ABSTRACT The English-language literature since 1950 was searched to gather published reports of abstracting and indexing rates and costs, and cost figures for the complete preparation of secondary publication. The search located relevant information for 24 abstract journals and 3 citation services, 18 abstracting cost figures, and 41 indexing cost figures. These reported figures were extracted with text or other amplifying comment and tabulated, with reference made to the included 79-item bibliography. Unit costs per bibliographic item were cited or computed. These data were plotted to detect possible patterns or trends. The reported unit costs for preparation of the secondary services were adjusted for 1968 dollar value and were plotted by number of items cited annually. Abstracting costs and indexing costs were each plotted chronologically, and then in rank order with dollar value adjustments. Abstracting and indexing rates were plotted. The plots serve to illustrate the scattering of the data and emphasize the problem of drawing generalizations from the existing data. (Author)

## Abstract

The English-language literature since 1950 was searched to gather published reports of abstracting and indexing rates and costs, and cost figures for the complete preparation of secondary publication. The search located relevant information for 24 abstract journals and 3 citation services, 18 abstracting cost figures, and 41 indexing cost figures. These reported figures were extracted with text or other amplifying comment and tabulated, with reference made to the included 79-item bibliography. Unit costs per bibliographic item were cited or computed. These data were plotted to detect possible patterns or trends. The reported unit costs for preparation of the secondary services were adjusted for 1968 dollar value and were plotted by number of items cited annually. Abstracting costs and indexing costs were each plotted chronologically, and then in rank order with dollar value adjustments. Abstracting and indexing rates were plotted. The plots serve to illustrate the scattering of the data and emphasize the problem of drawing generalizations from the existing data.

## BACKGROUND

This report is meant to be a comprehensive compilation and review of the literature relating to the costs of abstracting and indexing -- both for the whole system of preparing and distributing an abstracting, reviewing, or indexing publication, and for the abstracting and indexing alone. This work builds and expands upon the review work done earlier by Landau,<sup>40</sup> Schutze,<sup>62</sup> and Stevens.<sup>67</sup> This report provides a complete bibliography of the relevant works that were identified, and also extracts and summarizes much of the data given in these reports.

The coverage for this report was restricted to the English-language literature from 1950 to the present. We emphasized the coverage of those publications that reported their actual experiences with abstracting and indexing operations. The data given in those publications was extracted and summarized in this report as given in or inferred from the original publications. The given data were plotted as a function of the year reported. In addition, the cost data for each year were normalized to the accepted 1968 consumer dollar, which was the one modification we felt could be made without additional information.\* Aside from making this adjustment for the dollar inflation over the years, we made no attempt to normalize or in any other way modify the reported data, although such modifications might have been appropriate in order to do such things as standardize the treatment of general overhead costs.

Almost every one of the original reports was concerned with the processing of scientific or technical literature, in the usual forms of articles, patents, reports, and so on. In that regard, the reported data can be considered to be on a somewhat comparable basis.

Most of the cost reports were incomplete or faulty in some respect. This naturally limited the utilization and extension of the data provided.

---

\* Based on U.S. Department of Labor, Bureau of Labor Statistics, Consumer Price Index. 1970 World Almanac, p. 96.

These difficulties are discussed in more detail in later sections of this report.

Some of the data reported for a given service by several sources was contradictory. Examples of some of this can be seen in the tables of this review. In these cases of duplicate reporting, it is probable the included factors differ, and because we cannot standardize these factors, each report is taken as provided.

Some data was also obtained from personal communications in order to provide supporting information and a fuller context for the data from the literature. Letters were written to many of the abstracting and indexing services, requesting rate and cost data that could be used for this review; however, most of these services either ignored the request or said that the data was unavailable.

## I GROSS COSTS TO PROVIDE SECONDARY SERVICES

The literature covered in this section relates to the total cost to provide a secondary publication service. This is defined to be a service that reviews source literature; prepares a bibliography, index, abstract, or review publication; and distributes that publication to a number of recipients. This definition includes the familiar secondary services such as Biological Abstracts and Index Medicus, as well as some lesser-known examples. This can include in-house publications as well as publications that receive more extensive distribution.

The reader of this section is cautioned to refrain from making too literal an interpretation and comparison of the data reported here. This data can provide only order of magnitude estimates of the costs of a secondary service, rather than absolutely precise figures. Further detailed study is necessary to develop cost data that would be more exact and directly comparable. The assumption of the present work is that any specific comparison is suspect, but that there is some validity in the total compilation.

The data in the original reports have been used in this summary to derive a gross cost per bibliographic item processed. In some cases, a gross unit cost was given in the literature; for other cases this was computed by taking the reported total annual cost of a given service, and dividing it by the total number of unique bibliographic items (articles, reports, books, patents, etc.) published by that service during that year. These computed gross unit costs are indicated in parentheses, and must be used with at least as much caution as cost figures provided directly by the services, because they lack verification. Each unit cost figure for a given year represented a single case history data point for this review. For several secondary services, it was possible to obtain such a cost figure for several different years. The data gathered in our search, as reported and as computed from the reports, is shown with text and references in Table I.

There are many differences in the methods used by various services to report their costs, making it hazardous to draw direct comparisons

of the figures reported for different services. Most of the difficulties stem from differences in what cost elements are included in the costs reported by the various services. The following factors contribute to the difficulty of comparing the services' unit costs, or of considering them to be the exact costs of production:

- . Some services use volunteer or near-volunteer labor, others have to pay all the contributors
- . Some services have to pay for the source materials, many do not because they use the library services of a cooperating institution
- . Some services have research and development costs that may or may not be included in the reported expenses
- . Some services may have special non-recurring costs (e.g., purchase of new equipment, file conversions, special development efforts)
- . Some services have subsidies in the form of staff, office space, printing, mailing, R&D grants, or other services that are provided by another organization and may not be included in the reported costs
- . Some services, particularly in recent years, have developed a mix of publication processes and information services that make it difficult to assign a cost to separate parts or services. A good example is the difficulty of assigning a gross unit cost to Chemical Abstracts, when the same large production facility also provides Chemical Titles, Chemical-Biological Activities, and other secondary publications; magnetic tape services; chemical compound searches; reference handbooks; and the compound registry system
- . Services differ in printing (type of composition and printing, number of copies) and distribution (e.g., first class, book rate, government franked mail) expenses
- . Some services report employee benefits and overhead costs, others do not
- . There are variations in the type of abstracting provided (e.g., copy from other service, annotation, author abstract, new abstract, critical review)
- . There are variations in type (KWIC, deep indexing with controlled vocabulary) and amount of indexing provided (indexes with each issue, quarterly, annual, 5-year cumulations; indexing by author and the usual access points, or special indexes such as chemical formula or notation indexes)

There are differences in the data due to different dates of reporting (1950 vs. 1970 data) with the changing salary rates, techniques, as well as changing value of the dollar

The gross unit costs for more than 20 services, as extracted from the literature or obtained by the methods described earlier, are summarized in Fig. I-1 as a function of the annual production volume of items of each service, and adjusted to 1968 dollar values. The symbols used in this and other figures are identified in the tables associated with the figures. Reported costs for the bibliography or title listing services ranged from \$2.18 to \$2.24 per citation; when adjusted to equivalent 1968 dollar values, the unit costs ranged from \$2.58 to \$2.63 per citation.

Reported costs for abstracting services were generally higher, ranging from \$1.59 to \$57.96 per abstract. When adjusted to equivalent 1968 dollar values, the unit costs for abstracting services ranged from \$2.30 to \$57.96 per abstract.

There are too many differences in the data points (e.g., single points vs. several points for the same service, old data vs. current data, large volume production vs. small volume production, volunteer abstractors vs. paid abstractors) to make it particularly meaningful to talk of mathematical averages of all of this data. Further study is necessary in order to assemble these data points into major parametric or comparable groups, and perhaps make some adjustments to them before any meaningful "average" figure could be developed. At this point, the only valid generalization that can be made is that the gross unit cost to provide an abstracting service is likely to be in the range of \$5-30 per abstract.

For those services for which more than one data point was available, no clear pattern emerged regarding the unit cost as a function of the calendar year or volume of coverage. For some services, the unit costs generally increased each year; but for some services it generally decreased each year. For some services, the unit costs increased as the service processed a larger number of items; but for some services the unit costs decreased with increasing volume of coverage. There was insufficient data to make a valid generalization on these points.

## II RATES AND COSTS OF THE ABSTRACTING PROCESS

Those publications that reported the rates or costs of the abstracting process by itself, independent of the other costs of running an abstract service, received a separate analysis and review. These source reports also suffer from the same inexactness and incompleteness of reporting that was described in the previous section. Consequently, the reported rates and costs should be reviewed carefully before making direct comparisons.

The rates and costs reported for the abstracting process are given in Table II. Some of the reports included data on both indexing and abstracting, and for some of these it was not possible to separate the rates or costs of each process. For those instances in which the abstracting and indexing rates or costs could not be separately identified, the total cost was used and appropriately identified as a combination of both.

The abstracting costs in 19 reports ranged from \$0.43 to \$13.00 per abstract (excluding a special case of \$250 per abstract); with most of the costs clustered between \$2-8. This costs data is summarized in Fig. II-1 as a function of the year of the reported data. The normalized data are plotted in Fig. II-2. There is considerable variation in the reported data, and a mathematical average would not have much meaning for this mix of data (because of the combinations of reported ranges vs. single points, large samples vs. small samples, single vs. multiple points from the same facility, abstracting only vs. abstracting plus indexing). However, an estimated "average" or representative cost would seem to be about \$5 per abstract.

Only five abstracting rates were found in reports: 4-8; 6-7; 8; 10; and 8-16 abstracts per man-day. These are illustrated in Fig. II-3. Based upon this data, a representative or "average" rate for the abstracting effort would seem to be about 8-9 abstracts per man-day.

### III RATES AND COSTS OF THE INDEXING PROCESS

Reports of the rates or costs of the indexing process itself received a separate analysis and review. As with the abstracting reports, these also suffered from incompleteness and variances in reporting. Consequently the reported data should be reviewed with care before making direct comparisons. There were many more reports regarding indexing data than there were for the abstracting data. The rates and costs reported for the indexing process are summarized in Table III.

The indexing costs reported for more than 20 case studies ranged widely from \$0.23 to \$250 per indexed item, with most of the costs clustered between \$1-20 per indexed article or report. This reported cost data is summarized in Fig. III-1 as a function of the year of the reported data. The same data, adjusted to the 1968 dollar values, are shown in Fig. III-2. Even disregarding the extreme points, there is still a very wide distribution of reported costs, with most of the data falling between \$1-20 per indexed item. The differences would seem to be due largely to differences in basic factors such as type and depth of indexing, degree of vocabulary control, and type of source material indexed. Further study is needed in order to sort out this data into more meaningful groups according to some of these factors. It would be misleading to postulate any "average" indexing cost from the data assembled here.

The indexing rates reported for more than 20 case studies ranged widely from 2.4 to 160 indexed reports or articles per man-day. These rates are illustrated in Fig. III-3 as a function of the year of the reported data, and in Fig. III-4 in rank order. As with the indexing cost data, there is still a wide variation in the values of the reported indexing rate data, and probably for the same reasons described for the cost data. Most of the data falls in the range of 8-30 indexed reports or articles per man-day. As with the indexing cost data, further study is needed to group these case histories into major parametric groups, and any statement of "average" indexing rate would be misleading for this mix of data as reported here.

**SUMMARY**

The costs reported for abstracting and indexing services and processes were described in earlier sections, and are summarized below:

**Gross Unit Costs to Provide Secondary Services (cost per abstract or citation)**

	<u>Number of Services Studied</u>	<u>Range as Reported (\$)</u>	<u>Range as Adjusted to 1968 Dollar Value (\$)</u>	<u>Representative 1968 Cost (\$)</u>
Citation Services	3	2.18-2.24	2.58-2.63	2.60
Abstract Journals	24	1.59-57.96	2.30-57.96	5.-30.00

**Abstracting Process (cost per abstract)**

	<u>Number of Services Studied</u>	<u>Range as Reported (\$)</u>	<u>Range as Adjusted to 1968 Dollar Value (\$)</u>	<u>Representative 1968 Cost (\$)</u>
	14	0.43-250.00	.51-327.50	5.00

**Indexing Process (cost per indexed report or article)**

	<u>Number of Organizations Reporting</u>	<u>Range as Reported (\$)</u>	<u>Range as Adjusted to 1968 Dollar Value (\$)</u>	<u>Representative 1968 Cost (\$)</u>
	26	0.23-250.00	.28-327.50 (1-20 for most points)	--

The rates reported for the indexing and abstracting processes are summarized below:

	<u>Number of Reporting Organizations</u>	<u>Range of Rates</u>	<u>Representative Rates</u>
Abstracting	5	4-16 abstracts/man-day	8-9 abstracts/man-day
Indexing	20	2.4-160 indexed reports or articles/man-day (8-30 for most points)	--

The published accounts generally provided inadequate description and supporting details to permit direct comparisons or extensions of this data. Any further generalizations regarding rates or costs of abstracting and indexing must wait until the data itself can be studied in detail, or until arrangements can be made to work directly with some abstracting or indexing operations to collect their data in a systematic and consistent manner.

The authors are interested in continuing this investigation, and expanding their findings with additional data. Hence we would welcome receiving any additional reports or data on this topic that you might care to send to us.

(2.58) Costs include labor, equipment, supplies, printing, rentals, contract services, distribution costs. 50

(3.53) "In calendar year 1969, over 230,000 articles were indexed. Some of these were indexed commercially at a cost of about \$2.50 per article. Many were indexed by our own staff, at a per-article cost that appears somewhat lower, but perhaps only because it is non-comparable since it does not include an allocation of overhead costs. Finally, much of our indexing is now received at "no" cost to the U.S. Government, because it is received as a quid-pro-quo from institutions having the privilege of searching duplicates of our tapes ... The indexed citations are converted into machine readable form, partly by National Library of Medicine staff, and partly by a commercial contractor who charges \$1.26 per citation for keyboarding and proofreading. The citations that are input are used for Index Medicus, Cumulated Index Medicus, Abridged Index Medicus, 17 recurring bibliographies, published retrospective Literature Searches, as well as over 15,000 retrospective demand searches, and about 1,000 "S.D.I.'s." The indexing, keyboarding, and inputting costs far exceed the computer time costs, so the cost of Index Medicus depends primarily upon how one chooses to distribute these common costs among the products."

The estimate of \$3.76 was based on the sum of the highest unit cost for indexing, plus the machine input cost. No costs appear to be included for such things as maintenance of the subject heading list, overhead, computer processing, composition, printing, and distribution.

1968 Value	Comments	Refs.
(13.13) (12.49) (13.71) (13.80)	"Annual costs for publication of TAB and Indexes including Quarterly and Annual Indexes and the cost of announcing unclassified and unlimited documents in the USGRDR were: FY66 \$587,000 (47,891 items announced) FY67 601,000 (50,140 items announced) FY68 608,000 (44,333 items announced) FY69 674,000 (45,923 items announced)	1

Annually there are 24 issues of TAB, TAB Indexes, and USGRDR; three issues of Quarterly Indexes; and one Annual Index. Copy production averages 5,000 each."

(22.00)	"Our costs are usually based on the complete input cycle which includes examining the document for reproducibility and missing pages, checking for duplicates, descriptive cataloging, subject indexing, and abstracting. We would then keyboard the data for publication in the announcement journal. The cost per document involved in the above processing would amount to approximately \$13.50 direct plus \$8.50 for overhead. In most cases, abstracting costs would be included in the above costs as we are fortunate that over 90 percent of the reports we process have author abstracts. These are used in all cases and are only modified to meet certain criteria such as length and conversion symbols for acceptance by the computer. If it is necessary to write an abstract separately, the cost would be approximately \$8.00 direct plus \$5.00 overhead. This cost is based on writing an average of six to seven abstracts per day.	16a

Age per t or n (\$)	1968 Value	Comments	References
(18.69) (13.90)		Total costs for preparation, distribution, production.	44 44
(11.96)		Hypothetical abstract bulletin with 500 copies distributed weekly. This includes many factors such as subscriptions, abstracting, editing, supervising, indexing, typing, printing, mailing, and overhead. For this hypothetical bulletin, the author cites Ben Weil's lecture notes for Columbia and Rutgers.	25
(12.70)		Private communication to Friedenstein, describing costs of an abstract bulletin with 1,200 copies distributed quarterly. Cost factors such as abstracting, editing, supervising, indexing, typing, royalties, printing, mailing, and overhead are included.	25
(4.93)		Private communication to Friedenstein.	25
(11.64)		"A general average of \$10 per document processed (either abstracted or indexed or both) seems to be a reasonable estimate of unit costs, at least for the major U.S. services. Some of the smaller, specialized services are known to have costs as high as \$30 to \$50 per document. Unit processing costs have doubled in the last 12 years. Eighteen U.S. services, with budgets totaling \$7 million accounted for one-third of the two million documents processed in 1961 by 288 U.S. services in all scientific fields, making the average cost about \$10 per document."	53
(32.13) (8.03)		"The cost data suggest an average cost of \$30 for an abstract including the bibliographic citation and an average cost of \$7.50 for an item that is indexed but not abstracted. The average unit costs reported here are rough estimates. The data on which these estimates are based are extremely poor and do not allow comparisons between organization categories or between individual organizations."	71
(34.92) (11.64)		This report and a subsequent book version, reference an NSF/OSIS informal document, and say, "NSF states that for 1961 the estimated cost per abstract is \$30 and the estimate for an index or citation entry was \$10."	12,70

	Comments	Ref.
3-) 2) 0-) 5)	"An English-language patent can be abstracted in an hour or two." "... for patents, raw abstracts cost between \$2.00 and \$5.00, and the effort costs about \$3.80. The total cost, then, ranges from \$5.80 to \$8.80. Similarly for literature, raw abstracts cost between \$1.00 and \$3.00, and the effort is \$6.20 to \$8.20. Excluded in these figures are costs of journals, patents, paper, ink, machines, and equipment."	46
0)	Total contract cost is divided by the total number of reports "extracted" on this project by A. D. Little to establish a punched card file on the literature of explosives for Picatinny. "The total number of reports extracted at present is about 900 and the final figure should not exceed 1000. Dividing this by the total cost gives a cost per report of approximately \$250." Other estimates were computed on the basis of other factors. "Of these figures, the one based on the total project -- ... \$250 per report extracted -- are the most reliable, and are the ones used as a basis of comparison and analysis below." (Ref. p. 30)	68
2)	"... the cost of making the abstracts, classifying, proofreading, editing and indexing is about 5s. 8d. per abstract (9s. including overhead). A 1950 shilling was assumed to equal 14 cents.	29
1)	"The cost quoted for an abstract (1s.5d.) is somewhat misleading in that the total costs cover preparation and typing of original abstracts and also the reproduction of published abstracts. A more exact figure for the original abstract would be, perhaps, 3s. 6d. for the preparation plus 1s. for typing, and for the copying of a published abstract 9d. for typing." A 1960 shilling had a value of 12 cents.	72
15)	In-house abstract bulletin. "A recent cost survey which included time spent by abstractor, library staff, and departments responsible for mechanical processing resulted in an estimated \$1.50 per abstract."	45

	1968		
(4.70- 8.24)		"Similarly, a program at Esso Research and Engineering Company costs \$4 to \$7, exclusive of the expense of maintaining a reference pool of abstracts."	46
(3.00)		Indicative abstracts of new reports are prepared, and an average of 15-20 keywords are assigned to each report. "An eight to ten-line abstract is prepared. Author's summaries are taken into account, but not relied upon by the abstractors ... the average cost of indexing a report is approximately \$1, of which about 15s. represents technical effort in reading, abstracting, and allocating keywords; this figure excludes overheads ... An indexing time of half an hour to an hour is usual ..." The 1966 \$ had a value of \$2.80.	28
(8.23)		Cost per abstract (including labor and overhead, but no materials) to prepare in-house abstract bulletin and distribute in 200 copies.	27
(4.48)		"The average cost to prepare the unit record for a document and place it on the system library tapes is about \$4.00, which consists primarily of direct labor costs for professional and clerical efforts (less than 30 minutes each). Computer costs are virtually nil." (ref. p. 182) An average of 12 terms are assigned to each document. (ref. p. 178)	61
(9.26)		A 5 x 8 abstract card is prepared, but no mention is made of where the abstract comes from. "Indexing rate averages 2-7/8 document per hour." A cost breakdown for abstracting 1,920 documents showed a unit cost of \$8.20, without specifying what was included in that figure. A total of \$15.00 was given for all input processing and index production.	8
(14.04)		"Briefly, this index covers about 1,000 documents, each document being indexed under about 15 terms ... No master vocabulary was used, but an attempt was made to be consistent in assigning index terms. Terms were alphabetized, arranged, and printed by machine ... Abstracts are bound in separate volumes. The costs of abstracting and assigning coordinate terms (\$12,680), machine indexing (\$5,350), and reproduction (\$2,300) worked out to \$20.50 per document, which was believed to be exceptionally low." (ref. p. 192) "... our indexing rate averaged 2-7/8 documents per hour." (ref. p. 195).	4

1968 Value	Comments	Ref.
(0.81)	For indexing 2,000 documents, the following costs are given:	7
	Conventional UDC indexing £ 500	
	KWIC indexing on an in-house computer £ 200	
(0.32- 0.56)	KWIC indexing on a data center computer £ 350	
	No supporting evidence is given for these costs. The 1962 £ had a value of \$2.80.	
(3.00)	Indicative abstracts of new reports are prepared, and an average of 15-20 keywords are assigned to each report. "An eight to ten-line abstract is prepared ... Author's summaries are taken into account, but not relied upon by the abstractors ... the average cost of indexing a report is approximately £1, of which about 15s. represents technical effort in reading, abstracting, and allocating keywords; this figure excludes overheads ... An indexing time of half an hour to one hour is used ... The 1966 £ had a value of \$2.80.	28
(4.48)	"The average cost to prepare the unit record for a document and place it on the system library tapes is about \$4.00, which consists primarily of direct labor costs for professional and clerical efforts (less than 30 minutes each). Computer costs are virtually nil." (ref. p. 182). An average of 12 terms are assigned to each document. (ref. p. 178).	61
(75.82)	Costs include labor and machine rental.	78
(0.49)	"Three college juniors who both completed 3 or more years of chemistry ... were assigned the task of indexing ... they actually indexed 8,500 reports ... during the summer at a direct cost of \$3,328, or \$0.39 per report. Indexing was carried to an average depth of 12.2 locators per report ... the actual time required for the indexing was 1440 hours. The average indexing rate was 5.9 reports per hour ..." (The quoted labor cost is equivalent to \$2.31 per hour.) All of this indexing was done from the report announcement and abstract.	43
