TITLE Follow-Up Study of 1967-1971 Graduates of Indiana University at South Bend.
INSTITUTION Indiana Univ., South Bend. School of Education.
PUB DATE Mar 72
NOTE 49p.
EDRS PRICE MF-\$0.65 HC-\$3.29
DESCRIPTORS *College Graduates; *Curriculum Evaluation; *Evaluation Methods; Graduates; *Graduate Surveys; *Higher Education

ABSTRACT

The adequacy and effectiveness of an institution of higher education depends on a complex of factors, such as physical facilities, teaching faculty, offered curricula, nature of the student population, and the nature of the community. One often overlooked source of opinion are the graduates themselves, that is perhaps one of the most significant determinants of the adequacy of programs and measures of effectiveness. This study was initiated to determine general background information about all graduates from Indiana University at South Bend who graduated from 1967 through 1971. Information concerning the graduates' present geographic location, occupation, and general comments and suggestions about the university were sought. Only 44.3% return was realized; therefore, only tenuous generalizations to the population as a whole or no generalizations at all should be made. (Author/HS)

FOLLOW-UP STUDY OF 1967-1971 GRADUATES
OF INDIANA UNIVERSITY AT SOUTH BEND

by

Charles R. DuVall, Ph.D.
Associate Professor of Education

in cooperation with

Albert J. Beutler, Ph.D.
Dean of Student Services

and

Ann Chamblin
Joi Doi
Linda Jorgenson
Nancy Mills
Mary Perry
Judy Siefer

ACKNOWLEDGMENT

The completion of a study of this kind depends upon the assistance and cooperation of many persons. The investigators wish to thank the Indiana University Alumni Association and the former director of alumni activities for Northern Indiana Mr. Thomas White. Without the financial assistance provided by the Alumni Association this study would not have been possible.

CHAPTER I

THE PROBLEM AND DEFINITIONS OF TERMS USED

The adequacy and effectiveness of an institution of higher education depends upon a complexity of factors -- physical facilities, teaching faculty, offered curricula, nature of the student population, and the nature of the community. One often overlooked factor is the "final product" - the graduate. This group is perhaps one of the most significant determinants of the adequacy of programs and measures of effectiveness. Colleges should be aware of the status, adequacy, and success of their product. Many institutions periodically survey their graduates on a regular basis and use follow-up studies. Such surveys provide a means for close contact between alumni and the institution to improve programs of higher learning, to aid alumni fund-raising, and to maintain strong alumni communication with the institution involved. (57:202-04)*

Statement of the Problem

This study was initiated to determine general back-

Information such as geographic location, occupation, and general comments and suggestions about the university was sought. This survey was conducted under the supervision of the Division of Education, I.U.S.B., and the Indiana University Alumni Association.

Importance of the Study

The "newness" of the complete program (i.e. degree granting status) at I.U.S.B. makes this study a prototype. This study was intended, therefore, to be a beginning in the collection and dissemination of knowledge concerning the unique character of I.U.S.B.'s graduates. Further, it is believed that this study will have importance to persons throughout the Indiana University system.

Definitions of Terms Used

Several terms employed in the description of this study were defined as follows:

Catharsis. . . .the process of bringing repressed ideas into consciousness and thereby dealing with them; more broadly, and expressive reaction (usually emotional or accompanied by emotion), believed to have some psychotherapeutic effect. (21:77)

Closed Form Questions: Responses are made to a set

Follow-up. A plan by which the experiences or status of people who have left school are investigated or surveyed, either for the purpose of assisting them in further adjustment or for securing facts to improve the plan of guidance for those still in school. (21:233)

Non-respondent. Any recipient of a questionnaire who does not reply.

Open Form Questions. Used for intensive studies or exploration of novel problems. Each answer is a written description and much room is usually available for free response. (4:144-45)

Questionnaire. A list of planned, written questions related to a particular topic, with space provided for indicating the response to each question, intended for submission to a number of persons for reply, commonly used in survey studies and in the measurement of attitudes and opinions. (21:435)

Respondent. Any recipient of a questionnaire who actually replies to the questionnaire. (21:466)

Validity. The extent to which a test or other measuring instrument fulfills the purpose for which it is used. . . (21:593)

Limitations of the Study

One limiting factor which must be considered in any questionnaire study which utilized the mailed form, is that of nonresponse or failure to obtain information from the respondents. According to Kish, this nonresponse may fall into a number of categories, any one of which might describe

of motivating factors, the nature of the questions. Most refusals are considered permanent and fit under the category of "unobtainable."

3. "Incapacity or inability." This prevents a response due to physical or mental illness during the entire study period.

4. "Not found." This may be a large category for mailed questionnaires, and these respondents are usually not followed or identified because of the expense involved.

5. "Lost schedules." This would include questionnaires lost in the mail or destroyed, or those in such poor condition that they cannot be used. (32:533-34)

Another limitation was the nature of the population, i.e. all I. U. S. B. graduates. Because of the nature of the institution, its "newness" and the small number of graduates, the results could be skewed.

A follow-up letter should have been utilized to increase the per cent of responses. Only 44.3 per cent return was realized. For this reason only tenuous generalizations to the population as a whole, or no generalizations at all should be made.

CHAPTER II

DESIGN AND RATIONALE

To obtain the desired information a questionnaire was developed, as was an accompanying cover letter which included an explanation of the study. According to established patterns found in research, certain information, details, and form were included in the design of the cover letter. Such included items were as follows: the purpose of the study, the importance of the study to the respondent, the value of the respondent's reply, and the signatures and titles of the supervising I.U.S.B. educators involved in this particular study. (6:214-15) The cover letter did not mention any confidential treatment of the returned information due to the anonymity of the respondent. A summary of the findings was promised in a future issue of the I.U.S.B. Alumni Newsletter. (57:205) General attractiveness was stressed. Bold elite type printing was used on good quality white paper bearing the official letterhead of I.U.S.B. (57:203)

According to Good and Scates, questionnaires constitute a major, reliable survey instrument for data-gathering in various survey studies. (23:606) The mailed questionnaire was used because personal contact was impossible in many

mobility (52:127) and the possibility of some replies being incomplete or not returned, this technique was still employed in gathering the data for this study due to its proven general effectiveness and its relative low cost (13:256).

Concerning the beginning statements about degree area and major field of study, this information was requested for possible correlations drawn between the students' undergraduate major areas of study and their present occupational field. The year of graduation was included in order to find the number of years the graduate had been away from the university, as well as to establish the relationship (per cent) of returns by graduating class. This was deemed to be highly essential for an institution such as I.U.S.B. which is growing rapidly.

No identification of respondent was asked as anonymity encourages frank and truthful answers (22:193). It was hoped that a confidential and anonymous questionnaire would result in a higher return of survey forms.

In the ordering of questions, items were placed in a funnel structure, a psychologically and logically sound sequence, with simple, interesting, and neutral questions preceding more difficult, crucial, and personal ones

(55:257). This is succinctly presented by Levine and

to keep the first few questions simple and easy to answer, though not trivial. Respondents tend to be discouraged when they have to answer difficult or relatively personal questions in the initial part of the questionnaire. Important questions should not be placed at the very end, especially in long questionnaires, since fatigue factors lead to omissions and errors. (35:572)

Questions were kept short because brevity was stressed in research. The question length did not exceed more than 20 words, with every word being familiar and concise, (41:56) thus involving a minimum of the respondents time.

Both closed and open form questions were employed in the questionnaire. The closed form type question, requiring checked responses, was used to secure categorized data. These exercised a directive influence in obtaining responses and facilitated the processing, tabulating, and summarizing of the data. Open form questions were used in order to provide a more concise picture of how the respondent reacts to various topics. (55:256) The open type question form was employed in some questions even though it presented greater difficulty in terms of time and work involved in tabulating and summarizing. Open form questions may also produce answers that are impossible to tabulate. Despite its limitations and difficulties in analyzing replies this

Dichotomous questions (either "yes-no" or "true-false") more or less force respondents into taking a definite stand when they would not do so otherwise. These were used only where deemed appropriate, with full recognition of their limitations. (23:615, 617)

When wording questions the following ideas, from Parten, were taken into account:

Using simple words

Making the questions concise

Formulating questions to yield exact information desired

Avoiding ambiguous questions

Avoiding leading questions

Deciding as to the use of prestige names

Avoiding "danger" words connoting emotionalism, stereotyping, etc.

Making allowance for all possible responses

Designing realistic multiple-choice alternatives (42:200-01)

Some questions were asked, not only for information but also to prepare the respondent for the subject area, because of their general nature, and because these types of questions are expected in any questionnaire. Other questions were included for the purpose of catharsis, or release of tension and to allow the respondent to state any further

Oppenheim observed that:

The classification questions are a special type of factual question that ask about sex, age, marital status, income, education, occupation, family, the size of family, and so on. These are of special importance in stratifying the sample and tend to recur from survey to survey; for both of these reasons they are worth special attention. (41:57)

Instrumentation

Heading the list of numbered questions were the areas of gender and marital status. These were necessarily included for classification of the respondent. The answers elicited from these questions served as tools for interpretation of answers to the questions which followed. For example, the fact that a respondent checked "male" and "married, have children" had more bearing on the analysis of his responses to the questions about employment status and educational background than if he had checked "male" and "single." Sax listed as further justification for the inclusion of question 1 that whether a respondent is male or female "may correlate with student preferences" in the open-ended questions. (48: 218) It was decided that for this study Sax's justification could be extended to include the questions about marital status, as well as present age range, and present geographic location.

is a particular age. This question can be clarified by asking age to nearest birthday, date of birth, or age range. (4:150) Since there was no need to know the respondents exact age, the question was structured to determine only age ranges.

Questions 5, 6, 7, and 11 all pertained to one of the main concerns of the study-- present occupations of the I. U. S. B., graduates, if employed. Studying careers can be useful in noting particular aspects such as recruitment patterns, amount of vertical mobility, degree of job security, and adjustment problems at different stages of careers. (17: 284-85) Such information was thought to be useful to the I.U.S.B. administrators when reviewing data about the school's graduates in relation to their past training and future prospects. The questions on this subject (i.e. work area) were grouped accordingly and purposely to give the questionnaire a semblance of order. (38:245-46) The more general questions of the set came first, followed by the more detailed and specific ones, thus allowing for a more precise delineation. The categorizing of vocations in question 7 was an adaptation of a classification system used in the survey entitled "A Survey Report of Indiana School Dropouts for the Year 1964-65." This system used as its format the prestige

1. The division of the categories was exhaustive.
2. There were no overlappings across major divisions between categories.
3. The categories provided were mutually exclusive.
(28:45-46)

Hence, to avoid the possibility of numerous responses, a section for further description was provided to the far right of each multiple choice item of the job classification system. Question 11 was interjected to correlate the graduates' present occupations to their previous training and education at the university.

In some instances items dealing with salary may produce significant positive distortion in a respondent's answers. However, if the conditions of personal threat can be minimized, then somewhat less distortion may be expected. (44:5) This question concerning annual salary was considered necessary and helpful for counseling purposes. It was hoped that the personal threat would be alleviated, or at least greatly minimized, by including a salary range and by guaranteeing the anonymity of the respondent.

Questions 9 and 10, which requested information about involvement in an experimental program, provided the opportunity for the respondent to expound upon his innovations. It was indicated in studies conducted by other educational

Questions 12 through 15 were designed to elicit specific information concerning school training of the respondent at I.U.S.B., the amount and kind of this training, and the number and per cent of those returning to institutions of higher education for post-bachelor training. Questions 14 and 15 specifically asked for information from the graduates which could be used to determine their view of the effectiveness of their training at I.U.S.B. These questions would hopefully provide information useful in improving the institution's programs. A point of reference is necessary when asking for ratings on questionnaires, as in question 14, thus five different elicitors were provided from which the respondent was to choose. (44:5) Although it is possible to use fewer than five elicitors, generally speaking a more reliable response is obtained by using more elicitors. (4:148)

Questions 16, 17, and 18 were recognized to be parts of a "loaded question" series (48:219) but were included verbatim in the questionnaire at the request of the Alumni Association, which funded this study. According to Payne, in The Art of Asking Questions, a loaded question is one which, because of its wording, often causes some respondents to give answers which are different from those they would

16 through 18 were, in the opinion of those who developed the instrument, the most leading or "loaded" of any included in the questionnaire. The question "Do you read the Alumni Newsletter?" seemed to beg for an admission. Wouldn't those persons receiving the Newsletter think they were obligated to answer "yes?"

Questions 19 and 20 were included in the instrument for the purpose of catharsis as suggested by Good and cates. (23:618) By providing the respondent with the opportunity to comment generally about institutional procedure and courses, he will then feel more important. This quality of personal importance is to maximize the questionnaire returns. This information may be instrumental in initiating some changes in the I.U.S.B. programs which might have otherwise been overlooked. In addition, these open form questions may also elicit information not anticipated when the instrument was prepared. (35:572)

The responses to these questions were not codified and analyzed in this study. The raw data were provided to the appropriate officials within the university for their information, and hopefully for implementation of changes where necessary and/or possible.

CHAPTER III

PRESENTATION OF DATA

Data are presented in tabular form for the I.U.S.B. graduating classes of 1967, 1968, 1969, 1970, and 1971. These tables should be self-explanatory to the reader. Due to the few number of responses (44.3 per cent) care must be taken to avoid reaching conclusions that may over-extend these data. Data are presented "for their own worth" and the reader may draw his own conclusions, hopefully with a great deal of care and even trepidation. However, because of the nature of the study it is believed that the data are of great interest and should be of some limited significance and value.

Percentages are presented, in most tables, as a per cent of the total responses and not within discipline or division area. That is, percentages (in most cases) are additive.

APPENDIX

INDIANA UNIVERSITY at SOUTH BEND

1825 NORTHSIDE BOULEVARD
SOUTH BEND, INDIANA 46615

42

TEL. NO. 219-282-2341

April 19, 1971

Dear I.U.S.B. Graduate:

Enclosed you will find a questionnaire designed to determine general background information about all I.U.S.B. graduates. It should be mentioned from the outset that your participation in this research project is most appreciated. This survey has been developed by the I.U.S.B. Division of Education with the cooperation of the Indiana University Alumni Association. Your help is needed in determining where the graduates of I.U.S.B. are now living and what their present occupations are. Also, any suggestions and comments about your reflections of the university are most welcomed.

To determine these conditions, it is requested that you fill out the enclosed questionnaire, responding to all questions that are pertinent and relative to you.

Your participation and support in completing the survey form and returning it at your earliest convenience to the Indiana University Alumni Association at South Bend will be greatly appreciated. Results of this survey will be distributed upon its completion through the I.U.S.B. Alumni Newsletter.

9-23-71

Cordially,

Dear '71 Grad:

We used this last fall to "find out" about our other graduates. We decided that we would like to include the data from your class in the study.

Won't you help us by completing the enclosed questionnaire at your earliest convenience and returning it to us?

Thanks,

C.R.M. and A.J.B.

Bachelors degree area & major _____
 (e.g., B. S., Education, Biology)

Year of graduation _____

1. Sex: male
 female
2. Marital Status: single
 married, no children
 married & have children
 separated or divorced
 widowed
3. Present age range: 20-29
 30-39
 40-49
 50-59
 60 & above
4. Present geographic location
 (City and state): _____
5. Are you presently employed? yes no
 full-time _____
 part-time _____
6. Are you presently seeking employment? yes
 no
7. Employment status (Check area(s) and further describe your position at the right):
- Professional, technical & managerial _____
- Sales & merchandizing _____
- Clerical, accounting & kindred _____
- Skilled (requiring apprenticeship or
 special training) _____
- Farmers & farm managers, fishery and
 forestry _____
- Semiskilled (requiring some training) _____
- Service: Personal _____
 Protective _____
 Building _____
 Military _____
 Government _____
- Unskilled _____
- Homemaker _____
- Student _____
- Unemployed _____
- Retired _____
8. Approximate annual income (check one):
- Does not apply \$15,000 - 19,999.00
- Under \$5,000.00 \$20,000 - 24,999.00
- \$5000 - 9,999.00 \$ 25,000.00 and above
- \$10,000 - 14,999.00
9. Are you involved in any type of experimental program? yes
 no
10. If yes, briefly describe the program:

FILMED FROM BEST AVAILABLE COPY

11. Are you presently employed in the area in which you did your undergraduate work? ⁴⁴
 yes Does not apply
 no
12. Approximately how many hours of undergraduate education did you complete at I.U.S.B.?
 1 - 30
 31 - 60
 61 - 90
 91 and more

13. Are you doing or have you done any post-graduate work? yes
 no

If yes, specify degree(s) you plan to earn:

If so, where? I.U.S.B

Other: name _____

How much work has been completed? less than 10 hours
 11-20 hours
 21-30 hours
 31 and over

14. How would you rate I.U.S.B in training and preparation for you major field?
 Outstanding Good Average Fair Poor

15. Have you attended any of the non-credit Continuing Education classes? yes
 no

If yes, indicate: _____

What additional classes or areas would you be interested in seeing developed? (Describe)

16. Do you receive the Alumni Newsletter? yes
 no
