ABSTRACT

Good methods for assessing the comparative costs of various types of academic programs are badly needed. This report briefly describes a method for doing this used in 1970 at the University of South Florida. The method described has limitations, since the data are based on non-personnel costs only. A more useful analysis would be based on total costs. But the method can be applied in comparisons of either total costs or any specific type of cost, such as instructional personnel, support personnel, equipment, etc. It is felt that requiring departments and schools to develop data of this type would facilitate both short- and long-range planning.

Comparative Departmental Costs

H. E. Yuker

Good methods for assessing the comparative costs of various types of academic programs are badly needed. The present report briefly describes a method for doing this that was used in 1970 at the University of South Florida\*. As will be indicated, the method described has limitations since the data are based on non-personnel costs only. A more useful analysis would be based on total costs. But the method is the most important thing. It can be applied in comparisons of either total costs, or any specific type of cost such as instructional personnel, support personnel, equipment, etc. The specific data presented in the table are for illustration only; it should not be assumed that they are in any way comparable to Hofstra data. The question being raised is whether requiring departments and schools to develop data of this type would facilitate both short and long range planning.

Although the study being cited contains much data, only two sets of figures are presented here. The first set of data indicates the cost per full-time student equivalent (FTE) for each department and school within the university, for the two academic years 1967-68 and 1968-69. The number of FTE students is obtained by dividing the total number of student semester hours generated in a department in a given year by the average number of credits taken by students in a year. The total cost is the sum of all budgeted expenditures in each unit. It does not include overhead. The total cost per FTE student is obtained by dividing the total cost by the total number of FTE students. These data are presented in the first two columns of the table. In the last two columns of the table, the data for each unit are presented as an index number indicating the ratio of the total cost per FTE student within each unit to the average cost for all units within the university. In these columns a value of 2.00 indicates that the cost is double the university average, whereas a value of .60 indicates that the cost is only 60% of the university average.

The figures as given do not include salaries of either faculty or staff members. If these figures were included, the data would be much more meaningful.

While the numbers in the table have limited meaning per se, comparisons indicate the kind of analysis that would be useful. Thus, one can compare the costs of running different schools and departments. In the data presented, the most expensive school (Engineering) costs three to four times as much as the least expensive school (Business). The most expensive departments in the sciences cost more than ten times as much as most non-science departments. One can also compare year to year changes in the costs of running a given unit. In a given year, the costs will probably be up for some units, and down for others. These changes should be carefully analyzed to see whether they are justified.

It is suggested that these types of data should be collected for each department and school within the university. The data should refer to total costs, rather than only non-personnel costs. Both comparative and longitudinal analyses could then be performed in order to facilitate rational budget decisions that would lead to the implementation of predetermined specific goals.
