistants for summer work.

SUPPORTED BY U.S. National Science Foundation

### 5.0681, DRAG-REDUCING ALGAE

J.W. HOYT, U.S. Navy, Undersea Warfare Center, Pasadena, California 91107

This investigator is studying exudates of algae and bacteria as they affect the measurement in towing tanks and at sea. Effort is also underway to determine the polysaccharide chemistry of a typical friction reducing species, and to explore the relationship of algal activity in the ocean.

Determination of the causative factors in the ability of microorganisms or their products to reduce drag could lead to the synthesis of compounds which, when used as coatings on ship hulls could materially enhance their speed.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0682, GENETIC REGULATION OF HEMOGLOBIN SYNTHESIS IN ARTEMIA

S.T. BOWEN, San Francisco State College, Graduate School, San Francisco, California 94132

The long-term goal of this research is to elucidate the role of structural and regulator genes in the synthesis of hemoglobin in the brine shrimp, *Artemia salina*. This may be an excellent system for the study of regulator genes in a metazoan because *Artemia*

## 5. LIVING SYSTEMS (NON-HUMAN)

hemoglobin is an inducible protein which can be readily isolated and characterized and it occurs in a species which is suitable for intensive genetic studies. Shrimps mature in two weeks, making it possible to obtain more than 12 generations in one year. Females produce broods of about 50 nauplii every 6 days throughout their life span of 4-6 months. Of the nine single-locus mutations reported in this species, six have been found in our laboratory. Because *Artemia* races, when reared in the laboratory, initiate hemoglobin synthesis at different levels of oxygen deprivation, it is possible that they differ in regard to regulator genes.

There are three specific objectives: 1) We plan to determine which environmental factors are needed for maximum synthesis of each of the three hemoglobins. 2) We will determine the mode of inheritance of the three hemoglobins commonly found in wild populations in salterns on San Francisco Bay. More than 100 shrimps have been examined and it is evident that the hemolymph of one shrimp may contain any one hemoglobin, a combination of any two, all three hemoglobins, or none at all. There is a sex difference in the distribution of hemoglobins in the wild population. Hemoglobin synthesis will be studied in the progeny of single pair matings in our laboratory stocks which carry a marker on the sex chromosome and in which crossing over is suppressed between the sex chromosomes. 3) We will characterize the hemolymph chromoproteins by dissociation into subunits, determination of molecular weights, and (if time permits) by fingerprinting and amino acid analyses.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0683, GROWTH AND DIFFERENTIATION OF PLASTIDS

A. GIBOR, Univ. of California, Graduate School, Santa Barbara, California 93018

Acetabularia, a large single celled green alga offers unusual advantages in understanding the role of the nucleus in the control of the synthesis of the DNA of the chloroplasts. Nuclei of these cells can be removed and the cell is able to carry out normal physiological processes including, presumably the replication of chloroplasts. Thus one may study the effect of the chloroplast DNA freed from control by the nucleus. Another approach that is being followed to demonstrate the genetic role of the DNA in the plastids is to study the nature of the lesions induced in the process of ultraviolet light bleaching of *Euglena*.

Experiments will be carried out to provide further evidence for the metabolic functioning of an autonomous genetic system in plastids by studying the biosynthesis of their nucleic acids, especially DNA, and by studying the enzymes coded by this DNA. Experiments are planned to determine whether genetic differences occur among plastids or among mitochondria of the same cell.

Possible exchange of genetic material among plastids or mitochondria will be investigated by artificially establishing cell lines with mixed plastid or mixed mitochondrial populations. Micro surgical techniques and localized applications of mutagens such as U.V. and X-rays or combinations of these procedures will be attempted.

The search will be continued for proper isolation procedures and adequate nutrient media to carry on the development and multiplication of plastids in vitro.

SUPPORTED BY U.S. National Science Foundation

### 5.0684, EFFECTS OF DEPTH ON GROWTH AND REPRODUCTION OF BENTHIC MARINE ALGAE

M. NEUSHUL, Univ. of California, Graduate School, Santa Barbara, California 93018

Scuba-diving techniques were employed in the sea to follow the growth of benthic plants on substrate placed in underwater study areas. Laboratory culture was carried out in a sea water supplied greenhouse and in an aquarium facility where light and temperature levels were adjusted to simulate those encountered at depth in the sea. The growth and reproduction of plants in the sea and in the laboratory was compared. Plants in the laboratory under simulated depth conditions grew at rates comparable to, and sometimes in excess of those studied in the sea. Growth rates of red algae (*Bosniella* and *Corallina*) in the sea were within a factor of 2 of the laboratory estimates. In most cases plants showed

an inhibition at high light intensities, and a wide range of saturation growth (at 5-140 langleys per day).

In some forms (i.e., *Dictyopteris zonarioides*) growth and reproduction appear to be closely correlated. In others seasonal and lunar periodicity was observed. Many simple, yet cumulatively important techniques have been developed for transplanting, measuring and handling larger benthic marine algae under laboratory conditions. It is possible to experimentally cultivate a wide range of larger, benthic marine plants. The results of this continuing program (since July, 1962) are presented more fully in published papers (12); in-press papers (10); and unpublished theses and manuscripts (6).

### 5.0685, CIRCADIAN RHYTHM IN PHOTOSYNTHESIS IN THE MARINE ALGAE GONYAULAX AND ACETABULARIA

B.M. SWEENEY, Univ. of California, Graduate School, Santa Barbara, California 93018

The purpose of this investigation is to study the biochemistry of photosynthesis in *Gonyaulax* and *Acetabularia*, with the object of discovering through which of the component reactions of photosynthesis the control of the rhythm is exerted. The studies will be directed toward 1) a comparison of the kinetics of the partial reactions of photosynthesis in cell-free systems at different times in the diurnal cycle, and 2) measurement of photosynthesis in whole cells, utilizing flashing light and specific inhibitors as means of identifying partial reactions and detecting differences correlated with the time in the diurnal cycle. It is hoped that these studies will advance the understanding of the mechanism of timekeeping.

SUPPORTED BY U.S. National Science Foundation

### 5.0686, COPEPOD CRUSTACEANS PARASITIC ON FISHES

A.G. LEWIS, Univ. of British Columbia, Graduate School, Vancouver - British Columbia, Canada

The purpose of the project is to study the collections of copepod fish parasites from Eniwetok Atoll and from Indian Ocean fishes both from a taxonomic and a zoogeographic standpoint. The hydrographic data from cruise 2 of the Anton Bruun will be used in the discussion of the distribution of the copepod parasites of the pelagic fishes collected during this cruise. The distribution of these copepods, as well as others collected during cruise 2, will be compared with their distribution throughout the world.

SUPPORTED BY U.S. National Science Foundation

### 5.0687, LARVAL STUDY OF THE LOBSTER

W.A. LUND, State Board of Fish. & Game, Hartford, Connecticut

Plankton tows will be taken in Long Island, Fishers Island, and Block Island Sounds in the Atlantic Ocean off Block Island and Long Island in an attempt to locate larval lobsters. A few tows taken during 1965 have been examined for larval lobsters. Some larvae were collected in the Sounds, but better results were obtained in the Atlantic off Montauk.

Information available from the former Lobster Hatchery at Naank, Connecticut, indicates that the majority of lobster eggs hatched in June and early July. It is proposed to closely observe egg development on buried females during the spring. This can be accomplished by fishing our own pots or by sailing with certain commercial lobsterman.

Weekly plankton tows will be initiated in the inshore waters during the latter part of May. The periodicity and duration of the tows will be increased as information is gathered. Day and night tows will be made to evaluate which is the better time to sample. Only surface tows will be made during 1966.

Offshore plankton tows are believed to be necessary if we hope to delineate the population to which the Fishers Island and Long Island Sound lobsters belong. It will be necessary to determine the areas of origin, the transport of the larvae and the probable areas of settlement before we are able to understand the ecology of this animal in this area. An off-shore cruise made on

## 5. LIVING SYSTEMS (NON-HUMAN)

August 5, 1966, yielded six lobster larvae (three 1st stage, one 3rd stage and two 4th stage). The area sampled is approximately 40 to 55 miles SSE off Montauk, Long Island. This is the only evidence we have on the occurrence of larvae in the Atlantic off Block Island and Long Island. Periodic cruises will begin in June and continue until additional positive evidence is gathered on the off-shore occurrence of the larvae.

Part 1 of 3.

### 5.0688, POPULATION STRUCTURE OF THE LOBSTER

*W.A. LUND*, State Board of Fish. & Game, *Hartford, Connecticut*

In order to prepare a plan for the rational exploitation of the lobster with the goal of achieving the best long-term yield, it will be necessary to have information on the structure of the existing population and its distribution. Vital data such as abundance of various sizes, sex ratio within groups, distribution of sexes and size of females at first maturity, are needed to estimate the best theoretical size to harvest the lobster.

The objectives of this sub-project are to investigate the composition of the lobster population in Long Island and Fishers Island Sounds throughout the year. It is proposed to examine this population in the following ways: 1. Examine in port, the catches of commercial lobstermen. 2. Examine the catches as they are hauled aboard certain commercial lobster boats. 3. Fish our own pots to catch, in particular, small lobsters not retained by legal pots. 4. Scuba dive in a few selected localities, on a systematic basis, to determine size structure during most of the year. Some type of identification (marking if necessary) will be made to identify lobsters.

The problems associated with an attempt to determine an unbiased estimate of catch per unit of effort are magnified in this populous area. In addition to the sources of bias enumerated by Hancock and Simpson, the disturbance of pots and the theft of lobsters is highly probable in an area having boat traffic. It will be necessary to fish unbuoyed pots (checked by scuba diver) to evaluate this source of bias.

Part 2 of 3.

Connecticut State Government

### 5.0689, STRUCTURAL AND FUNCTIONAL ORGANELLE INTERACTIONS

*G.B. BOUCK*, Yale University, Graduate School, *New Haven, Connecticut* 06520

This research is being conducted to investigate the role of cell organelles in growth and differentiation. Apart from direct electron microscopic observations and autoradiography on differentiating tissues, we believe that by experimentally manipulating tissues in a predictable manner and correlating changes in growth or behavioral patterns with specific subcellular changes, we can gain significant insight into the general problems of morphogenesis. Embryogenesis in certain marine plants seem particularly approachable with these techniques and we are encouraged to believe from our early results that these relatively simple systems can provide fundamental new data on biochemical requirements, organelle ontogeny, and structural interactions during cell differentiation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0690, ECOLOGY OF MARINE ENDOLITHIC ALGAE

*S. GOLUBIC*, Yale University, Graduate School, *New Haven, Connecticut* 06520

The project deals with the microscopic marine algae living within hard calcareous substrate. It primarily concerns the following problems: 1 - Study of differentiation of the thalli into epilithic and endolithic parts and its taxonomic significance. The question is whether the endolithic forms represent ecologically influenced modifications or highly distinct specialized taxa. 2 - The endolithic environment is colonized by two ecologically different groups of algae: those actively boring the carbonate substrate and

those living in the already existing cavities. The study is aimed towards a recognition of the relationship between: a) the boring patterns and the organisms causing them and, b) the boring patterns and the mineralogical properties of the substrate. The results are expected to enable a characterization of the ecological role of different types of endoliths as well as to provide a basis for the interpretation of the boring patterns in fossil record. 3 - Algal boring activity and the lithification process frequently occur together. The question is whether the colonization of endolithic algae influences the lithification process or occurs after lithification is already accomplished.

### 5.0691, BIOTA OF THE RED SEA AND EASTERN MEDITERRANEAN

*W. ARON*, Smithsonian Institution, *Washington, District of Columbia* 20560

POWELL

It is proposed that a study of organisms of the Red Sea and Eastern Mediterranean with special reference to the movement of biotic species through the Suez Canal be continued. Surveys of existing organisms and studies in relation to their point of origin are being undertaken jointly by the Smithsonian Institution and the Hebrew University of Jerusalem. Both of the listed organizations incorporate, coordinate, and include research activities of other scientists in other agencies and organizations as necessary to accomplish the research.

SUPPORTED BY Smithsonian Institution

### 5.0692, CORAL ATOLL FLORA

*F.R. FOSBERG*, Smithsonian Institution, *Washington, District of Columbia* 20560

Descriptive flora of coral atolls, generally, with correct names, pertinent synonyms, descriptions, native names, if available; statements of distribution and occurrence, citation of specimens.

SUPPORTED BY Smithsonian Institution

### 5.0693, STUDIES WITH TROPICAL AND SUBTROPICAL MICROALGAE

*J.S. BUNT*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124 (AT-(40-1)-3795)

The argument is presented that an extensive and ecologically significant benthic flora of microalgae may exist over much of the shallow continental shelf of southern Florida and the Bahama Banks. It is intended to test this proposition, to build a culture collection of microalgae and other micro-organisms from the benthos and to study their physiology and general biology. There is a particular need to examine uptake of organic substrates both in the light and in the dark as well as the biological interactions between the algae themselves and the algae and other constituents of the microflora and microfauna of the benthos. Such an approach is prerequisite for meaningful assessments of primary production occurring at the surface of the continental shelf sediments. The program, further, should serve in some measure to enlarge our limited understanding of processes of primary production in tropical and subtropical waters and should be intrinsically relevant in the field of microbiology.

A survey cruise will be conducted during 1968 to collect core and other samples in transects across the Continental shelf of Florida and over into the Bahama Banks. These materials will be used to determine the types, abundance and distribution of microalgae especially in the superficial layers of shallow sediments. Cultures will also be set up for detailed lab study.

The collection of algae will be screened to identify species with heterotrophic characteristics and those which demonstrate a capacity to influence the growth rate and physiological activities of other species. Where this seems fruitful, attempts will be made to incorporate any bacteria and protozoa which lend themselves to isolation. Concurrently, studies will be initiated on the utilization of carbon-14 labelled organic substrates, wherever possible employing growth studies as well to serve as a guide and a check on short-term rate measurements.

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0694, DISTRIBUTION OF ANTARCTIC MARINE FUNGI J.W. FELL, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

A renewal of GA-672 to continue the study on the systematics and ecology of Antarctic marine yeasts, phycomycetes on filamentous fungi aboard the Eltanin. The distribution of marine fungi will be made by sampling various water masses from the Subtropical Convergence to the Antarctic continent. Microbiological stations will be taken every 2-3 degrees over cruise transects, and every 1-2 degrees at the Antarctic and Subtropical Convergences from the surface to bottom waters at standard hydrographic depths with biological samplers (Niskin). Fungal cultures will be prepared aboard ship and returned to the University laboratory for physiological characterization of marine yeasts and taxonomic study of asporogenous yeast and other fungal materials.

Eltanin participation is planned in 1 to 2 cruises; Cruises 34-37 will involve two shipboard persons. Coordination with the Lamont Geological Observatory hydrographic program is essential since there are no provisions for hydrographers.

SUPPORTED BY U.S. National Science Foundation

### 5.0695, ECOLOGICAL STUDIES OF THE SOUTHEASTERN FLORIDA SEA GRASS COMMUNITY - PRIMARY PRODUCTION BY THALASSIA TESTUDINUM KONIG L.J. GREENFIELD, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The objective of this study is to obtain estimates of both the normal and potential maximum contribution of the turtle grass, *Thalassia testudinum*, to the shallow coastal sea grass community in terms of oxygen and fixed carbon yields. To this end the rates of photosynthesis and respiration under normal conditions of field illumination intensities through the seasons and rates of photosynthesis and respiration at saturation and half-saturation illumination intensities will be determined. Comparisons of the relative contribution of plants having epiphytes with plants cleaned of epiphytes will be made. A study of plant growth under field and semi-controlled conditions may reveal some possible morphological and physiological changes in developing plants. An additional aim is to determine the sites of uptake, pathways and rates of translocation, and sites of accumulation of certain required inorganic nutrients and raw materials. It is hoped that the data obtained from this study, combined with the findings of our previous studies, will permit construction of a model of the dynamics of community interrelationships in the food network of the sea grass communities of tropical shallow coastal waters.

SUPPORTED BY U.S. National Science Foundation

### 5.0696, CONTINUED STUDIES OF THE SYSTEMATICS AND ZOOGEOGRAPHY OF WESTERN ATLANTIC CAECIDAE

D.R. MOORE, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The Caecidae are minute marine gastropods. The distribution of the family is circumtropical, but some species are found in cool temperate waters. Approximately 100 species have been described for the Western Atlantic region, but most of the names are synonyms.

It is proposed to monograph the Western Atlantic species. The biology of the living animal and the anatomy of the soft parts will be studied in addition to the study of the morphology of the shell. The generic classification of the family will be reviewed, and relationships with similar gastropods in other families will be considered. The vertical and geographical distribution of each species will also be plotted during the study.

SUPPORTED BY U.S. National Science Foundation

### 5.0697, COLLECTION AND EXTRACTION OF MARINE INVERTEBRATES AND PLANTS

UNKNOWN, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (PH-43-67-1179)

Independently and not as an agent of the Government, the Contractor will exert its best efforts to: 1. Collect and identify various species of marine invertebrates and plants. 2. Extract and lyophilize in 4-gram quantities approximately 100 samples as directed by the Project Officer. 3. Samples prepared will be stored and shipped as required by the Project Officer. 4. Perform large recollections of materials demonstrating activity in the Government's screening program. 5. Prepare and submit interim progress reports and a final comprehensive summary report acceptable to the Project Officer in format, quantity, and frequency.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0698, THE MARINE ALGAE OF VIRGINIA

H.J. HUMM, Univ. of South Florida, Marine Science Institute, Tampa, Florida 33701

Since 1942 the principal investigator has been making, opportunistically, collections of the marine algae of Virginia at various seasons of the year along virtually the entire coastline and Chesapeake Bay where salinity normally exceeds 15 o/oo. He has also received and worked over collections made by others. The work is now in completed manuscript form, includes records of about 130 species of benthic algae, keys, descriptions, and a general discussion of the coastal waters of Virginia. Illustrations are yet to be completed. The publication is intended as a guide to the identification of the benthic algae of Virginia as well as a species record and ecological study.

Most of the work has been done at the Virginia Institute of Marine Science, Gloucester Point, Virginia, and has been partially supported by that institution.

SUPPORTED BY University of South Florida  
Virginia Institute of Marine Science

### 5.0699, BIOLOGICAL ACTIVITIES OF MARINE FUNGI

M.S. FULLER, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The fungi are common in the oceans as saprophytes, parasites of algae, and invertebrate animals. This research has as its primary objective the acquiring of more precise information on the role of fungi in marine ecology. A group of little known coccoid organisms is to be examined morphologically, physiologically, and biochemically to determine both their evolutionary relationships and potential role in the marine environment. One such organism which may cause the gaping disease of oysters is being examined in greater detail. Two parasites each of marine algae and invertebrates are being subjected to detailed study to elucidate the (1) mechanism of host entry, (2) development of the parasites, and (3) the environmental and internal control of entry and development of the parasites.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0700, EFFECT OF EURASIAN WATERMILFOIL CONTROL PROCEDURES ON WILDLIFE AND OTHER ORGANISMS IN AQUATIC ENVIRONMENTS

J.H. STEENIS, U.S. Dept. of Interior, Patuxent Wlfe. Res. Ctr., Laurel, Maryland

Evaluations on control of Eurasian watermilfoil with 2,4-D and diquat reveal that native species of plants are not adversely affected in tidal waters. In fact, these treatments have resulted in released growth of native species, including the more desirable duck food plants.

To date investigations of the Chesapeake Biological Laboratory and Virginia Institute of Marine Science reveal no direct adverse effects on commercial shellfish, crabs and fish, or other associated marine life from recommended treatments on Eurasian watermilfoil with 2,4-D or diquat. However, these toxicological studies are not complete.

Guide lines on residue studies of commercial fish conducted by the Chesapeake Biological Laboratory are incomplete.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0701, SYSTEMATICS AND ECOLOGY OF SUBTIDAL BENTHIC MARINE ALGAE

R.T. WILCE, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

There is a paucity of information on the subtidal attached algal vegetation from the Woods Hole area. Studies of seasonal succession, vegetative and reproductive periodicity of members of these communities are unknown. It is also true that we have only a general knowledge of which taxa constitute this flora. Previous studies of the sublittoral benthic algal vegetation have all been based on sporadic dredgings made essentially during the warm months of the year. It is proposed to study the attached algae of four ecologically contrasting habitats in the Woods Hole area during a three year period, a program initiated in preliminary fashion by the Principal Investigator in 1966. Subtidal algal ecology will be studied in situ, described on tape and the algal communities photographed. Regular monthly and bimonthly sampling will be made at the four stations through the facility of SCUBA diving; this routine sampling will be made and data collected over a long period will provide much new information concerning these plants. This research will culminate in a systematic and ecological treatment of the subtidal flora of the area and include line drawings and photographs, keys to the species and a thorough discussion of species distribution and bibliographic citations.

SUPPORTED BY U.S. National Science Foundation

### 5.0702, ENVIRONMENTAL EFFECTS ON THE METABOLISM OF MARINE ALGAE

J.A. HELLEBUST, Harvard University, Graduate School, Cambridge, Massachusetts 02138

The mechanism and specificity of uptake of organic substrates by marine phytoplankton algae, and the influence of exogenous substrates on their metabolism. The effects of exogenous substrates on the induction of transport systems or enzymes for substrate assimilation. Light and dark effects on transport systems. Light effects on pathways of amino acid synthesis.

The effect of light quality and intensity on the metabolism and excretion of glycolic acid, and the possible role of glycolic acid in the 'light' respiration of marine phytoplankton. Effects of salinity on release of organic substrates by algae, and direct measurements of permeability constants for loss of specific algal metabolites.

The effects of light intensity on the composition and rate of synthesis of alginic acid in *Laminaria digitata*.

SUPPORTED BY U.S. National Science Foundation

### 5.0703, LIGHT REQUIREMENTS FOR MARINE ALGAE

G.C. MCLEOD, Tyco Laboratories Incorporated, Waltham, Massachusetts (N00014-67-C-0326)

In contrast to the large amount of existing knowledge concerning the photosynthetic mechanisms of higher plants and green algae which contain chlorophyll a and b, little is known of photosynthesis occurring in marine algae which contain the accessory pigments chlorophyll c and either fucoxanthin or phycobilines. The proposed study will ascertain the spectral requirements of selected marine algae and determine the action spectra of the photosynthetic pigments. This information will aid in the design of a detector with responses equivalent to that of the phytoplankton. Information on existing algal indicator species capable of bacteria-free culture will be compiled and the spectral requirements of these species for growth and pigment synthesis will be studied.

To provide the insight concerning aquatic biological phenomena needed by formulators of Naval operational planning, a vast accumulation of definitive background data is essential. The study of biological population dynamics, for example, with limits and interrelationships defined, could lead to the explanation of many phenomena of potential trouble to the Navy, such as plankton blooms, bioluminescence and biological acoustic interference. Research of the type proposed in this study program should serve to eliminate the crucial gaps in our knowledge of factors affecting planktonic marine organisms.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0704, REVISION OF THE CLASSIFICATION AND PHYLOGENY OF THE SUBORDER BALANOMORPHA (CIRRIPEdia - THORACICA)

V.A. ZULLO, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

It is proposed to undertake a revision of the supraspecific classification and phylogeny of the Suborder Balanomorpha (Cirripeedia: Thoracica), or sessile barnacles. This goal will be approached in two ways: 1) through a re-evaluation of previous systematic literature and the examination of the collections upon which these earlier studies were based; and 2) through additional field collection and examination of unstudied collections in various museums. The results of this study will provide a more useful, more flexible, and up-to-date replacement for a classification which has not been examined critically in the last fifty years.

In addition to the revised classification, an annotated and illustrated catalog of the known species of Balanomorpha will be compiled, together with biogeographic data and aids for the non-specialists, including illustrated keys, glossary, and bibliography.

SUPPORTED BY U.S. National Science Foundation

### 5.0705, SEASONAL VARIATIONS OF ALGAL POPULATIONS

R. OGAWA, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The purpose of this project is to correlate seasonal variations in algal populations in the field with laboratory studies of their nutrient requirements.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0706, NUTRIENT REQUIREMENTS OF ALGAE

R. OGAWA, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The purpose of this project is to gain insight on the effect of increased levels of nitrates and phosphates on unialgal cultures. Present investigations are primarily concerned with blue-green algae.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0707, TAXONOMY AND ECOLOGY OF NEARSHORE MARINE OSTRACODA

F.M. SWAIN, Univ. of Minnesota, Graduate School, Minneapolis, Minnesota 55455

Many efforts have been made to determine environmental conditions of early geologic periods through study of fossil remains in sedimentary materials. Because certain living organisms are identical or closely related to fossil forms, it is possible to use knowledge of existing marine environmental conditions to speculate with some assurance regarding the conditions under which earlier organisms lived. Although recent observations suggest ostracodes to be suitable organisms for such studies, their value in paleoenvironmental work is hampered by incomplete knowledge of living coastal species and of their ecological associations and other biodynamic features.

The marine and freshwater ostracodes of the west coast of North and South America from Alaska to Nicaragua have been the subject of intensive investigation. Collections of recent marine Ostracoda from Corinto Bay and Bahia San Juan de Sur, Nicaragua, Bay of Panama, and Cape San Lucas and Straits of Juan de Fuca are to be analyzed for distribution of species and development of biofacies, and correlated with environmental data. The establishment of nearshore ostracode biofacies should provide a basis for the recognition of similar biofacies in the geologic past. It is further proposed to complete a study of a large collection on hand of the late tertiary freshwater beds of the Great Basin, to work out the environmental assemblages and to set up paleontological zones based on the Ostracoda. In order to make adequate comparisons, examination is to be made of museum collections of type species of freshwater ostracodes in London, Newcastle, and Leningrad. The investigation should shed some light on the evolutionary development of certain stocks of Ostracoda.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0708, INDUCTION AND CONTROL OF DIFFERENTIATION IN ALGAE

H.W. NICHOLS, Washington University, Graduate School, Saint Louis, Missouri 63130

Basic biological properties of multicellular photosynthetic algae, in particular *Compsopogon coeruleus*, *Erythrocladia subintegra*, *Hildenbrandia rivularis* and *Polysiphonia urceolata* are under investigation. Of major importance will be the elucidation of some aspects of the nutrition and general physiology of the experimental organisms. Secondly, the influence of photoperiod and temperature on the initiation of developmental phases will be examined. Periodic changes in light, coupled with fluctuations in temperature, appear to be directly related to the development of the experimental organisms. Such studies may also reveal some of the controlling mechanisms which govern natural changes in cellular morphology and organization.

SUPPORTED BY U.S. National Science Foundation

### 5.0709, CHEMISTRY OF ALGAL TOXINS

M. IKAWA, Univ. of New Hampshire, School of Agriculture, Durham, New Hampshire 03824

A project is being undertaken to (a) study the occurrence of toxin-producing algae in local lake, estuarine and marine waters and (b) isolate and characterize toxic substances produced by algae. Toxicity is being determined through assays involving *Bacillus megaterium* spores, *Chlorella pyrenoidosa*, and mice. Initial studies are involved with the isolation of toxic substances produced by the blue-green alga *Aphanazomenon flos-aguae*, which blooms profusely in certain of the lakes in New Hampshire and which is implicated in recent incidents of fish kills, and by the dinoflagellate *Gymnodinium breve*, which occurs in blooms in the Gulf of Mexico.

The project was started in fiscal year 1968-69. There is no anticipated completion date for the project.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0710, ECOLOGICAL STUDIES OF THE MARINE RED ALGA *CHONDRUS CRISPUS* STACKHOUSE

A.C. MATHIESON, Univ. of New Hampshire, School of Agriculture, Durham, New Hampshire 03824

The ecology of the red marine alga, *Chondrus crispus* (Irish moss), will be investigated for the purpose of developing information which can be of use in expanding the amount of this valuable resource in American waters. This alga is one of the principal sources of the phycocolloid, carrageenan, which is widely used as an ingredient stabilizer in many food and pharmaceutical products. Regular observations and measurements will be made at each of four stations in the intertidal and subtidal zones, and the growth and reproduction of in situ plants of *Chondrus crispus* will be correlated with several environmental factors (temperature, light, salinity, nutrients, tides, substrate currents, precipitation, biological interrelationships, etc). Some of the measurements will involve the use of SCUBA techniques. Also, the growth of cultured germlings, and the photosynthesis and respiration of macroscopic plants will be determined in the laboratory. Other field studies will yield information on succession of the alga in denuded areas, potential usefulness of artificial substrates, effects of grazing by animals regeneration and the propagation capacity following harvesting, and transplantation potential of this species.

SUPPORTED BY U.S. National Science Foundation

### 5.0711, PRELIMINARY INVESTIGATION OF GROWTH AND DIFFERENTIATION IN MARINE COENOCYtic ALGA, *CAULERPA PROLIFERA*

J.C. CHEN, Rutgers The State University, Graduate School, New Brunswick, New Jersey 08903

*Caulerpa prolifera* is a marine coenocytic alga, much larger than most coenocytic organisms, that exhibits interesting and strong abilities for differentiation. It is unicellular in nature and able to differentiate three different 'organs,' namely the rhizome, 'leaf,' and rhizoid cluster.

Two questions about growth and rhizome formation in this alga are being asked: (1) How is the conical shape of the rapidly growing rhizoid tip maintained in the face of the isotropic effects of turgor pressure, and (2) What is responsible for the specific changes that occur in certain regions of the rhizome which initiates the differentiation of rhizoid clusters? Comparative measurements are being made of differential rhizome growth at different points of the rhizome. This will provide some measure of growth rates with respect to each region (point marked out by markers and time-lapse photography of growth). Two additional measurements will then be made (xylian content and birefringence of the cell wall) of each region and these will be related to the specific growth rate to give physical-chemical parameter of that unit portion.

SUPPORTED BY U.S. National Science Foundation

### 5.0712, MORPHOGENESIS OF THE DIATOM SHELL

B.E. REIMANN, New Mexico State University, Graduate School, Las Cruces - University Park, New Mexico 88001

Diatoms are unicellular algae characterized by the presence of a silica shell that encases the cytoplasmic contents. At certain periods during the life cycle of a diatom, i.e., after cell division, during cell extension, and during the formation of zygotes, the cells form new shells by assimilating soluble silicic acid from their environment and depositing it, as polymerized opaline silica, within a membrane system formed inside the living cell. This particular cytoplasmic membrane apparently has the sole function of concentrating silica. Studies are underway concerned with the origin, structure, and function of this very specialized membrane.

The following experiments are underway: 1) electron microscopy of dividing cells to trace the morphology of silicious shell deposition; 2) morphogenetic effects of silicic acid deficiency; 3) relationship between sexual cycles and cell types; 4) effects of osmotic and mechanical pressure, pH, on shell morphology; and 5) localization of silica inside the cell before it is deposited.

SUPPORTED BY U.S. National Science Foundation

### 5.0713, SYMBIOSIS IN *CONVOLUTA*

L. PROVASOLI, Haskins Laboratories Inc., New York, New York

The main objective is to elucidate the nutritional relationships between the marine flat worm *Convoluta roscoffensis* and its algal symbionts and how the symbiotic relationships affect the biology of *Convoluta*.

To determine the specificity of the symbiosis, larvae of *Convoluta*, which are born devoid of symbionts, were infected artificially with a variety of algae. The algae selected were the natural symbionts isolated from *Convoluta* worms collected at Jersey Isl., Roscoff and Henday, France, and Pisa, Italy as well as 15 species of free living *Platymonas* and *Prasinocladus*; three strains of *C. roscoffensis* and 1 strain of *C. psammophila* (Pisa) were reinfected. The natural symbiont of the 4 strains and 2 species of *Convoluta* was found to be always *Platymonas convolutae*, Matton at Parke. But 5 *Prasinocladus* species (and so far no other species of *Platymonas*) can establish an artificial symbiosis which is almost as effective as the one with *P. convolutae*. However in competition experiments the natural symbiont wins over the others and can even replace completely the unnatural symbionts after they have established a functional symbiosis. This experimental supremacy of *P. convolutae* over other species of related algae parallels the ubiquity of this species as the natural symbiont in different strains and species of the *convoluta* worm. Studies are in progress to find a physiological explanation of this supremacy.

### 5.0714, SYSTEMATICS, MORPHOLOGY, AND ECOLOGICAL DISTRIBUTION OF ALGO AND WOOD-INHABITING MARINE AND FRESHWATER FUNGI OF SURTSEY AND ICELAND

T.W. JOHNSON, Duke University, Graduate School, Durham, North Carolina 27706 (AT-(40-1)-3556)

Since 1964, the aquatic fungi of Surtsey and Iceland have been under continuing investigation. Prior to 1964 only eleven

## 5. LIVING SYSTEMS (NON-HUMAN)

species had been reported from Iceland. Over two hundred have now been recovered from Iceland (including Surtsey). The purpose of the continuing study is basically ecological distribution, occurrence, and ecological succession of freshwater and marine fungi on the volcanic, submarine upthrust, Surtsey. Developmental morphology and its application to systematics constitute the secondary objective. Collecting-trapping sites have been selected and are being serviced periodically for yield. Standard mycological techniques including baiting of soils and water, and trapping by submerged wood panels are used.

Over two hundred species of aquatic fungi have been recovered. These represent new records, and several are species new to science. Three papers reporting on the occurrence and morphology of some species have been accepted for publication in 1968. Representatives of all classes of aquatic fungi, save for one, have been recovered from Surtsey or adjacent land and water masses.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0715, STUDIES OF THE PHAEOPHYCEAN ORDERS CHORDARIALES AND PUNCTARIALES

R.B. SEARLES, Duke University, Graduate School, Durham, North Carolina 27706

The work proposed will be a study of the brown algae in the orders Chordariales and Punctariales which occur along the mid-Atlantic coast. Many of the members of this complex have incompletely known life histories and have interesting seasonal and geographical distributions along this coast. Life histories, tolerance to environmental conditions, and responses to changes in conditions will be studied in the laboratory using cultures.

SUPPORTED BY U.S. National Science Foundation

### 5.0716, MORPHOLOGY AND TAXONOMY OF MARINE FUNGI

J.J. KOHLMAYER, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

A revision of all higher marine fungi described between 1840 and 1940 is planned. Most of these species were incompletely described and their taxonomic position in the modern system remains uncertain. A second goal of the proposed research is to continue investigations on tropical and subtropical marine fungi, especially composition of the marine mycota in mangrove habitats. In the mangroves, occurrence of terrestrial and marine fungi overlaps, and this study could serve as a basis for future ecological studies on mangrove fungi.

SUPPORTED BY U.S. National Science Foundation

### 5.0717, QUANTITATIVE AND QUALITATIVE MEASUREMENT OF AQUATIC VEGETATION-CURRITUCK SOUND

T.E. CROWELL, State Wildlife Resources Comm., Raleigh, North Carolina

The objective of this job is to determine the amount and distribution of aquatic vegetation in northern Currituck Sound with particular emphasis upon the apparent immediate and long-range effects upon that vegetation resulting from the salinity artificially created in Back Bay by the City of Virginia Beach, Virginia, and draining therefrom into Currituck Sound. Similar effects by sea-water intrusions resulting from natural breaks through the Outer Banks will be determined should such breaks occur.

To accomplish this objective, three samples of aquatic vegetation, each two square feet in area, will be collected with modified oyster tongs at 500-yard intervals across Transect H (Virginia-North Carolina State line), Transect I (Knotts Island to Bench Marsh), and Transect J (Knotts Island to Swan Island). These samples will be collected quarterly (August, November, February, and May).

The percentage volume of each species present in each sample will be determined by an ocular estimate and the total volume of aquatic vegetation in each sample will be obtained by displacement following soil removal. Data also will be compiled to provide: total milliliters displaced by each species on a square-foot basis, and the percent frequency of occurrence of each species.

Comparable sampling and data compilation will be effected in the general area of any breaks that may occur naturally through the Outer Banks and result in a sea-water intrusion of significant magnitude.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
North Carolina State Government

### 5.0718, TAXONOMY OF CALCAREOUS GREEN ALGAE L.H. COLINVAUX, Ohio State University, Graduate School, Columbus, Ohio 43210

The work proposed is a taxonomic study of tropical marine algae, principally of the genus *Halimeda*, in the Indian Ocean. Extensive new collections were made by me as phycologist aboard the *Te Vega* on one of her cruises in the International Indian Ocean Expedition. Many additional collections obtained by other investigators participating in the International Indian Ocean Expedition have been sent for study.

The methods used for morphological study will include those found useful in my previous work on the genus *Halimeda*. Where important, comparisons will be made with related genera. Some cytological studies will be made of the fertile material and pertinent herbarium collections will be examined.

The complete program will provide additional knowledge of the morphology, reproduction, taxonomy and geographical distribution of *Halimeda*.

SUPPORTED BY U.S. National Science Foundation

### 5.0719, EXPERIMENTAL CULTURE OF CALCAREOUS GREEN ALGAE OF CORAL REEFS

L.H. COLINVAUX, Ohio State University, Graduate School, Columbus, Ohio 43210 (N00014-67-C-0262)

The investigator proposes to identify factors and combinations of factors in the environment which influence the form and growth rate of the calcareous alga *Halimeda*. This alga is one of the most important of the tropical reef formers, occurring in massive beds in most parts of the world where coral reefs occur and occurring as a major element in sediments. Because of its wide morphological diversity, its taxonomy has not been satisfactorily established. Dr. Colinvaux will attack this problem by experimental culture methods. This research will clarify the role of this alga as an indicator of modern and ancient reef climates.

Calcareous reefs, besides being a navigational hazard, also pose problems for the cutting of channels, harbor construction, and the location of submarine docks. In shallow water coral and calcareous algae rapidly foul submerged equipment; they modify bottom sediments, causing acoustic reverberation, changing the character of the bottom. This study may lead to reef control or at least to predictability.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0720, BIOSYNTHESIS OF 3-HYDROXYTYRAMINE IN MONOSTROMA FUSCUM

R.D. TOCHER, Portland State College, Graduate School, Portland, Oregon 97207

We are studying the biosynthesis of 3-hydroxytyramine (3-HT) in the marine alga *Monostroma fuscum* (Chlorophyta). 3-HT makes up as much as three per cent of the fresh weight of the alga, or about 20% of the dry weight. This alga is, therefore, the richest plant source of this material. Our working hypothesis is that 3-HT is an end-product of the shikimate pathway, although none of the intermediates have been detected. Currently, we are attempting to characterize DOPA decarboxylase in this alga. Of interest is the relationship of the alga's tyrosinase (specifically, the tyrosine ortho-hydroxylase activity) to DOPA-decarboxylase. Tyrosinase would be expected to further oxidize the newly formed DOPA to DOPA-quinone leading to the production of melanins. Instead, DOPA is decarboxylated and ordinarily does not fall prey to further oxidation by tyrosinase.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0721, GROWTH AND CELLULAR MORPHOGENESIS IN NITELLA

*P.B. GREEN*, Univ. of Pennsylvania, Graduate School, Philadelphia, Pennsylvania 19104

Two projects are under investigation which attempt to capitalize technically on the fact that the young and growing *Nitella* internode is nonetheless a very large cell and thus suitable for physical manipulation. Project No. relation between a single cell's turgor pressure and its relative rate of elongation. Since turgor is believed to be the driving force for growth, its exact relation to the elongation rate is of theoretical interest. This relation has not been worked out for the single growing cell (except in a highly indirect manner) because turgor is traditionally measured by bringing cells into osmotic equilibrium with a known solution. Under these conditions -- no net movement of water -- the cell cannot be growing. The present method utilizes an intra-cellular manometer to measure turgor pressure regardless of whether the cell is in osmotic equilibrium or not. Project No. quantitatively measure the distortions taking place on the expanding curved surfaces of laterals during their initiation in *Nitella*. Laterals can be artificially induced on young internodes and the details of this process are to be compared with those of normal laterals and the apical cell. These surface expansions are the immediate cause of change in cell shape. They must have their physical basis in the local structure and physiology of small regions of the cell. A tentative mechanism for the physics of the generation of a growth axis will be tested in the study of induced lateral initiation.

SUPPORTED BY U.S. National Science Foundation

### 5.0722, ECOLOGY OF TROPICAL DEEP WATER ALGAE

*L.R. ALMODOVAR*, Univ. of Puerto Rico, Institute of Marine Biology, Mayaguez, Puerto Rico (N00014-66-C-0330)

Objectives: Problems of bottom modification and biodeterioration are, in part, related to processes by which algae become attached to undersea substrates. The study of the ecology of algae and their succession on submerged structures will bring knowledge of the occurrence and distribution of these and other sedentary organisms to a predictive level.

Approach: Algae samples are being collected on a year-round basis by SCUBA divers in the 20-50 meter depth range and by dredge in the 50-75 meter range. Light, temperature, depth, and salinity data are being recorded for each sampling, as well as a description of each type of bottom encountered. Additionally, the ecological succession of algae on artificial substrates down to the 75 meter limit of algae growth is being studied. In both investigations, algae specimens are appropriately classified and analyzed with respect to the physical environmental data collected and their seasonal and vertical distributions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0723, MARINE ALGAE OF THE MANGROVE ROOT COMMUNITY

*L.R. ALMODOVAR*, Univ. of Puerto Rico, Graduate School, Mayaguez, Puerto Rico

This grant supports ecological studies of the marine algae of the mangrove root community in Puerto Rico. Constituent organisms will be identified and their physical niche determined; growth rates and fruiting periods of dominant algae will be determined; factors influencing the occurrence and growth of characteristic mangrove species will be studied.

The emphasis will be on experimental ecological work. Apart from identification and determination, animals will be considered only to the extent that they affect the algae (by competing for space upon the roots, by providing surface for algal growth, or in feeding upon or living within the plants). Consideration will be given to the related community of the mud bottom of the mangrove shore and adjacent areas near the mangroves.

SUPPORTED BY U.S. National Science Foundation

### 5.0724, THE EFFECTS OF POLLUTION ON BENTHIC MARINE PLANT COMMUNITIES

*J.T. CONOVER*, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

A concentration on algal community metabolism in coastal waters at depths between 15 and 60 feet as related to 'good' and 'bad' waters is being conducted in the Narragansett Bay, Rhode Island to determine how concentrations of metabolites, and waste products in the bay effect plant growth. A modified McClosky method of plating out and obtaining coliform counts is being used to determine animal-pollution gradients while OZR media is used to obtain counts on the natural populations of marine bacteria as an index to natural-pollution levels. Plastic hemispheres, equipped with temperature, light and oxygen probes are employed to obtain photosynthesis rates under certain conditions at various stations in the bay at various depths and pH and alkalinity data are taken to calculate the respiration rate. From these data a P/R ratio is obtained which has been shown to vary with animal pollution gradient. A search is now being made, for optimal and non-optimal growth enhancement habitats as related to the water quality. Incubator experiments will be continued to more precisely determine the effects of specific pollutants upon algal metabolism and to separate and clarify the role of salinity vs. pollution on plant growth. Studies are being continued on the meaning of epibiosis as an index to environmental stress on host plants along with a screening of epiphyte-host relationships morphologically and physiologically among many of the benthic marine plants species. Some work will also be done on the effect of different 'energy levels' upon community metabolism in coastal waters by comparing habitats in slow moving water with those exposed to rapidly moving tidal currents and turbulence.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0725, ALGAL SUBSTANCES IN THE MARINE FOOL WEB

*J.M. SIEBURTH*, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The brown algae are being studied as a model for the role of attached algae in the microbial stages of the food chain. The rate and nature of the production of extracellular organic matter is being studied. Attempts will be made to characterize the phaeophyte polyphenols which seem to be directly involved in the formation of humic substances. The relationship of dissolved humic substances to particulate material will be investigated.

SUPPORTED BY U.S. National Science Foundation

### 5.0726, DEVELOPMENT OF A METHOD FOR CHRONIC TOXICITY BIOASSAY USING MARINE PLANKTONIC ALGAE

*C.S. HEGRE*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Objectives: To develop a method which will permit exposure of algal populations to constant low levels of test compounds, as well as monitoring of population dynamics or metabolic effects.

Procedures: 1. Normal population dynamics and optimal medium exchange rates will be determined. 2. The utility of the apparatus will be tested by determining minimal requirements for a few known nutrients.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0727, STUDY OF NITROGEN METABOLISM IN MARINE ALGAE

*C.S. HEGRE*, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Objectives: To develop a method based on in vivo enzymatic activity which can be used as a bioassay parameter in determining the biological effects of potential pollutants.

Procedures: 1. An in vivo system for the assay of nitrite reductase activity in marine algae has been established. 2. Environmental factors which influence the expression of nitrite reductase activity will be investigated. 3. Cells preexposed to test compounds will be assayed for nitrite reductase activity. The results of such studies will be compared as indicators of biological effect with those of similar studies in which growth is measured.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0728, MEASUREMENT OF THE RATE OF CARBON DIOXIDE (C14) FIXATION INTO SUBCELLULAR FRACTIONS OF ALGAE

C.S. HEGRE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Objectives: To develop a rapid and sensitive method for detecting the metabolic effects of potential pollutants on cultures of marine algae.

Procedures: 1. Existing procedures for fractionating cells into classes of chemical constituents are being modified to permit processing of many small samples of algae. 2. Optimal labelling conditions and normal incorporation rates will be determined for each fraction. 3. Cultures preexposed to test substances will be allowed to fix Carbon-14 labeled CO<sub>2</sub>. The cells will then be fractionated, and rates of synthesis of each fraction will then be determined from isotope incorporation data. Results will be correlated with those of similar studies using growth rate as the measure of biological effect.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0729, ORGANIC INFLUENCES ON CALCIUM CARBONATE CEMENTATION

R. REZAK, Texas A & M University System, Graduate School, College Station, Texas 77843

An investigation will be carried out on the role marine algae play in investigation of sediments. Initially a number of species will be collected and grown in pure cultures to allow identification of compounds present in their organic matrices. Correlation of these with the geometries and crystallographic form of the secretions will be sought.

SUPPORTED BY U.S. National Science Foundation

### 5.0730, SYMBIOSIS BETWEEN MARINE ALGAE AND INVERTEBRATES

D.L. TAYLOR, Marine Biolog. Assn. of U.K., Plymouth - Citadel Hill, United Kingdom

The present work is a study of the physiology, biochemistry and ultrastructure of the symbiotic associations formed between marine algae and invertebrates. The specific purpose of the investigation is twofold, and consists of (1) a study of the taxonomy, distribution and ultrastructure of the organisms involved, and (2) an examination of how these associations are formed and a determination of their significance and potential value to the bioeconomy of the sea.

Previous work has shown that such associations may be divided into two distinct categories, (1) the zooxanthellae-invertebrate association of classical literature, which poses numerous problems of taxonomy, distribution, and significance which are still relatively unknown, and (2) the more recent discovery of chloroplasts functioning as symbiotic organelles in the digestive glands of several species of Opisthobranchs belonging to the Order Saccoglossa. Both of these aspects are being investigated along similar lines, exploring new techniques of utilizing the electron microscope as an instrument of cytological and functional investigation by employing various methods of ultrastructural cytochemistry and autoradiography.

The results of the projected study should provide valuable information relating to the taxonomy and distribution of the species of microalgae involved in zooxanthellae-invertebrate associations, as well as reveal something of the nature and significance of these associations along with others involving chloroplasts as symbiotic organelles.

SUPPORTED BY U.S. National Science Foundation

### 5.0731, LACUSTRINE AND ESTUARINE FUNGI

R.A. PATERSON, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

The proposed research is a continuation of an investigation of lacustrine fungi presently supported by National Science Foundation (GB-2703). It is planned to continue studies on estuarine fungi initiated in September, 1963. Research on these organisms from both fresh and salt waters has two phases. The first is a tax-

onomic and morphological investigation of fungi which infest plankton. In addition it involves a study of host ranges, host-parasite relationships, and their significance to the taxonomy of the lower fungi. Current studies indicate that research on host ranges will be profitable in clarification of some chytridiaceous taxa. Another aspect of the work on planktonic fungi will be an investigation of the vertical and horizontal distribution of fungal parasites of phytoplankton.

The second part of this program is a study of the occurrence of benthic fungi. The investigator believes these fungi to be more important in the breakdown of dead organic matter in lake and estuarine bottoms than is presently recognized by most limnologists and marine biologists. Some studies of benthic fungi have been made in marine waters, but very few investigations have been conducted in fresh water with the specific purpose of finding benthic fungi. Previous investigation of bottom decomposers have dealt primarily with bacteria, or have employed only bacteriological techniques in studying fungi.

SUPPORTED BY U.S. National Science Foundation

### 5.0732, ALGAE AS FOOD FOR MARINE INVERTEBRATE LARVAE HELD IN THE LABORATORY

J.L. DUPUY, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

Micro algae, especially phytoflagellates, will be isolated from Chesapeake Bay waters, screened for their ability to serve as food for invertebrate larvae held under laboratory conditions. Suitable isolates will be mass cultured and supplied to various user groups as larval food.

SUPPORTED BY Virginia State Government

### 5.0733, MARINE INVERTEBRATE EXPLORATIONS

D.L. ALVERSON, U.S. Dept. of Interior, Exptl. Fish & Gear Res. Base, Seattle, Washington 98102

Shellfish explorations are primarily concerned with benthic invertebrate populations. Its ultimate objectives are to define, on a seasonal basis, the quantitative and qualitative distribution of aquatic invertebrate resources having a potential for commercial utilization and to provide an appraisal of those resources. In its full extent, shellfish explorations is a cataloging of benthic invertebrate fauna in time and space.

The area stressed in the Northeastern Pacific and primarily from northern California to southwestern Alaska. The explorations are carried out by the Seattle, Washington based research vessel John N. Cobb.

Shrimp explorations have been conducted in Alaskan waters and off the coasts of Washington and Oregon. Commercial concentrations of shrimp were discovered and the catch ratios were increased by introduction of new gear.

Scallop explorations, initiated in 1963, will be conducted for the next two years. Future explorations include clams, crabs, and reassessment of all commercial invertebrate areas. Biological observations will also be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0734, MORPHOGENESIS OF THE DIATOM SHELL

J. LEWIN, Univ. of Washington, Graduate School, Seattle, Washington 98122

Diatoms form new silica shells during vegetative cell division and also at other periods during their life cycle. The formation of new silica shells takes place inside the cell. While the silica shell is growing, it is tightly enveloped by a specialized membrane (the siliclemma), which apparently has the sole function of concentrating and solidifying the silica. The origin, structure and function of this very specialized membrane, as well as its relation to adjacent cell contents, will be investigated using cells of several different diatom species in various developmental stages. The research project consists of two closely associated parts, one mainly concerned with the cultural and physiological aspects of the investigation and the other with morphological aspects.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0735, PHYSIOLOGY AND ECOLOGY OF MARINE DIATOMS

J.C. LEWIN, Univ. of Washington, Graduate School, Seattle, Washington 98122

Studies on the physiology, nutrition, and systematics of marine diatoms in relation to their ecology will be investigated. In particular, species belonging to the important marine genus *Chaetoceros* will be studied in cultures to clarify their systematics and their nutrient requirements and thus help to explain their natural occurrences. Special attention will also be given to the specific diatom microflora living on the surfaces of sand grains. The most important species will be identified and cultured, and will also be studied in their natural habitat.

Physiological studies which have a direct bearing on measurements of marine primary productivity will be made. These will involve critical investigations of respiration in marine diatoms and other phytoplankton organisms.

SUPPORTED BY U.S. National Science Foundation

### 5.0736, ASSESSMENT OF LAKE SUPERIOR LAKE TROUT

R.L. PYCHA, U.S. Dept. of Interior, Research Station, Ashland, Wisconsin

Control of the sea lamprey and large-scale plantings of lake trout in Lake Superior have brought about a rapid buildup of lake trout stocks. Close surveillance of the changes in the juvenile, legal sized, and spawning stocks is required for rational utilization in the future. Data currently utilized are collected by contract fishermen using conventional commercial gear and by the Bureau's research vessel *Siscowet* using experimental gill nets and trawls.

Present research, designed to assess the rehabilitation of the lake trout, includes inquiry into: changes in abundance of the size groups of the commercial portion of the artificially propagated lake trout to the commercial catch and the relative success of various hatchery plants; changes in age structure and growth rates of the populations; comprehensive evaluation of the effect of hatchery-reared fish on the juvenile and spawning populations; differences in the habits and distribution between hatchery-reared and native lake trout; the identities and biological features of discrete offshore populations; and the relationship between lamprey predation and the size of the lamprey population. Data on food habits and other features of the life history are collected incidentally to other studies.

Techniques and findings of research on lake trout in Lake Superior should aid similar studies on Lakes Michigan and Huron.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5G. MICROORGANISMS—PLANKTON

(see also Chapter 8j For Marine Fouling and Microbial Corrosion)

### 5.0737, MARINE BIOLOGICAL INVESTIGATIONS - SURFACE ZOOPLANKTON PROJECT

J.C. QUAIST, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

A two-year sampling period using Miller High Speed Samplers is completed, the samples have been analyzed, and a summary manuscript is in the terminal stages of completion. The project summarizes the identity and density distribution of common zooplankters in the upper water strata in the Auke Bay vicinity over the sampling period. The bay is regarded as representative of the northeastern part of the 'inside' marine waters of Southeastern Alaska.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0738, DEEP-WATER ZOOPLANKTON OF THE SARGASSO SEA

A.L. BROOKS, Bermuda Biolog. Sta. For Res., Saint George, Bermuda

The investigators are collecting, at monthly intervals for one year, four samples over 500 meter depth ranges down to 2000 meters at Station 'S', 15 miles SE of Bermuda in 1600 fathoms of

water. The zooplankton samples are being studied qualitatively and quantitatively. Hydrographic observations and chlorophyll a determinations are being done at the same time. The objective is to gain a better understanding of the plankton of deep water, how it changes through the year at a single station, both in species composition and in mass.

SUPPORTED BY U.S. National Science Foundation

### 5.0739, ZOOPLANKTON STUDIES IN BIG LAGOON, CALIFORNIA

G. CRANDELL, Humboldt State College, Graduate School, Arcata, California 95521

1) Temporal distribution based on biweekly samples taken with a Clarke-Bumpus plankton sampler.

2) Vertical distribution of zooplankton and vertical diurnal migration. Samples collected with a Clarke-Bumpus plankton sampler and water bottles.

Salinity, temperature and oxygen data taken concurrently with all plankton samples.

SUPPORTED BY No Formal Support Reported

### 5.0740, MICROBIOLOGICAL CONTROL IN NAVY AND MARINE CORPS OPERATING ENVIRONMENTS

N.A. VEDROS, Univ. of California, School of Public Health, Berkeley, California 94720

This research is concerned with microbiology as it applies to the Navy operating environment. Studies under this program will help establish which organisms are responsible for fouling and corrosion, or any other form of microbiological deterioration. Other studies will be concerned with performance of man and his equipment in the terrestrial environment. Research involving the effects of hypo- and hyperbaric conditions on the human microbial flora, in both static and aerosolized state will be undertaken.

This effort is directly related to Navy problems in biodeterioration. It is closely associated with the study of problems encountered in closed environmental systems such as found in deep sea habitats.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0741, SYSTEMATIC STUDIES OF CERTAIN MARINE PARASITIC WORMS

W.E. MARTIN, Univ. of Southern California, Graduate School, Los Angeles, California 90007

This investigation has three quite separate aims within the broad field of marine helminth parasitology. First, life histories of species of the taxonomically enigmatic trematode genus *Renicola* will be studied, and the results should provide a firm base for identifying species within this group.

The second aim concerns a nematode that is a spiruroid but with the habitat of filarioid. Spiruroids are obtained by ingesting infective stages in intermediate hosts, perhaps always arthropods, whereas filarioids are transmitted by the blood sucking activities of such hosts. Spiruroids localize in the vertebrate in places affording an exit for their eggs but the species in question seems to be an exception. The two groups form one order and helminthologists believe that the filarioids evolved from spiruroids in a manner paralleling that which apparently occurred in sporozoan and haemoflagellate protozoans. Hence the life history of the species in question would be of particular interest.

Thirdly, a new acanthocephalan worm from a marine fish will be studied from various approaches. Little is known concerning the life history of these thorny-headed worms.

### 5.0742, CHONOTRICH CILIATE PROTOZOANS

J.L. MOHR, Univ. of Southern California, Graduate School, Los Angeles, California 90007

Chonotrich ciliates, attached vasselike protozoans confined to crustaceans and apparently reflecting in their own evolution something of the evolution of the crustacean hosts, are under monographic study with emphasis on geographic and host dis-

tribution, taxonomic relationships, age of group, cytology and ultrastructure through the life cycle, and morphological adjustments to being whipped back and forward through water. Most intense current study is on *Loxochonas*, on the gribbles (*Limnoria* spp. boring through wood submerged in sea water or through brown algae), on the complex of genera on Leptostracans (*Nebalia* and related genera), and on the stylochonid genus on whale-lice (Amphipoda: Cyamidea), but materials of all three families (*Stylcoboridae*, *Spirochonidae*, *Chilodochonidae*) of the order are under study. The group is presumably cosmopolitan (although materials from Asia are sparse) and may be of Paleozoic origin.

SUPPORTED BY U.S. National Science Foundation

#### 5.0743, DRIFT-STATION BIOLOGY

J.L. MOHR, Univ. of Southern California, Graduate School, Los Angeles, California 90007 (NONR)

Qualitative and quantitative studies of biological populations are conducted in deep waters of the Arctic Ocean, over the Continental Shelf and in shallow coastal waters of Northern Alaska. Emphasis is placed upon taxonomy and ecology of pelagic and benthonic plankton as well as on unique aggregations of organisms occurring directly beneath drifting ice. Also investigated are distribution patterns, morphological and physiological adaptations to arctic environments, energy transfer in the food chain and parasitism of animals, including whales.

These studies contribute to knowledge of the total environment of Arctic seas; aid in identification and mapping of layered water masses of differing acoustic properties; establish the role of organisms in marine fouling; define adaptation to rigorous environment; and yield basic information on the total economy of Arctic seas.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 5.0744, DRAG-REDUCING ALGAE

J.W. HOYT, U.S. Navy, Undersea Warfare Center, Pasadena, California 91107

This investigator is studying exudates of algae and bacteria as they affect the measurement in towing tanks and at sea. Effort is also underway to determine the polysaccharide chemistry of a typical friction reducing species, and to explore the relationship of algal activity in the ocean.

Determination of the causative factors in the ability of microorganisms or their products to reduce drag could lead to the synthesis of compounds which, when used as coatings on ship hulls could materially enhance their speed.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### 5.0745, DISTRIBUTION AND BIOLOGY OF PACIFIC ZOOPLANKTON

E. BRINTON, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The grant supports the continuation of a large scale study with several objectives. This first objective is an intensive sampling of the Pacific Ocean in order to determine what species occur there. Results thus far indicate that there are fewer species in the oceanic region than in the terrestrial environment which may be accounted for by the fact that fewer niches are available in the ocean, and that genetic variability, spatial barrier formation or selection pressures differ quantitatively from those under terrestrial conditions. Secondly, collection of data distribution of these organisms will continue. The relationship of the shape of certain patterns of defined ranges to the shape of certain water masses will be examined. In addition, attempts will be made to obtain information on interspecies interactions, and interactions between a species and the physico-chemical characteristics of its environment in order to shed further light on the shape and size of species patterns and on the factors responsible for the maintenance of them. Finally, the information on taxonomy and distribution of zooplankton will be used to define the community structure of these organisms in the sea. With the accumulation of more data on interrelationships among the vertical ranges of spe-

## 5. LIVING SYSTEMS (NON-HUMAN)

cies, it is hoped to learn more about the co-occurrence among species within taxa and between taxa.

SUPPORTED BY U.S. National Science Foundation

#### 5.0746, ECOLOGY AND SEDIMENTARY PATTERNS OF FORAMINIFERA

F.B. PHLEGER, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This involves the quantitative measurement of features of marine environments which affect distributions of organisms. This should be supplemented by ecological laboratory experiments based on the results. Study of marine marshes is another area for investigation. Some data are presented to show the importance of measuring population variability as an index of the relative variation within natural environments. Other areas of investigation are productivity of benthonic foraminifera, re-investigation of depth assemblages, effect of low oxygen content on populations, depth of mixing of sediments, and concentration of trace elements in tests of foraminifera and its effect on the geochemistry of the sediments.

SUPPORTED BY U.S. National Science Foundation

#### 5.0747, ECOLOGY OF MARSH FORAMINIFERA

F.B. PHLEGER, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Study of the patterns of foraminifera in marine marshes in several areas of the world has been undertaken. The patterns are interpreted in terms of relative rates of deposition of sediment, of organic productivity and of the dynamics of the lagoon or delta area in which the marsh is present.

SUPPORTED BY Amer. Chemical Society

#### 5.0748, MICROZOOPLANKTERS IN THE MARINE FOOD CHAIN

J.D. STRICKLAND, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Using a submersible sea water pumping system with deckmounted plankton collecting unit, research under this grant includes: 1) an investigation of the vertical distribution of microzooplankton and their relationship to other seston components over the upper 200 m in several different marine environments; 2) a direct comparison of the relative abundance of microzooplankton and larger zooplankters; 3) a study of weekly changes over a five-month period in microzooplankton populations in relation to other biological parameters at three inshore locations; and 4) participation in EASTROPAC 76 (Eastern Tropical Pacific Biological Program) cruise during which the vertical distribution of microzooplankton at 12 sites in that little-studied ocean region was examined.

Efforts are being made to establish laboratory cultures of microzooplankters such as the tintinnid ciliates believed to be important in marine food chains so as to provide experimental animals for trophodynamic studies.

This work is a tripartite investigation using the facilities of the SUPPORTED BY U.S. National Science Foundation

#### 5.0749, STANDING STOCK AND GROWTH OF BACTERIA IN THE SEA

J.D. STRICKLAND, Univ. of California, Inst. of Marine Resources, San Diego - La Jolla, California 92038

Studies of the ATP assay have continued during the past year with investigations being made into the ATP content of several phytoplankton organisms as well as several species of marine bacteria. In addition, ATP profiles were obtained on two cruises.

The existence of a large population of small, pigmented, flagellated organisms at great depths in the ocean has been confirmed. Some of these forms are presently in culture as are some unpigmented protozoans from the same samples. Also phytoplankton cells, typical of the euphotic zone, have been cultured from samples obtained from down to 900 meters. Work is in progress to attempt to ascertain how such cells can survive under prolonged deep sea conditions.

## 5. LIVING SYSTEMS (NON-HUMAN)

A detailed analysis was made of the glucose metabolism of a marine *Pseudomonas* sp. It is concluded that if one wishes to extend the 'relative heterotrophic potential' method to include such parameters as in situ velocity of substrate utilization and residence time of natural levels of substrate, the velocity of assimilation should not be used. It was found that the amount of C-14 labeled CO<sub>2</sub> produced from C-1 and C-3,4 labelled glucose is a better estimate of substrate metabolized. It is believed that the 'relative heterotrophic potential' method should not be extended to include these parameters but should be applied as originally suggested, as a rough survey of heterotrophic activities in the sea.

### 5.0750, BIOCHEMICAL STUDIES ON SILICEOUS SKELETAL FORMATION

*B.E. VOLCANI*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Electron microscopic studies on the morphogenesis of the wall of *N. pelliculosa* suggested that the Golgi apparatus give rise to a procession of vesicles which integrate as a compartmented structure in which silicon is concurrently deposited. The role of the Golgi in wall formation will be intensively investigated by histochemical and radioautographic techniques.

Biochemical studies on the formation of the organic material in the wall of *N. pelliculosa* showed that proteinaceous and polysaccharide materials are formed just prior to and during silicon uptake. Additional polysaccharides are formed after silicon uptake has ceased. The sequence according to which each of the polysaccharides is synthesized will be determined.

A system of sequential column chromatography was developed which enabled us to separate the many unknown ninhydrin-positive compounds found in the diatom wall. A number of pure compounds have thus been obtained, and their chemical characterization will be established.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0751, COMPARATIVE PHYSIOLOGY OF BAROPHILIC BACTERIA

*C.E. ZOBELL*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

This proposal provides for investigating the cultural requirements and comparative physiology of barophilic bacteria, meaning those which grow at deep-sea pressures. Such bacteria are to be compared with barophobic varieties, which are adversely affected by increased pressures. Efforts will be made to obtain more species of barophilic bacteria. The most likely source of such bacteria is the deep sea, where pressures up to nearly 1100 atm prevail, but garden soil, shallow-water sediments, and other materials will also be examined for the presence of barophiles. The nutrient requirements, osmotic pressure tolerance, temperature range of growth, and other cultural conditions will be considered in comparing barophilic with barophobic cultures.

Emphasis will be placed upon investigating the biochemistry and physiology of bacteria cultivated at increased pressure, with special reference to protein synthesis, nucleic acids, and various enzyme systems. Cell wall composition, saturation of lipids, and disulfide linkages will be compared.

SUPPORTED BY U.S. National Science Foundation

### 5.0752, ORGANIZATION OF THE ACADEMY'S COLLECTION OF RECENT MARINE, TERRESTRIAL, AND FRESH-WATER INVERTEBRATES

*A.G. SMITH*, Calif. Academy of Science, San Francisco, California 94118

The Academy's Department of Invertebrate Zoology was established in 1960 to curate and maintain a large collection of preserved invertebrates and to make it available for scientific study by workers in invertebrate zoology. As a result of past work, about 14,000 lots representing approximately 150,000 specimens have been curated and arranged systematically on collection shelves. The present project is a continuation of this work on the remainder of the collection, which is estimated to contain 30,000 lots and 300,000 specimens on completion. Special attention is

given to the care of many type specimens already in the collections. Lists of these types are now in press for general distribution.

The Academy's objective is to make this collection a permanent centralized repository of preserved invertebrates readily available for research.

SUPPORTED BY U.S. National Science Foundation

### 5.0753, MICROSTRATIFICATION OF MARINE ZOOPLANKTON

*C.M. BOYD*, Dalhousie University, Graduate School, Halifax - Nova Scotia, Canada

This is a study of physiological factors regulating growth and distribution of marine zooplankton. It attempts to correlate small scale clumping of zooplankters in the water column with environmental inhomogeneities. The non-random distribution of zooplankters may be associated with strata or boluses of thermally inhomogeneous water in a larger water column composed of many of these strata of varying size and discreteness. An electronic plankton counting device will be used to determine the spatial distribution and size of individual plankters and simultaneously record the temperature, depth and ambient light intensity at the point of capture. Analog information will be analyzed by computers and plankton collections will be examined microscopically for correlation analysis.

SUPPORTED BY U.S. National Science Foundation

### 5.0754, ECOLOGICAL SIGNIFICANCE OF PARTICULATE MATTER IN THE SEA

*G.A. RILEY*, Dalhousie University, Graduate School, Halifax - Nova Scotia, Canada

The principal investigator and two associates on the project, Dr. Edward Batoosingh and Barbara Keshwar, completed a study of various factors involved in production of particulate organic matter in sea water by adsorption on bubbles. The paper is now in press in *Deep-Sea Research*. D. C. Gordon completed a doctoral thesis entitled 'Studies on the distribution and composition of non-living particulate organic matter in the North Atlantic Ocean'. Various projects are underway on relations of zooplankton and bacteria with organic matter, and a Research Associate, Dr. R. O. Fournier, is working on deepwater heterotrophic algae. The principal investigator is writing a review paper on particulate organic matter for 'Advances in Marine Biology'.

SUPPORTED BY U.S. National Science Foundation

### 5.0755, SYSTEMATICS, BIOLOGY, AND HYDROGRAPHIC RELATIONS OF SOME SPECIES OF CALANUS (CRUSTACEA, COPEPODA)

*B.M. BARY*, Univ. of British Columbia, Graduate School, Vancouver - British Columbia, Canada

This research is concerned with a definitive analysis of the distribution and morphological variation of the copepod genus *Calanus*, an animal which occupies a primary position among planktonic populations; often dominating a community and covering large areas of the upper sea layers. The investigator is attempting to determine the hydrographic water mass factors which support and/or limit the distinct populations of this animal.

An understanding of the biological and ecological factors that influence distribution of organisms is essential in hydrobiological studies. With information gained from these kinds of studies predictions can be obtained relating to the dispersal and occurrence of pelagic forms of boring and fouling organisms, those capable of acoustic interference and/or luminescence, and those forms which constitute toxic hazards to personnel.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0756, ECOLOGICAL INVESTIGATIONS OF MCMURDO SOUND ZOOPLANKTON

*J.L. LITTLEPAGE*, Univ. of Victoria, Graduate School, Victoria - British Columbia, Canada

Quantitative discrete depth macrozooplankton samples and simultaneous detailed oceanographic observations taken from

## 5. LIVING SYSTEMS (NON-HUMAN)

1960 to 1962 in McMurdo Sound, Antarctica, are being analyzed, the following specific objectives in mind: (1) Analysis of discrete depth vertical samples to determine the extent and duration of vertical migrations, the species involved in these migrations and the relationship between these vertical migrations and hydrographical and meteorological conditions. (2) Initiation of autecological studies on *Euchaeta antarctica*, *Euphausia crystallophias* and other ecologically significant zooplankton. (3) Specific identification of all ecologically significant holoplanktonic zooplankton in the present collections. (4) Analysis of microzooplankton samples with emphasis on the unusually abundant and poorly known Tintinnid fauna.

SUPPORTED BY U.S. National Science Foundation

### 5.0757, NEW APPROACHES TO BIOFOULING ASSAY R.J. BENOIT, General Dynamics Corporation, Groton, Connecticut

A. Tests indicate that a simple, quick, laboratory bio-assay procedure can be developed for use in marine fouling research. B. The evaluation of anti-fouling coatings in granular form (a new approach) appears to be feasible. C. Three test organisms were evaluated as candidates for a laboratory bio-assay procedure. D. Leaching rates obtained in granular, copper base paints was in the order of 0.1 to 0.3 mg Cu per day from 0.5 gm of powder in 100 ml sea water. The rates were consistently higher in granular paints of small particle size, and increased slightly daily for three days. These leaching rates are greater than rates reported in the literature for several copper paints evaluated as coated panels.

SUPPORTED BY General Dynamics Corporation

### 5.0758, MARINE SULFUR OXIDIZING BACTERIA R.C. TILTON, Univ. of Connecticut, Graduate School, Hartford, Connecticut 06105

The project concerns the distribution and characterization of marine thiobacilli from waters off coastal New England. Organisms will be isolated and studied as to their environmental and nutritional requirements. New methods will be developed for studying autotrophic marine bacteria in their natural habitat. Representative thiobacilli will be studied intensively for mechanisms of pH regulation.

SUPPORTED BY U.S. National Science Foundation

### 5.0759, ALGAL FOODS OF SHELLFISH (MICROORGANISMS AFFECTING SHELLFISH PROGRAM) R. UKELES, U.S. Dept. of Interior, Biological Laboratory, Milford, Connecticut

Recent interest in aquaculture as a means of increasing the world's food supply and saving commercially valuable species from extinction, has focused attention on the role of unicellular algae in the aquatic environment. The methods of shellfish culture being developed for commercial hatcheries make it necessary to devise means of raising food organisms, namely unicellular algae. We are providing large amounts of unialgal cultures for a pilot plant hatchery and also working on more efficient methods of culture, harvesting and storing algal cells. We have investigated the effects of pollutants found in the environment, as pesticides, herbicides and detergents, on algal growth. The nutritional requirements and effects of antimetabolites on growth of various species are under study, as well as physical factors important in growth, such as pH, temperature, and light.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0760, LIGHT RECEPTOR CONTROL OF THE DIURNAL RHYTHM OF ENZYME SYNTHESIS IN THE BIOLUMINESCENT MARINE DINOFLAGELLATE GONYAULAX POLYEDRA J.B. BURNETT, New England Inst. Med. Res., Ridgefield, Connecticut 06877

SUPPORTED BY National Council to Combat Blindness Inc.

### 5.0761, AN ANALYSIS OF PHOSPHORUS AND NITROGEN COMPOUNDS IN TIDAL MARSHLAND DRAINAGE - LABORATORY PROCEDURES

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: An evaluation of the effects of various types of marshland management on the diurnal and seasonal concentrations of phosphorus and nitrogen in tidal marshes.

Procedures: The water samples collected in the field will be processed in the following manner: 1. Inorganic phosphorus - Reimold, R. J., 1965. An evaluation of inorganic phosphate concentrations of Canary Creek Marsh. This procedure requires that inorganic phosphorus determination be made immediately after sample collection to avoid errors due to sample storage. The determination, a spectrophotometric technique, requires electrical power. 2. Total phosphorus - Water samples for total phosphorus concentrations are processed upon return to the Bayside Laboratory. The sample is oxidized in an ordinary autoclave according to the technique of Menzel, D. and Corwin, N. 1965. This procedure converts all phosphorus to the inorganic form which can then be measured by the technique of Reimold as cited above. 3. Organic phosphorus concentration is determined by the difference between the initially measured inorganic form and the subsequent total phosphorus determination. 4. Nitrate nitrogen - Wood, E.D., F. A. J. Armstrong, and F. A. Richards. 1967. This technique offers extreme accuracy and is easily used in the field. In this new method nitrate is converted to nitrite and then measured as in number 5. 5. Nitrite nitrogen - Strickland, J.D.H., and T. R. Parsons. 1960. A manual of sea water analysis. Fish Res. Bd. Can. 125:71-74. 6. Ammonia nitrogen - Roskam, R., and D. de Langen. 1964. A simple colorimetric method for the determination of ammonia in sea water. Anal. Chim. Acta 30: 56-59. 7. Salinity will be measured by the conductance method using an induction salinometer

The results will be processed for computer evaluation of the various suspected relationships between the phosphorus and nitrogen concentrations and related physical parameters measured. The I.B.M. computer program STUFF (Sixteen Twenty Universal Function Fitter) will be used to determine significant relationships between organic phosphorus, inorganic phosphorus, total phosphorus, nitrate, nitrite, ammonia, salinity, water temperature, air temperature, tide state, time, lunar phase, day of year and weather. Other statistical and graphical techniques may also be employed to interpret the data.

Delaware State Government

### 5.0762, BIOCHEMICAL EFFECTS OF MICROORGANISMS UPON THE SALT MARSH ENVIRONMENT - LABORATORY PROCEDURES

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: To enumerate and identify the microorganisms indigenous to various salt marsh environments, and to relate the known metabolic processes of the principal organisms found to the chemical cycles currently under investigation in these marshes.

Procedures: The sediment samples collected in the field will be processed in the following manner:

1. Weighed samples from each sediment horizon will be placed in dilution bottles containing the appropriate diluent, serial dilutions made and the final dilution will be selectively treated to enhance the growth of the organisms believed to be present in the sample. The number of bacteria in each sediment horizon will be ascertained by plating aliquots from each final dilution onto solid growth media. Replicate plates will be made for each sample. After incubation, the colonies growing on the plates will be counted. The number thus attained represents the number of bacteria in the sample when multiplied by the dilution factor.

2. Identification will be made of the more numerous bacteria growing on the enumeration plates. This will be done by standard bacteriological tests. These include biochemical reactions of the bacteria in specially formulated media, and morphological reactions of the bacterial cell to selective stains.

3. Water pH will be measured by means of a pH meter. 4. Water salinity will be measured by the conductance method.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
Delaware State Government

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0763, BIOCHEMICAL EFFECTS OF MICROORGANISMS UPON THE SALT MARSH ENVIRONMENT - FIELD TECHNIQUES

*F.C. DAIBER*, State Board of Game & Fish, *Dover, Delaware*

Objective: To enumerate and identify the microorganisms indigenous to various salt marsh environments, and to relate the known metabolic processes of the principal organisms found to the chemical cycles currently under investigation in these marshes.

Procedures: Sediment samples for bacterial analysis will be collected at locations in Delaware tidal marshes which represent the following conditions: unditched marsh exposed to normal flooding, man-made low level impoundments, high level impoundments, and ditched marsh exposed to normal flooding.

Once every two weeks cores will be taken from each station to a depth which represents the sediment horizons of the station. The sample will immediately be removed from the corer and aseptically transferred to clean polyethylene boxes with tight-fitting lids.

The core samples will be transported immediately to the laboratory so that drying will be prevented or minimized before testing.

In addition, sediment temperatures at the time of sample collection will be measured, and water for salinity and pH determinations at each station will also be collected.

Delaware State Government

### 5.0764, STUDY OF NORTH AND EQUATORIAL ATLANTIC PLANKTONIC FORAMINIFERA

*R. CIFELLI*, Smithsonian Institution, *Washington, District of Columbia 20560*

The description and determination of abundance and distributional patterns of the present planktonic foraminiferal fauna in the surficial waters of the North and Equatorial Atlantic. Study of the relationship between foraminiferal and water mass distributions.

SUPPORTED BY Smithsonian Institution

### 5.0765, SYSTEMATICS AND MORPHOLOGY OF THE SIPUNCULID LARVAE OF THE INDIAN OCEAN

*M.E. RICE*, Smithsonian Institution, *Washington, District of Columbia 20560*

A comparative study will be made of the morphological features of planktonic sipunculid larvae, collected by the International Indian Ocean Expedition, and the findings will be related to the existing descriptions in the literature. Sipunculid larvae have been found in most of the oceans of the world, but in only one instance has it been possible to make a specific identification. Identification will be attempted in this study, but it is probable that final specific identifications will necessitate a study of development, with eggs and sperm of known adults. Sixty-six specimens have been received from the Smithsonian Oceanographic Sorting Center and work on them will commence some time in 1967.

SUPPORTED BY Smithsonian Institution

### 5.0766, BIOCHEMISTRY OF MARINE ORGANISMS

*J.M. LEONARD*, U.S. Navy, Research Laboratory, *Washington, District of Columbia*

The standard approach to marine biodeterioration, fouling included, has been to submerge a material in the sea and to observe some relatively gross result after an exposure of weeks or months, or even longer. This approach ignores the less conspicuous chemical and biological successions that are essential to the macro result. We propose laboratory and field studies in which the successions are carefully studied and correlated with the total ecology. Phytoplankton determinations generally have been slow laborious work, with station-by-station sampling as an inadequate substitute for rapid, continuous measurements. Continuous towing of a turbidity-sensing device afford a non-specific

indicator of plankton distributions. Two novel spectrophotometric approaches offer promise of (1) rapid survey, from aircraft, perhaps, giving both qualitative and quantitative information, and (2) a laboratory method which avoids the delays and encumbrances of the conventional extraction-colormetric procedures.

(1) Devise and develop methods for determining phytoplanktonic populations (a) in situ by optical scanning, and (b) in the laboratory by spectrophotometric measurements of planktonic deposits on filters. (2) Explore a novel approach to the direct measurement of the density of seawater. (3) Make preliminary measurements of adsorptions on submerged surfaces. (4) Explore means of controlling surface bioluminescence.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0767, BIOCHEMICAL AND BIOPHYSICAL STUDIES OF THE MARINE ENVIRONMENT

*D.F. WILSON*, U.S. Navy, Research Laboratory, *Washington, District of Columbia*

(a) To correlate the occurrence of specific planktonic microorganisms and their biological and biochemical activities and products with the occurrence and properties of peculiar distributions of matter or energy in the sea. (b) To describe, on an experimental basis, the nature, specific origins, and transformations of organic matter produced in the marine environment by selected microplankters through metabolic activity and by decomposition (autolytic and microbial). (c) To determine whether or not the copepods influence the marine environment significantly enough to necessitate their inclusion in future research on the sources and transformations of organic matter.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0768, TAXONOMY AND ECOLOGY OF INSHORE MARINE MICROBIOTA

*J.B. LACKEY*, Individual Grants, *Florida*

This envisages publication of an illustrated account, with keys, of inshore marine and brackish water protozoa and microscopic algae, both planktonic and benthic. Their commonness or rareness, cosmopolitan or restrictive distribution will be covered by ecology, especially with reference to pollution, nutrient richness and water poor in nutrients. Regions covered to date are the Atlantic Coast, Florida to Woods Hole, Massachusetts; The Florida Gulf Coast, the California coast, the Island of Oahu and Guanabara Bay, Brazil.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0769, MICROBIAL CORROSION IN THE MARINE ENVIRONMENT

*P.L. SGUROS*, Florida Atlantic University, Graduate School, *Boca Raton, Florida*

Objective: This research is a comparative examination of the activities of microorganisms related to chemical transformation. Information obtained can be applied to the mechanisms involved in microbial corrosion in the marine environments.

Approach: Research effort will be devoted to determining the metabolic means by which marine fungi degrade carbon under environmental conditions dissimilar to those of terrestrial fungi.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0770, DETERMINATION OF CHLOROPHYLL DERIVATIVES

*C.S. YENTSCH*, Nova University, Graduate School, *Fort Lauderdale, Florida*

As part of the more general study of the decomposition of plant matter in the open ocean, the sequence of decomposition of chloroplastic pigments in marine phytoplankton is being investigated. Because of the general sparsity of pigments in oligotrophic waters, certain techniques had to be devised where very small quantities of chloroplastic material could be measured. One of the tools being utilized has been fluorescence. This

## 5. LIVING SYSTEMS (NON-HUMAN)

technique has been indispensable for an examination of the total amount of the pigment as well as some of the derivatives.

The results to date indicate that chlorophyll derivatives are found throughout the euphotic zone in most water masses. Their percentages are much larger near the base of the euphotic zone than in the well-lighted portion. The principle decomposition product appears to be a phaeo-type pigment. This pigment results from chlorophyll losing its magnesium. It is brought about by the action of either organic acids formed by the plants themselves during autolysis or the action of acids being grazed by herbivorous zooplankton.

We have also developed a batch filtration device which has allowed us to concentrate large amounts of particulate matter. By thin-layer chromatography we have been able to separate chloroplastic pigments from the particulate and have found most of the major chlorophylls and the derivatives, phaeophytin, phaeophorbide and chlorophyllide. The amounts of these pigments appear to be highly variable. Factors responsible for conversion of chlorophylls to the derivatives in situ are being investigated.

SUPPORTED BY U.S. National Science Foundation

### 5.0771, ZOOPLANKTON DISTRIBUTION IN THE TROPICAL ATLANTIC

*J.F. HEBARD*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Phase 1. Distribution of selected species of zooplankton in the surface mixed layer of the tropical Atlantic Ocean. The zoogeographical distributions of zooplankton will be studied. The distributions will be collated with the physical and chemical environment with special attention to areas of divergence, convergence, upwelling, river runoff, and water mass interaction. Seasonal variations in distributions will be examined wherever possible.

Phase 2. The vertical distribution of zooplankton in the Gulf of Guinea. 1. The vertical extent of diurnal migrations 2. Modification of vertical distribution by such hydrographic features as undercurrents, thermocline, river effluent, etc. 3. The definition of surface and deep communities and their interactions 4. Variation in adult-to-juvenile ratios as an index to community production, 5. Non-random concentrations of zooplankton as a potential food pasture for tuna forage organisms.

Phase 3. Design and construction of a discrete depth zooplankton sampler. A multiple opening-closing plankton sampler to assess the vertical stratification of zooplankton in the upper 200 meters of the sea will be designed.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0772, ECOLOGY AND TAXONOMY OF TROPICAL ATLANTIC SCOMBRID EGGS AND LARVAE

*W.J. RICHARDS*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., Miami, Florida

Study of systematics, life history, distribution, and abundance of scombrid fish larvae.

Phase 1. Identification, distribution, and ecology of larvae of scombrid larvae from EQUALANT surveys I and II. Phase 2. Distribution and ecology of scombrid larvae in the Gulf of Guinea. The material from EQUALANT III and subsequent cruises will comprise the basis for this study as well as the material from EQUALANT I and II already reported on. Phase 3. Distribution and ecology of scombrid larvae from the western Atlantic. The material from GERONIMO cruises 6, 7, and 8 and UNDAUNTED cruises 2 through 10 will comprise the basis for this study. This study will commence following solution of the problems of identification (Phase 7-9). The material from GERONIMO 8 has been analyzed and a report completed in FY 1967. Phase 4. Food of scombrid larvae. The larval period, from the viewpoint of mortalities, is probably the most critical in the life of the tunas. Therefore, it is essential to know which trophic levels are being preyed upon by these larvae. Phase 5. Distribution and ecology of scombrid eggs. Eggs do not actively move through the water, thus their distributions and numbers will give a more finite answer to the abundance and location of tuna spawning than the distribution of larvae. Inherent difficulties in

the identification of tuna eggs delays the start of this phase until reliable methods of identification can be formulated. Phase 6. Ecology of important species other than scombrids, fish eggs, and larvae to be studied from abundant existing material. To commence as opportunity and needs demand. Phase 7. Analysis of external characters of scombrid larvae to delineate scombrid types. Phase 8. Analysis of internal micro-anatomical characters of larvae to delineate types and confirm species' identities with larval types. Phase 9. Taxonomic investigation of scombrid eggs to associate types of eggs with species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0773, GENERAL SYSTEMATIC STUDIES OF THE OCTOCORALLIA OF THE TROPICAL ATLANTIC

*F.M. BAYER*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The proposed research deals with the systematics of tropical Atlantic octocorals. These coelenterates are one of the most important groups of sessile animals in the reef habitat and in many bottom communities of deeper water. Knowledge of the systematics of the West Indian forms has been put seriously out of date by rich collections obtained in the past five years by dredging, trawling and SCUBA diving, and the East Atlantic tropical fauna is very incompletely known. Material from the Straits of Florida, Bahamas, West Indies, Gulf of Mexico, Caribbean Sea, Brazil, and the Gulf of Guinea, now numbering about 900 lots and steadily increasing, will be studied systematically, described, and illustrated, toward two final goals: (1) a revision of the Octocorallia of the continental shelf and slopes of the tropical West Atlantic, and (2) a general account of the octocorals of tropical West Africa. These will include zoogeographical studies to reveal the degree and nature of the faunal relationship of the eastern and western Atlantic; information on geographical and ecological variation of individual species; and studies of the anatomy and histology of as many species as possible, in order to clarify basic questions of classification of higher taxa. The studies now undertaken are the first step toward a thorough modernization of the systematics of the Octocorallia in general, and are preliminary to the investigations of the more complicated (and taxonomically confused) Indo-Pacific fauna. In the two-year period of the present grant, research will be concentrated upon the West Atlantic fauna, and it is anticipated that approximately one-half of the revision of that area can be completed.

### 5.0774, RELATIONSHIP OF PHOTOSYNTHESIS TO RESPIRATION OF OCEANIC MICROALGAE

*J.S. BUNT*, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

In recent years, most measurements of primary productivity have been based on the carbon-14 technique introduced by Steemann Nielsen. In attempting to decide whether this method measures net or gross photosynthesis or something in between, comparisons have been made with net rates of oxygen evolution in photosynthesis. It has been conventional to calculate gross photosynthetic activity on the assumption that oxygen consumption continues in the light as it does in the dark. Data based on mass spectrometry have shown that this is not necessarily true. Increased oxygen consumption in the light has been attributed to processes leading to ATP formation. With this evidence at hand, studies were initiated in these laboratories to determine whether changed rates of oxygen consumption are general among marine microalgae and to identify environmental factors influencing oxygen consumption in the light. While this work was in progress, reports appeared indicating that another process, photorespiration, may be significant in photosynthesizing tissue and that photorespiration is influenced by oxygen concentration. This information forced a re-evaluation and extension of experiments in this laboratory. Progress has been hampered by technical difficulties not previously evident in the mass spectrometer technique and which raise doubts on interpretation of data. Notwithstanding these difficulties, evidence has been obtained which gives cause to question some of the evidence on photorespiration. Other information of interest in connection with photosynthetic transients

## 5. LIVING SYSTEMS (NON-HUMAN)

has also been collected and will be published shortly. Further studies will be needed to understand the full significance of increased oxygen consumption in the light.

SUPPORTED BY U.S. National Science Foundation

### 5.0775, BIOSYNTHETIC PROCESSES DURING DEVELOPMENT OF SEA URCHIN EGGS

R.M. IVERSON, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The sea urchin egg is a suitable system for investigating the processes occurring during the division stages and early embryogenesis. Large quantities of synchronous cells for studying the biochemical and physiological events concerned with mitosis and development of the organism can be obtained and embryos can develop to the blastula stage in the absence of m-RNA synthesis, at which time new m-RNA must be synthesized for continued development.

This raises the question of how the oocyte stores cellular components, for example, the m-RNA during oogenesis, activates it upon fertilization, controls its function at the translational level during early embryogenesis, and initiates at the blastulagastrula stage new m-RNA synthesis and integrates its function with the m-RNA stored by the oocyte.

Our investigations are concerned with: (1) the appearance and characterization of the polysomes after fertilization and during early embryogenesis; (2) the activation and integration of function of the m-RNA stored in the oocyte with that synthesized at the blastula gastrula stage (do they have different 'classes' of ribosomes associated with them?), and whether they are encoded for similar proteins; (3) the characterization of selected proteins formed by the polysomes at selected developmental stages; and (4) the basis for the difference in the 105,000xg supernatants obtained from fertilized and unfertilized eggs to support *in vitro* protein synthesis.

### 5.0776, CHEMISTRY AND BIOLOGY OF SOME COELENTERATE NEMATOCYSTS

H.M. LENHOFF, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The coelenterate nematocyst continues to intrigue biologists. The nematocyst, one of the most complex specialized intracellular structures known, is essentially a capsule containing an inverted thread retained by a closed operculum. When the nematocyst is stimulated to discharge, the operculum opens and the thread everts. Depending upon the type of nematocyst, the everted thread may either pierce the prey and inject a toxin, lasso bristles on the prey, or adhere to adjacent surfaces. Investigations are planned to identify the chemical composition and physical properties of purified nematocyst capsules, and to purify the toxin and study the mechanism of its action. Information obtained from these studies, will be used to investigate the synthesis to their eventual site of action, and their mechanism of discharge.

SUPPORTED BY U.S. National Science Foundation

### 5.0777, EXPERIMENTAL STUDIES ON THE BIOLOGY AND FOOD CHAIN ECONOMICS OF THE CHAETOGNATHS

M.R. REEVE, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The objective of this study is to advance our knowledge of the biology and physiology of this very important group of planktonic marine invertebrates, thereby working towards an understanding of their role in the food chain as plankton carnivores. Practical steps being taken to achieve these ends include the initiation of development of laboratory rearing techniques which will allow eggs hatched from mature adults to be reared through their immature stages and complete the cycle. Quantitative aspects of reproduction are being studied including gonad maturation sequence, egg production per brood and number of broods as a function of temperature. Energy budgets are being worked out using *Artemia* as food in experimental regimes by computing

the gross growth efficiency of *Sagitta hispida* at various stages in its life history and at various temperatures. The budgets are balanced by making measurements also of oxygen consumption, dissolved nitrogenous excretion and faecal pellet production.

SUPPORTED BY U.S. National Science Foundation

### 5.0778, ECOLOGY OF PHYTOPLANKTON IN SEMI-TROPICAL ENVIRONMENTS

E.J. WOOD, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Vertical and horizontal distribution of phytoplankton was related to the hydrographic factors in the Straits of Florida, Northeast and Northwest Providence Channels and the Tongue of the Ocean. It was found possible to relate phytoplankton maxima to isopycnals, and to interpret the peaks in terms of seasonality and depth relationships. The species were found to relate directly to the North Equatorial Current. Papers published as a result of this grant include; E.J.F. Wood, Bull. Mar. Sci. 18, 1-4; 481-543, Vargo, G. Bull. Mar. Sci. 18, 5-60. In addition a further paper on the Autecology of Diatom Species in the Area is in press (Nova Hedwigia) and another on the dinoflagellates and their ecology is in MS.

SUPPORTED BY U.S. National Science Foundation

### 5.0779, RELATIONSHIPS BETWEEN PHYTOPLANKTON AND ZOOPLANKTON IN THE CARIBBEAN SEA

E.J. WOOD, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The phytoplankton of the Caribbean appears to be derived in the main from the North Equatorial Current, though contributions are made from the neritic communities along the coasts of Venezuela and Brazil, from the islands of the West Indies, and from the shallow banks in the Honduras region such as Gorda Bank and Arrowsmith Bank. The micro-algae from these areas, including many species of benthic and epontic diatoms, usually enter the water at depths of 50 to 100 meters. A further contribution comes from the Sargassum which forms a large part, possibly at times the major part of the plant biomass of the Caribbean Sea. This contribution includes benthic and epiphytic species of diatoms and flagellates, which may also form as great a biomass as the true phytoplankton. The effect of upwelling to the east of the West Indies has been shown in the phytoplankton populations. Work on the western end of the Caribbean was not completed at the conclusion of the grant.

SUPPORTED BY U.S. National Science Foundation

### 5.0780, RED TIDE TOXICITY

J.E. SYKES, U.S. Dept. of Interior, Biological Laboratory, Saint Petersburg - St. Pt. Bc., Florida 33706

This research is concerned with biochemical aspects of *Gymnodinium breve*; specifically the isolation and characterization of its toxin. Phase one includes development of growth of the organism; Phase two- efforts to fractionate the toxin initially by analytical chromatography and later through use of preparative gas chromatography. Phase three will include a more detailed study of the chemical and physiological properties.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0781, THE OCCURRENCE AND EFFECTS OF PLANKTON IN THE SEA

A.W. COLLIER, Florida State University, Graduate School, Tallahassee, Florida 32306 (NONR)

The investigator is analyzing the chemical and physical characteristics of the metabolites of planktonic organisms under natural conditions, as well as in the laboratory under special environmental conditions in defined media. He is continuing his studies of the ultra-plankton organisms he discovered recently to determine their contribution to the physical and chemical properties of the air-sea interface and upper oceanic layers.

Hydrobiological studies have been contributing a large store of knowledge concerning the inhabitants of the sea and the effects

of the environment upon them. In the development of these studies, the more or less subtle ways in which the organisms effect the environment are coming under examination. The effects are particularly notable in the minute, but extremely abundant planktonic forms which are being shown to be causative factors in many problems connected with the installation, maintenance, and performance of underwater equipment.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0782, MICROBIAL ACTIVITY IN NON AQUEOUS SYSTEMS**

**C.H. OPPENHEIMER**, Florida State University, Graduate School, Tallahassee, Florida 32306

A study of the growth and distribution of microorganisms that preferentially live in oil. Experiments will provide information on water availability in the non-aqueous oil environment. Growth rates of selected microbes will be measured.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

**5.0783, RESEARCH ON THE ROLE OF BACTERIA IN THE OCEAN**

**W.J. PAYNE**, Univ. of Georgia, Graduate School, Athens, Georgia 30602 (NONR)

Objective: Some marine bacteria are responsible for the process of denitrification whereby nitrogen is lost from the environment in the form of nitrogen or ammonia. This terminal year of research is to determine what specific bacteria and chemical events lead to this undesirable process and subsequent loss of valuable nitrogen for marine and animal use.

Approach: An effort will be made to characterize the specific bacteria, the enzyme system, and electron transport mechanisms involved in denitrification. A comparison of marine and terrestrial bacterial species will be made to determine fundamental differences in denitrification metabolism in the two types.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0784, PHYSIOLOGICAL CHARACTERIZATION OF CERTAIN MARINE BACTERIA**

**N.W. WALLS**, Georgia Inst. of Technology, Engineering Experiment Station, Atlanta, Georgia 30332

The objectives of this research project were: (1) to isolate in pure culture the microorganisms contained as a mixed flora in certain ocean sediments material; (2) to lyophilize these and other bacteria collected in the field to preserve them for future study; and (3) to morphologically and biochemically characterize certain of the species.

SUPPORTED BY Georgia Institute of Technology

**5.0785, DIVERSITY, COMMUNITY STRUCTURE AND TROPHIC RELATIONS OF TROPICAL ZOOPLANKTON**

**R.I. CLUTTER**, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822

The research project involves sampling and analysis of plankton communities, in a tropical bay (Kaneohe Bay, Oahu) and in the open sea.

Assessment of standing stocks and species diversity is being done in the bay as a whole. Two subregions have been chosen that are similar in general species composition but have different standing stocks and different indexes of diversity. In these subregions an attempt will be made to determine trophic relationships and energy pathways among the major species.

With the background experience gained in the bay, it is expected that future work will include vertical distribution and energy exchange problems in the open tropical Pacific. Field equipment is being readied for this purpose.

SUPPORTED BY U.S. National Science Foundation

**5.0786, DEVELOPMENT AND EVALUATION OF A NEW TECHNIQUE FOR SAMPLING ZOOPLANKTON**

**G.I. MURPHY**, Univ. of Hawaii, Hawaii Inst. of Marine Biology, Honolulu, Hawaii 96822

## 5. LIVING SYSTEMS (NON-HUMAN)

It is proposed to construct, test, and do preliminary experiments with a radical innovation in zooplankton sampling, a plankton purse seine. If successful, this technique should yield absolute calibration of conventional equipment, new insight into distribution, and a more meaningful approach to zooplankton community dynamics.

SUPPORTED BY U.S. National Science Foundation

**5.0787, ISOLATION AND TAXONOMY OF YEASTS IN LAKES AND SEWAGE**

**L.R. HEDRICK**, Illinois Institute of Technol., Graduate School, Chicago, Illinois 60616

To date, 13 different sites in the Calumet River area on the Illinois-Indiana border have been sampled for yeasts. The two genera most often encountered were *Candida* and *Rhodotorula*. In an effort to determine just what aspects of pollution were affecting the yeast population, data on chemical and physical pollution indicators were fed along with the numbers of yeasts into an IBM 360 computer. At every station, it was found that two parameters which gave the highest regression values were the nitrite-nitrate nitrogen and dissolved oxygen content of the water.

Currently, a survey of changes in yeast populations with the seasons is being conducted. The following pathogenic yeasts have been isolated: *Cryptococcus neoformans*, *Torulopsis glabrata*, *Candida tropicalis*, *Candida Parapsilosis*, and *Trichosporon cutaneum*.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0788, ULTRASTRUCTURAL AND AUTORADIOGRAPHIC INVESTIGATION OF CALCIFICATION IN FORAMINIFERS**

**W.W. HAY**, Univ. of Illinois, School of Engineering, Urbana, Illinois

This proposal is to extend a study of calcification in foraminifers already underway (NSF GB-4101). It has been possible to establish viable cultures of a wide variety of foraminifers, and to induce some species to reproduce and so become convenient subjects for the study of calcification, to perfect a technique for sectioning cytoplasm and test wall intact and to start a survey of cell ultrastructure. A considerable amount of information on the biological ultrastructure of foraminifera is now being gathered, and study of specimens actively calcifying the test is being carried out. The project would extend the study from the species currently being investigated to representatives of other groups, correlate electron microscopic and light microscopic investigations of cytological structures, test a new working hypothesis of the calcification process, and study the pathway of calcium from uptake from the culture medium to placement in the wall, using autoradiography.

SUPPORTED BY U.S. National Science Foundation

**5.0789, ZOOPLANKTON OF THE GULF OF MAINE**

**K. SHERMAN**, U.S. Dept. of Interior, Biological Laboratory, Boothbay Harbor, Maine 04538

This research will provide information regarding seasonal and annual changes in zooplankton distribution and abundance in relation to hydrographic conditions. Present effort is centered along the Gulf of Maine coast, from Cape Ann (Mass.) to Machias Bay (Me.), and from inshore to the 50 fathom isobath.

Zooplankton collected from two series of seasonal cruises (winter, fall, summer, and spring) is examined: 1) along-shore coastal cruises (20 stations) using a Gulf III sampler, on 30-minute oblique tows, taken from 20 meters to the surface, 2) inshore-offshore transect cruises from three areas (west, central and eastern gulf). Three stations, spaced at 7.5 mile intervals, are located on each transect. Collections are made with Clarke-Bumpus samplers towed in a series at 0-10-30 and 60 meters depending on bottom topography.

Environmental observations at each station include: 1) Nansen bottle casts at 0-10-20-30-60 meters and bottom, 2) bathythermograph cast, 3) water transparency measurements using secchi disc and photometer, 4) meteorological observations recorded on NODC-BT log format, and 5) sea bed drifters and drift bottle releases.

## 5. LIVING SYSTEMS (NON-HUMAN)

The along-shore and inshore-offshore station collections are planned to extend over a two-year period. The 1963 along-shore zooplankton data has been analyzed for relative abundance, group and species (copepods only) composition and areal distribution.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0790, MICROBIOLOGY OF MARINE AND ESTUARINE INVERTEBRATES

R.R. COLWELL, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

A study of the natural bacterial flora of oysters and associated invertebrate animals has been initiated. Animals from specified areas of Chesapeake Bay and off the Atlantic Coast are being sampled, using specified aseptic techniques to determine the quantitative and qualitative bacteriological flora of the animals. The normal commensal flora of oysters is being determined by examination of the shell liquor, body flesh, and intestine.

Standard bacteriological procedures are being followed for sampling, testing, and analysis. However, newer techniques of diagnosis and taxonomy will be applied, including the high-speed computer methods and the nucleic acid analyses, techniques developed and/or adapted by the Principal Investigator in previous published research.

Ancillary studies of the environment of the animals, i.e., water and mud samples, are also being undertaken. Unique features of the bacterial populations which are observed will be studied in detail.

The work is being undertaken at Georgetown University with the active collaboration of personnel at the Biological Laboratory, Bureau of Commercial Fisheries, U. S. Fish and Wildlife Service, Oxford, Maryland.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0791, COMPARATIVE BIOCHEMICAL AND MORPHOLOGICAL CHARACTERISTICS OF MARINE FUNGI FROM SHELLFISH

S. GOLDSTEIN, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Appropriate histological, histochemical, and cultural methods are used to determine the presence of fungal parasites in shellfish. With the use of conventional and laboratory prepared and modified media, isolations and clones are made of the fungi present in tissues. Physical and physiological parameters necessary for the growth and reproduction of the organisms isolated are established. Morphological properties and nutritional requirements of the isolates grown in vitro are described. Appropriate chemical and biochemical analyses are carried out on the isolates and supporting media so as to permit adequate characterization, possible identification, and to establish the taxonomic position of the isolates. The work is being undertaken at Brooklyn College.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0792, MORPHOGENESIS OF THE BACTERIOPHAGE

M.B. BAYLOR, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

We are working on the interactions of genes that control the architectural proteins in the mature coliphage. We believe we have markers for these genes and thereby will be able to locate genes controlling different proteins in the same structure and also genes, the products of which, modify the final functional structure.

We have established by four very different approaches that one group of genes in which our mutants occur, control tail structure not including tail fibres. Our methods included phage morphology as revealed by the electron microscope, in vitro assembly of T2-T4 hybrids, genetic homologies between T2 and T4 and examination of purified solubilized sheath by gel electrophoresis. However, we have found a mutant, not in this region, which also affects both sheath morphology and the pattern of the band on the gel. Our results led us to suggest that at least two, and probably more, proteins are contained in the sheath. More are concerned with sheath morphogenesis.

We intend to study the sheath components by several physical chemical techniques. We believe we have also a label, through our mutants, on other tail structures such as face plate and tube.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0793, A STUDY OF THE ECOLOGY OF THE MICROFAUNA LIVING BETWEEN INTERTIDAL MARINE SEDIMENTS

D.J. ZINN, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

The work is directed toward studying ecologically and taxonomically the fauna belonging to the mesopsammic biotope environmentally represented by the various kinds of intertidal substrata that make up the beaches of the New England Coast. The main effort is to collect and interpret information on the psammon of the area. Representative beaches along the shores of Connecticut, Rhode Island, Massachusetts, New Hampshire and Maine will be sampled. In addition to quantitative and insofar as possible, qualitative determinations of the faunal groups comprising each biocoenose, attention will be paid to the interstitial milieu and the lacunar spaces between the sand grains, in whose water films the mesopsammic animals live, in terms of grain size, beach slope, temperature, salinity, oxygen, pH, tidal factors, meteorological and hydrological conditions, and so on. Faunal analysis will emphasize the mystacocarids and the copepods. As time permits zoogeographical distribution patterns of the dominant forms will be considered by comparison with psammon collections made at convenient locations along southern atlantic coastal beaches of the United States.

SUPPORTED BY U.S. National Science Foundation

### 5.0794, LANGMUIR CIRCULATION AND PLANKTON ECOLOGY

E.R. BAYLOR, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The food chain in the ocean depends primarily upon the events occurring in the upper one hundred meters of water. Most of the production of phytoplankton takes place in this stratum. Also, it has been shown by the principal investigator and his associates that in the upper layer of this stratum the naturally occurring suspended and dissolved organic materials in sea water may be concentrated and converted into edible particles used by zooplankton by wave-induced foaming. The work of the principal investigator on patchiness of plankton abundance questions its relation strictly to the hydrodynamic variables of Langmuir circulation. Results have permitted modification of the original theory which needs testing. The predictions to be tested are: when the wind direction is steady for twenty-four hours the plankton abundance is well correlated with the windrows; when a major shift in wind direction occurs, the plankton is patchy but poorly correlated with windrows; when the wind is highly variable in direction for twenty-four hours the spatial distribution of plankton is virtually random.

The purpose of this research is to test a model of air-sea interaction developed by the principal investigator and his associates to explain the plankton distribution and its relation to wind pattern and surface circulation pattern. The model proposes that the horizontal roll vortices of Langmuir circulation in the water are coupled to and driven by larger (1KM) horizontal roll vortices in the air just over the water. In effect, there is simply a large-scale Langmuir circulation in the air driving a smaller-scale Langmuir circulation in the water. A Hardy continuous plankton recorder will be towed to indicate what the Sperry reflectoscope (previous grant) recorded. Kites will be used to hold instruments directly over the plankton collection spots. All data will be subjected to computer analysis. The methods employed should settle many questions concerning plankton ecology, particularly the effect of Langmuir circulation on distribution.

SUPPORTED BY U.S. National Science Foundation

### 5.0795, RADIOELEMENT STUDIES IN THE OCEANS-PLANKTON DISTRIBUTION STUDIES

V.T. BOWEN, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543 (AT(30-1))

## 5. LIVING SYSTEMS (NON-HUMAN)

On samples collected for fallout isotopes measurements, studies are made of the species distribution and relative abundances of Foraminifera, Radiolaria and Acantharia. With few systematic exceptions, the three groups show covariance rather than opposing abundances. Both Radiolaria and Acantharia prove to be major components of the plankton, and of evidently underestimated geochemical significance. In those water masses lacking one or another of these groups, this should show in form of aberrantly high surface concentrations of the appropriate element. Much of this work is now being prepared for publication.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0796, MICROBIAL TRANSFORMATIONS IN SEA WATER

H.W. JANNASCH, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Studies on the development of reproducible enrichment techniques in continuous culture for the isolation of characteristic marine bacteria were completed. Within a certain range of dilution rates and concentrations of the limiting substrate, chemostat enrichments were successful. Experimental attempts to separate single species from mixed cultures of known composition showed that successful or unsuccessful competition for the limiting substrate could be expressed by kinetic growth parameters of the individual species under given conditions. Species exhibiting low values of their growth parameters displaced species with relatively high values if the continuous culture was operated correspondingly at low dilution rates and/or low concentrations of the limiting substrates. This behavior is significant for the characterization of those micro-organisms actually responsible for the degradation of organic materials in the sea under natural conditions.

Based on the determination of growth parameters, the studies on population dynamics were continued. Mixed pure cultures of marine and non-marine bacterial strains were grown in the chemostat at doubling times up to 100 hours and at various concentrations of limiting substrate. Predicted displacement times could be confirmed experimentally.

Techniques for studying sulfate reducing bacteria in steady state culture have been established. The kinetics of substrate- (sulfate) and product- (sulfide) limited growth were studied with the aim of detecting characteristics metabolic differences.

SUPPORTED BY U.S. National Science Foundation

### 5.0797, STUDIES ON MICROBIAL SULFATE REDUCTION AND SULFIDE OXIDATION IN MARINE ENVIRONMENTS

H.W. JANNASCH, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Forty-one strains of sulfate-reducing bacteria were isolated from various marine or saline environments including New England estuaries, Continental Shelves (U. S. East Coast and North Sea), the Peru trench, Lake Tiberias/Israel, the Red Sea, and Lake Faro (Sicily). All strains were studied with respect to utilization of significant organic hydrogen donors, salinity requirements, optimum growth temperatures, growth temperature ranges, and resistance to inhibitane. Based on these data the strains were classified according to Postgate and Campbell.

Enzyme activities of carbohydrate metabolism in *Desulfovibrio* were studied under various growth conditions. Chemostat grown cells of various generation times were compared with batch culture grown cells.

SUPPORTED BY U.S. National Science Foundation

### 5.0798, BIOLOGY AND CHEMISTRY OF MARINE PLANKTON POPULATIONS

B.H. KETCHUM, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The short term changes which proceed during the growth of plankton populations are to be studied in the Gulf of Maine. A parachute drogue attached to a radio buoy is used to identify a particular patch of water and observations are made close to the

buoy. The objectives of this program are to evaluate quantitatively the turnover rates of the nutrients and to study rates of decomposition in situ. It has been postulated that in situ recycling of elements maintains the level of productivity in parts of the world throughout much of the year, but no useful estimates of recycling rates have been available. Additional studies include the changes in the vertical distribution of chlorophyll and the rate of sinking of particles, the changes in the ratio of elements in particles as they sink and decompose in the water column, and diurnal variations in the rate of photosynthesis as a function of the chlorophyll content of the water. Studies of the vertical distribution of the zooplankton are included since a substantial part of the regeneration of elements may result from the phytoplankton respiration and zooplankton consumption and digestion of particulate matter in the sea.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0799, BIOLOGY AND PALEONTOLOGY OF MARINE DINOFLAGELLATES AND HYSTRICOSPHERES

D. WALL, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The life histories of modern thecate dinoflagellates (Dinophyceae) are being investigated with special emphasis on those genera and species that produce resting spores. Such spores are abundant both on the surface sediments of present day seas and as microfossils (variously called fossil dinoflagellates and hystrichospheres) that are preserved in marine sediments of post-Paleozoic age in the main. We are attempting to correlate resting spores with their appropriate motile stage in the life histories of numerous marine and freshwater species by the germination of spores in vitro and unialgal cultures and also to study the biogeographic distribution of spores in surface sediments of the eastern coast of the United States and Caribbean area. Paleontological studies also will be made of the vertical distribution of dinoflagellates in some Late Tertiary and Quaternary marine epicontinental sequences and attempts will be made to relate this distribution to the observed lateral distribution of corresponding cysts in modern sediments.

SUPPORTED BY U.S. National Science Foundation

### 5.0800, NITRIFICATION BY MARINE MICROORGANISMS

S.W. WATSON, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

This proposal is for the continuation and expansion of our studies on the role nitrifying bacteria play in the ocean and the molecular mechanisms by which these organisms convert, store and utilize energy derived from the oxidation of ammonia or nitrite. The specific objectives include: (1) the isolation and purification of new marine nitrifying bacteria; (2) the determination of the vertical and horizontal nitrification and distribution of nitrifying bacteria in the open ocean; (3) a morphological study of the fine structures of nitrifying bacteria; (4) a study of the metabolic pathway by which marine nitrifying bacteria oxidize ammonia to nitrite and nitrite to nitrate using cell free systems; (5) an attempt to elucidate the reason or reasons why nitrifying bacteria are obligate autotrophs (6) a study of the role of the submicroscopic cytomembrane systems and other submicroscopic structures observed in *Nitrosocystis oceanus*, *Nitrosomonas europaea* and *Nitrobacter agilis*; (7) a study of the kinetics of nitrification; (8) the development of new cultural techniques.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0801, PLANKTON AND BENTHOS COMMUNITIES OF THE GREAT LAKES

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The objectives of this project are to determine the plankton and benthos species occurring in the Great Lakes and study their distribution, and seasonal and annual abundance. Plankton and benthos have been sampled on a routine seasonal basis in Lakes Erie and Superior, and during surveys of a Lakes Erie, Huron,

## 5. LIVING SYSTEMS (NON-HUMAN)

Michigan, and Superior. At present, we are concerned primarily with changes in the benthos of Lake Erie, seasonal fluctuations of diatoms in Lake Superior, and determining the sampling efficiencies of the orange-pool, Petersen, and Smith-McIntyre dredges in various sediments and at various depths. Smaller phases of the project involve a study of the Japanese snail *Viviparus japonicus* which has appeared in Sandusky Bay, Lake Erie, and a study of the polychaete *Manayunkia* species in Lake Erie.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0802, DISTRIBUTION AND ABUNDANCE OF ZOOPLANKTON IN LAKE ERIE

J. REYNOLDS, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

This project is aimed at obtaining good estimates of relative abundance and standing crop of common species of zooplankton in Lake Erie. Such estimates require a knowledge of the variation in catch contributed by factors causing other than real changes in biomass (i.e., apparent changes due to sampling). Initially, a restricted area in Lake Erie will be sampled to determine the extent of sampling error. Subsequent experiments will attempt to quantify those ecological relationships which significantly mask the real changes in zooplankton abundance. Considering present knowledge of zooplankton ecology, some of the factors studied will be light, oxygen, temperature, diurnal movement, and horizontal distribution. Proper treatment of the data will require multiple regression analysis and multiple analysis of variance using the high-speed computer. Inclusion of any significant ecological factors as an adjustment in estimation would increase the precision involved in detecting real changes in zooplankton abundance. Hopefully, these improved estimates may give additional meaning to the relation between density of zooplankton and survival of certain species of fishes in Lake Erie, particularly young-of-the-year. The project will begin during May 1967.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0803, PLANKTON ECOLOGY

D.C. CHANDLER, Univ. of Michigan, Graduate School, Ann Arbor, Michigan (NONR)

This research bears on three related studies. A planktological survey of Lake Michigan has been conducted with especial attention being given to the microcrustacea. Secondly, the aforementioned planktological survey cruise Research Ships of Opportunity was being used to obtain information and experience as to the utility and problem in setting up a continuing RSO program. This project is utilizing the specimens and data gathered in the lake survey sampling, in a study of the seasonal and geographical patterns in the abundance of the several stages in each of the four species of the copepod genus *diaptomus*.

The gathering of data regarding physical, chemical, and biological parameters of ocean environments is a recognized necessity for the better understanding and prediction of effects of environmental factors on Naval operations. In order to collect adequate information, existing research equipment must be evaluated and new equipment developed. In addition, the technology of positioning the data gathering equipment in preselected geographical areas must be updated. Research Ships of Opportunity offer one means for synoptic oceanographic data collecting systems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0804, PLANKTON REARING, ENVIRONMENTAL REQUIREMENTS AND SENSITIVITY STUDIES

C.M. TARZWELL, U.S. Dept. of Interior, Natl. Water Quality Lab., Duluth, Minnesota

This project is carried out by the Culturing, Production and Sensitivity Studies Unit of the Plankton-Microbiology Section. It has as its purpose the determination of the sensitivity of the more important planktonic organisms to selected materials or wastes. In accomplishing this objective, all planktonic organisms within the upper Great Lakes area will be collected and identified. Those representing a considerable portion of the total population will be

cultured. It is anticipated that considerable time and effort will be devoted to this culturing activity. In connection with these activities, life history and requirements will be investigated and studied in some detail. Planktonic organisms of importance in the biota will be reared so that they may be used in short-term bioassay studies to determine the most sensitive species or life stages to a particular material or waste. This will involve the screening species or of wastes using a large number of different planktonic organisms. The species and life stage found to be most sensitive to the particular material or waste in question will then be used by another unit in studies to determine the long-term effects and the levels of a potential toxicant which are not harmful to the organism. This project was started in Fiscal Year 1967 and is a continuing activity.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0805, THE ROLE OF SULFUR BACTERIA IN CORROSION AND DETERIORATION

G.E. JONES, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

Objective: This task will assist the Navy in understanding the role of sulfur bacteria in the oceanic environment. Sulfur is relatively plentiful in the ocean, and its utilization by microorganisms contributes to corrosion and deterioration of structure materials.

Approach: Marine sulfur-oxidizing bacteria possess a membrane which appears to be the site at which sulfur oxidation takes place. The membrane will be harvested in quantity and examined for chemical composition and sulfur oxidizing activity.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0806, A STUDY OF THE ICHTHYOPLANKTON ASSOCIATED WITH TWO OF NEW JERSEYS COASTAL INLETS

W.S. MURAWSKI, State Div. of Fish & Game, Trenton, New Jersey

A. Objectives: To determine the species of fish which are found in our lower estuaries as eggs and/or larvae. To further determine at what time of year their occurrence takes place, for what duration of time, and under what salinity and temperature conditions. Information of this nature is very valuable in our biological appraisal of this area of the estuary, especially in regard to any proposed man-made changes in the environment.

B. Procedure: Weekly ichthyoplankton samples will be made year round at Manasquan and Corson Inlets. At the former station, the net will be fished from a bulkhead that runs parallel to the tide; and at the latter station, the net will be fished from the center of a low bridge that spans a branch of the inlet. In each case, the nets will be held stationary in a flooding tide. The nets used will be one-meter in diameter and will be fished in the surface waters for one hour during periods of darkness. Flowmeters will be used to determine the volume and velocity of the water sampled. Observations of the physical environment will include temperature and salinity.

New Jersey State Government

### 5.0807, BIOLOGICAL OCEANOGRAPHY & DETERIORATION - SHALLOW WATER MARINE SEDIMENTS & WATER COLUMN BACTERIA

E.C. FISCHER, U.S. Navy, Applied Sciences Lab., Brooklyn, New York 11251

Objective: To investigate biological problems associated with shallow continental shelf waters and to relate turbidity to microbiological content particularly directly over the sea floor.

Approach: Develop instrumentation package for concomitant turbidity and bacteriological analysis of continental shelf waters from surface to sea floor. Conduct at-sea measurements within local waters. Perform bacteriological and gross particulate analysis of samples.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0808, EXPERIMENTAL ECOLOGY OF LOWER MARINE FUNGI

S. GOLDSTEIN, City University of New York, Graduate School, Brooklyn - Brooklyn College, New York 11210

Comparative development and physiology of nonfilamentous zoosporic phycomycetes isolated from polluted littoral habitats.

SUPPORTED BY City University of New York

### 5.0809, A NEW APPROACH TO NUTRITION, PHYSIOLOGY, AND MINERAL CYCLING OF FORAMINIFERA

J.J. LEE, Amer. Museum of Nat. History, New York, New York (AT(30-1))

We are continuing our studies of the foraminifera, a biologically poorly known group of microorganisms which is important in marine biogeochemical cycling. Priority has been given to the establishment of gnotobiotic dependable laboratory cultures for use in experiments. Tracer technique will be used to identify food organisms. Reduction of non-growth promoting organisms from agnotobiotic cultures and aseptic technique should lead to vigorous synxenic cultures with fewest associated food organisms.

We will study the microbial flora and fauna of natural littoral foraminiferan bloom areas and the physiological ecology of prominent members of the community that can be isolated in axenic culture. The results of the foregoing studies, correlated with energy-flow experiments and experimental manipulation of model microcosms, should assist in the interpretation of the non-random distribution of foraminifera in nature and the conditions favorable to the bloom of certain species. This work will be of interdisciplinary value in marine productivity and paleoecology.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0810, MECHANISMS OF ATTACHMENT OF MARINE BACTERIA TO SURFACES

W.A. CORPE, Columbia University, Undergraduate School, New York, New York 10027 (N00014-68-A-0225-0001)

Objective: This research concerns microorganisms which grow on marine surfaces and are involved in fouling and corrosion. This effort will assist the Navy in developing procedures and methods for producing surfaces which possess antifouling and anticorrosion properties.

Approach: The growth of microorganisms on marine surfaces may effect the subsequent growth and development of higher forms of plant and animal life. Deterioration of surfaces exposed to the marine environment by molluscs, crustaceans, and other life is usually preceded by microbial growth. This effort is being devoted to the examination of kinds and characteristics of film-forming bacteria.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0811, MICROBIOLOGICAL ASSAYS OF SEAWATER USING RADIOISOTOPES

K. GOLD, New York Zoological Society, New York, New York

Objectives: 1) To study the role of vitamins in the ecology of marine primary producers, with special emphasis on thiamine in sea water. 2) To isolate marine planktonic ciliates and other ecologically important phagotrophic and heterotrophic protozoa for studies of protozoan - phytoplankton relationships - a primary link in the marine food chain.

It was determined previously that thiamine was rapidly destroyed in sea water at temperatures greater than 30 degrees C and less rapidly at 20 degrees C. Thiamine destruction can be prevented, however, if various organic compounds are added to thiamine-enriched sea water before incubation at destructive temperatures. Among the compounds tested naturally occurring amino acids, nucleotides and citric acid were the most effective protectants. Since these or related compounds may also play the same role in nature, it is of interest to know the mechanism of protection, and, therefore, one objective of this program is to pursue this study further.

A representative of the ciliate order Tintinnopsis was isolated and has been maintained in vitro since June, 1966. Tintinnids are the most abundant and diverse ciliates found in the marine en-

vironment; they are the only ciliates found in the fossil record. Since they are voracious feeders, agglutinate particulate material to their loricae and have a rapid diversion rate, these protozoa appear to be important micro-consumers of primary producers. Their role will be evaluated by in vitro feedings studies.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0812, ECOLOGY OF PLANKTONIC FORAMINIFERA AND RELATED STUDIES

A.W. BE, Columbia University, Graduate School, Palisades, New York 10964

Geographic, vertical and seasonal distributions of shell-bearing plankton groups (Foraminifera, Coccolithophoridae and Pteropoda), based on global plankton collection obtained on board R/V Vema and Robert Conrad.

The objective is to delineate the distributional patterns of individual species in the light of such environmental factors as temperature, salinity, depth, nutrients and food. This ecological information can be used for interpreting ancient environmental conditions during which fossil assemblages (now entombed in deep-sea sediments) had lived. Multivariate statistical analysis is used to determine coefficients of proportional similarity among the many species in order to discriminate natural species groupings.

The shell microstructures of planktonic Foraminifera and Pteropoda are being examined by transmission and scanning electron microscopy and internal shell morphology is investigated by means of an X-ray projection microscope.

Research and development of plankton sampling gear is being continued to study sampling reliability.

SUPPORTED BY U.S. National Science Foundation

### 5.0813, C-14 UPTAKE, LIMITING FACTORS AND EXCRETION PRODUCTS OF ANTARCTIC PHYTOPLANKTON

P.R. BURKHOLDER, Columbia University, Graduate School, Palisades, New York 10964 (AT(30-1)3849)

With <sup>14</sup>C techniques the assimilation and excretion of carbon by marine phytoplankton will be studied in relation to light, trace elements, phosphate, nitrate, and age of plankton blooms in waters adjacent to the Antarctic Peninsula. Effects of experimental enrichment of water samples upon the rate of carbon assimilation will be studied in the Gerlache Strait and the Drake Passage. It is hoped to obtain information that will help to explain variations in productivity in neritic and oceanic areas and the great differences that have been observed in assimilating numbers in different Antarctic areas and seasons.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0814, PHOTOSYNTHETIC BACTERIA

E.H. BATTLE, State University of New York, Graduate School, Stony Brook, New York 11790

This investigation is concerned with the isolation in pure culture and characterization of representative types of photosynthetic marine sulfur bacteria. Special instruments for precision measurement of the temperature, pH, and osmotic optima for growth have been developed as valuable aids in the classification process.

This task represents an additional effort in the current program in marine microbiology. The proposed studies will be devoted to the development of stable and reliable criteria for the characterization of photosynthetic sulfur bacteria, a group of organisms commonly found in marine estuaries. These organisms occupy a unique position biologically. Comparatively little is known about them due to difficulties in isolation and cultivation in pure culture. The principal investigator has successfully isolated a large number of strains, however, and has successfully developed criteria for their characterization. The information gained from this task will add materially to our knowledge of the photosynthetic sulfur bacteria and their relationship to the marine environment.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0815, SYSTEMATICS OF ANTARCTIC HYMENOSTOMATIDA (PROTOZOA)

J.C. THOMPSON, Queens College, Undergraduate School, Charlotte, North Carolina 28207

Queens College will conduct a survey of the ciliate order of Hymenostomatida in Antarctica. The principle interest is in the freshwater and marine species of this order of Protozoa but, in addition to aquatic habitats, the principle investigator proposes surveys of available moss and lichen vegetation for obtaining collections of related groups. Living material will be studied in the field, using phase microscopy and recording observations on 16 mm phase movie film. Cultures prepared in the field will be used for selecting material for fixing and staining permanent mounts for the work at Queens College and for exchange material. Field observations will include information on life cycles, food, cysts, conjugation and characteristics of habitats. Special techniques developed by the principal investigator will be applied in the development of the systematic studies on nuclear and subpellicular bodies and fibrillar systems of hymenostome ciliates.

The work will be conducted by the principal investigator and a graduate assistant at Palmer Station.

SUPPORTED BY U.S. National Science Foundation

### 5.0816, PLANKTON ECOLOGY OF BAR-BUILT ESTUARIES

W.J. WOODS, Univ. of North Carolina, Institute of Marine Science, Morehead City, North Carolina 28557

Studies of zoo- and phytoplankton populations have been conducted for several years in Bogue Sound and Pamlico Sound, North Carolina. In addition to periodic samples of the populations, water samples are analyzed for salinity, dissolved oxygen, nitrate, nitrite, ammonia and total nitrogen, and phosphate and total phosphorus. Primary production measurements (phytoplankton) are made routinely with nutrient enrichment.

A phase just starting will attempt to evaluate the contribution of the benthic flora to the production of the sounds.

SUPPORTED BY University of North Carolina

### 5.0817, STUDIES OF THE AEROCOCCUS-PEDIOCOCCUS BACTERIA

J.B. EVANS, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

It is proposed to investigate the occurrence, general physiological activities, DNA base ratios and DNA homology of this group of bacteria. The organisms under primary consideration are Gram-positive cocci that tend to produce tetrads in suitable broth media, produce little or no catalase, generally produce greening on blood agar, and ferment glucose much less vigorously than do the lactic acid group of bacteria.

One of the initial phases of this program is concerned with the incidence of these organisms in the hospital environment and the means of differentiating them from the other Gram-positive cocci that are also found there. The physiological studies will be particularly concerned with the pathways of energy metabolism of these organisms. The DNA studies will seek to establish the basic genetic and taxonomic relationships within this group of bacteria.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0818, DEGRADATION OF MARINE SURFACES BY SALT REQUIRING BACTERIA

I.E. DUNDAS, Univ. I Bergen, Bergen, Norway (F61052-67-C-0085)

The objectives of this research are to determine the biochemical, metabolic and genetic properties of some extreme, obligate halophilic (salt-requiring) microorganisms. This will include an investigation of the significance of unique satellite desoxyribonucleic acid (DNA) found in halobacteria. Strains of microorganisms will be isolated from solar salt (salt produced from sea water by solar evaporation). These strains will be further selected by treatment with penicillin since halophiles have been shown to be sensitive to this drug. In this manner mutants will be produced auxotrophic for the various intermediates in the

metabolic pathway, permitting a study of the regulatory mechanisms involved. The presence of two species of DNA in a single bacterial strain seems to be characteristic only of the halobacteria. Using standard techniques, the investigator will attempt to discover which fractions of RNA are able to hybridize with the two species of DNA.

The study of extreme halophilics will lead to a better understanding of marine microorganisms, which are important as geochemical catalysts, as links in the food chains leading to commercially important fish, and as fouling and corrosive agents on ships and structures in the water.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0819, THE ECOLOGIC IMPACT OF THE INTERACTIONS AMONG MICROORGANISMS AND AQUATIC CONTAMINANTS IN LAKE ERIE

R.M. PFISTER, Ohio State University, Graduate School, Columbus, Ohio 43210

Particulate matter in Lake Erie water will be examined on a physical, chemical, and biological basis, and this matter will be characterized using density gradient centrifugation, electron microscopy, and certain chemical analyses. Microbial portions of the Lake Erie ecosystem will be characterized on the basis of physiological types (not identification). Primary productivity, chlorophyll distribution and photosynthesis-pigment relationships will be examined to obtain information pertinent to particulate and bacterial interactions. Algae will be collected and treated to remove physically associated bacteria. Cultures of bacteria obtained from the algae will be examined in the same manner (e.g., determine physiological types) as the non-algal associated bacteria in water. Surface tension and water content of selected chemicals will be experimentally altered to study the effects on microbial populations (physiological types) and on types of particulates found in the water. Data from these experiments will be correlated in an attempt to establish cause-and-effect relationships.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Ohio State University

### 5.0820, MODERN FORAMINIFERA OFF OREGON

G.A. FOWLER, Oregon State University, Graduate School, Corvallis, Oregon 97331

The object of the proposed study is to make a detailed examination of the foraminifera from the sea floor off the coast of Oregon. This is an almost unexplored area from the standpoint of foraminiferal ecology. Findings are expanding and augmenting existing knowledge from this and other parts of the world. Results of current investigations demonstrate considerable variation in data from three discrete samples at each station and between closely spaced profiles in the shelf. It is important to determine to what extent the variance of faunal trends occurs. Sufficient samples for this have been obtained already and are partially processed. One year is needed to complete the study.

SUPPORTED BY U.S. National Science Foundation

### 5.0821, HYDROSTATIC PRESSURE-TEMPERATURE, AS ENVIRONMENTAL PARAMETERS, ON GROWTH, BIOCHEMISTRY AND PHYSIOLOGY OF MICROORGANISMS

R.Y. MORITA, Oregon State University, Graduate School, Corvallis, Oregon 97331

Objective - a. Problem: The study of metabolic processes under the environmental extremes of temperatures near 0 degrees C and between 50 and 100 degrees C under hydrostatic pressure. b. Application: To determine whether the maximum growth temperature (at 1 atm.) can be elevated by manipulation of hydrostatic pressure and temperature. c. Specifically, interpretations of growth processes will be made at the molecular level to determine the general and specific mechanisms through which temperature-pressure interaction influences or controls these reactions.

Approach - Pressure between 1 and 1,100 atmospheres (17,600 psi.) and temperatures near 0 degrees C and 50 to 100

degrees C will be employed. In vitro studies concerned with the molecular volume and conformational changes of hot and cold marine microorganisms will furnish data concerned with the precise concept and mechanism of the pressure-temperature interrelationship that can happen in vivo.

Progress - a. 30 04 67 to 01 05 68 b. Research indicates generally that microorganisms (terrestrial and marine) coming from environments close to 1 atm. cannot tolerate pressures greater than 600 atm. Certain organisms have been isolated from deep sea environment but in the laboratory have not been shown to withstand elevated pressures from where they were isolated. Three types of organisms have been categorized according to their pressure sensitivity: 1) Cultures able to survive 4 weeks at 1,100 atmos. 2) Cultures able to survive 1 week at 1,100 atmos. 3) Cultures not able to survive 1 week at 1,100 atmos.

#### **5.0822, DISTRIBUTION OF CL. BOTULINUM E. IN FISH, SHELLFISH AND THE AQUATIC ENVIRONMENT IN OREGON**

**K.S. PILCHER**, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives are (1) to survey the distribution of this organism as indicated above by appropriate cultural methods; (2) investigate the non-toxic variant strains of the organism to determine whether reversion to toxicity may occur.

SUPPORTED BY Oregon State Government

#### **5.0823, ENERGY AND ELEMENT TRANSFER IN LOWER MARINE TROPHIC LEVELS**

**L.F. SMALL**, Oregon State University, Graduate School, Corvallis, Oregon 97331

We have been estimating energy and element transfer in marine phytoplankton and zooplankton. Energy flow in terms of organic matter assimilated by phytoplankton under different environmental conditions in the field, and the utilization of phytoplankton 'energy' by selected important grazers off the Oregon coast is being measured. Estimation of energy inputs and outputs, as well as standing stock of energy, is done in calories, carbon, and ash-free dry weight. We are initiating studies on nitrogen and major molecular constituents (proteins, carbohydrates, lipids) as other indices of energy (organic matter) transfer. We hope this year to get field measurements in an already selected marine environment characterized by single-species phytoplankton successional blooms and one period of intense grazing by a few copepod species. To our knowledge, this will be a first attempt to use essentially laboratory 'energy flow' approaches in a field situation pre-selected for its simplicity to test the approaches.

SUPPORTED BY No Formal Support Reported

#### **5.0824, MARINE BACTERIAL ENZYMES**

**J.R. MERKEL**, Lehigh University, Marine Science Center, Bethlehem, Pennsylvania 18015 (NONR)

This research is concerned with the isolation and characterization of marine bacteria in an effort to determine the influence of physical and chemical factors on their growth and enzyme production. Current emphasis is being placed on studies of their proteolytic enzyme production by these bacteria. A technique involving the separation of protein components by ammonium sulfate is being employed for the identification of the enzymes in mixtures found in culture media. Another phase of this program deals with the distribution of proteolytic bacteria in various marine localities.

This investigation is important to the Navy in yielding useful information concerning the role of bacteria and bacterial processes in the sea.

SUPPORTED BY U.S. Dept. of Defense - Navy

#### **5.0825, DYNAMICS OF OCEANIC FLANKTON**

**W.H. SUTCLIFFE**, Lehigh University, Graduate School, Bethlehem, Pennsylvania 18015

## **5. LIVING SYSTEMS (NON-HUMAN)**

Preliminary experiments have shown that the concentration of ribonucleic acid in some small marine animals may be used as a measure of growth or 'productivity'. Attempts are now being made to apply the method to marine zooplankton.

SUPPORTED BY U.S. National Science Foundation

#### **5.0826, THE CHARACTERISTICS, MECHANISMS AND BIOGEOCHEMICAL CONSEQUENCES OF PHYTOPLANKTON FLOTATION**

**T.J. SMAYDA**, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The characteristics, mechanisms and biogeochemical consequences of phytoplankton flotation will be determined experimentally. The influence of cell size, chain type and colony size, culture age, silicon and fat content on sinking rates will be investigated. The influence of organic substance liberation and the ensuring changes in viscosity, and the role of viscosity in flotation will be examined. The influence of nutrients and light on sinking rates, as well as the Gross and Zeuthen theory of flotation will also be examined. If time permits, the influence of sinking on the liberation of dissolved organic matter and on the formation of organic aggregates will also be determined.

SUPPORTED BY U.S. National Science Foundation

#### **5.0827, MULTIVARIATE ANALYSIS OF MICROPALONTOLOGICAL DATA FROM DEEP-SEA CORES**

**J. IMBRIE**, Brown University, Graduate School, Providence, Rhode Island 02912

Research initiated under NSF grant GP-4994 on fossilized microorganisms from deep-sea cores will be continued using multivariate analysis of paleontological data as a foundation for geological interpretation. Fossilized microorganisms provide an important basis for historical interpretation in geology and climatology and contribute to our knowledge of submarine processes of erosion, transport, and deposition; but to date few investigations involving mathematical treatment of micropaleontological data have been undertaken. In view of the complexity of distribution patterns, both in organisms and sediments, which result from an interplay of geologic processes and ecological controls, it is especially desirable that mathematical bases for interpretation of the geologic record be improved. It is hoped that multivariate methods may prove helpful in extracting clear, reproducible patterns from complex data, and that these patterns will in turn be of maximum benefit in the interpretation of the geologic record.

Specific objectives of the continued research are: 1) to extend the analysis to depths where previously published analyses show conflicts between temperatures inferred from *G. menardii* and from oxygen isotope data; 2) to determine how many components are needed to describe foraminiferal communities in Atlantic cores, and if possible to interpret the components ecologically; 3) to attempt to derive a mathematical relationship between isotopic temperatures and quantitative data on planktonic foraminifera.

SUPPORTED BY U.S. National Science Foundation

#### **5.0828, ELUCIDATION OF THE METABOLIC PATHWAYS OF MARINE PLANKTONIC ORGANISMS**

**T.E. MALONEY**, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

This study is concerned with demonstrating the individual physiological processes concerned with the overall metabolism of marine planktonic organisms. This includes investigation of the various enzyme systems of these organisms and demonstrating the mechanisms of these systems with respect to enzyme concentration, substrate concentrations, pH, temperature, and coenzymes. Also included are investigations to determine the cell fractions or particulates with which the various enzyme systems are associated and the isolation and purification of the enzymes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0829, EFFECT OF NITRILOTRIACETIC ACID (NTA) UPON THE TOXICITY OF METALS TO SELECTED SPECIES OF ESTUARINE PHYTOPLANKTON

S.J. ERICKSON, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Laboratory studies will be conducted to determine the relationship of nitrilotriacetic acid (NTA), a metal chelator, to the toxicity of metals to selected species of estuarine phytoplankton. The metals employed in this study will be those which are known metabolic toxins and are of importance from the standpoint of estuarine pollution.

The toxicity of the various metals to six species of phytoplankton will be determined in the presence of several concentrations of NTA. In addition to growth rate, C14 labeled carbon dioxide will also be employed as a parameter for determining levels of metal toxicity.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0830, EFFECTS OF PETROLEUM AND PETROLEUM WASTES UPON IMPORTANT SPECIES OF ESTUARINE PHYTOPLANKTON AND ZOOPLANKTON

J.H. GENTILE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

The effects of petroleum and petroleum wastes upon important species of estuarine phytoplankton and zooplankton will be assessed. Assays on zooplankton will employ acute toxicity to various stages in the organisms' life history as the principal parameters. Assays on phytoplankton will involve the effects of pollutants on growth, photosynthesis, and respiration as well as mechanical effects such as cell lysis. Comparative toxicity of different types of petroleum products will be investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0831, INTEGRATED FIELD AND LABORATORY SYSTEM FOR ASSAYING THE EFFECTS OF POLLUTANTS AND TOXICANTS UPON WATER QUALITY

J.H. GENTILE, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

The purpose of this project is to investigate the effects of pollutants and toxicants on natural populations of marine phytoplankton as well as on axenic cultures of selected species comprising these populations. Assays will be performed in natural and defined seawaters in such combinations as to obtain a continuum of responses. Laboratory cultures will be designed to simulate field conditions. Measurement of photosynthesis and respiration rates using radioactive carbon will be the principal technique employed and will be correlated with long-term growth studies.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0832, USE OF MARINE PLANKTONIC ORGANISMS FOR EVALUATING THE QUALITY OF MARINE AND ESTUARINE WATERS

T.E. MALONEY, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

This project is concerned with the development of bioassay methods and techniques, employing various species of marine phytoplankton and zooplankton, for determining the toxicity and identity of pollutants in the marine environment and for determining and predicting the short- and long-term effects of lethal and sublethal concentrations of pollutants upon planktonic organisms and other organisms in the marine environment.

The test species will include those which are ecologically important and, in the case of zooplankton, their various life stages.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0833, DETERMINATION OF SELECTED ENVIRONMENTAL REQUIREMENTS OF IMPORTANT MARINE PHYTOPLANKTON SPECIES

J.C. PRAGER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Studies have been initiated to determine minima, optima, and maxima of selected physical and chemical requirements of four ecologically and economically important species of unicellular marine algae. Requirements considered in this program are nitrogen, phosphorus, sulfur, and silicon; also temperature, light, major cations, and redox. Methods used on axenic cultures in synthetic seawater media are growth studies, radioisotopic tracer techniques, chemostatic culture and continuous culture techniques, and various physical methods of measuring environmental changes. Species studied are *Skeletonema costatum*, *Olisthodiscus luteus*, *Nanochloris oculata*, and *Dunaliella tertiolecta*.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0834, DEVELOPMENT OF CULTURE METHODS FOR ECOLOGICALLY IMPORTANT MARINE ZOOPLANKTON SPECIES

E.J. ZILLIOUX, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Methods to culture large numbers of individuals of *Acartia tonsa*, *A. clausi*, *Pseudodiaptomus coronatus*, *Tisbe furcata*, *Calanus* sp., and *Tigriopus californicus* are being devised and tested in conjunction with another project concerned with environmental requirements of these species. Desiderata are the production of large numbers of individuals in a minimal volume of medium, successful completion of life cycles through several generations, elimination of undefined chemical compounds from the medium, simplicity of apparatus, definition of food materials, and ability to operate on a continuous basis.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0835, DETERMINATION OF SELECTED ENVIRONMENTAL REQUIREMENTS OF IMPORTANT SPECIES OF MARINE ZOOPLANKTON

E.J. ZILLIOUX, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

*Acartia tonsa*, *A. clausi*, *Pseudodiaptomus coronatus*, *Calanus* sp., *Tisbe furcata*, and *Tigriopus californicus* are undergoing experimentation to determine optimal conditions of temperature, salinity, oxygen saturation, and food materials for successful completion of their life cycles. Organisms are cultured and subcultured in the laboratory under small volume, static conditions. End points and condition of cultures are determined by microscopic examination of life cycle progress, in some experiments using time-lapse photography.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0836, STUDIES ON THE DEVELOPMENT OF DERMOCYSTIDIUM MARINUM

J.G. MACKIN, Texas A & M University System, Graduate School, College Station, Texas 77843

Studies to date have showed that *Dermocystidium marinum* Mackin, Owen, and Collier, a parasite of oysters, is a member of the Labyrinthales, and methods of culture have been developed. Extension of this work aims at study of the developmental cycle in culture, the relations beyond the Labyrinthales, and application of increased knowledge of epizootiology toward control of the disease in Gulf Coastal estuaries.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0837, LABORATORY STUDIES OF TOXIC DINOFLAGELLATES

S.M. RAY, Texas A & M University System, Graduate School, College Station, Texas 77843

Shellfish oysters, clams, and mussels are being subjected to laboratory cultures of Gulf of Mexico dinoflagellates (*Gymnodinium breve* and *Gonyaulax monilata*) which are toxic to marine fishes, to determine if these shellfish will produce toxic symptoms when eaten by mammals and birds. We have induced shellfish poisoning in chicks by feeding them oysters which had been subjected to *G. breve* cultures. The influence of variable cul-

ture conditions and media on the relative toxicity of *G. breve* and *G. monilata* cultures, and the influence of such factors on the stability of the toxin(s) in shellfish will be investigated. Furthermore, factors that might influence the feeding activity of shellfish subjected to cultures of these dinoflagellates will be considered. Pharmacological and toxicological studies will be conducted to determine the nature and mode of action of the toxins produced by these two dinoflagellates. The purpose of the proposed work is to gather information that will permit the evaluation of the Gulf of Mexico dinoflagellates as potential etiological agents for paralytic shellfish poisoning. Basic information will be obtained on dinoflagellate-mollusc relationships, and thus contribute to our knowledge of ecology and physiology of these two groups of organisms. Other species of Gonyaulax: *G. acatenella*, *G. catenella*, *G. tamarensis*, *G. polyedra*, *G. polygramma*, *G. sphaeroidea*, *G. spinifera*, and *G. washingtonensis*, will also be studied. The proposed studies are a part of this laboratory's long-range research program in molluscan biology.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0838, BIOLOGICAL OCEANOGRAPHY (GULF OCEANOGRAPHY PROGRAM)**

*C.J. GUICE*, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

The ecological factors of the ocean environments must be known to make possible the predictions of shrimp productivity. The exact influence of an influx of oceanic water over the continental shelf is not known. To do this, some constant quality of the significant water mass must be measured, and this may be accomplished by a grouping of microplanktonic constituents.

Project objectives are to determine (1) the distribution and abundance of plankton species and their association with water masses in the Gulf; (2) which, if any, planktonic organisms are sources of food or predators, or both, for larval and postlarval stages of shrimp and (3) to correlate the distribution and abundance of plankton with physical and chemical properties of Gulf waters and evaluate the use plankton as indicators of significant water masses.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0839, ULTRASTRUCTURAL STUDIES OF PARASITIC AND SAPROPHYTIC FUNGI AND PROTOZOA ASSOCIATED WITH MARINE INVERTEBRATES**

*F.O. PERKINS*, Virginia Inst. of Marine Sci., Gloucester Point, Virginia 23062

The research effort is being directed toward elucidating the fine structure of the following organisms in an attempt to better understand their life cycles and to better understand the host-parasite interactions: *Minchinia nelsoni*, *Minchinia costalis*, 'Pepper-crab' disease organism, *Labyrinthula* sp., *Labyrinthomyxa marina*.

The taxonomy and phylogenetic relationships of the above protists will be re-evaluated upon completion of this study. Comparisons of the various organelle systems will be made with comparable systems in higher plants and animals.

SUPPORTED BY Virginia State Government

**5.0840, A COMPARATIVE SYSTEMATIC INVESTIGATION OF MARINE CILIATES IN THE HOLOTRICHOUS PROTOZOAN ORDER HYMENOSTOMATIDA**

*J.C. THOMPSON*, Hampden Sydney College, Undergraduate School, Hampden Sydney, Virginia 23943

The proposed research will involve a comparative systematic study, especially of the somatic and buccal ciliature, of marine ciliates in the order Hymenostomatida. The primary objective of this investigation will be to collect marine ciliates in the order Hymenostomatida and to establish a system of taxonomy based on precise morphological data.

SUPPORTED BY U.S. National Science Foundation

**5. LIVING SYSTEMS (NON-HUMAN)**

**5.0841, THE ECOLOGY OF COCCOLITHOPHORIDACEAE IN THE ATLANTIC COASTAL WATERS OF THE UNITED STATES**

*H.G. MARSHALL*, Old Dominion College, Graduate School, Norfolk, Virginia 23508

The purpose of this research is to determine the spatial distribution of the coccolithophores in Atlantic coastal waters of the United States between Massachusetts and Florida. This represents a quantitative and qualitative study of the coccolithophores and other phytoplankters that are present at different seasons, over a four year time period. Collections have been made along transects over and beyond the continental shelf to depths of 300 meters. Emphasis has been placed on distribution and vertical stratification patterns of these algae and the classification of representative species.

Diurnal distribution patterns and the characteristic phytoplankton of the continental shelf waters, the Gulf Stream, and the Sargasso Sea are included in this investigation. Specific physical and chemical data have also been collected at each hydrostation. The use of an electronmicroscope has been utilized in the identification of coccolithophore species.

SUPPORTED BY U.S. National Science Foundation

**5.0842, NATURAL HISTORY OF SALMON POISONING RICKETTSIAE**

*R.L. OTT*, Washington State University, School of Veterinary Medicine, Pullman, Washington 99163

The objectives of this project are to expand the knowledge available on the role of helminthic endoparasites as reservoirs and vectors of viral and rickettsial diseases.

Work in this laboratory demonstrated that *Neorickettsia helminthoeca* the etiological agent of salmon disease of dogs, as well as another as yet unclassified rickettsial agent persist, remain viable and infectious for at least seven years in the metacercarial stage of the fluke *Nanophyetus salmincola*, encysted in a salmonoid fish. It has also been demonstrated here that the same fluke can transmit, at least mechanically, the virus of infectious canine hepatitis.

Experimental model systems are being developed to demonstrate the persistence and retention of virulence of the virus of infectious canine hepatitis in the canine dog around worm-*Toxocara canis* and a dog tapeworm-*Taenia taeniaformis*. Additional model systems are being developed to show the persistence of the virus of feline panleucopenia in the cat roundworm *Toxocara cati* and the tapeworm *Taenia taeniaformis*.

These experimental model systems will simulate natural endoparasite-virus relationships and hopefully will demonstrate how many infectious agents persist from one host generation to the next.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.0843, INPEC BIOLOGICAL OCEANOGRAPHY - (PHYTOPLANKTON AND ZOOPLANKTON RESEARCH)**

*F. FAVORITE*, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

Studies in progress in biological oceanography include phytoplankton productivity and zooplankton ecology.

Productivity and standing stock of phytoplankton and associated physical and chemical factors are measured seasonally in various water masses of the Pacific Subarctic region. The objectives are to assess the seasonal and annual primary production and determine its gross interrelationships with the environment. This work will continue with emphasis on the timing of changes in primary productivity during spring and associated changes of environmental conditions, especially zooplankton.

The zooplankton project is designed to study the seasonal and annual variations in abundance, distribution, and species composition of zooplankton populations with respect to known water regimes and environmental conditions in the central North Pacific Ocean. Current interest is directed toward study of the rapid increase of zooplankton organisms. Information from these investigations is necessary to understand the causes of variations in the migratory paths, growth and survival of salmon in the North Pacific Ocean and Bering Sea. Probable spin-off benefits:

## 5. LIVING SYSTEMS (NON-HUMAN)

specific zooplankton may serve as markers of matter masses and may be critical items in the food chain of other commercially important fishes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0844, PREDICTION OF BIOLOGICAL POPULATIONS FROM THE PHYSICAL OCEANIC ENVIRONMENT K. BANSE, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

Objective: A precise and reliable modeling technique for the prediction of both temporal and geographic occurrence of marine organisms would provide the Navy with a major informational asset in the resolution of such biologically produced operational problems as the sonic scattering layers. One of the most sensitive factors available for distributional predictions of motile marine organisms is the cosmopolitan and fundamental link in the oceanic food-chain represented by the phytoplanktonic forms. Since the principal theoretical model of plankton abundance extant lacks comprehensive field data for verification and refinement, this work unit has been expressly designed to supply such data and advance the level of predictive competence in this area.

Approach: The principal investigator will utilize commercial 'Ships of Opportunity' plying the Seattle-Yokohama route, as well as deploying the R/V Thompson to gather the quantified data necessary to verify or modify the Sverdrup Model of planktonic abundance. Data will be obtained for: chlorophyll A, mixed oceanic layer depth, extinction coefficient of light in the sea, incident surface radiation, volume of plankton, and nutrient concentration. Cruises are being concentrated in the February-June period of rapid planktonic growth and the geographic areas of interest are the temperate and subarctic North Pacific.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0845, NUTRIENT LIMITATION AND SOURCES OF NITROGEN FOR MARINE PRIMARY PRODUCTION R.C. DUGDALE, Univ. of Washington, Graduate School, Seattle, Washington 98122

The program is in three main areas: Nutrient Limitation A mathematical model describing the behavior of nutrient-limited phytoplankton populations under steady-state has been constructed. The transient behavior of this model and solutions for more complicated models will be investigated through simulation techniques using digital computers. Observations at sea have indicated silicate limitation in Peru coastal waters and nitrate limitation in the Bering Sea. Using the model for experimental design, attempts will be made to extend and confirm these preliminary observations.

Uptake of New and Regenerated Nitrogen in Primary Production: Measurement of primary production with  $^{15}\text{N}$  has been proposed and some measurements already made. Nitrate uptake is called 'new production'. The total amount of new production as nitrate uptake and nitrogen fixation (or atmospheric precipitation in some cases) sets the maximum limit for losses from a steady-state phytoplankton population. Additional measurements using incubation techniques identical to those employed in some  $^{14}\text{C}$  measurements of primary production will be made. The technique may be useful in understanding food-chains in some areas.

Nitrogen Fixation A new technique, faster and more sensitive than the  $^{15}\text{N}$  method is to be calibrated and modified for use at sea. Acetylene is converted to ethylene by the nitrogen fixing enzyme system. The method of detection for ethylene is by gas chromatography. The low cost of the equipment and the simplicity and rapidity of the experimental procedure will make it possible to measure nitrogen fixation over broad areas of the ocean. The increased sensitivity makes it possible to look for low level nitrogen fixation.

SUPPORTED BY U.S. National Science Foundation

### 5.0846, ANAEROBIC BACTERIA IN THE MARINE ENVIRONMENT J. LISTON, Univ. of Washington, Graduate School, Seattle, Washington 98122

Enumeration and isolation of anaerobic bacterial populations of water, sediments and animals in Puget Sound and adjacent waters will be continued. The presence of terrestrial pathogenic anaerobes in fish caught in polluted areas and the possible transfer of these organisms to the consuming public via the market chain will be investigated by selective sampling and laboratory experiments.

The identification of anaerobic bacteria isolated from the marine environment will continue by the use of appropriate media and techniques. The function of these organisms and their potential for survival and growth (particularly pathogenic) in the marine environment will be studied by growing isolates over a temperature range on a polythermostat to establish the minimum growth temperatures. In addition to this, the combined effects of temperature and pressure will be investigated.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0847, MARINE PHYTOPLANKTON RESEARCH R.E. NORRIS, Univ. of Washington, Graduate School, Seattle, Washington 98122

The primary phases of the research are 1) research on species of coccolithophorids and small dinoflagellates in preserved samples collected in the Indian Ocean; 2) isolation of northeastern Pacific and Indian Ocean species into unialgal culture, and using the isolated species for studies on life-histories, cytology, and nutrition; 3) investigation of species that seem to utilize the water's surface film at some phase of their life-history, with particular attention to the possible ways this adaptation has effected their morphology; 4) studies on consortism and symbiosis in marine phytoplankton, especially with respect to culture of species from tropical and sub-tropical regions. Host and consort are cultured independently if possible, nutritional studies are being carried on, and compared, for the isolated species and the consorting pairs.

SUPPORTED BY U.S. National Science Foundation

### 5.0848, AQUATIC MYXOBACTERIA - CHONDROCCUS COLUMNARIS E.J. ORDAL, Univ. of Washington, School of Medicine, Seattle, Washington 98122

Comparative studies are being carried out on aquatic myxobacteria pathogenic to fish with special emphasis on *C. columnaris* which is of particular importance as an agent of disease in fishes in the Pacific Northwest. Comparison will be made with cultures isolated or obtained from fish in regions other than the Pacific Northwest. The myxobacteria associated with diseases of Atlantic salmon, reported to be a form of columnaris disease active at low water temperatures, are of particular interest. New antisera will be prepared for identification of specific strains of *C. columnaris* by antigenic analysis. Further studies will be made on the role of water temperatures in diseases of fishes including exploration of the possibility that high water temperature may induce increased virulence in strains of *C. columnaris*.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0849, MARINE-BACTERIA CULTURE E.J. ORDAL, Univ. of Washington, Graduate School, Seattle, Washington 98122 (NONR)

This research involves: (1) the development of a steady state enrichment culture for selection of particular physiological types of aquatic or marine bacteria, and (2) the investigation of definitive groups of aquatic and marine bacteria. These bacteria include vibrios, stalked and budding bacteria, and myxobacteria.

This problem is significant to the Navy in improving the understanding of important food elements; possible mechanisms of corrosion, deterioration, and fouling, and other areas.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0850, ECOLOGY OF CLOSTRIDIUM BOTULINUM TYPE E IN GREEN BAY H. SUGIYAMA, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The presence of *Clostridium botulinum* type E in and on the fish of the Great Lakes constitutes a botulism hazard. The organism is particularly prevalent in Green Bay, not only in fish but also in environmental samples. The very low incidence of type E in the soil away from the aquatic environment suggests that passive accumulation of the organisms being carried down from the surrounding land mass is not the only explanation for this distribution. Attempts will be made to show the multiplication of type E in the bay itself. Other sources of the organism which contribute to the maintenance of the type E population in Green Bay will be studied. Effects of other microflora in limiting the growth of type E will be investigated. Contributions of industrial wastes and treated sewage to the growth of type E will be sought. Factors which prevent the multiplication of the botulinal organism in the living fish will be studied. Improvements in the procedures for the detection and isolation of type E from natural samples will be attempted. The relationship between *C. botulinum* type E and non-toxicogenic 'E-likes' will be studied.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

#### 5H. ECOLOGY, GENERAL

(*environmental Studies Specifically Oriented Toward Effects on Organisms; Effects of Pollution on Marine Habitats*)

##### 5.0851, COASTAL AND INSHORE OCEANOGRAPHY

H.E. BRUCE, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

This project is a comprehensive study of the chemical, biological, and physical oceanography of selected estuarine environments in Southeast Alaska.

The objectives are to describe the general physical, chemical, and biological oceanographic conditions of the inside waters of Southeast Alaska and the seasonal and annual variations in these conditions. The oceanographic work is done in conjunction with other investigations of the Auke Bay Laboratory (Marine Biological Investigations and Shellfish Investigations) and with the Federal Water Pollution Control Administration and the University of Alaska. The combined effort by the above groups resulted in detailed 'ecosystem studies' of selected areas.

The oceanographic studies are broken down into physical and descriptive oceanography and chemical and biological oceanography which results in an over-all comprehensive program in oceanography. Biological oceanography includes studies in phytoplankton ecology, taxonomy, primary and secondary productivity, and energy transfer from the primary producers through the primary herbivores. Also included are studies on dissolved and particulate organic materials and their relations to primary and secondary trophic levels and to benthic organisms.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 5.0852, ESTUARINE STUDIES OF SOUTHEASTERN ALASKA

J.B. KIRKWOOD, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

One of the aims of the Auke Bay Biological Laboratory is to accumulate detailed descriptive information on environmental characteristics of several estuarine environments within the inside waters of Southeastern Alaska, and to explain ecological reasons for some of the observed differences between environments. The ecological differences are undoubtedly responsible for the annual fluctuations and distributions and abundances of commercially valuable fish and shellfish species.

It is apparent that descriptive knowledge of local populations and their environments are not sufficient in themselves to provide a clear concept of basic ecological and biological principles controlling an ecosystem however, such knowledge is a prerequisite to planning and conducting more detailed and intensive studies of discrete ecological and biological problems.

A cooperative study was initiated in April 1967 that will involve Oceanography Investigations, Marine Biological Investigations, Shellfish Investigations of the Auke Bay Biological Laboratory, and outside agencies such as Federal Water Pollution Control Administration and the Institute of Marine Sciences, University of Alaska.

## 5. LIVING SYSTEMS (NON-HUMAN)

Each group submits a separate description of its proposed participation in the cooperative estuarine study. The shellfish investigations study involves the following objectives: (1) To determine species composition and relative abundance of pelagic and benthic invertebrates. (2) To determine the relationship between species composition, distribution, abundance, and the environment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

##### 5.0853, ARCTIC BIOLOGICAL OCEANOGRAPHY

M.B. ALLEN, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

It is well known that the polar seas are among the most productive oceanic areas of the world, in spite of the low temperatures and the fact that the photosynthetic organisms responsible for primary production must spend several months of the year in total darkness and several more months with a notably limited amount of light, which may differ appreciably in spectral distribution from normal sunlight due to absorption and scattering of light by ice and materials trapped in it. The Arctic Ocean is especially rich in phytoplankton and grows few benthic plants, although an extensive benthic algal bed has been reported near Point Barrow, Alaska, and beds of eelgrass are found in several arctic and sub-arctic locations on the Alaskan coast. If there is active growth of any of these organisms during the winter months, it must imply both the possibility of heterotrophic metabolism of the organisms and the availability of sufficient organic materials to support growth in the waters. The organic material need not necessarily be dissolved; many phytoplankton have the capacity for phagotrophy. The general objectives of this project are to determine (1) whether growth of photosynthetic organisms does occur during the arctic winter, (2) if so, what organic materials are used by the organisms involved, (3) whether these organic nutrients are present in the waters in which the organisms are found, (4) the yearly light and temperature regime to which the organisms are actually exposed, and (5) what are the mechanisms of adaptation which permit photosynthetic organisms to store sufficient reserves to help them through the months of total darkness in spite of much of a year spent at low light intensity. Both marine and freshwater environments will be investigated.

SUPPORTED BY U.S. National Science Foundation

##### 5.0854, MARINE BIOLOGY IN ALASKA

K.M. RAE, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735 (NONR)

The object of this task is to increase scientific knowledge of the hydrobiology of Alaskan waters and to analyze peculiarly Arctic and sub-Arctic biological conditions. A group of scientists is chosen yearly by the Director of the Institute, with the Scientific Officer's approval, to conduct short-term research in this area. Field work is emphasized. During the coming year, work will continue on cation exchange on particles and the availability of 'sorbed' metals to the biota, and the biology and hydrobiology of the Aleutian Trench. New work will include the isolation of a new amino acid with an unusual chemical structure from marine coelenterates, and possibly from ciliates; the ecology and fine structure of Arctic sponges and the relationship to the silicon cycling in the sea.

SUPPORTED BY U.S. Dept. of Defense - Navy

##### 5.0855, ECOLOGICAL STUDIES OF THE COPPER RIVER DELTA

B. HILLIKER, State Dept. of Fish & Game, Juneau, Alaska

Objectives: To determine the effect of land uplifting associated with the earthquake of March 27, 1964 on the production of waterfowl on the Copper River Delta.

Procedures: 1. Establish permanent vegetation sampling plots or transects within parts of the Copper River Delta used by ducks, geese, and swans during the breeding season. 2. Using this sampling system, construct a map of the Delta (or a segment of it) showing the present distribution of vegetation types. 3. Obtain detailed descriptions on the plant communities now present, including species composition, the form or structure of each vegeta-

## 5. LIVING SYSTEMS (NON-HUMAN)

tion type, and the sites on which the types are found. 4. Census spring breeding populations of waterfowl by aerial and ground counts, and map areas of high and low density of important species. 5. Measure production through use of permanent nest sampling units, aerial and ground brood counts, and other methods as needed.

Alaska State Government

### 5.0856, GULF OF CALIFORNIA BIOLOGY

*D.A. THOMSON*, Univ. of Arizona, Graduate School, Tucson, Arizona 85721 (N00014-67-A-0209-0003)

This is a long-term program for the elucidation of the intertidal and oceanic biology of the Gulf of California, a little known area scientifically, but one of real interest due to its isolation, linked with a high incidence of endemism and extreme tidal ranges along the typically hot, arid, desert climate of the Mexican Sonoran Coast. The International Marine Research Station at Puerto Penasco is jointly operated by the Universities of Arizona and Sonora (Mexico), and represents a unique research facility for studies in tropical biology by scientists from both cooperating countries.

This project which has as its goal a predictive level of ecological knowledge concerning those biological entities or systems which may affect Naval activities. In order to make such predictions, it is necessary to know as much as possible about the factors leading to such conditions as: alterations in bottom conditions due to density variations in biological populations, shoreline and emergent beach changes, bioluminescence, and emission absorption, or reverberation of acoustic transmissions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0857, INTERRELATIONSHIPS OF MARINE ORGANISMS AND SEDIMENTS

*R.N. GINSBURG*, Bermuda Biolog. Sta. For Res., Saint George, Bermuda

The objective of the proposed program is to bring together exceptional graduate students and staff, from diverse fields of specialization, to observe, study, and to do research on the complex interactions between living organisms, bottom sediments, and rocks, and sea water.

The program consists of two parts: (1) For the first three weeks of the course, students are introduced to shallow-marine environments, their organisms, and sediments. They learn the common organisms, make maps of selected areas, and examine the bottom sediments. Half-day field exercises alternate with laboratories, and lectures. (2) The last three weeks of the seminar are spent on individual research projects of the students' own choosing. This past year each student prepared an illustrated report of his results. These brief papers will be published during the year.

SUPPORTED BY U.S. National Science Foundation

### 5.0858, ECOLOGICAL SURVEY OF EFFLUENT DISCHARGE AT TWO PULP MILLS IN HUMBOLDT COUNTY, CALIFORNIA

*J.A. GAST*, Humboldt State College, Graduate School, Arcata, California 95521

A continuing study is being carried out on benthic organisms, fish, commercial crabs, and water quality to see if there is any significant affect on the environment by the discharge of pulp mill effluent into the near shore waters of Humboldt County, California.

Sampling of bottom invertebrates with a Smith-McIntyre bottom grab is conducted monthly at specified locations.

Sampling of water for chemical analysis and temperature measurements are made at regular periods.

Sampling of the neckton and commercial crabs by otter trawls. Otter trawl catches are examined on a quarterly basis.

SUPPORTED BY Georgia Pacific Corporation  
Crown Simpson Pulp Company

### 5.0859, THE ECOLOGICAL ARCHITECTURES OF THE MARINE BIOSPHERE

*J.W. VALENTINE*, Univ. of California, Graduate School, Davis, California 95616

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY John S. Guggenheim Memorial Foundation

### 5.0860, ENVIRONMENTAL BIOLOGY OF TOMALES BAY

*E.H. SMITH*, Univ. of The Pacific, Graduate School, Dillon Beach, California 94929

The principal objective of the research is to learn how marine communities change in time under natural and artificial conditions. It must be stressed that the research now in progress has passed the faunal check list stage and moved into the investigation of individual organisms or groups of organisms and their relationship to the environment in which they are found. Such knowledge is required in order to evaluate and control the effect of man on the marine environment. Tomales Bay is one of the last unpolluted bays on the West Coast of the United States. The establishment of the Point Reyes National Seashore is expected to increase the artificial disturbance of the shallow water marine communities to an appreciable extent. It should be possible to observe the reciprocal effects between the increasing human population and the marine communities by maintaining a program monitoring the ecosystem. Data on physical and chemical parameters will be used to assess the relationship between the environment of individual organisms to the general environment of the region. This information can be used to reconstruct the pathways by which stress is applied to the community. Studies of functional morphology and environmental physiology will help to show how marine species react to changing conditions. The data acquired in these studies can be used to predict the impact of man on the marine environment elsewhere and to the ultimate feedback to human welfare.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0861, MARINE COMMUNITIES

*E.W. FAGER*, Univ. of California, Scripps Inst. of Oceanography, San Diego - La Jolla, California 92038 (NONR)

The objective is to understand the structure and dynamics of shallow bottom communities through observations of activities in the natural environment, and measurements of community and environmental parameters. A secondary objective is to extend the same or analogous methods to plankton communities. Measurements of the distribution and life histories of bottom organisms are made by diving. Plankton distributions are obtained from samples collected on cruises to critical areas. Critical points in life histories are checked by culturing organisms in the laboratory. The total approach is a combination of field observation and experimentation with laboratory studies and computer simulation and analysis. In the near future, it is planned to increase the amount of experimental manipulation of the environment, for example, by setting up replicated 'reefs' and moving or rearranging them from time to time. Improvements in the now widely used computer program for grouping will continue.

The key to methods of control, avoidance, or utilization of organisms is frequently found in observations of the kind described here whereas without them, the development of a specific method is often expensive and of limited applicability.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0862, SIMULATION STUDIES OF ECOLOGICAL COMMUNITIES

*E.W. FAGER*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

A simulation space program for ecological communities is being developed. It will now take up to 50 species. It uses biologically interpretable input data such as age-specific birth and death rates, growth rates, feeding rates, feeding preferences, etc. All population parameters are in terms of individuals; all growth and feeding relations are in terms of micrograms of carbon. The ef-

fects of changes in the input data, of changes in the interrelations between species and of perturbations involving sudden increases or decreases in some species can be investigated. It has been run on data for two species of copepods and two species of chaetognaths that are abundant in the nearshore waters. The results seem to constitute realistic predictions of what is seen in samples taken in the field. A few somewhat unexpected results have been obtained: cannibalism may be an effective way for a predator to maintain itself for a short time in the absence of prey; mortality associated with factors other than predation seems relatively unimportant in control of population size and persistence; in the presence of random variability in reproductive success, a pattern of births spread over several time periods is superior to one with the same intrinsic rate of increase but with the birth all at one time period. The model is being used to explore the consequences of different population parameters and patterns of birth and death and of different predator-prey and prey-prey interrelations.

SUPPORTED BY U.S. National Science Foundation

**5.0863, RECENT AND ANCIENT FAUNAS OF A DROWNED ISLAND CHAIN (MID-PACIFIC MOUNTAINS)**  
*W.A. NEWMAN*, Univ. of California, Graduate School, *San Diego - La Jolla, California 92038*

The fauna of guyots and deep seamounts remains virtually unknown. Intensive sampling should provide material with which to commence the analysis of several fundamental problems related to the fauna of guyots. Dredging of fossil deposits will provide information pertaining to the composition and affinities of past faunas, their relationship to present Pacific faunas, and the history of submerged islands.

The Mid-Pacific Mountains have been selected for such investigation. They are presently represented by an extensive chain of seamounts and guyots at 1,500 - 2,000 m, separated from one another by considerable depths. During the Cretaceous the guyots stood at the surface as oceanic islands. Fossil outcrops of shallow water origin are known to occur.

Major sampling tools to be employed are, free vehicle trap, set line and camera, pipe dredge, otter and bean trawl, and Isaacs-Kidd Midwater Trawl.

Continuous Reflection Profiling with the Arcer will be used in order to reveal thickness and distribution of sediment overlying ancient land forms.

On an available-time basis, a recently charted seamount N.E. of Midway Island rising to within 35 fathoms of the surface, will be sampled by dredging and coring.

SUPPORTED BY U.S. National Science Foundation

**5.0864, INTERACTIONS OF INTERTIDAL POPULATIONS**  
*J.H. CONNELL*, Univ. of California, Graduate School, *Santa Barbara, California 93018 (NONR)*

The investigator is analyzing the population dynamics of a selected group of organisms which inhabit the intertidal regions of rocky marine beaches. Particular emphasis is placed on the interrelationships involving the activities of predators and prey animals and the environmental factors which contribute to the equilibrium of the system.

Because the Navy conducts its operations in the oceans, it is necessary to understand as much as possible about their ecology and the factors influencing it. Marine biological communities pose many specific problems, the group under study contributing notably to fouling and deterioration, modification of bottom sediments or beach conditions, masking of acoustic signals. The phenomenon of community dynamics and balance, however, applies even more broadly and relates to all aspects of hydrobiology.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.0865, ECOLOGICAL STUDIES OF ROCKY SUBTIDAL AREAS**  
*C.H. TURNER*, State Dept. of Fish & Game, *Terminal Island, California*

## 5. LIVING SYSTEMS (NON-HUMAN)

Objective: To study the plant and animal communities of rocky subtidal areas, including taxonomic classification and correlation between species and their relationships to sport fish populations.

Procedures: Studies will be devised to answer questions on the total ecological picture of these rocky subtidal areas, including interrelationship of species, relationship to substrate, and relationship of each to sport fishes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
 California State Government

**5.0866, ECOLOGY OF PANAMANIAN REEF COMMUNITIES**

*P. GLYNN*, Smithsonian Institution, *Balboa Heights, Canal Zone*

Studies on the ecology and behavior of tropical marine invertebrates.

SUPPORTED BY Smithsonian Institution

**5.0867, ECOLOGY OF THE PORITES FURCATA REEF-FLAT COMMUNITY**

*P.W. GLYNN*, Smithsonian Institution, *Balboa Heights, Canal Zone*

This project is concerned with studies on the ecology of the shallow-water *Porites furcata* assemblage which occurs on the reef-flat habitat of coral reefs located along the southwestern coast of Puerto Rico and on the Atlantic seaboard of Panama. Initial, major emphasis has been given to a study of the meteorology, hydrography and plankton populations. Additionally, a systematic program involving the procurement of quadrat samples and other quantitative measurements needed to assess spatial and temporal variations of the biota, has been executed on a long-term basis. The ultimate aim of the investigation is to obtain information on the following aspects of the coral community. a. composition and structure of the biological components; b. food interrelationships; c. movement of energy and materials through the assemblage.

SUPPORTED BY U.S. National Science Foundation

**5.0868, ZONATION OF THE WEDDELL SEA BENTHOS**  
*J.S. RANKIN*, Univ. of Connecticut, Graduate School, *Storrs, Connecticut 06268*

The Weddell Sea, an area of essentially constant environmental characteristics, is an ideal 'laboratory' for the study of factors affecting the distribution of marine benthic organisms. The prevailing hypothesis, that these organisms are zonally present because of temperature regimes, will be tested through intensive collections at a few stations at representative depths. The waters in this sea should be at essentially the same temperature at the various depths. Similarity or differences in species distribution and abundance, therefore, may be ascertained, with temperature a 'controlled' factor. Subsequent studies should evaluate other factors than temperature.

SUPPORTED BY U.S. National Science Foundation

**5.0869, AN ANALYSIS OF PHOSPHORUS AND NITROGEN COMPOUNDS IN TIDAL MARSHLAND DRAINAGE - LABORATORY PROCEDURES**

*F.C. DAIBER*, State Board of Game & Fish, *Dover, Delaware*

Objective: An evaluation of the effects of various types of marshland management on the diurnal and seasonal concentrations of phosphorus and nitrogen in tidal marshes.

Procedures: The water samples collected in the field will be processed in the following manner: 1. Inorganic phosphorus - Reimold, R. J., 1965. An evaluation of inorganic phosphate concentrations of Canary Creek Marsh. This procedure requires that inorganic phosphorus determination be made immediately after sample collection to avoid errors due to sample storage. The determination, a spectrophotometric technique, requires electrical power. 2. Total phosphorus - Water samples for total phosphorus concentrations are processed upon return to the Bayside Laboratory. The sample is oxidized in an ordinary au-

## 5. LIVING SYSTEMS (NON-HUMAN)

toclave according to the technique of Menzel, D. and Corwin, N. 1965. This procedure converts all phosphorus to the inorganic form which can then be measured by the technique of Reimold as cited above. 3. Organic phosphorus concentration is determined by the difference between the initially measured inorganic form and the subsequent total phosphorus determination. 4. Nitrate nitrogen - Wood, E.D., F. A. J. Armstrong, and F. A. Richards. 1967. This technique offers extreme accuracy and is easily used in the field. In this new method nitrate is converted to nitrite and then measured as in number 5. 5. Nitrite nitrogen - Strickland, J.D.H., and T. R. Parsons. 1960. A manual of sea water analysis. Fish Res. Bd. Can. 125:71-74. 6. Ammonia nitrogen - Roskam, R., and D. de Langen. 1964. A simple colorimetric method for the determination of ammonia in sea water. Anal. Chim. Acta 30: 56-59. 7. Salinity will be measured by the conductance method using an induction salinometer

The results will be processed for computer evaluation of the various suspected relationships between the phosphorus and nitrogen concentrations and related physical parameters measured. The I.B.M. computer program STUFF (Sixteen Twenty Universal Function Fitter) will be used to determine significant relationships between organic phosphorus, inorganic phosphorus, total phosphorus, nitrate, nitrite, ammonia, salinity, water temperature, air temperature, tide state, time, lunar phase, day of year and weather. Other statistical and graphical techniques may also be employed to interpret the data.

### 5.0870, TIDE MARSH ECOLOGY AND WILDLIFE

F.C. DAIBER, Univ. of Delaware, Graduate School, Newark, Delaware 19711

This project involves an analysis of phosphorus and nitrogen compounds in tidal marsh drainage with an evaluation of the effects of various types of marshland management. Preliminary results indicate that highest concentrations of nitrate and nitrite nitrogen were found in winter. Inorganic phosphorus concentrations appear to be much higher in the marsh than in the adjoining estuary, indicating that salt marshes are an essential part of the phosphorus cycle. The differences between phosphorus and nitrogen levels may be highly important in regulation of primary productivity in the salt marsh. Nutrient cycles are difficult to understand and much additional work needs to be done.

Another part of this project is a study of the biochemical effects of microorganisms upon the salt marsh environment. The objectives of this were to enumerate and identify the microorganisms indigenous to the salt marsh and to relate the known metabolic processes of the organisms found to the chemical cycles being investigated. It appears these microorganisms are extremely important in the nitrogen and phosphorus cycles in the salt marsh ecosystem.

SUPPORTED BY Delaware State Government

### 5.0871, ECOLOGY OF SABELLARIID REEFS IN DELAWARE BAY

H.W. WELLS, Univ. of Delaware, Graduate School, Newark, Delaware 19711

This study will document the pattern of distribution of sabellariid reefs in Delaware Bay and attempt to relate distribution to major physical factors of the environment: to turbulence, salinity, dissolved oxygen, and seasonal changes in temperature. The community relationships of these polychaetes and their tube masses will be examined, with particular attention to recognizing predators in the community and distinguishing them from species which use the masses primarily for attachment (fouling organisms), for shelter (crevice dwelling forms), or as a source of nutritive fecal pellets from the worms (scavengers). Quantitative observations will be made upon seasonal patterns of reproduction, settling, and growth of the worms and of the masses. Investigation includes an evaluation of the role of sabellariid polychaetes as a cementing agent of bay sediments, as an indicator of current and wave activity, as a provider of hard substrates suitable for the attachment of oysters, bryozoans, and other sessile organisms, and as an important element in the feeding relations of many animals.

SUPPORTED BY University of Delaware

### 5.0872, CORAL ATOLL ECOLOGY

F.R. FOSBERG, Smithsonian Institution, Washington, District of Columbia 20560

Collecting and organizing information on coral atolls, especially on the terrestrial aspects of them; developing an understanding of ecological relationships and processes in operation in these islands; describing the coral atoll ecosystems. Preparation of bibliography of such information and summaries of certain aspects of it.

SUPPORTED BY Smithsonian Institution

### 5.0873, PHYSIOLOGY AND ECOLOGY OF THE ADRIATIC BENTHOS

K. RUTZLER, Smithsonian Institution, Washington, District of Columbia 20560

This work will be a continuation of research begun in 1965. The project will comprise development of suitable instruments for measuring the microclimate (flow of water, light, oxygen, etc.) around selected benthic organisms, actual measurement of these microclimates and determining the importance of various factors for the well-being of the benthic communities, and laboratory experiments on the physiology and biochemistry of selected organisms.

SUPPORTED BY Smithsonian Institution

### 5.0874, MARINE BIOLOGY STUDIES ON FAIRFAX ISLAND

I.E. WALLEN, Smithsonian Institution, Washington, District of Columbia 20560

Field studies and collections will be made at Fairfax Island in the Barrier Reef area off Australia. Data will be collected and specimens will be forwarded to the Smithsonian Institution.

SUPPORTED BY G. Unger Vetlesen Foundation

### 5.0875, ESTUARINE ECOLOGY--INDIAN RIVER, DELAWARE

J.L. CHAMBERLIN, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Washington, District of Columbia

Preparation of a report on bi-weekly environmental observations along White Creek, a tidal tributary of the Indian River estuary.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0876, BIOGEOGRAPHY OF BENTHONIC ORGANISMS

J.L. CHAMBERLIN, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Washington, District of Columbia

Description, explanation, and prediction, of the geographic distribution of selected species of bottom dwelling marine organisms. Attention is primarily on sedentary species because their distributions are relatively stable and more amenable to analysis than the constantly shifting distribution of mobile species. Emphasis is on species inhabiting the continental shelf region of eastern North America, and offshore species are stressed rather than estuarine and shallow-water coastal forms. The results are presented primarily in the form of maps of distributional data on species, and maps of the distribution of limiting environmental conditions (barriers) for the particular species involved.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0877, AN ECOLOGICAL STUDY OF SOUTH BISCAYNE BAY IN THE VICINITY OF TURKEY POINT

R.G. BADER, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (AT(40-1))

This proposal is for a study of the ecology of south Biscayne Bay with particular attention to the environs of the Turkey Point power station. The existing and relatively unspoiled biological situation will be studied with regard to the hydrology and chemistry, phytoplankton, zooplankton and benthic organisms. The

## 5. LIVING SYSTEMS (NON-HUMAN)

biology of the organisms will be considered in relation to temperature, salinity ranges, and some gross chemical characteristics. Also, the effect of potentially higher temperatures on the dominant and subdominant species will be studied in the field and later in the laboratory. Information presently available in relevant areas of study (i.e., publications and research logs of the Institute of Marine Sciences) will be further analyzed and utilized in this program.

Because the first power unit of the Florida Power & Light Company plant is now in operation, it will be necessary to choose several control sites in order to monitor the changes which have already started to occur. Some rise in temperature and in the copper and iron content of the water near the effluent have already been observed during preliminary studies made by this Institution.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0878, WATER QUALITY AND FUNGI-NEMATODE-SEAGRASS RELATIONSHIPS

*S.P. MEYERS*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124

Studies involve analyses of the fungal and nematode populations in Biscayne Bay, Florida, and their interrelationships within seagrass communities. Major attention is directed toward ecological and biological analyses of foliicolous and benthic nematodes, life cycle studies, and examination of animal succession patterns in specific habitats. Fungal studies concern physiological investigations of specific taxa and broad comparative investigations of cellulolytic activity especially that of the dominant representatives of the marine mycota. Levels of enzymatic production and related weight loss of cellulose, are compared with those of non-marine cellulolytic species. Projected lines of nematode study include analyses of the benthic nematode biota within other types of turtle grass communities, characterization of the oncholaimid population in the Bay to determine the extent and range of specific abundant taxa and their extant sex ratio, and further examination of factors affecting attraction and aggregation of marine nematodes to sites of organic deposition and decay.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0879, THE BIOLOGY OF THE INFAUNA OF A TROPICAL SOFT BOTTOM AREA

*H.B. MOORE*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124

A study is in progress on the biology and ecology of the infauna of the soft bottom of Biscayne Bay, Florida. This is considered typical of a tropical estuarine area. Papers have been published on the heart urchin, *Moira atropos*, and the lamellibranch, *Tageus divisus*. Papers are in press on *Chione cancellata* on the fauna of intertidal muds, on sublittoral polychaetes and the biological effects of pollution in the bay. Studies are in progress on various mollusks, echinoids and brittle stars.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. C-1

### 5.0880, EFFECTS OF PESTICIDES ON ESTUARINE PRODUCTIVITY

*T.S. HOPKINS*, Univ. of West Florida, Graduate School, *Pensacola, Florida*

The campus of The University of West Florida is located on the west side at the head of Escambia Bay, a commercially important estuary for the production of oysters, shrimp, and fish. Part of the drainage basin of this estuary, including an embayment or bayou and small stream lies on University property that has been dedicated as a natural conservation area and will remain undeveloped.

The Faculty of the Department of Biology and Marine Sciences plans to initiate a continuing study of this habitat to determine the ecological relationship. Concurrently, a similar habitat on the east side of the bay that is not protected from man's encroachment will be studied in comparative detail to determine the effects of pollution. It is anticipated that the program will serve as a training program for graduate students in the field of marine biology.

An initial 12-month program is proposed that has the following objectives: 1. A physical, chemical, and biological inventory of the two bayous adequate to provide an understanding of the resident plant and animal communities; and, 2. An analysis of migratory fauna and their 'input' into the ecosystem; and, 3. A periodic surveillance project will monitor the water, bottom deposits and biota for pesticide residues. (These are anticipated because of the routine use of these chemicals in the drainage basin).

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0881, PESTICIDES

*P.A. BUTLER*, U.S. Dept. of Interior, Biological Laboratory, *Sabine Island - Gulf Breeze, Florida*

Although commercial formulations of synthetic pest control chemicals are screened for mammalian and target-animal toxicity levels, little is usually known of their possible effect on marine animals. Theoretically, there is the possibility of any and all of these chemicals draining into estuarine areas important to fish and shellfish.

This project determines acute and chronic toxicity levels of potential and commercial pesticides to representative marine fauna including but not limited to oysters, shrimp, and mullet. Tests are conducted in a flowing sea water system or in the field. Special studies are underway to determine most suitable testing techniques and bioassay animals.

Studies of the kinetics of persistent pesticides following pilot-scale applications in the field are being expanded. Residue analyses of sub-strata and food-chain organisms are made to determine ultimate fate of chemicals and possible danger sites.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0882, LABORATORY BIOASSAYS

*J.I. LOWE*, U.S. Dept. of Interior, Biological Laboratory, *Sabine Island - Gulf Breeze, Florida*

The primary objectives of the subject project are: (1) determination of the acute toxic levels of pesticides to representative marine species, and (2) investigation of possible adverse effects of prolonged exposure of marine animals to sublethal concentrations of the common pesticides.

Short-term (96-hour or less) toxicity tests are conducted in the laboratory under controlled conditions. Most of the tests are conducted in constant-flow seawater systems using oysters, shrimp, and marine fish as bioassay animals. These acute toxicity tests will be a continuing function of the project as new chemicals are received for evaluation.

Long-term experiments (3 to 6 months duration) involving the chronic exposure of marine animals to sublethal concentrations of selected pesticides will be conducted when the efforts and results seem justified.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0883, ESTUARINE ECOSYSTEMS

*G.E. WALSH*, U.S. Dept. of Interior, Biological Laboratory, *Sabine Island - Gulf Breeze, Florida*

The purpose of this research is to determine effects of sublethal concentrations of pesticides upon estuarine ecosystems. At present, physical, chemical, and biological characteristics of four very similar coastal ponds are being analyzed to learn normal seasonal variations. When these are known, three of the ponds will be treated with pesticide and one will be utilized as a control. Effects of pesticide upon population dynamics and community structure will be studied after contamination.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0884, ECOLOGICAL STUDY OF CHARLOTTE HARBOR ESTUARY AND SHARK PROGRAM OF MOTE MARINE LAB

*P.W. GILBERT*, Mote Marine Laboratory, *Sarasota, Florida* 33581

A long-term ecological study of the Charlotte Harbor-Pine Island Sound estuary. This study of a relatively uncontaminated

## 5. LIVING SYSTEMS (NON-HUMAN)

250,000-acre body of water over a period of years will yield invaluable information to assist in the evaluation of the impact man makes as he continues to invade the area and modify the environment.

Projects involving the behavior, physiology, anatomy, endocrinology and biochemistry of sharks are continuously in progress. Use of this vessel in the collection of sharks has greatly facilitated this program.

SUPPORTED BY U.S. National Science Foundation

### 5.0885, DISTRIBUTION OF LIFE WITH DEPTH

**R.J. MENZIES**, Florida State University, Graduate School, Tallahassee, Florida 32306

The objective of this proposal is to improve our knowledge of the distribution of animal life in the sea directly off the coast of North Carolina through a detailed photographic study on selected biological properties of the sea floor from shelf depth (180 meters plus or minus 20 meters) to the abyssal plain (6000 meters).

As a mechanism of significant improvement of the use of underwater photographs in biological studies, each photographic series will be coupled with samplings of animal life. Thus, this project involves the use of a grab camera, a multi-shot camera coordinated with large trawl samples, identification of species photographed, correlation of observed distribution with sediment type and hydrographic information. The aim will be to associate gross and reproducible features in the distribution of animal life with topography, hydrography (water characteristics, T, S, O<sub>2</sub>) and sediment type.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0886, ECOLOGY OF KRAFT PAPER MILL EFFLUENT IN SAPELO & ST. CATHERINES SOUNDS, GA

**M.D. DAHLBERG**, Univ. of Georgia, Marine Institute, Sapelo Island, Georgia 31327

This study will survey the ecological effects of kraft mill effluent from the Interstate Paper Co. in Riceboro, Ga. This study will determine changes, if any, in the chemistry, flora and fauna of the study area including Riceboro Creek, North Newport River, Sapelo Sound and St. Catherine's Sound.

SUPPORTED BY Georgia State Government

### 5.0887, AEGEAN SEA BIOLOGY

**V. KIORTSIS**, Athinisin Eth Kai Kap Panpstmn, Athens, Greece (N62558-3693)

This research is an ecological study of northern areas of the Aegean Sea. Emphasis is on the determination of the environmental factors which influence the distribution of plankton and bottom organisms of that area. Qualitative and quantitative analyses are made of daily and other cyclical fluctuations of environmental factors in an attempt to discover the mechanisms by which they affect the biological populations.

Biologically, the Aegean Sea is virtually unknown and hydrographic data of the area are sparse and sporadic. It is, however, especially interesting because of the extensive shoreline and the intricate currents around the Islands. The exchange of water with the Sea of Marmara and the Black Sea adds to the wide variety of ecological conditions and makes the area a particularly valuable base of research operations

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0888, INVESTIGATE FACTORS DETERMINING DISTRIBUTION OF PHYSICAL AND CHEMICAL PROPERTIES OF THE PACIFIC OCEAN

**R.A. BARKLEY**, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Honolulu, Hawaii 96812

Studies of Pacific-wide oceanographic conditions already underway reveal certain classes of deviations from average conditions which are being investigated in a variety of ways. For example, the effects of mid-ocean island groups on the distribution of properties, as well as on currents, are evident, and are being studied by means of field investigations including direct current mea-

surements; theoretical analysis including mathematical modeling with a computer; and physical modeling using a scale hydrodynamic model of the Hawaiian Islands. Winter-summer changes in properties are associated with water-mass formation and dissipation, which will be studied using field data and mathematical models. Long-term changes are also evident in synoptic sea-surface data obtained at nine monitoring stations maintained on islands throughout the central Pacific; these changes are being studied by means of Fourier analysis, which yields information on amplitudes and phase angles of periodic changes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0889, BIOLOGICAL RESEARCH ON THE VOLCANIC ISLAND SURTSEY AND ENVIRON

**S. FRIDRIKSSON**, Surtsey Research Society, Reykjavik, Iceland (AT(30-1))

Research on the terrestrial biota of the new volcanic island, Surtsey was continued during the year 1967, using the unique opportunity for studying dispersal, colonization and succession of plants and animals. Plant parts continued to disperse by ocean to the previously sterile islands. These were classified and recorded and when growth started, the locations of the plants were mapped. Already four species of coastal plants have colonized the island, *Cakile edentula*, *Honckenya peploides*, *Elymus arenarius* and *Mertensia maritima* as well as two mosses, *Funaria hygrometrica* and *Bryum argenteum*. Birds were also found to take part in the dispersal. Of the 14 species of migratory birds caught on the island during the spring, snow buntings were found carrying seed in their gizzards. As these birds had apparently migrated from the British Islands on their way to Greenland this must be regarded as a case of long distance dispersal of seed. As the immigration, however, most likely takes place from the close neighborhood, the vegetation of other islands in the group was studied. For comparison an ecological study of vegetation on a nunatak in the glacier Vatnajokull was continued. Regarding terrestrial invertebrates already 63 species have been recorded on Surtsey of which 37 species were discovered in 1967, the majority of these being casual visitors whereas only certain flies as *Leria modesta*, breeding in carcasses on the shore are permanent inhabitants. A meteorological station was established for climatic observations and a small field laboratory has been built on the island.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0890, ECOLOGICAL SUCCESSION ON SURTSEY

**S. HERMANNSSON**, Surtsey Research Society, Reykjavik, Iceland (F61052-67-C-0087)

A comprehensive coordinated study of the biological development of the new volcanic island 'Surtsey' will be continued with emphasis on geological and meteorological contributions to the total ecology. Especially considered is the succession of biological communities which establish themselves on the newly emerged areas of new land and the factors which determine or influence the sequences.

The solution to the Navy's problem of fouling and deterioration of underwater equipment will depend on an ability to predict the sequence of biological events. The land mass formed as a result of the volcano provides a unique opportunity to observe one set of these sequences under natural conditions.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0891, MARINE BIOLOGY OF RED SEA AND EASTERN MEDITERRANEAN

**L. FISHELSON**, Tel Aviv University, Tel Aviv, Israel (F61052-67-C-0043)

The investigator and his staff are conducting a comprehensive series of ecological studies in the Red Sea and Mediterranean Coast of Israel. Distribution of the dominant forms of plant and animal life, especially the benthic forms, is being mapped and related to environmental conditions and bottom sediments at mid-depth and in abyssal regions. Information is being collected on the population dynamics, life histories, and physiology of the organisms present in the Red Sea with emphasis on the many forms which are newly discovered.

## 5. LIVING SYSTEMS (NON-HUMAN)

Because these waters are virtually unknown with regard to their ecological and biological regimes, it is essential that more information be collected on all environmental characteristics of this area. These studies are particularly important since they involve an area in which the effects of engineering operations on the environment can be studied. The effects of the Suez Canal on the oceanography and biology of the Red Sea are dramatically observable, and it is expected that great changes in the Eastern Mediterranean will follow the completion of the Aswan Dam. Information collected relates to sound transmission effects, abundance and distribution of marine fouling and boring organisms, and ambient noise levels.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0892, MARINE LABORATORY

*J.G. BROOM*, State Wildlife & Fish Comm., New Orleans, Louisiana

This project area incorporates all six of the previous described phase areas, namely coastal Louisiana. Here, the project leader will compile, analyze and interpret the data.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Louisiana State Government

### 5.0893, HYDROGRAPHIC AND BIOLOGICAL SURVEY OF MONTSWEAG BAY AND VICINITY

*D. DEAN*, Univ. of Maine, Ira C. Darling Ctr. For Res., Walpole, Maine 04573

This project will investigate the quantitative distribution of benthos (by Ponar grab sampling), the types and distribution of zooplankton (010 net plankton), and the distribution of temperature and salinity in space and time in Montsweag Bay and vicinity. This study is a short-term (June to August 1968) pilot project for a long-range research program anticipated to begin in 1969 and extend through 1973. The latter project will monitor before-and-after changes accompanying the operation of a nuclear-powered electric generating plant scheduled to commence operation early in 1972.

SUPPORTED BY Maine Yankee Atomic Power Company

### 5.0894, WATER QUALITY - BENTHIC INVERTEBRATE RELATIONSHIPS IN ESTUARIES

*D. DEAN*, Univ. of Maine, Ira C. Darling Ctr. For Res., Walpole, Maine 04573

This project proposes to investigate the relationships between water quality and benthic invertebrates in Maine estuaries. Studies will be conducted in three estuaries, the Penobscot, the upper reaches of the Damariscotta and the Sheepscot, representing heavily polluted, moderately polluted and unpolluted conditions, respectively. Comparable portions of each estuary will be studied to determine the benthic communities present, the settlement of benthic invertebrate larvae, larval metamorphosis, and the growth and survival of juvenile forms. Hydrographic, chemical and geological parameters of the waters and sediments will be measured and used as guidelines for controlled laboratory experiments on larval settlement.

The results of this project should aid 1) in the interpretation of fish distribution patterns in estuaries subject to different levels of pollution and 2) in predicting biotic changes that would occur in an estuary subjected to increased or decreased pollution loads.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch  
University of Maine

### 5.0895, AN ENVIRONMENTAL SURVEY OF THE DAMARISCOTTA RIVER ESTUARY, LINCOLN COUNTY, MAINE

*B.J. MCALICE*, Univ. of Maine, Ira C. Darling Ctr. For Res., Walpole, Maine 04573

The present environmental characteristics of the Damariscotta River are little known, and may be significantly altered by the construction of a sewage treatment plant in the upper estuary.

Temperature and salinity distribution, the volume of fresh water entering the estuary, current velocities, and basin topography are being used to derive a picture of the salt balance, exchange rates, and circulation patterns.

Bottom grab and core samples will be taken to determine the present sediment distribution and recent changes in the sedimentation regime.

Intensive sampling of inorganic nutrient species is being carried out to determine the nutrient distribution in the estuary and the influence of present small quantities of raw sewage on the distribution.

Hydrographic and nutrient data will be used to predict the effect of the proposed treatment plant on the environmental characteristics of the estuary.

SUPPORTED BY Maine State Government

### 5.0896, ECOLOGICAL STUDIES OF ATLANTIC AND GULF COASTAL ESTUARIES OF IMPORTANCE TO WATERFOWL

*H.D. IRBY*, U.S. Dept. of Interior, Patuxent Wildlife Res. Ctr., Laurel, Maryland

The estuaries, sounds, and bays of the Atlantic and Gulf Coasts are of primary importance to the bulk of migrating and wintering waterfowl of the Atlantic, Mississippi, and Central Flyways. These habitats are of particular importance to diving ducks, for which we have few good habitat management techniques.

These areas are among the most susceptible to destruction from channelization, industrial development, real estate development, hurricanes, regulation of river flows, marsh drainage for mosquito control, and pollution from many sources. Because of the difficulty of making accurate observations of the productivity of estuaries, the distribution, abundance, quality, and quantity of the biota of these areas are more poorly known than most other waterfowl habitats.

This broad-scale study will provide much-needed information on the value and quantity of the estuarine habitat still of importance to waterfowl and establish a historical record of those values. The broad scope of this study makes it imperative that adequate planning and preliminary reconnaissance be conducted prior to finalizing specific work units. Initially, one biologist will conduct the needed reconnaissance to organize the program and formulate the specific plans.

This project will be started in fiscal year 1966 and will include a period of at least 5 years to determine major patterns of trends and fluctuations in estuarine vegetation and waterfowl use.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0897, OCEAN WATER INTRUSION INTO BACK BAY, VIRGINIA, & CURRITUCK SOUND, NORTH CAROLINA, ON THE WATERFOWL & FRESHWATER FISH HABITAT

*J.L. SINCOCK*, U.S. Dept. of Interior, Patuxent Wildlife Res. Ctr., Laurel, Maryland

The initial investigation into the ecology of Back Bay, Virginia, and Currituck Sound, North Carolina, was terminated on March 7, 1962, when an Atlantic Coastal storm introduced ocean water into the fresh to slightly brackish water of the area. The second phase of the investigation is now in progress and its objectives are to determine the effects of the increased water salinity on the waterfowl and fresh water fish habitat. The methods employed are identical to the first phase of the investigation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0898, ECOLOGICAL STUDY OF DUXBURY BAY

*C.A. WILLINGHAM*, William F. Clapp Laboratories, Duxbury, Massachusetts 02323

The purpose of this study is to survey the flora and fauna of Duxbury Bay and establish the pattern of interactions between these organisms and the various environmental parameters found in Duxbury Bay. The Bay itself is a relatively high salinity area with a fifteen foot tidal amplitude. Twice each day the bay bottom is left exposed by the out-going tide. Data are collected on the

## 5. LIVING SYSTEMS (NON-HUMAN)

various organisms from twelve stations along transects which cross the Bay.

SUPPORTED BY Battelle Memorial Institute

### 5.0899, YEAR-ROUND PROGRAM OF RESEARCH IN MARINE ECOLOGY

*M.R. CARRIKER*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

A year-round, long-term program for basic research and training in the systematics and ecology of the marine biota of the area was initiated in 1962 with the assistance of funds from the Ford Foundation and grant NSF GB-561. The present request is for continued support for research and advanced training in the coherent area of marine ecology of the Cape Cod region. The research will stress ecological life histories and populational ecology with reference to the complex of environmental parameters. The commonest dominant marine and estuarine species along the coast, and even less of organisms off the coast. Especially lacking is information on the ecology of larval and early post-set stages. Research associates participating in the program will select specific problems on some aspect of the marine ecology of the region. These concerted studies should add important information to our knowledge of the ecology of marine organisms of the northeast coast of the United States. A second benefit of the program is the increased training of individuals in marine ecology. The results of these investigations will enhance the work of other biologists who participate in the Laboratory's summer program.

SUPPORTED BY U.S. National Science Foundation

### 5.0900, BENTHONIC BIOLOGY

*M.R. CARRIKER*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543 (NONR)

This is a long-term, year-round comprehensive study of the biota of Cape Cod region using standardized collection and analysis methods. Pelagic, as well as bottom organisms to a minimum size of 1 mm are included. The major purpose is to understand the spatial and temporal distribution and density of organisms relative to temperature, salinity, bottom substrate and biological neighbors. Taxonomic studies are also included. Scuba divers make direct observations and the most up-to-date equipment available is being used from shipboard. New equipment designs are also being developed.

Attention is focussed on the composition and ecology of organisms living in, on, or near, the sea bottom. Not only do these organisms most often contribute to the fouling mass, but they directly affect the characteristics of the sediments. They may consolidate the bottom, or prevent its consolidation, and lead to shifting and instability.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0901, THE OCEANOGRAPHY OF NEW ENGLAND FISHING BANKS

*D. BUMPUS*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

The purpose of the research is to determine the relationships between meteorological conditions, hydrographic conditions, and the distribution and abundance of groundfish in the ocean between Nova Scotia and New Jersey. Methods include standard hydrographic cruises, release of drift bottles, and sea bed drifters and the collection routinely of meteorological and hydrographical information from lightships and Texas Towers along the entire Atlantic Continental Shelf.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0902, BIOLOGY OF THE DEEP-SEA BENTHOS

*H.L. SANDERS*, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

Diversity, zonation and density were the major research interests of our deep-sea benthic program during the period of July 1, 1967 to June 30, 1968. Our findings on the Gayhead-Bermuda Transect of low animal density, pronounced faunal zonation, and

very high diversity were verified in our sampling of bathyal and abyssal depths in the tropical Atlantic. We therefore conclude that these features are universal attributes of the deep-sea benthos. The diversity of our deep-sea samples is about the same order of magnitude as that present in tropical shallow seas and considerably greater than equivalent shallow boreal marine and tropical and boreal estuarine environments. We are also able to measure the horizontal as well as the vertical component of deep-water benthic zonation using a modification of the rarefaction methodology. At least for the groups examined, a change of a few hundred meters vertically is equivalent to thousands of kilometers horizontally.

SUPPORTED BY U.S. National Science Foundation

### 5.0903, ENVIRONMENTAL CHANGES IN LAKE ERIE

*J.F. CARR*, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Lake Erie has experienced major changes in the benthos and fish populations. Analyses of physicochemical data show that concentrations of most major ions have increased significantly, very low dissolved oxygen concentrations occur during the summer, and mean annual water temperatures have increased. Present studies are directed toward documenting the extent of change in the benthos and studying the factors which result in the oxygen depletion of the hypolimnetic waters. Laboratory and field studies are being made of the exchange of nutrients and the oxygen demand at the mud-water interface.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0904, PHYSIOLOGY AND BEHAVIOR

*T.A. EDSALL*, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Laboratory and field studies are underway to determine the potential productivity of Lake Michigan for intermediate and top carnivores. Recent biological changes in Lake Michigan that have altered the lake's trophic structure are under investigation. Analysis of food chains and energy flow within and between trophic levels will include studies of food preference, food competition, and the efficiency of utilization. The effects of the chemical and physical factors of the environment on the physiology and behavior of native and exotic species are being investigated. Special emphasis will be placed on determining the role of these factors as controlling mechanisms in energy flow and productivity in the ecosystem.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0905, EXPLORATORY COLLECTION AND CARE OF AQUATIC INVERTEBRATES FOR TESTING AT TIBURON

*T. LANE*, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

It is necessary to explore sources of brackish-water and marine invertebrates for pesticide bioassay work at Tiburon, and to determine the most feasible procedures for collecting and holding the test animals. Areas in San Francisco Bay and the delta of the Sacramento-San Joaquin will be searched, and culture of animals will be studied at Tiburon, and holding facilities will be tested under various space, time, feeding, and water flow conditions.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0906, TOXICANT TOLERANCE STUDIES - SCREENING OF PESTICIDES AND AQUATIC INVERTEBRATES AT TIBURON

*T. LANE*, U.S. Dept. of Interior, Fish Pesticide Res. Lab., Columbia, Missouri 65201

The work will be performed to obtain acute toxicity information on marine and estuarine aquatic invertebrates with insecticides, herbicides, and other pesticides at Tiburon, California. Invertebrates and toxicants will be tested in continuous-flow systems in the laboratory, according to a standard test method, and the data will be treated by probit analysis to obtain LC50 values under various time schedules.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

**5.0907, PRE-CONSTRUCTION ENVIRONMENTAL SURVEY**

*L. OGREN*, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Conduct an ecological, hydrographic and geological investigation of potential reef sites from New England to Florida by periodic underwater observations at each area selected for construction. Sampling techniques will depend upon water conditions and diver support facilities at each locality. Observations will be made on the existing fish fauna and benthic organisms using standard sampling methods, i.e., swimmer transects, timed observation periods, and random quadrants. Faunal collections for identification and bottom samples for sediment analysis will be taken at each locality. Water temperature, salinity, transparency, and current direction and velocity will be recorded at the construction sites. Natural reefs and other bottom disconformities in the construction areas will be investigated in order to evaluate the reef fishing potential for each region.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

**5.0908, ESTUARINE DREDGE HOLE INVESTIGATIONS**

*W.S. MURAWSKI*, State Div. of Fish & Game, Trenton, New Jersey

Objectives: To summarize our studies on the ecology of sub-marine estuarine dredge holes, especially in regard to finfish habitation.

Procedure: Information relative to the location of estuarine dredge holes, their area, depth and other physical characters gained during the course of four years of field work will be analyzed and brought together in a final report.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.  
New Jersey State Government

**5.0909, EUTROPHICATION OF TIDAL WATERS**

*J.P. BARLOW*, State University of New York, School of Agriculture, Ithaca, New York 14850

The objective of this investigation is to determine the effect of allochthonous nutrients on the growth of algae in tidal waters. The pigment content, and rate and efficiency of photosynthesis of algae will be measured in natural populations and in impounded populations subjected to experimentally modified nutrient levels. Differences in these measurements of physiological state will be related to differences in nutrient supplies. From these relations it is hoped to obtain quantitative expressions for the effects of nutrient levels on the rate of photosynthesis of populations which can be used in dynamic models to predict effects of changes in nutrient levels on growth kinetics of algal populations.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

**5.0910, CONTINUAL MONITORING OF AREA THROUGHOUT SPAWNING, SETTING, AND GROWING PERIOD**

*W.S. MILLER*, State Div. of Fish & Game, Oakdale - Long Island, New York 11769

Continual monitoring on a semi-weekly basis to determine biological, physical, and chemical characteristics and to determine intensity of spawning, setting, and survival in this area so that comparisons can be made with known ponds which do produce good sets on a sustained annual basis.

This phase will commence on a limited basis upon project approval and semi-weekly beginning several weeks prior to anticipated favorable conditions for spawning.

Part 4 of 4.

**5.0911, ACCUMULATION OF RADIOACTIVITY BY ORGANISMS IN EXPERIMENTAL MARINE ENVIRONMENTS**

*T.W. DUKE*, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

## 5. LIVING SYSTEMS (NON-HUMAN)

The ultimate purpose of laboratory experiments on the uptake, accumulation, and retention of radionuclides from sea water by marine organisms is to collect sufficient data to be able to anticipate the dangers from any intentional or accidental pollution of an estuary or the oceans. To have some assurance that predictions concluded from results of laboratory experiments will be valid, it is necessary that laboratory data be compared with data collected as nearly as possible under field conditions. This, it is believed, can be accomplished by comparing laboratory findings with results obtained on the accumulation of radionuclides by communities of organisms held in large tanks or in ponds.

Research activities include experimentation in the laboratory and in the field. Laboratory experiments are being conducted with communities of marine organisms maintained in large tanks (1000-liter capacity) and exposed to flowing sea water containing various radionuclides including zinc-65, iron-59, iodine-131 and cesium-137. Also, a marine community composed of oysters, clams, fish, snails, crabs, algae, and marsh grass was placed in a shallow salt water pond and exposed to zinc-65 and chromium-51. Organisms, sediments, and water are being removed periodically, their radioactive content measured, and then returned to the pond. Upon completion, samples will be analyzed for total element so that the specific activity of the components in the pond can be determined. Data obtained in such experiments also will be useful in determining the trace metal requirements of various marine organisms.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0912, MEASUREMENT OF RADIONUCLIDES IN ESTUARINE AND MARINE ENVIRONMENTS (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)**

*D.A. WOLFE*, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

Many scientists have been concerned with the potential effects on marine organisms of low-level radioactive wastes from nuclear reactors on land as well as those on ships and submarines. Additionally, fission products from nuclear weapons are now found in the biosphere. To evaluate the ecological effects of radionuclides on organisms of commercial importance, it is necessary to know the quality, quantity, and form of radionuclides in estuarine and marine environments. These data are needed now so they can be utilized to establish base lines for existing levels of radioactivity in various components of estuarine and marine ecosystems, and so the mechanisms of uptake in the passage of radionuclides through food chains can be investigated.

Large samples of biological materials (1 kg.) are collected for analyses. These samples are either dry ashed or wet ashed to reduce the volume and to provide homogeneous samples. The gamma activity of the samples is then measured with a low background detection system consisting of a multichannel analyzer and a 4 x 4-inch sodium iodide crystal-detector housed in a 7-ton shield. The data for each sample are stored on binary-coded punched tapes which can be used in a computer for comparisons with the radioactivity of future or past samples.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**5.0913, OPTIMUM ECOLOGICAL DESIGNS FOR ESTUARINE SYSTEMS OF NORTH CAROLINA**

*H.T. ODUM*, Univ. of North Carolina, Inst. of Marine Science, Chapel Hill, North Carolina 27514

This project will provide information on the feasibility of establishing associations of organisms in estuaries which can process man's wastes, metabolize inflow, develop the missing loops of the mineral cycles, and channel the fertility into one or more populations with food potential. Nine marine ponds will be constructed in a high marsh area along the coast of North Carolina. Three of the ponds will be continually seeded with mixtures of marine organisms (larvae, adults, plankton, micro-organisms, etc.) and will receive a steady flow of urban waste mixed with sea water. Three ponds will be seeded, but will be supplied only with sea water, i.e., no wastes. The remaining three ponds will receive the wastes mixed with sea water, but will not be seeded artificially.

## 5. LIVING SYSTEMS (NON-HUMAN)

Principal populations, some principal nutrient cycles and the total photosynthetic production and system respiration will be measured. Those populations of larger organisms which develop in large mass will be studied for growth rate and not production per area of meat potential.

SUPPORTED BY U.S. National Science Foundation

### 5.0914, EVALUATION OF HABITAT ALTERATION, CURRITUCK SOUND

T.E. CROWELL, State Wildlife Resources Comm., Raleigh, North Carolina

The objective of this job is to record the extent of habitat alteration that results from the influx of salt water and/or turbidity to Currituck Sound during the Fiscal Year and to evaluate the resulting effects upon the game-fish resources.

Particular emphasis will be placed upon the drainage of artificially maintained salinities out of Back Bay and upon such salt-water intrusions as may result from natural, storm initiated, breaks through the Outer Banks.

The work outlined under the preceding Jobs I-A to I-G, inclusive, concerns the recognition of habitat changes and estimating their effects upon separate facets of the Currituck Sound flora and fauna.

The subject job represents, in essence, an integration of all of the individual considerations into one comprehensive analysis of the combined direct and indirect effects of habitat alteration upon the game fish.

The procedures employed will involve an integrated consideration of the net effects upon the game-fish resources resulting from the interaction of the various individual effects of habitat alteration after the latter have been estimated.

### 5.0915, CHANGES DURING EUTROPHICATION OF AN ESTUARY

D.B. HORTON, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

To measure quantitatively the effects of the pollutants and the ensuing eutrophication on the communities of the plankton, rooted aquatic plants, and the macrobenthos, and to determine the factors that influence the distribution and abundance of the various species. 2. To predict the effects of even greater pollution of this estuary and, if possible, to make suggestions to alleviate the eutrophication. 3. To demonstrate the value of field plot design for understanding the biology of an estuary and for predicting effects of a pollutant. 4. To determine if a measurement of the heterotrophic activity of the planktonic bacteria with radioisotopes is a useful method of indicating the degree of eutrophication and pollution.

### 5.0916, RESEARCH IN MARINE BENTHIC ECOLOGY OFF OREGON

A.G. CAREY, Oregon State University, Graduate School, Corvallis, Oregon 97331

The distribution, abundance, and ecology of the large and small marine benthic macrofauna off Oregon are being studied to define interrelationships of the benthic fauna with their environment. A line of stations across the continental shelf, continental slope, and Cascadia Abyssal Plain has been sampled repeatedly with trawl, dredge, and grab to a depth of 3000 meters and a distance of 322 kilometers offshore. The fauna shows a layered distribution, many species being limited to a narrow depth range. Six depth zones exhibit transitions from one animal assemblage to another. These transitional areas are generally associated with changes in sediment type, one of the complex of environmental factors affecting distributions. The benthic invertebrates are most abundant beyond the edge of the shelf at 225 meters; a slightly smaller peak in abundance occurs inshore at 25 meters.

SUPPORTED BY U.S. National Science Foundation

### 5.0917, MARINE ECOLOGICAL STUDIES

J.W. HEDGPETH, Oregon State University, Graduate School, Corvallis, Oregon 97331 (N00014-67-A-0369-0001)

This is a program of long-term observations on populations of intertidal and shallow water marine invertebrates of the Oregon Coast. Investigations are being made into the effects of environmental fluctuations on these populations. The continuous recording of intertidal water and air temperatures on a rocky shore, never previously attempted, are made to provide essential data for understanding environmental stresses that influence distribution, abundance and reproduction of marine organisms. Studies of organisms at the recording stations and at standard plot sites are to coincide with the continuous record.

Hydrobiological data such as these can lead to better understanding of the interrelationships among the biological, physical, chemical, and geological components of marine environments. This understanding is essential for the development of more efficient and effective techniques for the control of and/or protection against marine life whose presence or absence are of operational significance to the Navy. Biological fouling and deterioration, modification of beach conditions, and bottom sediments are examples.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0918, EFFECTS OF PESTICIDES ON ESTUARINE ORGANISMS

R.E. MILLEMANN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. To evaluate, through short-term bioassays, the acute toxicity to certain estuarine organisms of the insecticide Sevin. 2. To determine the effects of Sevin on a community of organisms in artificial mud flats. 3. To follow the residual life and metabolism of Sevin in estuarine organisms and in their environment. 4. To study compounds related to Sevin, as well as other pesticides, in the above manner.

SUPPORTED BY Oregon State Government

### 5.0919, EFFECTS OF PESTICIDES ON ESTUARINE ORGANISMS

R.E. MILLEMANN, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

Studies are continuing on the establishment of a well-balanced community of organisms in laboratory models of an estuary. The chronic effects of Sevin and other pesticides on members of such communities will be studied. Studies are in progress on the effects of the insecticides Sevin and Dursban on the survival, growth, and reproduction of the Dungeness crab, the viviparous shiner perch, and the viviparous chum salmon. Biochemical studies on the modes of action of Sevin and its metabolites on estuarine organisms are continuing.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0920, BIONOMICS OF FISHES AND SHELLFISHES

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

To: obtain bionomic information of important fishes and shellfish species of Oregon bays in relation to ecological factors (temperatures, salinities, currents and tidal phases, pH, dissolved oxygen, carbon dioxide, turbidity, edaphic conditions, folds, industrial and domestic sewage wastes, etc.); continue development of aqua-culture procedures for oysters, clams and other marine species of importance, particularly rearing of free-swimming larval stages of oysters and clams to seed stage; and, obtain reliable biological information as to resistance and susceptibilities of marine organisms to various pollutional conditions occurring in marine waters and provide methods and scientific data for predicting effects on marine organisms and for establishments of water quality criteria for marine areas.

Description of Work: Perform bioassays with various toxic effluents commonly discharged into marine waters using fishes and the several life stages of oysters and other marine organisms as test animals; and perfect the mussel embryo-larval bioassay techniques for quickly assessing the toxic components of effluents discharged by wood-processing industries into bays and estuaries.

## 5. LIVING SYSTEMS (NON-HUMAN)

Continue oyster culture studies, particularly the rearing of pelagic larvae of the Kumamoto oyster to 'seed' stage under controlled laboratory conditions; and begin preliminary studies on the damages and control of mud-shrimps to oysters.

SUPPORTED BY U.S. Dept. of Agriculture  
Oregon State Government

### 5.0921, THE ENVIRONMENTAL REQUIREMENTS OF MARINE PLANKTONIC ORGANISMS

J.C. PRAGER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

This study is concerned with obtaining marine planktonic organisms in culture and the developing of methods for the mass culturing of these organisms. Also included are studies to determine the environmental requirements of marine planktonic organisms in relation to nutrients, temperature, pH, salinity, and light quantity and the physiological responses of lower marine forms to environmental changes.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0922, ENVIRONMENTAL CONDITIONS AND POPULATION DYNAMICS IN SELECTED UNPOLLUTED ESTUARIAL AND COASTAL AREAS

C.M. TARZWELL, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

When the full research program is under way, laboratory studies will be made for the determination of the environmental requirements of marine organisms and levels of potential toxicants which are acutely toxic and those which are not harmful under conditions of continuous exposure. These laboratory findings are to be field tested. It is proposed to make these tests in pilot areas or in areas which are controlled but resemble the natural environment or in areas where the environment is essentially natural. It is planned to introduce these toxicants at the selected levels in such areas and to keep their concentrations at a constant level in order to determine their effects on the biota under conditions of continuous exposure. In order to evaluate these effects, the environmental conditions and the populations and the relative abundance of the different organisms under natural conditions must be known. It is proposed to begin a study in the immediate future to serve as such a baseline, so that changes due to potential toxicants or changes in environmental conditions may be evaluated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0923, HISTOLOGICAL, HISTOCHEMICAL AND HISTOPATHOLOGICAL EFFECTS OF WATER POLLUTANTS ON MARINE ORGANISMS

P. YEVICH, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., Wakefield - Kingston, Rhode Island 02881

The National Marine Water Quality Laboratory has as its function, the collection of data essential for the development of water quality criteria for the protection of aquatic life and other uses. To secure this data, research must be carried out to determine (1) the levels of potential toxicants which are acutely toxic and those which are not harmful under conditions of continuous exposure. Several disciplines will be utilized in this work, including histology, pathology, toxicology, exzymology, biochemistry, etc. In this project, it is planned to determine the effects of sublethal and very low levels of toxicants on important marine organisms through histological, histochemical and histopathological studies. In order to do this effectively and efficiently, the normal histology of these organisms must be known. Therefore, before the completion of the main laboratory, studies of the histology of so-called normal organisms in unpolluted areas are being initiated to serve as a baseline of comparison for evaluating the effects of sublethal levels of potential toxicants. A library of slides will be built up showing the natural or normal condition for all important marine organisms in the shore and estuarial areas. It is expected that this project will get underway in Fiscal Year 1967 and will continue for a number of years.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0924, EFFECTS OF CRUDE OILS AND THEIR EMULSIONS TO MARINE ORGANISMS

R. EISLER, U.S. Dept. of Interior, Natl. Marine Water Qual. Lab., West Kingston, Rhode Island 02892

Oil discharges at sea, especially accidental discharges by super-tankers, represent a potential threat to aquatic life. Laboratory bioassays on the acute toxicity of different grades of crude to various species of marine fishes and crustaceans are now in progress. The effect on toxicity of emulsifying or complexing the oil with various chemical agents is being investigated.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0925, BIOLOGICAL COLONIZATION OF A RECENTLY FORMED ISLAND

B. MAGUIRE, Univ. of Texas, Graduate School, Austin, Texas 78712

Analysis of rate and pattern of colonization of fresh waters on the recently formed volcanic island, Surtsey, will give new insight into some of the processes and interactions which determine the biogeography of islands. Information gained by the analysis of the communities as they develop should permit increase of our understanding of: 1. The process and pattern of community development when its greatest limitation is the rate of arrival of potential participants, 2. Some aspects of the ecology of colonizing species which relate to their successful transport to and invasion of the water in the tubs, 3. The inter-relation between dispersal rates to island communities and the rate at which previously successful colonizers are eliminated, 4. The nature and relative stability of the communities which occur at equilibrium or near equilibrium conditions in this kind of small, isolated habitat, and 5. The mechanisms of passive dispersal of small aquatic organisms. Dilution and enrichment experiments should give information concerning the number of resting stages of various species which are present but not taking part in the active community at the time of collection. Interpretation of the seral stages which follow both dilution and enrichment should provide information concerning the importance of the process of succession in production of community structure observed and hopefully also will permit increased insight into the nature of the successional process itself.

SUPPORTED BY U.S. National Science Foundation

### 5.0926, A STUDY OF SELECTED CHEMICAL AND BIOLOGICAL CONDITIONS OF THE LOWER TRINITY RIVER AND THE UPPER TRINITY BAY

R.J. BALDAUF, Texas A & M University System, School of Agriculture, College Station, Texas 77843

The Galveston Bay System of Texas serves as an essential nursery area for commercial shrimp and certain fishes. The System serves in this capacity because of the discharge of fresh water from the Trinity River and the subsequent mixing of this water with the saline waters of the Gulf of Mexico. Available data suggest that a reduction in the flow of water will cause the System to become more saline and thus unable to serve as a nursery area.

The Texas Basins Project, the proposed dredging of the Trinity River for navigation, and the current construction of the Wallisville Dam just above the Trinity River Delta will influence the chemical, physical, and biological conditions of the System. The purpose of this project is to determine the nature of this influence.

Samples of fishes, crustaceans, and water will be collected from above and below the proposed site of the Wallisville Dam to determine (1) the chemistry of the water, (2) the fish and crustacean fauna, (3) the salinity tolerances of the animal species collected, (4) the role of a dam on the flow of nutrients into a major bay system, and (5) the population dynamics of the fauna.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

### 5.0927, THE EFFECT OF CONTROLLING SALT-MARSH MOSQUITOES ON BEEF CATTLE PRODUCTION, PLANT

## 5. LIVING SYSTEMS (NON-HUMAN)

### ECOLOGY, SOIL PRODUCTIVITY, AND ESTUARINE ANIMALS

J.C. SMITH, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: (1) To determine the nature and extent of loss in beef production of Hereford, Brahman and Braford cattle from high infestations of salt-marsh mosquitoes (*Aedes sollicitans* and *Aedes taeniorhynchus*), (2) Ascertain the feasibility of chemical control of mosquitoes for beef cattle production, (3) Determine the effectiveness of physical methods of mosquito abatement (water management) in salt-marsh pastures, (4) Determine the effect of physical control practices on soil structure and productivity, on plant species, and on estuarine animals.

Procedure: Obj. in the salt-marsh and each pasture stocked with three breed of cows. Chemical mosquito control will be maintained on two pastures with the other two pastures left as a control. The animals will be individually sprayed in one treated pasture and one control pasture. Periodic weights, calving percentage, and milk production records will be maintained on the cows. Periodic and weaning weight and carcass quality will be recorded on the calves. Mosquito counts will be made on both light trap collections and selected animals from each group to measure mosquito population. Obj. bay will be surveyed for elevation and a main lateral ditch cut from the lowest depression into the bay. Feeder laterals will be cut from the minor depressions to the main lateral ditch to permit free water movement by tidal action. Mosquito population, plant and soil studies, estuarine animal studies, pasture fertilizer, weed 028 control and pasture management will be evaluated in this phase of the program.

SUPPORTED BY Texas State Government

### 5.0928, ECOLOGY OF WESTERN GULF ESTUARIES (ESTUARINE PROGRAM)

W.L. TRENT, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Demands upon water resources along the coast of Gulf of Mexico are rapidly altering the estuarine environment. These combined alterations disturb the integrity of large estuaries to the extent that entire biological systems may be significantly affected. Basic to an evaluation of the effects of estuarine alteration is knowledge of the inter-relations of factors, such as nutrients, bottom types, marine organisms, and vegetation.

Project objectives are to (1) compare the productivity of natural estuarine habitats with areas altered by dredging, spoiling, bulkheading and filling; (2) determine practical methods for rehabilitating altered habitats so that productivity can be reestablished; and (3) determine management procedures for maintaining or increasing the productivity of estuarine areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0929, BIOLOGY-MIDDLE EAST WATERS

J.S. PEARSE, Amer. University At Cairo, Cairo, United Arab Republic (N62558-5022)

The proposed research is designed to delineate life cycles and reproductive periodicities of selected marine organisms of the Red Sea, Gulf of Suez, and the Suez Canal. These waters, even though relatively small in volume, span from tropical to north temperate latitudes; and consequently, the common widespread tropical Indo-Pacific species native to this area are subjected to varying degrees of seasonal temperature change. The investigator will compare breeding frequencies of tropical area versus north temperate area populations of the same species in an attempt to determine what environmental factor(s) are responsible for the synchronization of reproductive development within a population or possibly within a particular species.

The Middle East Indo-Pacific waters are areas where there are pronounced deficiencies in biological and environmental data. It is essential that information on normal fluctuations in population composition and abundance be obtained, in order to predict the effect of the biological and environmental parameters.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0930, SEASONAL DISTRIBUTION AND ABUNDANCE OF DEMERSAL FISH AND INVERTEBRATES IN THE MARINE WATERS ADJACENT TO THE MOUTH OF THE COLUMBIA RIVER

D.L. ALVERSON, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Seattle, Washington (AT(49-7)1971)

A continuing cooperative investigation between the AEC and the Bureau of Commercial Fisheries has been carried out in the marine area adjacent to the Columbia River mouth since 1961. The objectives of the investigation are to (1) determine on a seasonal basis the composition, distribution, and relative abundance of marine resources inhabiting these waters, and (2) assist in the evaluation of the role that the bottom animal community plays in the biological transport of radionuclides by providing samples of various bottom dwelling animals for radiological analysis by the Radiation Ecology Laboratory at the University of Washington.

The relative abundance of fish in this area ranged from a high of about 5,000 pounds per hour of trawling at depths of 50 fathoms to 100-300 pounds per hour of trawling at depths greater than 500 fathoms. Invertebrate catch rates were lower, being greatest at depths from 100-375 fathoms where they averaged 100-250 pounds per hour of trawling. The investigation has also shown that commercially utilized forms of fishes, such as sablefish, inhabit depths at least to 600 fathoms, and that several forms such as Tanner crabs, Pacific ocean perch, and sablefish undergo seasonal bathymetric movements. In addition, other commercially utilized species, such as Pacific hake and Dover sole, carry out north and south seasonal migrations in the study area. A study of the feeding habits of the Pacific hake, the dominant higher level forage species in the outfall area, has established that this species feeds primarily on euphausiid shrimp, a form important in the uptake of  $^{65}\text{Zn}$ . The above results represent steps leading toward an eventual understanding of the radionuclide budget in the marine area adjacent to the Columbia River mouth with an assessment of the magnitude of the total radioisotope load imposed on the system by the atomic reactors at Richland, Washington. Knowledge gained as to size and composition of the deep-water fish and invertebrate populations will also be helpful in appraising deep-water dumping sites.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0931, ANNUAL PHYTOPLANKTON PRODUCTION IN PUGET SOUND WATERS

G.C. ANDERSON, Univ. of Washington, Graduate School, Seattle, Washington 98122

Studies of phytoplankton production are being continued in Puget Sound. The investigation, since 1964, has provided quantitative information on annual phytoplankton production and mean standing crop in two areas of the Sound.

The research proposed herein is to elucidate the reasons for the very large blooms of *Phaeocystis* when maximum values of 6-7 g C/square meter are photosynthesized per day. Weekly, daily and diurnal sampling will be carried out during periods of high phytoplankton production along with measurements of hydrographic conditions, light and nutrients. Particular attention will be given to the effect of stability, as affected by tides and winds, on the timing of phytoplankton blooms. Measurements will be made of the chemical composition of the crop as well as growth rates of dominant species.

Experimental work involving studies of phytoplankton blooms in enclosed columns of water in situ will be carried out. In this manner, the effects of advection will be eliminated. Culture studies will be conducted with some of the herbivorous copepods.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

## 5I. PRODUCTIVITY - BIOCHEMISTRY

(Food Chains, Primary Productivity, Laboratory Studies of Reproduction, Cytology, Physiology, and Behavior.)

### 5.0932, PHOTOBIOLOGICAL STUDIES ON MARINE CHRYSOMONADS

M.B. ALLEN, Univ. of Alaska, Graduate School, College, Alaska 99735

## 5. LIVING SYSTEMS (NON-HUMAN)

SUPPORTED BY U.S. National Science Foundation

This research is to continue studies on the phosphorylation and electron transport system of *Hymenomonas* chloroplasts. These have previously been shown to carry out active cyclic photophosphorylation with phenazine methosulfate (PMS), but not to possess appreciable activity when FMN or vitamin K compounds are used as cofactors, nor to be capable of non-cyclic photophosphorylation with NADP or ferricyanide. Since the chloroplasts retain a high degree of overall photosynthetic activity, it seems unlikely that these results are due to a deficiency in the oxygen evolving system. The reasons for this difference from green plant chloroplasts will be investigated and the ability of the chloroplasts to carry out various other light driven electron transport reactions will be explored.

An attempt to isolate the organelle with the finely coiled lamellar structure and determine its composition and metabolic activity, if any, will be made. The marine chrysoomonads are generally considered to be a group of organisms in which many evolutionary experiments have taken place, and the possibility exists that this organelle represents a vestige of some experiment with chloroplast structure. On the other hand, structures appearing somewhat similar in the electron microscope have been observed in photosynthetic cells. In these cells, it has been proposed that the structures are digestive organelles. Possible relations with the coccolith forming system must also be considered, since such a function has previously been suggested.

SUPPORTED BY U.S. National Science Foundation

### 5.0933, DYNAMICS OF THE NITROGEN CYCLE IN THE SEA

J.J. GOERING, Univ. of Alaska, Graduate School, College, Alaska 99735

This is an investigation into several aspects of the marine nitrogen cycle using  $^{15}\text{N}$  tracer techniques. The major emphasis is on measurement of in situ rates of nitrogen fixation, nitrate, ammonia, and amino acid assimilation, nitrification, and denitrification.

SUPPORTED BY U.S. National Science Foundation

### 5.0934, ABUNDANCE AND MIGRATION STUDIES OF THE WHITE SEAPERCH (*P. FURCATUS*), PILE PERCH (*R. VACCA*), STRIPED SEAPERCH (*E. LATERALIS*) AND STARRY FLOU

A.J. BEARDSLEY, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

Objective: 1. To study the movements and possible migrations of the four recreationally important species in Yaquina Bay, Oregon, in relation to environmental factors. 2. Estimate the abundance by angler yield of these species.

Procedures: Species to be studied are the white seaperch (*Phanerodon furcatus*), pile perch (*Rhacochilus vacca*), striped seaperch (*Embiotoca lateralis*) and the starry flounder (*Platichthys stellatus*). Intra-estuarine and coastal movements of these fishes will be determined by analysis of tag recoveries. Yaquina Bay will be divided into nine geographical areas for sampling purposes. Environmental data (tide, temperature, salinity) will be taken at each trawl sampling station. Estimates of population will use the capture-mark-and-recapture technique.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0935, STRUCTURE AND FUNCTION OF CELL ORGANELLES DURING GROWTH AND DEVELOPMENT

M. ALFERT, Univ. of California, Graduate School, Berkeley, California 94720

The structure of the nucleolus and nucleolar-like bodies, and their role in ribosome formation in *Urechis* are being studied; attempts will be made to hybridize ribosomal RNA to DNA of the nucleolar organizer of fixed plant cells in situ. The structure of the *Urechis* acrosome and the formation, characterization and function of acrosomal basic protein are being studied. The onset and termination of nuclear basic protein synthesis in relation to DNA synthesis in unfertilized eggs of *Urechis* and its effect on early development will also be studied--cytochemical, biochemical and electron microscopic techniques will be used in these investigations.

### 5.0936, STRUCTURE AND FUNCTION OF CELL ORGANELLES DURING GROWTH AND DEVELOPMENT

M. ALFERT, Univ. of California, Graduate School, Berkeley, California 94720

The structure of the nucleolus and nucleolar-like bodies, and their role in ribosome formation in *Urechis* are being studied; attempts will be made to hybridize ribosomal RNA to DNA of the nucleolar organizer of fixed plant cells in situ. The structure of the *Urechis* acrosome and the formation, characterization and function of acrosomal basic protein are being studied. The onset and termination of nuclear basic protein synthesis in relation to DNA synthesis in unfertilized eggs of *Urechis* and its effect on early development will also be studied--cytochemical, biochemical and electron microscopic techniques will be used in these investigations.

### 5.0937, UPTAKE AND ASSIMILATION OF ORGANIC COMPOUNDS IN MARINE ORGANISMS

G.C. STEPHENS, Univ. of California, Graduate School, Irvine, California 92664 (N00014-67-A-0323-0001)

The investigator is attempting to determine the role of dissolved organic matter in the nutrition of organisms and in the total economy of the sea. Results of studies by others have not been definitive on this important subject, although the investigator's laboratory has established the ability of soft-bodied invertebrates to remove amino acids and other small organic molecules from dilute solutions characteristic of natural waters. He is conducting laboratory and field studies to determine the mechanism of uptake and assimilation of the organic matter, the metabolic fate of the compounds, and to assess the potential contribution of this process to the total nutrition in the sea.

Since it is unlikely that any areas of the sea are completely sterile for long, and since many Navy problems are caused by biological agents, it is important to determine the basic factors which influence the distribution and abundance of organisms.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0938, UPTAKE OF ORGANIC COMPOUNDS BY MARINE INVERTEBRATES

G.C. STEPHENS, Univ. of California, Graduate School, Irvine, California 92664

A number of soft-bodied marine invertebrates are capable of removing small organic compounds from solution in the ambient medium. This has been established for almost 100 genera in 11 phyla. The present project is designated to explore the potential significance of the process: a. as a source of nutrition, b. as a source of specific required dietary constituents, and c. as a source of information for the organisms.

The project is also designed to exploit the capability of pulse labelling the free amino acid pools of the organisms studied in order to study their metabolism. Finally, we propose to study the mechanism of uptake of small organic compounds.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0939, PHYSIOLOGY OF MARINE ORGANISMS

R. LASKER, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

This project deals with the study of energy budgets of important food fishes and of the organisms on which they depend for their food. Primary attention has been directed both to the utilization of food during assimilation and to the measurement of quantities required for growth, maintenance activities, and reproduction from the egg to the adult. Important physiological aspects such as osmoregulation and salinity tolerance, digestion, chemoreception, and rates of development are also studied under different environmental variables such as light, salinity, and temperature.

It is further planned to study the requirements of larval fish after the critical period of yolk resorption and to carry these and other studies to sea in the Center's new research vessel, David

## 5. LIVING SYSTEMS (NON-HUMAN)

Starr Jordan, where it will be possible to measure these requirements under the most realistic experimental situations.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0940, PRODUCTIVITY MEASURES

*P.E. SMITH*, U.S. Dept. of Interior, Fishery Oceanography Ctr., La Jolla, California

In order to assess the abundance and availability of commercial fish stocks, it is necessary to understand the food chain in the sea which begins with the primary production of phytoplankton and proceeds through many complex steps to the production of fish. Comprehensive data on physical oceanography and primary biological production, accumulated over many years of survey cruises, are available from the California Current area but better information is needed on the composition and distribution of the zooplankton and nekton, higher in the food chain.

Present studies on zooplankton abundance in the California Current will be continued to include the development of more precise sampling techniques and methodology. Computer analysis of past zooplankton data is nearly complete and the results will be used to improve the efficiency of future surveys. Nekton distribution and abundance will be assessed by two independent methods; one will be a limited number of tows with standard trawl gear and the other, more extensive method, will be standard transects with sounder and sonar acoustic apparatus.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0941, STUDIES OF PROTEINS UNDER EXTREME ENVIRONMENTS

*J.K. LANYI*, U.S. Natl. Aero. & Space Adm., Ames Research Center, Moffett Field, California 94035

**OBJECTIVE** a. Problem - To study the biological, physical-chemical and structural properties of proteins, enzymes and membranes which function at concentrations of salt so high as to be normally incompatible with life. b. Application - To provide a basis for understanding life processes possibly present in extraterrestrial situations. c. Identification of the components of the membrane-bound respiratory chain, study the effects of the presence and absence of salt on substrate-protein and protein-protein interactions. Exploration of the unique features of proteins in halophiles which require salt.

**APPROACH:** Spectrophotometric and polarographic study of the oxidation and reduction of cellular components. Use of inhibitors and redox dyes in identifying pathways of electron transfer. Fractionation and individual study of some of the enzymes involved.

**PROGRESS:** Reporting period 04 67 to 04 68. The cytochromes of *H. cutirubrum* have been identified by their pyridine hemochromogen spectra and by their functional relationship to various reduced substrates. It was found that at neutral pH all electron flow passes through cytochromes b559, c555 and a592. At higher pH, however, an alternate pathway operates as well which consists of cytochromes b563 and c550. The alternate pathway shows different salt dependence than the main pathway and is inactivated on overnight incubation. Two publications on this work are being submitted to Archives of Biochemistry and Biophysics: 'Studies of the Electron Transport System of Extremely Halophilic Bacteria. I. Spectrophotometric Identification of the Cytochromes in *H. cutirubrum*, and II. Salt Dependence of Cytochrome b563.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 5.0942, POLYPEPTIDE INTERACTIONS ON A STERILE SEASHORE

*H.H. PATTEE*, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

This work is one approach to the general origin of life problem. We assume two working hypotheses: (1) On the primitive earth there was established a sterile irreversible, multi-phase ecocycle which provided the primary materials and reaction processes to condense and degrade copolymers, and (2) in this complex environment, one necessary condition for the origin of

life is the occurrence of specific catalytic control of monomer sequence in copolymer synthesis. One set of experiments is designed to demonstrate a possible geochemical cycle for carbon and nitrogen passing through copolymer synthesis and degradation. Synthesis of many biological monomers such as amino acids has already been demonstrated. We have studied the degradation of the large amounts of nearly intractable melanine-like material which probably requires continuous deposition on silica beaches, exposure to ultraviolet radiation from 1800-2000 angstroms, and return of soluble products to the sea. A second set of experiments is designed to find reasonable condensation reactions for amino acids in the sea, and catalytic monomer ordering constraints resulting from heterogeneous reactions occurring at interphase boundaries on foams, emulsions or particles. Theoretical studies on the ordering of copolymer sequences and the origin of hereditary codes is being simulated by computer programs.

SUPPORTED BY U.S. National Science Foundation

### 5.0943, PRESSURE EFFECTS ON MARINE ORGANISMS

*H.A. LOWENSTAM*, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109 (NONR)

Studies will be continued on the biochemistry and physiology of organisms collected from deep ocean waters. Organisms will be collected from various depths in the ocean and maintained in open flow, high pressure vessels at preselected pressures and studied with regard to such factors as viability, growth rates, and nutritional requirements. During these studies, research will be continued on the design and development of more advanced culture equipment and techniques pertinent to maintaining living deep sea organisms under high pressures.

It is becoming more apparent that deep ocean environments represent areas of vital importance to Naval operations. Little knowledge of any aspect of these waters has been obtained by direct observation. Present concepts are based largely on predictions and extrapolation from shallower waters and from very few actual samplings. Although historically thought to be a biological desert, the deep oceans are now known to be populated by a moderate number of organisms, but representing a relatively large number of species and displaying many bizarre characteristics.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0944, CAROTENOIDS, CAROTENOID CHROMOPROTEINS, AND ASSOCIATED LIPIDS IN ANIMALS

*D.L. FOX*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

Comparative biochemical studies of the metabolic fractionation of carotenoids and associated pigments in marine and other aquatic animal phyla (e.g. sponges, coelenterates, worms, crustaceans, mollusks, echinoderms, fishes and birds), with special reference to (1) selective assimilation of unchanged food-carotenoids; (2) complete destruction or partial oxidation of some of these, e.g. into alcoholic or ketone derivatives; (3) relative quantities of various carotenoid fractions stored; (4) disposition as carotenoid chromoproteins, e.g. in certain nudibranch mollusks and asteroid echinoderms, and the possible physiological bearing of carotenoids, e.g. in photokinesis of animals.

Melanin, naphthoquinones and tetrapyrroles (porphyrins and bilins) are of common incidence, and may call for some special attention in certain animals.

Studies such as these are sometimes found to be significant in supporting certain morphological differences between species or subspecies of a common genus. In other instances, a single species within a lower evolutionary group, such as the plumose anemone, *Metridium*, may involve considerable flexibility in its metabolism of colored molecules.

SUPPORTED BY U.S. National Science Foundation

### 5.0945, STUDIES ON EMBRYONIC CELLS

*G. FREEMAN*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

## 5. LIVING SYSTEMS (NON-HUMAN)

Two separate but related projects are underway designed to answer the question: How does a population of embryonic cells maintain its quality of being embryonic? One project is a study of the cellular basis for asexual reproduction in Tunicates, and the other a study of the developmental potential of cell cultures of unincubated chick blastoderm cells.

The ascidians (sea squirts) can reproduce asexually in a variety of ways. There are at least two other embryonic populations in addition to the embryonic cell population of the blood that can provide a cellular basis for asexual reproduction. The histological studies which have been done on asexual reproduction and regeneration in this genus indicate that during asexual reproduction only one embryonic cell population, the lymphocyte cell class, provides the cellular basis for a new bud formation. During regeneration of the zooid, the other embryonic cell population, the epicardium, provides the cellular basis for new tissue formation. The epicardium is only found within the zooid proper while the lymphocyte cell class is found both in the stolon and in the zooid. The relationship between these two embryonic cell populations will be studied by making chimera between closely related species of *Clavelina* such that only the lymphocyte population of one species is present and only the epicardial cell population of the other species is present.

SUPPORTED BY U.S. National Science Foundation

### 5.0946, BIOCHEMICAL BASIS OF SPECIFIC CELL ASSOCIATION

*T.D. HUMPHREYS*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

The arrangement of individual cells into a variety of specific groupings and architectural patterns characteristic of adult tissue is being investigated. Explanations of this cell order usually center around some ideas of cell surface reactions; such as specific cell adhesion which guides cells during morphogenesis. However, there has been little information on the mechanism by which the surfaces of cells interact with one another and the ideas invoking adhesive reactions in guiding cells during development have necessarily been speculative.

A system for isolation and analysis of the aggregation factor on the sponges available in the Pacific Ocean is being worked out. The information gained by the isolation of the cellular components involved in species specific aggregation of marine sponge cells suggests many experiments on the cells of higher organisms. To work out the problems of tissue dissociation and to demonstrate and characterize an aggregation factor, cells of early chick embryos will be used.

SUPPORTED BY U.S. National Science Foundation

### 5.0947, MARINE PHYSIOLOGY

*P.F. SCHOLANDER*, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

P. F. Scholander: Mechanism of osmosis and imbibition. Negative interstitial-tissue pressure. H. T. Hammel: Temperature regulation. Osmotic mechanism and ice formation. R. W. Elsner, D. L. Franklin, and G. L. Kooyman: Cardiovascular parameters in asphyxial defense mechanisms during birth and diving. E. A. Hemmingsen: Supersaturation and Cavitation in biological liquids. ### 5.0948, STUDIES OF THE EFFECTS OF NUTRIENTS ON THE GROWTH OF PHYTOPLANKTON IN THE TROPICAL PAC. OCEAN

*W.H. THOMAS*, Univ. of California, Inst. of Marine Resources, San Diego - La Jolla, California 92038

Algal cultures from the tropical Pacific Ocean have been established and their growth has been measured in various media and at several light intensities and temperatures. At optimum light and temperature levels, nutritional requirements are defined in terms of the effects of nutrient concentration on growth rates and final yields of both cultures and natural populations. To describe the relative fertility of various areas of the tropical Pacific, these nutrient requirements are compared with nutrient concentrations in sea water samples. To determine which nutrients are limiting, sea water samples have been enriched with various nutrients and the effects of enrichment on photosynthesis or chlorophyll synthesis have been measured. The degree of deficiency of natural populations will be defined by comparing various intracellular ratios and photosynthetic parameters - especially assimilation ratio - in populations from poor water with the same ratios and parameters in populations from rich water. These will be compared with the same ratios and parameters in cells grown in the laboratory at varying degrees of nutrient deficiency.

SUPPORTED BY U.S. National Science Foundation

### 5.0949, NUTRIENT STORES IN REPRODUCTION IN SEA INVERTEBRATES

*M.A. NIMITZ*, Dominican Coll. of San Rafael, Graduate School, San Rafael, California 94901

The aims of this investigation are fourfold: 1) to trace the reproductive cycles of two species of starfish (*Patiria miniata* and *Pisaster ochraceus*) and two crustaceans (*Pachygrapsus crassipes* and *Emerita analoga*) through monthly gonad index determinations of samples of 10 animals. 2) to determine the sites of lipid and carbohydrate nutrient stores in the tissues of each species by histochemical procedures, and to trace changes in the location (and quantity, insofar as possible histochemically) of the reserves during the course of the reproductive cycle; 3) to determine the effects of a period of starvation coextensive with the normal period of gametogenesis on the quantity and quality of the gametes produced; 4) to gain as much information as possible on the distribution of acid and neutral mucopolysaccharides and proteins in the tissues of these animals.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0950, PHYSIOLOGY OF LUMINESCENT SIGNAL SYSTEMS

*J.F. CASE*, Univ. of California, Graduate School, Santa Barbara, California 93018 (N00014-67-A-0120-0002)

It is proposed to study, physiologically and behaviorally, the visual receptors of light producing marine and terrestrial animals to consider the development of their function as receptors of photic and other stimuli and their response mechanisms. The investigation will attempt to determine the biological significance of the luminescent systems and to examine the role of the environment in the operation of the systems.

The light producing behavior of many organisms serves as a means for quantitative detection of certain trace elements required for luminescence in some forms. Controlled production of light, when and where desirable, is possible and the proposed study will permit more effective control.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0951, BEHAVIOR AND SPECIFICITY IN MARINE SYMBIOSIS

*D. DAVENPORT*, Univ. of California, Graduate School, Santa Barbara, California 93018 (NONR)

Objective: The understanding of the responses of marine organisms to the physical environment and to one another is of direct importance to a wide range of problems encountered by the Navy in the marine environment. The presence or absence of organisms which are responsible for biodeterioration, bioluminescence, or bioacoustical problems as determined by a host of environmental factors about which little is known.

Approach: Interrelationships between symbiotic marine organisms are being investigated by researchers to determine what biochemical attractants may be produced by the animals, and

## 5. LIVING SYSTEMS (NON-HUMAN)

what means are employed for sensing these chemicals. Attempts are being made to isolate the active principles.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0952, PALEOBOTANICAL RESEARCH AT YALE UNIVERSITY

*T. DELEVORYAS*, Yale University, Graduate School, *New Haven, Connecticut 06520*

Studies on the development of reproducible enrichment techniques in continuous culture for the isolation of characteristic marine bacteria were completed. Within a certain range of dilution rates and concentrations of the limiting substrate, chemostat enrichments were successful. Experimental attempts to separate single species from mixed cultures of known composition showed that successful or unsuccessful competition for the limiting substrate could be expressed by kinetic growth parameters of the individual species under given conditions. Species exhibiting low values of their growth parameters displaced species with relatively high values if the continuous culture was operated correspondingly at low dilution rates and/or low concentrations of the limiting substrates. This behavior is significant for the characterization of those microorganisms actually responsible for the degradation of organic materials in the sea under natural conditions.

Based on the determination of growth parameters, the studies on population dynamics were continued. Mixed pure cultures of marine and non-marine bacterial strains were grown in the chemostat at doubling times up to 100 hours and at various concentrations of limiting substrate. Predicted displacement times could be confirmed experimentally.

Techniques for studying sulfate reducing bacteria in steady state culture have been established. The kinetics of substrate-(sulfate) and product-(sulfide) limited growth were studied with the aim of detecting characteristic metabolic differences.

SUPPORTED BY U.S. National Science Foundation

### 5.0953, AN ANALYSIS OF PHOSPHORUS AND NITROGEN COMPOUNDS IN TIDAL MARSHLAND DRAINAGE

*F.C. DAIBER*, State Board of Game & Fish, *Dover, Delaware*

Objective: An evaluation of the effects of various types of marshland management on the diurnal and seasonal concentrations of phosphorus and nitrogen in tidal marshes.

Procedure: Water samples will be collected from managed marshes representing ditched, high-level impounded, low-level impounded, and old and new champagne pools. Collections from natural marshland will serve as the control. The ditched marsh will be represented by Canary Creek Marsh. All the other types of marsh mentioned will be located on the Murderkill Marsh.

Collections will be made every six hours for one 24-hour period at each area once a month. The collection dates will be at 3 or 5 week intervals to allow sampling of spring and neap tides. Water samples will be collected in 250 ml amber glass bottles with rubber stoppers. Salinities will be collected in translucent plastic bottles for later determination. Water temperature will be measured with a centigrade thermometer. A battery-operated field pH meter will be used to determine pH and redox potential. Time, weather condition and air temperature will also be recorded.

The distance from the laboratory to the Murderkill Marsh area and the time involved in travel requires that the investigators remain in the field during the 24-hour collection period.

Delaware State Government

### 5.0954, PRIMARY PRODUCTION AND DECOMPOSITION IN ESTUARINE WATER

*H.D. PUTNAM*, Univ. of Florida, School of Engineering, *Gainesville, Florida 32601*

The objective of the proposed research is to contribute to an understanding of the synthesis and decomposition of organic matter by primary producers in an estuarine environment. Studies will be conducted to estimate the productivity of certain red and

brown algae which are part of the benthic community in the Waccasassa Estuary. Appropriate methods for measuring fixation of isotopic carbon by attached plants were worked out under grant No. WP-00678-03 which will be completed by this investigator August 31, 1967.

In addition an attempt will be made to define more clearly the limiting factors for primary production in the Waccasassa Estuary. Emphasis will be directed toward the interaction of chemical and biological factors.

Efforts also will be made to follow the decomposition of organic matter under anoxic conditions in estuarine sediments. These studies will be directed mainly toward the characterization of substrates which are involved in methanogenesis. The pool size of volatile fatty acids resulting from the breakdown of algae will be determined and efforts made to establish metabolic turnover rates of these components.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0955, PRIMARY PRODUCTIVITY

*J.W. JOSSI*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., *Miami, Florida*

Objectives: 1. To understand the biology of the primary producers in the sea and to predict times and places of high organic production. 2. To develop valid techniques for measuring the standing crop and production rates of the primary producers in the sea, in order to meet the objective stated above.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0956, INTERACTIONS OF MARINE NUTRIENT COMPLEXES

*J.W. VANLANDINGHAM*, U.S. Dept. of Interior, Trop. Atlantic Biolog. Lab., *Miami, Florida*

Objective: To clarify the nutritional roles of iron and phosphorus compounds within the framework outlined in the proposal.

A laboratory study of possible chemical and physical interaction of iron and phosphate compounds within the marine nutrient cycle. a. Study of the mechanism of such interaction, if found, using labelled compounds of  $^{32}\text{P}$  and  $^{59}\text{Fe}$  as chemical tracers. b. Study the relationship of such interactions upon ingestion and assimilation in phytoplankton using  $^{32}\text{P}$  and  $^{59}\text{Fe}$  as chemical tracers.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0957, FORMATION AND UTILIZATION OF TERPENES

*D.G. ANDERSON*, Univ. of Miami, School of Medicine, *Miami - Coral Gables, Florida 33124*

Isolated and purified zooxanthellae, intracellular symbionts of gorgonians and other marine invertebrates, are used as a source for enzyme systems capable of converting isoprenoid intermediates into a series of sesquiterpene hydrocarbons, a macrocyclic diterpene lactone (porosin acetate), and other isoprenoid products. Formation of these compounds is followed radiochemically from a series of labeled substrates, including specific geometric isomers of farnesyl pyrophosphate.

The gorgonian - zooxanthellae symbiotic complex is also studied from the viewpoint of terpene synthesis and terpene utilization. Gorgonian species utilized include *P. americana*, *P. porosa*, and *E. mammosa*.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0958, DEVELOPMENTAL STUDIES OF SELECTED INVERTEBRATES

*H.B. OWRE*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida 33124*

Descriptive studies of the development of locally abundant, littoral invertebrates which are either potentially useful to man as experimental forms or as food, or are deleterious, are underway. The subjects are members of the phyla Coelocata, Platyhelminthes, Annelida, Mollusca, Echinodermata and Hemichordata. Information is being accumulated on size at reproductive maturity.

## 5. LIVING SYSTEMS (NON-HUMAN)

ty, type of spawn, early developmental stages, hatching and subsequent development. In the coming year, work will be concentrated on coelenterates, e.g., the stinging hydroid *Lytocarpus phillipinus* and stinging coral *Millepora alcicornis*, annelids, pelecypod molluscs and echinoid and holothuroid echinoderms.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0959, RELATION OF ENVIRONMENTAL FACTORS TO THE PRODUCTIVITY OF ESTUARINE SEDENTARY FAUNA P.A. BUTLER, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

The incidence of setting per square centimeter per seven days on asbestos-cement plates at one station in Santa Rosa Sound near Pensacola, Florida has been measured since 1949. Predominant fauna counted include barnacles, oysters and bryozoa. Concurrent data are collected on water salinity, temperature and tides. Meteorological data are available. All data are to be programmed for analysis. Continuing project.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0960, SONIC SENSITIVITY OF FISHES AND AMPHIBIA B.A. WEISS, Univ. of South Florida, Graduate School, Tampa, Florida 33620

In this project, the relative roles of auditory and lateral line sensitivity will be investigated in selected fishes and amphibians through a shock avoidance technique in response to a stimulus tone of closely controlled characteristics. Additionally, the evolution of auditory receptors will be studied by use of late stage tadpoles and fully developed frogs. An attempt will be made to differentiate between the near and far fields in sonic reception by fishes.

Sound production and reception by aquatic organisms gains in importance as acoustic instruments become more discriminative through technical refinements.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.0961, BIOSYNTHESIS OF BROMOPHENOLS IN MARINE INVERTEBRATES R.B. ASHWORTH, Univ. of Georgia, Graduate School, Athens, Georgia 30602

During attempts to isolate luciferin from the marine hemichordate *Balanoglossus biminiensis* an interesting brominated compound was isolated and its structure identified by UV, IR, NMR, mass analysis and melting point data. The isolated hemichordate *Balanoglossus biminiensis* (10-15 mg. per organism) and is responsible for its peculiar odor which has been described as 'iodoform-like.' These worms, belonging to the family, enteropneusta, are distributed all over the world and comprise some twelve genera and fifty-odd species, at least three of which are luminescent. Although dibromophenol has been identified only in one species, all apparently synthesize the compound since all possess the same pungent odor. There is no evidence to suggest any connection between luminescence and production of the compound.

It might be surmised that bromophenol production is simply a defense mechanism, but this does not explain the prodigious synthesis of the compound. It is also possible that dibromophenol serves as an intermediate in thyroxine production in invertebrates.

It is hoped that by setting up a large-scale collection program of *Balanoglossus biminiensis* and other related invertebrates that sufficient material can be collected to resolve the question as to whether bromophenol is produced in other families of marine invertebrates and if so, whether there is a relationship to thyroxine biosynthesis.

SUPPORTED BY U.S. National Science Foundation

### 5.0962, CHEMISTRY AND ENZYMOLOGY OF BIOLUMINESCENCE M.J. CORMIER, Univ. of Georgia, Graduate School, Athens, Georgia 30602

This is a renewal of GB-3156. Studies on the sequence of chemical events leading up to light emission in several luminescent systems will be continued (i.e., the sea pansy, *Renilla reniformis*, a model peroxidase type luminescent system, luminous bacteria, and luminous earthworms (*Diplocardia*)). A detailed study of the enzymology of these processes and of the nature of the intermediates involved in these reactions will be made. *Renilla luciferase* has been purified about 100 fold and a partial separation of the 3, '5'-diphosphoadenosine (DPA)-linked activating enzyme from that of luciferase has been achieved. It is hoped to completely separate these activities and study the mechanisms of a recently discovered, DPA-dependent, sulfate-luciferin sulfate exchange reaction. In addition, more *Renilla luciferin* will be isolated in order to complete structural studies. Isolation of a luciferase from a strain of bacteria that emits at a different wavelength than luciferase isolated from *Ph. fischeri* will be attempted and a comparison of the properties of the two enzymes will be made. Studies on the mechanism of the peroxidase-luminol-H<sub>2</sub>O<sub>2</sub> luminescent system will be continued. It is hoped to correlate light production with one of the many enzyme complexes formed in this reaction. One of the new bioluminescent systems which will be studied is that of the large luminous earthworm, *Diplocardia*. A H<sub>2</sub>O<sub>2</sub> requirement for this reaction has been demonstrated. Isolation of the luciferase and luciferin from *Diplocardia* is in process.

SUPPORTED BY U.S. National Science Foundation

### 5.0963, THE ROLE OF COPROPHAGY IN MARINE FOOD CHAINS D. FRANKENBERG, Univ. of Georgia, Graduate School, Athens, Georgia 30602

This study will evaluate the hypothesis that fecal material plays a significant trophic role in marine food chains. The proposed research will seek answers to the following questions: 1. What kinds of marine animals, under what conditions, utilize fecal pellets as food; 2. How much organic matter is made available in fecal pellets of various marine organisms; and 3. What physical, chemical and microbiological changes occur in fecal pellets after excretion. Information pertaining to these questions will be sought for a variety of marine organisms representing a diverse spectrum of feeding and taxonomic types.

SUPPORTED BY U.S. National Science Foundation

### 5.0964, THE ROLE OF FECAL PELLETS IN MARINE FOOD CHAINS D. FRANKENBERG, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The proposed study will evaluate the hypothesis that fecal material plays a significant trophic role in marine food chains. The study will be conducted utilizing field and laboratory facilities of the Department of Zoology and the Marine Institute of the University of Georgia. This proposal summarizes the evidence leading to the hypothesis, and outlines studies designed to test it.

The proposed research will seek answers to the following questions: 1. What kinds of marine animals, under what conditions, utilize fecal pellets as food; 2. How much organic matter is made available in fecal pellets of various marine organisms; and 3. What physical, chemical and microbiological changes occur in fecal pellets after excretion. Information pertaining to these questions will be sought for a variety of marine organisms representing a diverse spectrum of feeding and taxonomic types. The utilization of fecal pellets as food will be studied in experiments in which the growth and ingestion rates of animals offered fecal pellets as food will be compared with similar rates of animals offered other food sources. The rate at which organic matter is made available in fecal pellets will be analyzed by determining the production rate and organic matter content of a variety of fecal pellets, and by comparing the percentages of ingested food converted into new tissue (ecological growth efficiency), feces, and metabolism for a variety of marine animals. The post-excretion changes in fecal pellets will be analyzed by experimentally determining the transport and destruction rates, the changes in chemical composition, and the changes in microbiological content of a variety of fecal pellets at various times after defecation.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0965, FIELD EXPERIMENTS ON THE FLUX OF RADIONUCLIDES THROUGH A SALT MARSH ECOSYSTEM

L.R. POMEROY, Univ. of Georgia, Graduate School, Athens, Georgia 30602 (AT(40-1)-3238)

After some 12 years of work on the salt marshes of Georgia by a number of investigators, it is now possible to begin building models of the flux of materials through the system. A compartmental-diagram model, showing standing stock and flux of phosphorus has been constructed. This is now being transformed into a mathematical model suitable for computer simulation of events in the salt-marsh ecosystem. The model will be tested and refined by computer techniques. Deficiencies in our data shown by computer analysis will be remedied by additional, small-scale field and laboratory work. Manipulation of the model simulating changes in flux and storage of phosphorus by various populations (compartments) will help us predict the effect of various natural and man-made changes on the ecology of salt marshes.

In its present primitive state our model tells us that the marsh grass, *Spartina alterniflora*, which is the dominant primary producer, is unusually important in the biogeochemistry of its phosphorus marshy estuaries. *Spartina* appears to be taking all its phosphorus requirements from subsurface, reduced sediments that would otherwise be a sink. This phosphorus is released into the water when the *Spartina* dies and decays, as most of it does. This process undoubtedly has great significance in maintaining high productivity in the estuary.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0966, METABOLISM OF MARINE ECOSYSTEMS

L.R. POMEROY, Univ. of Georgia, Graduate School, Athens, Georgia 30602

This research is concerned with secondary and tertiary stages in the food web of natural waters. The results of work on the previous grant indicate that much of the energy available to all organisms in the sea is consumed by microorganisms. These microorganisms are in part bacteria and in part flagellates and other heterotrophic protozoans. The latter appear to be of major importance in the regeneration of  $PO_4$  (and probably  $NH_3$  as well). The microorganisms of the open sea are to a considerable extent associated with the so-called organic aggregates, which are flocculent detrital material thought to originate through some physico-chemical process of aggregation from dissolved organic materials. The research now proposed is concerned with such aspects of the metabolism of ultraplankton as diurnal cycles of respiration, respective roles of bacteria and flagellates, energy requirement of the entire water column, descriptive aspects of the organic-aggregate community, and further development of methods appropriate to the research. Some of the developmental and exploratory parts may be done in fresh water and inshore marine environments.

### 5.0967, METABOLISM OF COMPLETE WATER COLUMNS

W.J. WIEBE, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The University of Georgia proposes to make estimates of total metabolism of both photosynthesis and respiration for a series of water columns in the Southern Ocean between Antarctica and approximately 50 degrees S latitude. In this investigation, metabolism of all populations from bacteria in the sediments to whales will be considered. Metabolism rates for respiration, photosynthesis and assimilation will be made under in situ conditions of light, temperature, salinity and pressure. The incorporation of pressure represents a new approach. Data on the metabolic rates and flow of energy within the water columns are essential to the analysis of the integrated biological system (ecosystem).

For data on photosynthesis it is proposed to use El Sayed's data as well as a  $C^{14}$  method. Respiration of marine mammals and birds will be taken from available data on abundance and metabolism. Quantitative sampling of bathypelagic and benthic

fishes can be estimated from the work of Wohlschlag. Crustacea estimates will utilize work by McWhinney. Ultraplankton estimates will involve a method developed by Pomerey.

The investigation is proposed for Eltanin cruise 37. It requires six stations: (1) shallow water off the Antarctic continent, (2) Antarctic continental shelf, (3) Antarctic continental slope, (4) deep (5,000 m) station in the Southern Ocean, (5) Antarctic Convergence, (6) Divergence. Stations will require at least 48 hours; the cruise party will consist of seven persons.

SUPPORTED BY U.S. National Science Foundation

### 5.0968, IMPROVEMENT AND APPLICATION OF BENTHIC ALGAL ISOTOPE PRODUCTIVITY MEASURING METHODS

M. DOTY, Univ. of Hawaii, Graduate School, Honolulu, Hawaii 96822 (AT(04-3)235-4)

Benthic algal genera and community productivity methods, measurement and interpretation are being studied in seeking an understanding of the changes in algal populations as they vary with longitude in the Central and Western Pacific. The principal algal genera are those conspicuous in the communities where coralline algae, *Caulerpa* and *Eucheuma* are abundant. Studies of physio-ecological phenomena such as response of algae to dissolved organic material, current and their periodicities are specific approaches.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0969, SENSORY PROCESSES, MARINE AND HUMAN

G. VONBEKESY, Univ. of Hawaii, Laboratory of Sensory Sciences, Honolulu, Hawaii 96822

The investigators propose to conduct research on the sense organs and transmission pathways of man and other animals, particularly the marine animals. Different sense modalities will be studied and compared for common general sensory principles as well as for principles specific to particular senses.

Initial investigations will study the amplifying mechanism in sensory transducers, the role of inhibition in localization and sensory magnitude, inhibition between point sources in the eye, nerve membrane permeability, the role of free radicals in the nerve impulse conduction and sensory changes with neurological disease. A variety of experimental techniques will be employed, such as electrophysiological recording, electron spin resonance, psychophysical average error matching, and psychophysical location.

SUPPORTED BY U.S. National Science Foundation

### 5.0970, REGULATION OF IONIC CONSTITUENTS OF PROTOPLASM

H.B. STEINBACH, Univ. of Chicago, Graduate School, Chicago, Illinois 60637

The work in general, consists of a series of studies to determine how living cells manage their inorganic ion content.

More specifically, the projects include: A. Studies on regulation of water and salts by frog skins. Empty sacs of skin can manufacture a fluid, nearly isotonic to normal blood and of concentration and composition nearly independent of the external bathing media. This system is being studied as a convenient device for solving problems of secretion. B. Studies on the relationship of K ion to amino acid contents of marine invertebrate muscle and nerve. As an example, crab nerve and crab muscle have about the same intracellular concentration of amino acids but nerve extract contains a high proportion of dicarboxylic acids and double the K concentration as compared to muscle. C. Comparative studies on fresh water invertebrates and their ability to manage osmotic problems. D. Intracellular distribution of ions, studied by re-distribution of muscle fiber components during high speed centrifugation in isopycnotic media.

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0971, STRUCTURE AND REACTIVITY OF PROTEINS AND LIPOPROTEINS

*F.R. GURD*, Indiana University, Graduate School, *Bloomington, Indiana 47405*

The proposed work will continue the comparison of structure reactivity relations among myoglobins of different species. Much of this work is directed at relating the crystalline structures of these proteins, which are either known or under study, to their chemical reactivity characteristics, and in turn observing the chemical reactivity in solution. The conformations of fragments of the myoglobins prepared by specific cleavage reactions will be studied. Similar work will be begun on human hemoglobin. A summary of many of the aims of this work can be found in the *Journal of Biological Chemistry*, 243, 683 (1968).

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0972, DEVELOPMENT OF POLARITY IN THE FUCACEAN ZYGOTE

*L.F. JAFFE*, Purdue University, Graduate School, *Lafayette - West Lafayette, Indiana 47907*

The mechanism of localization or pattern formation is a central problem of developmental biology. A large electrical current begins to flow through the developing *Fucus* egg as its polarity becomes irreversibly determined. The current intensifies as the egg becomes grossly differentiated into rhizoidal and thallus cells, and this current is likely to be the cause as well as an effect of this localization process. The current may affect localization in either or both of 2 ways: It generates a cytoplasmic field sufficient to concentrate some large negatively charged particles at the basal pole and also involves enough ions to directly produce large gradients of ions across the embryo.

The method of measuring the current is being refined to allow a probing of the field around, and an influence of the currents entering, single developing eggs. Then, using this single cell method, it is proposed to more closely measure the transcellular currents during the rhizoid localization process in the *Fucus* egg, and then to survey such currents in a wide variety of other eggs during localization processes.

### 5.0973, RENIN AND EURYHALINITY

*H. SOKABE*, Toho University, *Tokyo, Japan*

The physiological role of the renin-angiotensin systems as an aldosterone stimulating factor has been elucidated. The studies have been mostly performed in dogs or humans. Information in other animals, especially in the lower vertebrates are relatively scarce.

The first purpose of this project is to determine chemically and histochemically the presence of renin in the kidney of the lower vertebrates from Aves to Agnata, and to study the ultrastructure of the site of renin secretion, that is the juxtaglomerular apparatus in Mammalia.

The second purpose is to investigate the role of the renin-angiotensin system in the lower vertebrates. We have found that the system plays a role in the osmoregulation of fishes.

The work will furnish not only phylogenetic information on the renin-angiotensin system, but suggestions to solve the problems in the mechanism of control of renin secretion in Mammalia.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0974, ULTRASTRUCTURE OF CELL ION TRANSPORT MECHANISMS

*D.E. COPELAND*, Tulane University of Louisiana, Graduate School, *New Orleans, Louisiana 70118*

Electron microscope observations are continued on the cellular fine structure of tissues specialized to the transport of salts. Comparative studies have been made on the anal papillae of mosquito larvae (which can absorb salts from water that is almost pure) and the gills of the brine shrimp (which can secrete salt while the animal is living in pure brine, i.e. crystallizing salt concentrations). Both show in common a unique plasma membrane/mitochondrial membrane association which I have labeled

'mitochondrial pump.' A similar 'pump' is found in the Blue Crab gill and is responsible for absorbing salts when the animal is adopted from sea water to fresh water. An unusual method of pinocytosis is seen in the basal folds of the cells, involving out-pocketings of the folds. This may be the mechanism for the first step in Diamonds' theory of salt and water movement.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0975, THE BIOLOGY AND CHEMISTRY OF TRACE ELEMENTS IN MARINE AND ESTUARINE WATERS

*W.R. TAYLOR*, Johns Hopkins University, Graduate School, *Annapolis, Maryland (AT(30-1)-3497)*

The objective of the project is to clarify the biogeochemical cycles of trace elements through the initial trophic levels of the Chesapeake Bay. Both biological and chemical samples have been collected in the major river entering the upper Chesapeake Bay and a series of stations in the Bay. Chemical analyses are done by atomic absorption spectrophotometry. Both phytoplankton and zooplankton organisms are being surveyed quantitatively for spatial and time distribution patterns.

The chemical sampling program is nearly complete. Analyses for iron, manganese, copper, nickel, zinc and cobalt have been partially completed. The trace metal requirements of representative phytoplankton organisms are being investigated. An iron requirement has been found for five algae. Cladocerans appear to be a major component of the zooplankton.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.0976, PHYSICAL AND BIOLOGICAL OCEANOGRAPHY OF A LUMINOUS BAY

*W.D. MCELROY*, Johns Hopkins University, Graduate School, *Baltimore, Maryland 21218 (AT(30-1)-3480)*

The present study will be concerned with a detailed physical and biological study of one well protected bioluminescent bay in Jamaica. However, the equipment constructed for this study will be used for additional studies at other sites such as the luminescent bay on the south shore of Puerto Rico and our own Chesapeake Bay in Maryland. There are several biological parameters that will be studied but two that are very useful and can be measured quantitatively are photosynthesis and luminescence of the phytoplankton.

The Jamaican 'Phosphorescent Bay' is ideal for our proposed studies and is located near the town of Falmouth on the north shore about twenty miles east of Montego Bay. The density of the organisms in this bay is most unusual and forms essentially a constant bloom. The average depth of the bay is about four feet with a surface area of about one square kilometer. The bay is bordered on the north, east and south by dense strands of mangrove trees. The entire Falmouth Harbor lies behind extensive offshore coral reefs and the bay is therefore protected from extreme wave action. The tidal variations are very small - seldom more than 12 cm. Thus this is a well protected bay that supports heavy growth of dinoflagellates - an ideal place for study since it is not, as yet, affected by tourists in contrast to other such bays. From our previous investigations we feel that the bay is an ideal natural oceanographic model possessing many characteristics of larger estuaries. Continuous monitoring of temperature, salinity, tide, climate, fresh water influence, flushing rates, etc. will produce a series of records that are essential for the interpretation of the biological data. As an oceanographic model the waters of the bay may, at some future date, be manipulated physically and/or chemically to study the relative effects of such change upon both oceanographic and biological aspects.

### 5.0977, IMMUNOLOGY AND SEROLOGY OF MARINE ANIMALS

*G.E. KRANTZ*, U.S. Dept. of Interior, Biological Laboratory, *Oxford, Maryland*

Serological and biochemical techniques are employed to describe differences among genera, species, and subpopulations of marine animals (fishes, mollusks, Crustacea). Preliminary stu-

## 5. LIVING SYSTEMS (NON-HUMAN)

dies of the cellular and humoral responses of invertebrates to injected foreign proteins and particulate antigens have been initiated. Clinical diagnostic tests and comparative serology of parasites of marine animals are being developed to enhance analysis of variation in healthy and diseased marine animals.

Serological techniques include the development of rabbit antisera for use in immuno-electrophoresis, agglutination, precipitin, complement fixation, and fluorescent antibody tests. Biochemical studies utilize agar, starch, and polyacrylamide gels, and cellulose acetate in electrophoretic studies of proteins and enzymes from invertebrate tissues (body fluids, serum, hemocytes, muscles, and style).

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0978, TISSUE CULTURE - VIROLOGY

A. ROSEFIELD, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

Attempts are being made to establish in vitro monolayer cell cultures of marine invertebrate tissues (particularly *Crassostrea virginica*) for the purpose of using cultured cells to study the life cycles and physiology of certain infectious agents (such as certain viruses, bacteria, fungi, and protozoans) as well as to study the cytopathogenic manifestations, biochemistry, morphology, and cytology of the cultured cells themselves.

Tissue explants and dispersed cells taken from a variety of oyster tissues are planted in commercial and laboratory prepared media with and without supplements under a variety of environmental conditions. Addition to media of mitotic initiators such as colchicine and phytohemagglutinin are also being attempted.

Maintenance for periods up to three weeks of isolated oyster cells and up to 10 months for heart tissues has been accomplished. However, cell division and concomitant increases in cell number have not been observed, nor have cell lines as yet been established.

### 5.0979, IONIC PERMEABILITIES OF THE SQUID GIANT AXON. - EFFECTS OF CHEMICAL AGENTS

L. BINSTOCK, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Natl. Insts. of Health, Washington - Bethesda, Maryland 20014

The ionic current flow across the membrane of the squid giant axon and the central nerve cord of a marine worm has been measured, without the complications of excitation and propagation, after a sudden change of the membrane potential. The currents have been analyzed in terms of the membrane permeability to sodium and potassium ions. Much of classical nerve physiology is explained by these permeabilities which are themselves not understood. The long range objectives are the further interpretation of nerve function in terms of these fast ionic permeabilities and the elucidation of the structures and mechanisms by which the permeabilities are controlled. The original instrumentation of the potential control concept has been extensively modified and expanded in continuing work with the squid axon. The membrane potential is measured between micropipette internal and nearby external reversible electrodes and is maintained and changed as required by an electronic control system. This system computes, produces, and measures the necessary flow of membrane current between axial and external axon electrodes to follow commanded rapid changes of the membrane potential. Considerable progress has been made in improving the reliability, speed and simplicity of the system.

The voltage clamp technique allows measurements of ionic current flow across nerve membrane as a function of voltage and time. These parameters have been combined into a set of empirical equations capable of expressing nerve membrane activity, but the physical meaning of the equations is unknown. It is hoped that the use of various chemicals known to effect nervous activity may contribute to understanding the physical mechanisms of the membrane. Irrespective of the chemical properties of the substances, this may permit dissection of the lumped parameters of the equations as well as a correlation of known chemical properties with the observed effects.

### 5.0980, FORMATION AND METABOLISM OF NEUROHUMORAL TRANSMITTER SUBSTANCES IN MARINE ANIMALS

E.A. BROWN, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Natl. Insts. of Health, Washington - Bethesda, Maryland 20014

Studies of the metabolism of appropriate compounds in more primitive animals can offer clues to the evolutionary development of those enzyme systems which break down both foreign compounds and naturally occurring substances in the body. Levels of the classically studied drug metabolizing enzymes have therefore been determined in several tissues of pelagic animals. The observation that shark interrenal body contained surprisingly high levels of an endogenous substrate for transmethylation enzymes led to the discovery that conversion of norepinephrine to epinephrine takes place in this organ. The elasmobranch interrenal body is analogous to the cortex of the mammalian adrenal gland. The presence of what is usually a medullary function in such a tissue suggests that this organ can be utilized to study the interrelationship between corticosteroids and catecholamines.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0981, METABOLISM OF NEUROHUMORAL TRANSMITTER SUBSTANCES IN MARINE ANIMALS

E.G. TRAMS, U.S. Dept. of Hlth. Ed. & Wel., P.H.S. Natl. Insts. of Health, Washington - Bethesda, Maryland 20014

This study represents an attempt to follow development of neurohumor transmitter substances and their metabolism in animals lower on the evolutionary scale.

Pelagic organisms have developed not only variants of transmitter substances (such as octopamine) but also a variety of potent blocking agents (neurotoxins) and it is hoped that a better understanding of their structure and metabolism may aid in elucidating the function of neurohumoral transmitters.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.0982, MORPHOLOGIC REGULATORY MECHANISMS IN TERRESTRIAL AND MARINE ORGANISMS

J. GROSS, Mass. General Hospital, Boston, Massachusetts 02114

The mechanisms of formation, organization and removal of structural elements of animal tissues during development are under investigation. To understand the way these processes are regulated and synchronized with each other, work has been directed to the fibrous protein, collagen, since this structural element is involved in practically all tissue remodeling processes from embryogenesis through senescence.

Five areas are under investigation: (1) morphogenesis of collagen in reaggregating sponges and the germination of gemmules, (2) collagen biosynthesis in reaggregating sponges, (3) hormonal regulation of protein synthesis and comparative studies in fish and amphibia, (4) formation and properties of yolk protein in teleosts, and (5) autonomy, regeneration and collagenases in invertebrates.

SUPPORTED BY U.S. National Science Foundation

### 5.0983, MOLECULAR MECHANISMS IN BIOLOGICAL CLOCKS

J.W. HASTINGS, Harvard University, Graduate School, Cambridge, Massachusetts 02138

Studied in the area of biological rhythmicity - endogenous persistent rhythms, which continue to occur even when the organism is kept under constant conditions - are being carried out. A unicellular photosynthetic organism, the marine dinoflagellate *Gonyaulax* is being used. It exhibits several rhythms (photosynthesis, luminescence, cell division) and has been shown to exhibit rhythmicity in the isolated single cell.

This research is concerned explicitly with the molecular nature of the rhythmic mechanism and how it controls the 'target' systems.

SUPPORTED BY U.S. National Science Foundation

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.0984, MOLECULAR STUDIES OF DIFFERENTIATING CELLS

*E. BELL*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

Although a number of reports have concluded that the mature, unfertilized sea-urchin egg is quiescent, recently experiments have made it clear that this view is not longer tenable. It is true nonetheless that fertilization results in an increase in the rate of protein synthesis. The less active, or previously thought 'inactive' state, of the unfertilized egg has been attributed to defects of one kind or another in the egg's protein synthesizing apparatus. Much recent work has focused on 'masked' m-RNA.

The research is concerned with regulation of macromolecular synthesis in mature clam and sea urchin eggs before and after fertilization, in developing and differentiating pollen grain cells and in cells of the chick lens and feather which pass through distinct phases of proliferation, morphological differentiation and senescence.

SUPPORTED BY U.S. National Science Foundation

### 5.0985, MOLECULAR ASPECTS OF CELLULAR DIFFERENTIATION AND DIVISION

*P.R. GROSS*, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

Work primarily on early stages in the embryogenesis of the sea urchin is underway, making use of concepts and methods developed in molecular biology, in relation to the transcription of genetic information and its translation into new proteins.

Identification underway on the intracellular location and ultrastructural features of stored mRNA, the fraction of the genome represented by stored messengers, and such architectural details of the stored particles as may influence their utilization in protein synthesis. Further evidence will be obtained on the translation-level control of protein synthesis during early development of the sea urchin, with respect to the whole pattern of protein biosynthesis and to the assembly of certain differentiated organelles, including microtubules, cilia, mitotic proteins, and membrane derivatives. Certain features of the metabolism of early embryos, related to cell division and differentiation without growth, will be studied. Among them is the initial absence of ribosomal RNA synthesis accompanied by a rapid increase in the number of chromosomes.

SUPPORTED BY U.S. National Science Foundation

### 5.0986, FILAMENTS, MORPHOGENESIS AND CONTRACTION OF MUSCLE

*B. KAMINER*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

The main objectives of the proposed study are to gain a better understanding of the molecular structure of muscle filaments and of the factors which influence their pattern of organization, size and stability. Comparative studies of myosin filamentogenesis, for example, suggest that the intrinsic structure of the myosin molecule determines the size of the natural filaments under given environmental conditions.

The in vitro findings will be applied to living muscle and also to problems in muscular dystrophy.

SUPPORTED BY Marine Biological Laboratory

### 5.0987, CELL DIVISION, BIOENERGETICS, CHEMISTRY OF MUSCLE

*A. SZENTGYORGYI*, Marine Biolog. Laboratory, Woods Hole, Massachusetts 02543

Our research has made it probable that cells are kept in the quiescent state by glyoxal derivatives which are present. Though these are contained in animal cells in surprisingly high concentration, they were not discovered until the present because they are masked. It is the object of the proposed research to collect more data about their distribution and function, prepare them in pure condition, establish their chemical configuration and synthesize them.

It is also our object to draw closer, the relation of these glyoxal derivatives to incidence and the development of cancer, and to establish the optimal conditions for their possible therapeutic use.

SUPPORTED BY Marine Biological Laboratory

### 5.0988, PRODUCT/PROCESSING DEVELOPMENT RESEARCH

*J.A. EMERSON*, U.S. Dept. of Interior, Technological Laboratory, Ann Arbor, Michigan

Four discrete phases of activity are being pursued: (1) Increased mechanization of industrial processing, (2) Development of new products from problem fish species, (3) Investigation and evaluation of new preservation techniques, and (4) Extension to members of industry current and forthcoming information to assist in the resolution of industry's problems.

The mechanization phase provides for surveys of various types of processing equipment currently available, and determining the interest and capability of manufacturers in developing and producing suitable equipment not now available, and conducting in-plant tests of such forthcoming equipment.

Product development is primarily concerned with the utilization of problem species such as carp, sheepshead, and small chub towards the production of fillets, blocks, and boneless, skinless raw material for portion-controlled, frozen, reconstituted products.

The evaluation of new preservation techniques is presently concerned with a detailed study of the application of controlled atmospheres to the extension of refrigerated shelf life of freshwater fishery products. This study is being conducted in cooperation with Whirlpool Corporation, who provides atmosphere generation equipment at this laboratory and technical assistance. This method of preservation will be evaluated as to its application to both vessel and shore installations from the standpoints of effect on product quality and comparative economics to simple refrigeration and other preservation methods. In addition, studies will be conducted in conjunction with the laboratory's irradiation project, as to the effects of controlled atmospheres as a pre- or post-irradiation treatment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0989, UTILIZATION OF FRESHWATER FISH FOR ANIMAL FOODS

*R.A. GNAEDINGER*, U.S. Dept. of Interior, Technological Laboratory, Ann Arbor, Michigan

Detailed studies on the time/temperature relationships for inactivating enzyme thiaminase were completed. The purpose of the study was to examine the potential usefulness and energy requirements for related heat processing approaches for rendering whole, thiaminase-containing fish safe for animal foods, particularly mink.

Subsequently, an experimental fish reduction process, under study for making fish press-cake from thiaminase-containing fish, was modified to convert the approach to a continuous pressure cooker type. The initial bench-scale model was scaled up to a pilot plant or working model and is presently undergoing testing. In addition to developing engineering and economic-related specifications for production-size models, press-cake and meals will be prepared for extensive 2-year mink feeding studies that are planned for initiation this year under a separate project.

Studies are underway or are planned to examine several experimental FPC products made from whole fresh fish, press cake, and fish meal, utilizing several freshwater industrial species. Solvent extraction procedures will be employed; resulting products will be examined for yield and general composition data, their content of elemental residues, and biological response by feeding studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.0990, NUTRIENT ASSIMILATION RATES - FIELD STUDIES

*W. ABBOTT*, Gulf Coast Research Laboratory, Ocean Springs, Mississippi

## 5. LIVING SYSTEMS (NON-HUMAN)

A series of estuarine ponds have been formed by capturing a bayou channel between levees. The ponds are utilized for factorial experimentation on effects of various nutrients in multiple dose combinations.

Phosphorus studies have shown that the ultimate fate of an added tracer spike is conditioned by the recent fertilization history of the pond. Ability of the whole pond ecosystem to function as a sort of 'phosphorus buffer' is indicated by the results.

Repetition of phosphorus studies and studies on the nitrogen cycle are planned for the near future.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.0991, STUDIES ON INORGANIC NUTRIENT ASSIMILATION RATES IN ESTUARINE PONDS

W. ABBOTT, Gulf Coast Research Laboratory, Ocean Springs, Mississippi

The captioned research grant has provided funds for construction of 18 estuarine ponds. These ponds are being utilized for field scale testing of hypotheses developed during a series of microcosm studies (Abbott, J. Water Poll. Control Fed., 38:258-270 (1966); 39: 113-122 (1967)).

Studies are oriented toward evaluation of phosphorus and nitrogen turnover rates, kinetics of uptake of these elements, and validity of their roles as limiting nutrients in hyperfertilized estuarine situations.

SUPPORTED BY Rockefeller Foundation

### 5.0992, MECHANICAL PROPERTIES OF MAMMALIAN CELLS

R.W. CORELL, Univ. of New Hampshire, School of Engineering, Durham, New Hampshire 03824

Cells are the basic building elements of living organisms. The gross or macroscopic mechanical behavior of tissues is dependent upon the rheologic properties of the cells themselves. Research in this field, in recent years, indicates that considerable effort will be required at the cellular level before more complete understanding is obtained for the gross rheologic properties of groups of cells or tissues. Therefore, a student-faculty team is studying the viscoelastic properties of individual cells. To accomplish this, stationary cultured cells are grown in the laboratory. Diluted suspensions containing the cells whose rheological characteristics are sought, are studied by injecting living cells into a nutrient filled microscope chamber. The cells are viewed through a horizontally mounted research microscope. The cells, in time, settle down through the nutrient solution. Some of the cells settle on an optical viewing platform. The data on the flow and deformation characteristics of the cells on this platform are obtained by time-lapse photomicrographs. These photomicrographs provide the experimental data from which a number of characteristics are determined as a function of time, including: 1. Cell Shape. 2. Rate of Change of Membrane Stress. 3. Strain in Cell Membrane.

SUPPORTED BY University of New Hampshire

### 5.0993, STUDIES ON THE STRUCTURE OF HEMERYTHRIN

G.L. KLIPPENSTEIN, Univ. of New Hampshire, School of Agriculture, Durham, New Hampshire 03824

Hemerythrin, the oxygen-carrying protein of certain marine invertebrates, including the sipunculoids, is being studied from a structural point of view. There are three general aspects to this project: 1) A study of the primary structure of the hemerythrin of the sipunculoid *Golfingia gouldii* and analysis of the structures of several molecular variants of hemerythrin which occur in this species. 2) An examination of the primary structure of the hemerythrin from another sipunculoid species, *Dendrostomum pyroides*, and evaluation of similarities and differences between this and *G. gouldii* hemerythrin. 3) An investigation into the structure of the active or iron-binding site in hemerythrin. This latter project involves chemical modification studies on the protein of *G. gouldii* and studies comparing the structures of hemerythrins of several species.

The goals of this research are: 1) to gain insight into structure-function relationships in this protein system, particularly with regard to the structure and chemistry of the iron-protein linkages; 2) to provide information on the evolution of this protein and the evolutionary relationships between invertebrates containing hemerythrin.

SUPPORTED BY University of New Hampshire

### 5.0994, BIOCHEMISTRY OF DEVELOPMENT

M. SPIEGEL, Dartmouth College, Graduate School, Hanover, New Hampshire 03755

Brief Description of Research Project: Isolated blastomeres of the sea urchin embryo, if taken at early cleavage stages, are able to regulate almost perfectly to form a normal larvae of reduced size. Methods have been devised to isolate pure cell suspensions of the three sizes of later blastomeres: micromeres, mesomeres, and macromeres. These cells, when recombined in sea water, are capable of reaggregating to form normal embryos.

Using this technique, investigations are underway, as suggested by previous workers, to determine whether RNA is first synthesized in micromeres and this RNA is then transported to other cell types. If this hypothesis is supported, the investigation of whether this RNA synthesis is correlated with the inductive capacity of micromeres is proposed. Further investigation is also underway on the effects of poly-U on unfertilized and fertilized sea urchin eggs and to continue investigations on the identification of the protein synthesized during early development with particular emphasis on the basic proteins. Other projects underway include (1) an investigation of the 'appearance,' localization and chemical composition of a basic protein found during amphibian gastrulation, and (2) investigations on the factors regulating tryptophan pyrrolase activity in development.

SUPPORTED BY U.S. National Science Foundation

### 5.0995, PHYSIOLOGICAL AND BIOCHEMICAL REQUIREMENTS OF PHYTOPLANKTON SPECIES

J. MAHONEY, U.S. Dept. of Interior, Sandy Hook Marine Lab., Highlands, New Jersey

Description of Work: Grow pure cultures of each species in various salinities, light intensities, photoperiods, and temperatures to determine their gross physiological tolerances. By varying the composition of chemically defined artificial sea water media, 1) determine nutritional requirements of species 2) determine which of those non-essential nutrients available in the sea the species is capable of utilizing. Determine carbon, nitrogen and phosphate sources, vitamins, and trace metals utilized by each species.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.0996, CELL CONTACT IN RELATION TO GROWTH AND MORPHOGENESIS

M. STEINBERG, Princeton University, Graduate School, Princeton, New Jersey 08540

A research program to study cellular properties of adhesion, aggregation, sorting out and migration is underway. Fundamentally, it is hoped to explain how the arrangement of diverse types of cells into tissues is brought about; how this arrangement is maintained; and how it is re-established following disturbance to it. The proposed studies will contribute to our knowledge of 1) the associations and spatial arrangements adopted by cells and tissues in mutual contact; 2) the degrees of selectivity exercised by cells in adopting these associations; and 3) the origins and magnitudes of the physical forces under the influences of which cells and tissues rearrange themselves.

One area of investigation, the selectivity of cell adhesion will employ an examination of chick embryonic cells to determine whether adhesions between cells of different histotypes are initiated randomly or discriminately, and of whether homologous cells 1) of fore and hindlimb and 2) of mouse and chick make adhesive distinctions between one another. Sponge cell aggregation will be studied in a similar manner by use of the electron microscopy together with specific stains which reveal cell surface

constituents as a means for quantifying cell aggregation and the affects of agents upon it; and the use of microscopic electrophoresis as a means for determining certain physical chemical properties of the sponge cell surfaces.

SUPPORTED BY U.S. National Science Foundation

**5.0997, ECOLOGY OF SKELETAL PLANKTON**

*A.W. BE*, Columbia University, Graduate School, New York, New York 10027

Grant NSF GB-155 assisted in the investigation of living plankton Foraminifera. Dr. Be now wishes to extend his studies to include two other calcareous shell bearing groups of plankton, Pteropoda and Coccolithophoridae. Regional planktonic surveys in the Pacific, Atlantic and Indian Ocean are to be continued in order to obtain data on the geographic, bathymetric, and seasonal distributions of plankton populations. Collected material is to be sorted, identified and enumerated. All data will be processed and subjected to multivariate statistical analysis using computers. The knowledge of spatial and time distributions of contemporary species belonging to these three groups should lead to a coherent analysis of their environmental significance. This in turn is a prerequisite for extending the degree of accuracy and reliability of interpreting fossil assemblages and paleoenvironments in deep sea sediments.

**5.0998, GRANT FOR RESEARCH IN ISOLATION OF MARINE PROTEINS**

*O. ROELS*, Columbia University, Graduate School, New York, New York 10027

NO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY John J. Ryan & Sons Incorporated

**5.0999, INTERACTION OF PROTEINS WITH METAL AND HYDROGEN IONS**

*E.M. BRESLOW*, Cornell University, School of Medicine, New York, New York

Studies of cupric and zinc ion - binding to ribonuclease will be continued to elucidate the mechanism by which ribonuclease is inhibited by these ions. Particular emphasis will be given to the application of gel-filtration chromatography to determine binding constants and to study of the interactions of nucleotides and metal ions upon binding to ribonuclease.

Studies of the protein neurophysin will continue with the aim of developing new purification procedures and of characterizing in greater detail the interactions of neurophysin with oxytocin and vasopressin.

Myoglobin investigations will emphasize further studies of the conformational relationships between myoglobin and apomyoglobin, and the mechanism of protoporphyrin-sensitized apomyoglobin photooxidation.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.1000, A HISTOCHEMICAL STUDY OF THE CENTRAL NERVOUS SYSTEM OF LIMULUS POLYPHEMUS**

*R. VONBURG*, Fordham University, Graduate School, New York, New York 10458

Acetylcholine has been implicated as a transmitter in the neurogenic heart of *Limulus* (Carlson, 1909). It has also been demonstrated that it enhances the firing rate of the abdominal ganglia (Von Burg, and Corning, 1968), after ectopic application. Histochemical studies are underway that will attempt to localize cholinesterase activity in the central nervous system of adult organisms.

SUPPORTED BY Fordham University

**5.1001, NUTRITIONAL STUDIES ON MARINE ORGANISMS**

*L. PROVASOLI*, Haskins Laboratories Inc., New York, New York

## 5. LIVING SYSTEMS (NON-HUMAN)

This grant continues support of a long-range examination of the fundamental nutritional aspects of marine ecology, such as the nutritional relationships between the organisms and the chemical environment, and the relationships between organisms. The results of these studies have revolutionized our thinking on the trophic relationships of phytoplankton.

The project will now be extended into three new phases which, nevertheless, represent a continuation and development of this program. Each is an attempt to apply microbiological thought and methods to outstanding problems in marine ecology. The specific goals are concerned with neglected ecological and practical problems. The role of light in the production of nutrients other than carbohydrates is to be investigated.

The second phase will involve the examination of metabolites as morphogenetic factors for seaweeds in order to obtain information which will lead to successful cultivation of these marine plants. Finally, the nutrition of marine crustaceans is to receive attention.

The search for methods to create micron-sized particles as nutritious as the microorganism comprising the normal food of the filter feeders will be continued. Since phagotrophy is common in invertebrates, such a technical advance would be widely useful in the laboratory culture of marine invertebrates.

SUPPORTED BY U.S. National Science Foundation

**5.1002, EXPERIMENTAL MANIPULATION OF MECHANICAL AND PHYSIOLOGICAL RHYTHMS - A DUAL APPROACH TO THE BIOLOGICAL CLOCK PROBLEM**

*J.D. PALMER*, New York University, Graduate School, New York, New York 10003

The circadian activity rhythms of several species of passerine birds and the tidal activity rhythm of the fiddler crab (*Uca*) will be studied under a variety of photo- and thermoperiods, under constant conditions, and under thermal stress in an attempt to discover new properties of these rhythms. Secondly, the photosynthetic rhythm of the very large, single-celled algae, *Acetabularia*, will be studied (polarographically) in a variety of experimental conditions. These cells can be easily enucleated so that the various roles of the nucleus and the cytoplasm in biological rhythms can be ascertained.

SUPPORTED BY U.S. National Science Foundation

**5.1003, CHEMISTRY AND FUNCTION OF BRAIN PLASMALOGENS**

*M.M. RAPPORT*, Yeshiva University, School of Medicine, New York, New York 10033

The chemistry and biochemistry of plasmalogens are under study. The organic chemistry of alpha, beta-unsaturated ethers is being examined in relation to possible functions of this type of lipid in mammalian and marine animal tissues. Enzymic as well as chemical characterizations of the phosphatidyl species (plasmalogens) serve to distinguish them from the structurally analogous phosphatidyl species (diacyl phosphatides), and further studies of the difference are in progress.

Phosphatidyl ethanolamine appears to be a major constituent of the myelin membrane that may have metabolic as well as structural significance. The biochemical relevance of a number of systems is being investigated.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**5.1004, CHANGES IN THE LIMITING NUTRIENT DUE TO TEMPORAL, GEOGRAPHIC, AND DEPTH VARIATIONS**

*G.S. POSNER*, City University of New York, Graduate School, New York - City College, New York 10031

Laboratory and field studies of nutrient enrichment are being used to explore the effect of geography, depth in the water column, time and factors associated with time of a non-cyclical nature on nutritional factors controlling phytoplankton abundance in New York and semi-tropical waters.

SUPPORTED BY City University of New York

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.1005, BIOLOGICAL PRODUCTIVITY IN THE SARGASSO SEA, THE GULF STREAM AND IN THE ATLANTIC COASTAL WATERS OFF CAPE HATTERAS

P.R. BURKHOLDER, Columbia University, Graduate School, Palisades, New York 10964

Studies will be conducted to determine seasonal variations in the biological productivity in the U.S. Atlantic Coastal Waters, the Gulf Stream, and the continental slope and shelf between Montauk Point and the Chesapeake Bay. The influence of effluents entering the ocean via the Hudson River and Chesapeake Bay estuaries, on the plankton in the shelf area and in adjacent water masses will be determined. Consideration will be given to possible radionuclide accumulation in plankton and other indicator organisms. Integrated biological studies will include measurements of primary productivity and of the standing crop of plankton and nekton and their chemical composition. Supporting data will be obtained for inorganic and organic nutrients in the water and for light energy available for photosynthesis in the water columns at all stations. By using different types of collecting apparatus and suitable screens for sorting various particle sizes of organisms in the food chain, an attempt will be made to evaluate the biomass of different size classes of organisms which contribute to the total biomass. These materials will also serve for the biochemical study of protein metabolism at different trophic levels in the sea, with particular reference to the sequences leading from phytoplankton to crustaceans to important species of fish. The data will be compared to that obtained during 1966-1967 in the coastal area off Cape Hatteras, Gulf Stream and Sargasso Sea.

Six cruises were accomplished to date: (5 aboard R/V EASTWARD) E-2-66: Jan. 10-14, 1966. E-27-66: July 11-15, 1966. E-36-66: Sept. 12-16, 1966; E-4-67: Jan. 16-20, 1967. E-24-67: May 22-27, 1967. 1 cruise: July 31, - Aug. 12, 1967. A full data report on cruises E-2-66 & E-36-66 has been completed and is available to AEC. A data report on the other three cruises is in preparation.

SUPPORTED BY U.S. Atomic Energy Commission

### 5.1006, VITAMIN A AND PROTEIN METABOLISM

O.A. ROELS, Columbia University, Graduate School, Palisades, New York 10964

It is the purpose of the present investigation to determine the metabolic function of vitamin A outside the visual cycle. Vitamin A is essential for growth and growth is specifically related to protein synthesis. Previous studies in our laboratory have indicated a close relationship between peptide synthesis and vitamin A status. Intracellular free amino acid concentrations appear to be governed by the vitamin A status of the animal. The size of the intracellular amino acid pools may be governed by protein anabolism or catabolism or by the transport mechanisms of amino acids or peptides across the cell membrane. Effect of retinol and its derivatives, of alpha tocopherol and of the coenzyme Q group of compounds on the structure and function of biological membranes is therefore under intensive investigation. Various model systems are being utilized in this study: - lipid monolayers - lipid bilayers - cells and subcellular organelles of mammalian tissue (rat erythrocytes, rat liver) - cells and subcellular organelles of a protozoan (*Ochromonas malhamensis*)

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1007, EFFECT OF LIPIDS ON STABILITY OF BIOLOGICAL MEMBRANES

O.A. ROELS, Columbia University, Graduate School, Palisades, New York 10964

It is the purpose of the present study to determine the effect of retinol, alpha-tocopherol, coenzyme Q and their analogs and metabolites on the stability, the structure and the function of biological membranes.

Lysosomes, microsomes and plasma membranes will be isolated by density gradient centrifugation and will be used for further studies concerning the effect of certain lipids on membrane stability and function. The relative purity of the centrifuged fractions and the fine structure of the particles and membranes will be investigated by electron microscopy in conjunction with biochemical studies of the same preparations. These combined

biochemical and electron microscopic studies should clarify the influence of certain lipid factors on the structure and function of biological membranes.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1008, MECHANISMS OF CYTOKINESIS IN ANIMAL CELLS

R. RAPPAPORT, Union College & University, Graduate School, Schenectady, New York 12308

Division of animal cells is a physical event which can best be analyzed by physical experimentation. Despite early recognition of the importance of cytokinesis in the lives of cells and organisms, available information has been fragmentary and derived from study of a very few forms. In this investigation experimentation will be extended to cell-types not usually used and new experiments will be devised. Several areas of investigation will be pursued. A better understanding of the events which determine where division will take place will help in analysis of the nature of the division process as well as revealing more about the preparatory phase. Once division has begun, it will be possible to subject the source of the required force to biophysical analysis and thus learn more of its constitution.

As circumstances permit, three different cell types will be used for experiments - vertebrate cells in tissue culture, dividing marine invertebrate eggs and dividing amphibian eggs. Investigations will be carried out at the Union College campus and the Mount Desert Island Biological Laboratory.

SUPPORTED BY U.S. National Science Foundation

### 5.1009, ZOOPHYSIOLOGY OF OCEANIC BENTHIC ANIMALS OFF THE NORTH CAROLINA COAST

F.J. VERNBERG, Duke University, Graduate School, Beaufort, North Carolina 28516

There has been considerable speculation about the factors which influence the zoogeography and speciation of oceanic animals. However, there is limited documentation with observational and experimental data. The oceanic waters off the North Carolina coast are not only rich in fauna as shown by recent ecological studies but also offer markedly different biogeographic regions. In the present study it is proposed to try to characterize the physiological parameters which are operative in two of these biogeographic areas. One of these areas in a submerged reef in the warm waters of the Florida current, the other a cold-water area just north of Cape Hatteras and Diamond Shoals. These physiological studies would include both resistance and capacity adaptations of various stages in the life cycle of the dominant species of both areas. The physiological indications of adaptive responses to the environment to be studied would include reproductive cycles, feeding behavior as influenced by temperature, measurement of various overt function responses and metabolic-temperature curves using animals acclimated to different thermal levels, and osmoregulatory ability at different temperatures.

SUPPORTED BY U.S. National Science Foundation

### 5.1010, PRODUCTIVITY OF ESTUARINE AND MARINE ECOSYSTEMS (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

R.B. WILLIAMS, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

All life ultimately depends on autotrophic organisms. Therefore, knowledge of primary production in estuaries is required for evaluation of their potential to produce commercially important fish and shellfish, and for elucidation of the movement of radionuclides through estuarine food chains into edible species. The primary production of phytoplankton and benthic algae, two groups of autotrophs important in the characteristically shallow southeastern estuaries, is being measured at regular intervals in inshore waters near Beaufort, N. C. Phytoplankton production is estimated by the light and dark bottle technique. Bottles of seawater (with zooplankton removed by filtration) are incubated for 24 hours at several fractions of surface illumination, and charges

## 5. LIVING SYSTEMS (NON-HUMAN)

in dissolved oxygen are determined by titration. To estimate benthic production, areas of bottom are enclosed (in situ) for 24 hours beneath clear and opaque plastic bell jars, and changes in dissolved oxygen within the jars are obtained by titration of water samples withdrawn from them. In addition, measurements of standing crop accompany the measurements of production.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 5.1011, MACROMOLECULAR EVENTS OF FERTILIZATION AND EARLY EMBRYONIC DEVELOPMENT

*D.W. STAFFORD*, Univ. of North Carolina, Graduate School, Chapel Hill, North Carolina 27514

The aggregation of the sea urchin, *Arbacia punctulata*, ribosomes gives rise to a question: Are sea urchin egg ribosomes fundamentally different from those of *E. coli* or rat liver, or is their aggregation caused by 'sticky' proteins in certain cells? This problem is being approached by adding isolated *E. coli* ribosomes to ribosome-free supernatant prepared from the sea urchin. The ribosomes are pelleted by centrifugation, and the degree of aggregation determined. If this experiment results in aggregation, this system will be tested for activation of protein synthesis by proteolytic enzymes.

In addition, the isolation of a ribonuclease inhibitor from sea urchin eggs and the methods for handling sea urchin ribosomes are being worked out. A previous project on sea urchin sperm mid-piece DNA is being completed, and studies on in vitro protein synthesis in bull sperm mid-piece are being continued.

SUPPORTED BY U.S. National Science Foundation

### 5.1012, MACROMOLECULAR BASIS FOR ADAPTATION TO SALINITY CHANGES IN *PRYMNESIUM PARVUM*

*G.M. PADILLA*, Duke University, School of Medicine, Durham, North Carolina 27706

Decreasing salinities to 5% sea water reduces the growth rate of *Prymnesium parvum* as well as the rate of synthesis of RNA and protein. Yet the content of both of these components rises on a per cell basis. Acute shifts in salinity induce a five-fold increase in RNA content within six hours after the shift. Both of these observations suggest that *P. parvum* adapts to lower salinities through the synthesis of new macromolecular components involved in permeability functions. Increasing salinities induce a faster growth rate and reduce content of RNA and protein. The DNA content remains constant. Toxin synthesis on the other hand achieves its maximum levels at 75% sea water.

Biosynthetic pathways by which macromolecules are synthesized following salinity shifts and the relevance of such synthesis to permeability functions are being examined. These experiments are being coupled to the analytical separation of subcellular structures by density zonal ultracentrifugation and examination with the electron microscope in order to determine the cytological sites of adaptation to salinity changes and toxin synthesis.

SUPPORTED BY U.S. National Science Foundation

### 5.1013, NATURAL COMPOUNDS WITH CARBON-PHOSPHORUS BONDS

*L.D. QUIN*, Duke University, Graduate School, Durham, North Carolina 27706

The insoluble protein remaining from extractions performed on marine animals is being examined for the presence of compounds with C-P bonds. Coelenterates in general seem to be positive in this sense; a number of other animals are negative, but some contain C-P compounds in extractable form. The nature of the bonding of 2-aminoethylphosphonic acid (AEP) in the protein is being studied by subjecting the material to degradations. Small fragments amenable to structure determination have been obtained; one fragment appears to contain AEP and aminosugar, and is being investigated further. One sea anemone has been encountered in which the predominant C-P compound in the protein residue is 2-(methylamino) ethylphosphonic acid, and the project will include studies on the mode of bonding of this substance.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1014, SUBCELLULAR REACTION TO INJURY IN THE KIDNEY

*B.F. TRUMP*, Duke University, School of Medicine, Durham, North Carolina 27706

The principal research objective is the delineation, at the subcellular, supramolecular, and molecular levels, of the response of kidney cells to lethal as well as sub-lethal injury. The principal emphasis is on the structural and functional modulation of cellular membranes as they relate to modification of energy transduction by these systems. Complementary objectives include an understanding of the ultrastructural characteristics of human renal disease, methods of ultrastructural and cytochemical analysis, and the ultrastructural basis of active transport. Particular attention has been given to the study of systems such as isolated, perfused flounder tubules and toad bladders in Ussing chambers, where correlations between alterations of structure and function can be made.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1015, MECHANISMS OF CALCIUM CARBONATE DEPOSITION

*K.M. WILBUR*, Duke University, Graduate School, Durham, North Carolina 27706 (NONR)

The investigator will continue his analysis of physiological and biochemical and crystallographic mechanisms of calcium carbonate deposition in shells and other structures in marine organisms. In particular, during this renewal period, the principal investigator will concentrate on the ultrastructure of the barnacle shell and its relations with the substratum. The calcium deposition process will be studied, in part, radiographically after exposure of the animals to  $Ca^{45}$  in sea water.

One of the aims of the research in this programmatic area of interest is the discovery of vulnerable stages in the life cycles of fouling organisms. Physical or chemical intercession at these stages could provide the means for the prevention of attachment to submerged structures and equipment. Data resulting from this research will help prepare Navy planners for combating fouling, and will furnish information that can be used to reduce the yearly multimillion dollar cost, maintenance, delay, etc., caused by this fouling.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 5.1016, CALCIFICATION MECHANISMS IN MARINE ORGANISMS

*K.M. WILBUR*, Duke University, Graduate School, Durham, North Carolina 27706

The general objective of our program is a comparative study of calcification systems in certain marine organisms. It has two major phases. The first is a study of the ultrastructure of each system with particular attention to the relationship of crystal formation to cell components and the organic matrix. The second phase concerns physiological aspects of calcification with emphasis on conditions which favor and inhibit calcification.

The studies are being carried out on the following: 1. Amino acid analysis of organic matrix in mollusc shells 2. Analysis of extrapallial fluid of molluscs 3. Intracellular localization and transport of calcium by marine algae 4. Experimental studies of nucleation and crystal growth in the organic matrix of marine algae.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1017, PRODUCTIVITY STUDIES IN NORTH CAROLINA SALT MARSHES

*A.W. COOPER*, Univ. of North Carolina, School of Agriculture, Raleigh, North Carolina 27600

This research will study primary productivity in North Carolina salt marshes. Studies in other areas have shown that salt marshes are among our most productive natural communities. Salt marshes fix large quantities of solar energy and perhaps as much as half is washed out by the tide into estuarine waters and forms a major source of food used by commercial and sport fin- and shellfish which inhabit estuaries during some point in their life cycle. Despite their obvious importance, salt marshes are sub-

## 5. LIVING SYSTEMS (NON-HUMAN)

ject to great destructive pressures by man. There have been no studies of productivity in North Carolina and such studies are needed to enable the State to develop better policies with respect to its management of these lands and associated waters.

Initial field work will obtain data needed for a final classification of community types in North Carolina salt marshes. The distribution of these types will then be mapped from aerial photographs and the total acreage of each type determined. Detailed studies will then be made of primary productivity within each type. Clip-samples will be used first, but it is hoped that these will be supplemented by refined data using techniques such as gas analysis so that estimates can be made not only of net productivity but also of gross productivity. From these data and the distribution data estimates of total productivity of each type on the entire coast will be made.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch  
North Carolina State University

### 5.1018, CONDUCTION AND INTEGRATION

R.K. JOSEPHSON, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106

Work in this laboratory is directed toward an understanding of physiological mechanisms controlling behavior in lower animals. Specific projects planned include (1) a comparative study of pacemaker systems and conducting systems in hydrozoan polyps, (2) a study of the properties of electrically active epithelia in Hydra, and (3) and investigation of the neural control of sound production and of rapidly contracting muscles used in singing by the katydid *Neoconocephalus robustus*.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1019, PRODUCTIVITY OF OCEANIC POPULATIONS OF VERTICALLY MIGRATING ANIMALS

W.G. PEARCY, Oregon State University, Graduate School, Corvallis, Oregon 97331

Project Description: Collections obtained with meter plankton nets and midwater trawls will provide data on the number and biomass of common species of vertically migrating animals off Oregon. Changes in size frequency distributions of species will be used to estimate growth rates. With periodic estimates of growth and population size, net production will be calculated. Seasonal and inshore-offshore variations in numbers and population size structures will also be studied, particularly in regions influenced by upwelling.

SUPPORTED BY U.S. National Science Foundation

### 5.1020, ENERGY TRANSFER IN LOWER MARINE TROPHIC LEVELS

L.F. SMALL, Oregon State University, Graduate School, Corvallis, Oregon 97331

We are obtaining estimates of energy flow in significant second trophic level grazing organisms in the pelagic marine environment. Currently we are employing respiration and growth measurements, and ingestion-egestion measurements, and propose to compute carbon budgets. Effects of temperature, light, pressure, food types and concentrations, and grazer concentrations are being investigated. Extrapolations of physiological data in the laboratory to conditions in the sea are to be attempted, to assess relative importance of various organisms in the energetics of the pelagic biota.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1021, POPULATION STUDIES ON INTERTIDAL INVERTEBRATES

P.W. FRANK, Univ. of Oregon, Graduate School, Eugene, Oregon 97403

Using recently developed techniques of marking, the investigator is determining longevity and growth rate of a number of gastropod mollusks, and of several species of echinoderms (Asteroidea). Growth of all sizes is observed for at least a 1-year period. Work is being done at the Great Barrier Reef Committee

Research Station at Heron Island, Queensland, Australia, and along the Oregon coast.

The main information to be gained concerns 1) whether longevity on a tropical reef is relatively high--as is to be expected from arguments about stability of the fauna; 2) the extent to which data gathered on size distributions may be of value in making predictions about longevity. Comparisons will be made between different species, and between different populations of the same species. Specific organisms concerned, for the Barrier Reef: *Nerita albicilla*, *Trochus pyramidus*, *Conomurex luhuanus*, *Monetaria annulus*, *Conus flavidus* and *Conus* spp.; *Fromia* spp. For the Oregon coast: *Tegula funebris*, *Searlesia dira*.

SUPPORTED BY U.S. National Science Foundation

### 5.1022, COMPARATIVE STUDY OF NITROGEN SECRETION IN FISHES

R.W. MORRIS, Univ. of Oregon, Graduate School, Eugene, Oregon 97403

The investigator plans to investigate some aspects of gas secretion in fishes, specifically the possibility of metabolic origin of at least some of the nitrogen found in the gas bladders of certain bony fishes.

Comparative studies will be run on anadromous species, freshwater fishes from freshwater ancestry, marine fishes of recent freshwater ancestry, freshwater fishes of marine ancestry, and marine fishes of marine ancestry. Gas will be removed from the gas bladders of the fishes, fishes will be denied access to molecular nitrogen during regeneration of its contents by brine kept in an atmosphere of commercial oxygen (less than 1.0% N<sub>2</sub>). These will be run with suitable controls for varying periods of time.

SUPPORTED BY U.S. National Science Foundation

### 5.1023, NEUROSECRETION AND ENDOCRINE PHYSIOLOGY

L.H. KLEINHOLZ, Reed College, Graduate School, Portland, Oregon 97202

The proposed work continues studies with the physiological and chemical characterization of four neurosecretory hormones of the crustacean eyestalk: the retinal pigment hormone, a family of chromatophorotropins, and the diabetogenic hormone. The basic physiological and bioassay methods have already been established. The major portion of current and future work deals with purification of the separate hormones, determination of their physiological specificities. It is expected that amino acid compositions of these will be determined, and hopefully, that sequence studies will be made on the purified peptide hormones.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1024, NUCLEIC ACID AND PROTEIN SYNTHESIS DURING OOGENESIS

M.J. ALLEN,

The transcription and translation of genetic information during oogenesis and early development in spiralian eggs, specifically those of the polychaetous annelids (*Autolytus* and *Chaetopterus*) and those of the gastropod mollusc *Ilyanassa*, are being studied. This study involves exposure of developing eggs and embryonic stages to the radioactive precursors of nucleic acids and proteins in conjunction with actinomycin D and puromycin. The chief aims (besides continuing the radioautographic studies of *Autolytus* eggs) are: 1) to extend to annelid eggs biochemical studies similar to those on *Ilyanassa* and sea urchin eggs, and 2) to detect differential gene activity in spiralian eggs (specifically those of the gastropod *Ilyanassa*) by radioautography; in effect, to make a biochemical cell lineage study on these eggs.

SUPPORTED BY U.S. National Science Foundation

### 5.1025, PRIMARY PRODUCTIVITY IN PUERTO GALERA BAY, MINDORO, PHILIPPINES

A.A. DELACRUZ, Univ. of The Philippines, Manila, Philippines

SUPPORTED BY Society of The Sigma Xi

### 5.1026, CHEMICAL RESPONSES BY MARINE ORGANISMS TO STRESS

H.P. JEFFRIES, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The ocean is physically stable compared with land and fresh-water environments, and the medium has intimate association with the life it bathes. Consequently marine organisms have developed less complex regulatory systems than their terrestrial and aquatic counterparts. But when the ocean does change -- by natural processes or as the result of pollution -- it follows that the biotic community will also change, along with the ecosystem's ability to process waste materials. Homeostatic control at the community level is, therefore, an essential element in understanding the sea's populations, especially in coastal waters where environmental oscillations are large.

The major goal of this investigation is to identify and measure quantitatively the ways marine communities respond to ecological stress. The internal responses are measured in terms of homeostasis; the external stresses result from temperature, salinity, competition, food and pollution.

The first phase of this investigation showed that the balances of free amino acids, fatty acids and blood constituents are sensitive indicators of environmental conditions. Relationships observed in nature between external stress and internal composition are now being analyzed in the laboratory. In addition, the genetic determinants of chemical specificity will be separated from environmental influences in copepods, mollusks and fishes.

When we know the minimum stress intensities and corresponding maximum internal tolerances within which normal community composition and function are maintained, we should be able to predict the fate of populations living under various conditions of water quality.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 5.1027, TROPHIC RELATIONSHIPS IN SHOAL BENTHIC ENVIRONMENTS

N. MARSHALL, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

Shoal benthic environments in the estuaries of the southern New England coast are very productive in the natural state. Trophic relationships in these habitats are being pieced together through studies of producer and consumer groups. Since little is known of the organic matter contribution by the benthic microflora special attention is being directed to this group, assaying production from <sup>14</sup>C uptake by intact and undisturbed sediment samples. Attention is also directed to improving techniques for this assay.

SUPPORTED BY U.S. National Science Foundation

### 5.1028, AGE DETERMINATION OF LARGE ATLANTIC SHARKS

J.G. CASEY, U.S. Dept. of Interior, Marine Game Fish Research Lab., Narragansett, Rhode Island 02882

Sample sharks from southern New England to North Carolina. Collect vertebrae that represent full ranges of sizes, section vertebrae to treat for microscopic examination; interpret year marks using standard techniques of age determination; prepare growth curves for *Carcharhinus milberti*, *C. obscurus*, *Carcharias taurus*, *Carcharodon carcharias*, *Prionace glauca*, and *Sphyrna zygaena*.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 5.1029, LIPASE RESISTANT GLYCERIDES

N.R. BOTTINO, Texas A & M University System, School of Agriculture, College Station, Texas 77843

The long-chain highly unsaturated fatty acids typical of aquatic animal lipids, (eicosapentaenoic, docosapentaenoic, and docosahexaenoic acids) are known to be located preferentially in the 2-position of the glycerides of marine crustacea and fish. On the other hand, these acids are located in the extreme positions of whale oil triglycerides. The reasons and mechanism for the

change in position are being investigated by feeding whale oil, fish oil, and shrimp to pigs. It is expected that the pig, whose triglycerides, like those of the whale, possess higher unsaturation in the extreme than in the middle positions, will distribute the long-chain highly unsaturated fatty acids in a manner similar to that of the whale. As a control, groups of rats which have the 'normal' predominance of unsaturation in the middle position of their triglycerides will also be fed whale oil and fish oil, separately.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 5.1030, BIOLOGICAL PRODUCTIVITY INVESTIGATIONS OF THE WATERS SURROUNDING ANTARCTICA

S.Z. ELSAYED, Texas A & M University System, Graduate School, College Station, Texas 77843

This amendment to Texas A&M Research Foundation proposes participation in the Weddell Sea Expedition during austral 1967-68 to investigate the biological productivity of the Weddell Sea with emphasis on factors governing organic production for comparison with other Antarctic regions. The objectives are: (1) to estimate standing crop of phytoplankton in euphotic zone; (2) to measure primary productivity by <sup>14</sup>C uptake method (3) measure light transmission and solar radiation; (4) study concentration of nutrient elements; (5) study concentration of soluble and particulate organic carbon; (6) and obtain plankton samples. This participation represents an extension of shipboard work on USNS Eltanin in South Pacific under GA-915 and will utilize existing supplies and equipment essential for the additional work, with the personnel accommodation provided by this amendment.

Equipment and supplies for the work aboard USCGC Glacier will be provided by USARP. The principal investigator will be assisted on shipboard by two assistants from Texas A&M Research Foundation and one technician from the USCGC Glacier.

SUPPORTED BY U.S. National Science Foundation

### 5.1031, LIPID COMPOSITION OF ANTARCTIC MARINE ORGANISMS AND SEA WATER

L.M. JEFFREY, Texas A & M University System, Graduate School, College Station, Texas 77843

The objectives of the research are to utilize the low temperature flora and fauna populations of the Antarctic Ocean to determine: A. The effect of temperature on the lipid composition of phytoplankton, zooplankton and fish. B. The influence of temperature on polyunsaturated fatty acid metabolism of marine organisms. C. The changes in the triglyceride and phospholipid (Polar lipid) structure and fatty acid composition of marine oils as they pass through the entire food chain, including whales. D. The relation of kinds and amounts of marine water lipids with plankton production in Antarctic and Gulf of Mexico waters.

SUPPORTED BY U.S. National Science Foundation

### 5.1032, ORGANIC PRODUCTION OF EPIFAUNAL ORGANISMS

W.E. PEQUEGNAT, Texas A & M University System, Graduate School, College Station, Texas 77843

Research will be continued on the energy budget of the biomass of rock-reefs of the sublittoral zone. Growth rates of the living population will be studied, primary production of the area will be determined, the concentrations of soluble and particular organic carbon in the ambient water will be measured; from these and supplemental data, on local currents and associated hydrographic information, calculations will be made with regard to the amount of energy required to support an incomplete ecosystem of this kind.

Possibilities in control of, protection against, and utilization of biological material and activity are also considered in this program. Information resulting from this research will be particularly useful in the prediction of the type and distribution of organisms which cause or affect fouling and deterioration of submerged equipment and structure.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 5. LIVING SYSTEMS (NON-HUMAN)

### 5.1033, CARBON DIOXIDE FIXATION IN HETEROTROPHIC ORGANISMS III THE BREAKDOWN OF GLYCOGEN IN MARINE INVERTEBRATES

J. AWAPARA, Rice University, Graduate School, Houston, Texas 77001

Our previous work has established that a large number of marine invertebrates degrade glycogen to yield products not commonly observed in other animals. Of these products, succinic acid appears in abundance. In order to account for the formation of one molecule of succinic acid from one molecule of glucose carbon; three of the six glucose carbons flow into succinic acid, a process which requires two reductive steps. The two reductions are balanced by the oxidation of two molecules of glyceraldehyde phosphate during glycolysis. The other three carbons undergo reactions to produce alanine. None of the reactions involve oxidoreductions.

All the above expectations have been realized and proven by a series of experiments. The ratio of alanine to succinic acid formed from glucose was found to be one in every instance.

In sum: many marine invertebrates degrade glucose as follows: (Step 1) Glucose reacts to form 2 phosphoenolpyruvic acid (PEP). (Step 2) PEP reacts to form pyruvic acid, which reacts (Step 3) to form alanine (Step 4) PEP reacts to form oxalacetic acid which reacts (Step 5) to form malic acid which, in turn, reacts (Step 6) to form fumaric acid, forming (Step 7) succinic acid. Two molecules of coenzyme are reduced in (1); the two molecules of reduced coenzyme serve as the reducing agent in steps (5) and (7). Although the pathway of glucose breakdown has been elucidated in general terms, there remain some difficult questions to be answered. For example, how is fumaric acid reduced to succinic acid when oxygen is present. Under those conditions it is unlikely that the reduction is the reverse reaction of the oxidation of succinic acid by the mitochondrial succinic dehydrogenase.

We are now studying the reduction of fumaric acid in marine organisms in the presence of oxygen.

### 5.1034, PRESENCE OF ENZYMES RELATED TO DNA SYNTHESIS IN EGGS OF ECHINODERMS

R.E. BLACK, Coll. of William & Mary, Graduate School, Williamsburg, Virginia 23185

**BRIEF DESCRIPTION OF RESEARCH PROJECT:** Research on protein synthesis during sea urchin development is underway to determine which enzymes related to DNA synthesis are present in the cytoplasm of eggs and which enzymes must be synthesized. The enzymes concerned in the experiments are the deoxynucleotide kinases and DNA polymerase.

The enzymes will be studied in preparations of nucleate and enucleate egg fragments prepared by centrifugation of the unfertilized eggs of various species. The presence of the kinases and polymerases in enucleate and nucleate halves will be evaluated under exposure to puromycin to determine whether the enzymes are stored in the nucleus or cytoplasm or both, are found in sperm nuclei, and/or are synthesized during each cleavage division.

### 5.1035, BIOCHEMISTRY OF FISH MUSCLE AND QUALITY CHANGES

H.S. GRONINGER, U.S. Dept. of Interior, Technology Laboratory, Seattle, Washington

Many of the biochemical reactions that occur in post-mortem fish muscle affect the flavor and textural quality of the muscle. Some of the enzyme catalyzed degradations of nucleotides and nucleosides appear to be important quality changes.

The objectives of this work are (1) to study some of the nucleotide and nucleoside degradations in fish muscle, and (2) to study potential methods of controlling these reactions.

Results: The dephosphorylation rate of inosinic acid (IMP) was found to vary over a fairly wide range in the muscle from different species of fish. There was some difference in the heat stability of the enzymes from different species. It was found that the dephosphorylation of IMP could be inhibited in certain species by treatment of the muscle with ethylenediamine tetraacetic acid. In substrate specificity studies it was shown that the dephosphoryla-

tion activity can be attributed mainly to the nucleotidase enzyme. The nucleotidase activity is found mainly in the microsomal fraction after centrifugation of muscle extracts.

### 5.1036, MEASUREMENTS OF OXYGEN CONSUMPTION BY THE SEA BED IN DEEP WATER OF PUGET SOUND

K. BANSE, Univ. of Washington, Graduate School, Seattle, Washington 98122

Instrumentation to push light and dark bell-jars into the sediment under TV control will be used to measure the in situ oxygen consumption of the level sea bed in Puget Sound to 200 m depth. Oxygen electrodes and telemetry will be employed. Eight stations on which the infauna is well known will be visited quarterly for one year. The oxygen consumption in cores will be studied at the same time. The fraction, due to the macrofauna of the total oxygen consumption of the bottom will be estimated. In shallow water, oxygen production from microscopic benthic algae will also be measured.

SUPPORTED BY U.S. National Science Foundation

### 5.1037, CYTOPLASMIC FILAMENTS AND CELL MOVEMENT IN DEVELOPMENT

R.A. CLONEY, Univ. of Washington, Graduate School, Seattle, Washington 98122

**Brief Description of Research Project:** The development of any metazoan is characterized by a complex series of cellular movements leading to increased cellular interaction, functional specialization and structural complexity. A theory of development depends, in part, on an understanding of cellular kinetic mechanisms and their regulation and control in ontogeny.

Ultrastructural studies revealed oriented filaments and microtubules in cytoplasm fixed in a phase of movement. Experiments are performed with ascidians (tunicates) where contraction of the caudal epidermis during metamorphosis is accompanied by extensive and rapid alignment of filaments in the axis of shortening. The epidermis contracts to 1/20 of rest length in only six minutes. Data obtained from time lapse cinematography, electron microscopy and a variety of experimental methods support the hypothesis that the filaments are contractile elements.

Work is continuing to determine to what extent the contractile mechanism in the caudal epidermal cells of the ascidian is related to contractile mechanisms in other cells (such as muscle and fibroblasts) in terms of structural and physiological properties. The development of birefringence in the caudal epidermis of living specimens with the reorganization of filaments observed in ultrastructural studies of fixed tissues will be correlated.

SUPPORTED BY U.S. National Science Foundation

### 5.1038, BIOLOGICAL OCEANOGRAPHY

T.S. ENGLISH, Univ. of Washington, Graduate School, Seattle, Washington 98122

The broad objective is to determine the daily and seasonal distribution of phytoplankton, zooplankton and organic detritus in a typical water column beneath the ice and to measure the annual biological productivity. Kinds of organisms, their size, absolute abundance, life history stages and movements are studied in relation to physical factors of the environment. Special emphasis is placed upon quantity of light at various depths and to the transfer of radiant to chemical energy by phytoplankton populations whose abundance is measured by analysis of the concentration of chlorophyll a. Productivity is studied by carbon-14 techniques and energy transfer is followed through the food chain from producers through the several trophic levels of consumer populations.

Distribution, kinds, numbers and behavior of planktonic organisms and detritus contribute to knowledge of the total environment of Arctic.

SUPPORTED BY U.S. Dept. of Defense - Navy

**5.1039, THE EFFECTS OF SEAL AND FISH PREDATION ON CERTAIN ANTARCTIC BENTHIC COMMUNITIES**

*R.T. PAINE, Univ. of Washington, Graduate School, Seattle, Washington 98122*

The additional funds for GA-1187 will permit complementary work on the research of trophic stratification within shallow water communities. This will consist of (1) collection of sediment samples with a piston corer adjacent to the established experimental, exclusion cages and (2) quantitative enumeration of bacteria present. A second addition to the original proposal is measuring the respiratory (maintenance) cost of the dominant benthos to permit ecologically more dynamic standing crop measures for information on decomposers active in the Antarctic marine communities. This will be conducted by the principal investigator. For the purposes of the additional field objectives and to provide necessary assistance in the planned scuba work, two more graduate assistants are included under the supplement.

The field work will be conducted at McMurdo Station, principally during the austral summer by four scuba graduate assistants. The principal investigator will be at the Bio Lab one month. Plans for early winter participation are under consideration.

SUPPORTED BY U.S. National Science Foundation

**5.1040, STUDIES ON GAMETOGENESIS IN HYDROMEDUSAE**

*E.C. ROOSENRUNGE, Univ. of Washington, School of Medicine, Seattle, Washington 98122*

A detailed and, as far as possible, a quantitative exploration of the sequence of events in the regeneration of gonads after castration is to be carried out in *Phialidium* by means of observations on the living, histology, and electron microscopy. The source and mode of proliferation of germ cells is to be investigated by labelling with thymidine-H3. External factors which stimulate or inhibit regeneration of ovaries or testes are to be explored. Steroid hormones are of most immediate interest. In addition, the role of the gastrodermis and the influence of gonadal tissues on gonadal regeneration will be studied.

SUPPORTED BY U.S. National Science Foundation

## 6. PUBLIC HEALTH AND SAFETY

### 6A. FOOD AND FOOD SANITATION

*(Fish Protein Concentrate; Seafood Processing and Marketing; Irradiation.)*

**6.0001, BOTTOM FISH, FISH WASTE, SCRAP FISH & OTHER SEA PRODUCTS FOR FUR ANIMAL DIETS**

*J.R. LEEKLEY, Univ. of Alaska, Agricultural Experiment Sta., College, Alaska 99735*

Object: To determine the relative feeding value to fur bearing animals of ocean and fresh water fish, fish products now being discarded by canneries and cold storage plants, sea mammals that are harmful to commercial fisheries in Alaska, scrap fish available in the Great Lakes region, and other products which have no market for human consumption.

Plan of work: Feeding tests at Petersburg will be made on various types of fish, fish waste products and sea mammals singly and in combination. Special consideration will be given to compounding satisfactory feed mixtures and to nutritional characteristics of diets made of maximum of readily available Alaska feed ingredients. Chemical analyses will be run as necessary. Rates of growth and complete breeding and reproduction records will be kept on animals receiving test diets. Various vitamins, antibiotics, antioxidants, and other supplements and preservatives will be tested as to desirability and level of feeding, with emphasis on further comparison of the relative value of phenolic antioxidants and to tocopherols in control of yellow fat disease, and on the value of certain dietary iron compounds in prevention of cotton pelts. Work at Ithaca will be continued on the use of trawler chubs and alewives (Great Lakes fish species) in diets for mink.

SUPPORTED BY U.S. Dept. of Agriculture

## 6. PUBLIC HEALTH AND SAFETY

**6.0002, PROCESSING ALASKA SHRIMP**

*J. COLLINS, U.S. Dept. of Interior, Technological Laboratory, Ketchikan, Alaska*

This research involves a general study of the processing of pink shrimp. Specifically, we plan to modify existing methods or develop new ones to improve quality and develop new products.

Immediate improvements in quality can be made by developing an alternate method to the ice-holding method currently used to prepare shrimp for mechanical peeling. A pre-cooking technique that is being developed as an alternate to ice-holding results in much better quality and suggests end products other than canned. Accordingly, methods are being studied to produce a machine-peeled frozen cocktail style pack to replace the scarce and costly hand-peeled product.

Since the red color of the shrimp is an important factor of quality, current studies are concerned with the stability of the carotenoid pigments during peeling and other operations in the canning process. Conditions of retorting (time and temperature) are being studied. The use of the various additives to stabilize the carotenoids during frozen storage of machine-peeled, blanched, frozen shrimp are being studied.

The program is a continuing one and future projected work will include vessel unit handling and delivering systems, and demonstrations of the need for developing heading and sorting equipment.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**6.0003, PROCESSING KING CRAB**

*R.D. TENNEY, U.S. Dept. of Interior, Technological Laboratory, Ketchikan, Alaska*

This project is designed to improve quality and increase value of king crab seafood products by improving canning methods by increasing natural moisture retention, by adopting new freezing methods, and by combining raw freezing with satisfactory thawing and shucking variables. Additionally, to fabricate by-products of king crab waste to provide a useful product from large amounts of costly material which is presently discarded to form a pollution problem.

Work is being done on the use of polyphosphates as additives for control of moisture retention and reduction of canning defects such as sulfide blackening and struvite. This approach is now nearing completion.

There is a need for freezing methods that are more efficient and more amenable to use aboard vessels and ashore. Studies on brine freezing of cooked crab have been initiated and will be followed by storage studies with chemical and organoleptic testing of brine frozen product over a time temperature cycle.

In combination with the brine-freezing studies on cooked crab, studies on both brine-freezing and blast-freezing of raw crab will be made. Experimentation of thawing, cooking and extraction of meats through manipulation of these variables will follow to determine an efficient method of processing raw frozen crab.

Additional studies on protein quality of meal processed from crab waste are in progress in conjunction with other laboratories. These studies include mink and chick-feeding experiments using crab meal as a source of protein.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

**6.0004, CONSUMER EVALUATION OF FISH PRODUCTS**

*W.R. MORRISON, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701*

The objectives are (1) to investigate the influence of socio-economic characteristics of the population on consumer evaluation of smoked buffalo fish ribs, breaded scored fillets; and other products prepared from farm produced fish, (2) to evaluate consumer conceptual image of the products, reaction to product characteristics such as appearance, flavor, aroma, texture, etc., and reasons for these reactions, (3) to estimate market potentials and competitive position of these products.

Description of work - The first phase of the study will be conducted in Memphis, Tenn., with Census Tracts comprising the sampling unit. City blocks will be randomly selected from the census tracts with the number of blocks selected in each tract being dependent upon the population characteristics within the tract. Households will be randomly selected within city blocks. For

## 6. PUBLIC HEALTH AND SAFETY

cooperating households an enumerator will fill out a family questionnaire and will give the homemaker the test item along with special instructions and an evaluation schedule on which the adult members of the household will list their separate evaluations of the test product.

If acceptance of the test items by consumers appears likely, further market testing may be desirable. Experimental procedure for this phase of the study would depend upon the kind of economic information needed. Appropriate analytical techniques for studying consumer acceptance would be used in any further testing.

Arkansas State Government

**6.0005, PROGRAM PROJECT - FOOD MICROBIOLOGY**  
*G.F. STEWART*, Univ. of California, School of Agriculture,  
*Davis, California 95616*

Research on food-borne infections and intoxications, especially those caused by the *Salmonella* and *Clostridia*.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**6.0006, THERMAL DESTRUCTION OF TYPE E CLOSTRIDIUM BOTULINUM**

*C.W. BOHRER*, Natl. Canners Association, *Washington, District of Columbia*

The characterization and definition of the heat resistance of *Clostridium botulinum* type E in foods forms the foundation of this project. The interlocking effects of spore production medium, recovery medium for heat injured cells, and heating substrate on resulting resistance found in the initial years of this grant will be expanded. The effects of water activity on outgrowth of spores will be studied both as to optimum growth and limits for outgrowth. In addition, the heat inactivation of the type E toxin will be defined. Knowledge on all of these factors are of extreme importance to food processors, food handlers, and public health officials for use in preventing outbreaks of type E botulism.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**6.0007, DIMETHYLNITROSAMINE IN CURED, SMOKED WHITE FISH AND FLOUR BLEACHED WITH OXIDES OF NITROGEN**

*C.J. BARNES*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To determine the amount of dimethylnitrosamine in cured, smoked whitefish following treatment with sodium nitrite, and in flour following treatment with oxides of nitrogen.

To determine ethylene dichloride at 5 ppm in whole fish protein concentrate.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0008, RADIOCHEMICAL TECHNIQUES**

*M.K. ELLIS*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

Purpose: To improve, develop, and/or apply radio-chemical techniques for the determination of radionuclides in foods and to promote and/or assist in the utilization of such techniques and Drug Administration research projects and regulatory problems.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0009, TOXIC IMPURITIES IN MARINE PROTEIN CONCENTRATE**

*T. FAZIO*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To develop qualitative and quantitative methods for the isolation and determination of toxic impurities and their alteration products in marine protein concentrates.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0010, BACTERIOLOGICAL SURVEYS FOR MICROBIAL STANDARDS FOR FOOD**

*F.A. PHILLIPS*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Microbiol. , *Washington, District of Columbia 20204*

To compare inspectional and analytical results of good and poor manufacturing operations in order to develop microbiological standards for coliforms, *E. coli*, coagular-positive *Staphylococcus* and aerobic plate counts for several classes of food products.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0011, INVESTIGATION OF DECOMPOSITION IN SHRIMP**

*B.S. RICHARDS*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

Purpose: To find a substance or substances indicative of decomposition in shrimp and to devise a method for its determination.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0012, INVESTIGATION OF THE PRESERVATION OF FOODS BY FREEZE DRYING**

*B.S. RICHARDS*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To determine the effects of freeze drying on sensory, chemical, and physical measurements of decay. Develop chemical indices of decomposition applicable to freeze-dried foods.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0013, CHARACTERISTICS OF CANNED SALMON**

*G. THOMPSON*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To accumulate information on the characteristics and fill of container of canned salmon involving the five species of Pacific salmon for use in proposing standards for canned salmon.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0014, ELECTROPHORETIC PROFILES FOR THE IDENTIFICATION OF FISH SPECIES**

*R.R. THOMPSON*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To develop a catalog of electrophoretic protein band patterns for various fish species for use in determining when a cheaper fish species has been substituted for a more expensive one.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0015, COMPOSITION OF BREADED FISH PRODUCTS**

*J.C. WERREN*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To accumulate information regarding good manufacturing practices on which to base a requirement for fish flesh content and the amount of breading material in proposing standards for breaded fish products.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

**6.0016, INVESTIGATION OF FOOD PRESERVATION METHODS**

*G.E. WOOD*, U.S. Dept. of Hlth. Ed. & Wel. , F.D.A. Div. of Food Chem. , *Washington, District of Columbia 20204*

To develop information regarding the mechanisms of decomposition and preservation processes. Relate organoleptic, chemical, physical, and microbiological data on food spoilage.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - F.D.A.

## 6. PUBLIC HEALTH AND SAFETY

Part 2 of 3.

Georgia State Government

### 6.0017, INOCULATED PACK STUDIES ON LOW-DOSE IRRADIATED MARINE PRODUCTS - SHRIMP

*B.Q. WARD*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida 33124*

The Contractor will conduct research involving irradiation with ionizing radiation at low-dose on marine products, principally inoculated packs of shrimp. This program will investigate outgrowth and toxin production by the organism *Clostridium botulinum*, Type E, in the low-dose irradiated shrimp following, as a minimum, the protocol established by an AEC Ad Hoc Committee for this type of study. On completion of the studies on shrimp, the program will proceed with similar studies on oysters.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0018, MARKET RESEARCH STUDIES ON THE EFFECTS OF THE FLORIDA MARKETING PROGRAM ON THE SALE OF FLORIDA SEAFOODS

*H.W. SHIELDS*, State Board of Conservation, *Tallahassee, Florida*

Objective: To determine the degree of effectiveness of the Florida marketing program in increasing the demand for Florida seafoods in retail and institutional markets.

Procedure: The Florida Board of Conservation has contracted with the University of Florida for a study of the effectiveness of the marketing program. The University of Florida has completed the studies and a report will be submitted during 2-11-D-4 period. Funds will be provided the University of Florida to publish this report.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Florida State Government

### 6.0019, ANALYSIS OF THE DEMAND FOR RED MEAT, POULTRY, EGGS, SEAFOOD, AND MEAT MIXTURES

*R. RAUNIKAR*, Univ. of Georgia, Agricultural Experiment Sta., *Athens, Georgia 30602*

(1) To estimate levels and patterns of consumption and expenditures for red meat, poultry, eggs, seafood, and meat mixtures by socio-economic groups of the Atlanta urban population. (2) To analyze the effect of income, prices, price relationships, race, occupation, education, household composition, and other socio-economic factors on the consumption of various red meats, poultry, eggs, seafood, and meat mixtures, and to determine the substitution relationships among red meats, poultry, eggs, seafood, and meat mixtures, and between these products and their substitutes.

Description of Work: Detailed data on quantity, price, expenditure and form of red meat, poultry, eggs, seafood, and meat mixtures will be analyzed for a panel of approximately 300 households in Atlanta, Georgia. Cross-sectional and time series analyses will be used. The time series analysis will reveal seasonal and cyclical variations in the several food items. Weekly and quarterly summary data will be used to measure the effect on quantity purchased of red meats, poultry, eggs, seafood and meat mixtures resulting from changes over time in prices, income, and price relationships. Substitution relationships will also be analyzed. Work will consist primarily of an analysis of data previously accumulated.

SUPPORTED BY U.S. Dept. of Agriculture  
Georgia State Government

### 6.0020, ESTIMATING THE VALUE ADDED TO SEAFOOD PRODUCTS LANDED IN GEORGIA AT THE VARIOUS STAGES OF THE MARKETING CHANNEL

*D.H. CARLEY*, State Game & Fish Commission, *Atlanta, Georgia*

Objective: To estimate the value added to seafood products landed in Georgia at the various stages of the marketing channel from the primary producer (fishermen) to the consumer.

Procedure: Prices and/or charges and the amount of each form of seafood product at each stage of the marketing process will be obtained from personal interviews, mail questionnaires, and secondary sources. Quantitative techniques will be used to determine the proportion of the total value of seafood products going to each segment of the industry.

### 6.0021, ANALYZING THE FACTORS AFFECTING THE DEMAND FOR SEAFOOD AND TO PROJECT THIS DEMAND TO FUTURE TIME PERIODS

*C.M. FRISBIE*, State Game & Fish Commission, *Atlanta, Georgia*

Objectives: To estimate the effect of physical and socio-economic factors on the consumption of seafoods. To project the demand for sea-food to future time periods.

Procedures: Secondary data from a consumers panel in Atlanta, Georgia, operated from 1958 through 1962 will be utilized to obtain estimates of demand parameters for seafood. A cross sectional analysis will be used to determine the effects of income, race, household, and composition on purchases of seafood.

Pertinent census data on population, population characteristics, and race will be used in combination with derived demand estimates to estimate local and national projected aggregate demands for seafood products.

Location: Experiment, Georgia.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Georgia State Government

### 6.0022, GROWTH CHARACTERISTICS OF TYPE E CLOSTRIDIUM BOTULINUM IN THE TEMPERATURE RANGE 34 TO 50 F.

*W.P. SEGNER*, Continental Can Company Inc., *Chicago, Illinois*

A marked extension of the refrigerated storage life of low dose irradiated fresh marine food products might create a health hazard due to *Cl. botulinum* Type E, because of its ability to grow at low temperature, the radiation resistance of its spores, and the ubiquity of the organism in marine environments. Studies are in progress to assess the importance of this problem. It is proposed for the contractual year January 15, 1968 through January 14, 1969 that inoculated pack studies be conducted on selected marine products; namely, picked blue crab, clams, and scallops. The protocol recommended by the Ad Hoc Committee to the AEC on botulism will be followed. The relationship between the earliest time for toxin production and the time for unquestionable recognition of spoilage by the potential consumer will be determined.

Inoculated pack experiments were conducted on fresh haddock and cod. The results at 46 F and below are quite encouraging. The results at 50 F are somewhat less favorable than at lower temperatures. However, the 50 F results must be considered in view of the rigorous test criterion used in establishing the maximum product storage life estimates, that being unanimous rejection of a sample based solely on odor as judged by an untrained consumer type panel.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0023, ANTIOXIDANT AND NUTRITIONAL POTENTIAL OF FERMENTED AND UNFERMENTED SOYBEANS IN COMBINATION WITH FISH

*L.V. PACKETT*, Univ. of Kentucky, Agricultural Experiment Sta., *Lexington, Kentucky 40506*

Objectives: To determine the changes in nutrient composition that occur in the fermentation process of making tempeh from soybeans. To preserve whole raw fish by mixing with tempeh and determine the feasibility of this method for preserving fish as a protein source in technologically underdeveloped countries. To evaluate the potential of the antioxidant of tempeh in preventing autoxidation of lipids and deterioration of protein in both raw and freeze-dried whole fish. To determine physiological and tissue effects resulting from consumption of fish, soybeans, tempeh, and fish-soybean and fish-tempeh mixtures as the only protein source in rat and chick diets.

Description of work: Compositional differences in soybeans and fermented soybeans will be determined. High oil and low oil raw dehydrated and freeze-dried fish will be mixed with tempeh or soybeans and stored without refrigeration. Lipid autoxidation organoleptic and protein deterioration test (trimethylamine ox-

## 6. PUBLIC HEALTH AND SAFETY

ide, trimethylamine, dimethylamine, free tyrosine, volatile fatty acids and decarboxylated amino acids) will be made to assess product quality. Fish and tempeh or soybean combinations will be tested as protein sources. PER and tissue antioxidant capacity (liver homogenate thiobarbituric acid assay, B-glucuronidase activity and tissue respiration) will be determined on rats receiving the fish-soybean and fish-tempeh as a sole source of protein.

SUPPORTED BY U.S. Dept. of Agriculture  
University of Kentucky

### 6.0024, RADIATION PASTEURIZATION OF SHRIMP AND OYSTERS

A.F. NOVAK, Louisiana State University, School of Agriculture, Baton Rouge, Louisiana 70803

Radiation pasteurization of shrimp and oysters has proven to be a highly successful procedure for increasing their iced storage life.

Physical, chemical, microbiological, and organoleptic studies have been completed in evidence that this process is safe, and that irradiated shellfish are preferred over the non-irradiated products when subjected to consumer appraisal.

The scope of proposed research will include investigations into the value of reduced temperature during radiation (cryogenics), the required condition of shellfish prior to irradiation, mechanisms by which texture seems to be improved during irradiation, the developments of a simple procedure for determining the extent of radiation, the effect of radiation on traces of insecticidal residues which may be found in shellfish, and the isolation and identification of compounds and their changes during radiation.

Microbiological techniques, chemical analyses, gas chromatography, infra-red spectrum analysis, organoleptic tests and nutritional evaluations will be included in making these studies.

This progress should enable the consumer to purchase a higher quality product, while increasing production and income for the producer.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0025, COMMERCIAL IRRADIATION OF SHELLFISH WITH A PORTABLE SHIPBOARD IRRADIATOR

A.F. NOVAK, Louisiana State University, School of Agriculture, Baton Rouge, Louisiana 70803

The portable shipboard irradiator will be used for making commercial feasibility studies at a dockside shrimp unloading site on the Gulf coast.

Washed, headed, and iced stored shrimp will be obtained from several trawlers to uncover problems caused by variations in ship construction, and handling by different crews. When arriving dockside, the shrimp will be packaged and irradiated at 0.22 plus or minus 0.05 Megarad, and iced stored for appraising shelf life extension. Products showing evidence of decomposition will not be irradiated.

The samples will be analyzed chemically for indole and ammonia, and microbiologically for total counts and several pathogens. Organoleptic evaluations will include general appearance, odor, texture, sweetness, flavor and blackspot.

Results will be reviewed for possible application to commercial practices, and for solving unforeseen problems which could serve to aid in the preparation of a petition to the F.D.A. for approving low dose radiation preservation of shrimp.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0026, CAUSES AND PREVENTION OF UNDESIRABLE CHANGES IN THE QUALITY OF FRESH AND FROZEN GULF SHRIMP IN REFRIGERATED STORAGE

A.F. NOVAK, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

Cause and prevention of undesirable changes in the quality of fresh and frozen Gulf Shrimp in refrigerated storage. Subproject: Radiation Pasteurization of Shrimp.

Objectives: 1. To extend the refrigerated (32 degrees and 36-40 degrees Fahrenheit) storage life of headless unpeeled shrimp.

2. To extend the refrigerated storage life of peeled deveined shrimp. 3. To extend the refrigerated storage life of cooked peeled deveined shrimp.

Proposed Work: Shrimp samples will be irradiated at 50,000 to 750,000 rads and stored in ice and at 36-40 degrees Fahrenheit. At periodic intervals samples will be removed from storage, unirradiated controls also, for chemical, microbiological and organoleptic evaluation.

SUPPORTED BY Louisiana State Government

### 6.0027, EVALUATION OF PRESENT AND PROPOSED LAWS REGULATING THE PROCESSING AND PACKING OF OYSTERS

A.F. NOVAK, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

1. To reappraise the total solids range of Louisiana oysters. 2. To measure the amount of drained liquid obtained with various grades of oysters throughout the year, when processed according to present F.D.A. methods. 3. To study and evaluate improved procedures for processing and packing. 4. To propose regulatory changes to the F.D.A. for the establishment of rational standards favorable to both the packer and consumer.

Proposed Work: Oysters will be processed and packed at several packing houses monthly using present F.D.A. method. Drained liquid content and total solids will be determined after various time intervals of draining after washing.

SUPPORTED BY Louisiana State Government

### 6.0028, REGIONAL DEMAND IN THE U.S. AND TRENDS IN THE FISHING AND SEAFOOD PROCESSING INDUSTRIES OF THE CHESAPEAKE BAY AREA

R.E. SUTTON, State Dept. of Ches. Bay Affs., Annapolis, Maryland

Objectives: (1) To determine product classification and regions for demand analysis, determine availability of data, and make preliminary consumption estimates; (2) to determine trends in the Chesapeake Bay catch and resources employed in fishing; (3) to determine trends in the seafood processing industries and their relationship to consumption and the Bay catch.

Procedures: (1) The classification of seafood products which is most relevant to studying regional differences in consumption will be determined. The regions to be used in the demand analysis will be delineated. The available data on the consumption of seafood and the relevant demand theory will be reviewed. Preliminary estimates of regional consumption will be made. (2) Detailed data on the Bay catch will be assembled and analyzed. Labor and capital quantities and wage rates and prices will be used to estimate the value of economic resources employed in the Bay fishing industry. Changes in these resources will be compared with changes in the catch. (3) Trends in the seafood processing industry of the Chesapeake Bay area will be analyzed and the current structural characteristics of the industry will be described. Changes in the industry will be related to changes in consumption and the Bay catch.

### 6.0029, STABILITY OF FOOD LIPIDS TO IONIZING RADIATION

W.W. NAWAR, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003 (AT(30-1)3499)

The objective of this project is to gain detailed information on the nature and magnitude of radiation effects on the lipids of foods. A combination gas chromatograph-fast scan mass spectrometer system will be used in the continuing identification of the volatile components produced in the lipid fractions of irradiated fish. Various other micro-chemical techniques will be used to determine radiation-induced changes in the nonvolatile fraction. The organoleptic implications of the various compounds characterized as irradiation-induced will be established.

SUPPORTED BY U.S. Atomic Energy Commission

## 6. PUBLIC HEALTH AND SAFETY

### 6.0030, EFFECTS OF IONIZING RADIATION ON FOOD LIPIDS

W.W. NAWAR, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

Pork fat, beef fat, fish oil and a number of model systems were irradiated under controlled conditions and the volatile components analyzed qualitatively and quantitatively. Dosages from 0.3 to 7.0 megarads were studied. Approximately 50 compounds formed by radiation of fats were identified. The flavor implications of such compounds is being investigated. The effect of the physical state of the fat on the volatiles formed by radiation is under study.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0031, THE EVALUATION OF WHOLESOMENESS OF RADIATION SUB-STERILIZED FOOD PRODUCTS USING RATS

E.F. REBER, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

The phase of the work to evaluate the wholesomeness of irradiation pasteurized clams fed to rats for a two-year period has been completed. The irradiation of clams did not impair the growth, feed efficiency, reproduction of male and female rats. There were indications of significant treatment effects in serum glutamic pyruvic transaminase, lactic acid dehydrogenase and white blood cell counts at various time intervals. There was no significant effect on the sizes of the organs weighed at the time of necropsy which could be correlated with an effect of feeding irradiated clams. Work is planned to investigate the protein quality of clams which appears to be complicated by the presence of thiaminase. Additional work will also be done to investigate the presence and effect of thiaminase as it occurs in clams.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0032, CONSUMER EDUCATION AND MARKET DEVELOPMENT

F.C. WILBOUR, State Div. of Marine Fisheries, Boston, Massachusetts

Objective: To promote greater utilization of north-west Atlantic seafoods on a national basis.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish. Massachusetts State Government

### 6.0033, RADIOPASTEURIZATION OF FISHERY PRODUCTS-OPERATION AND DEVELOPMENTAL INVESTIGATIONS

J. HOLSTON, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

This contract deals with the investigation of radiopasteurization of fishery products of commercial significance and the establishment of handling and processing methods necessary for commercial application of irradiation in the seafood industry. The work is broken down into two divisions: laboratory research; developmental studies involving the Marine Products Development Irradiator (MPDI).

The major objectives of the research are (1) to establish the maximum edible shelf life of radiopasteurized and nonirradiated haddock and codfish fillets (based solely on odor of raw sample); (2) to determine the optimum dose for radiopasteurizing scallops and blue crab meat; (3) to continue the study of the feasibility of using radiopasteurizing to extend the shelf life of slacked-out products (products stored and handled frozen until they reach the retail outlet whereupon they are thawed and held refrigerated until sold and consumed); (4) to complete the study of the effect of preirradiation quality on post irradiation quality and shelf life of clam meats and cod fillets, and to look into the preirradiation quality of ocean perch as it affects the postirradiation shelf life of the fillets; (5) to continue to relate organoleptic changes in radiopasteurized, nonirradiated, and sterile, nonirradiated fish with changes which occur in the composition of the volatile chemical components in the product; and (6) to monitor bacteriological quality of test samples in order to observe relationship between quality of irradiated and nonirradiated fish with total

plate counts (e.g., of specific organisms such as *Clostridium botulinum*, *E. coli*).

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0034, RADIATION PRESERVATION OF FISHERY PRODUCTS

J.A. HOLSTON, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Gloucester, Massachusetts

The objectives of this contract are: Task I. 1. To conduct quality studies on mackerel, whiting, blue crab, scallops, lobsters, and oysters. 2. To conduct applied flavor and odor studies to relate changes in composition of the volatiles of irradiated products to changes in product quality. 3. To expand the studies to determine the effect of pre-irradiation quality level on post-irradiation shelf life of clam meats, ocean perch, and other species. 4. To ascertain the bacteriological quality of samples initially and periodically following irradiation, and to determine the bactericidal effects of different low dose levels of irradiation. 5. To determine the maximum edible shelf life of fish fillets packed in commercial 20-30 lb fillet tins. 6. To conduct large scale shipping, storage, and distribution tests of marine products in conjunction with the operation of the Marine Product Development Irradiator and in cooperation with the fishing industry. 7. To conduct studies of irradiated and non irradiated commercial size shipments of fresh fish and shellfish with industry to determine efficacy of the radiation treatment. 8. To determine if present commercial distribution and storage conditions are suitable for handling irradiated fresh fillets, and if present market and distribution of these products can be broadened. 9. To perform irradiation services for AEC-sponsored projects and other approved federal, state, or industry requests. Task II. 10. To operate an on-ship irradiator to establish possible advantages of irradiating seafoods at sea. Task III. 11. Determine the advantage of irradiating in inert or reducing gases. 12. Develop analytical methods to expedite analyses of volatile components in fish in cases where suitable methods do not exist. 13. Determine the absorption characteristics of known bacteriostatic salts in whole fish fillets.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0035, LABORATORY SCALE INVESTIGATION INTO THE FEASIBILITY OF RADIOPASTEURIZING FISH PRODUCTS

J.A. HOLSTON, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

This research is concerned with many related aspects of determining the feasibility of pasteurizing fish products by radiation. Storage studies are conducted in which we measure the benefits of radiation at 50 to 200 kilorads for fillets and up to 450 kilorads for shellfish by comparing the organoleptic quality, the total plate count, and the shelf life of irradiated samples with those characteristics of the nonirradiated samples. The effects of storage temperature, packaging materials, and initial quality of the fish are determined concurrently. The samples are also studied to determine the composition of their volatile chemical compounds using gas chromatography and mass spectrometry. Significant changes in the concentration of the volatile chemical compounds can thus be related to organoleptic changes, and attempts to control the production of critical compounds can then be made.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0036, IRRADIATION SERVICES AND STUDIES

J.A. HOLSTON, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

The Marine Products Development Irradiator operates under contract to the U. S. Atomic Energy Commission for preservation of fresh marine food products. Preservation of foods by ionizing radiation is the newest and least known method of preservation. All foods do not respond in the same manner to identical doses of irradiation. The reasons for this phenomenon can only be determined by performing the necessary experimental irradiation experiments in cooperation with industry and research units. We

## 6. PUBLIC HEALTH AND SAFETY

service all industry requests for experimental irradiation services and all similar requests that arise from university, state or other federal agencies. We supply information and technical services other than irradiation services in joint industry-government studies on specific food irradiation problems. Irradiation services are available at no cost provided such services are not available from private industry.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0037, COMMERCIAL BENEFIT STUDIES

*J.A. HOLSTON*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

The objective of this study is to determine the magnitude of the shelf life extension conferred by ionizing radiation over non-irradiated control samples of fishery products when both are subjected to the stresses normally encountered by commercial size shipments in regular channels of distribution from fish pier to inland consumer. This research is also aimed at adducing proof that the radiation doses proposed for fresh marine food products accomplish the intended technical effect and do not exceed the amount reasonably required to achieve the purpose of irradiation. The help of qualified industry experts will be solicited to determine the commercial benefits to be derived from radiation treatment of fresh seafoods for extension of shelf life.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0038, INCIDENCE OF BACTERIA OF PUBLIC HEALTH SIGNIFICANCE IN FRESH COMMERCIAL SHELLFISH

*J.A. HOLSTON*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

Some seafoods such as crabmeat and oysters are commonly eaten with no further cooking. Thus, there exists a greater possibility of transmission of pathogenic organisms by means of these two seafoods than by those shellfish which are always cooked before consumption. The accepted public health indices of bacterial contamination of shellfish (coliforms and fecal coliforms) are labile to pasteurizing dose levels. Therefore, we propose to determine the minimum efficacious radiation dose level of these and other bacteria of public health significance in shellfish. Irradiation treated packs will be subjected to commercial shipping and handling to determine whether or to what extent the usual bacterial indices of sanitation are reduced and held at acceptable levels. Such tests will include total plate counts, coliforms, fecal coliforms, coagulase positive staphylococcus and salmonella.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0039, SHIPBOARD IRRADIATION STUDIES

*J.A. HOLSTON*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

In work conducted under a Task I project, it was established that the length of the postirradiation shelf life of fish is a function of its preirradiation quality. The main object of this research, scheduled to terminate August 1967, is to determine the extent of the benefit which might be gained by irradiating fish at sea just after catching them. The fresh caught fish are packaged and irradiated at different levels aboard the vessel using a portable irradiator. A storage study of these samples will indicate to us the extent of savings in radiation energy we can expect if we irradiate fish before they undergo bacterial contamination under normal handling. We can also obtain more information regarding the benefits of irradiating fish in the prerigor state which preliminary experiments seemed to indicate, and we can determine the effect of double dose applications (a fractional dose applied at sea followed by a fractional dose applied on land when the vessel docks).

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0040, FUNDAMENTAL RADIATION CHEMISTRY RESEARCH

*J.A. HOLSTON*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

This project, which is scheduled to terminate September 30, 1967, is concerned with investigating fundamental aspects of Radiation Chemistry. The principle objective is to develop or to modify existing analytical methods. Methodology is required for studying changes in the concentrations of volatile and nonvolatile chemical compounds in fish flesh, and for measuring the penetration of bacteriostatic salts in fish flesh. Practical techniques for conducting applied chemistry research in areas described above have been successfully developed as has a technique for controlling the composition of headspace gases in packaged fish products. The latter technique has enabled us to study the possible synergistic effects of radiation and inert or reducing gases for controlling spoilage in fish.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0041, INVESTIGATION OF FEASIBILITY OF STERILIZING FISH BY RADIATION

*L.J. RONSIVALLI*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts

This research conducted under contract to the U.S. Army Quartermaster is concerned with determining the feasibility of producing shelf stable sterilized fish products. This involves the solution to difficult problems associated with high level radiation (about 4.5 megarads). The problems are to minimize induced radiation effects on flavors and odors to prevent color changes, and inactivate flesh enzymes by some method other than the use of radiation which is considered inadequate for enzyme inactivation. Practical methods which can be used to solve these problems often introduce one or more new problems. Thus, heat, which can be satisfactorily used to inactivate enzymes, unfortunately causes gross, undesirable physical changes in the product.

Under the terms of the contract, research is directed to unprocessed fish products such as fillets, but can be directed towards processed items such as fish cakes, fish rolls, etc. should it be found that it is not feasible to radiosterilize the unprocessed items.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0042, FUNDAMENTAL STUDIES IN THE FLAVOR AND ODOR CHEMISTRY OF FISH PRODUCTS

*J.W. SLAVIN*, U.S. Dept. of Interior, Technological Laboratory, Gloucester, Massachusetts (AT(49-7)2443)

Many published data indicate the feasibility of preserving fish as well as other heat labile food products with ionizing radiation. However, some detrimental organoleptic changes occur as a result of irradiation, extended storage, environmental factors, and combinations of these.

The objective of this research program is to define the development of detrimental organoleptic changes in irradiated fishery products in terms of related chemical and biochemical reactions. The information gained in this research will be used to derive maximum benefit from radiopreservation methods and to otherwise exert control measures to slow, and in some cases prevent, spoilage processes.

The approach employed in this continuing research is to study by instrumental methods, the volatile fractions in fish products since quality is largely reflected by the chemical compounds in their flavors and odors. Techniques to collect volatile compounds have been developed, and recently we modified and combined two analytical methods which enabled us to establish the effect of irradiation, extended storage, available oxygen, temperature, and bacteria on the development of carbonyl compounds in clam meats. We are presently evaluating methods for studying the development of sulfides and mercaptans in spoiling fish, and this will be followed by an investigation of methods to study amines and possibly other compounds. The capability to follow the development of these important compounds is the key to controlling detrimental changes in fish products.

SUPPORTED BY U.S. Atomic Energy Commission

## 6. PUBLIC HEALTH AND SAFETY

### 6.0043, GROWTH AND TOXICOGENESIS OF *C. BOTULINUM* IN FISHERY PRODUCTS

*J.T. GRAIKOSKI*, U.S. Dept. of Interior, Technological Laboratory, *Ann Arbor, Michigan*

The objective of this project is a study of the growth of *C. botulinum* type E, in reference to all spore forming organisms (those organisms important in the design of processing parameters). Growth involves the germination of the spore, proliferation of the vegetative cell with toxin synthesis, subsequent sporulation, and a period of spore dormancy. Dormancy also involves the unique character of spore resistance. The development and evaluation of agents which inhibit and/or kill the organism is an integral part of growth studies, i.e., antimetabolites. This aspect is of importance in the development of proper sanitation procedures.

Basic to this study is the development of methodology for measuring growth requirements and the end products of metabolism, including the toxin.

Portions of the research are carried out under contract.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0044, EFFECTS OF HANDLING AND PROCESSING PROCEDURES IN POTENTIAL PATHOGENUS ON FISH

*J.T. GRAIKOSKI*, U.S. Dept. of Interior, Technological Laboratory, *Ann Arbor, Michigan*

Research in this project is directed toward a determination of the effects of processing and handling procedures on the survival, growth, and toxicogenesis of *C. botulinum* and other potentially pathogenic or toxicogenic organisms which may be found in fishery products. The next step in this research sequence is to develop and recommend processing and handling techniques which will produce fishery products of acceptable quality that are safe for human consumption. The most immediate problems under this project are to assess the current degree of risk to the public from smoked fish consumption caused by the presence of *C. botulinum* (particularly type E) and to develop smoked fish processing guidelines that allow a margin of safety to the consumer.

In reference to smoked fish processing, the establishment of methodology for the standardized production of a quality smoked fish is being developed, since knowledge in this area is completely lacking even within industry itself. In the present phase of the project, the primary emphasis is being placed on the processing parameters for the production of smoked whitefish chub of uniform quality. Concurrently, the effect of known inhibitors of *C. botulinum* outgrowth are being evaluated for type E strains (NaCl, NaNO<sub>2</sub>, organic acids, etc.).

In respect to control of botulism in smoked fishery products, the heat resistance of *C. botulinum* type E spores is being studied in phosphate buffer and in fish flesh. The influence of hydrogen ions, sodium chloride, nitrite, nisin, and other inhibitors on the heat resistance of the spores in fish flesh is being compared. The outgrowth potential of *C. botulinum* type E spores at various incubation temperatures and in the presence of sodium chloride, nitrite, antibiotics, and various hydrogen ion concentration is being determined. Portions of the research are carried out by contract.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0045, CONTROL OF OXIDATIVE CHANGES IN FRESH-WATER FISH

*R.A. GREIG*, U.S. Dept. of Interior, Technological Laboratory, *Ann Arbor, Michigan*

The primary objective of this project is to determine methods for significantly improving the frozen storage capabilities of freshwater fishery products. Investigations to fulfill this objective have been centered on controlling the onset of oxidative rancidity during frozen storage of these products. Investigations on controlling other quality deterioration factors--such as off-color development--will also be emphasized.

A secondary objective is to evaluate possible chemical methods for objectively following the above mentioned quality deterioration factors in frozen freshwater fishery products.

Frozen storage tests on various freshwater fish products were broadened to include basic investigations to determine the

mechanisms of lipid oxidation in freshwater fish, a limiting problem in extending the frozen storage of many species. Particular attention is being paid to the catalytic factors involved and methods to block these.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0046, COMPOSITION STUDIES OF FISH AND SHELLFISH AS RELATED TO STORAGE AND PROCESSING PROBLEMS

*R.N. FARRAGUT*, U.S. Dept. of Interior, Technological Laboratory, *Pascagoula, Mississippi*

Work undertaken under this project will attempt to relate differences in composition of various fish and shellfish to problems encountered in the handling, processing, and storage of the product. Differences in composition from species to species can be related to the appearance of particular problems in the handling of the species. An attempt will be made to utilize specialized knowledge of compositional factors in solving technical problems in order to increase the consumption of that particular product. Specific problems on hand include, but are not limited to: browning discoloration of cut surfaces and skin of snapper and grouper steaks and fillets during frozen storage; development of rancidity in frozen Spanish mackerel; discoloration of processed crab meat; and skin shrinkage upon cooking of certain species of snapper. The effects of various antioxidants, chelating agents, packaging atmospheres, and packaging materials will be investigated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0047, PROCESSING AND PRODUCT DEVELOPMENT OF EDIBLE FISH AND SHELLFISH

*R.N. FARRAGUT*, U.S. Dept. of Interior, Technological Laboratory, *Pascagoula, Mississippi*

The first phase of this work will be concerned with the development of new products and processing methods for the several additional red snapper species--a new resource delineated by Exploratory Fishing and Gear Research.

The second phase, to be carried out concurrently with the first and to be financed by Army Research Laboratories contract, will be to develop a product(s) suitable for irradiation sterilization processing. Others to be included are, but not limited to, the mackerel, oyster, clam, blue crab, mullet, and grouper fisheries.

a. In cooperation with Exploratory Fishing and Gear Research, Pascagoula Fisheries Station, fisheries with large potential will be delineated. b. Suitable products, processes, and packages will be investigated. c. The product, process, and package most suitable for particular markets (institutional vs. retail) will be selected and produced in cooperation with retail industry. d. Through the cooperative effort of the Branch of Marketing, suitability and marketability of the product will be tested. e. Information gathered will be made known to industry through oral, audio-visual, and written communications.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0048, CHEMICAL REACTIONS IN PROCESSED SEAFOODS

*H.C. THOMPSON*, U.S. Dept. of Interior, Technological Laboratory, *Pascagoula, Mississippi*

Changes, occurring during the storage and processing of seafoods, in the basic biochemical and physiological make-up of seafood products contribute both evident and non-evident changes in quality of the product as it reaches the consumer. The objective of this project is to define the changes and the mechanism(s) underlying these changes. Possession of the basic facts concerning changes in quality will thus enable logical and scientific correction of storage and processing procedures to ensure a better quality product.

Work is underway in defining the basic mechanism(s) concerned in the iron sulfate discoloration of canned shrimp. Although this problem appears to be related to pH of the raw and processed material, research has indicated that this is a superficial answer and that changes in the basic structure of a protein or

## 6. PUBLIC HEALTH AND SAFETY

other biochemical constituent during iced storage allows the binding of tin ions from tin plate.

Further work is being done presently on changes occurring during iced storage of shrimp which result in altered texture of the finished product. In this connection, the possibility of alteration in the chemical and physiological structure of the connective tissue proteins is being investigated.

Other problems to be considered in the future are: The loss of protein-bound water and its effect on texture, the connection of protein denaturation with toughness in texture, the effect of bacterial enzymes on quality deterioration in seafoods.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0049, CONTAINERIZATION OF FISHERY PRODUCTS

*M.E. WATERS*, U.S. Dept. of Interior, Technological Laboratory, Pascagoula, Mississippi

The containerization of shrimp, on shore and at sea, will form the first phase of this work. Subsequent investigations will include, but are not limited to, the menhaden and industrial fish fisheries.

a. Efficient containers will be selected and evaluated first in the laboratory and then in the field. b. Demonstrations of efficiency and consequent economic gain will be made to the industry via audio-visual techniques.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0050, CHEMICAL AND MICROBIOLOGICAL APPLICATIONS TO PRODUCT ENGINEERING

*B.J. WOOD*, U.S. Dept. of Interior, Technological Laboratory, Pascagoula, Mississippi

Work undertaken in this product will attempt to relate scientific principles to the solving of technical industrial problems. Better methods of producing, handling, and transporting fishery products will be devised. Adaptation of advances made by other segments of the food industry will be made for use with fishery products as the starting medium. New products, processes, and concepts in handling will be experimented with. Specific points include, but are not limited to: containerization of iced stored shrimp; development of a satisfactory method of freezing raw oysters; development of means of reducing bacteria present in fishery products; development of an on-board shrimp heading machine; development of methods to increase iced storage life of shrimp; and development of techniques for processing industrial fish at sea.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0051, DEVELOPMENT OF MECHANIZATION DEVICE PROTOTYPES

*B.J. WOOD*, U.S. Dept. of Interior, Technological Laboratory, Pascagoula, Mississippi

The first phase of this project will deal with the development of an onboard fish press that will reduce the moisture content of certain species of fish by as much as 50 percent. The resulting product will be suitable for processing into pet food, fish meal, or fish protein concentrate. Other devices to mechanize the handling of fish and shellfish will constitute subsequent phases and will include, but not limited to, a shrimp deheading device, fish filleting and handling devices, etc.

a. Develop prototype mechanization devices. b. Test prototype and product therefrom. c. Contract with reputable engineering firm to design final version of the device.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0052, ENTERIC BACTERIA AND VIRUSES IN SEWAGE, WATER, AND SHELLFISH

*L.W. SLANETZ*, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

Studies will be continued on the correlation of numbers of coliforms, fecal coliforms, and fecal streptococci with the presence of salmonellae and enteroviruses in seawater and oyster samples collected from stations in our bay and estuarine areas.

Particular attention will be given to the detection of salmonellae and viruses in oysters harvested from shellfish growing waters considered to be of approved sanitary quality based on recommended coliform standards. Hydrographic conditions in the study areas will be determined to establish the possible impact of such conditions on the microbiological data obtained. Studies will also be continued to assess the efficiency of newly installed sewage treatment plants in eliminating enteric bacteria and enteroviruses in seawater and shellfish at sampling stations in several estuarine and bay areas. The effectiveness of depuration procedures for providing shellfish of acceptable microbiological quality will be determined using shellfish harboring indicator bacteria, salmonellae, and enteroviruses.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0053, BIOCHEMISTRY OF FISH AS RELATED TO HUMAN NUTRITION

*A.E. TERRI*, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824

Objectives: 1. To investigate release of hypoxanthine from the breakdown of muscle ATP, with a view to expanding use of this reaction for estimating freshness and potential storage life of fish as food for humans. 2. To investigate fish as a source of amides from amino acids essential for humans.

Work Proposed: 1. Species of fish commonly consumed in the New England area will be analyzed for hypoxanthine which results from the breakdown of muscle ATP. The relationship between free hypoxanthine and storage time will be studied, and an attempt made to use the procedure for estimating future storage life of various specimens. 2. In the studies with amino acid amides, standard synthetic organic (ammonolysis of amino acid esters), and chromatographic methods will be employed. The chromatography work will involve investigation of numerous solvent systems in an attempt to define one which is efficient for chromatographic separation and identification of amides. If development of an analytical method is successful it will be used for investigation of these compounds in various marine species.

SUPPORTED BY U.S. Dept. of Agriculture  
New Hampshire State Government

### 6.0054, NUTRITIVE VALUE OF FISH AND OTHER MARINE PRODUCTS

*A.E. TERRI*, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824

The objective of the project is to determine the nutritive value with respect to water soluble vitamins, and amino acids, of fish and other marine products such as lobsters, clams and oysters. Various species have been analyzed quantitatively for several of the B-vitamins. This work is continuing with respect to thiamine and ascorbic acid. Various species have been analyzed qualitatively, by means of paper chromatography, for their free amino acids, and proteins. Present, and future work involves development and improvement of quantitative chromatographic amino acid analyses, and their application to various fish species.

SUPPORTED BY New Hampshire State Government

### 6.0055, FERMENTED PROTEIN-RICH FOODS

*A.G. VANVEEN*, Cornell University, Graduate School, Ithaca, New York

A need exists for cheap, digestible, nutritious and acceptable protein-rich foods to combat protein malnutrition which is prevalent in many areas in the world.

So-called 'fermented foods' from soybeans, peanuts, grain legumes, fish, spices, and milk fall in this category (and a similar microbiological treatment might be applied to some other commodities such as sources of leaf protein). There is no acceptability problem with these fermented foods in areas where they are known, but this acceptability is usually a serious problem with 'new' and unknown protein-rich foods.

Microbiological, biochemical and nutritional research of these products has been very incomplete and the presence of mycotoxins will have to be investigated. There is a great need for

the improvement and standardization of nutritive quality, the microbiological properties, and improvement of the stability.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

**6.0056, BACTERIAL INDICATORS OF THE SANITARY QUALITY OF DEPURATED HARD CLAMS, MERCENARIA MERCENARIA**

*G. STROBEL*, State Conservation Department, *Oakdale - Long Island, New York*

This phase will be undertaken to obtain an adequate and rapidly determined bacterial indicator of the sanitary quality of depurated hard clams, *Mercenaria mercenaria*, to insure a wholesome food product and avoid unnecessary storage after processing.

Tests will be performed using known and standard techniques to gather information on changes of the Standard Plate Count, Coliform and Fecal Coliform Group, *Escherichia coli* Type I, Fecal Streptococci, and *Clostridium* species in hard clams before, during and after the depuration process.

Data will be evaluated and that bacterial indicator selected which most nearly fulfills the objectives of this phase.

Work will commence immediately and continue for the duration of the project.

All laboratory studies will be conducted at the New York State Laboratory Department, *Oakdale* on samples taken from the Depuration Plant, *West Sayville, New York*.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
New York State Government

**6.0057, ENTEROVIRUSES IN DEPURATED HARD CLAMS, MERCENARIA MERCENARIA**

*G. STROBEL*, State Div. of Fish & Game, *Oakdale - Long Island, New York 11769*

The purpose of this phase is: 1) To survey hard clams from moderately polluted waters of Long Island for enteroviruses (Polio Types I, II, and III; Coxsackie B Types; ECHO). 2) To observe release rate of enteroviruses in hard clams during the depuration process, and thus obtain information on the efficacy of the process for virus removal.

Samples will be collected from the Depuration Plant, *West Sayville, New York* and examined for the presence of viruses in the Department of Biology, State University of New York at *Stoney Brook, New York*.

Hard clam samples will be homogenized and rendered bacteriologically sterile with antibiotics and high speed centrifugation. Viruses will be detected using an indicator system of commercially purchased Rhesus monkey kidney monolayer cell culture tubes. Inoculated tubes will be observed during 10-14 days incubation for viral cytopathogenic effects.

Release data will be evaluated in conjunction with the bacterial studies to determine if any correlation exists between the bacterial release rates and the viral release rates.

Work will commence immediately and continue for the duration of the project.

Part 2 of 5.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
New York State Government

**6.0058, EVALUATION OF PARAMETERS OF OPERATION**

*G. STROBEL*, State Div. of Fish & Game, *Oakdale - Long Island, New York 11769*

This phase will concern an evaluation of those parameters which significantly effect the depuration process for the hard clam *Mercenaria mercenaria*, and which may be controlled. The objective will be to determine optimum conditions of operation so that realistic specifications may be developed. The effect of these parameters will be evaluated based on the reduction of bacterial contaminants as measured by the standard indicator tests for sanitary quality.

The parameters to be evaluated are salinity, turbidity, temperature, flow rate, recirculation factor, and dissolved oxygen. In-

## 6. PUBLIC HEALTH AND SAFETY

dividual variation and past history will also be evaluated as to source, level, and nature of original contamination, and the time lag between harvesting and processing. Plankton, Phosphorous and Nitrogen content and distribution of the process water will be measured also to determine the effect of variations in these factors on the process. Seasonal variations exhibited by the clams will also be evaluated.

Experiments will be run concurrently to determine the effect of each variable. These tests will be repeated periodically throughout the year to test for seasonal variations.

Procedures and techniques will follow those given in 'Standard Methods for the Examination of Shellfish and Sea Water' for bacteriological work and 'Standard Methods for Water and Waste Water' for chemical examinations.

**6.0059, EFFECT OF PROCESS ON SHELLFISH**

*G. STROBEL*, State Div. of Fish & Game, *Oakdale - Long Island, New York 11769*

Some concern has been raised about the effects of the process on the value of the clam with particular emphases on shelf-life. Local dealers claim that clams harvested during the time of year when they are emerging from hibernation have a shorter shelf-life than those taken during the rest of the year. Since plants will have to operate during the winter months, and since economics will play a major role in determining the feasibility of such a process, it is necessary to determine any effects of depuration on market value.

Work on this phase will start immediately and continue for one year to determine any seasonal variations.

Work will be performed at the plant in *West Sayville, N.Y.* with laboratory tests performed in the State laboratory at *Oakdale, L.I.*, using established techniques.

Part 5 of 5.

**6.0060, RESEARCH AND GRADUATE TRAINING IN FOOD AND DRUGS FROM THE SEA, AND MARINE POLLUTION**

*O.A. ROELS*, Columbia University, Graduate School, *Palisades, New York 10964*

Applied biological research will be expanded in three main areas, Food from the Sea, Drugs from the Sea, and Detection of Marine Pollution.

Under the Food from the Sea category, work will be expanded on the fermentation of trash fish for the development of foods suitable for human use, and the isolation of marine proteins to produce hydrolysates and protein isolates suitable for human consumption. In the Drugs from the Sea studies, new antibiotics and potential anticancer agents will be isolated, and their structure and synthesis defined. The Pollution Studies are intended to devise novel systems of detecting marine pollution and ways of monitoring and relieving its undesirable effects on the environment. The initial effort will be to determine the influence of effluents from the land upon the water masses between *Montauk Point* and the *Chesapeake Bay* with particular emphasis on the influence of *Long Island Sound*, the *Hudson River*, the *Delaware* and the *Chesapeake*.

SUPPORTED BY U.S. National Science Foundation

**6.0061, THE EFFECT OF PROCESSING VARIABLES ON THE QUALITY OF MEAT FROM THE BLUE CRAB - CALINECTES SAPIDUS**

*W.A. THOMSON*, Univ. of North Carolina, Agricultural Experiment Sta., *Raleigh, North Carolina 27600*

This study would compare the quality of pasteurized and non-pasteurized crab meat with respect to the type of meat and the original physical condition of the crab. An attempt to reduce the possibility of thermal damage to crabmeat during pasteurization would be made by means of addition of fluids such as edible

## 6. PUBLIC HEALTH AND SAFETY

oils and aqueous solutions of inorganic salts, acids, chelating agents, etc. to the canned meat. Methods of study will include flavor and texture evaluation, color measurement and examination of bacterial populations.

SUPPORTED BY North Carolina State Government

### 6.0062, EFFECT OF STORAGE ON FISH MUSCLE PROTEINS

*N.B. WEBB*, Univ. of North Carolina, Agricultural Experiment Sta., Raleigh, North Carolina 27600

The objectives of this project are to evaluate the methods of analysis and determine the effect of changes in emulsifying capacity, viscosity, water-binding capacity, texture and rheological properties and protein solubility of fish and/or shell fish muscle proteins during post-mortem storage. Furthermore, the characteristics of these basic properties of muscle proteins are to be used in developing the functional aspects of seafood products. The experimental work is to entail the evaluation of muscle protein changes in relation to microbiological level, time of storage and temperature of storage. Subsequently, these findings are to be used as a basis to manufacture comminuted prefabricated seafood products.

SUPPORTED BY North Carolina State Government

### 6.0063, SURVIVAL OF FOOD PATHOGENS IN RADIATION PASTEURIZATION SEAFOOD

*A.W. ANDERSON*, Oregon State University, Graduate School, Corvallis, Oregon 97331

Studies were conducted under controlled conditions in order to observe the resultant survival patterns in solid crabmeat and in Hartsell's broth of *Salmonella enteritidis*, *S. paratyphi A*, *S. choleraesuis*, *S. pullorum*, *Streptococcus pyogenes*, and *Staphylococcus aureus* after individual exposure to Co 60 irradiation. A 'tailing off' was found in the survival patterns of *S. paratyphi A*, *S. pullorum*, *S. enteritidis*, and *S. aureus* when irradiated in crabmeat, but was not found upon exposure in Hartsell's broth. However, *S. choleraesuis* and *S. pyogenes* showed a definite 'tailing off' in the broth while only weakly, if any, in the crabmeat. Thus this 'tailing off' phenomenon cannot be explained as a mere effect of the medium, but rather indicates a much more complex situation. The results indicate that predictable pasteurization doses usually based on D values would be quite inaccurate, since the projection is based on sigmoidal and linear inactivation curves.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0064, DEVELOPMENT OF THE SHAD INDUSTRY

*D.L. CRAWFORD*, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: (1) Develop new products consistent with the unique characteristics of shad. (2) Improve the quality of shad processed by usual methods. (3) Investigate the utilization of shad by-products. (4) Determine the potential United States market for fresh Pacific shad in areas not presently supplied. New products utilizing shad such as precooked frozen products and such items as fish sausage of various kinds will be developed. Procedures used in canning herring, sardines and anchovies will be adapted to shad. Processing variables such as time and temperature and factors such as sex, moisture and fat content on the final texture and acceptability will be investigated. The effect of pre-processing procedures such as brining and application of polyphosphates as firming agents will be determined. Conventional means of processing shad such as mild curing, smoking, kippering, pickling and freezing will be investigated. The effect and value of certain additives including antioxidants will be investigated for possible use in processing shad. The potential of expansion and extension of the marketing of fresh Pacific shad into areas not presently supplied will be investigated. The suitability of the by-products of the shad industry for animal, fish and pet food will be determined.

SUPPORTED BY Oregon State Government

### 6.0065, DEVELOPMENT OF NEW HUMAN FOOD PRODUCTS FROM SHAD

*E.W. HARVEY*, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

Objectives: Develop new products consistent with the unique characteristics of shad; examples: fish sausage, fish loaf of the luncheon type, pepperoni, etc.

Procedures: A fish sausage using shad as the major component will be developed using condiments which are commonly associated with pork sausage, frankfurthers, salamis, etc. Fish of the Sebastodes grouping, which are in abundant supply off our coastal waters will be the complimentary fish used with shad to formulate the fish sausage. Incorporation of cereals and other fish items will be used to improve texture. Methods for removal or comminution of objectionable bone particles will be investigated. Casings of various types including both artificial and natural will be tried. Fish loaf samples using artificial as well as natural smoke will be prepared. Partial economics of the operation will be determined through records of ingredient cost and yields. A close monitoring to determine keeping qualities and bacterial load will be conducted. Samples will be submitted to taste panel for consumer acceptance tests.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Oregon State Government

### 6.0066, PREPARATION OF FISH PROTEIN HYDROLYSATES

*D.K. LAW*, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

Objectives: To develop a method of preparing protein hydrolysate from fish scraps and by-products including hake and dogfish.

Procedures: A procedure used to pasteurize salmon viscera will be adapted to digest hake, dogfish and other fish. Time and temperature relationships will be studied to determine optimums. Methods for bone and oil separation will be studied. A high degree of protein solubility may occur with no particular increase in free amino groups. Formol titration and other appropriate chemical methods will be used to determine the degree of proteolysis. Proximate analysis of the protein hydrolysates will be determined. Their nutritive value will be determined in preliminary studies with suitable test animals including rats.

Work Schedule: For the remainder of the fiscal year (approximately from Feb. salmon viscera will be adapted to digest hake, dogfish and other fish scrap. Optimum time and temperature relationships for this process will be determined.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.  
Oregon State Government

### 6.0067, UTILIZATION OF HAKE, DOGFISH, AND BY-PRODUCTS OF THE FILLET INDUSTRY FOR PROTEIN SUPPLEMENTS

*D.K. LAW*, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: (1) Develop fish protein hydrolysates from fish scraps and by-products including hake and dogfish. (2) Prepare and evaluate high quality fish meals made from hake, dogfish, and by products of the fillet industry. (3) Investigate procedures for heat pasteurization and acidification of hake which will yield a stable protein product.

Hake, dogfish, and other fish scrap will be digested utilizing the natural autolytic and digestive enzymes in fish and possibly certain vegetable proteolytic enzymes. Time and temperature relationships will be studied to determine optimums. Methods of bone and oil separation will be investigated. Uses for these hydrolysate products will be investigated and evaluated. Fish meal of hake, dogfish, and other fish scraps will be prepared and evaluated both chemically and nutritionally. The use of antioxidants will be investigated. Procedures will be developed for pasteurization of hake and dogfish. The addition of various acids to this pasteurized product to achieve a stable product which can be stored at room temperature will be investigated. The storage stability of these products and the value of antioxidants for prevention of fat oxidation will be determined.

SUPPORTED BY Oregon State Government

## 6. PUBLIC HEALTH AND SAFETY

### 6.0068, UTILIZATION OF LATENT MARINE RESOURCES AND WASTE PRODUCTS

D.K. LAW, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objective: To investigate the latent marine resources and available waste products as sources of protein and other nutrients for use in animal and human nutrition. A method for production of a low-fat marine protein concentrate from hake and other latent species will be developed. The marine protein concentrate will be evaluated as a source of protein for use in human nutrition. Procedures will be developed for processing and storing shrimp and crab scrap. Its nutritive value as a supplement in trout rations will be evaluated. Acidification as a means of preserving whole ground fish for use as an animal feed will be investigated. Use of latent marine resources such as anchovy, silver smelt, krill, etc., for use as human and animal food, will be investigated.

SUPPORTED BY Oregon State Government

### 6.0069, SURVIVAL MECHANISM OF IRRADIATED BACTERIA IN FOODS

J.S. LEE, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives - (1) Examine and describe the nature of the changes that occur in microorganisms that have received sub-lethal doses of radiation. (2) Investigate the action of certain food additives and bacteriostatic agents on radiation injured microorganisms. (3) Investigate the effect of radiation on microorganisms according to the physiological or genetic parameters, e.g., permeability changes, DNA degradation, capability to produce exo or endo toxins, antibiotics sensitivity and morphological or taxonomic variations.

Select group of microorganisms will be studied in order to demonstrate the nature and extent of sub-lethal radiation damage. We have already demonstrated this in *Escherichia coli* B. (1) This will be extended into other bacteria that survive irradiated foods in a significant number. We will initiate our investigation with *Achromobacter* species that survive in irradiated Dover sole, Dungeness crabmeat and in Pacific oysters. (2) The sub-lethally damaged cells can be isolated from the non-injured cells by the penicillin technique. A threshold concentration of penicillin may be incorporated in the basal media for the initial recovery of radiation survivors. After incubation to permit the growth of healthy cells which then are inactivated by penicillin the plates will be overlaid with complete media. This will dilute the penicillin and also permit the growth of cells that did not grow on the basal media. These colonies will be investigated for their physiological and genetic variations.

SUPPORTED BY Oregon State Government

### 6.0070, SURVIVAL MECHANISM OF IRRADIATED MICROORGANISMS IN FOOD

J.S. LEE, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

Ionizing radiation of food is being accepted as an extended method of preserving man's food supply. A further understanding of the action of radiation on food-borne microorganisms, at the cellular level, is the subject area of this proposal.

This proposal intends to investigate the nature of change that occurs in sub-lethally injured microorganisms due to irradiation. Several food preservatives such as sodium benzoate, potassium sorbate and sodium chloride have been shown to exert different effects on radiation injured bacteria than to the unirradiated cells. In irradiated sea-foods, for example, the recovery rates of survivors at 7 degrees C were further reduced by 0.1% sodium benzoate. The irradiated *Salmonella typhimurium* and *S. enteritidis*, on the other hand, remained viable for longer periods of time at 7 degrees C when 0.1% sodium benzoate was present.

The mode of action of such food additives and other bacteriostatic agents on the radiation injured bacteria will be determined by measuring the cellular functions following irradiation. Respiration, catabolic incorporation of nutrients and the specific effects of the preservatives can be determined by manometric methods. The suspected change in permeability, degradation of macromolecules or inhibition of their synthesis can be determined by the use of radioisotopes. Other changes that will be ex-

amined will include capability to produce toxins, sensitivity to antimicrobial agents and morphological and taxonomic variations.

### 6.0071, LIPID OXIDATION AND ASSOCIATED BIOCHEMICAL CHANGES OCCURRING DURING THE PROCESSING AND STORAGE OF FISHERY PRODUCTS

R.O. SINNHUBER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. Investigation of objective methods for the determination of quality of fishery products. 2. Determination of oxidative rancidity by chemical or physical means. 3. Investigation of changes which occur in lipids during processing and storage. 4. Investigations of antioxidants and their role in the prevention of oxidative rancidity.

Changes in the lipid portion of seafoods will be followed by applying or developing certain chemical tests and correlating these results with sensory evaluation. Techniques to be used are the indole and picric acid methods and the 2-thioarbuturic (TBA) acid, peroxide and carbonyl determinations will be modified to permit their application to a greater variety of processed seafood products. The Sanger technique will be used to follow reactions between the protein and carbonyl groups of lipid oxidation as related to browning of stored fishery products. The effect of antioxidants in stabilizing the lipid portions of seafood products will be determined by application of the above techniques and by the celite method for accelerated tests.

SUPPORTED BY Oregon State Government

### 6.0072, INVESTIGATE THE EFFECT OF IRRADIATION ON THE MICROBIAL FLORA SURVIVING IRRADIATION PASTEURIZATION OF SEAFOODS

R.O. SINNHUBER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. Study the shift in the natural microbial flora (including yeasts and molds) due to the variation in irradiation resistance and determine a) the spoilage by these microorganisms, b) their pathogenicity. 2. Determine whether a significant number of those microorganisms which survive are mutants, and their role if any in spoilage. 3. Investigate the complimentary effects of approved food additives such as nitrites, nitrates, sodium chloride, and possibly other radiolethal agents.

By taste panel methods the maximum allowable radiation dose will be determined. The kinds, types, and pathogenicity of the surviving microorganisms will be ascertained by conventional methods. The normal microbial flora and spoilage pattern as well as that which results after radiation and storage will be followed by chemical and microbiological techniques.

SUPPORTED BY Oregon State Government

### 6.0073, DEVELOPMENT OF RADIATION STERILIZED FISH ITEMS FOR ARMED FORCES FEEDING

R.O. SINNHUBER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. Conduct studies to determine optimum conditions for producing acceptable irradiation sterilized seafood products that will remain stable at ambient temperature. 2. The species shall include but not be limited to cod and halibut. 3. The influence of the following processing variables will be studied: a) selected additives, b) antioxidants, c) odor scavengers, d) Oxygen scavengers, e) packaging environment, f) Cooking procedures and use of condiments at time of serving for evaluation. 4. Sufficient samples shall be prepared to permit periodic examination of the over a period of 9 months. The storage temperature will be 72 degrees F. Large consumer type acceptance panel evaluation will be made of the various treatments using proven psychological methods with adequate controls and statistical evaluation of the results. Appropriate chemical tests will be made to determine the changes that occurs during storage and to correlate these findings with panel evaluation.

SUPPORTED BY Oregon State Government

## 6. PUBLIC HEALTH AND SAFETY

### 6.0074, STORAGE STABILITY STUDIES ON RADIATION STERILIZED FISH ITEMS

UNKNOWN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. To determine cause of 'browning' and other changes that occur during storage of irradiated fish items. 2. To develop methods for controlling these changes that adversely effect the products.

1. Studies on carbonylamine reactions, the production of carbonyl compounds from carbohydrates and unsaturated lipids, the production of amines from protein, and the effect of irradiation at sub-freezing temperature (-80 degrees Centigrade). 2. Studies on the use of selected 'browning' inhibitors, antioxidants and various packing procedures using appropriate chemical and physical techniques. 3. The various treatments will be evaluated by subjective panel evaluations after storage at 22 degrees Centigrade over a period of 12 months.

SUPPORTED BY Oregon State Government

### 6.0075, VITAMIN K5 AS A FOOD PRESERVATIVE

H.Y. YANG, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. To study the inhibiting action of Vitamin K5 against various food spoilage microorganisms.

The effect of vitamin K5 on the microorganisms isolated from meats, seafoods, fruits and vegetables will be studied. Two or three foods from each group will be used as representative samples. Vitamin K5 in the concentrations ranging from 10 to 1000 ppm will be added to these organisms and their survival will be observed. The combined effect of vitamin K5 and other food preservation methods on microorganisms will be studied using various concentrations of vitamin K5 in combination with canning, freezing, dehydration, and irradiation techniques and determining the effect of the combined process on the survival of the microorganisms.

SUPPORTED BY Oregon State Government

### 6.0076, THE COMPOSITION, NUTRITIVE VALUE AND QUALITY OF FISHERY PRODUCTS WITH SPECIAL EMPHASIS ON LIPID AND ITS INTERACTION

T.C. YU, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. Extend the storage life of frozen seafood products. 2. Improve nutritive value and to prolong the storage life of fish meal and fish flour. 3. Stabilize lipids in irradiated fishery products. 4. Investigate the role of polyunsaturated fatty acids (fish oils) in animal growth. 5. Develop and improve chemical methods for testing the quality of fishery products.

The effectiveness of various antioxidants in the protection of frozen seafoods (also fish meals) from oxidative deterioration and methods of incorporating antioxidants to fish will be investigated. Packaging material having least air permeability and highest protection of the products against desiccation will be sought. Factors causing the development of browning discoloration of the irradiated fishery products by means of inhibiting these adverse reactions will be investigated. The experiments designed to study the role of polyunsaturated fatty acids in fish growth will be conducted to utilize the existing fish rearing facilities of the Food Toxicology and Nutrition Laboratory using rainbow trout as test animal.

SUPPORTED BY Oregon State Government

### 6.0077, THE STORAGE LIFE OF ICED DEEP SEA RED CRABS - GERYON QUINQUEDENS

A. HOLMSEN, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Justification: The red crab is caught in large quantities by the deep sea lobster trawlers. It has a delicate flavor and a good dressing percentage, but since it can not be stored in lobster tanks it is thrown overboard.

Objective: To determine the keeping quality of iced crabs and the effect of icing on the texture of the meat.

Procedure: On board a trawler various ways of icing crabs will be tried (iced in the hull, iced in burlap bags, vegetable bags etc.). The crabs will be stored for various lengths of time from one to ten days, and bacteriological test will be carried out to determine the effect on quality of handling, temperature, and length of storage.

SUPPORTED BY Rhode Island State Government

### 6.0078, THE STRUCTURE OF DECISION MAKING IN MAJOR MARKETING AGENCIES OF FOOD FISH IN THE N.E. UNITED STATES

H.C. LAMPE, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objectives: (1) To determine the variables controlling decisions in the purchase, processing, and distribution of food fish in the existing market system; including: short run factors regarding volume, variety, source, and prices; effect of existing market restraints on the scope of decisions; evaluation of the information leading to decisions; and examining the effect of firm policy on the scope of decisions by those responsible for the purchase, sale, and distribution of food fish. (2) To determine changes necessary in the structure in order to effect changes in the market process for food fish; with particular attention to the importance of reducing costs as an inducement to change, and the possibility of changes in decision making structure as regards marketing.

Work Proposed: (1) From secondary and primary sources develop a complete description of the channels of trade to determine: the volumes of fish of various species moving through; to evaluate the relations between imports, cold storage holdings and catch volume; to examine the price-quantity relations among relations among various species. (2) To survey industry representatives (wholesalers, manufacturers and chain store buyers regarding the importance of species, prices, quality, and quantity of fish purchases.

SUPPORTED BY Rhode Island State Government

### 6.0079, MARKETING EFFICIENCY IN A COOPERATIVE FOOD-FISH PROCESSING PLANT, A CASE STUDY

H.C. LAMPE, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objectives: To discover and identify inefficient product handling and processing in a cooperative multiple product, fish food processing plant; to develop and recommend alternative methods of processing and product handling as a means of reducing marketing costs; to analyze and recommend changes in plant and equipment that will improve the operating efficiency of a given plant.

Methods and Procedures: The plant operations will be divided into definite job series, and the jobs will be further subdivided into operations; general production study will be conducted for each operation and for each job; a detailed production study will be conducted on the freezing storage and shipment aspect of the plant; partial budgeting and/or linear programming will be used to evaluate the potential of various alternative approaches to resolving production problems where inefficiencies are discovered.

SUPPORTED BY Rhode Island State Government

### 6.0080, PROCESS ENGINEERING

J.A. DYER, U.S. Dept. of Interior, Technology Laboratory, Seattle, Washington

This project is designed to study the application of chemical engineering processes to the production and utilization of fish oils. The current project is the production of high-grade fish oil from the solvent processes used to produce fish protein concentrate.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

## 6. PUBLIC HEALTH AND SAFETY

### 6.0081, OUTGROWTH OF CLOSTRIDIUM BOTULINUM TYPE E IN NONIRRADIATED AND IRRADIATED FISHERY PRODUCTS

*M.W. EKLUND*, U.S. Dept. of Interior, Technology Laboratory, Seattle, Washington (AT(49-7)2442)

Objective: During a study of the incidence and concentration of *Clostridium botulinum* type E cells in the marine environment, strains of nonproteolytic types B and F were isolated from the Pacific Coast of the United States. Both of these types are uncommon to the North American continent and only a few pure cultures of this type exist in the world. Since these cultures were isolated from the marine environment, it is very important that the physiological and biochemical characteristics of these strains be studied to determine whether they are of any greater public health significance than type E in irradiated fishery products held at refrigerated temperatures.

Results to date: The physiological and biochemical characteristics of strains of nonproteolytic *Clostridium botulinum* types B and F are indistinguishable from those of type E. Nonproteolytic types B, E, and F all: 1) produce a protoxin activated by trypsin; 2) produce spores of low thermal resistance; 3) grow and produce toxin at 38 degrees F.; and 4) possess the same cultural, biochemical, and colonial characteristics. The data collected thus far, however, do not indicate that the outgrowth time of types B and F at refrigerated temperatures are of any greater public health significance than that of type E. Antitoxin serums prepared by immunizing rabbits with the toxoid of the nonproteolytic type F isolate do not show any cross-neutralization with the toxins of other known types of *C. botulinum*. However, approximately 2 to 3 MLD of type of F toxin is cross-neutralized by 1,000 anti-MLD of type E antitoxin. More detailed experiments are currently in progress to evaluate the degree of safety that exists in irradiated fishery products with respect to *Clostridium botulinum*. The factors responsible for the differences in the outgrowth of type E in petrale sole and haddock fillets are also being investigated.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0082, CHEMISTRY OF FISH OILS AND THEIR UTILIZATION

*E.J. GAUGLITZ*, U.S. Dept. of Interior, Technology Laboratory, Seattle, Washington

This project is phased to study the chemical and physical changes that occur during processing, handling, and storage of fish oils that are detrimental to the product quality, and the chemical reactions and procedures that can be used to adapt fish oils or fish oil derivatives to edible usage.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0083, APPLICATION OF RADIATION PASTEURIZATION PROCESSES TO PACIFIC CRAB AND FLOUNDER

*D. MIYAUCHI*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Seattle, Washington.

The objective of this work is to develop a practical procedure for the radiation pasteurization of Pacific crab meat, flounder fillets, and related products. The specific tasks are: 1. The determination of the optimum pre- and post-irradiation conditions (sample treatments, radiation dose, storage-life tests, etc.) directed towards defining commercial process parameters. 2. The development of methods for assessing quality for maintaining quality control, and for establishing the safety of the radiation-pasteurized seafoods by sensory microbiological, chemical, and physical tests. 3. The determination of maximum time ('X'-value) for an untrained panel to unanimously reject irradiated fish fillets and relate to the toxin-production time of corresponding irradiated fillets inoculated with spores of *Clostridium botulinum* type E at various storage temperatures to establish the safety of the irradiation process. 4. The determination of the commercial value of the radiation-pasteurization process by shipping commercial quantities of irradiated fillets through regular commercial channels for evaluation by industry.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0084, PRESERVATION AND DEVELOPMENT OF FOOD PRODUCTS

*R.W. NELSON*, U.S. Dept. of Interior, Technology Laboratory, Seattle, Washington

This project involves a continuing study of methods (sensory, chemical, and physical) for determination of the quality of fishery products, the changes due to processing, and the effects of various techniques of preservation. Current subprojects are:

Quality Criteria Development: In connection with other projects and phases of the program research will be conducted on methods of evaluating and assessing the quality of fishery products. The criteria developed will be used in evaluating the effectiveness of preservation and processing variables and treatments for the entire program. Adaptation of color measurement techniques to fishery products evaluation, improved procedures for measuring texture, and rapid methods for measuring salt content are examples of analytical procedures which may be investigated.

New Products from Underutilized Species: Underutilized species will be used in preparing new types of products and in modifying conventional products which will accommodate some of the unusual properties previously considered undesirable. Fish blocks prepared from ground fish tissue of various species will be investigated. Products such as fish cakes, canned smoked products, fish blocks with flavor additives, and canned products with altered flavor and texture will be prepared as means of utilizing species of rockfish, sole, herring, mussels, squid, and others which are not readily acceptable in their present form.

Shellfish Preservation Studies: Research is being conducted on methods of holding and shipping live Dungeness crabs in order to extend market areas farther from the fishing grounds. Procedures for packaging live crabs and maintaining them alive after reaching the destination are being developed. The relationships between time and temperature of holding and crab condition are being studied. The feasibility of air-shipping live crabs from the Pacific Coast to the East Coast is being investigated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0085, STUDY OF THE BASIC MICROBIOLOGICAL AND BIOCHEMICAL FACTORS IN THE IRRADIATION PRESERVATION OF MARINE PRODUCTS

*J. LISTON*, Univ. of Washington, Graduate School, Seattle, Washington 98122

This project represents a continuation of a general investigation of the effects of low dose gamma radiation on the microflora of fish and shellfish and the changes which occur in this flora during subsequent refrigerated storage of the irradiated food. The results achieved previously have confirmed that sequential double irradiation treatments are highly effective in retarding bacterial spoilage of fish fillets. Studies of the nature of radiation damage in *S. aureus* cells suggest that this effect may be due in part to a sensitizing effect of the primary irradiation exposure. The proposed work is designed to determine optimum conditions for effective double irradiation processes and to relate the procedure to ship-board irradiation of fresh caught fish. Studies will be continued on the identity and physiological properties of microorganisms which multiply on irradiated stored seafood products with the objective of correlating the microbiological changes with chemical changes occurring in the stored foodstuff. Specific studies will be made of the effect of radiation on *Vibrio parahaemolyticus* which has recently been isolated in the Puget Sound region. An investigation will also be made of the effectiveness of low dose irradiation in eliminating enteric organisms from West Coast shellfish.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0086, LOW TEMPERATURE GROWTH OF BACTERIA ON FOODS

*J. LISTON*, Univ. of Washington, Graduate School, Seattle, Washington 98122

This investigation is concerned with the low temperature growth of bacteria on foods. The organisms to be used in these studies will be gram-negative rod-shaped bacteria commonly occurring on seafoods held at low temperatures or which are of public health significance. They will be tested for the occurrence of a growth temperature shift and ability to produce isoenzymes

## 6. PUBLIC HEALTH AND SAFETY

active at low temperatures. Enzyme systems which show activity shifts with lowered temperature will be investigated to determine their temperature optima and confirm or refute the hypothesis that psychrotrophic growth in bacteria is mediated by the cell's ability to produce both mesophilic and psychrophilic enzymes.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0087, BOTULINUM FOOD POISONING IN RELATION TO FISHERY PRODUCTS

*E.M. FOSTER*, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Objectives: To study (1) ecology of *C. botulinum* type E in the Great Lakes; (2) conditions affecting spore formation by *C. botulinum* type E; (3) the heat resistance of *C. botulinum* type E spores with the view of establishing minimum times and temperatures that will destroy the majority of spores without damaging marketability of the product; and (4) to establish conditions necessary to prevent growth of *C. botulinum* type E fishery products.

Procedure: Samples of fish, water and mud from the Great Lakes will be tested for *C. botulinum* type E to see if its occurrence can be related to specific environmental conditions. Study cultural conditions of spore formation of *C. botulinum*, observing effects of nutrients, pH, incubation temperature, and time on sporogenesis. Establish minimum temperature and time which will destroy all heat sensitive spores. Determine efficacy of various food additives for purpose of preventing growth of spores which survive the heat process. Salt, benzoate, nitrite and polyphosphate hold promise. When an effective control procedure is found in the laboratory it will be tried on a pilot scale basis with full size equipment operated under normal commercial conditions. Determine consumer acceptability of finished product by qualified taste panels.

SUPPORTED BY U.S. Dept. of Agriculture  
Wisconsin State Government

### 6.0088, DISTRIBUTION OF *C. BOTULINUM* IN COMMERCIAL SMOKED FISH

*E.M. FOSTER*, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Outbreaks of type E botulism in 1960 and 1963 have been traced to smoked fish processed in the Great Lakes area. The purpose of this study is to determine the source of *C. botulinum* type E on the fish.

Samples of water, mud and fish from various places in the Great Lakes will be tested for the presence of the type E organism to see if it occurs commonly and, if so, where it exists on or in the fish. Various species of fish will be tested to see if there is a difference in incidence between species. Efforts will be made to determine the natural habitat of the organism if it is found commonly. Concurrently, experiments will be run to evaluate methods of detecting *C. botulinum* type E in natural materials.

SUPPORTED BY Wisconsin State Government

## 6B. HYPERBARIC MEDICINE AND ADAPTATION

(effects of Deep Oceans on Divers and Habitation)

### 6.0089, MAN IN THE SEA - VISUAL ACUTTY RESEARCH

*R.A. CHRISTIANSON*, North Amer. Rockwell Corp., Long Beach, California 90803

Experimenters at North American Rockwell's Ocean Systems Operations conducted the initial phases of a research program for testing and measuring the visual responses of divers underwater. Using specially developed techniques and instrumentation, it was found that divers require between 63 and 72 percent more time to perceive and respond to the details of an object when viewed underwater. According to test conclusions, this is partially due to the slight jarring of a diver's head caused by his rising exhalation bubbles, as well as other probable contributing factors. This work was undertaken because divers are being called upon to perform complex underwater-tasks, read instruments in

flooded submersibles, and perform a variety of visual search and identification missions where visual perception of objects underwater is of major importance. The project manager, R. A. Christianson, concluded that the technique and instrumentation developed for the visual acuity research was highly successful and will be standardized as a basis for future company experimentation in this area.

The experimental work was conducted at the Diving Research Facility of the University of California at Los Angeles. A technical report, 'A Study of Visual Acuity Underwater Using an Automatic Landolt Ring Presentation Technique', X8-128.020, February 1968, was prepared by Raymond A Christianson.

SUPPORTED BY North American Rockwell Corporation

### 6.0090, SHARK ATTACKS

*L.P. SCHULTZ*, Smithsonian Institution, Washington, District of Columbia 20560 (NONR)

This work unit provides for the compilation of information on factors relating to shark attacks on humans. These data include geographic distributions of certain shark species and the environmental conditions attending shark attacks. These data are now being analyzed in an effort to form a basis for the prediction of attacks. A central reference file is maintained for the use of investigators in this field. In addition, the Museum's reference collection of sharks and other elasmobranch fishes has been made accessible to researchers by the establishment of special new tanks and hoists which allow easier observation and handling of the large specimens. The shark file is now being prepared for incorporation into a data retrieval system.

It has become evident that the Navy's increasing use of relatively unprotected swimmers and divers in such operational activities as beach reconnaissance, UDT work, and amphibious landings has increased the hazard of encounter by sharks and other obnoxious animals. Damage to morale and the interference with psychological readiness are often equally detrimental to an operation. It is important, therefore, that the extent of the problem in specific geographic areas be evaluated and that as much as possible be learned about the conditions which affect the behavior of sharks. Such information will also serve to guide the chemists and engineers in the development of shark repellents, as well as those who must judge the value of recommended methods.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0091, SEALAB III PARTICIPATION

*R.A. WALLER*, U.S. Dept. of Interior, Bureau of Comm. Fisheries, Washington, District of Columbia

The U.S. Navy is exploring the possibilities of having men do useful work from an ambient pressure habitat 620 feet beneath the surface of the ocean off San Clemente Island, California (SeaLab III). As an integral part of this experiment two aquanauts from the Bureau of Commercial Fisheries will, for the first time at this depth, do extended work in marine biology and ecology. The major purpose of BCF participation is to create a cadre of personnel trained in saturation diving techniques and familiar with engineering, design, support, and operations of seafloor habitats. In so doing, the Bureau will be assisting the Navy by providing know-how in marine biology. The participation of the Bureau's diving scientists will also enable them to make a preliminary assessment of the value to research programs of in situ observations and work.

A number of short-term experiments will be undertaken. These include: lobster transplant studies, light attraction studies of fish and invertebrates, observations of fish behavior, species interaction, and light production by biological organisms.

The development of this undersea capability will reveal new avenues of bureau knowledge and radically different methods of ocean harvesting.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0092, METABOLIC ADAPTATION TO COLD

*S.K. HONG*, Yonsei University, Seoul, Korea

## 6. PUBLIC HEALTH AND SAFETY

Objective: Prof. Hong will continue his studies on cold adaptation of the diving women of Korea which he has been working on for several years in collaboration with Prof. Herman Rahn and Dr. D. W. Rennie of the University of Buffalo. Emphasis in the first phase of this grant will be on regional heat loss during cold water immersion in order to describe more precisely the role of blood flow metabolic rate and insulation in the limbs in relation to the overall body insulation. Measurements will be made simultaneously of trunk and limb heat loss, limb, muscle and skin blood flow and deep muscle temperature.

SUPPORTED BY U.S. Dept. of Defense - Air Force

### 6.0093, ENVIRONMENTAL PHYSIOLOGY

L. FARHI, State University of New York, School of Medicine, Buffalo, New York 14214

Objective: The objective of this program is to increase our knowledge and understanding of the effects of various environmental stresses on Naval and Marine Corps personnel. This research will elucidate and solve some of the biomedical problems of deep submergence associated with the adverse conditions of free swimming and SeaLab type environments.

Approach: The contractor is conducting research, using basic and novel techniques in high pressure physiology to study submergence, deep submergence, increased 'G' forces, and gas exchange in SeaLab type environments. Each of these operational conditions, which is characterized by specific change in one or more of a relatively small number of environmental factors such as gravity, pressure, temperature, breathing atmosphere, or surrounding medium, is being studied. This program will not only investigate how man is affected by these various environmental conditions but also the steps that can be taken to improve performance, extend the limits of exposure, and promote acclimatization.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0094, HUMAN TEMPERATURE REGULATION IN WATER

D.W. RENNIE, State University of New York, School of Medicine, Buffalo, New York 14214

It is our broad purpose to study temperature regulation of human beings in a water environment. Emphasis will be upon the effects that exercise in water has upon body heat loss, overall cardiac output and the vascular distribution of blood. Specifically, we propose to measure heart rate,  $\dot{V}O_2$ , cardiac output and regional heat loss of man at rest and exercising in water of different temperatures and in different underwater postures. The ventilatory response to exercise in water will be compared to that in air as will the local distribution of blood to exercising limbs.

Basic instrumentation and techniques have been and will continue to be developed on ourselves in the Department of Physiology at Buffalo. These methods will then be applied to a study of cold-acclimatized human beings, the Korean diving women, who have been studied extensively by us in the past in the excellent field laboratory in Pusan, Korea.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0095, THERMAL REGULATION DURING WATER IMMERSION OF MAN

A.B. CRAIG, Univ. of Rochester, School of Medicine, Rochester, New York 14627

Water immersion is a physiological stress which affects respiratory, cardiovascular, and thermal regulatory mechanisms. Past investigations in this laboratory have indicated that in man an understanding of the heat exchanges during immersion is fundamental to many other responses. Indirect calculations by methods used for man in air are not applicable to the subject in water.

It is proposed that thermal exchanges and their regulation will be studied using methods of direct calorimetry. A bath calorimeter will be constructed and operated. Heat loss from the bath will be controlled and measurable. Heat input will be from the immersed subject and from electrical heating elements.

Therefore, if the bath temperature remains constant, the heat contributed by the subject can be calculated.

This calorimeter will be used to study subjects at rest and during exercise in water of various temperatures. In conjunction with these studies attempts will be made to develop and test methods of indirect calorimetry which would be valid for the immersed subject. In addition we propose certain studies of cardiovascular function which will aid in the understanding of regulation of heat exchanges under these conditions.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0096, MANNED DIVING RESEARCH

H.R. SCHREINER, Ocean Systems Incorporated, Tonawanda, New York 14150

Exposure of the deepsea diver to air or synthetic breathing gas mixtures under increased pressure leads to the uptake of inert gases by his tissues. These dissolved gases must be removed by his circulatory and respiratory system during his ascent to the surface in a manner which precludes the formation of a clinically significant gas phase. This program evaluates in human decompression experiments the theoretical ascent profiles that have been developed for this purpose by proprietary computer methods. A five-lock, 700-cu.ft. pressure chamber system is being utilized for this investigation. This manned diving research facility is extensively instrumented for physiological research, its individual components provide working pressure equivalent to seawater depths ranging from 600 to 1000 feet.

Proprietary decompression schedules for helium-oxygen dives to up to 450 feet of seawater developed by this program have been extensively field-tested by Ocean Systems Operations, yielding a current level of incidence of decompression sickness of 2%. The current objective of this program is to extend this decompression capability to manned working dives to depths of 1000 feet.

SUPPORTED BY Ocean Systems Incorporated

### 6.0097, HUMAN PERFORMANCE

H.R. SCHREINER, Ocean Systems Incorporated, Tonawanda, New York 14150

The limits of human performance under conditions of submergence and exposure to high gaseous pressures is being investigated under this program. Particular attention is being directed to measuring the ability of the deep sea diver to perform manual and mental tasks and to determine the degree of deterioration of his performance under the influence of environmental factors.

SUPPORTED BY Ocean Systems Incorporated

### 6.0098, DECOMPRESSION TABLE DEVELOPMENT

H.R. SCHREINER, Ocean Systems Incorporated, Tonawanda, New York 14150

Using advanced mathematical models of inert gas transport in the human body this proprietary project is devoted to the: (1) computer analysis of past diving experience, (2) establishment by statistical methods of the probable risk of decompression sickness associated with any given dive profile, (3) development, by digital computer methods, of decompression tables for dives to depths of up to 1500 feet of seawater.

SUPPORTED BY Ocean Systems Incorporated

### 6.0099, NITROGEN-OXYGEN DECOMPRESSION TABLES FOR ALTITUDE FLIGHT

H.R. SCHREINER, Ocean Systems Incorporated, Tonawanda, New York 14150

The objective of this program is to complete the development of nitrogen-oxygen decompression tables for the safe ascent of aerospace personnel from ground level to altitude which was initiated during the first year of this contract. This will be done by (1) analyzing a total of 1388 altitude decompression histories accumulated under controlled laboratory conditions, (2) extracting from these computer-analyzed decompression histories statisti-

## 6. PUBLIC HEALTH AND SAFETY

cally secured maximum permissible values of tissue nitrogen tensions in the ascent-limiting gas exchange compartment of the human body, and by (3) constructing with this information decompression tables for various ascent modes and nitrogen-oxygen compositions associated with extended manned spaceflights.

SUPPORTED BY U.S. Natl. Aero. & Space Adm.

### 6.0100, RESEARCH STUDIES IN MOLECULAR PHARMACOLOGY

H.R. SCHREINER, Ocean Systems Incorporated, Tonawanda, New York 14150 (PH-43-68-992)

Research under this program is designed to produce answers to the following two questions: (1) Do gases having important roles in pharmacology, anesthesia, and diving physiology alter the function of macromolecules by virtue of specific interactions? (2) What effects do these gases have on the permeability of cell membranes to amino acids, sugars and ions?

Approaches to be utilized in the execution of this program include the measurement of (1) solution and solid state binding equilibria of inert gases with biopolymers, (2) electronic absorption spectra of inert gas-model compound systems to determine possible charge-transfer interactions, (3) 'inhibitor' binding energies from thermodynamic analysis of enzyme inhibition kinetic data, and (4) membrane transport in cultured mammalian cells.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

## 6C. MARINE TOXINS-PHARMACEUTICALS

### 6.0101, VENOMOUS FISHES AND SEA SNAKES OF SOUTHEAST ASIA

B.W. HALSTEAD, World Life Research Institute, Colton, California (N00014-67-C-0379)

The investigator and his associates propose to determine the identity and incidence of the venomous fishes and sea snakes in certain localities in Southeast Asia, investigate the morphology of the venom apparatus and the behavior related to aggression and the delivery of the toxins to the victims. Photographic records of the animals, as well as habitats, will be taken in the ecological phase of this project.

Less than a dozen of species of venomous fishes have been studied by venom experts and virtually nothing is known about the anatomy of the venom apparatus, the ecology of the populations of these forms or the factors which attract or induce aggression in these animals. The greatest concentration of the most dangerous of venomous fishes and sea snakes are found in Southeast Asia. It is essential that more be learned about these animals for the morale, as well as for the protection of personnel.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0102, CHARACTERIZATION AND MODE OF ACTION OF PROTEIN VENOMS OF MARINE ANIMALS

G.A. FEIGEN, Stanford University, School of Medicine, Palo Alto - Stanford, California 94305

During the past year Dr. Feigen has undertaken a preliminary investigation of the chemistry and mode of action of the venom produced by the Hawaiian sea urchin. The results of these studies show that the venom is a protein having a Svedberg coefficient of 2.6, that it is relatively stable at room temperature at a neutral pH, and that it precipitates from aqueous solution in the presence of 65%-saturated ammonium sulfate. It is lethal on intravenous and intraperitoneal injection in mice. It contracts the isolated guinea pig gut and produces arrest of the isolated guinea pig heart. Concomitantly, it liberates histamine from these tissues together with other physiologically active materials which have not yet been identified. Preliminary studies of its mode of action suggest that it may be a lecithinase.

The aim of the present research is to complete the chemical and pharmacological characterization of this venom and to initiate certain immunological, physiological, and biochemical studies to round out the understanding of its chemistry and mode of action. At the same time, it is intended to compare the chemical, pharmacological, and immunological characteristics of the

venom of the Hawaiian species with that found on the Pacific Coast, particularly in the vicinity of the Hopkins Marine Station at Pacific Grove.

SUPPORTED BY U.S. National Science Foundation

### 6.0103, MODE OF ACTION OF MARINE TOXINS

G.A. FEIGEN, Stanford University, School of Medicine, Palo Alto - Stanford, California 94305

Studies during the current grant period have shown that crude sea urchin toxin contains a variety of enzymes which can react with serum proteins to form dialyzable physiologically active products that have striking pharmacological similarities to plasma kinins. Partially purified fractions have shown a high degree of substrate specificity, particularly with respect to attack on 1) purified  $\alpha$ 2-macroglobulin and 2) B-globulin. They also possess the property of inactivating the product as well as synthetic bradykinin. These fractions are immunogenic and the rabbit antibodies have been shown to 1) fix complement; 2) precipitate; 3) protect against, and 4) neutralize the toxin. This year our aims will be: 1) to continue purification by column chromatography; 2) to study the mode of enzymatic action on natural and synthetic substrates; 3) to determine the antigenic components; 4) and to attempt a characterization of the product formed by pharmacological and chemical methods, which will require the preparation of large quantities of material by the attack of the various enzymes on human plasma proteins.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0104, PHARMACOLOGY AND CHEMISTRY OF TOXIC MARINE ANIMALS

F.A. FUHRMAN, Stanford University, School of Medicine, Palo Alto - Stanford, California 94305 (N00014-67-C-0319)

Objective: Understanding the sources as well as the effects of toxins found in certain marine organisms is germane to successful survival techniques. Hence, it is important to have a background of pharmacological information regarding such toxins as those found in the eggs of certain fish.

Approach: The investigator will study the effects of cabezon (*Scorpaenichthys marmoratus*) toxin on lymphocytes in the blood, muscle contractions, and upon other organs. Preliminary studies of the chemical structure of the toxin and its purification have been necessary to provide material for the pharmacological studies.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0105, CHEMISTRY AND PHARMACOLOGY OF TETRODOTOXIN

H.S. MOSHER, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

The distribution of tetrodotoxin in nature is being explored and a search is being made for other animal toxins.

Chemical studies aimed at the synthesis of tetrodotoxin-like structures are under investigation. The ultimate aim is to prepare related derivatives or analogs for further investigation of their pharmacological activity.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0106, USEFUL BIOMEDICAL MATERIALS DERIVED FROM THE SEA - AN INTERDISCIPLINARY APPROACH

J.H. GREEN, New England Inst. Med. Res., Ridgefield, Connecticut 06877

Recent work identified the presence of a substance extracted from the liver of the lemon shark which acts as a stimulant to the body's host defense system and also suggested that other fractions of this same extract could inhibit this same system. At the present time physical and chemical analyses are being made to determine the structure of the active agents. Work under this project will include the determination of the scope and level of effectiveness of the materials in various disease states and the tolerance level and toxicity, if any. Also, efforts to understand the biochemical mechanism by which these materials activate the host defense system will be made.

## 6. PUBLIC HEALTH AND SAFETY

The second phase of this project involves studies of bioluminescent marine planktonic organisms. While earlier work has identified the luciferin-luciferase system, the mechanism by which light is emitted is not completely understood. This program will attempt to further elucidate the system, especially to establish the nature of the light-emitting moiety. Secondly, the development of a method of growing bacteria will be completed; extraction and purification of the enzyme will be made to be completed; extraction and purification of the enzyme from *Photobacterium fischeri* on a preparative scale will be undertaken, and an effort will be made to find a linking system that will enable the bacterial luciferase to be used for detection of adenosine triphosphate and other co-factors which supplant firefly luciferase in these reactions.

SUPPORTED BY U.S. National Science Foundation

### 6.0107, PHYSALIA TOXIN AND THE ACTIVITY OF BIOLOGICAL MEMBRANES

*C.E. LANÉ*, Univ. of Miami, Graduate School, *Miami - Coral Gables, Florida* 33124 (N00014-67-A-0201-0003)

The investigator is examining the properties of the toxin of *Physalia*, the 'Portuguese Man O' War' which account for its activity on specialized conduction systems as those in the mammalian heart, on ionic regulation in crustaceans and on the sodium, potassium and ATP enzymes of gills, nerves and gut membranes of crustaceans. He is utilizing his knowledge of this toxin as a means to study the mechanisms of active transport in a variety of biological membranes.

*Physalia*, as well as most other pelagic coelenterates, produce a potent toxin. While some forms are mainly a nuisance, others are fatal and have been known to cause death in seconds. Its mode of action is not known and the proposed research may provide information useful in the development of antidotes for the slower acting forms or perhaps preventatives to be administered to personnel liable to encounter jellyfish. Knowledge about active transport through biological membranes is applicable to an enormous number of biological and medical problems.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0108, EFFECTS OF INGESTION OF RADIOACTIVE FISH AND THE NATURE AND BIOLOGY OF TOXINS IN CERTAIN FISHES

*A.H. BANNER*, Univ. of Hawaii, Hawaii Inst. of Marine Biology, *Honolulu, Hawaii* 96822

This is part of a comprehensive investigation of the toxin causing ciguatera, a disease resulting from the ingestion of coral reef fish in the tropical Pacific. Studies included in the project are: 1. An investigation of the biological origin and transmission of the toxin: it is suspected that the toxin originates in some alga at the base of the food pyramid and is transmitted through the food chain to the large carnivores where it is stored. 2. An investigation of the chemical nature of the toxin; the empirical and structural formula of the toxin, previously isolated at the ratio of approximately one part per million of raw fish, are currently being studied. 3. An investigation of the pharmacological action of the toxin; during the previous year it was established that this toxin is an irreversible anticholinesterase, and presently this knowledge is being utilized to develop a new *in vitro* assay, while other species of fish, previously considered to have the same toxin, are being investigated to determine the presence of a toxin with this specific action.

SUPPORTED BY U.S. Atomic Energy Commission

### 6.0109, EXPLORATION FOR TOXIC MARINE ANIMALS IN THE TROPICAL PACIFIC

*A.H. BANNER*, Univ. of Hawaii, Hawaii Inst. of Marine Biology, *Honolulu, Hawaii* 96822

The investigator and his team will search the waters near the tropical Pacific Islands for organisms in the food chain which may be the source or one of the sources of the toxins found in marine life, capable of causing severe poisoning in humans. Special attention will be accorded those organisms or toxins which have not been studied extensively.

The importance of understanding the geographical distribution and physiological action of toxins relates to protection of personnel which may consume toxic food under survival or recreational conditions and to the utilization of the substances for medical purposes may provide new investigation techniques in human pathology.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0110, EXPLORATION FOR TOXIC MARINE ANIMALS IN THE TROPICAL PACIFIC

*A.H. BANNER*, Univ. of Hawaii, Hawaii Inst. of Marine Biology, *Honolulu, Hawaii* 96822 (N00014-67-C-0127)

The investigator and his team are searching the waters off of the tropical Pacific Islands for organisms in the food chain which may be the source or one of the sources of the toxins found in marine life, capable of causing severe poisoning in humans. Special attention is being accorded those organisms or toxins which have not previously been extensively studied.

The importance of understanding the geographical distribution and physiological action of toxins relates to protection of personnel which may consume toxic foods under survival or recreational conditions. The utilization of these toxic substances for medical purposes may provide new investigative techniques in human pathology.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0111, PHYTOCHEMISTRY OF NARCOTIC PRINCIPLES IN CAULERPA.

*M.S. DOTY*, Univ. of Hawaii, Graduate School, *Honolulu, Hawaii* 96822

Three kinds of substances have been obtained in pure form: sterols, red crystalline caulerpin and a physiologically active compound, caulerpicin. Significant progress has been made toward processing 76 kilos of *Caulerpa lamourouxii* for major and pharmacologically active constituents. Techniques were developed and modified. Three papers were presented in International Congress invitational symposia, one was published and two are in the manuscript stage.

Taxonomic studies preliminary to phytochemical work have been done on the genera *Caulerpa* and *Laurencia*.

Using special gas chromatographic columns, a mixture of about 50 aromatic substances has been obtained from *Dictyopteris plagiogramma* and *D. australis* and these are awaiting mass spectrometric determination.

At present the chemical work involves developing thin-layer chromatographic and other microassay methods for use in following the active substances in the food chain and in ecological work.

A marine laboratory has been refurbished and air conditioned for experimental culture of *Caulerpa*, and general culture methodology is being developed for future chemical biogenetic work.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0112, PACIFIC BIOMEDICAL RESEARCH

*T.A. ROGERS*, Univ. of Hawaii, Pacific Biomedical Res. Center, *Honolulu, Hawaii* 96822

Planning in the Pacific Biomedical Research Center will be continued with particular emphasis on development of: a) A Marine Experimental Laboratory for the exploitation of marine organisms for basic biomedical research. b) A research program in the pharmacology of natural products of the Pacific. c) A research program in regeneration of nerve structure and function. d) A program in Tropical Medicine, with initial emphasis on Hansen's Disease. e) A program in experimental psychiatry. f) Planning for the orderly development of rapidly expanding animal facilities in several physical locations.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0113, MARINE TOXINS OF THE TROPICAL PACIFIC

*A.H. BANNER*, Univ. of Hawaii, Hawaii Inst. of Marine Biology, *Kaneohe, Hawaii* 96744

## 6. PUBLIC HEALTH AND SAFETY

In the investigation all marine toxins arising from the tropical biota of the reef and shore fauna of the Central Pacific that may be passed on to man, directly or indirectly, will be studied. The studies are divided into three major phases; the biological origin, the chemical isolation and identification, and the pharmacological action of the toxins. Correlated with the major aspects of the investigation is the accumulation of local island knowledge of toxic marine animals, native remedies, and the epidemiology of fish poisoning in the Pacific.

For the present year of investigation, as in the previous years, the main emphasis will be upon those fish which are regionally toxic and cause the loosely defined disease known as ciguatera: biological field studies will be conducted in French Polynesia; chemical studies will attempt to further elucidate the structure of the toxic molecule, now isolated; and pharmacological studies will be concerned both with the development of assay methods adaptable for field conditions and with investigations of the mode and site of action of the drug.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0114, STUDIES ON VIBRIO FOOD POISONING

*K. FUJIWARA, Chiba University, Chiba City, Japan*

The purpose of this work is elucidation of manifestation mechanism in vibrio food poisoning. The project consists of two parts mainly.

The first one is feeding experiments with monkeys to examine synergetic activities of toxic metabolites produced by the pathogenic bacteria in provoking symptoms. The materials given will be mixtures of endotoxin fractions and haemolytic agents extracted from cells and culture supernatants of *Vibrio parahaemolyticus*. The materials of necropsy will be examined histologically and microbiologically.

The second part is study on host side factors in developing of food poisoning symptoms. In order to investigate the influences of substances in pharmacological activities similar to histamine i.e. serotonin will be given to experimental animals with living cells of *Vibrio parahaemolyticus*. And besides, the relationship between attack rate and situations of living, i.e. fatigue and other factors which might have influences on vegetative nervous systems, in human beings, will be investigated epidemiologically in many outbreaks of this type of food poisoning.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0115, ORGANIC CHEMICAL STUDIES ON ANIMAL AND PLANT TOXIN

*Y. HIRATA, Nagoya University, Nagoya, Japan*

Organic chemical studies are currently in progress on the following toxic components of plant and animal origins.

The main purpose of the present studies is correlation of chemical structure with physiological action, prevention of injuries due to poisoning and production of derivatives as potential medicines. 1) Alkaloids of *Daphniphyllum macropodum* M.: Structure proof of three crystalline compounds is being conducted. Transformation of yuzurimine to daphniphylline is being attempted. Physiological action of each alkaloid is being tested. 2) Alkaloids of Orchidaceae: Synthetic work is in progress. Structural investigations of newly isolated alkaloids is being conducted. 3) Alkaloids of *Anodendron affine* D. and of *Trochelospermum asiaticum* N. (Apocynaceae): The alkaloidal components have not as yet been obtained in a pure form. The latter one was reported to have anti-cancer properties. 4) Toxic plankton (*Gonyaulax polyedra*): We have collected a large amount of the plankton and are currently attempting purification of the toxic component(s).

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0116, MARINE ANIMAL TOXINS

*S.L. FRIESS, U.S. Navy, Medical Research Inst., Washington - Bethesda, Maryland*

This effort is comprised of two closely related parts. The pharmacology and physiological pathways of biologically active substances from marine organisms and the modes of action of

some of these substances when used in the field to repel or deter sharks. Holothurin, an extremely toxic substance produced by certain echinoderms is the primary subject of these studies. Other substances are also being sought which will have similar characteristics and action.

The need to become knowledgeable about biologically active substances from the sea is serious from several points of view. Very little is known about these substances, many of which are very different from terrestrial toxins. Personnel in survival, operational or recreational situations must be warned of the presence and behavior of dangerous local animals, antidotes, and treatment techniques must be developed. Since the producers of the toxins appear to use them against enemies, they serve as a likely source of information about protective chemicals and repellents, especially against sharks.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0117, ACTIVE CHEMICAL PRINCIPLES DERIVED FROM ECHINODERMS

*S.L. PRIESS, U.S. Navy, Medical Research Inst., Washington - Bethesda, Maryland (PO)*

This work unit involves the study of the neuropharmacologic, enzymatic, and toxicologic properties of biologically active principles elaborated by marine animals and plants. Primary emphasis is directed to those natural products and their derivatives which exert blocking actions in mammalian neuromuscular tissues, or which appear to exert specific actions at chemoreceptor systems controlling behavioral responses to stimuli. Holothurin A, an extremely toxic substance extracted from the Bahamian Sea cucumber is the primary subject of these studies, while other toxins extracted from related Echinoderms are being compared pharmacologically.

Operational difficulties created by noxious marine animals point to the need to become knowledgeable about biologically active substances from the sea. Very little is known about the substances, many of which are very different from terrestrial toxins. Personnel in survival, operational, or recreational situations must be warned of the presence and behavior of dangerous local animals, antidotes, and treatment techniques must be developed. Since the producers of the toxins appear to use them against enemies they serve as a likely source of information about protective chemicals and repellents, especially against sharks.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0118, ELASMOBRANCH PHARMACOLOGY

*S.L. SCHWARTZ, U.S. Navy, Medical Research Inst., Washington - Bethesda, Maryland (PO)*

This research program is a pharmacological survey of the elasmobranchs. Primary emphasis is on the actions of drugs and the consequences of their various means of administration on sharks. A comprehensive array of drug depressants and stimulants is being evaluated for their effects on the central, autonomic, and peripheral somatic nervous systems of sharks, as well as the cardio-vascular complex. Concurrently, the drug and stress-induced reactions of the study animals will be described as a function of the variation in their biochemical profile.

There exists a continuing need for knowledge of the many noxious marine animals encountered in Naval operations. Particularly important in this regard is the requirement for wide ranging studies on shark biology. Protection of Naval personnel from predacious shark activities and the related search for an improved shark repellent necessitate comprehensive data on the reactions of these animals to chemical and physical stimuli. Additionally, the increasing numbers of scientists who are utilizing sharks as study animals in Naval medical research relating to normal and abnormal human physiology and biochemistry point up the need for foundation studies such as this one.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0119, ELASMOBRANCH PHARMACOLOGY

*S.L. SCHWARTZ, U.S. Navy, Medical Research Inst., Washington - Bethesda, Maryland*

## 6. PUBLIC HEALTH AND SAFETY

This research program is a pharmacological survey of the elasmobranchs. Primary emphasis will be on the actions of drugs and the consequences of their various means of administration on sharks. ### 6.0120, MONITORING OF PESTICIDE LEVELS IN THE GREAT LAKES

R. REINERT, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

A monitoring program to measure levels of insecticides in various species of fishes and water from each of the five Great Lakes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

### 6.0121, COMPARATIVE STUDIES OF DINOFLAGELLATE TOXINS

J.J. SASNER, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

The proposed research program will attempt to elucidate the physiological and pharmacological effects of several naturally occurring marine dinoflagellate biotoxins. Primary objectives are; 1) to culture several toxin producing dinoflagellate species in the laboratory; 2) to concentrate these cells, extract and accumulate the harmful materials; and 3) to test, in a comparative manner, their effects on living systems, particularly nervous and muscle tissues. The primary goal is to study the deleterious effects of these microorganism products on the electrogenic properties of excitable systems; including resting and action potential in nerve and muscle and parameters of contraction and tension development in muscle. Both vertebrate and invertebrate nerve-muscle systems will be tested. Similar experiments, comparing neurogenic and myogenic cardiac systems, are planned. In general, comparative studies will include the testing of toxins on invertebrate organisms, particularly Molluscs and Crustaceans which, in nature, are subject to the effects of dinoflagellate 'blooms'.

The association of paralytic shellfish poisoning and ciguatera-like poisoning with substances produced by marine dinoflagellates has closely linked commercial fisheries research with that of public health. Relatively recent chemical and biological findings concerning this association will now permit studies of the comparative effects of these naturally occurring biotoxins, as well as their specific site(s) and mode(s) of action. It is toward this understanding that this research proposal is intended.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0122, STUDIES ON PHARMACOLOGICALLY ACTIVE COMPOUNDS DERIVED FROM MARINE ORGANISMS

R.F. NIGRELLI, New York Zoological Society, New York, New York

Chemical and pharmacological characterization of antibacterial, anti-viral, antitumorous, nerve-blocking and other metabolic regulating substances derived from marine organisms.

SUPPORTED BY John A. Hartfo Foundation Incorporated

### 6.0123, NEW DRUGS FROM THE SEA, ESPECIALLY ANTIBIOTICS

P.R. BURKHOLDER, Columbia University, Graduate School, Palisades, New York 10964

Numerous kinds of marine plants and animals are being screened for antimicrobial properties and other kinds of biological activity. Crystalline compounds and oils have been isolated from marine algae and sponges and the chemical structures determined for some of them.

Research will continue mainly on the isolation and characterization of antimicrobial substances produced by marine flora and fauna in the Caribbean Sea and in the Pacific Ocean.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0124, STUDY OF TOXIN SYNTHESIS IN PRYMNESIUM PARVUM

G.M. PADILLA, Duke University, School of Medicine, Durham, North Carolina 27706

To establish axenic cultures of marine and fresh water algae that yield toxins of potential health hazard in order to study the factors which govern the growth and toxigenesis of such organisms. To continue investigations on the cellular localization of toxin synthesis in the euryhaline flagellate *Prymnesium parvum* by density gradient ultracentrifugation and extend such studies to representatives of dinoflagellates, such as *Gonyaulax* and *Gymnodinium*. Lastly, to develop physiological and chemical assays of such toxins to determine their mode of action, chemical identity, and potential use as pharmacological agents.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0125, UTILIZATION AND PREPARATION OF FISH PROTEIN CONCENTRATE

J.E. LANGLER, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: (1) To develop nutritive fish protein concentrates suitable for use in human diets, (2) To nutritionally evaluate fish protein concentrate, (3) To investigate the basic chemistry of fish protein concentrates. (4) To investigate, develop and/or improve products utilizing fish protein concentrate that are aesthetically consistent and of acceptable flavor to the ethnic and national groups intending to use fish protein concentrate in their diets. A fish protein concentrate (FPC) will be developed that is suitable for use in human diets. Experiments will be conducted to evaluate and expand basic knowledge concerning the chemistry and nutritive value of FPC. New and/or existing products will be investigated utilizing FPC as a source of protein. Especially efforts will be directed toward the development of food products that will be acceptable to those in the developing nations who are desperately in need of nutritive proteins in their diets.

SUPPORTED BY Oregon State Government

### 6.0126, MARINE ANIMAL USE IN THE STUDY OF HEALTH PROBLEMS

I. PRATT, Oregon State University, Graduate School, Corvallis, Oregon 97331

The proposed work is subdivided into 3 parts:

Ivan Pratt will work on the life cycle of a hemiurid trematode, *Tubulovesicula lindbergi* and start or continue several other trematode and acanthocephalan ecology studies.

Austin Pritchard will study the metabolism of intertidal molluscs and crustacea by varying oxygen tension, temperature and other ecological factors.

Frederick Hisaw, Jr. will work on the isolation and effects of various hormones or hormone-like substances found in fish, tunicates and echinoderms.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6.0127, CONTROL OF PLANT PATHOGENS USING ACTIVE ANTIMICROBIAL SUBSTANCES ISOLATED FROM MARINE ALGAE

N.G. NADAL, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

## 6. PUBLIC HEALTH AND SAFETY

Description of Work: Sarganin complex purified from crude extracts of *Sargassum natans*, *Chondria littoralis*, *Cymopolia barbata* will be separated in A and B fractions by paper chromatography. Their effect (using bioautographs) will be studied on such plant pathogens as *Fusarium* of tobacco and coffee, *Cercospora* of tobacco, coffee and banana, *Alternaria* of tobacco and *Pseudomonas* on tomatoes. Dose response curves will be drawn. Synthetic and natural medias (plant tissue extracts) will be evaluated as well as the effect of nutrition on pathogenicity of the organisms. Evaluation will be made using antibiotics (cycloheximide, antimycin and streptomycin) as control standards.

SUPPORTED BY Puerto Rico Government

### 6.0128, ACTIONS OF BIO-TOXINS ON CELL MEMBRANES

M.H. EVANS, Agric. Research Council, Cambridge, United Kingdom

It is proposed to determine, as a first stage, how many so-called 'neurotoxins' of animal origin (snake and other venoms, tissues of poisonous animals and toxins produced by marine organisms) have specific actions upon the nervous and muscular systems of higher vertebrates. If modern neurophysiological research techniques confirm that a poison has a specific neurotoxic action, then that poison will be subjected to a more detailed analysis to try and determine the site and mode of action, in the hope that some of these poisons may prove to be useful tools for the physiological research, or may have valuable therapeutic applications.

Some progress in this direction has already been made in the case of some relatively simple stable substances such as Tetrodotoxin and Saxitoxin. As these two poisons are now available in pure form it is proposed to subject their actions on nerve and muscle cell membranes to further detailed electrophysical analysis.

Concurrently, the more complex protein types of toxin, especially the venoms of some snakes (*Crotalus*, *Naja* and *Notechis* species) scorpions (*Androctonus*, *Buthus* and *Centruroides* spp.) and spiders (*Atrax* and *Latrodectus* spp.) will be studied with the intention of determining whether their reported neurotoxic actions are due primarily to some specific toxic constituent or are more general consequences of their enzymatic activity.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

### 6D. SAFETY AT SEA

(navigation Safety; Shark Attacks.)

### 6.0129, SURVIVAL CRAFT DRIFT AND LEEWAY

R.C. CLASBY, U.S. Dept. of Transportation, Oceanographic Unit, Washington, District of Columbia

This project is an attempt to determine the effects of wind and sea surface currents on various types of survival craft. The data will be used to update the drift and leeway tables presented in the National Search and Rescue Manual (CG-308).

The project was initiated in FY-68 and will be a continuing project at this Unit.

During the studies buoy-surface current meter systems, with a wind recorder, will be implanted. An 'over-the-side' deck recording current meter will be used, and surface drogues tracked. Various types of life rafts will be used. No oceanographic casts will be made during any of the cruises.

This project is designed to provide a controlled experiment from which data concerning the direct effects of surface currents and wind on various types of survival and small craft can be obtained. This data can then be used to up-date the drift and leeway tables in the Coast Guard Search and Rescue Manual resulting in an increase in search accuracy. The tables now used were prepared during the late 1940's and are very general in scope, having been based on observations with small life rafts at low wind velocities.

Surface currents will be determined from a stationary buoyed current meter and surface drogues. Surface winds will be determined from a wind recording system also mounted on the buoy. The test craft will be equipped with radar transponders and radar reflectors to facilitate tracking. Positions of underway targets will

be referenced to two stationary radar targets, i.e. Nantucket Light Vessel and the instrumentation buoy.

SUPPORTED BY U.S. Dept. of Transportation - Coast Guard

### 6.0130, SEARCH AND RESCUE - U.S. COAST GUARD

A.E. KARP, U.S. Dept. of Transportation, Coast Guard, Washington, District of Columbia 20591

The objective of this project is to provide consultants to assist with problems concerned with locating and rescuing victims of marine accidents. These services will include definition of Operations Research Studies and aid in monitoring such studies.

SUPPORTED BY U.S. Dept. of Commerce - N.B.S.

### 6.0131, DIVER NAVIGATION DEVICE

F.J. ROMANO, U.S. Navy, Ship Systems Command, Washington, District of Columbia 20360

Objective: Provide an accurate means of navigation for the individual diver. Swimmer missions require precise navigation. Insure location of the objective in restricted visibility water.

Equipment fulfilling this need must be extremely compact, neutrally buoyant and easily handled by a swimmer and yet provide reliable navigation data regardless of adverse conditions. The system or systems must withstand the environmental conditions imposed.

Approach: Through industry or Navy labs a model of an active self-contained navigation device will be constructed to demonstrate feasibility applied to individual swimmer navigation. This system will include a total depth recorder for bottom profile mapping, and thus provide a complete device specially suited for the navigation problem in the inshore area. The device will present and record course, drift angle and distance traveled information to the swimmer plus providing a permanent record of total water depth.

SUPPORTED BY U.S. Dept. of Defense - Navy

### 6.0132, STUDIES OF SHARK REPELLENTS AND OTHER ANTI-SHARK MEASURES

H.D. BALDRIDGE, U.S. Navy, Aerospace Medical Center, Pensacola, Florida 32512

The purpose of this project is the development of reliable assay procedures for determining shark repellent activity with a low dependency on subjective observations. Supportive field and laboratory research is being carried out in the areas of buoyancy-maneuverability and drug exposure dynamics as physical and chemical factors affecting shark behavior.

One section of the Noxious Marine Animal Program is concerned with the biology of sharks. Sharks pose a physical, as well as psychological, hazard to personnel in the sea for operational or recreational purposes. They may also cause the loss of moored and floating equipment because they are capable of biting through cable and puncturing flotation gear. In order to develop effective shark repellents and survival techniques, therefore, it is necessary to determine the dynamics, mode, and limits of action of physico-chemical factors in the natural or induced field environment which influence these animals.

SUPPORTED BY U.S. Dept. of Defense - Navy

## 6E. WATER QUALITY AND POLLUTION

(waste Disposal Effects; Pollution Identification, Monitoring, and Movement. See Chapter 5 For Effects on Non-humans and Chapter 8m For Engineering Aspects.)

### 6.0133, FATE OF INLAND DERIVED POLLUTANTS IN AN ESTUARY

P.B. MEDZ, Univ. of Alaska, U.S.D.I. Alaska Water Lab., College, Alaska 99735

Organics and inorganics in an estuary have both marine and ground and surface water resources. The changes occurring to inland originating organic and inorganic pollutants as they enter the estuarine environment and the determination of their impact on

## 6. PUBLIC HEALTH AND SAFETY

the biota of the estuary will be investigated. The overall objective is to isolate sources of pollutants that have an unfavorable effect upon the estuarine environment and through a systems analysis to determine how these pollutants can most effectively be removed from the water system.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0134, RELATIONSHIP BETWEEN GLACIAL FLOUR POLLUTION AND POLLUTANTS FROM OTHER SOURCES

*D.L. WOLF*, Univ. of Alaska, U.S.D.I. Alaska Water Lab., College, Alaska 99735

In the heavily glaciated areas of Southeast Alaska glacial silt is washed into the estuaries in large amounts. Industrial wastes from the paper pulp and canning industries and domestic and marina sewage could interact as floatation and foaming agents with this finely divided silt. The nature of this interaction, the susceptibility of the adsorbed organic pollutants to stabilization by the estuarine biota, the effect of this pollution floated silt on the estuarine biota, and the ability of the silt to coagulate and settle with adsorbed pollutants will be studied and methods will be developed to prevent glacial flour-organic pollutant interactions that have been shown to be unfavorable.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0135, HISTORICAL STUDY ON EFFECT OF HARBOR DREDGING ON THE ENVIRONMENT (ENVIRONMENTAL FACTORS PERTINENT TO EFFECTS ON MARINE ENVIRONMENTS)

*M.J. CRUICKSHANK*, U.S. Dept. of Interior, Marine Min. Technol. Ctr., Belvedere - Tiburon, California 94920

The methods used in mining a marine mineral deposit will have an effect on the efficiency of mining and also on the surrounding environment. The nature of the excavation, the disposal of the barren material, and the general disturbance of the area, will each present its own problems.

Such problems must be studied from the point of view of the exploiter and of the conservationist.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

### 6.0136, SAN PABLO BAY STUDY

*F.A. NUDI*, U.S. Dept. of Interior, Tiburon Marine Lab., Belvedere - Tiburon, California 94920

Objectives: To determine the effects on marine life caused by increased dredging and spoil disposal by the Army Corps of Engineers at pre-selected areas in San Pablo Bay in cooperation with U.S.B.S.F.W. River Basins.

Procedure: Monthly sampling will be made for the collection of water samples and marine organisms at five separate areas involving twelve station from Tiburon Peninsula to Carquinez Strait. Sampling areas include past, present and future dredged and spoiled areas as well as areas yet undisturbed. The type of sampling to be done will include trawling with a 15-foot otter trawl to determine the abundance and distribution of benthic swimming animals, bottom samples taken with a Birge-Ekman dredge to determine the types and abundance of smaller, more sedentary benthonic animals and water samples taken at surface and off-bottom to measure the temperature, and dissolved oxygen present.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

### 6.0137, EDDY DIFFUSION AND BACTERIAL REDUCTION IN WASTE FIELDS

*J.E. FOXWORTHY*, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The principal objectives of the proposed work are: 1. To further demonstrate the applicability of previously proposed continuous volume source diffusion models to the dispersion of conservative tracer dye and bacteria within surface waste fields in the sea. 2. To ascertain the effect of the type of submarine outfall on the rate of dispersion of tracer dye and bacteria. 3. To determine, under field conditions, the rates of disappearance of coliform and

Fecal Streptococcal Group bacteria. 4. To investigate the effect of vertical mixing combined with radiant energy (sunlight) on bacterial disappearance in surface waste fields.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0138, ULTRAVIOLET ABSORPTION IN COASTAL WATERS

*R.B. TIBBY*, Univ. of Southern California, Graduate School, Los Angeles, California 90007

The proposed work revolves around the basic hypothesis that UV absorbance is a quantitative measure of the extent and dilution of a marine sewage field and that it is directly related to organic load and may be a better index to organic load than BOD.

Improved methods developed during the past year for determining dissolved, particulate and total carbon, and for separating the contributions of organic and inorganic constituents of the waste field and of the background waters, now will be applied in situ and in conjunction with the routine monitoring programs of selected waste disposal agencies in Southern California whose discharge is subject to primary, secondary, or tertiary treatment.

The procedures also may provide information on the rates of biodegradation in the marine environment.

Present studies on the productivity of phytoplankton and benthic algae by oxygen evolution and isotopic carbon uptake will be continued, and will be correlated with the release of extracellular metabolites as determined by UV absorbance.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0139, WATER QUALITY AND NUTRIENTS, SACRAMENTO-SAN JOAQUIN RIVER SYSTEM

*W.D. SILVEY*, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with the State of California. The total project is to provide the knowledge needed to avoid excess blooms of tidal plankton and undesirable concentrations of dissolved oxygen by determining the relationships between nutrients, tidal plankton, dissolved oxygen, and fish in this estuarine environment. The water quality aspects of the study includes source and concentration of both organic and inorganic constituents in waters in the delta system together with pertinent physical characteristics

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

### 6.0140, EFFECTS OF WATER POLLUTION IN SAN FRANCISCO BAY

*R.K. LINSLEY*, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

1. To determine how people are affected by water pollution in San Francisco Bay. 2. To estimate the number of people affected in various ways by water pollution in the bay. 3. To measure attitudes toward water pollution in the Bay. 4. To determine where people acquire information about pollution in the Bay. 5. To determine what actions of adjustment (substitution, curtailment of activity, reduction in frequency of participation, etc.) are taken by people as a result of water pollution in the Bay. 6. To obtain data that could be used in an assessment of the economic value of water pollution control measures, especially the value of recreational activities and esthetics.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

### 6.0141, POLLUTION STUDY OF THE VENICE DISTRICT CANAL

*W.A. ANIKOUCHINE*, Oceanographic Services Inc., Santa Barbara, California 93105

Study conducted in a 90-foot scaled hydraulic model of the canal.

SUPPORTED BY Los Angeles City Government - California Koebig & Koebig, Inc.

## 6. PUBLIC HEALTH AND SAFETY

### 6.0142, EFFECTS OF HEATED WATER DISCHARGE ON THE MARINE ENVIRONMENT

*D.D. POLLARD*, Oceanographic Services Inc., Santa Barbara, California 93105

OOONO SUMMARY HAS BEEN PROVIDED TO THE SCIENCE INFORMATION EXCHANGE

SUPPORTED BY Redondo Beach City Government - California

### 6.0143, ORGANIC DEBRIS ON CONNECTICUT BEACHES AND SHORES

*R. BENOIT*, General Dynamics Corporation, Groton, Connecticut

General field surveys of selected sites are made. The quantity and identity of beach debris present in significant amounts is determined. Water characteristics (temperature, dissolved oxygen, salinity, turbidity) are determined. The origin of the debris is determined if possible. The microbial flora of water, sand, mud, and debris are determined in relation to the mode of decomposition of the debris.

SUPPORTED BY Connecticut State Government

### 6.0144, STUDY OF EFFECTS OF OFFSHORE DUMPING

*T. SAVILLE*, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Study will be made of the effects on the local environment of the offshore dumping (under Corps of Engineers permit) of such things as sewage sludge, cellar dirt, and acid wastes. Study will include circulation and dispersion patterns, and changes in bottom characteristics, and collection of bottom organisms. Data are planned for eventual interpretation in terms of effects on biota. Initial work will be done in the New York Bight.

SUPPORTED BY U.S. Dept. of Defense - Army

### 6.0145, EFFECTS OF HEATED WATER IN A TIDAL ESTUARY

*R.L. CORY*, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia
