## THE NATIONAL COUNCIL ON MARINE RESOURCES AND ENGINEERING DEVELOPMENT

The National Council on Marine Resources and Engineering Development was established within the Executive Office of the President in June, 1966, under Public Law 89-454, which declared it to be "the policy of the United States to develop, encourage, and maintain a coordinated, comprehensive, and long-range national program in marine science for the benefit of mankind to assist in protection of health and property, enhancement of commerce, transportation and national security, rehabilitation of our commercial fisheries, and increased utilization of these and other resources."

The Act provided for a cabinet-level Council composed of heads of those departments and agencies having statutory missions to engage in oceanographic research and exploration, and it designated the Vice President to serve as chairman. The duties of the Council established by the Act are to assist and advise the President to:

(1) survey all significant marine science activities, including the policies, plans, programs, and accomplishments of all departments and agencies of the United States engaged in such activities;

(2) develop a comprehensive program of marine science activities, including but not limited to exploration, description and prediction of the marine environment, exploitation and conservation of the resources of the marine environment, marine engineering, studies of air-sea interaction, transmission of energy, and communications, to be conducted by departments and agencies of the United States, independently or in cooperation with such non-Federal organizations as States, institutions and industry;

(3) Designate and fix responsibility for the conduct of the foregoing marine science activities by departments and agencies of the United States;

(4) insure cooperation and resolve differences arising among departments and agencies of the United States with respect to marine science activities under the Act, including differences as to whether a particular project is a marine science activity;

(5) undertake a comprehensive study, by contract or otherwise, of the legal problems arising out of the management, use, development, recovery, and control of the resources of the marine environment;

(6) establish long-range studies of the potential benefits to the United States economy, security, health, and welfare to be gained from marine resources, engineering, and science, and the costs involved in obtaining such benefits;

(7) review annually all marine science activities conducted by departments and agencies of the United States in light of the policies, plans, programs and priorities developed pursuant to this Act;

(8) coordinate a program of international cooperation in work done under the Act, pursuant to agreements made by the President with the advice and consent of the Senate;

(9) prepare a report, as assigned by the President, to be transmitted to the Congress in January of each year which shall include (1) a comprehensive description of the activities and the accomplishments of all agencies and departments of the United States in the field of marine science during the preceding fiscal year, and (2) an evaluation of such activities and accomplishments in terms of the objectives set forth pursuant to the Act.

Under the National Sea Grant College and Program Act of 1966, P.L. 89-688, the Council was assigned the additional responsibilities, as the President may request, to: (1) advise the National Science Foundation with respect to policies, procedures, and operations of the Foundation under the Act; (2) provide policy guidance to the Foundation with respect to contracts or grants in support of the program; and (3) submit an annual report on its activities and recommendations on this program to the Speaker of the House of Representatives, the Committee on Merchant Marine and Fisheries of the House of Representatives, the President of the Senate, and the Committee on Labor and Public Welfare of the Senate.
