ABSTRACT
        Originally designed to describe change in school
systems, a model for educational improvement is generalized here in
terms of university extension. An assumption is made that Extension
is also an open system, where an observable improvement process
occurs. The model permits an idea to be traced from the point where
it enters the system to where it becomes part of the organization's
action program. The flow may proceed through the stages of research,
development, diffusion, and on to adoption. An essential part of the
model is its social change mechanism which includes (in the case of
university extension systems) administrators, specialist staff,
program participants, and a governing board. An example illustrates
the importance of interaction between representatives of these groups
if commitment decisions are to be reached about improvements in the
system. (Four figures are included.)' (Author/LY)

STATEMENT OF FOCUS

The Wisconsin Research and Development Center for Cognitive Learning focuses on contributing to a better understanding of cognitive learning by children and youth and to the improvement of related educational practices. The strategy for research and development is comprehensive. It includes basic research to generate new knowledge about the conditions and processes of learning and about the processes of instruction, and the subsequent development of research-based instructional materials, many of which are designed for use by teachers and others for use by students. These materials are tested and refined in school settings. Throughout these operations behavioral scientists, curriculum experts, academic scholars, and school people interact, insuring that the results of Center activities are based soundly on knowledge of subject matter and cognitive learning and that they are applied to the improvement of educational practice.

This Theoretical Paper is from the Models for Effecting Planned Educational Change Project in Program 3. General objectives of the Program are to develop and test organizations that facilitate research and development activities in the schools and to develop and test the effectiveness of the means whereby schools select, introduce, and utilize the results of research and development. Contributing to these Program objectives, the main objective of the Planned Change Project is to develop and test system-wide mechanisms which local school systems can employ in utilizing knowledge and innovations of the type generated by the Center. Change-agent teams have been organized in area school systems and their effectiveness is being evaluated.

ABSTRACT

Important improvements within any organization require profound adjust-
ments throughout the entire system. The authors propose that the Model for
Educational Improvement is a suitable instrument for describing the change
process within the context of university extension systems. Originally
designed to describe the change process in school systems, the Model is
generalized here to describe the flow of the change process in an extension
system. In doing so an assumption is made that Extension is also an open
system, with a specific internal structure, where an observable improvement
process occurs. The Model permits an idea to be traced from the point where
it enters the system, to where it becomes part of the organization's action
program. The flow may proceed through the stages of research, development,
diffusion, and on to adoption. An essential part of the Model is its social
change mechanism which includes, in the case of university extension sys-
tems, administrators, specialist staff, program participants, and a governing
board. An example illustrates the importance of interaction between repre-
sentatives of these groups if commitment decisions are to be reached about
improvements in the extension system.

INTRODUCTION

Implementation of improvement within a university extension system requires the active involvement of many persons representing a wide variety of positions. The improvement process is complex, but it does occur. Ideas for improvement within the university extension system may be isolated and traced from the point where they are first introduced into the system, through their establishment as policy concerns, and on to the stage where they are implemented in program action. A model has been developed to describe the process of improvement. It is designed to graphically portray the human purpose, action, and interaction that occurs when a problem is identified and a solution sought, and when an idea for improvement moves from the point where it is identified as a possible solution to the point where it is adopted as a practice of the system. It is believed that this Model for Educational Improvement describes the social concept of educational improvement.

The model was originally designed to describe the improvement process in public schools. The same graphic structure may also serve to describe improvement in university extension systems. This transition requires the assumption that the process and the structure are generalizable across institutional lines. The assumption is made and appears viable.

ORIGIN OF THE MODEL

The Model for Educational Improvement is derived from two major sources of data: models for the change process developed by social scientists and field studies of change within school districts. Earlier models which contributed to the Model for Educational Improvement were those of Egon Guba and David Clark (Classification Schema of Processes Related to and Necessary for Changes in Education); R. L. Bruce (The Supply and Demand-Activated Extension Systems); Hendrick D. Gideonse (An Output-Oriented Model of Research and Development and Their Relationship to Educational Improvement); George Beal and Joseph Bohlen (The Diffusion Process); and Burton W. Kreitlow (Periods and Conditions in Community Change).

Attempts to validate the model were carried out in the context of a study of change within three experimental and two control school districts. Change Agent Teams were formed in each of the districts and the school improvement-oriented action was either observed or tape recorded for later analysis. This experimental setting was not established for the exclusive purpose of model-building. The experimental and control schools were formed in order to determine the differences in the improvement which might have resulted from "inputs" to the experimental systems by Wisconsin's Research and Development Center for Cognitive Learning.

Within the context of the school system are characteristic structural organizations and improvement processes which, the authors of this paper contend, are similar to the processes operating in university extension systems. It is the purpose of this paper to describe the model within the context of university extension.

STRUCTURE OF THE MODEL

Figure 1 is a representation of a three-dimensional conceptual schema of the university extension as a social system. It is an open system with access of resources "outside" and room for outsiders to get "inside." The internal structure is the area where the educational program takes shape and is accomplished. The "mechanism for change" within the space is that part of the regular internal structure of university extension where arrangements are made to meet the developing needs of the institution. This is the cauldron of change which every service-focused institution requires in order to function in a dynamic society. It is the social change mechanism within the university extension system.

Figure 2 on page 4 is an enlarged diagram of the central social change mechanism and is called the "Improvement Module." Its key ingredients are those human resources which have the greatest responsibility for positive production by the system. In university extension there

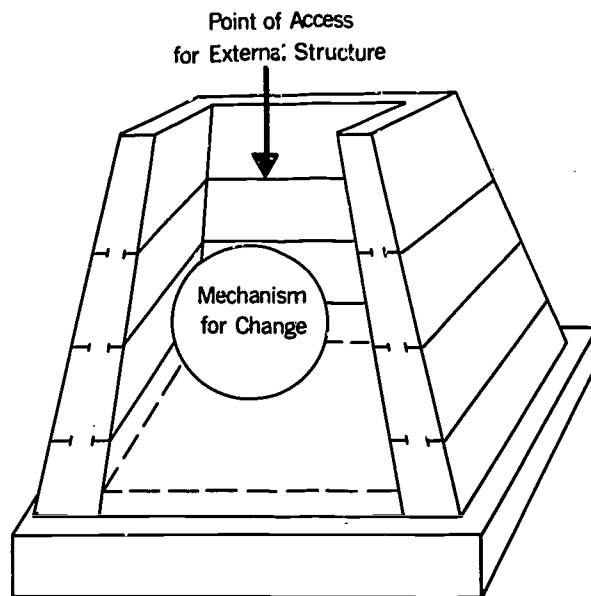

Fig. 1. University Extension as a Social System

2/3

Fig. 2.   The Improvement Module: A Mechanism for Change

are a number of such resource groups.   In Figure 2 they are identified as: administration, specialist staff (instructional), program par-ticipant (present or potential student), and the governing board.   Through formal or in-formal interaction among representatives of these key groups comes the initial commitment decision on improvements to be made within the extension system.   This overall interaction is illustrated in Figure 2 at Point I.   Interac-tion which does not include all key groups is illustrated at Point II.   In this instance it is interaction between staff and participants. It is possible for limited improvement to take place with a limited number of interacting groups.   The authors have observed extension systems that do not have a complete interacting Improvement Module as in the Figure 2 Module at Point I.   More frequently observed are ex-tension systems where a number of Mini-Modules operate, similar to the one illustrated

at Point II of Figure 2.   It is reasonable to expect the outcome of mini-modules to be mini-improvement.

Thus far in this paper the authors have made two assumptions about university ex-tension systems: that there is access to re-sources outside the system; that there is a specific internal structure made up of a variety of resource groups.   A final assump-tion about university extension systems is that an observable improvement process oc-curs within them.   The arrows in Figure 3 il-lustrate the way the process flows from prob-lem identification through to solution and implementation.

A number of alternatives may occur as the process proceeds from a concern with pur-poses, problems, and needs to solutions and action.   These alternatives are indicated in Figure 3. First, the input from either inside or outside the system may not be acted upon.
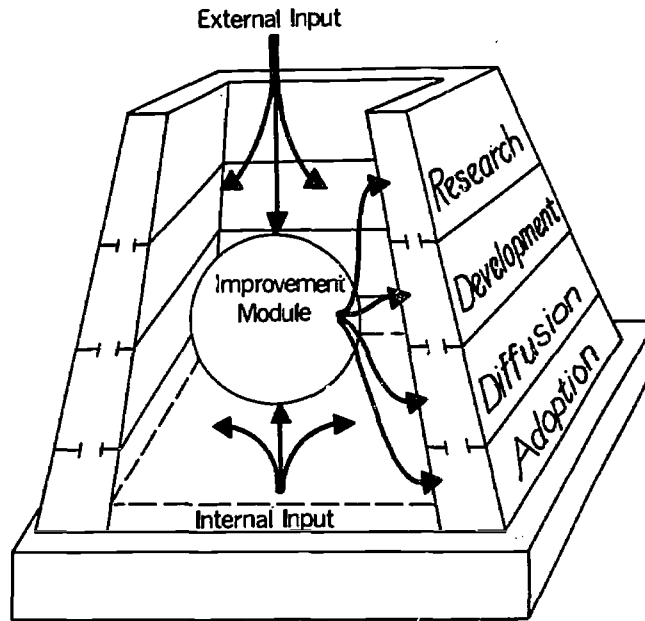

4

External Input

Research
Development
Diffusion
Adoption

Improvement Module

Internal Input

Fig. 3. The Improvement Process in Extension

The entire area of the internal structure sur-rounding the Improvement Module is symbolic of all educational agencies. It is that space where inefficiency dominates. These are places where improvement ideas can get lost. Thus input often gets lost before it touches the Improvement Module. In an extension system where there is no organization for im-provement, the chance for inefficiency is greater than that shown in Figure 3. In other words, there is more room for ideas to get lost. Secondly, if the input is acted upon (gets into the Improvement Module) and a commitment decision is made with its subse-quent administrative decision, the action can next move to any level surrounding the internal structure. These are levels of re-search, development, diffusion, or total adoption. It is not necessary for the flow of action to proceed in sequence from one level to the next. The model is structured to per-mit the vertical flow from level to level de-pending upon the operational requirements of the agency. Thus an idea may move from Research to Diffusion without having to stop at the Development level.

5

A review of tape recordings of meetings of committees within the Improvement Module of public schools cooperating in the project gives evidence that the structure and process depicted in Figures 1, 2, and 3 do operate. The model shows where improvement ideas come from, where they move within the system, where they get lost, and the point of institutionalization.

Figure 4 places in a single drawing the total structure and process as they have been described. It should be noted that a few additional words are added to the model. The base of the pyramid includes the philosophy, values, and traditions of extension. Both the external and internal input sources are identified as being "supply-" or "demand-" oriented. The use of supply and demand in this context indicates whether the solution to a problem is sought by the system (demand) or whether it is available (supply) with an attempt made by the supplier to have the

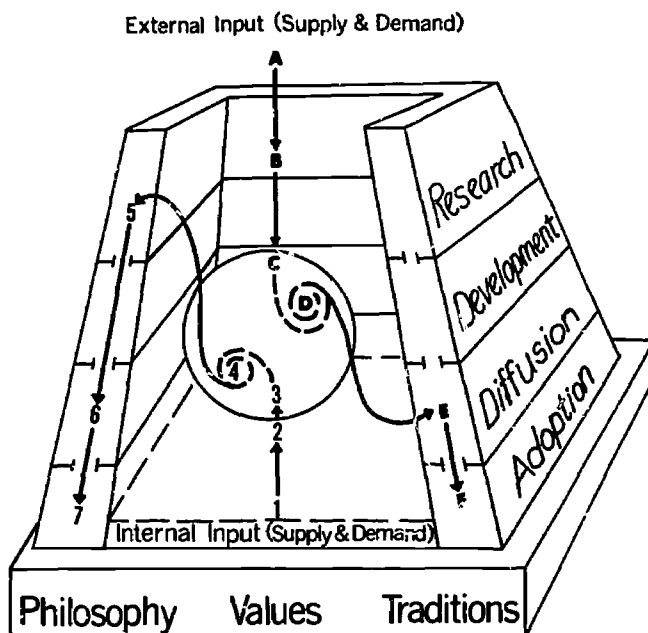

Figure 4. A Model for Educational Improvement in Extension

system put it to use. Whether a problem or proposal comes from the inside (internal) or enters from without (external), it may be traced through the system as indicated by Figure 4.

The process flow of a; external input (supply oriented) is demonstrated by the Points "A" through "F" in Figure 4. In this instance a piece of research completed under the auspices of the Office of Economic Opportunity dealt with criteria for effective recruiting of the disadvantaged for manpower training programs. The researcher, convinced that the findings had broader application than to manpower training alone, decided (Point "A") to disseminate the criteria (supply) in a number of professional journals. It is at this point—"B"—that these criteria entered the university extension system and a staff member who read the report did something about it. It was moved from Point "B" into the Improvement Module "C". After considerable discussion of the potential use of these criteria in new programs developed in extension, "D," a commitment decision and recommendations were made and administration encouragement given to diffuse ("E"), the criteria, into the system so that the staff of the developing program would be acquainted with its potential. At Point "F" the determination is made to adopt the idea and put it into general practice when recruiting disadvantaged.

An example of an internal input (demand-oriented) in the same extension system is shown by the numbers 1 through 7 in Figure 4. Beginning near the bottom of the model at "1" an extension staff member in political science is concerned about a problem of communication he experienced in dealings with community groups. Believing it may be a simple problem to solve, he began asking his colleagues for suggestions. The more he asked, the more apparent it became that it was a general problem, not his alone. Following these informal discussions, the chairman of his department brought the question to a committee ("2") making up part of the Improvement Module. There was no guarantee that any consideration would be given to the staff member's very real question. In this case, preliminary discussion of the problem led to the conviction that

a communications problem existed for the entire department and a decision was made to work on a solution of the problem ("3"). The resources used to determine a solution to the problem came from both "inside" and "outside" of the system. None of the potential solutions transferred easily to the community setting with which the staff was concerned. Thus, they believed it wise to select a solution most likely to work and adapt it to their own setting. On this basis the working committee within the Improvement Module ("4") proposed and received the administrative "go-ahead" for three staff members to try to develop ("5") the suggested communications ideas during 1968-69. If the ideas worked well, they were to be diffused through the system as soon as possible ("6") and if there was continued success, the ideas were to be fully adopted ("7"). However, if the ideas did not work well they could return to either the research or development levels for further attention.

SUMMARY

The value of a model to the practitioner is in the number of aspects it will help explain about the operation of an educational system. Initial testing of the Model for Educational Improvement in public schools indicates that the Model suitably describes the improvement process. Observations of school districts in action can be related to both the structure and process of the Model. The Model has a potential for use as a guide to appraise the improvement process. The structure and process of university extension are such that the Model transfers easily.

The administrator, board member, extension agent, and program participant examining the Model for Improvement is asked to compare his system for improving extension's educational program with the Model described in this paper. Is there a structure in your extension system which encourages the improvement process? Would the potential for educational improvement be greater if your extension system operated as does the model?
