Contained in the annotated bibliography are 73 references to research dealing with creativity and gifted children. Research covers such aspects as academic achievement, cognitive processes, creative thinking, individual characteristics, personality, student attitudes, teaching methods, testing, and program evaluation. The bibliography is one in a series of over 50 similar listings on handicapped and gifted children. For each of the entries, which were selected from Exceptional Child Education Abstracts, bibliographic data, availability information, indexing and retrieval descriptors, and an abstract are given. Also provided are author and subject indexes. (KW)
GIFTED AND CREATIVITY RESEARCH

A Selective Bibliography

February 1971

CEC Information Center on Exceptional Children
The Council for Exceptional Children
Jefferson Plaza, Suite 900
1411 S. Jefferson Davis Highway
Arlington, Virginia 22202

This bibliography is a product of the Information Processing Unit, CEC-ERIC Information Center on Exceptional Children.

The work presented or reported herein was performed pursuant to a grant from the Bureau of Education for the Handicapped, US Office of Education, Department of Health, Education, and Welfare. However, the opinions expressed herein do not necessarily reflect the position or policy of the US Office of Education and no official endorsement by the US Office of Education should be inferred.
The CEC Information Center on Exceptional Children

With a grant from the US Office of Education, the CEC Information Center was established at The Council for Exceptional Children to serve as a comprehensive source of information on research, instructional materials, programs, administration, teacher education, methods, curriculum, etc. for the field of special education. The Center functions as the Clearinghouse on Exceptional Children in the Educational Resources Information Centers (ERIC) program and also as a member center in the Special Education IMC/RMC Network. In addition, the CEC Center's program includes a commitment to a concentrated effort towards the development of products which will interpret research results into educational methods and practices.

How to Use This Bibliography

The abstracts in this bibliography have been retrieved, on a selective basis, from the computer stored information of the CEC Information Center. Abstracts were selected from the Center's complete holdings on this topic as of the date indicated.

How to Read the Abstract

Each abstract contains three sections—bibliographic data, descriptors, and a summary of the document. The bibliographic section provides the document's identifying number (ED and/or EC), publication date, author, title, source, and availability. The descriptors indicate the subjects with which a document deals. The summary provides a comprehensive overview of the document's contents and in some cases document availability is announced here.

How to Use the Indexes

Some bibliographies in Exceptional Children Bibliography Series contain author and/or subject indexes. In these bibliographies, readers seeking work on a specific aspect of the general topic may consult the subject index to be referred to specific abstract numbers. Abstracts dealing with several topics may be identified by finding the same abstract number under two or more subjects in the subject index.

How to Purchase Documents

For documents available from their publishers, information on price and address is included in the abstract.

Many documents may be purchased in microfiche (a 4" x 6" microfilm card containing up to 70 pages of information) and/or hard copy (readable size photo reproduced pages) reproduction from the ERIC Document Reproduction Service. For example, "EDRS mf" indicates the document may be purchased in microfiche reproduction and "EDRS mf, hc" indicates the document may be purchased in both microfiche and hard copy reproduction.

Microfiche reproductions may be obtained for $.65 per document. To determine purchase prices for hard copy reproductions, consult the table below.

To order document reproductions, provide the ED number of the desired document, the number of copies being ordered, and the type of reproduction desired (microfiche or hard copy). Payment must accompany orders totaling less than $10. Book rate or library rate postage is included in the prices indicated. The difference between book rate or library rate and first class or foreign postage (outside the continental United States) rate will be billed at cost.

Orders should be sent to:
ERIC Document Reproduction Service
P.O. Drawer O
Bethesda, Maryland 20014

The Effects of Typing Instruction on Creativity and Achievement among the Gifted.  
Champaign Community Unit School Dist., Ill.  
EDRS mf,hc

Descriptors: exceptional child research; gifted; achievement tests; academic achievement; elementary school students; typewriting; creativity research; work study skills; creative writing; creative thinking; reading; spelling; intermediate grades; curriculum enrichment; Iowa Every Pupil Tests; Guilford Unusual Uses and Consequences Tests; 1960 Stanford Binet Intelligence Scale; California Achievement Test; Champaign

Two groups of 31 or more fourth grade children, who tested at 115 or higher on the 1960 Stanford-Binet Intelligence Scale, received enrichment in creative thinking and writing. One group received typing instruction. Pretests administered in the fourth grade and again to the same students in the sixth grade included the California Achievement Tests (reading and spelling), work-study skills tests of the Iowa Every Pupil Tests of Basic Skills, Guilford Unusual Uses and Consequences Tests, and a creative writing test. Results showed that the use of typing by academically talented intermediate grade children was not harmful to achievement in such areas as work-study skills, reading, and spelling. The experimental group using typewriters showed significantly greater gains in creative writing and creative thinking than did the control group. (JA)

The Illinois Television Project for the Gifted, a Combined Experimental and Demonstration Project to Test and Demonstrate Televised Enrichment Units for Students at Upper Elementary School Levels. Final Report.  
EDRS mf,hc

Descriptors: exceptional child research; gifted; audiovisual instruction; enrichment; enrichment programs; academic enrichment; enrichment activities; astronomy; mathematics; geography; television instruction; television instruction—audio; television; video tape recordings; grade 5; grade 6; comparative testing; attitudes; changing attitudes; academic achievement; creativity; independent study; student reaction; demonstration projects

The results of an experimental project using three series of enrichment units are summarized in this report. Each project consisted of 12 half-hour videotape presentations in astronomy, mathematics, and geography. The lessons were presented to 350 gifted (average IQ of 124) fifth and sixth grade students who represented the upper 25 percent of the total fifth and sixth grade population.

Control groups were established by having the children view two of the three series. Work in the project was voluntary, and no grades were given. The program operated completely apart from classroom context and did not involve teachers in any way. Viewers and nonviewers were compared in test performance reaction, attitude toward subject matter, and other factors. Results indicated that significant (.001 level of confidence) improvement in learned context occurred for all three courses.

Pupils reported liking the lessons, but little or no difference in attitude or overt behavior was found between viewers and nonviewers. Few students reported any difficulty in keeping up with regular classroom work. The Creativity Aptitude of the student had little bearing on success in (achievement) or attitude toward the telecasts. Independent study ability was related to success in the course. Recommendations are made on selection of students who will view and methods of using the telecasts. Sample tests, questionnaires, and information on related studies are included. A bibliography lists 29 items. (RM)

One in a Thousand: A Comparative Study of Moderately and Highly Gifted Elementary School Children.  
EDRS mf,hc

Descriptors: exceptional child research; identification; gifted; student characteristics; children; elementary grades; family background; educational experience; physical development; adjustment (to environment); ability identification; talent identification; creativity; personality; socioeconomic background; Iowa Tests of Basic Skills; Stanford Binet Intelligence Scale; Children's Personality Questionnaire; CPQ; IPAT; Columbus

Modestly gifted and highly gifted children were studied to determine differences in educational development, adjustment, physical development, and family background. School psychology interns nominated potentially capable pupils from grades 3 to 6. From these, 65 matched pairs of moderately gifted (IQ scores of 120 to 130) and highly gifted (IQ scores of 148 and above) were selected. Stanford-Binet Intelligence Test scores, Iowa Every Pupil Test of Basic Skills scores, Institute for Personality and Ability Testing Children's Personality Questionnaire scores, parent ratings of child, autobiographies, Who Is It scores, school records, socioeconomic levels, and home information were obtained. Structured interviews and instruments measuring creativity and self concept were used with 40 of the subjects. Findings indicated that the highly gifted group came from more affluent backgrounds, had more highly educated parents, and rated higher on creativity measures. Both groups were found to be well adjusted, and there were no outstanding differences of physical development. Teachers did not identify 25 percent of the highly gifted. Large numbers would have been missed through reliance on group tests. The study recommends a state registry of highly gifted children, summer workshops for teachers, and excess cost support. (RM)

Creativity and Conformity.  
OEC-5-10-154  EDRS mf,hc

Descriptors: exceptional child research; creativity; environmental influences; children; public schools; conformity; creativity research; visual perception; student attitudes; achievement; grade 5; matched groups; training; social factors; social influences

Conformity to group pressure was compared for 76 fifth grade public school subjects receiving a 4-week program of creativity training and for 88 controls matched on IQ scores, achievement scores, and socioeconomic status. Three weeks after the training period all subjects responded to a series of 24 slides consisting of visual, attitudinal, and achievement items. The children were tested an hour later with the same slides. In addition a fictitious class norm purporting to be the majority response was given orally after each slide on the second presentation. Effects of creativity training on conformity were quite specific since conformity was reduced on items having correct answers (achievement), but not on subjective items (visual, attitude). Results also showed that the subjects receiving creativity training responded significantly (p is less than .02) more selectively than controls to
items similar in content, agreeing with the group on some items but not on others. In addition, the creativity training reduced overall conformity for the low IQ subjects but not for the subjects of average and high IQ levels. It was concluded that there is a causal relation between creativity and conformity due to the transfer of common skills across the situations. Four tables and a 17-item reference list are included. (AA)

**ABSTRACT 10378**

Descriptors: exceptional child research; gifted; cognitive processes; creativity; children; creativity research; sciences; social and emotional development; interpersonal relations; self-concept; behavioral study; student ability; study criteria; music; art; intelligence tests; Guilford Hoepfner Measures of Intellectual Ability

In order to assess the quality of creative products—art, music, writing, social studies, and science—children attending grades 3 to 6 of the University Elementary School of the University of California, Los Angeles, were divided into two groups on the basis of intelligence. The higher group (49 pupils, IQ of 130 or more) and the low group (57 pupils, IQ of 120 or less) were similar in educational backgrounds, external environment, parental valuing of education, parental level of education, and sex ratio. Three independent judgments of each child's product in each subject were made by experts in the particular field represented. Criteria for creativity included originality and effectiveness of expression. In five out of the eight products evaluated, a significant relationship (p equals .05) was found between high IQ and high quality of judged product. Findings thus supported the hypothesis that giftedness and creativity are not antithetical. Both groups were also given Guilford and Hoepfner's test for divergent thinking. The only test which significantly separated the high from the low groups was the Association Test (t test, p equals .05). Since no significant differences were found between high and low IQ groups on the four remaining tests, a negligible relationship between intelligence and divergent thinking was indicated. Examples of the children's products in all areas and an 18-item reference list are included. The appendix contains biographical sketches of the judges. This document is available from The Council for Exceptional Children, NEA, 1201 Sixteenth Street, N.W., Washington, D.C. 20036, for $2.00. (FP)

**ABSTRACT 10551**

The Council For Exceptional Children, NEA, 1201 16th Street, N.W., Washington, D.C. 20036 ($2.00).

Descriptors: exceptional child research; gifted; adjustment; environment; personality; behavior; adolescents; personal adjustment; social adjustment; self-concept; self-evaluation; interpersonal relationship; personality assessment; peer groups; intelligence factors; conformity; responsibility; Thematic Apperception Test; LaForge-Sueck Interpersonal Check List

The study examined similarities and differences in the personal and social adjustment of intellectually gifted and average adolescents along six criteria: independent dominant and responsible-cooperative interpersonal behavior, moderation of interpersonal behavior, unity or integration of personality, self acceptance, and evaluation of self perception. Two matched groups of 42 subjects each, one with IQ's from 130 to 150, the other with IQ's between 90 to 110, completed the Thematic Apperception Test (TAT) and the LaForge-Sueck Interpersonal Check List. Additional interpersonal ratings were secured from teachers and classmates. Results on interpersonal behavior indicated that the superior students were significantly higher in independent dominant traits, agressive-rebellious traits, and responsible-cooperative traits. On the TAT average students expressed a higher proportion of themes of masochism-weakness and conformity-trust. On concepts of ideal traits a significantly larger number of average subjects fell above the median on the responsible-cooperative cluster. On all other items, superior students failed to differ significantly. It was thus concluded that factors other than intellect influence personal and social adjustment. Earlier studies are reviewed, and 76 references are cited. Twenty-five tables and an appendix present data. (UD)

**ABSTRACT 10577**

Descriptors: exceptional child research; gifted; academic achievement; peer rating scale; self rating; test validity; grade point average; predictor measurement; questionnaires

Using 857 male National Merit Finalists and Commended Students, scales to predict 1st year college grades and science, writing, art, music, speech, and leadership achievement were developed by analysis of 906 pre-college questionnaire items. Two item analysis strategies were used: responses of achieving subjects (S's) and general samples of nonachieving S's were compared; responses of achieving and nonachieving S's who had previously indicated desire to achieve were compared. The two strategies did not yield essentially different scales. Validity coefficients ranged from .15 to .38 with 300 cross-validation S's. Similar correlations resulted from applying the scales to 681 female S's. More items about past accomplishment, activities, and competence entered the scales than did other item types, relative to the size of the item pools. The content of the scales and the correlations among variables support some unfavorable interpretations of high grades and placement. Results suggest the hypothesis that the grade scales should be a negative predictor of nonacademic achievement, and the nonacademic scales should predict grades negatively. (Author/ED)

**ABSTRACT 10626**

Descriptors: exceptional child research; gifted; professional education; teaching methods; behavior; teaching models; teacher characteristics; inservice teacher education; teacher impersonation; teacher rating; test reliability; behavior rating scales; test results; questioning techniques; teacher selection; teacher behavior

Inservice self-study was utilized to improve the qualitative level of classroom method among teachers of the gifted. Ten judges selected 45 to 75 elementary and secondary teachers by a rating scale of significant behaviors, classroom observation ratings, the Weiner Attitude Scale, and the Terman Concept Mastery Test. The 45 were considered flexible, intelligent, creative, and stimulating. Analysis of the teacher behavior scale indicated four main factors: individualized materials and instruction, art of questioning, encouragement of higher level thinking, and communication-interaction. Inservice activities were pupil study (case studies) of gifted characteristics, study of classroom principles for higher level thinking, and discussion and evaluation of a teacher model; teacher-made videotapes of classroom activities, using the principles learned, were also shown and evaluated at the inservice Exceptional Child Bibliography Series
meetings. Interjudge reliabilities of .90 were obtained from audiotape analysis of the teachers’ questions and answers at the beginning and end of the project. Significant improvement between the two tapes (p equals .01) occurred in the application, generalization, and synthesis questions by the teacher (indicating growth in higher cognitive level questions), and growth in open responses by students were noted. EDRS mf, hc
OEC-5-10-149
CRP-S-174
Descriptors: exceptional child research; achievement; teaching methods; gifted adjustment (to environment); elementary school students; academic achievement; achievement gains; study skills; critical thinking; personal adjustment; social adjustment; student development; autoinstructional methods; reading; social studies; sciences; test results; self directed classrooms; resource materials; intermediate grades
Gifted school children worked for a period of several months in self directed learning situations in a resource room without teacher imposed direction. They had opportunities to explore areas of interest (during two class periods per day) in reading, social studies, and science in the manner and depth which they chose. Pre- and posttests were administered to measure student growth in academic achievement, study skills, divergent thinking, and personal and social adjustment. Test results were compared with those of a random control sample which had no contact with self directed learning. Other information was gathered through daily logs maintained by resource room personnel. Both the experimental group and the control group were chosen from fourth, fifth, and sixth grade classrooms and were considered to be moderately superior on various intellectual measures. Lift’s difference was noted between the two groups on gains made in academic achievement, study skills, and divergent thinking ability. Personal and social adjustment appeared to be favorably affected when self direction was used. (JH)

The purpose of this first phase of a continuing research program was the development of a test of creative problem solving in general design. A design class of 186 members was divided into an experimental and control group; a non-design control group (an educational psychology class) of 45 was also tested. Multivariate interpretation of creative problem solving was developed; five test problems were selected to make up the Creative Design Test (CDT); and solutions were judged for fluency, flexibility, and originality. An acceptable scoring and interproblem reliability was achieved on the instruction, library materials, and school pride problems, but not on the laundromat and paper product problems. No construct validity was obtained from teacher ratings of creativity in class or from a comparison of design and non-design students. Predicted relationships were not supported between performance on the CDT and the amount of problem-related knowledge possessed or whether systematic or non-systematic problem solving procedures were employed. Variations in variety and originality of prior solutions examined before the test made little difference to test performance. (Author/SN)

In investigating patterns of family relationships conducive to creativity, several inventory-type personality tests and a questionnaire about family relationship and childhood interests were sent to 99 Mills College alumnae 5 years after their graduation and to the siblings of 51 of them. All had been tested, while seniors, for personality and some had been selected as creative by the faculty. The 12 of the 51 who had been picked as creative had nine sisters and eight brothers participating while the comparison 39 had 31 sisters and 28 brothers participating. The creates had higher aptitude scores and made better grades than the other seniors (p less than .01) and since graduation had shown a higher level of creative activity (p less than .001). The brothers and sisters of the creatives consistently made higher scores than siblings of other Mills women on the indices of creative traits; they had a higher educational level (p less than .01); and the brothers received more honors for intellectual distinction (p less than .01). For the creative Mills sisters, support was found for the conceptualized pattern of having the following: dissatisfaction with their relationships in the family, symbolic facility and an approach to the world focused on the potential or intuitive rather than the practical, and confidence that they could intervene in symbolic affairs and could do so by their efforts and initiative gain a more satisfying set of relationships. Varieties of Giftedness in the Classroom: Studies of Cognitive and Psychosocial Functioning in Adolescents.
Chicago University, Illinois
Office Of Education (DHEW), Washington, D. C.
EDRS mf, hc
CRP-998
Descriptors: exceptional child research; cognitive processes; personality; gifted; creativity; adolescents; cognitive tests; concept formation; creativity research; psychological testing; intellectual development; moral values; testing; academic achievement; personal values; values; family environment; attitudes; student attitudes.
The cognitive and psychosocial functioning of four categories of gifted children was studied. Two groups of adolescents showing different types of cognitive excellence (intelligence and creativity) and two groups exhibiting different types of psychosocial excellence (morality and psychological adjustment) were investigated using a wide variety of measures, some of them especially developed for this research. Traditional methods of evaluating giftedness have divided children into categories of high or low intelligence, but results of this study indicate there are two other useful categories of cognitive functioning: high IQ without concomitant high creativity and high creativity with nonconcomitant high IQ. Those students representing those categories were found to be equally superior in scholarship and were drawn to the population from which they were drawn; but the two groups differed
The Gifted family occurred at the senior high level; reduction in the positive image of the groups were observed: the concept of cated few consistent differences on mea-

laboratory and the secondary school adaptation battery, a self concept scale, and an above 125). Tests from the Guilford thinking; convergent thinking; sec-

value orientations, their effect upon teachers, their fantasy productions, their career aspirations, and in family environments. (AL)

ents; teacher attitudes; sex differences; student attitudes; family relationship; questionnaires; questioning techniques; cognitive measurement; convergent thinking; divergent thinking; evaluative thinking; participant characteristics; Guilford; Theoretical Model for the Complete Structure of Intellect

A research project attempted to identify and classify productive thought processes of gifted junior high school students and their teachers. Subjects were 176 gifted high achieving students of both sexes with a verbal IQ range of 125.00 to 135.35, a nonverbal IQ range of 115.88 to 134.50, and a chronological age range of 12.50 to 14.63 years. The students were given tests to determine attitudes and divergent thinking abilities and were evaluated for social qualities and class contributions by their teachers. Parents were asked to complete ques-

tionnaires independently to determine family relationships. Three judges, working as a team, tape recorded five consecutive sessions of classes in social studies, science, and English conducted by different teachers in the fall and again the following spring; all comments were classified according to levels of thinking defined in Guilford's structure of the intellect. The types of questions asked by teachers strongly influenced the quality of pupil response. More than 50% of questions asked in a class ses-

sion were cognitive memory questions. The second most frequent category was convergent thinking, with a much smaller proportion of divergent and evalu-

ative thinking questions. (BB)

Verbal Skills of Superior Students. Wisconsin University, Madison

Office Of Education (DHEW), Washington, D. C.

EDRS m.f. hc

CRP-P-036

Descriptors: exceptional child research; gifted; tests; cognitive processes; cogni-
tive tests; logical thinking; recognition; recall (psychological); thought process-
es; high school students; grade 10; grade 12; verbal ability; verbal tests; high achievers; learning processes; testing; student improvement
The value of a new procedure for assessing verbal performances of superior high school students was studied. The instrument consisted of two parts. In part A, the student was given an analogy and asked to identify the most logical relationship between the two elements in it. He was then asked to write a description of the relationship identified. Part B required the student to construct an analogy statement comparable to the one given. Part A was designed to study the student's reasoning behind the analogy he produced in part B. It was hypothesized that items of this nature might help differentiate students capable of original performance from those who become skilled in recognition and recall tasks. Experimental analogies items were administered to 143 10th grade and 130 12th grade students (males and females). Mean scores of both sophomores and seniors were almost twice as high on analogy recognition as on production. Mean scores for boys and girls at both grade levels showed negligible differences. It was concluded that scores on both parts of the test were associated with grade in school which in turn is associated with age and experience. However, results in production indicated little improvement from the 10th to the 12th grades. (AL)

Parental Influence Upon Decisions of Scholastically Talented Youth Concerning Higher Education.

Wisconsin University, Madison
Office Of Education (DHEW), Washington, D. C.
EDRS m/hc
CRP-247

Descriptors: exceptional child research; gifted; family (sociological unit); parent attitudes and behavior; background; parent influence; higher education; high school graduates; college bound students; academic aspiration; motivation; family characteristics

The primary purpose of this investigation was to determine whether there are important differences in selected parental background factors between scholastically talented high school graduates who continue their education in degree-granting institutions and those who do not. There were two related problems: to determine the amount of stability of the post-high school plans of these scholastically talented youth, and to report on the specific activities in which they were engaged in the fall of 1957. Data used for the study were obtained by a statewide survey of 3,500 high school seniors concerning plans beyond high school and family background. A special analysis of 5,500 seniors was used as a later sampling. A survey of their parents determined what they were doing and furnished additional family background information. Analysis of data indicated that the education level attained by parents, occupation of father, economic status, financial help from parents, and parental encouragement were similar in both the students who went on to higher education and those who did not. In addition, a high degree of stability between the various plans of the group expressed in the spring and the realization of the plan was demonstrated. (GC)

Identification of Gifted Elementary School Children With Exceptional Scientific Talent.

City University Of New York, Hunter College
Office Of Education (DHEW), Washington, D. C.
EDRS m/hc
CRP-392

Descriptors: exceptional child research; tests; identification; gifted; academic ability; academic aptitude; ability identification; elementary school students; talented students; test construction; predictive validity; grade 3; Hunter Science Aptitude Test

A test of science aptitude was constructed, and preliminary evidence of its validity obtained by individual administration to 58 gifted, 6- and 7-year-old children. Two forms of a 91-item Hunter Science Aptitude Test were constructed. Items included in these tests were designed to measure the ability to recall scientific information, to assign meanings to observations, to apply scientific principles in making predictions, and to use the scientific method. The tests were administered at the beginning of the school year and during the year at the completion of seven different science units. A single-weighted, composite science achievement score was thus obtained from each subject. The parallel forms reliability coefficient of the Hunter Science Aptitude Test and the reliability of the weighted composite science achievement score were found to be somewhat lower than expected. However, the predictive validity correlation coefficients were extremely high, because the aptitude tests and the science achievement criterion that were used overlapped the kinds of ability and content measured. Both were modeled upon the content of the third grade science curriculum. Research extensions were recommended in time and scope of the criteria, as well as in additional validation studies. (JH)

The Gifted Group at Mid-Life: Thirty-Five Years' Follow-Up of the Superior Child. Genetic of Genius, Volume V.

EDRS not available

Stanford University Press, Stanford, California 94305 ($5.50).

Descriptors: exceptional child research; gifted; family (sociological unit); behavior; health; personality; adjustment (to environment); intellectual development; occupations; educational background; recreation; social attitudes; political attitudes; geography; participant characteristics; personal interests; followup studies

The 35 years' followup of the Terman investigation on the gifted child is presented. In order to describe the gifted group at mid-life, a general information blank was mailed in 1950 (1,437 subjects) and in 1955 (1,424 subjects). The field study, completed in 1952, included personal interviews, the Concept Mastery Test, supplementary questionnaires of subject and spouse, and testing of offspring. Results for 97.5% of the subjects include the following: intelligence increased significantly from 1939 to 1952 (p less than .001); 85% of the group went to college and nearly 70% graduated; two-thirds of the men and three-fifths of the women did graduate work; on the Minnesota Occupational Scale, all subjects were in the first five of the seven groups and 86% were in the first two (professional and executive) and one-half of the women were housewives but many contributed to community and civic activities; the marriage rate and personal adjustment were average for the population. Other results are given for mortality, health, avocational interests, political and social attitudes, marriage, divorce, income, and offspring. Sixty-one tables are provided. The appendixes include the forms used and a 45-item bibliography. (SN)

CRP-2250

Descriptors: exceptional child research; environmental influences; creativity; creative thinking; Caucasian students; creative activities; thought processes; socioeconomic influences; psychological evaluation; measurement instruments; Negro students; social class; grade 3; verbal ability

Environmental factors related to creative production were studied to obtain knowledge of the learning characteristics and educational performance of children from various socioeconomic levels. Children from the fifth grade were selected as subjects and included 395 Negro and 244 white children. Further division was based on four socioeconomic levels. A variety of measuring instruments was employed to gather the data and test the variables. Analyses were accomplished by analysis of variance and other measures. (AN)

Reviewed are studies on the gifted covering the 3-year period from December 1959 to 1962. Consideration is limited primarily to research and theory with selective emphasis on quantitative studies. Bibliographies are mentioned and research is covered for three major areas. Characteristics and Identification of the gifted includes the topics of economics of talent, intellectual characteristics, personal and social characteristics, creativity and achievement, under-achievement, and achievement motivation. Under curriculum development and adaptations, community and parental attitudes toward special education for the gifted, ability grouping, acceleration, and curriculum studies are discussed. In general developments, major books published since 1959 are listed and described and suggested. (JK)

The motivational patterns and the educational achievement of talented students were identified and analyzed. The objectives were to determine the differences between achievers and nonachievers in the following areas: motivation toward academic achievement; self-concept; developmental history and home background, social adjustment, peer relationships, and parents' social status; and continuation of study beyond high school. Also, the patterns of educational motivation of boys and girls were studied for possible differences. It was found that high achieving students tend to be more highly motivated as measured by the interview Measure of Motivation and, in the case of boys, by McClelland's Test. Value achievement was higher as measured by the Semantic-Differential and, in the case of girls, by Strodbeck's and DeCharms' instruments, and more adjusted as measured by the California Psychological Inventory, Who Are They, and Behavior Description Chart instruments. The girls were more active in extracurricular activities, had more leadership, were more independent, had somewhat higher social status, came from small families where they were the first-born or only child, had parents who were better educated and held high aspirations for them, saw their fathers as important in their lives, and had mothers who placed a high value on imagination. OEC-4-10-079
CRP-S-004
Descriptors: exceptional child research; classroom environment; creativity; creative teaching; creativity research; environmental influences; high schools; high school students
The project studied the characteristics of a highly creative school as opposed to those of a traditional school. Four high schools of comparable socioeconomic and student ability level were involved, two of which were judged to be of the highly creative type. The students were given various tests, and classes were observed. The findings showed the following characteristics of creative schools: high aspiration level and intellectual climate; less authoritarian, but not less rational, teacher direction; and stimulating and original classroom behavior on the part of the teachers. Suggested aims for an extension of the present study include projects for comparison of creative student productivity as well as further investigation into the nature of creativity and of the relationship of the school environment to the development of creativity. (PM)

The findings indicated significant differences in creative thought favoring the higher socioeconomic child in both verbal and nonverbal areas. The lower socioeconomic child, however, performed better in the nonverbal areas. Further research was suggested to determine the specific environmental factors which influence performance in creative thought. (RS)

The Educational Motivation Patterns of Superior Students Who Do and Do Not Achieve in High School

Cognitive maps or internal representations of a situation are discussed in terms of creative achievement and focus is placed on the influence of preconceptions on creative behavior. It is claimed that 36 engineers who are divided into five groups to constructively or destructively criticize homogeneous and heterogeneous groups are rated as significantly more creative on both problems. The replication of this study (with alterations and studies with a new focus (reformulations of initial solutions to problems) are described. Limitations of current creativity research are indicated with attention given to inadequacy of research tools, and the inability of current methods to deal with the interaction of variables in systems. Different ways of analyzing data, research needs, and the gradual approach are discussed. (RJ)

EDRS mf,hc

Descriptors: exceptional child research; gifted; program evaluation; educational research; student evaluation.

To determine the advantages of intergroup grouping, students were assigned to two intergroup classes. All students selected had been recommended by their kindergarten teachers as their brightest students. The intergroup condition was compared against the control group on all achievement scales; group means were significant on word discrimination and arithmetic (p < .01). Students scoring high on the initial adjustment problems showed greater gains than their controls on all four scales. However, they achieved significantly lower scores on the California Test of Personality. The parents of children in both conditions responded favorably to questions concerning the children's reactions to school, their adjustment in and out of school, and their interest in reading. The parents of children in the intergroup program provided significantly higher ratings on the richness and variety of classroom experiences and the motivations provided to challenge the child to make use of his talents. The California Test of Personality revealed no significant differences in social adjustment of interage as opposed to straight grade classes. (Author/BB)

Seven articles from the Institute for Research on Exceptional Children consider the gifted child. The first article, Leadership Training for the Gifted--A Graduate Program, by J.J. A final report was given of a three-part study that was made to determine differences in the attitudes, interests, and values of gifted high school students in relation to their total environment. A research design was developed to delineate the characteristics of these gifted students, especially those characteristics which differentiate the three profile types of creative intellectual, studious, and social leaders. Superior students from the 10th, 11th, and 12th grades were assigned to one of the three profile groups on the basis of self-classification. Comparative analysis was performed throughout the study by drawing a contrast between two 11th grade groups, one average in ability and the other superior.
Superior Formal and informal measures were used to acquire the results. It was concluded that the creative intellectuals showed strong, self-directed interest in learning and a great willingness to deal with both the subjective data of the self and the objective data of the larger world. The studious, while also showing a concern for ideas and a desire to learn, mainly confined their efforts to completing teacher-directed assignments. The social leaders preferred to make their impact felt on people rather than in the realm of ideas. It was felt, that on the basis of these findings, new guidelines for educational strategies should be developed to take into account differences among the gifted. A related report is ED 003 182. (GD)

ABSTRACT 20028

Descriptors: exceptional child research; gifted; tests; creativity; verbal tests; originality; testing; factor analysis; pictorial stimuli; intelligence; cognitive processes; learning processes; maturation; self concept; test validity; test construction; visual perception; Symbol Test of Originality; STO
The Symbol Test of Originality (STO) was studied and modified to substantiate its usefulness and to meet several criteria for test construction: freedom from intellectual bias, objectivity, and direct relationship to a general creativity factor. From an original group of 4,500 persons ranging in age from 10 to 25 years, a random sampling of 600 was drawn, based on grade level percentages within the general population. The final population numbered 478 with 12 subgroups. Three modified 'versions of 'the STO and the original version were selected along with items from Kell'sbach's Test of Aesthetic Discrimination, Thurston's Hidden Figures and Mutilated Words Test, Guilford's Brick Uses Test, and modified forms of Taylor's Relationship Test and of a Self Concept Rating Scale. Biographical data were also gathered. The battery was given to the 4,500 sample, and its analysis yielded variables of general creativity, visual perception, maturation, process strategy, self concept, and biographical information. Four significant factors were observed: general creativity, intelligence, process strategy, and maturation. Conclusions were that general creativity could be isolated, although ., is a composite of varying proportions of several primary creativity abilities, and that the criteria set for the measure were appropriately met. An appendix contains the STO, Variable Description, Variable Analysis 15-41, Symmetric Correlation Matrix, Rotated Matrix of Factor Loadings, and Project Test Battery. (AAJP)

Descriptors: exceptional child research; creativity; teaching methods; evaluation; reinforcement; tests; teacher attitudes; research reviews (publications); thought processes; sex differences; rewards; peer relationship; self concept; cultural differences; case studies (education); measurement techniques; effective teaching; originality; educational methods; experimental programs
The need for rewarding creative thinking is asserted; a plan is proposed for studying evaluation and creative behavior; and measurement of creative behavior is discussed. Three groups of studies are presented. The first considers the ways the intermediate environment rewords creative behavior; aspects treated include applying principles rewarding creative thinking, creative and critical evaluative attitudes of teachers, creative activities as rewards for creative thinking, and differential rewards for boys and girls. The second set investigates the following issues about the evaluative behavior of the classroom teacher: competition as an external evaluative; unevaled practice and creative behavior; critical and creative peer-evaluated practice; evaluative discussions about creative productions; peer pressures in homogeneous and heterogeneous groups; positive, negative, and trouble-shooting evaluation; and cultural differences in evaluating creative characteristics. The final study concerns helping children value their ideas. Practical applications of the studies are presented; appendices are provided on the instruments used in the described studies and on developing creative thinking through language arts. (JD)

Descriptors: exceptional child research; gifted; mathematics; teaching methods; programmed instruction; mathematics instruction; teaching machines; rural schools; programmed texts; autoinstructional programs; modern mathematics; student seminars; instructional technology; programmed materials; high school students; rural education
A study was conducted on the achievements of superior students who used programmed instruction and seminars in modern mathematics. Two experiments were conducted to test the hypotheses that superior students using programmed instruction will achieve higher scores than those using conventional materials, students using programed instruction by machine will not differ from those using a programmed textbook, and students will not show a preference between the two modes of programmed instruction. Four groups were established for the basic experiment. The sample consisted of 100 high school students who were randomly assigned to the machine, programmed textbook, conventional textbook, or control groups. The results indicated that self-instructional materials in mathematics can be used profitably by superior students with or without a teacher. (RS)

Exceptional Child Bibliography Series
Gifted and Creativity Research

To investigate intelligence level, academic achievement, idealational productivity, and the uniqueness of the ideas produced, a sample of 503 incoming freshman university students was recruited. Intelligence was measured by using students' Scholastic Aptitude Test scores; verbal and visual stimuli were used to elicit ideas. Correlations between intelligence and the number and uniqueness of ideas were low while high productivity and high uniqueness scores tended to go together. Students were divided into groups of high and low intelligence, high and low ideational productivity, and high and low ideational uniqueness. Intelligence was found to exert no effect on the generality of nonacademic accomplishments; however, the number of ideas typically produced by the student and the uniqueness of the ideas had a significant impact on nonacademic accomplishments (p less than .001 for the total group). Implications were that students who will succeed at creative writing, science, painting, or some other endeavor cannot be predicted by grades or test scores alone. Nonacademic accomplishments should be examined and credited when searching for talented students. (RJ)

National Art Education Association, 1201 16th Street, N. W., Washington, D. C. 20036 (HC $0.60).

Descriptors: exceptional child research; art; gifted; creativity; curriculum; art education; problem solving; design; student evaluation; creative art; testing; student attitudes; thought processes; self concept

To investigate the relationship of a creativity-oriented design curriculum to the creative development of gifted adolescents, an activities guide was developed and used with 27 pupils placed in a special design class which met for one period daily. Creativity tests were given and evaluations of art products were made before and after six months of the program for the experimental group and the 32 controls although these frequently called for subjective judgements, criteria for rating were established. Students in the experimental group generally performed significantly better in terms of fluency, adaptive flexibility, and originality requiring divergent production, but not in convergent production or in rate of emission of familiar cognitive responses. Attitudes toward creativity changed in a positive direction, and experimental students indicated less fear of failure and more self confidence. Conclusions were that designing may be a more complex process than had been assumed and that an art program focusing on problem solving and creative behavior has important functions in the education of the gifted. Descriptors: exceptional child research; early admission; gifted; college admission; program evaluation; high school students; admission criteria; academic achievement; social adjustment; parent attitudes; student attitudes; testing; academic failure; transfer students; withdrawal; administrator attitudes; individual characteristics; emotional adjustment

Twelve colleges and universities participated in a program of early admission for promising high school students. Colleges selected students according to their own criteria for high academic promise and maturity; scholarship aid was provided. Most of the students received the same academic treatment as other freshmen; 70% were male; 80% came from urban areas; 73% attended public schools; and most were from the middle class, were 16 or younger, and had not completed high school. As a result, the students as a group outperformed their classes as a whole, and a higher proportion ranked in the top of their classes than a comparison group with similar abilities. Of 860 scholars who entered the 12 colleges in 1951 and 1952, about 6% failed academically and 6% failed because of adjustment difficulties. The greatest loss of scholars was through transfer to other institutions. Forty-two percent of the 1957 group felt that early admission was profitable while 75% of the 1952 group felt this way. Parents whose children did well tended to express approval while parents of unsuccessful children tended to show reservations. All participating colleges considered the program a success. Conclusions were that high academic achievement and the ability to handle the responsibilities of college life are requirements for early admission. (RJ)

Descriptors: exceptional child education; gifted; superior students; summer programs; academic achievement; follow-up studies; teacher role; parent role; program evaluation; accelerated programs; teacher education; elementary school students; high school students; student attitudes; teacher attitudes; parent attitudes; characteristic of successful students; student evaluation; Western Carolina College

Follow-up studies were conducted to determine the influences of four summer projects (1958-1961) upon gifted students and their teachers. Eleven colleges selected students according to their own criteria of high academic promise and maturity; scholarship aid was provided. Most of the students came from rural areas; 60% were male; 80% came from urban areas; 73% attended public schools; and most were from the middle class, were 16 or younger, and had not completed high school. As a result, the students as a group outperformed their classes as a whole, and a higher proportion ranked in the top of their classes than a comparison group with similar abilities. Of 860 scholars who entered the 12 colleges in 1951 and 1952, about 6% failed academically and 6% failed because of adjustment difficulties. The greatest loss of scholars was through transfer to other institutions. Forty-two percent of the 1957 group felt that early admission was profitable while 75% of the 1952 group felt this way. Parents whose children did well tended to express approval while parents of unsuccessful children tended to show reservations. All participating colleges considered the program a success. Conclusions were that high academic achievement and the ability to handle the responsibilities of college life are requirements for early admission. (RJ)
The findings of the three programs, elementary, high school, and teacher training, are presented mainly by citation of quotes from questionnaires and interviews. The student areas covered are academic achievement, motivation, financial aid, guidance, motivation, problem-solving, emotional adjustments, study habits, and underachievement. Statistical information on each group is included along with a summary of the findings for each program. The teacher-training program has two aspects: a two-week workshop for teachers and a leadership conference for school leaders. Their comments in the area of initiating a program, group work, peer teaching, nongraded primary, enrichment, curriculum and methods are given. The findings include the following needs: special education services, home and school working together, enrichment, and taken with problems of emotional adjustment. The identification of underachievers, and new procedures for school reports and grading systems. (DS)

Descriptors: exceptional child research; gifted; teaching methods; inquiry training; instructional materials; sciences; academic achievement; critical thinking; questioning techniques; teacher behavior
To test the efficacy of inquiry development materials with the gifted, six 7th-grade classes in the top 25% participated in an inquiry science class with specially selected materials twice a week for 40 minutes over 6 months; six children with IQs in the top 10% worked on science activities in another room. Pre- and posttests in critical thinking and science achievement were administered; in addition, a matrix of inquiry and analysis of student questions and teacher interaction were made. Results indicated that the students in the inquiry class asked significantly more questions relating to experiment and that the teacher, while in the inquiry class, was significantly more likely to clarify pupil questions and to respond to pupils seeking data than he was with the conventional class, to whom he provided data. Other results were nonsignificant, thus failing to provide evidence of noticeable improvement in the area of inquiry. (JD)

Descriptors: exceptional child research; gifted; student attitudes; student interests; individual differences; personal values; creative ability; social values; student leadership; ability identification; academic achievement; creativity; individual characteristics
To determine differences in the attitudes, interests, and values of gifted high school students in relation to their total environment and to delineate the characteristics of these gifted students, especially those characteristics which differentiate the three profile types of creative intellectual, studious, and social leaders, superior students from the tenth, eleventh, and twelfth grades were assigned to one of the three profile groups on the basis of self-classification. Comparative analysis was performed throughout the study by drawing in contrast between two eleventh grade groups, one average in ability and the other superior. It was concluded that the creative intellectuals showed strong, self-directed interest in learning and a great willingness to deal with both the subjective data of the self and the objective data of the larger world. The studious, while also showing a concern for facts and a desire to learn, mainly confined their efforts to completing teacher-directed assignments. The social leaders preferred to make their impact felt on people rather than in the realm of ideas. It was felt, that on the basis of these findings, new guidelines for educational strategies should be developed to take into account these differences among the gifted. Extensive tables present results. (Author/GD)

A Psychological Study of 10 Exceptionally Creative Adolescent Girls. EDRS not available
Exceptional Children; V36 N6 P431-41 Feb 1970
Descriptors: exceptional child research; gifted; creativity; adolescents; family background; educational background; self-concept; peer assessment; leisure time; student interests
Ten high school girls were identified as exceptionally creative on the basis of teacher nominations and test scores. Historical, personality, and profile data were collected by means of tests and interviews. Particular emphasis was placed on life history antecedents of creative achievement. The highly creative girls were found to possess a number of common characteristics, particularly in the areas of familial and educational history, leisure time activity, fantasy experience, and self concept. A Field Demonstration of the Effectiveness and Feasibility of Early Admission to School for the Mentally Advanced Children.
Pennsylvania State University, School Of Education Office Of Education, Washington, D. C.
EDRS mf,hc
OEC-2-10-074  CRP-D-010
Descriptors: exceptional child research; gifted; demonstration programs; early admission; early childhood education; kindergarten; academic achievement; social adjustment; personal adjustment
A 4-year study demonstrated the feasibility and effectiveness of early admission to school for mentally advanced children. Approximately 800 children were screened to locate the 36 children who entered kindergarten before the usual time. Criteria for early admission included an IQ of 130 or higher, social maturity at least 1 year advanced, absence of health problems, satisfactory emotional development, approval by kindergarten teachers after observation of a kindergarten visit, and parental approval. Data were collected on the attitudes, costs, and modifications required in activities of professional staff, and on the achievements of pupils. Children admitted early to school on the bases of mental, physical, social, and emotional readiness did as well in academic work as their older classmates of like ability in kindergarten and first and
second grades. On sociometric measures there was no evident difference between early admitted children and others. The process of demonstration was analyzed in terms of innovation and change. Information about the demonstration was disseminated widely through public information media. (JM)

Reading of Highly Creative Versus Highly Intelligent Secondary Students.
EDRS mf.hc
Paper Presented At International Reading Association Conference (Boston, Massachusetts, April 24-27, 1968).

Descriptors: exceptional child research; creative reading; creativity; functional reading; gifted; imagination; intelligence; interpretive reading; reading processes; reading skills; secondary school students; cognitive processes

The purpose of this study was to explore the similarities and differences in the reading behaviors of highly creative (HC) and highly intelligent (HI) secondary students. An intensive analysis of the oral introspective and retrospective responses of 36 subjects to two written passages was made. An experimental classification framework was developed to analyze the data. Results include the following: the HC group exceeded the HI group in responses for selected content elements and cognitive patterns in both free and controlled reading situations; there was no difference between groups in the recall of directly stated information; the HC group exceeded the HI group in reading for nonliteral meanings; and the HC group exceeded the HI group in variation of thinking methods. It was concluded that these two groups had different reading styles. The HC group possessed imaginative characteristics and HC read from without. The HI group possessed intellectual characteristics and read from within. The implications of this study for the areas of understanding giftedness, understanding the reading process, and curriculum planning are discussed. Sample interviews are included. (BS)

Descriptors: exceptional child research; Caucasian students; creative ability; creative development; creativity; creativity research; grade 4; grade 7; grade 12; Negro students; parochial schools; student characteristics; student evaluation; teacher attitudes; public schools; sex differences; age differences

The purposes of this investigation were to determine whether differences in creative ability exist between white and Negro students, between public and parochial school students, between students of different grade levels, and between sexes. A corollary purpose of this study was to determine how well teachers can identify the creative students in their classes by personal contact and by observation. A total of 600 students in grades four, seven and twelve were given the California Test of Mental Maturity and the Torrance Tests of Creative Thinking. The teachers involved with these students were asked to select the five most and the five least creative students in their classes. Significant differences were shown between grades four and twelve, favoring the higher grades. Public school students were more creative than parochial students. No significant differences were found between Negro and white students, between grades seven and twelve, or between the sexes. Results indicate teachers are not able to identify creative students. The Variables of Race, Sex and Intelligence Related to Social Choices of Disadvantaged, Gifted Children.
Champaign Public Schools, Illinois Illinois State Office Of The Superintendent Of Public Instruction, Springfield
EDRS not available
Office Of The Superintendent Of Public Instruction, State Office Building, Springfield, Illinois 61106.

Descriptors: exceptional child research; gifted; disadvantaged youth; social attitudes; racial attitudes; sociometric techniques; race differences; racial differences; social relations; parent school relationship; intelligence factors; racial integration; integration effects; racial discrimination; Negroes; Caucasians

To explore the relationship of sex, race, and intelligence factors to social choice, a sociometric questionnaire was administered to 100 culturally disadvantaged, gifted children composed of both Negro and Caucasian boys and girls. Results showed that sex was the most important single factor in choosing companions, race the next most important factor, and intelligence the least significant. The isolates tended to be from the more deprived homes and were usually quiet and withdrawn with a few being the aggressive type. Diagrams are provided indicating sex and race characteristics of choices. (RD)

Office Of The Superintendent Of Public Instruction, State Office Building, Springfield, Illinois 61106.

Descriptors: exceptional child research; gifted; honors curriculum; self concept; college students; questionnaires; intelligence tests; personality tests; creative ability; program effectiveness; motivation; academic achievement; student characteristics; student attitudes

Self concept questionnaires were administered to 196 participants of the James Scholars honor program at the University of Illinois. Data from these and from previously administered areas as chapters; creativity, and personality tests were analyzed in order to determine student characteristics among those who had become inactive in the program and those who remained active. Results showed little in the way of a significant and consistent pattern of differences between Inactive and Active scholars of either sex. Conclusions included a need for program improvement and further studies in motivation and attitudes of students (RD)

Largely as a result of the extensive work carried out during the past decade, the concept of creativity has become increasingly important in educational and psychological thinking. This monograph attempts to impose a framework within which to describe the main varieties of research on creativity. The monograph includes the following areas: intellectual creativity; creativity related to intelligence and personality; special abilities in creativity; studies of creativity in the arts and sciences, personality and intellectual
characteristics in creativity, the development of creativity, environmental studies, studies of problem-solving in creativity, group processes and group effectiveness in creativity, tests and measurements, and research reports prepared by the Aptitude Research Project, University of Southern California. Descriptors: exceptional child research; anxiety; correlation; gifted; group intelligence testing; individual characteristics; intelligence tests; personality; self concept; self control; verbal ability; vocabulary.

The degree to which potentially useful group intelligence tests were affected by personality characteristics such as anxiety, impulsiveness or caution, and verbal interests was investigated by a battery of intelligence test interest, and personality tests administered to 1,163 gifted adolescents in special summer programs. Intelligence was measured by the D-48 (non-verbal) and the Terman Concept Mastery Test (CMT-Verbal), anxiety by the Minnesota Multiphasic Personality Inventory (MMPI) A-scale, impulsivity by the MMPI PD- and MA-scales, verbal interest by the Strong Vocational Interest Blank (SVIB) Lawyer and Author-Journalist (men's) scales, self-concept by Gough's Adjective Check List, and carelessness by errors on easy intelligence items. Significant negative correlations were found between anxiety and intelligence, impulsivity and intelligence, and carelessness and intelligence. Positive correlations were found between verbal interest and verbal intelligence, non-verbal and verbal intelligence, and counseling readiness and intelligence. Wider use and revision of the D-48, restricted use of the CMT, part and total score-reporting of the CMT, and additional correlational analyses between the MMPI scales and Adjective Check List, and between the SVIB scales and the two intelligence tests are recommended. *The Fulfillment of Promise: 40-Year Follow-Up of the Terman Gifted Group.*
Stanford University, California, Department Of Psychology EDRS not available Genetic Psychology Monographs; V77 First Half P3-93 Feb 1968

Descriptors: exceptional child research; gifted; achievement; personal adjustment; individual characteristics; follow-up studies; success factors; adult characteristics; psychological characteristics; political attitudes; social values; social characteristics; personality; professional recognition; educational background; family background.

As followup, a seventh survey was done in 1960-61 of the 1,538 subjects studied by Terman in 1921-22 (837 boys and 671 girls, aged 3 to 19, all scoring top 1% on intelligence tests). Data were obtained by mail questionnaire for 87% of the 1,398 subjects still living (median age 49). Conclusions were as follows: the subjects had become gifted adults, maintained intellectual ability, had lower mortality rates, and good physical and mental health, manifested minimal crime, ranked high in educational and vocational achievements, were active in community affairs, and held moderate political and social views. Two-thirds felt they had lived up to their intellectual ability. To assess correlates of vocational achievement, the 100 most and 103 least successful men were compared. Results indicated that the most successful men came from families having higher socioeconomic status and giving more encouragement to succeed; ranked higher as adolescents in volitional, intellectual, moral, and social traits; and had more self confidence, perserverance, and integration toward goals. In addition, although school achievement had been similar in grade school, half as many of the least successful men had graduated from college; they were also more prone to emotional and social difficulties. Descriptors: exceptional child research; gifted; talent; individual characteristics; prediction; academic achievement; behavior patterns; talent development; intellectual development; cognitive ability; personality; behavior theories; peer relationship; self concept; student evaluation; social values.

With a dyadic interaction theory of human development and behavior as the framework, success and failure, multiple regression analyses were used to determine predictors and criteria of talent (socially or culturally valued behavior). Analyses covered grade point average and scores on standard academic achievement and scholastic aptitude tests; also covered were teacher, peer, and self ratings. Of the resulting 13 underlying criteria of talented behavior in 961 twelfth graders and nine predictors in 1,464 ninth graders, intercorrelations were found between the following (criteria appear first): academic performance and convergent thinking; reputed brain and peer evaluated brain; social poise and peer evaluated brain, also self rated conformist; and (negative) potential delinquency and social isolation. Findings supported the dyadic theory. Discussions are provided on the theory and teacher evaluation of academic achievement; data, methodology, and dissertation abstracts by staff are appended. (JD)

*Laboratory Studies of Creative Thinking Techniques: The Checklist and Morphological Synthesis Methods.*
Wisconsin University, Madison Office Of Education (DHEW), Madison, Wisconsin OEC-5-10-154
TR-94

Descriptors: creativity research; creative thinking; problem solving; inquiry training; questioning techniques; productive thinking; cognitive processes; check lists; thought processes; performance factors; teaching methods; productivity.

Six experiments were conducted to determine whether idea checklists increased idea quantity and quality. College students were allowed 10 or 20 minutes or unlimited time to find ideas for product improvement problems. Results indicated that the only checklist which significantly stimulated productivity was composed of some verbal categories of solutions (e.g., change shape, change material). Another creative thinking technique, the morphological synthesis procedure (Allen, 1962), also significantly stimulated idea production, but a direct comparison with the brief checklist condition was not meaningful. Subjects provided with longer checklists, including Osborn's (1963) 73 idea spurring questions, performed no better than controls. With additional problem solving time, rate of idea generation decreased but idea quality increased. Object complexity, manipulated in two timed studies, was not systematically related to product improvement scores, and instructional constraints to be original and be practical decreased idea frequency. It was thus concluded that creativity can be increased by teaching deliberate techniques for generating new combinations of ideas. (Author/ JD)

Descriptors: creativity research; creative thinking; creative development; workbooks; creative ability; instructional materials; teaching methods; program evaluation; creativity; Stretch Workbook

To determine if use of a creativity training workbook (Stretch) would increase creative performance, 45 fourth grade pupils were studied. The students were divided into control and experimental groups with half high (mean IQ 113) and half normal (mean IQ 101) ability. The controls were given a placebo workbook and the experimental group was assigned the Stretch workbook. The data upon pre- and posttesting with the Torrance Tests of Creative Thinking revealed no significant differences between the two groups. However, the author felt from analysis and informal observation that Stretch did improve verbal originality, certain scores of the low ability group, and all students improved significantly on almost all measures. The author indicates that the workbook has the potential to be helpful in creativity training. (JM)

Descriptors: exceptional child research; gifted; creative ability; creative development; creativity research; cultural enrichment; fine arts; originality; personality development; talent development; teaching methods; Living Arts Program

The purpose of this study, sponsored by a ESIA Title III grant, was to evaluate the effectiveness of the Living Arts Program in developing creative behaviors. The data were obtained from a random sample of 198 students in grades 7-10 who took part in the Living Arts Program for one semester. The data were obtained from an experimental group of 188 students in grades 7-10 who took part in the Living Arts Program for one semester. Each group was divided into high, middle, and low levels of creativity based on three different measures of academic potential with somewhat different methods. The results indicate that the Stretch Workbook did not improve creative performance, but generally the gifted performed significantly faster on both academic and non-academic behaviors. Also, the higher the level of creativity the faster the behavior, and the correlations between academic rates and achievement scores, non-academic rates, and intelligence test scores are all above the .005 level of significance. The conclusion is that study should be made to determine whether accelerating behavior rates could increase abilities and giftedness. (JM)

Illinois State Office Of The Superintendent Of Public Instruction, Springfield
Descriptors: exceptional child research; gifted; teacher evaluation; questionnaires; evaluation techniques; student attitudes; student reaction; class management; classroom techniques; cognitive objectives; teaching quality; teacher behavior; teaching methods; special classes; cognitive processes; class activities questionnaire

Developed to assess congruence of intent and practice (the teacher's ideal and students' perceived real) in instruction of the gifted in the Illinois program, the Class Activities Questionnaire (CAQ) includes 52 forced choice items evaluating cognitive emphasis, classroom conditions, and student attitudes and reactions. Cognitive items were shown to be consistently identified with the appropriate level of the taxonomy of intellectual abilities. Field testing indicated that the CAQ could be used with grade 6 and above. Intercorrelation, factor, and reliability analyses demonstrated the CAQ to be an adequate instrument. Scoring procedures and interpretation are explained for each of the three areas evaluated. (JD)

EDRS mf,hc

Descriptors: exceptional child research; creative development; cultural factors; creative ability; Negro education; Negro culture; elementary school students; culturally disadvantaged; testing

Designed to examine the cultural influences on creative development, the study analyzed imaginative stories by students from a segregated Negro school in Georgia and from a middle class white school in Minnesota. The stories were evaluated in terms of originality, interest, style, and pressures of divergence and conformity. The students were further compared by teacher ratings and by performances on the Verbal Creative Thinking Task. Statistical data provided for the results showing greater creative ability among the Negro students, and implications regarding cultural causation are indicated. (RD)

The Talented Student: A Validation of the Creativity-Intelligence Distinction
EDRS not available

Descriptors: exceptional child research; giftedness; creativity; intelligence achievement; academic achievement; creative activities; individual activities; science activities; leadership; art activities; creative writing; creative thinking; grades (scholastic); personal adjustment; productive thinking; originality; curricular activities

The relationship between intelligence and creativity was studied in 503 college students. Scholastic Aptitude Test scores were averaged to determine intelligence; tasks were designed to measure number and uniqueness of ideas. High school and freshman college grades indicated academic accomplishment; student questionnaires rated talented nonacademic accomplishment in aesthetic, scientific, and social areas. Results indicated that high intelligence was linked with higher grades but was unrelated to nonacademic accomplishment. Idiational output was related to both academic and nonacademic accomplishment generally, ideational uniqueness was not pivotal in nonacademic accomplishment. In interviews, students with high ideational productivity manifested the highest degree of competence at self initiated activities. (JD)

Descriptors: exceptional child research; giftedness; grouping (instructional purposes); student development; enrichment programs; enrichment activities; program descriptions; program evaluation; experimental programs

While in 3rd grade, 487 students were selected for placement in special classes for the gifted from grades 4 through 8. Teachers of the special classes were chosen by school administrators. Their teaching experience averaged 9 years, and eight held advanced degrees. Sixteen attended special summer programs on the gifted and were given in-service assistance. Results indicated that the program children equalled or surpassed the controls in academic achievement as measured by standardized tests despite the fact that their supplementary enriching activities reduced by about one half the time spent on regular classroom activities. Further results indicated skill in foreign language, research, and critical thinking as well as growth in social awareness and concern, leadership, creativity, interests, and self reliance in school activities. Approval of the program by both teachers and parents was noted. (Author/JD)

A Doctoral Thesis Prepared By The Author And Presented To The Faculty Of Purdue University.

Descriptors: exceptional child research; material development; creativity; creative thinking; language development; problem solving; language ability; audiosvisual aids; learning activities; intermode differences; instructional materials

Instructional materials designed to increase creative thinking abilities and language achievement were used in nine training conditions with children in grades 4, 5, and 6. Results indicated that treatment conditions were most effective at the 4th grade level, where at least one treatment was effective for all variables. At the 5th grade, two variables, verbal fluency and verbal originality, were unaffected. The materials were least effective at the 6th grade, where gains occurred on only three variables: nonverbal fluency, nonverbal flexibility, and verbal originality. At all grade levels, treatment conditions were generally more effective when exercised as either exercise or single component conditions. (Author/JD)

Descriptors: creativity; creative develop-
ment; creative teaching; teaching tech-
niques
The author drew from over 500 research
reports on creative thinking to compile
the most valuable items for classroom
teachers, emphasizing positive aspects
rather than gaps in knowledge. Creativi-
ty is defined, and its manifestations and
the means of measuring creative think-
ing abilities at various educational levels
from preschool to college are mentioned. Pat-
terns of development of creative abilities
and creative ways of learning are dis-
cussed. Specific ideas offer suggestions
to a teacher for providing opportunities
for creative behavior. Also considered
are common blocks to creative develop-
ment, how teachers can increase their
own creativity, and goals in guiding creativity. (KW)

A report designed to provide assistance
to school personnel responsible for re-
search on the education of academically
talented students is the result of a con-
fERENCE on such research as part of the
NEA Project on the Academically Tal-
ented Student. Basic assumptions and
procedural safeguards related to design,
variety of procedures, and evaluation of
data are suggested. School-initiated and
teacher-initiated research are discussed,
and various organizations and projects
concerned with research on the academ-
ically talented are described. Research is
reviewed as illustrative of sound proce-
dures and recommended technique in the
areas of individual characteristics (de-
velopmental studies, the structure of in-
te11ect, cultural factors, personal fac-
tors), educational practice (general sur-
veys, administrative provisions, course
content and method), and research stat-
tus and needs (coordination and con-
tent). A bibliography is included. (KW)

ues; audiovisual aids; testing
A study was made to describe and to
discover possible ways of influencing in-
tellectual and personality development in
ninth grade gifted youth. The report, sec-
ond in a three-part study, reviewed the
results of an experimental program designed
especially to produce changes in atti-
itudes, interests, and values toward cre-
ative intellectual norms. The investi-
gation centered on two distinctive pat-
terns: the creative intellectual style and
the feminine dimension. Formal and
informal measures of creative intellec-
tual attitudes were administered to both
experimental and control groups. The ex-
perimental group was found to be higher
than the control group at post-
testing in originality, complexity, aesth-
eticism, theoretical orientation, and
philosophical contemplation. It was con-
cluded that attitude change could be
brought about through special efforts. (GD)

nitive ability; originality; creativity re-
search; sex differences; intelligence lev-
el; psychological characteristics; individ-
ual differences
An examination was conducted to deter-
mine if a child's ability to create (cogni-
tive originality) is independently asso-
ciated with his general level of intellig-
ence, and if so, to study psychological corre-
lates that distinguish individual dif-
fences on the creativity and intellig-
ence dimension considered jointly.
Instruments, covering both verbal and
visual formats, were developed and ad-
ministered to over 150 fifth grade
children in a gamelike context without
time pressure. These required the child-
ren to generate various kinds of asso-
ciates with given task requirements. Each
child determined uses for particu-
lar objects, ways in which particular
objects were similar, and things that
particular patterns represented to them.
Intelligence information was obtained
through the use of a standard test ho-
metry. Correlations between the creativity
and intelligence measures were found to
be extremely low. The subjects were
then isolated by sex into one of four
groups: high creativity, high intel-
ligence; high creativity, low intelligence;
low creativity, high intelligence; and low
creativity, low intelligence. Differences
among these groups were studied in four
areas of cognitive functioning: behavior
as observed in school and play settings;
activities in categorizing and concep-
tualizing; sensitivity to psychogenic
properties of environment; and person-
ality dispositions, indicated through self
description and teacher evaluation.
A student's score indicated he was
a distinctive and unique association were found
to exist. The research indicated the
importance of jointly studying variations
in creativity and general intelligence, if
understanding of creativity is to be
furthered. (JH)

Nonintellective Variables Related to
Academic Achievement of Bright Ju-
ior High School Boys.

achievers; psychological patterns; ad-
justment (to environment); student prob-
lems; student research; student motiva-
tion; student interests; junior high
schools; motivation
In previous studies, personality varia-
bles, such as adjustment, motive to
achieve, motive to affiliate, acceptance
of self and others, and acceptance of
adult values, have been studied to deter-
mine their relationships to school
achievement. Interrelationships among
these variables were examined in this
study. The California Test of Mental
Maturity was used to select boys from
grade 8, and the Wechsler Intelligence
Scale for Children was used to confirm
selection. The 264 students were inter-
viewed and tested with the California
Psychological Inventory, Bills Index of
Adjustment and Values, and a card sort.
Grade point averages were obtained and
the Iowa Test of Basic Skills was admin-
istered. The high and low thirds of the
group were tested using Dunn's Visual
Discrimination Test, Wechsler Thematic
Apperception Test, and McClelland's Projec-
tive Test. Results showed that low
achievers do not have as close ties with
home nor do they accept conventional
values as much as do high achievers. The various measures tended to confirm each other in measurement of variables. Findings confirmed many findings of earlier studies of nonintellective characteristics of high and low achieving bright pupils. This confirmation suggests that future research should attempt to modify certain student characteristics both in the laboratory and in the field. (AL)

An analysis of a field test of science learning materials for able elementary students is reported. The learning materials field tested and evaluated were ungraded independent study kits, designed for maximum suitability regardless of teacher or school circumstances. The learning materials involved concept formation in the topics of atoms, molecules, and measurement. A total of 259 students from 31 different Illinois schools used the materials. Students in the study were selected by their teachers and administrators. Methods of using the materials were established by the teachers. Pretests and posttests were administered to the students. Results are reported for each test item and each grade level, and the authors conclude that the learning materials tested can be used effectively, with greater success predicted for grades 2 and 3 than for grades 1 and 4. Descriptors: exceptional child research; gifted; programed instruction; program evaluation; measurement techniques; innovation; rural schools; rural environment; high schools; demonstration projects; newsletters; information dissemination; secondary school students; parent school relationship; community support; Attitude toward Programed Instruction Inventory; Semantic Differential Scale

Superior students in rural high schools were given programed instruction in selected subject areas to determine whether a nondirective method of diffusing an innovation, like programed instruction, was appropriate for dissemination in a rural environment. The effects of the cooperative demonstration project on students, parents, teachers, and high school administrators were measured by the Attitude toward Programed Instruction Inventory and the Semantic Differential Scale. Results showed that predisposition of the individual to either adoption or rejection will affect the rate and final decision regarding the acceptance or rejection of the innovation. It was recommended that premeasures should be employed to determine the predisposition of the target population, and that the nondirective method of diffusing an innovation was appropriate for the dissemination of programed instruction in a rural environment. Since the use of newsletters proved to be an important contribution to the success of the project, the use of similar means of communication with the target audience is advised when dissemination is an objective. Recent findings concerning the education of superior students are compared with past research in this area. Examination was made of current projects in relation to perennial unsolved problems and with new or uncharted concerns. Social and personal characteristics, identification of the superior student, and intellectual and motivational factors are reviewed. In addition, the discrepancy between prediction and achievement (underachievers), administrative and guidance provisions, course content and method, and current trends and concerns for schools are examined. A selected bibliography on education of the talented, arranged by topic, is included. (KW)
