ABSTRACT
                This document presents the results of an extensive
study whose ultimate purpose was to identify the aggregate perceived
values, needs, and aspirations of the total postsecondary
nonuniversity student population in the Province of Alberta. It
describes in considerable detail the needs and motivations of various
groups of students enrolled in a variety of postsecondary,
nonuniversity educational institutions. In doing so, the monograph
also evaluates the degree of accessibility of colleges to different
strata of people and the perceptions that students have with regard
to the services being provided. (Author/HS)

FOREWORD

If educational planning is premised on the belief that man is free to expand his mental powers and is capable of greater perfectability through experience and education, then the needs and aspirations of present and potential clients of the educational system assume paramount importance. The Alberta Colleges Commission Master Planning Project is premised on such a belief and for that reason commissioned an extensive study whose ultimate purpose was to identify the aggregate perceived values, needs, and aspirations of the total post-secondary non-university student population in the Province of Alberta.

Master Planning Monograph #7 reports the findings of this study. It describes in considerable detail the needs and motivations of various groups of students enrolled in a variety of post-secondary, non-university educational institutions. In doing so the monograph also evaluates the degree of accessibility of colleges to different strata of people and the perceptions which students have with regard to the services being provided.

The study is the first of its kind in this Province. It develops a methodology for data collection and analysis which ultimately might be applied to extend research to identifying the values, needs and motivations of potential clients drawn from that portion of the population which has not historically availed itself of post-secondary educational opportunities. The information provided by this extended research will enable institutions to develop additional programs and services to meet the educational needs of designated target populations.

i

The report departs considerably from the traditional format used in reporting research findings. Institutions have been identified by name so that the information provided might be used to achieve greater congruence between client needs and educational services. Comparisons between and among institutions and sub-systems have been made for constructive rather than critical purposes.

The findings reported in the body of this monograph deserve careful study by policy makers, administrators, faculties, and student associations throughout the Province. The institution-specific information contained in the appendices deserves detailed study by the members of each educational institution. Such study and review will bring us closer to the ideal of being able to provide the necessary educational experiences by which each individual in the Province may elect to develop his innate potential as a member of society.

R. A. Bosetti,
Director of Planning and Research.

ACKNOWLEDGEMENTS

The author of this report is indebted to a number of people who provided essential services without which the study would have been impossible. However, he alone is responsible for the accuracy and interpretation of the materials presented.

Miss Pat Fleming acted throughout as chief research assistant, being responsible for coordinating the different forms of the questionnaire, administering the earlier version to selected students and analyzing it for defects. She also interviewed more than 150 students in diverse locations all over the Province of Alberta, summarizing these as she went.

Dr. David Flathman, original coordinator of the inquiry made all the administrative arrangements for administering the questionnaire in the colleges, checking the returns, coding the responses and operating computer programs. He participated at all stages in the discussion of the methodology and helped unobtrusively in all sorts of ways.

Mrs. Ross was responsible for typing the report and transcribing the interviews from tape recordings. My wife typed out first drafts of sections of the report. Emma Collins helped me organize secretarial resources. My son Richard analyzed the course offerings of the various colleges, collected other kinds of information and checked the report for clerical errors.

The Alberta Human Resources Research Council which initially sponsored the study provided all resources, until March, 1972. At that

point, from being Consultant to the Project, the author became Director

of it.   The Colleges Commission in the persons of Reno Bosetti and

N. J. Chamchuk provided information and encouragement at various stages

of the investigation.

Respectfully submitted,

J. McLeish.

Educational Psychology Department,
Faculty of Education,
University of Alberta.

ABSTRACT

The purposes of this study were to determine the social characteristics and motivations of students who enrol in non-university post-secondary institutions.   In addition to certain standard demographic variables, the study examines:

    (a) the attitudes and motivations of students in relation to socio-economic and other variables,

    (b) the influences which seem to affect students' career plans,

    (c) students' attitudes towards education, occupations, and the future,

    (d) the students' attitudes towards the provision made for post-secondary education in the Province, including reasons for the choice of a particular institution,

    (e) career plans, including possible plans for continuing education, and

    (f) the influences which led the student to decide to enrol in the non-university post-secondary institution of his choice.

The data collected and analysed in this study provide information which can be used to evaluate the extent to which there is equality of access to different programs and institutions in the non-university sector of post-secondary education, the financial and "social" costs of attendance for different groups of students, the process by which the decision to attend was made, the extent to which student needs are being met, and numerous other questions.

A questionnaire was developed and administered to a selected sample of full-time students and others in fourteen publicly supported, non-university, post-secondary institutions in Alberta, as well as two private colleges, round about the time of registration in the fall of 1971. A large sample of individual students was interviewed in depth to supplement the questionnaire data. Calendars from the Colleges were systematically analysed to determine the exact nature of the programs being offered.

SUMMARY

To achieve the objectives of this study, a 75-item questionnaire was constructed. It was administered to 864 students, selected as *random* or *complete* samples from the student populations of the sixteen colleges involved in the enquiry. The report is primarily concerned with answering three questions: (a) what type of student goes in for post-secondary, non-university education, with special reference to the factors of ethnic origins, socio-economic level and career aspirations; (b) is the "system" represented by these sixteen colleges doing a satisfactory job in catering for the expressed and felt needs of their students; (c) can the system of post-secondary, non-university education be regarded as performing adequately, especially in regard to vital educational functions essential in a democratic and rapidly changing society but which may not be experienced as needs by the student body.

A detailed analysis of the interrelations between student needs and motivations and the characteristics of the student body constitutes the body of the report. The opportunity is taken to discuss differences between individual colleges and between the various types of college. Broadly speaking, we are dealing with students whose primary objective in attending college is to prepare themselves by the necessary training and certification for a specific occupation, or to upgrade their present job status. The numbers who study "for the fun of it" are quite small. To put this otherwise, the "academic approach" (with all its strengths and weaknesses) is not very well represented in the student body. On the other hand, neither is the irresponsible, cars-girls-drink-sport "collegiate" type of student very

common. Student radicalism, the so-called "counter-culture," is not too well represented in this group either. The students seem to be drawn predominantly from the working class stratum of Albertan society. The children in this group appear to be conscious of the fact that they are having opportunities of educational and social advancement better than were available to their parents. This is an unconfirmed hypothesis: what is certain is that, in general, there is considerable satisfaction with the programs, courses and physical amenities provided for them in these colleges. The college programs in particular, and the methods of teaching adopted, generate satisfaction in the clientele of the colleges. No basic student need has been identified as being frustrated on any sizable scale. The message from the student body seems to be: (a) the general principles on which the system of post-secondary education is based are sound; (b) in certain respects each college could be improved but these ways are college-specific; (c) it is a matter of identifying weaknesses (perhaps in the physical facilities, perhaps in the area of student government, certainly in the area of vocational counselling) and remedying these piecemeal, without any violent change of direction. In the following tables, these weaknesses are pinpointed for each college. This is done by comparing the average level of expressed satifaction with the educational and physical environments to the specific levels of satisfaction in each college. The tables also record differences in the values and career aspirations of students in each of the colleges.

When we analyze the actual programs and course offerings of the different colleges, matters do not appear to be quite so healthy. There

seems to be a dearth of liberal studies in most of the colleges. Even in those in which a university transfer system operates, courses seem to be narrowly geared to the techniques and skills required for particular occupations, without the benefit e .. and even in the most techno- logical of universities) of a substantial body of student and faculty interested in a liberal education oriented towards the humanities and creative arts. This problem, (and one way in which it might be dealt with on a Province-wide basis), is discussed at greater length in the next section.

A new dimension is added to the study by the interview material, collected from a random sample of 153 students in colleges all over the Province of Alberta. In the interview, a more individual standpoint is presented; criticism, constructive or otherwise, can be developed within a specific context. In general, this interview material "comes over" as more negative in tone than the questionnaire materials. However, it should be remembered in reading the transcribed interviews that these represent only a sample of student opinion (albeit chosen as being not untypical). The interviewees were drawn from a pool of students who indi- cated their willingness to *be* interviewed. Presumably, these volunteers felt they had something to say, not catered for in the questionnaire. Given the favourable nature of the questionnaire responses, it might have been predicted that the interviewees would appear to be more negative and more critical of the college faculty, amenities, government and college provision generally. However, it must be said that the tone remains objective, constructive, reasonable.

The materials must be left at this point to speak for themselves.
But it seems to the investigator that the students (as well as administra-
tion and faculty of the college) approached the task of evaluating their
college provision and experience in an extremely responsible fashion. They
did so on the premise that the Colleges Commission (a) was interested in
their experiences and point cf view; (b) had the serious intention of paying
attention to their needs as these were set down by the students themselves,
and (c) were prepared to give some consideration to their views in any
future plans to improve the system of post-secondary, non-university educa-
tion in the Province.

IMPLICATIONS AND RECOMMENDATIONS

General

1. As far as the main question posed in this study is concerned the students in post-secondary, non-university education in the Province of Alberta, as a body, are of the opinion that their colleges adequately satisfy their needs and meet their expectations. There are differences between various groups within the total student population--for example, some colleges seem better than others; there are also differences associated with age, sex, program in which registered, ethnic group, socio-economic class, etc. of the students. But the major finding is that students perceive their basic motivations catered for by the existing provision made for them.

2. However, this generalization has to be interpreted in the context of these actual motivations, and the students' perceptions of what their needs are. College programs and students' motivations are clearly oriented towards the existing world of jobs, technology, and of opportunities generally in the Province of Alberta. This realistic emphasis is a matter for congratulation. There is no doubt that the colleges are responsive not only to the students' demands, but to the pressures of a developing economy, mediated by the worlds of industry, commerce, business and social and governmental agencies. But, on the other hand, it is generally agreed that a primary goal of higher education is to provide the student with the opportunity to develop his own individual standpoint from which to evaluate the existing world. It is in this area that, with exceptions, the system seems to present some inadequacies. In the light of the

present study, the time seems opportune to begin a discussion of the place of liberal studies within the system, and in each student's program.

3.   This problem is pointed up by the existence of university transfer courses, that is, the recognition by the three universities of the Province of certain instructors as providing the equivalent of particular university classes, especially at a preparatory level.   This generates a great number of problems which are closely associated with the question of educational objectives.   The problems appear in the form of relations between faculty, between faculty and students, and between students and administration within the colleges.   Practical difficulties emerge in the context of the different needs of students in such courses as these are perceived--or not perceived by the college administration.

The students in the three institutions offering these programs seem to differ in certain respects not only from other students in the total post-secondary population but also as between the three colleges.   The basic question that presents itself however is whether the university transfer course, and student, is to be regarded as a leaven which is working to change the character and nature of the education provided by the colleges in desirable ways or a foreign body to be excised for the future health of the system.   The basic pre-requisite for the solution of this problem is clarity about the objectives of the post-secondary system as a whole, and the place and function of various elements within it.

4.   As a preliminary, it would seem to be desirable to discover the actual *effects* of colleges on the attitudes, values and motivations of students.   The present investigation was not designed for this purpose.   As

a result we have no hard data from which conclusions can be drawn about the actual outcomes of college education in this area. A carefully designed enquiry, using controls from the university and private sectors of the post-secondary system would provide a base for firm generalization and policy decisions. We envisage a longitudinal study, beginning with students in high school, following them through college and perhaps for a short period at their work-place. For a definitive study of the contribution of post-secondary non-university education, actual and potential, to the Province, a considerable period of discussion and planning is an essential preliminary. The present study has opened up the area of student needs and motivations. It also provides an investigatory model which could be used to generate reliable information in the most economical way in relation to the problem of the effects of college education in the post-secondary system.

5. It is clear from policy statements, programs and general orientation that colleges as corporate institutions profess to "serve the community," not only locally but province-wide. This they certainly do in terms of vocational needs, especially of full-time students who have recently completed high school. They also cater very well to the needs of young men anxious to upgrade their qualifications. The point has already been made that perhaps these students, and their colleges, take too narrow a view of their actual needs as well as of the needs of a modern technological society in process of rapid change. In terms of "serving the community" the same point has to be made. It is one of the functions of an institution of higher education to satisfy existing demands for particular kinds of occupational and professional training. It is also required

of such an institution that it should seek to *discover* educational needs which are poorly represented (minority interests) or of which their present clients are unaware, although they exist in potential form in themselves.

It is an impression, not grounded on specific facts, more on the *absence* of certain expected data, that colleges could do more development work. This would lie especially in the areas (i) of liberal adult education, and (ii) follow-up courses of a type more "slanted" towards established vocational and professional groups. Existing resources might be better used in an overall plan which seeks to integrate available resources from within and outside the regions served by individual colleges. We have in mind an ambitious development of programs sponsored by the colleges and aimed at identified "target" populations in the local community, offering *inter alia* credit courses, college and region based, using media such as radio, television videotape presentation and correspondence. The programs would draw on materials provided by personnel from the colleges themselves as well as from other institutions of higher education.

One of the main "target populations" would be the full-time students registered in college programs. Such a plan could be developed and implemented only by a central organization--the Colleges Commission is an obvious nominee for the task. The British "Open University" experience is available as a starting point to demonstrate one way of integrating local institutions (and unorganized students) into a national program which utilizes all available resources of media and technologies providing liberal education of high quality for great numbers of people in scattered geographical areas. This would not replace the colleges; on the contrary, it would create a larger demand for their services and expertise.

6. As far as the data permit such a generalization, there appear
to be no factors of a discriminatory character operating *within* the svstem
other than those inherent in the programs offered. Liberalization of
studies in the ways suggested (or by other means) would operate to redress
certain imbalances that exist at present--the relative scarcity of female
students, of older students, of liberal arts students. This would, of
course, radically change the nature of the colleges and in the long run
also affect other post-secondary institutions. The two basic questions
seem to be: are those who provide the resources for the post-secondary
system satisfied with the education provision made for this stratum of the
population? Second question: should they be?

Specific

7. The detailed breakdown of students' attitudes and evaluations
of their educational and physical environments, college by college, carry
their own implications for action. The improvement of the educational and
physical environment is a matter of adopting the best as the standard and
bringing the other institutions up to this level. Presumably the institu-
tions themselves are aware, in a general way, of inadequacies and imperfec-
tions now pinpointed by particular students or groups of students. It
would seem to be the responsibility of the Colleges Commission to make known
the views of student respondents, to define minimum acceptable standards,
especially in relation to the physical environment, to draw attention to the
best available models, to encourage action by the appropriate administrative
action (for example, by earmarked grants for particular purposes) and by

commendation of excellence wherever encountered. These suggestions, of course, carry financial implications which need not be laboured.

8. One of the major weaknesses revealed by the student responses was a certain lack of impact of the counselling services available to them in high school and elsewhere. The problem seems to line in the preparation and training of vocational counsellors in the Province. Here the emphasis needs to lie differently from that proposed for courses. Counselling seems to be relatively ineffectual in influencing or guiding students since it does not seem to be oriented towards the real world of jobs and opportunities, specific skills, abilities and temperaments identified and developed in line with quite specific career and occupational decisions. There seems to be a need for a retraining program, oriented in Alberta vocational realities, and de-emphasizing concern with psychological problems which students may or may not have. A movement away from concern with the individual student's "hangups" and from "non-directive" counselling towards counselling based on providing information of a factual character about job specifications, about training programs, about career opportunites and about the student's own special aptitudes, abilities, interests and attitudes requires active sponsorship within the system. The long-established National Institute of Industrial Psychology in Britian provides an alternative model to that of the Rogerian individual-centered, social deviancy oriented counselling program.

9. The study has thrown light on the development of a "counter-culture" at Red Deer College. This section of the report would repay close study, having in mind the context provided above. Until the commission of

inquiry has completed its study of the issues involved on-the-spot, it is not intended to do anything other than point to the very special circum- stances connected with the composition and attitudes of the student body. One of the basic questions to be resolved here is the generally favourable attitude of students to the college environment and the factual evidence of unrest.

10.   It is suggested that, in view of the nature of the area being investigated in this study and the fact that very diverse interests are involved, the desirability of holding some kind of conference might be considered to discuss the various implications of the data presented before action is taken on particular problems.

Chapter 1

COLLEGE ENVIRONMENT MEASURES

State of the Art

In a famous report, Jacob (1957) demonstrated that in Social Science departments in American universities no significant changes in students' attitudes or values could be attributed to the curriculum, the methods of teaching, nor to the quality of the teaching. This was true of the great mass of students. In exceptional cases and in a limited number of colleges, some teachers seemed to be capable of exerting a profound influence on some students. This effect seemed to be associated with a distinctive climate of unhurried, relaxed, frequent and adult encounters between teachers and students, where the teacher behaved habitually in a warm, out-going manner, clearly expressing his own value commitments.

Attention was thus drawn sharply to the "college environment"--this being interpreted primarily in terms of the interpersonal relations, social "climate," the psychological qualities and intellectual emphasis which prevailed in the college. Some regard was also paid to the physical facilities and amenities. Barton (1959, 1961, 1963) conceptualized the college as a system of interacting elements, those elements consisting of students, faculty and administration, as well as external sources of control and support. He indicated a vast range of problems and interrelations within this systems model which cried out for investigation before meaningful statements could be made about students, about their perceptions of college life and structure, about the impact of college on their characteristics, beliefs and values, about the real sources of influence which operated.

1

The first objective measuring instrument for studying college environments was the *College Characteristic Index* of Pace and Stern (1958). This 300-item questionnaire sought to identify the "press" of the environment according to H. A. Murray's theory of 30 personality needs, of which the various environmental "presses" are counterparts. The Stern (1958) *Activities Index* sought to provide a parallel form which would identify congruent events, conditions and practices to be found on college campuses which would be significant for students and their teachers. The relations between the CCI and AI have been clarified by McFee (1969), more recently by Stern (1970). The parallelism between these measures has *not* been demonstrated: each gives rise to its own factors. In the case of the CCI these have been identified (Stern, 1965) as: vocational climate, intellectual climate, aspiration level, student dignity, self-expression, group life and social form. The scores from these, or similar factors (Pace, 1962; Stern, 1963) can be used to compare colleges, or groups of colleges, and to relate environment differences to "productivity" of scholars, attitude changes, student "sub-cultures," and other variables. A form of the Pace and Stern *Colleges Characteristics Index*, suited to English colleges, was devised by McLeish (1970), who sought to relate changes in students' attitudes and beliefs over a three-year period to the quality of their environment.

The CCI is based on the collective perception, or consensus of students about the specific features of their college. Several other instruments have been devised on the basis of discovering what constitutes the college "image." Some, like Pace's *College and University Environment*

Scales (CUES, 1963) and Thistlethwaite's (Nunnally and Thistlethwaite, 1963) *Factored Scales*, are based on the CCI. Pervin (1967, 1968) has devised a *Transactional Analysis of Personality and Environment* (TAPE) by means of which students provide data which throw light on the integration among students, faculty and administration. A semantic differential technique reveals accord or discrepancy between the students' perception of himself, his college, other students, the faculty, the administration, the ideal college. A sample of 3,000 students from 21 colleges rated these concepts on 52 scales, using an eleven-point scale. The scales have shown their usefulness in relation to the problem of student "dropouts." Large perceived discrepancies between the student's perception of himself and of the college are associated with dissatisfaction ratings and an intention to terminate.

Other workers take the view that the types of students who enrol in a college provide one of the most salient features of the environment. This is the assumption underlying Astin's work in this area (Astin and Holland, 1961; Astin, 1962, 1963, 1964, 1965, 1968). His *Environmental Assessment Technique* takes account of college size, the intelligence level of the students, their personal characteristics as shown by their vocational choice. Adapting Holland's classification of vocations in six categories (realistic, intellectual, social, conventional, enterprising and artistic) to the major fields of study, and calculating the proportions of students in each categroy, it is possible to differentiate college environments in terms of their salient emphases. Astin (1965) has demonstrated that classroom environments reflect systematic differences according to the various

fields of studies--the instructor's personal style and classroom behavior, the students' attitudes to knowledge and to the instructor, the kind of evaluation used, these are related to the subject area. For example, students in English and political science tend to argue more with the instructor, and with other students, than do those in chemistry and biology. Instructors in French and Spanish are more likely to know their students by name than are those in sociology and psychology. In a sense, the choice of a field of study represents a crude personality test, and constitutes a guide to possible behavior patterns. According to this view, these behavior patterns of students and instructors are essential, differentiated features of the college environment. The great advantage of Astin's EAT technique is that, at least in the United States, the necessary data on colleges can be obtained from public sources, thus eliminating the need for reliance on informants in the institutions being investigated. The validity of the method has been checked (Astin, 1963) by correlating the public data against questionnaire responses made by selected students from 76 colleges and universities.

More recently, Astin (1968) has conducted a survey of 60,505 students. These are National Merit Scholarship winners located in 246 institutions. The objective was to identify patterns of environmental stimuli which could be used to differentiate between colleges. Factor analyses were carried out on the student peer environment, the classroom environment, the administrative environment, and the physical environment. Beginning with a list of 275 "stimuli" (defined as any behavior, event, or other observable characteristic of the institution capable of changing the

student's sensory input), Astin discovered 27 which differentiate between institutions. In addition, 75 items dealing with the student's impressions of his college environment yielded eight more measures of the college "image." The study is too complex to summarize adequately, but the flavour can be conveyed from the characterization of teacher education college. In such colleges the peer environment is typically feminine, a large amount of leisure is associated with regular sleeping habits and the frequent use of automobiles. Students show less independence and are more decisive about their career plans than students in other institutions. Students and instructors are deeply involved in the classroom; there is little familiarity with the instructor; there is little verbal aggressiveness. Students are relatively passive. The administrators are very harsh towards student aggressiveness although relatively permissive about cheating. There is a very low degree of academic competitiveness and the school spirit is low. Interesting differences were also detected between religious and secular colleges, Negro and integrated colleges, single sex and co-educational colleges.

A third approach to measuring the college environment was used by Astin (1962). This consisted of analysing 33 pieces of objective data, from directories and other published sources, and 335 colleges. The data consisted of major attributes such as financial resources, denominational affiliation, student and faculty orientations and characteristics as well as the EAT materials previously mentioned. The six dimensions along which colleges seemed to vary were identified as: wealth, size, private vs. public, masculinity vs. femininity, technical emphasis and homogeneity.

The most important of these factors turned out to be affluence in that it
accounted for, or was associated with, nearly one-fourth of the measured
differences between these colleges (variance). In a study of high ability
students who give up their college courses, Astin (1964) found no associa-
tion between these environmental variables and the student's decision to
discontinue, except that the chances of a female student "dropping out"
are increased if the college contains a high proportion of men.

The fourth technique for analyzing environments is the study of
student and faculty *behavior*, with special reference to the concept of
"sub-cultures." Trow (1960, 1962) identifies four broad patterns of
response or orientation towards colleges--the *collegiate* (football, frater-
nities, dates, cars and drinking, campus fun); the *vocational* (courses,
credits, student placement, a job); the *academic* (knowledge, libraries,
laboratories, seminars, scholarships); the *non-conformist* (verbal aggressive-
ness, ambivalence towards faculty, critical detachment, hostility to
administrators, alienation, pursuit of an "identity"). In the *College
Student Questionnaire* (Educational Testing Service, 1965) descriptions of
these life styles are presented, the student respondent being invited to
indicate which description comes closest to his own values, interests and
attitudes. He is also asked to rank the other three as well. The environ-
ment can then be characterized in terms of the prevailing sub-cultures by
totalling the numbers in the four categories (Adams, 1966). In reflections
on "the troubles at Berkeley," Trow (in Denniss and Kauffman, 1966, pp.
126-130) remarks:

> Berkeley is not an academic community, despite all the rhetoric;
> it is a collection of communities and aggregates of students. At
> least some of our difficulties have arisen out of our indifference
> to the nature of the complex society that these constitute.

One of the ways in which conflict develops in this situation of institutional complexity, as Trow points out, is that administrators are oriented towards infractions of discipline by the relatively immature "collegiate" sub-cultural group and are not equipped by habit or training to deal with the organized political activists belonging to the "non-conformist" sub-culture.

Becker and his associates (in Sanford, 1962, pp. 515-530) using a more direct method of participating observers studied the behavior of students and student groups in the University of Kansas Medical School. The theoretical framework used was to consider student sub-cultures as differentiated responses to a common set of environmental pressures. According to this study, the most important factor in the development of student culture is the formation of groups of a small and intimate kind (Boyer, 1965). These generate common understandings, norms of behavior, agreements about what constitutes "academic crud" and the "straight griffin" (to use a Yorkshire expression). Student culture, so generated, consists of a set of perspectives and practical recipes for dealing with the problems imposed by the continuous, unremitting pressure of clinical work and the question of how to select from the faculty "offerings" what the group believes to be relevant to their future day-to-day work in medicine. For example, laboratory work, blood counts and urinalyses say, are regarded as a time-wasting imposition as students believe they will

never be called upon to carry out these procedures as estabished physicians.
The student culture is in many ways a mechanism for institutionalizing
deviance from the formal rules and values of the medical school. At the
same time it is a mode of adaptation to the pressures of the curriculum.
It provides a rationale for coping with what would otherwise be a totally
unrealistic demand on their time and energies.

These four different approaches to the definition and measurement
of the environment are not mutually exclusive. Indeed, each is open to
criticism on methodological grounds of various kinds (cf. Review of Educa-
tional Research, 1965, 35, 258-259) which can best be muted by an attempt
to make use of all four methods of evaluation (McLeish, 1970). In other
words, the techniques and theoretical approaches can be considered as
complementary, possibly subsumed in the concept of the college as a minia-
ture social system. As Barton (1961, p. iv) says:

Organizations are made up of individual people, but they are more
than mere collections of individuals. The people are interacting;
their interactions are governed by informal expectations and formal
rules which are agreed upon to varying degrees; the members have
attitudes and beliefs about the organization which may form a common
culture or a set of conflicting subcultures; and the organization as
a whole possesses common facilities and symbolic objects, such as its
plant, its budget, and its constitution. The measurement of organiza-
tional characteristics must take into account these complex relation-
ships, groups and common properties.

The net outcome of research on colleges from these various stand-
points may be summarized: first, a number of instruments and conceptual
schemes have been made available to administrators, teachers and research
workers which can throw a bright light on a number of problems of adjustment
to the realities of sub-group differences (between colleges, between teachers

and students, between administrators and other sectional interests, etc.);
secondly, major dimensions of variations between colleges have been
recognized (intellectual, humanistic-vocational, friendliness, and prop-
riety); thirdly, that considerable variations exist, cutting across many
of the commonly accepted classifications (liberal arts vs. teacher educa-
tion; secular vs. denominational; co-educational vs. single-sex; regional
or rural vs. urban; residential vs. non-residential, etc.).

Environments and Student Characteristics

In a longitudinal study of changes in students' attitudes over a
period of three years in ten colleges, McLeish (1970) used a *College
Environment Index* based on Pace and Stern's *Inventory*. The attempt was
made to relate the students' image of their environment to objectively
determined features of the academic community as well as to their examina-
tion results, attitude and personality changes, values of a personal,
social and religious kind. A complete sample (n=1, 247) of the student
intake was tested on entry and retested on exist. Ten dimensions of college
environment were established--student energy, concern for individuality,
social commitment, staff image, intellectual climate, clarity and system of
courses, student loyalty to college, humane regulations, group participation
and lack of tension. It was found that the colleges differed very signifi-
cantly across all ten dimensions and that the differences were meaningfully
associated with the more public aspects of the colleges--for example, their
physical environments (situation, facilities, aesthetic value), whether they
were provided by the local authority in contrast to private colleges, rural-
urban, co-educational-single sex, size and composition of the student body.

The *College Environment Index* was also related to 30 attitude and personality variables, to the students' final examination results, to their attitudes to three teaching methods, and to 23 indices drawn from returns made by colleges to the Ministry of Education. These objective indices of environment were grouped under four headings: size, character of college, nature of the courses provided, staff preparation.

The relationship between the various dimensions of the *College Environment Index* was examined by factor-analysis. Further analyses, including the 30 variables or measures of students' attitudes on completion of their courses, indicated that scores on the environment index were closely related to professional attitudes to a career (Figure 1). This is consoling news, especially in view of the remarkably unflattering estimate of the colleges given by these students on the *College Environment Index*, (McLeish, 1970, p. 86).

In an earlier study of a random sample of University of Reading students (McLeish, 1968) a typology had been erected on the basis of students' expressed attitudes to the methods of lecture, seminar and tutorial. Student "types" were identified by using extreme scores on one or other of the teaching method attitude scores as identifying "tags." The nine student types revealed by this classification were clearly distinguishable in terms of personality variables. Almost precisely the same distribution of types was discovered in the colleges sample. Students who are "naturalistic" in their philosophy of education, who are radical in politics and independent in their thinkings tend to take an unfavourable view of the college environment and of the lecture method. Older, conservative students who believe

in formal methods, who are stable, submissive to expert opinion, scoring high on religious value and relatively unsure of their own views tend to have a favourable attitude to the college environment and the lecture method. Similar relationships are found with regard to the seminar and tutorial methods. Factor analysis of this sample verified the student typology--rebels vs. enthusiasts, oracular vs. participatory, tutor-centered vs. student centered, group-oriented vs. individually-oriented, and quietists--developed previously (McLeish, 1970).

The students in this study were also classified in terms of their "main," non-vocationally oriented subject, college by college. Striking differences appear between students in the different subject areas. It may be concluded tnat these differences determine a large part of the variance between colleges of different emphases and point to the existence and nature of kinds of student "sub-culture" other than those given by the earlier typology. Using "humanities" students as the criterion group, since they were the most numerous, it is manifest that students studying as their major subject physical education or sociology or home economics, as well as those who failed their courses are distinctive in terms of their attitudes and values at the time of the examination, as well as differing markedly on entry. Some of these differences are clarified in Table 1.

These differences between students classified by main subjects are not so great as the differences between the students as a group and the college lecturers as a group. The latter are, to begin with, older, they are considerably more radical, are much more certain of their opinions, are more naturalistic and less punitive. In addition, they are much more stable

Table 1

Differences in Main Course Students

("humanities" students as criterion group n=365)

Attitude or Value	n=76 Divinity	n=27 Ph. Ed.	n=32 Sociology	n=71 Home Ec.	n=28 Failures
Radicalism	low	-	-	-	-

Formalism	-	-	-	high	high
Helpfulness	high	-	-	-	-
Experience need	low	-	-	-	low
Power need	low	high	-	high	-
Recognition need	-	-	high	-	very high
Naturalism	-	low	low	low	-
Uncertainty	-	high	high	-	-
Physical value	-	very high	-	low	-
Aesthetic value	low	very low	-	-	-
Scholastic value	-	low	low	low	-
Religious value	high	low	-	-	-
Job satisfaction	-	-	low	-	low
College "Concern for Individuality" rated	-	low	very low	very low	low
College "Intellectual Climate" rated	-	low	-	very low	low
Anxiety level	-	-	-	very low	-

and introverted, they are less religious, they disbelieve in formal methods of instruction. The lecturers, classified according to subject area, differ from each other even more than the corresponding student groups. This means that the student must accommodate himself not only to the academic staff as a group, in terms of their different norms, aspirations, attitudes and expectations; they confront also the varying emphases of subject specialists, as well as their individual qualities. The fact that the students themselves fall into various sub-groupings in terms of basic social, educational and professional attitudes as well as in their approach to the college experience no doubt assists each individual student to adjust to the environment in his own unique way during this period of professional development. Each student can draw the necessary support from the appropriate peer groups in his struggle to accommodate to the pressures to which he is subjected.

Impact of the College Environment

The main outcome of the period spent in college of this particular sample was that students, over a period of three years, change in the direction of the lecturers' views. They tend to move from a religious conservatism towards a secular humanism. This is associated with greater radicalism, a greater emphasis on the value of spontaneity in child development ("naturalism"), a disenchantment with traditional teaching methods and the development of a less punitive attitude. These changes, towards social and secular radicalism seem to be closely related to two main influences. There is a direct relationship between the educational quality of the environment and the amount of change which takes place in students--the better the college, the greater the change. Of equal influence is the question whether

the college objectives are framed within a matrix of liberal theology and assumptions or in a secular, local-authority framework. The religious colleges of liberal persuasion "push" their students further towards non-commitment to a religious confession than do the secular colleges. The less liberal the religious college, the less is the change towards secular radicalism. Quality of environment and religious "liberalism" have approximately the same value as far as general outcome is concerned.

The two main predictors of change were found to be the *emphasis on science* in the college curriculum and the existence of a *democratic climate*. Combining college scores on these two predictors provided a multiple correlation of 0.73 with change towards radical humanism in the student body. The interrelationships are shown in Figure 1.

Figure 1

Predictors of Outcome in Ten Colleges

Democractic Climate

		High	Low
Science Emphasis	High	Academic Success Marked $r_m = 0.73$	Achievement high; little attitude change
	Low	Increase in Radical Humanism $r_m = 0.62$	Low achievement; little attitude change

The direction of change is in line with the results of other studies, in Britain as well as in the United States. Webster and his associates (in Sanford, 1962, pp. 811-846) summarized the research on personality and other changes in college students in America. In contrast to Jacob's (1957) findings, Webster et al assert that students in this period, as in the 1930's and 1940's become more "liberal" in their attitudes, more sophisticated and independent in their thinking, more tolerant of ethnic differences. This is a result of their college years. In England, K. M. Evans (1967) found marked changes after one-year's training on the *Minnesota Teacher Attitude Inventory*, on the other hand there were virtually no changes in the Allport-Vernon-Lindzey *Study of Values* with the same group. Newcomb and Feldman (1969), reviewing about 1,500 studies carried out over a forty-year period, discovered consistent patterns of change in students' values and attitudes which are in general agreement with the findings set out above. The pattern of change in the 'Sixties as a result of college experience can be characterized as a tendency to lose faith in religion, and to develop radical viewpoints. Attitudes to war, communism, patriotism, censorship, civil rights, labour and government are affected: these changes are attested to by well-designed studies which follow groups of students through their college years. There are, of course, differences in the rate of change as between men and women, Catholics, Protestants and Jews, different colleges and universities. But the general line of change during this period was leftwards and towards atheism and agnosticism, against the Establishment. Authoritarianism also declines; students tend to become less dogmatic and less conventional.

Morrison and McIntyre (1967) working in Edinburgh, discovered that Scottish student-teachers becames less tough-minded about education, more radical in their views about desirable changes in the school system, and more inclined to naturalism as an educational philosophy after three years of teacher-training. However, after one year of actual teaching they revert to their original position. A similar "back-lash" effect was discovered in sample f male and female graduates after a year's teaching following one year of training.

The problem of impact is complicated by a number of factors. Output may be simply a function of input: in other words, changes in students may be induced entirely by assimilating the norms of particularly influential sub-groups (collegiate, academic, non-conformist, or occupational). Alternatively, changes in students' attitudes and values may simply reflect changes in the general social ethos and have nothing to do with the college experince at all. The measuring instruments used to study the college environment may be so crude or inappropriate in relation to the objectives of college education, or the criterion tests for measuring change may be so irrelevant that the real causal associations may be obscured rather than revealed by their use. Different departments certainly maintain different pressures on students (and on faculty): different personality types react differently to similar aspirations and similar pressures. Where there is a congruency between personality, press, sub-culture aspirations, faculty objectives, administrative provision and societal demands we can assume maximum impact. As Pace (1969) has proposed, there is probably a law of mass action operating in this area. The more mas ive, cumulative and

congruent with each other the input stimuli are, the greater the impact
they will have on students. Perhaps cross-cultural studies would be the
experimental area within which such a law might be demonstrated. But we
are dealing with an extremely complex problem. A research design is
necessary in which students are tested on entry to college with instruments
of proven validity and reliability, and retested with the same instruments
on completion of their training (Harris, 1963). A control group design is
also mandatory to discover what extra-college influences affect students in
general during the period being investigated and which are specifically
associated with the college environment. It is also desirable to deal with
complete groups (to resolve the problem posed by "drop-outs" from the
program), rather than with "volunteers." The alternative is a sophisticated
methodology which operates with properly established random samples.

Those investigations which meet these rather stringent research
desiderata (McLeish, 1970 summarizes these), uniformly suggest that the
effects of college education are to produce an increased open-mindedness, a
growing awareness of the realities of individual experience, a developing
aesthetic sense and a declining commitment to a fundamentalist and institu-
tionalized religion. In many cases there is also an increased confidence
and a greater expressiveness. Students are less dominated by conventional
habit patterns and more ready to deal with the emotional and other aspects
of the real situation.

Some colleges are more successful in generating these changes than
others: how they do it is the question.

Chapter 2

THE PROBLEM AND METHODOLOGY

Background and Conceptualization

Work was begun on the conceptualization and methodology of the *Study of Student Needs and Motivations* in the summer of 1971. The research was initiated to supply information for future planning by the Colleges Commission, in order that the facilities and services provided by the colleges would be adequate for the future. The project is one of several that, it is hoped, will contribute to this goal. But this research is unique in its investigation of needs and aspirations of individual students through the college system.

The objectives of the study can be listed in five general areas:

1. To ascertain the nature of the non-university post-secondary school population in the Province in terms of: (a) demographic characteristices, (b) interests and activities, (c) previous educational experience.

2. To investigate the educational and other needs of the non-university post-secondary school population. The main task in this connection was whether, in the opinion of the students themselves, their needs were being met with special reference to three areas: (a) education, (b) vocational and job training, (c) social and recreational needs.

The collection of data on demographic characteristics was intended to discover particular kinds of needs and sources of motivation not only in the group of students as a whole but within specific ethnic, socio-economic, local and other kinds of sub-groups.

18

3. To study the attitudes of this population, and these sub-groupings, towards post-secondary education in general, and towards their own institution in particular.

4. To discover which of a number of possible variables are closely related to the choice of a career, the choice of a particular college, and of a particular program or specialty.

5. To investigate the students' values, aspirations, and future plans and to relate these, if possible, to the other areas being surveyed and analyzed.

Given these as the major objectives of the study, an attempt was made to articulate them more closely to provide a conceptual framework for the research. This conceptual framework sought to identify, or at least to indicate, the sorts of environmental influences that might conceivably shape the needs and motivations of the individual student. In addition, the needs of small, primary or face-to-face student groups must be considered in the planning. We have in mind special interest clubs, sports enthusiasts and other groups. The expectations of parents and individual students of the institution of their choice must also be considered. The aggregate needs of the entire non-university post-secondary population are the ultimate concern of the study.

Because of the great importance of the concept of 'needs' for this research undertaking, a listing was made of some current classifications of needs systems. The three major classifications considered were those of Malinowski, Maslow, and Murray. These provided a starting point for this study since their authors intend these system to be comprehensive

classifications which should form a b___; for the understanding of this concept. The main use made of these classifications was to ensure that all types of needs which students might reasonably, or even unreasonably, expect to be satisfied by their institution of choice should be taken under consideration and investigated in the course of the research. The classifications could also be considered important in the task of interpretation and analysis of the data collected in the course of this study.

After conducting a review of related literature, decisions about the most suitable research methodology for the project were taken. It was decided that a self-administered questionnaire, supplemented with individual interviews to provide greater depth would provide a relatively inexpensive data bank. The combination which would enable answers to be obtained to a number of hypothetical questions and provide a basis for a more intensive and continuing study of specific problems thrown up by the factual materials allows for a broad coverage of all areas of concern to a representative sample of the entire student population. At the same time it directs attention to the needs and motivations of individual students in the flexible interview situation. The interview provides the essential context within which the questionnaire responses can be evaluated for honesty, completeness, relevance and objective reference.

The Conceptual Framework

It was assumed that other kinds of investigations would be carried out in relation to the non-university intake to Alberta institutions of post-secondary education, and that certain specific and limited objectives should be developed as the basic task of this study. The brief provided by the Colleges Commission was interpreted in the sense that an attempt should be made to determine the nature of the student body as it existed in September, 1971, to discover the individual and group needs in relation to the provision made at the post-secondary level in this province. Four special problem areas were then delimited: (1) the expressed needs of the individual student; (2) the needs of face-to-face groups at specific institutions; (3) the needs of the total non-university post-secondary population as represented in September, 1971; and (4) the expectations which specific groups have of their institution of choice. From this information, it was hoped that conclusions could be drawn about the expectations which the total registered student population had and will continue to have of the Alberta post-secondary institutions, these being conceptualized as elements of a total system of educational provision.

It seemed clear that one major question to be studied, especially at this initial stage of information gathering, must be the characteristics of the existing student body--the total number, a breakdown by institution in terms of age, sex, socio-economic level, and other relevant variables. The detailed information about actual respondents can then be used to relate their replies in other sections of the questionnaire to the objective, demographic situation. We need to know broadly who is specifying the needs

of students since the student population is not a homogeneous mass but is made up of special groups categorized by (say) sex, age, ethnic origin, religious affiliation, previous education, as well as other differences.

In addition to these demographic variables, and probably closely related to them, are the actual career plans of individual students, possibly also of defined groups in the student population. The sources of these career plans might be classifiable, at least in a broad sense, in terms of a small number of main influences working with (or against) unique individual aspirations. For example, the actual economic situation and opportunities as these are perceived by parents, teachers, civic leaders, etc.; the potential of the student as defined by previous education, special talents, interests and abilities; the kinds of training and educational opportunities that exist both at home and further afield; projections into the unknown future of all these factors embedded in a matrix of hopes and fears which derive from the individual experience and psychological makeup of the student--some attempt must be made to tap these sources of motivation. To put the question otherwise: at some point the student decided to register for a particular program in a particular institution. What were the influences working on him at this decision point? How much weight did particular influences have on the outcome decision--parents' advice, home circumstances, personal self-concept, the availability of programs, the desire to leave home, aspirations for a better future, the costs of education and the availability of certain kinds of support, the simple desire to continue former associations will classmates, lack of a viable alternative ...?

As far as the needs of face-to-face groups of students at specific

institutions are concerned, clearly a number of these will overlap with those of the individuals of whom the groups are composed. Decent courses, humane instructors, realistic standards, properly-based teaching methods, an objective grasp of the needs and potential of the student as a person-- these are demands which students everywhere can legitimately make of their institution. In addition (and not divorced from the above) the student body can legitimately expect to be dealt with as members of a democratic community dedicated to the development of educated and responsible citizens, accustomed to participating in decisions that affect their day-to-day life, and expecting to be consulted about any major changes that affect their condition. Facilities for sports and recreation, in the form of gymnasia, equipment, time and unobstrusive support in other ways from the academic community; opportunities for interest groups--drama, music, debating and other societies which provide a total supportive atmosphere in which qualities of an individual character can flourish--these are also legitimate claims which students may press on college authorities. Material resources, personnel, opportunities and time must be provided on the appropriate scale to facilitiate satisfaction of the recreative needs of the student body. Special interest groups, be they related to sports, "hot rods," chess, politics, religion, woman's liberation, should be given every encouragement as being the medium within which the student can be expected to develop to adult qualities of responsibility, toleration, goodwill--as well as support- ing the more specifically educational aspects of college life.

The 1971 intake of existing college samples can be expected to represent a considerable proportion of the available post-secondary

population. It might be anticipated, therefore, that any provision made by the agents of the Provincial Government (as this provision is perceived by their "constituents") should be elicited in the course of the enquiry. The question of whether the student freely chose to go to a particular institution or was compelled by the lack of a suitable alternative, defects in the programs and courses provided in the institutions available to the student, possible developments and improvements which the student body can detect in advance of administrative thinking, new areas of provision, or novel facilities for achieving present objectives more effectively—the respondents are being invited to take these matters under consideration.

The fourth problem area, that is the expectations which students have of the college of their choice, can be covered by an analysis of the foregoing materials in relation to the particular areas, and institutions from which the respondents were drawn. One hand washes the other: the total population specifies the broad framework within which the individual's needs and motivations can be identified. Similarly, the generalization of the definition by the individual students should yield useful materials bearing on the expectations of the total student population in relation to the Alberta system of post-secondary education.

Construction and Analysis of the Questionnaire

To construct the questionnaire, a pool of items was collected from a variety of source materials which seemed to show some relationship to the objectives of the study. Additional items were created to cover areas which showed a deficit. A selection, and modification of items was then made and these were drawn together to constitute the first draft of the questionnaire.

This first version was shown to a number of experts in questionnaire construction: they provided comment and criticism of the instrument as well as of the general methodology of the study. Extensive revisions were made, resulting in a second draft. This was still further refined and constituted the pretest questionnaire.

This version was administered to an *ad hoc* sample of freshmen students at the Northern Alberta Institute of Technology. They were asked to comment freely on each item and on the questionnaire as a whole. The results were analyzed to discover ambiguities, redundancies and repetitions both in the questions and in the instructions to respondents.

As a result of this pretest experience, a final version of the questionnaire was produced (Appendix C). The items of this version were classified into content areas, to ensure that it now covered all objectives and pertinent need categories. An attempt was made to simplify the instructions so that self-administration would be possible and ensure a clear understanding of the nature of the responses intended.

While preparation of the questionnaire was underway, a list of registered full and part-time day students at each cooperating institution was obtained. From each list, a simple random sample of students was selected. The sampling ratio was 5 percent at the larger institutions, (defined as having more than 800 students in the population), 10 percent at medium sized institutions, and 100 percent at smaller schools (defined as having less than 100 students in the population). These sampling ratios were used to minimize administrative inconvenience and still provide adequate stability and reliability in the data.

Table 2

The Colleges and Student Samples

	Population	Sample Size		Completed	Response Rate	Willing to be Inter- viewed	Inter- viewed	Actual Return
Public Colleges:								
1. Grande Prairie	362	36	- 10%	34	94%	31	6	100%
2. Grant MacEwan	425	43	- 10%	33	77%	28	10	93%
3. Lethbridge	995	50	- 5%	44	88%	38	9	100%
4. Medicine Hat	520	52	- 10%	50	96%	41	11	100%
5. Mount Royal	1,800*	90	- 5%	45	50%	37	-	70%
6. Red Deer	662	65	- 10%	43	66%	31	5	89%

16. Canadian Union	85	85	- 100%	83	98%	68	5	100%
TOTALS	13,397	1024		864	84.4%	-	153	

*Estimated.

On receipt of the completed questionnaire forms, a straightforward coding scheme was devised, involving one numerical digit tor each item on the questionnaire, with a zero code for missing or multiple responses. Each item is coded into the card column of the same number as the item, except item 1 (institution) which is incorporated into the first two digits of the ID number in columns 76-80. Column 1 is always coded zero. Each item should have only one response: if two responses are encountered, the first or second is selected alternately as coding proceeds. Three or more responses to a single item receive a zero code.

The analysis of the questionnaire responses was undertaken in several stages, each involving a higher level of complexity, and building on the results of the earlier analyses. The attempt to extract meaningful and relevant conclusions from a mass of data such as is provided by this detailed and complex questionnaire is a lengthy and difficult process. It was believed that it would better fit the objectives of the enquiry if attention was directed in the first place to these basic questions:

1. the characteristics of the student population as a whole;

2. differences between colleges in terms of student characteristics;

3. the differences between students across colleges, especially in terms of possible student sub-cultures related to special needs and motivations; and

4. the differentiating features as between the sixteen colleges classified into five groups shown in the table--colleges for which the Colleges Commission is directly responsible, Institutes of Technology controlled by the Department of Education; Agricultural and Vocational

Colleges also controlled by the Department of Education; private colleges based on a religious persuasion and ethos.

Registration lists were supplied by sixteen institutions (all those listed in item 1 of the questionnaire, except Camrose, Hinton, and Grouard). The three largest institutions, NAIT, SAIT, and Mount Royal agreed to provide a computer-generated five percent random sample list. At other institutions, the entire registration lists were obtained and sampled, using the Provincial Government computer. A gummed label, typed with the student's name, was prepared and attached to a questionnaire for each student in the sample. This procedure was devised to ensure that the questionnaires were completed by all of the selected students.

Detailed suggestions (Appendix C) on the method of administering the questionnaires were produced and provided for the convenience of the staff of each institution. The suggested procedures involved determining the most suitable class in which to distribute the questionnaire, and sending a letter to the instructor involved. Considerable thought was devoted to devising procedures and materials in such a way as to minimize inconvenience to the institution and its staff, and to improve the quality of the data. Nevertheless, extensive assistance and cooperation of the staff were still required. This was given unstintingly: the actual cooperation obtained from both faculty and students went far beyond our expectations.

In the case of two colleges the response rate was actually 100 percent; in two more it was 99 percent; in two others it was well over 85 percent. Only two colleges presented difficulty, shown in the response rates of 89 percent and 70 percent respectively. The two colleges, Red Deer and

Mount Roval, were involved in certain administrative problems which he up
the completion of this study. These problems need not be dwelt on at this
stage--the actual response rates were still reasonably high.

The Interview

The interview phase of the study contributes to a greath in-depth
investigation of student needs and motivations. A flexible interview,
focused but not constricting in content, with some probing into expressed
individual areas of concern, was designed and used on a specially chosen
sample of students.

The last item of the questionnaire asked whether the student was
willing to be interviewed in greater detail about his special needs and
motivations. Of those from each institution who responded affirmatively,
a random sample was selected to be interviewed. The interviewer (Miss
Fleming) was trained for three weeks, in the course of which she studied
interview techniques, practised interviewing according to a schedule
developed for this study, and improved the content of the interview sche-
dule itself. The training program was directed towards developing a
standardized but flexible technique, where comprehensive coverage would be
ensured by working from a pre-determined schedule but adapting the actual
questions to the respondent's level of participation and understanding of
the realities of the college situation. The actual questions asked were
generated in the interview session itself with the primary objective con-
stantly in mind, that an atmosphere of total acceptance of the student's
view should be generated by the interviewer, but with sincerity. Informal-
ity was also to be a keynote of the interview.

Interview Content Areas

1. Type of Program

   - reasons for entering program.

   - type of counselling; where received before entering program.

   - why didn't you go to a different institution or enter labor
     force.

2. Career Plans

   - provisions and adequacy of information on programs, job
     opportunities, job requirements--vocational guidance.

3. Training Program

   - courses and instructors.

   - auxilliary services (laboratories, library, field work, etc.).

   - examinations, teaching methods.

   - availability of instructors outside regular class time.

4. College Community Needs

   - participation in the democratic process (student government,
     channels for expressing students' complaints).

   - channels for complaints.

   - other counselling.

   - effectiveness of student council as a means of communication
     between student body and administration.

5. Sports and Recreation

   - equipment and time for sports and other leisure activities.

   - leisure groups (drama, special interests, etc.).

6. General Question of Improving Provisions

   - see checklist attached.

   - student is asked to look over the list and comment upon any
     need that is not being met.

7. Summary

   - major inadequacies and satisfactions.

As the schedule indicates, the interview content was developed to be broadly similar, but to elicit supporting and complementary data related to the questionnaire content areas. The completed questionnaire for the student was studied in detail before each interview, to look for ways in which the interview questions could best be phrased to supplement the content of the questionnaire responses. Questions about the student's background, his reasons for coming to the institution and for not selecting a different school or university, his reasons for deciding not to take up gainful employment instead were standard. The interviewer also asked about the student's future plans and aspirations, and the extent to which the institution's facilities and services were meeting his needs and community needs as he saw them.

At the close of each interview, the student was handed the checklist set out below and asked to comment on any needs that he considered were not being met by the institution he was attending. Finally, each interview terminated with the student being asked to summarize areas of inadequacy as well as to indicate aspects of the college provision and life which were really outstanding. The checklist was found to be rather ill-designed (it was based on H. A. Murray's scheme of needs) for this particular purpose as most of the students found it difficult, if not impossible, to relate the series to their actual situation and their perception of the college environment.

Figure 2

HUMAN NEEDS CHECKLIST

Does the institution provide ways or facilities for meeting these needs?   Does it encourage action or attitudes on the part of the student to help achieve these needs?

1. overcoming obstacles

2. making friends

3. resisting influence or coercion

4. refusing to admit defeat

5. exploring; asking questions

6. attracting attention to oneself

7. explaining and demonstrating

8. avoiding failure or shame

9. being tidy; organized

10. relaxing; amusing oneself

11. snubbing, ignoring, or excluding other people

12. seeking and enjoying sensuous impressions

13. being recognized for achievements

14. analyzing, discriminating, defining and
     synthesizing information

Progress of the Study

Registration li<ts from most of the institutions were received in October or early November. Questionnaires were prepared and sent promptly to each institution after sampling from the lists as required. By December 15, 1971, questionnaires had been sent to the sixteen institutions involved in the study; returned questionnaires had been received from ten of these.

In the case of these institutions which had returned the questionnaire by this date the rate of response was exceptionally high. Only a very small number of questionnaires were not returned as requested: and each case was followed up with the institution involved. Of the questionnaires returned, about 90 percent were fully completed, with the reason for non-completion of the remainder being known in each case. The usual reason for the 10 percent incomplete questionnaires was student withdrawal from the program or prolonged absence from the institution.

Concurrently, the coding of items and the complete tabulation of written open-ended responses was proceeding, along with the involvement of the other six colleges. Because of the rather slow returns from some institutions, and the Christmas recess, progress was not as rapid as had originally been anticipated. However, interviews were conducted at seven of the institutions before the Christmas vacation. Progress on interviewing went hand-in-hand with the return of questionnaires, since only those students who indicated their willingness to be interviewed on the questionnaire were considered for inclusion in the interview sample. The interviewer found that the level of cooperation from the institutions involved in the interviewing left little to be desired, every assistance being freely given.

It was not until the end of February that all the questionnaires were retrieved and the analysis begun. Interviewing was completed at all institutions shortly afterwards, so that it became possible to consider the project in its entirety. Unfortunately due to the winding-down of the Human Resources Research Council, which had been responsible for the project to this point, the analysis of the material was further delayed until the various responsibilities could be re-assigned.

Each interview was tape-recorded and later summarized. It is possible to correlate the interview with the appropriate questionnaire as a checklist was maintained. This interview material could be further processed by means of a standard procedure but no attempt has been made to do this, up to this point in time. A complete transcript of one interview, chosen as being fairly typical and at the same time informative, was made for each institution: these are reproduced in Appendix A.

Chapter 3

THE ALBERTA COLLEGE SYSTEM

For the purposes of this enquiry the post-secondary, non-university

institutions in the Province of Alberta have been classified into five

groups. These follow the lines established by various Acts of the Govern-

ment of Alberta, recognizing the existence of (i) *Public Colleges*, of which

there are at present six, under the administration of the Alberta Colleges

Commission; (ii) *Institutes of Technology*, of which there are two, adminis-

tered by the Department of Advanced Education; (iii) *Agricultural Colleges*,

of which there are three in the sample, administered by the Department of

Agriculture until 1972; (iv) *Alberta Vocational Centres*, of which there are

three in the sample, administered by the Department of Advanced Education;

(v) *Private Colleges*, of which there are two in the sample, administered by

the Lutheran (Concordia College) and Seventh Day Adventist (Canadian Union

Colleges) Churches respectively. A number of small schools, including a

great number of public and privately run vocational training colleges

(nursing, forestry, hairdressing, etc., etc.) were seen as being too small,

too specialized, or predictably averse to cooperation, to be included in

this enquiry. The sixteen colleges sampled may be regarded as constituting

. major part of the system, including perhaps 40 percent of the total full-

time student population registered in post-secondary, non-university

institutions in the Province. All are co-educational.

Several of the colleges in the sample have affiliations with one or

other of the three universities, Alberta, Calgary or Lethbridge. Certain

35

courses are recognized by these bodies for credit toward a degree. But the major functions of the colleges are to provide vocational programs, academic upgrading programs, adult and continuing education programs and programs of a general educational nature. It is also intended that the six public colleges, administered directly by the Colleges Commission, should serve as cultural centres within the communities they serve.

Group I: Public Colleges

These are two-year colleges, providing general education and career training leading to a diploma or certificate. The three colleges located in university centres do not offer university transfer programs, the others do. They provide academic upgrading programs for students who need to improve their qualifications to proceed to more advanced programs of study. The primary function of teachers in the colleges is *teaching*: research is considered an appropriate university function. It is intended that the vocational and technical courses should be limited in number so as not to duplicate provision made by the Institutes of Technology. Vocational guidance and counselling of students is regarded as an important function of these public colleges. The purposes of these institutions has been declared by the President of Medicine Hat College as follows:

The College conceives its role as a multi-purpose institution, meeting the career aspirations and needs of both the academically and non-academically talented students. It also recognizes that education is more than a pursuit of a particular course of study - it deals with the whole man. Intellectual tolerance, kindness, respect for learning and the ability to analyze and evaluate intelligently and objectively the issues and problems that confront him in everyday life are qualities of an educated person. Such qualities are best inculcated in an atmosphere where the quest for knowledge and the freedom to think and explore are respected, and where excellence is standard.

The analysis of the programs, course offerings, and number of hours per week spent in the various courses indicates that these colleges devote approximately 45 percent of their time and resources to *direct vocational training* (including nursing and teaching), 20 percent to education in the *natural and physical sciences*, 15 percent to the *social sciences* and about 20 percent to the *literary and creative arts*. The pattern of provision varies from college to college depending on local needs, alternative institutions offering supplementary programs, policy decisions at various levels, and student demand. A detailed breakdown is providing in the following table showing the regional variations in emphasis.

It is clear from the table that university transfer colleges place more emphasis on the physical sciences and less on industrial, technical and engineering studies than do the community colleges. Except in the case of Mount Royal, the creative arts appear to be on the same level at all the colleges as the "Bridge for Beginners," "Poise and Social Graces" and "Remedial Reading" offered at some of the commun—ty colleges. Overall, there seems to be nothing else worth noting in contrasting university transfer with community colleges. The literary arts fare just a little better at the university transfer colleges than at the community colleges, the social sciences just a little bit worse.

Group II: Institutes of Technology

The two in this group, the Northern and Southern Alberta Institutes of Technology (N.A.I.T. and S.A.I.T.) are very similar in practically every respect. They are both very large, vocationally oriented institutions, offering varied programs of instruction under the direction of the Department of Advanced Education. More than fifty different programs are available in these Institutes oriented towards current technology in engineering, business, applied arts and medical sciences. They do not elaborate any educational philosophy except to declare that they are modern, closely integrated with business, industry and government, and oriented towards careers for their graduates. These emphases are revealed in the breakdown of course offerings and course hours per week, contrasted in the table with Public College Courses. The overwhelming contrast is the emphasis in the Institutes of Technology courses on industry, technical and engineering courses, with a corresponding emphasis in the public colleges on the social sciences, the literary and creative arts. These differences are probably to be explained by the availability of other post-secondary programs offered by the other institutions in Edmonton and Calgary respectively.   The presence, and the character of university education in the area, as well as the differing technological needs of the local environment are clearly relevant to the decisions about courses which the colleges' administration will make:

Group III: Agricultural Colleges

Three colleges at Vermilion, Fairview and Olds are included in
this group.   These are relatively small colleges which are under the admin-
istration of the Department of Advanced Education. The programs offered are
intended to meet the needs of specialized farm enterprises, to emphasize
the business aspects of farming and to help cate to the demand for increas-
ing numbers of technicians in agriculture, home economics and business. It
is hoped that those graduating will have a sound academic background,
theoretical knowledge and practical skill. The differences in programs as
between the agricultural colleges and the public colleges are not surprising.
Considerably more emphasis on business and commercial studies, but especially
industrial, technical and engineering programs and courses, characterize the
agricultural colleges. Correspondingly, there is less emphasis on the
physical and social sciences but a greater emphasis on the biological. The
creative and literary arts take a back seat, along with health and welfare
programs.

Group IV: Alberta Vocational Centres

There are four such institutions which are administered by the
Department of Advanced Education (Vocational Division). They are situated
at Edmonton, Calgary, Fort McMurray and Grouard. Only the first three were
included in the sample in this enquiry; information about course work is
only available about one--Fort McMurray. This centre was established to
provide essential educational and vocational training for "the uneducated,
undereducated, untrained and undertrained" for the purpose of permitting
them to enter the labour force on an equal basis with others.   The centres

*No information on courses available from Vermilion.

are not intc led as substitutes for the regular school system: students

must be employed, or underemployed, and are normally sponsored by some

Government agency. The courses provided are not broken down in a form

which makes comparison with other post-secondary institutions possible.

Group V: Private Colleges

There are two religious colleges included in the sample--Concordia

College, administered by the Lutheran Church, and Canadian Union College

administered by the Seventh Day Adventists.   These colleges are small

co-educational colleges offering university transfer and arts courses.

Canadian Union also offers business-commercial, health service and other

kinds of courses.

Chapter 4

THE COLLEGES AS A GROUP

At first sight, the sixteen colleges in the sample represent a very heterogeneous group of institutions of higher education. All grades and kinds of education are provided for, from classes for near-literates in some institutions to university level credit courses in others. The students are drawn from all walks of life, they come from a multiplicity of ethnic and cultural backgrounds, and manifest a great variety of religious and other kinds of affiliations. Perhaps of greater relevance to this study, they express the most diverse occupational and other aspirations.

To reduce the vast store of data on the colleges so as to derive meaningful and relevant generalizations, it is necessary to devise standard schemes for simplicity of analysis, interpretation and exposition. This is no easy task. A number of statistical devices and procedures were adopted to enable valid comparisons of a meaningful kind to be made.

The first such procedure consists of coding all variables in terms of percentages of student responses in the various categories. Certain key categories have then been selected, 86 in all, on the basis that it is possible to say, on a priori basis if you will, that we can identify them as being desirable features of an educational environment, or as pointers in that direction. Other things being equal, most educators would agree, for example, that a varied or heterogeneous environment is preferable to one which is homogeneous with regard to sex, cultural groups. ethnic origins, etc. Similarly, an environment which satisfies the student with regard to

44

the physical and other amenities is surely to be preferred to one which he regards as inadequate for his (or her) educational, recreational, cultural and organic needs.

The 86 variables fall broadly into these two main types--those which can be defined on a relatively *objective* basis--for example, size and heterogeneity of programs offered, or of student characteristics, and a second set of more *subjective* indices based on the student's view of the educational environment provided. By coincidence, it happens that there are equal numbers of these two, objective and subjective variables in these two groups.

There being sixteen colleges in the sample, it was decided to code all these variables on a five-point scale. Using Pascal's triangle for the binomial distribution, it will be observed that we can expect the five-point scale to point to *one* college which is outstandingly superior in any given characteristic; *four* which group together, as being above average in the particular quality; *six* which fall at the average level; *four* which fall below this average, and *one* which is quite far below average.

Pascal's Triangle for the Binomial Expansion

$$
\begin{array}{ccccccccc}
 & & & & 1 & & & & \\
 & & & 1 & & 1 & & & \\
 & & 1 & & 2 & & 1 & & \\
 & 3 & & 3 & & 3 & & 1 & \\
\end{array}
$$

n = 1 + 4 + 6 + 4 + 1 = 16 Colleges

Grade Levels: 5   4   3   2   1

Using sometimes the actual numbers (as in the *size* of the student population), more commonly the percentages in various categories, the sixteen colleges were assigned grade points, ranging from one to five on each of the 86 variables. (See Appendix for description of the qualities rated). In only one or two cases was there any difficulty in assigning colleges to grades. The difficulty arose because of "ties:" in such cases one or the other of the colleges was assigned the higher grade by a random method.

The advantages of this system of reducing all variables to a uniform scales are numerous. We can see, almost at a glance, the general character of a particular college. By a simple process of averaging the grades we can determine the rank of each college in a hierarchy of merit. By dividing the variables into two groups we can relate the objective features of each college to the students' perceptions of it. By the simple process of cross-multiplying grades for the colleges in pairs and summing these cross-products we can arrange the colleges according to their degree of similarity.

The first generalization about the colleges we can make is that the tend to cluster closely about the general average. The range is from highest to lowest, only about half a standard deviation. It may seem arbitrary, in view of this, to rank the colleges in order of educational merit. The colleges seem to fall close together around the mean point, but this is in large part due to a defect of the averaging procedure adopted. It givens equal weight to a great number of features which clearly are of unequal value in determining the quality of the educational environment.

Table 6

Summary of Assigned Grade Points

Name of College	Grade Points					Average Grade	Cross-Product Adjusted sum	Rank Order
	5	4	3	2	1			
Calgary AVC	5	23	21	28	9	2.85	- 7.59	13
Canadian Union	10	20	28	21	7	3.06	1.17	8
Concordia	6	24	28	23	5	3.03	0.41	9
Edmonton AVC	10	29	19	23	5	3.19	6.51	1
Fairview	5	14	29	25	13	2.69	-14.47	16
Fort McMurray	4	15	33	19	15	2.70	-13.98	15
Grande Prairie	3	18	40	21	4	2.94	- 3.22	12
Grant MacEwan	6	26	29	23	2	3.13	4.43	6
Lethbridge	-	28	40	14	4	3.07	2.26	7
Medicine Hat	5	28	30	21	2	3.15	5.45	2
Mount Royal	3	27	27	26	3	3.01	- 0.41	11
N.A.I.T.	6	18	45	15	2	3.13	4.62	5
Olds	12	17	34	17	6	3.14	4.63	4
Red Deer	2	21	42	18	3	3.01	0.20	10
S.A.I.T.	3	20	49	14	-	3.14	5.33	3
Vermilion	6	16	22	36	6	2.77	-10.93	14
Totals	86	344	516	344	86	3.00	0.00	-

A more refined technique is to use a weighted average. This is obtained by grouping the colleges according to their degree of *similarity*, in terms of these 86 criteria of educational excellence. By calculating the 16 x 16 matrix of cross-products, and arranging the sum of these cross-products in hierarchical order (McLeish, 1970, p. 104) we can obtain a second estimate of quality. This rank order is identical with that given by the average grade scores.

A third method was then used to discover how the various patterns of grade points assigned to each college departed from a chance distribu- tion, a method which told us at the same time which deviations from the average could be interpreted as merely random fluctuations. Using this technique we can proceed with confidence to divide the college into three groups. Making use of all the irformation from these analyses of the objective data and from the st dents' perceptions of th; excellence of their environment, we can find three groups as follows. (Adjusted cross- product averages are shown for each group at base of table).

If we re-arrange the 16 x 16 matrix of cross-products in the order of the colleges as given, it is clear that the hierarchical order is not perfect. It is disturbed by various "lumps" which break up the descending sequences. This points to the fact that the colleges are related to each other in ways other than general excellence. This "lumpiness" could have been predicted on a *priori* basis. Clearly one would have expected N.A.I.T. and S.A.I.T. to have a number of similarities unlike those which are common to (say) Edmonton A.V.C. and Calgary A.V.C. The more complex pro- cess of calculating weighted averages to be called in at this point, is

Table 7

The Colleges Classified

Above Average Level	Average Level	Below Average Level	
Edmonton A.V.C.	Medicine Hat	Calgary A.V.C.

factor analysis. This method of analysis points to similarities and
differences between colleges in terms of hypothetical constructs
called factors. These represent principles of classification (Burt,
1940). The technique used here ensures that each classification is
(a) independent of all the others, and (b) successively takes up, or
accounts for, the maximum amount of variation remaining in the sample.
Applying this technique to the data from the colleges, we arrive at
seven principles of classification. These are indicated by the positive
and negative saturation coefficients in the table below.

Table 8

Patterns of Relationship Between Colleges: Factor Analysis

(Varimax Rotation/Saturation $<\pm$ 0.40 Omitted)

Name of College	Factor Number							Commu-nality
	I	II	III	IV	V	VI	VII	
Calgary AVC	-79							0.699
Canadian Union		+50			-59			0.713
Concordia		+79						0.670
Edmonton AVC	-78							0.741
Fairview	+62							0.591
Fort McMurray		-57						0.629
Grande Prairie					-66			0.748
Grant MacEwan			+72					0.756

Mount Royal		+41					-71	0.782
N.A.I.T.				+77				0.716
Olds	+58							0.648
Red Deer							+74	0.780
S.A.I.T.				+77				0.654
Vermilion			-78					0.766
Percentage Variance	17%	12.5%	10%	9.5%	7.5%	7.5%	6.5%	70.5%

The interpretation of these various groupings to the colleges must clearly be in terms of similarities in the patterns of excellence, mediocrity and below-average quality revealed in the various grade points awarded the various colleges on each of the 86 variables. The first conclusion which jumps from the table is that the colleges appear to be as sparsely distributed in seven-dimensional hyper-space, in the sense of being as far removed from each other, as they are in the Province of Alberta itself--perhaps even more so.

I. *The first factor* groups together Calgary AVC and Edmonton AVC at one pole with Fairview and Olds at the other. The contrasts that are implied in this classification can be readily identified by reference back to the original data. These point up the differences as being those between a relatively older and more mature student body, heterogeneous in ethnic origin and vith a clear and definite occupational orientation (Calgary and Edmonton) and the others. The other two colleges have a student population drawn mainly from the Province of Alberta, from better educated, smaller and wealthier families, with a high proportion of the students living at home. They are not so interested in exploring new ideas nor in developing a professional field of study for its own sake as are students in the two vocational colleges, nor are they interested in establishing an identity for themselves. They do not plan to continue study after graduating. The students at Calgary and Edmonton AVC's are more oriented towards service to others, they are very confident of finding a job on completion of their courses. They are also very willing to be interviewed to give further information about their attitudes.

The most striking contrast between Calgary and Edmonton colleges on the one hand and Fairview and Olds on the other is revealed in the answers to questions 32 to 38. These questions seem effectively to separate out the four student sub-cultures recognized by Trow--"academic," "occupational," "collegiate" and "non-conformist." The division here is between collegiate and academic populations. Calgary and Edmonton students can be reliably categorized as academic and anti-collegiate in their basic orientations. Fairview and Olds are negatively related to these other two colleges being predominantly collegiate and non-academic.

II. *The second factor* sets off the Canadian Union, Mount Royal and Concordia colleges over against Fort McMurray. The first three have as common characteristics (in opposition to the fourth college) a student population diversified in terms of ethnic origins, supporting themselves from savings and part-time work, more than averagely interested in developing a professional field of study but less than averagely interested in developing skills for a job.

In terms of sub-cultures the contrast here is between the collegiate culture represented by Fort McMurray and the anti-collegiate culture of the Canadian Union College, Concordia and Mount Royal.

III. *The third factor* opposes Grant MacEwan College to Vermilion College. The explanation of this factor seems clear in view of the fact that the two colleges appear at opposite ends of the scale with regard to no less than 27 of the 86 variables. These relate to five main areas: type of student registered, students' value system, students' reason for

choosing the particular institution at which they are studying and the students' attitudes to the future.

At Grant MacEwan College students declare their parental occupation to be predominantly office worker, self-employed, professional and managerial with farming and labouring accounting for only 24 percent in all. At Vermilion these two occupations account for 75 percent of the sample population, with the armed forces and police accounting for another 8 percent. The students at the former college come from relatively small families, in contrast to the latter where 50 percent come from families of five or more. The students at Grant MacEwan provide a different pattern of reasons for having completed high school. One-eighth declare they did so because they had nothing better to do: more than 15 percent did not finish at all. The percentage of Vermilion students who declare they completed high school because of an interest in study is five times as great (15.4 percent) as the percentage at Grant MacEwan (3.1 percent).

On the other hand, the students at Grant MacEwan were more often in the top 10 percent or 30 percent of their class at high school than the students at Vermilion College. They are much more interested in technical, scientific, and cultural events and choose creative artistic activity as their preferred leisure time occupation much more often than do the Vermilion students. At Grant MacEwan students are much more interested in exploring new ideas and developing a deep grasp of a subject for its own sake and not for immediate occupational purposes than at the other college. Here the students' orientation is much more towards mastering particular occupational skills which they perceive will be useful to them on graduation. At

Vermilion College students regard preparation for marriage and family life as being very important whereas at Grant MacEwan this is given a relatively low priority.

In deciding on which institution to attend, family influence was a major factor in the case of Grant MacEwan students, a minor factor in the case of Vermilion where teachers and high school counsellors played a major role. In the outcome, 64 percent of the Grant MacEwan students say they are very sure they made the right choice. This seems paradoxical when it is observed that this college has the lowest percentage of students who agree that the college has a good reputation which is well-deserved. On the other hand only 46 percent of the Vermilion students are very sure they made the right choice although it is third in percentage of students who agree that the college has a good reputation which is well-deserved. This anomaly may arise because of the double-theme character of the latter question.

In choosing their subject area for study a quarter of the Grant MacEwan population declare that they were motivated by ? idea of service to others, none of the Vermilion students give this as a reason. They were more influenced by the view that the subject offered a good professional training and because the options they had chosen in high school led directly to their particular choice. Students at Grant MacEwan chose their future occupation because it provided the opportunity of doing useful work (69 percent) whereas Vermilion students were influenced by other considerations as well, such as security or that the area was one which would expand in the near future. The latter also predict that they will have a choice of jobs

on graduation (62 percent) whereas the Grant MacEwan students tend to be more pessimistic about their career prospects, expecting difficulty, or even great difficulty, in finding a job in their specialty now and in the foreseeable future (62 percent).

In their attitude to the college environments there is the same dichotomy between these two colleges although the pattern of reaction is not clear cut approval versus an unfavourable attitude. The bipolarity of the attitudes can be shown best in tabular form.

Table 9

Percentages of Students Declaring Certain Statements
About Their College to be True

		Grant MacEwan	Vermilion
Q. 49	Student energy perceptible	51.7% (12th)*	69.2% (3rd)
Q. 50	Student independence fostered	90.3% (2nd)	58.3% (14th)
Q. 51	Student responsibility fostered	57.1% (13th)	62.2% (4th)
Q. 52	Complaint channels available	86.7% (3rd)	61.5% (13th)
Q. 55	Excellent reputation deserved	61.9% (16th)	84.6% (3rd)
Q. 56	Students encouraged to criticize	93.1% (1st)	41.7% (12th)

*Rank shown in parentheses.

It is surprising at first sight to find as little apparent connection between the general summary question 55 and questions 49, 15 and 55. The apparent discrepancy seems best accounted for by hypothesizing that there are two kinds of student "culture," one in each of the colleges. The Vermilion culture would appear to be predominantly "occupationally" oriented, the Grant MacEwan to be predominantly an "academic" one. If these two types of students contemplate the same phenomenon, they are very likely to evaluate it differently. For the former, the development of independence of thought and action in students, the existence of channels for student complaints and the fact that students are encouraged to criticize courses are not marks of a "good" college. On the contrary, these administrative innovations represent blocks to the pursuit of the major aim, the development of specific skills (cognitive, psycho-motor and attitudinal) essential for efficient performance in a future career. The "academic" student, especially if there is an admixture of "non-conformist" sub-culture, will be less ready to give an over-all rating of "excellent" to his college: he will be rather more discriminating in his praise (if not in his blame). He will regard the opportunity to criticize and complain as a basic right and the fostering of independence in the student as the primary objective of a "good" college.

IV. *The fourth factor* groups together N.A.I.T. and S.A.I.T. These institutes are very similar in 15 of the 86 characteristics used in the analysis. They are both large colleges offering a variety of programs. A large proportion of the students are males (in the proportion of three to one). Having completed high school, students are now primarily interested in technical and scientific matters and minimally interested in thinking

about the question, "What they want to be as a person." The student populations in the two colleges are about equally heterogeneous containing a variety of ethnic groups, in addition to about 85 percent of Canadians. They have very similar educational and home backgrounds and very similar leisure time activities and interests. A very small proportion chose their present line of study with the motivation of helping others. Both groups think highly of their institute and consider that the students show plenty of energy in their various pursuits. A very high proportion at both (70 percent) plan to go to work immediately after graduation: few have definite plans to continue their studies except at some unspecificed time in the future. They agree fairly closely in their estimates of their probably annual income: they regard the institute as having given them an adequate preparation for entry into the labour force and agree in their estimates of the probable ease or difficulty with which they will find jobs, about a third (30 percent N.A.I.T; 36 percent S.A.I.T.) anticipating some or considerable difficulty. Compared with students in other colleges, they are generally *unwilling* to be interviewed for future expressions of viewpoints about their needs and motivations.

The question of student sub-cultures is not so clear as with the earlier factors probably because the unifying characteristics of these two colleges is the heterogeneity of the environments, including student populations. Thus the common feature here has to do with the fact that N.A.I.T. consists of a mixture of occupational, collegiate, academic, and non-conformist sub-cultures, in that order and that S.A.I.T. is a mixture of collegiate, academic, occupational and non-conformist sub-cultures, again in that order.

V. *The fifth factor* groups together Canadian Union College and Grande Prairie with Lethbridge at the other pole. The reasons for this are clear when we go back to the original data. Lethbridge has twice as many students as the other two colleges combined. More than a quarter of the students spoke a language other than English as their first language, probably Japanese and East European languages other than Ucrainian. The parents of the students are on a higher educational level at Lethbridge, both fathers and mothers having proceeded in greater proportion to high school and beyond. Families are larger in Lethbridge, on the average, 18 percent of the student population having three or more siblings compared to 9 percent at Canadian Union and 13 percent at Grande Prairie. A greater proportion of these siblings will take post-secondary education in the case of Lethbridge than at Canadian Union or Grande Prairie.

Although roughly the same proportion of students were amongst the top 10 percent at high school, a much greater proportion of those at Lethbridge declare their main reason for completing high school to be interested in their studies; the students at the other two colleges are much more concerned about obtaining the prerequisits for further education.

The student populations at these three colleges differ significantly in the kinds of events they find most interesting. At Lethbridge the prime interest is in sporting events, with entertainment as closest second: at Grande Prairie and Canadian Union students are interested in sports, but an equally large proportion are more interested in cultural events and a considerable proportion in political and economic events. In their choice of a free, leisure-time activity the three colleges also differ in interesting

ways. Students at Canadian Union and Grande Prairie are much more interest-
ed in creative artistic activities (Canadian Union students in playing music;
Grande Pr. irie students in writing) whereas the Lethbridge students are more
interested in "fixing things" and finding the solution to problems.   Leth-
bridge students in a very considerable proportion regard the development of
skills necessary for a career to be very important: they emphasize the need
for preparation for immediate employment on graduation. Students at the
other two colleges do not basically disagree with them on these points but
do not lay so much stress on immediacy and concreteness, seeing these skills
and job orientation as being of less importance. They emphasize more the
need for a broad professional education, without having a particular career
or occupation in mind.

A much greater proportion of Lethbridge students chose this college
on the grounds that it provides a very good training in the particular field
of study the student is interested in. However 75 percent of the students
at the three institutions believe that their college has an excellent
reputation which is well-deserved. Family influence was of much less
importance in the case of Lethbridge. In the two other colleges, a third of
the student body describe this as being the major influence in deciding to
attend this particular institution. More than two-thirds of the parents in
the latter cases desired the student to do "as . is doing now" on leaving
high school, whereas this is the case with less than half of the Lethbridge
students. At Grande Prairie, a quarter of the students would have preferred
to start working, at Canadian Union 12 percent and at Lethbridge only 7
percent.

The students' perceptions differ with regard to the degree to which
they help eac! other. At Canadian Union (86 percent) and Grande Prairie
(91 percent) there is a consensus of more than 85 percent of the student
body that students often help each other with their work: a more competi-
tive spirit seems to prevail at Lethbridge College where only 73 percent
agree with this statement. At Lethbridge students tend to support the
statement that classrooms and laboratories are completely adequate (80 per-
cent) or good (20 percent) whereas at Grande Prairie and Canadian Union
College these proportions are very much reduced with a considerable minority
suggesting the facilities are quite inadequate.

The major contrasts between Lethbridge and the other two colleges,
Canadian Union and Grande Prairie, can be summed up in the statement that
the predominant student culture at Lethbridge is "occupational" whereas at
Canadian Union and Grande Prairie the culture seems to be "anti-occupational"
but not clearly belonging to any of the other three types.

VI. The sixth factor singles out Medicine Hat College relating it
somewhat to Grande Prairie positively, and to Olds and Fairview negatively.
As far as the special features of Medicine Hat are concerned, these can be
recognized in terms of study of the 86 variables. The college has an
unusually large proportion of students of German ethnic origin (30 percent)
and of students born in Canada (92 percent). An unusually high proportion
are married and living in their own home. It is first in the proportion of
students with some experience of university education. It is the highest in
proportion of students who completed high school because of their interest
in succeeding in their studies and is very low in the proportion of those

interested primarily in a career or occupation. A very large proportion of
the students, relatively to other colleges, were in the top 10 percent of
their classes at high school. In spite of these indications, however,
students' values and attitudes are relatively undistinguished. Except in
one area, the college population tends to fluctuate around the average level.
They have the highest proportion of students who chose the college because
it was close to home (48 percent); after Corcordia students, the case of
finding work afterwards had little weight in their decision. But the area
in which the students are quite outstanding is in relation to their degree
of satisfaction with the physical facilities and arrangements. This student
population notes that the sports and recreation facilities, the cafeterias
and common rooms, the library facilities, classroooms and laboratories are
completely adequate in the highest proportion of all six colleges.

The other respect in which this college is unusual is the degree of
satisfaction expressed (in percentages of satisfied students) with regard
to other aspects of the environment. For example, the college falls in
either second or third place in the proportions agreeing that students work
hard, that courses are well-organized, that students are encouraged to
criticize courses, that there are very adequate opportunities for student
self-government, that study areas other than the library are completely
adequate. Interestingly enough, however, they are amongst the bottom three
student groups in the percentage believing that the students develop a sense
of social responsibility.

We are dealing here with an academic sub-culture, with subordinate,
minor sub-cultures.

VII.   *The seventh factor* contrasts Red Deer with Mount Royal College. Red Deer has about twice the proportion of native-born Albertans compared to Mount Royal but only a third of the proportion of students born in other Canadian Provinces. The socio-economic origins of the students also differ considerably between the two colleges insofar as 25 percent of the Mount Royal students come from a labouring background, 10 percent from a farming background, whereas the relative proprotions at Red Deer are 7.5 percent and 22.5 percent. In the larger families many more children in the Red Deer group will go on for post-secondary education than in the Mount Royal group. Although a much higher proportion of the Red Deer students were in the top 10 percent of their classes at high school, Mount Royal students constitute a much higher proportion of the student population, giving as their reason for completing their high school course "interest in studies." Unlike the Red Deer students they tend to be uninterested in political and economic events, neither are they particularly interested in creative artistic activities in their free time. However, they seem to be interested in things of the mind generally more so than the Red Deer students, a very high proportion noting that the excitement of learning and of exploring new ideas is very important to them (43 percent as against 28 percent). Likewise, many Red Deer Students gave as their main reason for choosing this college that it was close to home, whereas very few of the Mount Royal students gave this as their reason. There is another reversal in this area in that many Mount Royal students gave their main reason as their need for prerequisites for further training, few Red Deer students gave this as their most important reason for choosing this particular college.   The

parents played rather different roles in the students' decision. About 10 percent of the Mount Royal parents provided critical assistance in making the decision whilst 40 percent gave only support and encouragement: in the case of Red Deer the proportions are zero and 63 percent respectively. Twice the proportion of Red Deer students anticipate some trouble or even a great deal of difficulty in their courses compared to the students at Mount Royal. At the former college, students believe they develop a sense of responsibility, at Mount Royal students are much less convinced of this. Channels for student complaints appear to be more visible at Red Deer than at Mount Royal. There is a difference too in the perception of students' tension, especially at examination times: at Red Deer 50 percent agree that students are tense, at Mount Royal only 33 percent agree. Apart from the adequacy of study areas, the environment at Red Deer is more favourably evaluated by students than is the case in Mount Royal. Sports and recreation facilities, cafetarias and common rooms, opportunities for special interest groups, opportunities for student government, library facilities, classroom and laboratories-- these are highly approved by the Red Deer students, normally being endorsed as completely adequate by about twice the proportion of students as at Mount Royal.

The contrast between Red Deer and Mount Royal can be summed up in terms of the "academic" sub-culture at Mount Royal and the "occupational" sub-culture at Red Deer.

We can sum up these patterns of relationship between the sixteen colleges by categorizing them in terms of the predominant and minor student sub-cultures, recognizing that these can be readily categorized as

"occupational," "academic," "collegiate" and "non-conformist." The follow-

ing table brings out these similarities and differences in a summary fashion.

Table 10

Student Sub-Cultures in Relation to Factors

Name of College	Student Sub-Cultures			
	Major	Minor in Order of Significance		
1. Calgary AVC	academic	anti-collegiate	occupa-tional	
2. Canadian Union	anti-collegiate			
3. Concordia	anti-collegiate			
4. Edmonton AVC	academic	anti-collegiate	occupa-tional	
5. Fairview	collegiate	anti-academic		
6. Fort McMurray	collegiate			
7. Grande Prairie	anti-occupational			
8. Grant MacEwan	academic			
9. Lethbridge	occupational			
10. Medicine Hat	academic			
11. Mount Royal	anti-collegiate	academic		
12. N.A.I.T.	occupational	collegiate	academic	non-conformist
13. Olds	collegiate	anti-academic	anti-occupat'n	non-conformist
14. Red Deer	occupational			
15. S.A.I.T.	collegiate	academic	occupa-tional	non-conformist
16. Vermilion	occupational			

Chapter 5

THE STUDENTS AS A GROUP

In what follows we must remember that all the statements made are *estimates* which refer to a total college population of 13,397, but that we have sampled at best only 7 percent of the student body. The techniques used in selecting the sample, coupled with a very high response rate (just over 85 percent), inspires us to proceed wit' confidence to generalize about the nature of the total student population of the Province of Alberta in post-secondary, non-university institutions. But the reader should constantly bear in mind that the complex selective processes operating in relation to the colleges' intake, together with the unusual demographic characteristics of this population and the different selection ratios used in choosing respondents depending on the *size* of the college, the differential wastage caused by particular questions not being answered by some respondents--these reduce the confidence with which particular conclusions may be drawn.

These, and other processes, can be regarded as confounding variables which interfere, in an unknown way, with the proportions of cases, in all categories, particulary in some. For example, an estimated 24 students failed to say whether they were male or female, an estimate of 23 females failed to state their age. These examples strongly suggest that a number of important comparisons will be affected in unknown ways. Again, choosing at random, 843 students (about 6 percent of the sample) left the question on the opportunities to form special interest groups in the colleges unanswered;

65

just over a thousand failed to answer the next question on student government.

By an elaborate process of deduction we could, of course, seek to discover the characteristics of students who failed to complete these, and similar, questions. This would provide data for speculation about what they would have answered if they had answered. But such an approach would be an elaborate exercise in futility: our conclusions would still be in terms of probability. They might indeed be less likely than the conclusions drawn from a straightforward analysis of the "hard data."

As an introductory summary we may say that the post-secondary, non-university college population of Alberta consists predominantly of young, unmarried males, born in Canada, of British descent. They are Christians (Catholic or Protestant) whose parents speak English at home. The education of their fathers and mothers terminated at high school level. The parental income is moderate--they are not poor, neither are they rich. The students come from relatively large families (four or more children). They are from a non-professional background and expect only one, or perhaps two, of their brothers or sisters to proceed to higher education. They mostly live at home during term time, their homes being near one of the two main centers of population, Edmonton or Calgary.

The great majority completed Senior High school or its equivalent, being urged to do so by considerations of a future career. They have a strong occupation drive at the present time. Mostly they were average, or slightly above average achievers at high school. They have little interest in political or cultural matters, preferring to devote their spare time to

entertainment or to sporting and fashion events. They have a practical orientation in daily life and do not much favour solitary activities. In fact, they spend their free time in various kinds of group activities with friends. Their major aspirations for the future are oriented towards an occupation, towards friendship, and towards establishing an identity for themselves. Thinking about marriage and family life does not preoccupy them very much, nor do they look on the prospect of "having fun" in the future as a major motivation in their studies. They intend to continue their studies although from an occupational base, not as full-time students. They expect to earn a lot more than their parents and to be in a higher occupational bracket.

Mostly they made the decision to atten' a particular college them-selves, on the basis of information derived mainly from calendars, but to some extent from family members or friends who had attended the particular institution. Indeed a large majority decided to attend college against their parents' inclinations. On the other hand, half had actually planned to do something different on leaving high school. They chose their present program on the basis of liking for the area of study.

The student group can be classified in a number of ways on the basis of the questionnaire data. For clarity of exposition, we will provide a breakdown by content area of the questionnaire.

1. Demographic Characteristics (Questions 1-22). The student population is divided between the sexes in the proportion of about two men to each woman (males 8,512; females 4,861). They fall mostly in the age range 18-24 years (77 percent). There are sizeable proportions in the age

ranges, 17 years or less, and 25-29 years. Three-quarters are bachelors or spinsters; about 20 percent are married. As far as religion is concerned, a quarter of the group are Roman or Greek Catholics; a quarter are Anglicans; a quarter have no religious affiliation at all. Most of the remaining quarter are Protestants; only a tiny percentage declare themselves to be Eastern Orthodox. Roughly half of the sample are British in ethnic origin, another quarter are of West European origin; only 6 percent are French and 7 percent are of Ukrainian ethnic origin. Two percent are North American Indians.

More than 85 percent of the students were born in Canada (60 percent in the Province of Alberta); the other countries of origin (U.S. 2 percent; Great Britian, 2 percent; Western Europe, 4 percent; Eastern Europe, one percent; the rest of the World, 6 percent) have at best a token representation. More than 80 percent learned English as their first language. French, German and Ukrainian account together for less than 10 percent of the first languages spoken by respondents. The fathers of half of the respondents, and 40 percent of the mothers, did not proceed beyond junior high school. About 10 percent of the parents had some university education. The farming community provides about 20 percent of the student population, another 14 percent come from the craftsman group, 14 percent of parents are self-employed; there are smaller proportions whose fathers are from managerial, office, professional and labouring occupational groups. Forty percent of parents have an annual income of less than $7,000; 13 percent have $15,000 or more. Three percent of the students are only children, 37 percent belong to families of five or more. Forty percent have neither a brother nor a

sister at college or university, nor do they expect to have one. Three-quarters live at home during term-time, either with parents (32 percent) or in their own home (43 percent). Nearly a fifth of the sample leave the parental home to attend college during term-time, to return there during vacation. Most of these students live in lodgings when away from home. Eighty percent of the group live near the main centres of population, Edmonton, Lethbridge, Calgary or Red Deer. Parents support about a quarter of the group through college; another quarter support themselves from personal savings or part-time work; about a third are financed by loans, grants or scholarships; the rest have some other means of support.

2. Previous Education (Questions 23-25; 43; 44). About 10 percent did not complete high school. More than three-quarters (76 percent) were inspired to do so by virtue of occupational motivations; two percent say they had nothing else to do. Only 21 students were influenced to complete high school by their teachers (0.2 percent). Less than 10 percent (7.8 percent) did so because of an interest in study. It is indeed extraordinary, as we shall see, how little influence teachers exercised on this population with regard to vital educational decisions. Two-thirds of the group describe their position in high school as having been "average;" 12 percent claim they were amongst the top ten percent. Fifty percent of the group, on leaving high school, wanted to attend college; 15 percent would have preferred to continue with other studies (presumably at university): 13 percent wanted to start work; 9 percent would have liked to travel. The remainder would have preferred marriage, or to join the family business, or do something different.

Roughly similar proportions of the parents would have made the same choices for their children.

3. <u>Interests and Activities (Questions 26-30)</u>. The student group seems to represent a fair cross-section of the community as far as interests and activities are concerned. The most interesting event, say 60 percent of the sample, is either in the area of sport (34 percent) or entertainment (27 percent). Less than 10 percent are interested in political or economic questions; another 10 percent are interested in cultural events. Ten per-cent of the women students are interested most of all in fashion events, so say also 27 percent of the men. Technical and scientific events interest about 20 percent of the men most of all, as well as 10 percent of the women. As far as recreation goes, 28 percent of the group would choose as their free activity either writing, painting, playing music or acting; 22 percent like "fixing things" best of all; a third of the women choose decorating as their favorite activity while about 10 percent of the group express a liking for solving problems. Presented with a different list of preferred activities, 24 percent would be most likely to go out on a "date." Thirteen percent would prefer to talk with friends; 7 percent would go to the local tavern; 20 percent would go to a sporting event; 27 percent would watch TV or listen to music as their first choice.

4. <u>Future Plans and Aspirations (Questions 31-38, 66-69, 70-72, 73, 74)</u>. The basically serious nature of the college population is brought out in the pattern of answers to questions which deal with what they hope for from the future and what they hope to achieve. Eight kinds of activities

were presented with the invitation to say whether the respondent regarded

these as being very important, of some importance or of no importance. The

percentage of replies in each category is shown in Table 11.

Table 11

Students' Value.

		Percentage Replying		
		Very Important	Some Importance	No Importance
Q. 31	preparation for marriage and family life	27	41	32
Q. 32	having fun	38	48	14
Q. 33	establishing meaningful friendships	52	40	7
Q. 34	thinking and preparing for career	79	18	3
Q. 35	mastering a field of study	63	28	8
Q. 36	exploring new ideas	37	48	15
Q. 37	developing a deep grasp of an area	21	51	28
Q. 38	finding oneself, dis- covering values	57	30	13

This basic seriousness is also brought out in the fact that 83 percent of the group intend either to pursue other studies (26 percent) or to go to work (57 percent) on completion of their present course. Only 8 percent "don't know" what they plan to do, even in a general way. Seventy percent of the group envisage at least the possibility of continuing to study in the future; 11 percent see this as unlikely to happen. Twenty percent have not yet decided on their future occupation and the students' occupational aspirations. The indications seem clear that the students perceive the education they are receiving as a step toward mobility, out of the manual worker categories into the professional and managerial. This is confirmed by a two-way classification and analysis of "parental" by "child-aspiration" occupation, but a straight comparison will make the same point.

Table 12

Parental Occupation and Students' Aspirations

Occupation	Parental	Students' Choice
1. Farmer	18.4	2.0
2. Teacher	4.8	17.4
3. Professional	6.4	20.4
4. Craft Trade	14.2	8.8
5. Labourer	17.1	1.8
6. Office Worker	10.7	14.9
7. Managerial	11.3	10.6
8. Self-Employed	14.0	3.7
9. Police, Armed Forces	3.1	Option Omitted
10. Undecided	-	20.4

A similar conclusion is suggested by comparing parental income with the students' perception of his anticipated value to society, shown by his estimate of his probable annual income.' The relationship between the parents' combined annual income and what students expect to be earning on leaving college is shown in the next table. More than 24 percent of the students anticipated an earning capacity more than the *combined* income of their parents. Whether this estimate is realistic or not, it points clearly to what must be a major motivating factor in the student's pursuit of higher education.

Table 13

Student's Estimate of Salary Compared with
Combined Parental Income

Very much less than parents	Much less than parents	Less than parents	Same as parents	More than parents	Much more than parents	Very much more than parents
12%	16.5%	20.5%	26.5%	15.5%	7%	2%

Asked to choose as first and second choices two things which they expect to be most important to them in the future from a list of nine vital concerns, the students' choices ranked them in Table 14.

However, the students are not motivated by the narrow conception that higher education is the path to affluence and financial security, the only prop for the good life ("*la dolce vita*" conception of happiness). Nearly half chose their particular occupation because the found the work

very interesting (47 percent); 14 percent chose it as an expanding area; 6

percent as well paid or a secure job (11 percent). Students perceived their

situation on completion of their courses as a matter of risk--38 percent

said jobs were scarce, they foresaw some or even great difficulty in

establishing themselves in work. This was not regarded as any fault of the

colleges. However, only 10 percent saw the courses and curricula offered

by these institutions as inadequate in preparing students for their future

job situation.

Table 14

Students' Vital Concerns for Future

Rank Order	Concern With	Weighted Choices per 100
1st	Occupation	42.3
2nd	Marriage	24.2
3rd	Children	8.7
4th	Friendship	8.5
5th	Intellectual Life	4.3
6th	Religion	4.2
7th	Aesthetic Life	3.4
8th	Community	3.1
9th	Sports	3.1

5. <u>Attitude to College (Questions 47-58, 39-42, 45, 46)</u>. To discover the students' view of the college environment certain key items from the *College Environment Index* (McLeish, 1970) were included in the questionnaire (questions 49-58). In addition, the confidence of the student in relation to the correctness of the decision he had made in choosing the particular college, as well as his confidence about the work he has handling at the college, were probed. Only 9 percent expected some trouble with college studies; another two percent expected or were actually experiencing great difficulty. More than half (57 percent) were very sure they had made the right choice of college; a third were fairly sure (33.7 percent); 9 percent were not sure at all that they had made the correct decision.

The replies to the questions about the college environment can be tabulated in terms of whether the respondents believed the key statement to be true or false about their own institution. (Table 15)

Taking a consensus of two-thirds of student opinion as a cut-off point, implying that this amount of agreement probably reflects something objective about the college, it follows that students agree that the post-secondary non-university colleges do foster independence, that channels are readily available for the expression of dissatisfaction, that students as a group do *not* work hard for the "fun of it," that college courses are well organized, that the good reputation of their college is well deserved, and that students often help one another with their work. There is better-than-chance agreement that students put a lot of energy into whatever they do, that many develop a sense of responsibility about social and political

Table 15

Students' View of Educational Environment

Statement		% Recording "True"	% Recording "False"
Q. 49	student energy visible	59%	41%
Q. 50	student independence fostered	75%	25%
Q. 51	students develop responsibility	58%	42%
Q. 52	student complaints, channels exist	74%	26%
Q. 53	students work hard	29%	71%
Q. 54	courses are well organized	90%	10%
Q. 55	college's good reputation deserved	83%	17%
Q. 56	students encouraged to criticize courses	60%	40%
Q. 57	students help each other	88%	12%
Q. 58	students are tense during examinations	43%	57%

life and their role in the community, that they are encouraged to criticize courses, and are not tense either in the normal run of events nor at examination times.

Altogether, the students' attitudes seem to be extremely favourable to the colleges. Student morale seems, in general, to be high. Although comparable data do not exist for the university population in Alberta, general impressions suggest that (for a number of reasons having to do with the nature, aspirations and expectations of the student body) the universities would not come off so well in these respects as do the colleges. Although there are differences between the sixteen colleges in the group, these are not significant enough to invalidate the generalizations made above. Where a doubt exists, it is clear that the student body is prepared to give the college the benefit of this doubt.

Other questions throw light on the students' attitudes, especially prior to entering college. They suggest the attitude of neighbouring communities to the work done by these institutions and the success with which they serve the educational needs of these neighbouring communities. Presented with a choice of eight reasons for selecting thier particular institution, 38 percent of the students said they chose it because it was a very good college for training in their particular field. The second best reason, given by 12 percent of the students, was that it was relatively inexpensive compared to other kinds of studies. Presented with eight more possible reasons, students emphasized that the training given made it easy to find a job afterwards (19 percent); 15 percent said they chose it because it was close to home; 12 percent because they did not have the prerequisites

for other training. A large number of students obtained information about the colleges from calendars (32 percent); 20 percent chose theirs on the recommendation or on the basis of information provided by old students; 13 percent consulted with family and friends. More than half of the students (56 percent) were not influenced by anyone in making their decision. Teachers and counsellors together exerted influence on only 7.5 percent of the students in making the decision. Canada Manpower played about the same role. Parents provided critical help or encouragement to 56 percent of the students in making their career decision. The main reason for selecting the particular department in which to enroll was *liking* for the subject of instruction (51 percent); employment opportunities on completion of course provided the next best reason (16 percent of the cases).

6. <u>Students' View of College Provision for Needs (Questions 59-65)</u>. The various needs of the student body, whether social, recreational, vocational or narrowly oriented towards job training, constituted one of the main centres of interest of the present inquiry. A group of questions with the same format explored these areas: the results readily lend themselves to tabulation. (Table 16)

Just less than half the student body is completely satisfied with the seven kinds of facilities listed in Table 16. Just over a third believe the facilities could be improved; 15 percent regard the facilities as inadequate for their needs. This argues a remarkable degree of contentment amongst the student body. The suggestions made by students towards improving college amenities will be dealt with in a later section. Here it need only be noted that the general pattern of attitudes, and the evaluation of the

sixteen colleges, is highly favourable to the colleges and their adminis-
tration. It is clear that the student body has approached the task of
providing information about their needs, and their impression of the
provision made in post-secondary education, in an extremely responsible and
open fashion. The fact that their attitude is so positive has been a sur-
prise to the present writer who is more familiar with student unrest,
dissatisfaction and general negativism. The students' expressed attitudes
need not generate complacency on the part of those who provide the courses,
amenities and financial support. But a certain amount of self-satisfaction
and congratulation for effective performance, seems appropriate.

Table 16

The Colleges

Facility Provided by Institution	Students' View of Provision		
	Completely Adequate	Good	Inadequate
Q. 59 Sports and recreation	48%	34%	18%

Averages	48%	37%	15%

Chapter 6

STUDENTS' ATTITUDES: DEMOGRAPHIC DIFFERENCES

The main reason for including demographic variables was to determine specific needs which were unsatisfied and specific attitudes which develop in terms of the student's prior value-systems and attitudes based on such factors as sex, age, religion, place and residence, etc. It is clear from the analysis that such differences do exist.

Sex Differences

The first fact that emerges in comparing the distribution of the two sexes with regard to the variables in the study is that females in the group 22-24 years are badly under-represented in the sample. Having regard to the fact that men are already over-represented in general, being about two to one in the total sample, this suggests that the programs of certain colleges (we would instance as possibilities, Fairview, Vermilion, S.A.I.T., N.A.I.T.) are relatively unattractive to this section. On the other side, the male students differ from the female in the disproportionate numbers of females whose costs of education are met by parents or husbands, in contrast to the men students, over 30 percent of whom support themselves through part-time work or from their own savings. Only one percent of the weighted sample are in receipt of scholarship, another 3 percent pay for their education from grants and loans. This suggests that if money were more readily available in the forms of grants and scholarships, many more males would take advantage of the post-secondary opportunities available to them in the Province.

80

The women students express themselves as being more interested in entertainment and fashion events than do the men who are more interested in sports, technical or scientific events. It still seems to be the man's place to "fix" things in the home whereas the women are concerned with home decoration. Women are more interested in talking with friends, going on dates and watching T.V where as the male students prefer going to the tavern, participating in sports, more so than do the women.

As far as certain vital concerns go, the main differences between the men and women students are that women are much more interested in forming meaningful friendships and in discovering what kind of person they really want to become than are the men. Men are much more interested in developing a deep, professional grasp of a field of study and somewhat more interested in preparation for marriage and family life. The two sexes do not differ in their attitudes to "having fun," developing the skills necessary for a career or to the excitment of exploring new ideas.

The greater seriousness and greater degree of job orientation of the male students are shown in the fact that, to a greater degree, they chose the college to attend from a study of college brochures or calendars, whereas a greater proportion of women were more influenced by information given by firends or family members or by reports about the superior quality of the teaching methods used. Proportionately more of the men than of the women would have preferred to start work or to travel immediately after finishing high school; more of the women would like to have got married or taken up other studies. More of the women chose their present specialty because they believed it offered the opportunity of being of service to others.

Proportionately, women students appear to take a slightly more favourable view of the colleges, presumably because they are not so subject to the additional strains imposed on male students by virtue of their occupational orientation, the fact that they are more self-supporting and have greater family responsibilities. The differences are quite small, with one exception: this in fact reverses the general trend insofar as male students express a *more* favourable view. Proportionately more men consider that their college has a good reputation which is well-deserved. Interesting sex differences are apparent in relation to the expressed attitudes to the various extra-course facilities provided by the colleges. Men students as a group are more impressed than are the women by the sports facilities, by the opportunities provided for student government and by the classrooms and laboratory facilities provided. Women are less impressed by the cafeterias and common rooms, the opportunities for special interest clubs, the libraries and classrooms.

Given a choice of various activities, proportionately more of the women declare that they would prefer to continue with further studies when their present courses are finished (possibly because there are more part-time and short-course students in this group). However, on being asked for a definite commitment more of the men declare they will (definitely or probably) continue with future studies. As far as occupation is concerned, more women intend to become teachers or office workers; more men intend to take managerial positions. It is hardly surprising therefore that women anticipate considerably less than do the men in annual income when they have completed their present courses, nor that they consider opportunities

of service to others as being most important in the choice of a career. As an additional sex burden, proportionately more women expect to have great difficulty in finding employment when they have completed their present programs. This appears to nothing to do with the provision and training made by the colleg.. the two sex groups are equally satisfied that the kinds of courses offered are adequate preparation for future entry into the labour force. As a kind of compensation, women are proportionately more oriented towards marriage, and men towards their occupation, in their first choice of important future activities.

Age Differences

As far as age is concerned, there are no specific trends of interest from the point of view of students' needs and motivations. General trends, such as might be predicted, can be found. For example, religious affiliations are different in different age groups. The proportions of Roman (or Greek) Catholics change slightly, first appearing to decrease, then to increase. The proportion of Protestants increases as we go up the age groups. The proportion of atheists and agnostics seems to increase, then to decrease, as the older age groups are traversed. Similar trends may be detected with regard to marital status: the proportion of single students decreases over the age span; the proportion of married increases. The proportions living with parents decreases with age, the proportion living in their own residence increases. Various similar, more or less well-marked trends are visible; had they been otherwise the nature of the sample would be suspect.

As far as educational matters are concerned, the factor of age begins to show some significance in relation to sources of information about particular colleges. Canada Manpower begins to be a significant source of information in the age group 22-24 years, increasing in importance with the increasing age of the groups until more than half in the range 40-49 years put it down as the one most important source of information. The news media become important in the same way but not to the same extent. The contrast can be se n in Table 17.

Table 17

Source of Information About the College

Age Group	Age Groups		
Sources of Information	18-21 Years	25-29 Years	40-49 Years
School	21%	6%	5%
Intimate associates	31%	37%	9%
Public sources	7%	13%	20%
Canada Manpower	2%	33%	55%
Calendars	38%	10%	11%

Apart from these trends, and a general tendency for older students to take a more favourable view of the college they are in and the facilities it offers, there appear to be no systematic variations across the age groups.

Place of Birth and Ethnic Differences

Apart from other associated demographic variables, such as parental occupation, place of residence in Alberta, first language spoken, etc., the birth-place of the student and/or his ethnic origin carry with them interesting differences both in value systems and in attitudes. These clearly reflect cultural differences. The college student population represents a multi-national system within which such variables as the country or origin of the student, his parents and other ancestors, operate to generate great diversity of viewpoint. We can search for these underlying differences within the student body at several different levels. Each of these levels is connected, sometimes very directly, at other times quite indirectly, with the needs and motivations of students which should be of concern to colleges. Once again what is needed to bring out these differences is a simple, uniform or standard statistic, a common measure which enables us to compare groups of students and different values.

In the case of values, a group of questions (Q. 31 - Q. 38) invites the student to designate the importance of particular ends which may or may not be significant in terms of his own objectives in his present course of study. The percentages of students stating that a particular objective is "very important" or of "some importance" gives us a common criterion with which to measure the significance of these values. In comparing the different ethnic groups, two categories ("very important" and "some importance") have been combined, giving the first a weight of *one* and the other a weight of a *half*. The results are shown in Table 18.

Table 18

Place of Birth and Patterns of Value

Value	Canada	Alberta	Britain	U.S.A.	Canada Indian	West. Europe	East. Europe	Asia	South America	Rank of Value
Q. 31 Preparing for family life	47	48	46	58	52	46	22	55	27	8th

Q. 38 Finding oneself; thinking about values	76	72	68	62	90	69	73	85	50	3.5
Average Score	67	66	71	71	72	64	58	69	63	-
Rank of Group	5th	6th	2.5	2.5	1st	7th	9th	4th	8th	-

We may hypothesize that these values share some general quality. It seems to be "responsible participation with others." In other words, each value reflects an aspect of socialization of the student groups. Each in his own particular way has taken on the social imprint of the "ideal student." The total group, including all the different varieties of students testifies to the success or failure of this process of socialization, the nature of the student ideal assimilated in passing through the school system, the family, and other social agencies. The consensus which different groups express about particular values provides us with a picture of this ideal.

As far as the total student population of Alberta is concerned, the different values selected for consideration in the questionnaire are ranked in a hierarchy as follows: thinking about a future occupation, and mastering particular job skills for the purpose of immediate employment tie for first place; thinking about the question of identity and values, together with the establishment of meaningful friendships come next in importance; exploring new ideas and the excitment of learning come fifth in significance; enjoying oneself, having fun, comes relatively low down at sixth place; even lower, in seventh place, comes the idea of developing a deep grasp of a specific field of study, not necessarily with a particular career or occupation in mind; lastly, but still with a considerable number of votes comes preparation for marriage and family life. Clearly, in Trow's sense, the "vocational" culture is predominant in the student body as far as the value system expressed is concerned. But there is a considerable admixture of the other three student cultures as well. We can estimate the relative contributions

of each by using the factor loadings for the eight variables in combination with the voting percentages. Expressing the predominant "vocational" sub-culture as 100, the rest of the mixture can be characterized as "academic," 71; "collegiate," 65; "non-conformist," 57. This categorizes the basic needs and motivations of the group as a whole.

The different ethnic origins of students shown in the table represent another dimension of considerable interest. The Canadian Indian students, perhaps as a consequence of their marginal situation, appear to be closest to the student norm or ideal as this is widely accepted and propounded by institutions. However, this is not due to any overall superiority in assimilating the various values of this group in contrast to the others. Rather, it is a consequence of the fact that this group is consistently average or above average in all variables and very much above average in one of these. Other groups tend to fluctuate above and below the average of the total group. In other words, it is a statistical artefact. This suggests that it would be more profitable to elicit the different emphases of the various ethnic groups, the value-patterns to which they adhere, instead of adding scores for values that often point in different directions. Using factor scores and combining the responses as appropriate, the following result (Table 19) is obtained as a very tentative first approximation.

The main conclusion to be drawn from these comparisons are as follows: (i) the student group as a whole has a predominent orientation towards "vocational" values, but this is modified by the perception of the necessity for an academic base in the pursuit of career skills; (ii) preparation for a career or an occupation does not exclude the idea

Table 19

		East Europe	47				

that this is not entirely an end in itself but is the foundation of a life which includes friendship, fun and recreation;

(iii) the vocational drive is not incompatible with the continuing search for identity, nor with the establishment of meaningful friendships, at least in the view of this student body. These general findings on student values are to be seen·as a framework within which different ethnic groups place a special emphasis on particular kinds of activity, pursuits or objectives.

These various emphases are as follows: (a) East Europeans are most strongly "vocationally" oriented, with the least admixture of other sub-cultures; (b) those born in South America express their highest allegiance to "academic" values with complete de-emphasis of the other values; (c) Canadians (including Albertans) tend to generate a "collegiate," "non-conformi.t" sub-culture which is "non-academic" and not particularly career-oriented; (d) Canadian Indians on the other hand are strongly oriented towards vocational values and towards non-conformism; in these respects they differ markedly from other North Americans; (e) students born in America are predominantly "collegiate" in their basic value-system but they place some emphasis on "academic" and "vocational" activities, especially the former; (f) students born in Britain are "vocationally" oriented; they are similar to Americans in adhering to "academic" and traditional (conformist) values but differ from them in de-emphasing the "collegiate" spirit; (g) students from Western Europe tend to be "counter-culture" people in that they gravitate towards the bottom of three subcultures and appear in the middle of the fourth--the "academic sub-culture. This suggests a balanced or perhaps a relatively uncommitted view of the significance of the given objectives in relation to their present course of study; (h) students born in Asia fall into the non-conformist category with Canadian Indians; they resemble these students also in their relative coolness towards "academic" and "collegiate" activities, they differ in that the Asiatics are relatively unaffected by the "vocational" drive.

The main significance of these variations in accepted valuations relates to the fact that the different groups perceive the college environments differently. Those differences are summarized in the following table.

Table 20

Place of Birth and Students' Perceptions of the College Environment
(Percentages Accepting Favourable Statement)

	Canada	Canada Alberta	Britain	U.S.A.	Canada Indian	West Europe	East Europe	Asia	South America

Putting the two sets of data together, it is possible to see a connection between the cultural perspective from which the student perce_ves the college and the judgment he makes of it. The analysis is relatively crude since we have not controlled for the actual differences between colleges nor for differences in the college enrolment figures for students of foreign origin. These two differentials confound these comparisons of ethnic groups. We tend to confuse the very real differences between the colleges which we have already dealt with with the differential viewpoint of the different value systems of the student groups. The following table is suggestive: it provides interesting hypotheses for future examination.

Table 21

Rank Order for Favourable – Unfavourable Attitudes and
the Corresponding Student Subcultural Perspectives

Rank Order of Group	Group Place of Origin	Predominant Sub-Culture
1st	South America	"Academic"
2nd	Eastern Europe	"Vocational"
3rd	U.S.A.	"Collegiate/Academic"
4th	Britain	"Vocational"
5th	Asia	"Non-conformist"
6th	Western Europe	"Anti-collegiate/conformist"
7th	Alberta	"Non-academic/collegiate"
8th	Canada	"Non-academic"
9th	Canadian Indian	"Non-conformist/vocational"

It seemś to be a matter for congratulation that the groups which

are predominantly academically and vocationally oriented take a more favour-

able view of the colleges than do those groups which are relatively negative

in their attitudes to academic and professional values.   It is a striking

fact that all three Canadian groups come together at the bottom of the rank-

ing system.   The provisions made by colleges in Alberta appear to be more

favourably regarded by immigrants than by the natives of this country.

Religious Differences

· There is, of course, a high correlation between ethnic origin and

religion: it is probable that some large part of the differences in values

and attitudes indicated in the previous section can be attributed to these

religious differences. The correlation can be attributed to the fact that

students of British origin lean towards the Anglican church; West Europeans

tend to be Roman Catholic or non-Anglican Protestants; East Europeans are

likely to be Orthodox; Asiatics tend to have no religious affiliation.   In

addition to the fact that the colleges are influenced by the differential

distribution of ethnic groups in the Province--Ukrainians concentrating in

the Edmonton region, Germans and Japanese in the Lethbridge area, and

students of British origin in the vicinity of Calgary--they also operate a

selective differential towards the various religions. The most obvious

example is, of course, Canadian Union College which is establish d as a

Seventh Day Adventist institution of higher education. Here only two students

declare a religious affiliation different from the rest of the sample from

this college. Similarly, Fort McMurray consists predominantly of Roman

Catholics, only a quarter of the students declaring themselves to be
Anglicans or of no religious affiliation. Red Deer College has a surplus
of atheists and agnostics (30 percent), Vermilion has a deficit (8 percent).
Various socio-economic and educational variables are tied in with these
different religious affiliations--for example, category and year of program,
parental education, first language spoken, number of siblings, occupation
of parents, age, place of birth, etc. These various connections are all
in the directions which could have been predicted, which inspires confidence
in the sampling and responses but which are otherwise not of great interest.

The student's religious affiliation influences his choice of free-
time activity in significant ways inasmuch as those who belong to no church
appear to spend more time with friends and much less time on sport than
other students. Mormons, Seventh Day Adventists and similar Christian
groups spend much less time going on dates or drinking and more time watch-
ing television or listening to music than do other students.

Curiously enough, the religious differences do not appear to affect
the students' attitudes towards marriage, friendship, occupation, learning
or self-discovery--at least at the superficial levels tapped by the questions
in these areas, and when we compare them group by group. However, certain
patterns appear which suggest that the religious differences that really
matter to us, as affecting students' attitudes, are between Group 5 (defined
as "other Christians, that is, Mormon, Seventh Day Adventists, etc."),
Group 9 ("No religious affiliation") and the other students. Comparing these
two groups in turn with the remainder of the sample, certain interesting
differences emerge which otherwise are concealed from sight.

In the case of "Other Christians," two-thirds are in attendance at one college (Canadian Union), the rest being dispersed unevenly over all but three of the remainder. A large proportion live in students' residences during term-time and tend to be self-supporting. They are better educated, on the average, than the other religious groups, 45 percent having had previous post-secondary education. They also have a slight advantage in their earlier schooling both in terms of their class standing and a clearer sense of direction. As a group they are more interested in scientific, cultural and political events and much less in sport and entertainment. In their free time they prefer to engage in creative artistic activities much more than do other students. We have already referred to their greater propensity towards listening to music or watching television in contrast to going on dates or drinking in taverns. Altogether they take a much more serious attitude to such vital questions as preparation for marriage and family life, establishing meaningful friendships, the search for identity. On the other hand, they are not too interested in "having fun," developing job skills or exploring new ideas.

Their reasons for choosing to attend their particular college are markedly different from those of other students: in place of relative shortness of courses, inexpensive character of the education provided, the easiness of the curriculum, the state that they were influenced by reports of the teaching methods used, and give "other" (presumably religious) reasons for their choice. In making the choice, they were influenced by their parents and by the rewarding social life and extra-curricular activities on campus much more than other students. Their main source of information about

the college was family, friends and old students, in that order. The
influence of their parents in the choice of a college was not greater than
in the case of other students, they were only slightly more helpful than
the average group of parents. The choice of special area of study was moti-
vated about equally by liking for the area and by the notion of service to
others. It is in the emphasis on service to others that this group of
students differs most markedly from other religious groups.

Their attitude to the college they are attending seems slightly more
positive (or "objective," perhaps) than students of other groups. They are
more confident about being able to handle the work than other religious
groups; they are quite sure they have made the right choice of college.
According to their perceptions, students put a lot of energy into everything
they do (two to one vote); they develop a sense of responsibility (seven to
three). However, much less than other religious groups they perceive students
being encouraged to complain or to criticize their courses. As regards the
physical facilities of the college, they are more satisfied than are other
groups, except in regard to classroom, laboratory and study accommodation.

Nearly half of the group intend to continue their studies on complet-
ing college, a third more plan to go to work. Mostly they intend to take up
professional work of some kind, only about 20 percent of the group opting for
farming or manual work. They expect to find a job easily, to be interested
in the work itself and to find satisfaction in serving others. In contrast
to all the other groups, they place their future occupation as being only of
secondary importance to them in the future, their religious beliefs and
attitudes being more important. Religion, occupation, family are the first

or second choices made by about 90 percent of this group; the intellectual and aesthetic sides of life are given possible first or second place by only 5 percent; friendship, citizenship, games and sports are chosen by another 5 percent. The group is very willing to be interviewed further about their beliefs and attitudes.

The group of atheists and agnostics (that is, "no religious affilia-tion") are another rather special group. They constitute 22 percent of the student group and are located in all the colleges--preferentially in Calgary A.V.C., Red Deer, Grande Prairie, Mount Royal, S.A.I.T., Lethbridge, N.A.I.T. They are enrolled especially in university transfer and arts programs. Their parents tend to be better educated with a higher proportion having taken a university degree. They are less interested in sport and more interested in politics than are the religious groups of students, spending more time with friends. They do not regard marriage, career or friendship with the same seriousness as other groups; they are more interested in "having fun" and exploring new ideas for their own sake. They tended, along with the Roman Catholic students, to choose their college because the education provided was relatively cheap, easy and short-term. The decision to attend a parti-cular college was largely their own, more than half of the parents being either unhelpful or uninvolved. Their subject of study was chosen because of liking for the area, without much consideration of its usefulness for a job or possible service to others. A relatively large proportion is not at all sure they have chosen the right college to attend.

In most of the questions designed to elicit attitudes to the college, this group is on the unfavourable side. The actual differences in terms of

the proportion of the group giving a favourable response and the average of the total student population is often small, but the trend is highly significant. Along with the Roman Catholic students, they anticipate some or great difficulty in finding a job after completion of their courses. They do not consider that the specializations offered by the college adequately prepare students for the labour force.

Program Differences

As has been suggested previously, the students' decision to register in a particular program of studies is not a chance decision but depends on a great number of factors--personality, motivation, special needs, both psychological and academic, as well as the actual nature of the provision made in specific subject areas based on the social demand for specialists. It is not surprising that, when we cross-classify the type of program in which the student is established with the other variables, we find a number of highly significant (in the statistical sense) associations. Sex, age, marital status, religion, education of parents, occupation and annual income of parents, the place where the student lives normally and when attending school, proximity to a university centre, how his education is being paid for, the highest grade of education attained previously by the student, his reason for completing high school as well as his position in class--these are all correlated to some degree or other with the kind of course he is taking, whetner this be university, commerce, industry, health or social services, liberal arts, or some other.

As far as attitude to the colleges is concerned, the health and

social sciences group play a pivotal role, contrasting now with one, now with another subject interest area. Usually the contrast is with the commercial and industrial grop, sometimes with the university transfer group.

It is difficult to detect any pattern here. The university transfer group appears to have a relatively unfavourable image of their college at least as far as the psychological environment is concerned. They are neither very much above nor very much below the average so far as the physical environment is concerned. Students in commercial and industrial programs appear to have a positive image of the college environment not only in its psychological but in its physical aspect as well. The health and social science students come out as generally favourable to the psychological environment and relatively unfavourable to the physical environment in terms of the facilities provided.

The liberal arts students are generally unfavourable to the psychological environment but are not too unfavourable to the physical amenities and facilities. Those in other courses are generally unfavourable both to the physical and to the psychological environments.

The marked differences between the course groups is brought out in their plans for the future, when their present courses have been completed. Three-quarters of the university transfer group will take up other studies (presumably at university); three-quarters of the commercial and industrial students will go to work; the liberal arts students will split fifty-fifty, half going to work, half continuing with other studies; the same will happen with the health and social science students except that rather more will go

Table 22

Note: Highest and lowest extreme scores are underlined.

to work than to study; those in "Other Courses" will go to work (50 percent) or continue with other studies (30 percent). As for their future occupations and prospects: professional work will claim all but a small proportion of the university transfer and the health and social sciences groups. The commerce and industry group proposed to engage in farming (44 percent), professional work (20 percent), and managerial work (20 percent) predominantly. The liberal arts students expect to engage in professional work, including teaching (83 percent). Those in other courses see their future in professional work (40 percent), farming (20 percent), managerial work or self-employed (28 percent). The expectation of occupational income is an average over $6,000.00 per annum divided as follows:

Table 23

Expected General Income by Program Groups

Program Group	Expected Income	Odds on Job Availability
1. University Transfer Students	Above $7,680	Even chance
2. Commerce & Industry Students	Above $6,290	5 to 2
3. Health & Social Science Students	$6,350	5 to 2
4. Liberal Arts Students	$6,780	Even chance
5. Other Course Students	$6,420	3 to 2
Average	$6,210	7 to 4

In choosing their particular occupational speciality, the main factors operating in most groups were interest in the work itself and its future expansion, the conditions in terms of pay and free time, security of employment. In the case of the health and social science students the main source of motivation claimed was the job itself, next service to others. It seems clear that the choice in this case was made *in spite of* the actual conditions of work.

As indicated in Table 23, expecations about jobs being available or unavailable differ considerably as between the course groups. A quarter of the total population do not know, or profess not to know, whether the kinds of programs offered by the college they are in provide an adequate preparation for the labour market. Two-thirds say "yes" to this and one-twelfth say "no." All groups regard their future career or occupation as being the most important things for them in the future: this is followed by marriage and family life. Religion figures third, with the worlds of ideas, art and music tieing for bottom place with friendship and community concerns. The only variations from this general pattern are that: (i) the commercial and industrial students stress occupation more and tend to de-emphasize religion; (ii) health and social science students emphasize it much more than do other students as a major pre-occupations; (iii) liberal arts students emphasize the significance of the intellectual life more than any other group. We can derive a more exact measure of the relative importance of these values if we consider the students' first and second choices of what they think will be important to then in the future, weighting them in the proportion of two to one, and rounding off.

Table 24

Students' Perception of Future Concerns

Socio-Economic Differences

A number of variables are associated in a cluster which clearly differentiates students in terms of a general factor of socio-economic level. The existence of the cluster is shown by the very high correlations between the variables themselves as well as by the fact that these other variables which appear to be influenced by, or associated in a certain way with, one of these variables tends to be associated in the same way with all the others. The cluster consists of (i) parental occupation, (ii) the students' estimate of parental income, (iii) the highest level of father's education, (iv) the

highest level of mother's education, (v) the size of family, and (vi) the
number of siblings who are in or (vii) who will take some form of post-
secondary education. As in other places, these variables and associations
reflect social class differences: their significance here is the strong
reciprocal influence they exert on educational attitudes, values and
motivations. The latter constitute our central concern.

The most focal variable in this constellation is clearly parental
occupation. Forty-nine of the seventy-four variables in the questionnaire
are related to parental occupational differences, including all but five of
the thirty-six variables relating to the students' perceptions of the
educational institution. It is a little surprising to discover this per-
vasive influence affecting all these variables (or being affected by them,
whichever is the direction of the causal process). Such student character-
istics as: marital status, age, sex, church attended, type of program, year
of study, category of enrolment (full or part-time), ethnic origin and birth
place are quite closely related to the cluster, the correlations indicating
the operation of complex social processes and selective educational
mechanisms. A consideration of the processes would take us far away from
our resources of empirical data, into the realms of abstract social theoriz-
ing. It is enough at this stage merely to point to the higher level
problems of models, mechanisms and simulations which, in conjunction with
other kinds of studies, historical and perhaps even experimental, might
throw light on the forces which operate to generate the various differentials
and associations revealed by the raw data.

The basic structure of the family background and the relationship

between the social-class indicators is brought out in the table of

correlations below.

Table 25

Correlations Between the Socio-Economic Indicators
(Contingency Mean Square Coefficients)

No.	Indicator	P/O	P/I	F/E	M/E	F/S	S/E
1	Parental Occupation	-	.98	.98	.97	.84	.87
2	Parental Income	.98	-	.97	.92	.82	.79
3	Father's Education	.98	.97	-	.99	.86	.86
4	Mother's Education	.97	.92	.99	-	.98	.87
5	Family Size	.84	.82	.86	.98	-	.97
6	Siblings in post-secondary education	.87	.79	.86	.87	.97	-
	Averages	.93	.90	.93	.95	.89	.87

The different occupational categories used in this analysis are as

follows: (i) farmer and unskilled workers; (ii) manual (craft) worker;

(iii) professional people; (iv) managerial and self-employed persons;

(v) unclassified because of failure to reply. Unfortunately, one-ninth of

the sample falls in the last category. The actual make-up of this group in

terms of the other variables has not yet been established although there

are various indications that the group would repay very close scrutiny, the non-respondents being obviously unusual in many respects. Since chi-square is the main statistic used to discover significant differences, the *idio-syncratic* nature of the responses of this "unclassifiable" group tends to confound the comparisons between the other groups since the "unclassifieds" are often the most discrepant group. However, allowance has been made for this in the specific conclusions drawn from the data.

The value-systems of the occupational groups manifest fairly characteristic, not to say predictable, differences. These are brought out in the table below where index numbers have been calculated to the base line of 100. This base indicates the lowest percentage in each case describing the activity in question as "very important." High scores therefore indicate a relatively greater concern with that particular problem in the occupational group as a whole. In addition, the index numbers have been standardized on the basis of assuming a fifty-fifty split as between the choice "very important" and the other three possible responses. Thus, the *differences* between the index numbers, indicating differences in attitude to the given values, are strictly comparable.

The index numbers indicate at once a considerable degree of overlap testifying to the fact that the particular value system favoured by individual students is not to be explained as a direct product of their socio-economic status (as we have already shown, ethnic origin, religious affiliation, etc. also play a part) but that this is certainly a leading factor influencing the accepted valuations.

Table 26

Value-Patterns Associated with Socio-Economic Status

Value	Farmer & Un-Skilled	Profes-sional Workers	Manual Workers	Self-Employed & Manage-ment	Unclass-ified	Chi-Square n=12
Q. 31 Marriage	127	133	142	100	101	50.86
Q. 32 Having fun	151	148	148	143	100	61.28
Q. 33 Friendship	140	124	127	118	100	23.71
Q. 34 Broad Career Skills	113	127	117	102	100	31.16
Q. 35 Job Preparation	127	100	127	109	133	25.46
Q. 36 Ideas, Learning	100	153	172	123	148	35.69
Q. 37 Professional Attitude	100	124	105	102	132	35.88
Q. 38 Self-Concept	130	128	123	126	100	18.64

Apart from the last line in the table, the other comparisons indicate significant differences at a high level. Thus it is apparent that farmers' children are more interested in friendships, manual workers' children in marriage, professional workers' children in developing a professional attitude, and self-employed persons' children in exploring new ideas than are the other groups. The "unclassified" appear to be different from the others in that they are interested in ideas and in study for its own sake, whilst still being

strongly interested in developing skills for immediate use. Coupled with the fact that they refused to reveal the parental occupation, it is tempting to suggest that they belong to the "non-conformist" student sub-culture. It is possible too that they are older, married, part-time students who do not really form part of the "normal" student population. Both of these hypotheses may be true--indeed they are self-supporting. As against these values, farmers' children are more averse to exploring new ideas and the development of a detached, professional attitude, professional workers' children deprecate skill development as immediate job preparation, manual workers' children are like farmers' children in not appreciating the idea of developing a deep grasp of a field of study divorced from a particular career or occupation, children of managers and self-employed persons are relatively unenthusiastic about marriage preparation, friendship and a professional attitude. The unclassified are not so interested in marriage, having "fun," friendship, thinking through their choice of occupation nor in the problem of discovering what kind of person they are.

The importance of these differences is that they provide different frames of reference from which the various groupings evaluate their experience of college. The attitudes and judgments which students develop are certainly dependent not only on the objective realities of college life, but on the students' prior experience and the possibilities this provides for comparing the college with other kinds of institutions--home, family, church, school, to mention a few examples. In the area of social class differences it is probably the anticipatory socialization oriented towards career or occupation provided by the home which is the important influence. If the college ethos

is concordant with the often unverbalized and unobtrusive emphases to which the student has been subjected in the family, if he feels "at home" with the career aspirations and definitions given by his college teachers, he will develop a favourable "image" of the college and its faculty. If these forces are pulling in opposite directions, there will be a tendency to regard the college unfavourably--unless the student, under 'he impulsion of upward class mobility is ready and able to re-define his occupational aspirations and self-image. In this case, it .s the home which will tend to be devalued. There is evidence of both of these effects in the data. Many students are (relatively) disenchanted with college, others live away from home even during vacation time clearly because the lower educational level of the parents and sometimes parental opposition to what the children are doing in attending college renders the home atmosphere uncongenial.

It will be observed from a close study of Table 27 that, although the students seem to be in basic agreement about the quality of the educational environment provided by the colleges, this general consensus is reached by each group on the basis of their different perceptions of particular features of the environmen... The agreement about the physical facilities is much less marked '· .n it is about the educational influences. We are probably observing the influence of the student "sub-cultures" discussed in a previous section--the hypothesis being that the "vocational," "academic," "collegiate" and "non-conformist" attitudinal differences are being reproduced by virtue of the socio-economic categories we are using. Certainly children of professional class origin, hypothesized as belonging in the main to the "academic" sub-culture, appear to be impressed with the

Average-Educational Environment Factors	116	118	112	109	108	112
Average-Physical Environment Factors	_130_	115	121	127	_106_	120

encouragement given to independent thought and action, with the student's capacity for hard work, their energy and their sense of responsibility. They are not so persuaded that their college has a good reputation, or that it deserves to have one. Their special interests appear to be well-catered for in terms of clubs and sports.

Children of farmers and unskilled workers perceive channels for student complaints as well as opportunities for student government. They are, relatively speaking, highly impressed with the physical environment, especially the sports facilities provided by the college. Classrooms and laboratories are also very adequate according to their perceptions. Children of manual workers are not too impressed either with the educational or physical environments of the colleges, tending to fall in an intermediate or lowly position with respect to the seventeen indices. However, their perception is that students help each other, that there are opportunities for student government and special interest clubs. Otherwise, like the other groups of students they appear to be convinced of the high quality of provision, academic and physical, established by the colleges to satisfy their needs. These two groups, farmers' and manual workers' children seem to belong to the vocational sub-culture.

Children of self-employed persons and managerial staff workers recognize the general good quality and high repute of their college and of the sports and recreation facilities. Apart from this, they single out only the study a: s as constituting something special, in contrast to other groups. The "unclassified" group can be differentiated from the other occupational groups only by their relative negativism, tempered by the

recognition that channels of complaint are readily available to students and that the level of student anxiety is low. The self-employed and the un-classifiable suggest a "non-conformist" sub-culture.

These indications seem to be supported by the students' plans for the future. Children of farmers, unskilled labourers and craftsmen mostly plan to go to work immediately their courses are finished. Children of professional p ·le, in disproportionate numbers, intend to pursue further studies. There is a close relationship between the student's choice of occupation and the declared parental occupation, the coefficient of mean square contingency being 0.86. As indicated in a previous section, the discordance is to be accounted for in part by the students' aspirations to move upwards in the socio-economic hierarchy. Additionally, and so to speak complicating this upward movement, is a smaller scale projected down-ward movement. Our data are not strong enough to support any very definite conclusion as we are entirely dependent on the students' perceptions and did not define our categories with that kind of analysis in mind.

Table 28

Students' Expectations of Upward Mobility

Students' Expected Occupation	Parents' Occupation					Total
	Farmer	Craftsman	Manager	Profes-sional	Unde-clared	
Farmer	10 %	6 %	5.5%	2.5%	2 %	26 %
Craftsman	·3 %	3.5%	2 %	0.5%	1 %	10 %
Manager	6.5%	5 %	5 %	2.5%	2.5%	21.5%
Professional	11 %	11 %	8 %	5 %	5 %	40 %
Undeclared	0.5%	0	⌐ ˮ	0	1 %	2.5%
Total	31 %	25.5%	21.5%	10.5%	11.5%	100 %

However, the evidence already presented of estimates of parental income and the students' anticipated income on completion of course-work seems to support the conclusion that there are two motivational factors which tend to work against each other: (1) the student's expectation that he will follow in father's footsteps, occupationally speaking, and (2) that a great part of the student body is experiencing an opportunity of higher education denied to their parents, and expect to be upwardly mobile as a direct consequence of this.

The Students' View of the College Environment

With this as preamble, it is necessary to return to the individual colleges and the raw data concerning their students' view of the provision made for them. The variables which measure the students' attitudes fall into two groups, one set concerned with the educational environment, the other with the physical environment. The wording of the questions within each group was in a standard form so that comparisons could be made of the different elements of the environment using the same scale of reference. The scale is, of course, that provided by the individual student, being the product of the "set" be develops towards the questions as a group.

In Table 29, we have moved student government and opportunities for special interest clubs from amongst the physical environment questions where these items were misplaced. They become elements of the educational environment. The percentages of students responding positively to the various questions--13 in the case of the educational environment variables, the question about student tension having been dropped as ambiguous in interpretation (Questions 47-57; 61, 62); five in the case of the physical

Table 29

Students' View of Their College Environment

Average	60.6		44.3	

environment (Questions 59, 60, 63, 64, 65)--are shown in the table. The

rank of each college in terms of the favourable attitude of the students is

also shown as a matter of interest. It will be observed that there is a

fairly low correlation between the evaluations made of the physical and

educational environments by students, it is by no means a one-to-one corres-

pondence (rho=0.47). The colleges where the differences in rank as between

educational and physical environments are extreme are: Fort McMurray (10),

Grant MacEwan (8), Canadian Union (7.5), Lethbridge (7) and S.A.I.T. (6).

The differences are probably to be explained in terms of student morale.

Chapter 7

NEEDS AND MOTIVATIONS IN RELATION TO
TYPES OF COLLEGE

It is no part of the mandate of the present study to discuss the historical development, the administrative structure, or the underlying philosophy of the Alberta college system. This is accepted as a given datum, a starting point. The colleges exist, they have a history, albeit a brief one; they have a charter (in Malinowski's sense, a definition by the Alberta community of the nature, purposes and values of these institutions). Our purpose and concern is with the function *actually* performed by these institutions. Specifically it is our task to collect and examine factual materials having some bearing on questions such as the accessibility of the colleges to different strata of the communities in the Province, the perceptions by the groups which make use of the services provided of the college effectiveness in serving community and individual needs, the special character of these institutions in relation to other kinds of educational provision made by the Province of Alberta, especially at the post-graduate level.

The theoretical design of the study, coupled with the success in implementing this design in practice thanks to the cooperation discovered at all levels (the Commission in the first instance, the sixteen colleges which participated, the selected student respondents) make it possible to bring the most powerful statistical methods of analysis into play to discover the interrelationship and meaning of the data collected.

116

After considerable reflection and having regard to a certain urgency imposed by the deadline for completion of the study, it was decided that the most powerful and suitable analysis to throw the maximum light on the basic questions being examined is the discriminant function technique. Briefly, the method, as used in this instance, begins from some existing and meaning-ful classification, such as full versus part-time students or College X students versus College Y students, and proceeds to state which attribute or characteristic of the population studied most effectively separates or distinguishes between the two (or more) groups. The analysis picks out the distinguishing characteristics from amongst those available and states in a quantitative form how best these characteristics should be combined (regres-sion coefficients giving the actual "weights" to assign to the different scores or discriminants) to produce the maximum separation of the two (or more) groups.

For example, let us consider the question: what best distinguishes between the full-time students (n=12, 611) and the part-time students (n=440), two different groups in the sixteen colleges investigated. To answer this question and others we will ask later, we have 44 items having to do with the student's demographic characteristics, and 41 items having to do with his perception of the quality of the particular institution in which he is registered. Using the discriminant function technique, we can separate the "nuggets" in our data from the "dross," as far as this question is concerned. For example, the analysis shows that as far as the demographic characteris-tics are concerned, the best information we have to separate the groups is marital status. Full-time students are mostly single; part-time students

are mostly married. Starting from the student's perceptions, the best
information we could have if we wanted to predict whether the student was
part-time or full-time is the answer to the question about the part his
parents played in his decision to attend the particular college in which he
is registered. In other words, full-time students more often than not are
single; their parents played a supportive role in the decision to attend the
college. In connection with the question: is this particular student full-
time or part-time (assuming, for example, that a particular student failed
to say whether he was full or part-time), we could make a very informed
guess from the answers he gave to these other two questions. In addition,
we know from the analysis that the question whether he is married or single
is a better item to make the prediction than is the parental attitude, by a
factor of 205 to 127 (these being the respective beta or regression, co-
efficients). This is a relatively trivial example intended only to illus-
trate the technique.

In effect, the full-time students can be distinguished from part-
time (including short-course students) by *ten* demographic variables and *five*
attitudinal variables. These, so to speak, define the typical full-time
student in contrast to the typical part-time student. In talking about a
particular student, we allow for a certain margin of error insofar as not
all students are typical of their group. In other words, we are dealing in
probabilities, the virtue of this method being that we actually *know* the
level of probability of the relationships we are asserting. On the basis of
the best information, we can summarize the most important discrimants, their
order of significance being shown by the relative size of the beta coefficients.

119

Table 30

Full-Time and Part-Time Students:
Distinguishing Characteristics

Discriminating Question	Beta Coefficient	Full-Time Student Description
7	-205	Not married
6	-185	Under 25
3	148	(a) In business/commercial program
5	147	Male
3	125	(b) Or in university transfer program
22	-120	Not supporting himself
8	117	(i) Attending a Christian Church
3	116	(c) Or in industrial/technical program
21	116	Lives near University centre
8	112	(ii) Or has no religious affiliation
45	127	Parents played a supportive role
66	117	(x) Intend to work on completing course
68	114	(y) But undecided about type of work
68	104	(z) Although oriented towards professional work
49	100	Believe students are energetic, forceful

Demographic Variables: Multiple correlation = 0.43; Explained variance = 19%

Attitudinal Variables: Multiple correlation = 0.35; Explained variance = 12%

As in other following tables the question still to be answered is:
how good is the discrimination which these variables make between the two
kinds of student? In other words, suppose we had all this information about
the total group but (say) had lost their classification as full or part-time
students, how much closer to the real classification would we be using this
information than if we simply guessed each student's category at random?
The answer is provided by the multiple correlation coefficient. This tells
us the relationship between the *prediction* we might make about each student,
using regression coefficients as best weights, and the actual status of the
student provided by the answer actually given to the question whether he was
full or part-time. In this particular instance we do improve on chance
allocations. Using the first set of demographic variables shown in the
table, the correlation between the actual and the predicted classification
of the students would work out at 0.43; using the student attitude variables
the correlation would be 0.12. Putting this otherwise, using the squared
multiple correlation as the basis of the calculation, 18.5 percent of the
differences (variance) between full and part-time students is associated
with, or has been "explained by" the ten demographic characteristics; only
12 percent of the variance is "explained by" or associated with the five
attitudinal variables. In other words, marital status, religion, program
and proximity to a university centre are more important defining character-
istics of the full-time student than are the orientation towards a job,
parental attitude and attitude to students as being energetic or apathetic.
One set of variables is more effective in predictive (or descriptive) value
than the other by a factor of 37 to 24.

The major point about this technique has not yet been stated--that its usefulness consists *not* so much in the positive information it yields, but rather in the specific questions to which it returns a *negative* answer. In this particular illustration, the analysis has enabled us not only to discover ten demographic and five attitudinal "nuggets:" it has testified to the fact that (at least in relation to this first question--full versus part-time students), 70 of the items which *might* have discriminated are so much "dross." Parental education, parental occupation, income level, ethnic origin, place of birth, attitudes towards college facilities and educational environment, etc. are *not* characteristics which distinguish part-time from full-time students.

This is the rationale underlying the more important question we are about to propose, namely: what characteristics distinguish between full-time students at the various kinds of post-secondary institutions in the Province of Alberta? We have now dropped part-time and short course students from the sample. Putting this otherwise: are there differences in the accessibility to colleges by different kinds of students? Perhaps subtle discriminatory factors operate to inhibit particular kinds of persons from taking advantage, or fully benefiting from, the facilities provided? This has nothing to do with the formal and declared administrative policies concerning pre-requisites for admission to certain programs. We accept as a fact that access to the system of post-secondary non-university education as a whole is affected by numerous factors grouped under the headings of academic ability, social class, geographic location and ethnic origin. But we start from the existing post-secondary population and ask two slightly

different questions: How is the available "pool" of students distributed

within the five groups of colleges which constitute the system? Given this

distribution, what are the characteristics (demographic and attitudinal)

which define the type or species of college? In other words, we are con-

cerned with the end results of extremely complex social and educational

processes which work normally outside of our awareness to produce the

diverse patterns of the dynamic present.

To begin with, we divide the colleges surveyed into five groups

according to the agency "sponsoring," or accepting responsibility for the

college. The six public colleges for which the Colleges Commission is

directly responsible (Grande Prairie, Grant MacEwan, Lethbridge, Medicine

Hat, Mount Royal, Red Deer) constitute Group I. This group is the focal

point of the analysis. Group II consists of the two Institutes of Tech-

nology, N.A.I.T. and S.A.I.T. Group III consists of Fairview, Olds and

Vermilion Agricultural and Vocational Colleges. In Group IV are the

Alberta Vocational Centres situated at Calgary, Edmonton and Fort McMurray.

Finally, Group V consists of the Seventh Day Adventist and Lutheran private

colleges, Canadian Union and Concordia.

The technique of discriminant analysis outlined above has been

applied in a systematic and uniform fashion, comparing each group of

colleges in turn with the public colleges. A further breakdown of the

first group was effected in which we compare those colleges which offer

university transfer courses (Grande Prairie, Medicine Hat, Red Deer) with

community colleges which do not offer these courses (Grant MacEwan, Mount

Royal, Lethbridge). In a final analysis, Red Deer College is compared

with the five other colleges in its group to discover any specific features of this college which might throw light on student unrest there.

The first comparison is between the six public colleges (Group I) with all the other ten colleges in the sample. The two groups differ in terms of the programs students are registered in, the proximity of their homes to the three university centres, their religious affiliations, and what they look for in their courses. They also differ in their attitudes to colleges, to other students and in their plans for the future. These significant discriminants account respectively for 40 percent of the variance between the two college groups (demographic) and 27 percent (attitudinal variables).

It would appear from the absence of socio-economic, ethnic and similar variables from the regression equation that there are no discriminatory selective processes operating as between Group I colleges and the remainder of the colleges in the sample. There are certain differences between the two groups of students in relation to their perceptions of the college environment. The students differ not only in the blanket evaluation of the colleges under the Colleges Commission that their institution has an excellent reputation which is well-deserved; they also take the view that their college does not encourage criticism of courses, nor do they foster student independence. These statements are, of course, relative to what students say about their college and are not absolute judgments.

Table 31

Public Colleges versus Other Colleges

Discriminating Question	Beta Coefficient	Public College Student Characteristics in Contrast to Other Students
3	-352	(a) Not in industrial/technical programs so much
3	292	(b) In university transfer program more often
21	-179	Permanent residence *not* near university centre
4	133	In first year of present program
8	-125	(i) Has no religious affiliation
32	121	Expects "fun," enjoyment, recreation
8	-120	(ii) Or a *Christian*, if religious
3	-119	(c) Not in business/commercial programs
3	-115	(d) Nor in academic upgrading programs
66	220	Plan to continue studies after leaving this college.
40	170	Chose college to be close to home.
55	145	College is excellent, with well-deserved reputation.
57	141	Perceives students as helping each other.
50	-129	College does *not* encourage student independence.
43	109	Parents' wish was for them to go to College.
56	-107	Believ students *not* encouraged to criticize courses.
67	-103	Plan *not* to continue studies after present program.

Demographic variables: Multiple Correlation = 0.64; Explained variance = 40%
Attitudinal variables: Multiple Correlation = 0.52; Explained variance = 27%

At this point, in view of the differences which have ⹟erged, it is of interest to break down the public college group into those which provide university transfer courses and those which are community colleges, which do not make this kind of provision. Here we are slightly embarrassed by the wealth of material, as the two types of institutions differ in 16 out of 44 demographic variables and 21 of the 41 attitudinal variables. These two sets of discriminants account for 49 percent and 47 percent of the variances respectively. It is clear that the most significant and very complex selective processes are at work here, separating two kinds of students.

The fact that the two kinds of college sub-groups are not very clearly differentiated in terms of *program* variables is most remarkable considered in relation to the rest of the material which does figure prominently in the discriminent function. In other words, the actual programs offered in the two types of public colleges appear to be amongst the least important factors in determining who should attend and who not. The most important question seems to be where the student lives in relation to the three university centres in Alberta. The implication seems to be that students attend university transfer colleges as a convenience rather than as institutions where a university type of education or atmosphere is to be enjoyed. This can be readily seen also in the table of course offerings, and the hours per week devoted to different subject areas in these two kinds of college.

Table 32

University Transfer Colleges versus Community Colleges

Discrimination Question	Beta Coefficient	Univeraity Transfer Student Tendency in Contrast to Community College Students
21	-539	Does not live near university centre.
8	348	No religious affiliation.
8	243	Or is a Christian (not other kinds of religion).
14	188	(1) Father office-worker, police or self-employed.
6	176	25 or over.
11	174	English as first language.
38	-167	Not so interested in discovery of self and values.
19	-153	Does not live in own residence while at school.
32	-151	Does not rate "having fun" as course objective.
24	140	Completed high school because of influence of persons.
14	139	(ii) Or father s occupation professional.
3	132	(a) Program is in university transfer area.
3	131	(b) Or in business/commercial area.
24	130	Completed high school because of study interest.
20	-117	Does not live with parents during vacation.
3	108	(c) In health aervices, aocial sciences or arts program.
42	465	Choice of college influenced by intimates.
41	383	Information about college: family and former students.
41	275	Or teachers, counsellors, apeaker, or career fair.
63	-270	Not impressed by library facilities.
59	-250	Nor with sports and recreation facilities.
65	233	But is impressed with adequacy of study area.
73	222	Marriage and family will be important future concerns.
62	-209	Not impressed, opportunities for student government.
68	-180	(a) Has not yet decided on type of work to be taken up.
58	-179	Perceives students as tense.
68	-144	(b) Definitely not office work or self-employed.
39	-142	Chose colle; r quality of teaching or athletics.
68	-135	(c) And definitely not farming, labouring or craft trade.
43	134	Parents wish that he should go to college.
48	-133	Not sure he made the right choice of college.
50	135	Perceives students as encouraged to be independent.
55	-122	Disagrees with view, college has well-deserved reputation.
73	121	Perceives career as primary future concern.
51	-114	Does not perceive students as responsible.
46	-113	Did not chooae specialism for "service to others."
46	-102	Did not choose specialism because of training or employment.
70	105	Chose future career as interesting work.

Demographic variables: Multiple correlation = 0.70; Explained variance = 49%.

Attitudinal variables: Multiple correlation = 0.68; Explained variance = 47%.

The most significant fact about university transfer colleges is the high degree of dissatisfaction of the student group. They rate the facilities low; they perceive themselves as extremely tense; they are disenchanted with the lack of responsibility in the study body itself and with the relative lack of opportunities for student participation in the democratic process. Small classes, a relatively non-threatening community, a college close to home where the fees are low, where competition is not too fierce, where it is possible to carry university credit and high school upgrading courses simultaneously--these are the main reasons for choosing their particular college given by these students in the open-ended questions and in the interview.

The character of the student intake is brought out very clearly in one particular university transfer college, one in which a considerable degree of student unrest has been evident for a considerable period--Red Deer. In no less than 56 characteristics this college stands out from the rest of the college group. It stands in first, second or third place from the top or bottom of the total sample of sixteen colleges. The tabulated materials speak for themselves in Table 33.

Within the group of public colleges, the discriminant function analysis indicates that Red Deer is distinguished from the other colleges in terms of sixteen of the demographic and nine of the attitudinal variables (Table 34).

Table 33

Red Deer College : A Student Counter-Culture?

[Very High (HHH) or Very Low (LLL) in Proportion, Relative to Other Fiften Colleges
1st, 2nd, or 3rd Place from Top of from Bottom]

HHH	LLL
University Transfer students	Business and Commerce students
Social Science students	
Health Services students	
Students 17 years or less	Return of questionnaires (only 67%)
Students no religious affiliation	Students Roman (or Greek) Catholics
Anglicans	Proportion of Other Christians
British ethnic origin	French or Ukrainian ethnic origin
Born in Alberta	Proportion Other Canadian
Born in America	
Students First Language English	
Father with University Degree	
Parent in Police or Armed Forces	Parent Labourer
Parent Professional (but not teacher)	
Sibling will take further education	
Parental income over $15,000	
Nearest centre is Red Deer (76%)	Few live near Edmonton (14%), Calgary (5%)
Students with Some University Education	
Completing H.S. because of Friend's Influence	Completing H.S. because of Study Interest
Completing H.S. for Prerequisites	
Students in Top Ten Percent at H.S.	
Students in Top Thirty Percent at H.S.	
Interested in Going on Dates	Interest in Creative Arts for leisure
	Interest in Establishing Meaningful Friendships
	Interest in Exploring New Ideas
Student choosing college as (Less Expensive).	Student choosing college as (Good College)
or (Some Place Different)	
or for the (Social Life)	
Parents wish to do As Doing Now	
Parents gave Encouragement Only in choosing college	Parents played Critical Role
Parents Little Involved in decision	Choosing speciality for Good Job Opportunities
Anticipate Little Trouble with studies	Students Entirely Confident about College Work
Believe Channels Exist for Student Complaints	Believe Students Work Hard
Believe Students Encouraged to Criticize Courses	Students Willing to be Interviewed
Believe Opportunities Exist for Special Interest Groups	
Believe Opportunities for Student Government	
Students Definitely Not Planning to Continue Studies	
Students choosing a particular future occupation as well paid	
Students believing family life and relations with kids most important future activity	
Students believing Sports & Games Most Important as their future pre-occupation.	

Table 34

Red Deer College versus Other Public Colleges

Discriminating Question	Beta Coefficient	Red Deer College Students in Contrast to Others
21	-335	Do not live near the university centre.
8	300	Declare they have no religious affiliation.
8	280	Or that they attend a Christian church.
38	-206	Not interested in discovering self and values.
24	191	Completed high school for prerequisites.
2	182	Come under category of full-time students.
10	-163	Were not born outside Alberta.
3	156	Are in an academic up-grading program.
18	151	Three siblings who will take further education.
3	-137	Are not in a business/commercial program.
20	-129	In vacation time do not live with parents.
27	-125	Uninterested in creative art as leisure pursuit.
11	113	English was their first language.
5	113	Are of the male sex.
24	109	Completed high school to prepare for a career.
3	-107	Are not in industrial/technical program.
65	248	Impressed with study areas other than library.
67	-156	Do not plan to continue studies after this program.
45	-133	Parents did not play critical role in career decision.
52	-131	Perceive channels exist for student complaints.
43	121	Parents' wish was for them to do as doing now.
64	-112	Classrooms, labs perceived as not inadequate.
58	-107	Students perceived as extremely tense.
61	-106	No opportunities for special interest groups, clubs.
66	105	Plan other studies (at university?) on leaving this college.

Demographic variables: Multiple Correlation = 0.53; Explained Variance = 28%
Attitudinal variables: Multiple Correlation = 0.48; Explained Variance = 23%

It seems clear that a great part of the differences between the university transfer colleges and the community colleges are, in fact, to be attributed to the presence of Red Deer in the former sub-group. To put this otherwise, the characteristics or tendencies which distinguish the university transfer group from other student groups appear to be concentrated or exaggerated in the case of Red Deer College.

When we compare the two university transfer colleges, Grande Prairie and Medicine Hat with the three community colleges (dropping Red Deer College from the university transfer group) a different set of discriminants appear. This confirms the view that the qualities and attitudes which seem to distinguish university transfer students and community college students in the previous analyses are, in general, those of students of Red Deer College.

A new pattern appears in the Medicine Hat and Grande Prairie students. The typical student here, in contrast to the community colleges and the Red Deer College student, is involved in a health service program, is older and completed high school as a result of an interest in studies and under the influence of family and friends. The most interesting events to these students are in the cultural domain. They believe preparation for marriage and family life to be very important. In contrast to Red Deer, they were much influenced by the school in the choice of college and in obtaining information about it. They have not yet decided what to do on completion of their courses, but it will not be manual work, office work nor will they be self-employed. They chose their career and their present course of studies on the basis of interest and liking for the area. Service to others or the thought of a future job were not important. They consider their present

college to be convenient: the studies are shorter, they are easier and less expensive than other studies. The college facilities themselves are not too special but the students are sure they made the right choice. Although the student body is perceived as energetic, students do not tend to help each other. The opportunities for student government are limited.

The group of colleges under tne Commission can be compared with the two Institutes of Technology, N.A.I.T. and S.A.I.T. in the same way. There are nineteen characteristics which distinguish between the students at these two kinds of institutions--nine in the demographic area and ten in the attitudinal. The clearest discriminants relate to the programs students are in, the contrast being between university transfer students in the first group and industrial/technical and commerce/business students in the second. However, as we could have predicted at this stage, these program differences are associated with home, school, and college values, as well as with attitudinal variables. The discriminants are set out in Table 35. It seems remarkable that, after programs, the most discriminating variables are (i) religious affiliation or none, and (ii) the influence of home and school, these being opposed to occupational considerations in the case of public college students in the choice of college to attend.

It seems clear from the following table that N.A.I.T. and S.A.I.T. cater to quite a different stratum of the population from that served by the six public colleges. The students anticipate taking up some kind of manual work (skilled or unskilled, or farm work) in contrast to the public college students who are preparing for a professional career. This class difference, manual versus professional man, seems to be the key to the other differences perceptible between the two groups.

Table 35

Public Colleges versus Institutes of Technology

Discriminating Question	Beta Coefficient	N.A.I.T. and S.A.I.T. Students in Contrast to Public College Students
3	-432	(i) In industrial/technical programs.
3	297	(ii) Not in university transfer programs.
3	-178	(iii) In business/commercial programs.
8	-154	Have a religious affiliation of some kind.
32	146	Do not accept "having fun" as a course objective.
21	-131	Live near university centre.
4	121	Are enrolled in various years of program.
14	-108	Fathers are not professional men.
24	-107	Prerequisites for career, occupation, important in high school.
40	257	Home/school not influential in choice of college.
66	234	No plan for other studies on completion of course.
41	-206	Publicity media influential in choosing college.
55	197	Reject idea that college has excellent reputation.
41	-189	Family, students source of college info.
70	-134	Chose career as well paid, ex, inding profession.
50	-130	Perceive students not encourage in independence.
59	122	Sports & recreation facilities seem inadequate.
68	-114	Expect to take up some kind of manual work.
72	-108	College specialisms adequate as preparation.

Demographic variables: Multiple correlation = 0.71; Explained variance = 51%
Attitudinal variables: Multiple correlation = 0.61; Explained variance = 38%

Much the same contrasts can be recognized when we compare the six
public colleges with the three Agricultural Colleges. The latter seem to
be still predominantly based on, and to serve the specific educational needs
of the local agricultural communities. The demographic variables bring out
this fact rather clearly: the attitudinal variables also tune in with the
expectations created by this hypothesis. The contrast between the two
kinds of college is marked. This is shown by the fact that over half the
variance (53 percent) is accounted for by the demographic variables, and 30
percent of the variance by the attitudinal variables. (Table 36).

Students at the Alberta Vocational Centres represent another type
which is in considerable contrast with the public college student. They
differ most significantly in previous education and in their ideas about
their future occupation. But they differ hardly at all in relation to their
attitudes to the college they are attending. There are six discriminants in
the area of demographic variables, another 16 have to do with values and
attitudes. The two types of college population are markedly different.
This is shown, amongst other things, by the amount of variance explained by
these variables--61 percent by the six demographic variables, and 56 percent
by the attitudinal variables. These differences are tied to the core
variable of previous education, this of course being a basic occupational
prerequisite. The fact is that the main motivation of students in the
A.V.C.'s is to improve their educational qualifications with a view to
bettering their career prospects: that this turns up in the regression
analysis as the principal discriminant serves to increase our confidence in
the rest of the analysis.

Table 36

Public Colleges versus Agricultural Colleges

Discriminating Questions	Beta Coefficients	Agricultural College Students in Contrast to Public College Students
3	-525	(i) Are in agricultural programs.
3	-317	(ii) Or in industrial/technical programs.
19	252	Not living in own residence while at school.
3	-159	(iii) In academic upgrading program.
12	-124	Father's education elementary or less.
16	123	Have less than four siblings.
18	-110	These will take post-secondary education.
10	-105	Born in Alberta or elsewhere in Canada.
26	104	Not interested in scientific, technical matters.
68	-381	(a) Future work of manual type.
41	-338	College information from family, friends.
41	-335	Or from school sources.
40	247	Chose college on advice of parents, teachers.
63	-230	Impressed with library facilities.
66	215	Do not plan other studies on completion.
68	-211	(b) Have decided about future work (self-employed).
41	-210	Public publicity used in choosing college.
68	-187	(c) Or are undecided.
57	151	Perceive that students do not help each other.
62	130	Do not see opportunities for student government.
51	126	Do not see students as developing responsibility.
56	-124	Perceive students encouraged criticize courses.
47	106	Do not expect trouble in passing their courses.
70	-102	Chose their career as of "service to others."

Demographic variables: Multiple correlation = 0.73; Explained variance = 53%
Attitudinal variables: Multiple correlation = 0.54; Explained variance = 30%

...

Table 37

Public Colleges versus Alberta Vocational Centres

Discriminating Question	Beta Coefficients	Alberta Vocational Students in Contrast to Public College Students
3	-362	(a) In academic upgrading program.
23	-314	Previous education junior h.s. or less.
21	-213	Live near university centres.
3	-181	(b) In industrial/technical programs.
26	-107	Most interesting events political-economic.
20	102	Do not live with parents when not in school.
68	-287	Future occupation seen as manual work.
44	209	Wish on leaving h.s. different from now.
70	-194	Career chosen as being of "service to others."
48	-191	Very sure made right choice of college.
61	-186	See opportunities for interest groups, clubs.
67	-182	Definitely plan to study in the future.
70	-161	(i) Chose future career because of interest.
43	150	Parents' wish when at h.s. different from now.
70	-145	(ii) Or as expanding, or well paid area.
65	145	Not impressed with study areas in college.
73	134	Do not see marriage and parenthood as urgent future interest.
45	131	Parents not seen as supportive.
39	-131	Easy, cheap, convenient education in college.
56	-121	Perceive students not encouraged to criticize courses.
41	102	College information from family and graduates.

Demographic variables: Multiple correlation = 0.78; Explained variance = 61%

Attitudinal variables: Multiple correlation = 0.75; Explained variance = 56%

The final comparison to be made in this way is between the six public colleges and the two private colleges. Since the basis of the provision made by the latter is to perform an education function within a matrix of Christian apologetics, it is not surprising to find that religious affiliation is the first discriminant amongst the demographic variables. What is surprising is to discover the relatively low discriminatory power of this and other variables as between the two groups of colleges. The two groups are quite similar so far as the demographic variables are concerned—the only other discriminants are a preponderance of students of British ethnic origin in the public colleges and the fact that more students in the private colleges declare that political and economic events are the most interesting to them than in the case of the public colleges. In the field of attitudes and values on the other hand there are a considerable number of discriminatory variables, thirteen in all, using the same criterion of selection as before. But these explain only 14 percent of the variance between the two college groups, and they are not at all the variables that might have been predicted as distinguishing features of the religious colleges. On the basis of their philosophies of education, their objectives and aspirations, Concordia and Canadian Union Colleges might have been thought of as exclusive, not to say "closed" communities. But as far as our data are concerned, they appear to cater for very much the same kind of student as do the public colleges.

A reminder should be given at this point that these are *comparisons* that are being made, not absolute statements. Statements about students and colleges should be considered in relation to the earlier sections which

Table 38

Public Colleges versus Private Colleges

Discriminating Questions	Beta Coefficients	Private College Student Characteristics in Contrast to Public College Students
8	122	Atheists and agnostics unrepresented.
26	-120	Political and economic events most interesting.
9	123	British ethnic origin not well represented.
73	275	Career not the most important future concern.
73	253	Neither is marriage or parenthood.
41	180	Public media not source of colleges information.
68	-174	(i) Expect to be engaged in professional work.
39	153	College chosen not for cheapness or convenience.
60	151	Not so satisfied with cafeteria and common rooms.
56	-136	Perceive students encouraged to criticize courses.
57	124	Do not perceive that students help each other.
65	-121	Satisfied with study areas other than library.
41	119	College information not from intimates or graduates.
70	-110	Service to others most important career aspiration.
68	-107	(ii) Or in office or self-employed.
49	106	Do not perceive student body as energetic.

Demographic variables: Multiple correlation = 0.37; Explained variance = 7%

Attitudinal variables: Multiple correlation = 0.37; Explained variance = 14%

deal with the total student population: here the statements do have more
of an absolute quality. To illustrate this point, consider the variable
British ethnic origin which discriminates between public college students
and students at private colleges. The regression coefficient seems to be
small (0.123). But is is above the cut-off point we have chosen as signi-
ficant in these various comparisons (Beta = 0.1000). The breakdown by
ethnic origin in the public and private colleges, the raw data so to speak,
are shown in Table 39. The actual difference between the two groups is of
the order 51 percent as against 32 percent, with no overlap in percentages
between the public and private colleges.

Table 39

Comparison of Students' Ethnic Origin (British),
College by College

Public Colleges	British	Total	%	Private Colleges	British	Total	%
Grande Prairie	160	362	44				
Grant MacEwan	232	425	55				
Lethbridge	407	995	41				
Medicine Hat	239	510	47				
Mount Royal	1,000	1,800	56	Canadian Union	30	85	35
Red Deer	369	647	57	Concordia	19	68	29
Average	2,407	4,739	51		49	153	32

Another way of indicating the scale of this comparison of ethnic origins is to classify the data on this question in a two-by-two table. This is rather more enlightening in that we can see the actual numbers of students not only of British origin, but those of non-British origin as well. However, this technique fails to take account of the variability *within* the group of public colleges, whereas the discriminant function method makes use of all the information in comparing the group of six colleges with the group of two. Not only does it take account of each college and the variability within the groups, it assigns these due weight in making the final discrimination.

Table 40

College Type and Students' Ethnic Origin

Type of College	British Origin	Non-British	Total
Public College	2,407	2,332	4,739
Private College	49	104	153
Total	2,456	2,436	4,892

Tetrachoric correlation = 0.30

Chi-square = 23.33

p less than 0.01

This is the explanation of the power of this method: it makes use of all the information available in testing for really signif;~ant differences. Thus the test is much more rigorous than any method of analysis which looks at only one fact at a time.

What general conclusions can we draw from these analyses? The rationale of the procedures adopted has already been outlined. The point has been made that, like the classic non-barking dog in the Sherlock Holmes story, the most interesting feature of the analyses lies in the demonstration of a *lack* of association between particular variables. The various kinds of colleges, in comparison with the public colleges, differ in certain ways but it is at least of equal interest to discover the ways in which they are the same.

There is no evidence that particular groups in the communities served by the sixteen colleges are disadvantaged in the pursuit of post-secondary education by such factors as ethnic origin, socio-economic status, religion, age or sex. This is not to say that the system of post-secondary non-university institutions as such is an open one, available without distinction to all. It is clear, for example, that the proportion of females in the student body is grossly disparate from that in the community at large. But given a certain input of students into the system there is no evidence of selective processes of an illegitimate kind operating to exclude particular kinds of student from particular colleges or programs.

The discriminating factors which *do* operate as between the different groups appear to be valid and legitimate. Entry to particular kinds of programs demand differential levels of previous education and general

background.   It is a fact of life that these differentials are linked to socio-economic status differences, to occupational differences, and to ethnic variables.   In this connection, it must be remembered that the process of selection works in two ways--the student selects the college, the college selects the student.   This accounts for the fact that the Agricultural and Vocational Colleges are differentiated on a socio-economic basis from other colleges in the sample.   Provision is made, however, for those lacking in particular areas to make up any inadequacies, to up-grade their qualifications and enabling them, if they so wish, to pass on to more advanced work.

The post-secondary educational system in Alberta does reflect the society it serves--this is simply another fact of life.   Perhaps it could be said that this sytem of colleges accepts too readily and bends too easily to meet the needs, motivations and aspirations *as these are perceived* by the students.   Students in the Province of Alberta, in general, seem to accept the basic philosophy that education is an investment which pays off.   This is a great initial insight.   But it is clouded over by the students' inability to see that the dividends are not confined to an immediate "pay-off" in terms of concrete and material advantages.   The fact that the great mass of the student boc; seems to be satisfied with the provision made for them by the colleges is a matter for congratulation.   But it has to be seen in the light of the narrow, utilitarian criteria these students apply in selecting their institution and program and in judging the education provided for them.   The post-secondary system of colleges in Alberta is a free and democratic group of institutions, responsive to student demands--

and one would not wish it to be otherwise. Unfortunately, we have no data from which to discover the demands which colleges make on students in the area of values and attitudes, nor of the response of students to their college experience in this area.

The main exception to these generalizations, an exception which seems to point up the moral of these remarks, is the university transfer colleges. The existence of the university transfer programs seem to generate serious problems of one kind or another. They seem to bring into play certain selective, not to say discriminatory mechanisms as far as student intake is concerned. These mechanisms function to produce conflicts of aim, of personalities, of educational and social-political values. From an educational point of view, apart from other considerations, the university transfer student is conscious of the fact that, in terms of his purposes and aspirations, he has chosen the second best. Many seem to regret the choice; some are vocal in criticizing the second best option they have elected.

The differentiation of the various types of college within the system of post-secondary non-universtiy education in the Province of Alberta is brought out in the summary table on the following page. The attitudinal differences, especially to careers, occupations and education have previously been shown to be associated with ethnic origins, social class, religion, etc. It is not surprising that these differences are mirrored in the five types of college in the sample.

In comparing the various groups of colleges within the system we can distinguish between two aspects--the *number* of characteristics ir which the groups differ from each other, and the *amount* of actual variation

Table 41

Differentiation Within the Groups of Colleges

Types of Colleges Contrasted	Discriminating Variables		Explained Variance	
	Demographic	Attitudinal	Demographic	Attitudinal
Public Colleges with:				
All the rest	9	8	40%	27%
Institutes of Technology	9	10	51%	39%
Agricultural Colleges	9	16	53%	30%
Alberta Vocational Centres	6	18	61%	56%
Private Colleges	3	13	7%	14%
University transfer versus Community Colleges	16	21	49%	47%
Red Deer versus Public Colleges	16	9	53%	23%

between them. For example, the Alberta Vocational Centres only differ from the central type in six of the demographic variables but the actual variation within these categories is almost as great as the variation within the 18 attitudinal variables in which they also differ, 61 percent as against 56 percent. In other words, the two types of colleges differ about as much along the dimension of attitudes and values as they do along the demographic dimension.

It is clear from the table that, as far as the *number* of distinguishing characteristics are concerned, in the demographic area (including socio-economic status, educational background, home influences) the colleges which most resemble the public college group are, in order of decreasing similarity: private colleges, Vocational Centres, Institutes of Technology, and Agricultural and Vocational Colleges. The colleges which differ most from each other are the university transfer colleges and the community colleges, both types being under the aegis of the Colleges Commission.

In terms of the *amount* of variation from the public college type, the different groups arrange themselves in much the same order. With regard to attitudes, the degree of similarity is again rather similar; the sequence now runs: Public colleges, Institutes of Technology, Private colleges, Agricultural colleges, Vocational Centres. The greatest difference once more is between the colleges offering university transfer programs and the other public colleges.

In questions 42, 47 and 65 students were invited to say whether, and what needs, were not being satisfied by their college but which should be provided for. Many students indicated that there was no way in which their

particular college could be improved: it was "up to the student" in the final analysis to get down to work and pass his examinations without too much care and attention from the college administration or faculty.

Others listed very general remarks, such as "a good library," "better teachers," "more financial assistance"--these usually being in the areas that could have been predicted as possibly sensitive ones which students would tune in to when trying to pinpoint a general malaise and locate its origin and etiology. Others again tended to be more specific, but in a relatively unhelpful way: "Fire Mr. X.Y.Z.;" "At the moment I need money very badly;" "Ninety-eight percent of the students need counselling;" "A ski club;" etc.

Some suggestions were made which seemed to express a real and general need which could be considered appropriate for college authorities to consider. These are listed in the order in which they appear, with no attempt to identify by college nor to determine their legitimacy or practicability:

- a day care centre for the unmarried girls at A.V.C.'s.

- clubs for the foreign students to help adjust to Canada.

- speed reading courses.

- courses (for adults especially) on how to study.

- liberalization of programs, more drama, plays, etc.

- in-service training for counsellors with emphasis on vocational aspects.

- improved laundry facilities in students' residences.

- no smoking in classes.

- more quiet study areas or booths outside the library area.

- more tutorials and conferences with professors.

- improved libraries; more books, less noise.

- audio-visual materials, more films, tapes.

- duplicated notes and reading materials to save time in class.

- labs for individual projects and for supervised work by students.

- more and better language laboratories.

- a small performing arts centre.

- more exams and structure in courses.

- lengthening of programs to give students more time.

- more workshops, more outside speakers, more films.

- library to be open on Sundays and at other times.

- less talk by professors, more demonstrations.

- training courses for new professors.

- easier access to books at other institutions via micro-film
  catalogues and administrative action.

A general comment may be permitted at this point. It would appear that the student body is generally satisfied with the overall *nature* of the provision made in terms of programs, faculty, teaching methods, material facilities. What they seem to be doing is asking for *more* of the same with not much variation, and certainly with no revolutionary changes which would substantially alter the nature of the provisions. Working at different levels and in different programs, the student body seems to find the nature of the post-secondary system in the Province of Alberta exactly in line with their needs, as they perceive them. There is a sufficient diversity of

program to allow the bulk of students to find exactly what they are looking
for; certain colleges make a unique contribution in particular occupational
areas attractive to students (motel management, training for a specific
ministry, technical electronics, etc.); courses and programs are available
which provide cheaply and close-to-home what can be obtained only with much
greater expense and inconvenience elsewhere, the predominantly vocational
orientation of the student is catered for by the predominantly vocational
orientation of the colleges.

The open-ended responses to these three questions about needs and
motivations to which colleges might devote more thought confirms the
impressions that the basic motivation of the great majority of students is
to improve their job situation.   They are oriented towards particular
programs and professional (vocational) certificates: the major objective
of most students is certification as competent to do a particular job.   The
colleges' task, as students perceive it, is to give them the best possible
training in their particular field of specialization as economically and
as conveniently as possible.   In the case of the private colleges, this
primary objective is qualified by the students' need to receive this train-
ing within a context of Christian values.   The students have a "vested
interest" in the maintenance of standards--no one expressed the desire to
have their course content simplified or bowdlerized.   The colleges must,
above all, remain and manifestly appear to be efficient, modern, relevant
and of the highest quality in their field.   They must also continue to
provide a less expensive, better organized, more convenient and *practical*
education in competition to the universities in the Province.   As one

student put it, in capsule form: "Low cost, high quality training."   This

appears to be the message which students wish to be carried to the Colleges

Commission and, through them, to the Government of Alberta.

APPENDIX A

Summary of Student Characteristics

by College

SUMMARY OF STUDENT CHARACTERISTICS

BY COLLEGES

Immediately following is a summary College by College of the raw

data on the students' attitudes to various aspects of the environment,

their career plans and their values and interests. The method of pre-

sentation consists of indicating the percentage of students in each

college accepting a particular alternative compared to the overall per-

centage in all the Colleges combined.

A full statement of the question posed, and the alternatives pre-

sented, can be found in the questionnaire in Appendix B. These tables

should be studied in conjunction with the questionnaire. In certain

instances particular alternatives have been combined or dropped.

COLLEGE *MEDICINE...HAT........*

		College %age	General Average %age
Q.24	Reasons for completing high school	-	-
	(i) Study interest	22.4	7.8
	(ii) Personal influence	4.1	3.6
	(iii) Career preparation	61.3	76.0
	(iv) Nothing to do	2.0	2.3
	(v) Did not complete	10.2	10.1
Q.26	Most interesting event	-	-
	(i) Political/economic	13.0	10.4
	(ii) Sport/Entertainment/Fashion	69.6	61.4
	(iii) Technical/scientific	8.7	14.6
	(iv) Cultural	8.7	13.6
Q.27	Free-time activity	-	-
	(i) Creative arts	34.0	27.9
	(ii) Fixing things	30.0	35.9
	(iii) Solving problems	16.0	11.0
	(iv) None of these	20.0	25.2
Q.29	Second list of activities	-	-
	(i) Friends	34.0	42.6
	(ii) Athletics	30.0	25.2
	(iii) TV, listening to music	36.0	28.1
	(iv) None of these	0.0	4.1
	Values accepted as objectives	-	-
Q.31	Marriage/Family life preparation	23.9	29.1
Q.32	Having fun, Enjoyment	44.9	37.7
Q.33	Friendships	46.8	54.1
Q.34	Career and Skills	76.6	78.0
Q.35	Job preparation	63.3	61.1
Q.36	Exploring ideas	46.8	36.0
Q.38	Finding oneself	69.4	58.8

Q.47 Feeling about work at this College: Confident 86%; Difficulty 14 %

      general average: <u>88%</u>;   <u>12%</u>

Q.48 Sure have made the right choice: Very sure 56 %; Not sure   14 %

      general average: <u>57%</u>;   <u>9%</u>

Q.49 Students put energy into everything: True   50 %; False   50 %

      general average: <u>59%</u>;   <u>41%</u>

Q.50 Students encouraged to be independent: True   81 %; False   19 %

      general average: <u>72%</u>;   <u>28%</u>

Q.51 Students develop responsibility here: True   57 %; False   43%

      general average: <u>62%</u>;   <u>38%</u>

Q.52 Channels for complaints are available: True   85 %; False   15 %

      general average: <u>74%</u>;   <u>26%</u>

Q.53 Students work hard "for fun of it":   True   37 %; False   63%

      general average: <u>31%</u>;   <u>69%</u>

Q.54 Most courses are well organized: True   96 %; False   4 %

      general average: <u>90%</u>;   <u>10%</u>

Q.55 College has excellent reputation: True   75 %; False   25 %

      general average: <u>80%</u>;   <u>20%</u>

Q.56 Students are encouraged to criticize: True   77 %; False   23 %

      general average: <u>54%</u>;   <u>46%</u>

Q.57 Students often help each other: True   89 %; False   11 %

      general average: <u>88%</u>;   <u>12%</u>

Q.58 Most students are extremely tense: True   41 %; False   59 %

      general average: <u>42%</u>;   <u>58%</u>

Q.59 Sports facilities: Adequate 73%; Inadequate   8 %

      general average: <u>48%</u>;   <u>17%</u>

the library.

So there is just not a big enough selection for you to work with?

Well, you see, when we started in September there weren't any books,

and still our books aren't in.

Books on library science?

Yes, the type that we need for our course - even our textbooks are not in.

Oh, that makes it a little difficult then.

We've had to use the Cameron library and the Mead library, but there again

we can go and use the books, but we can only borrow them through the college.

That means it's a day before they get here, and you can only keep them out

for five days, and you have to go back. I haven't even bothered trying to

borrow them through the college.

How do you get your reference books, then?

Well, I've gone over to the University library for some, and I've gone to

the public library; and our instructor has brought us books and has xeroxed

some things for us. And she has borrowed books from the University library

on her card.

Is the problem, then, that these books have been ordered, but they just

haven't arrived?

Well, in the beginning - last trimester they hadn't even been ordered

because the instructor wasn't here to order them. This trimester they've

been ordered, but there has been some foul up and they haven't arrived.

Do you do any sort of field work - by this I mean going out into the com-

munity and seeing how things operate there, as well as bringing speakers

into your classroom?

We've had guest speakers in our English courses, last trimester, and in

our psychology course last trimester. We did some field work in office

procedure. We had typing last trimester, and of course we didn't do any

field work in that. In library we went to the University library on a

couple of trips.

Do you find this sort of thing is valuable to you?

I'd like to see more field work.

Good. Can you tell me a bit about the grading system here, how your instruct-
ors tend to allocate grades, taking into account your term work as well as
a final exam?

In our library course last trimester it was all based on assignments, and we
handed in term papers. This trimester it's going to be on assignments, part-
icipation and on quizzes. Our English one was periodic evaluation; our psy-
chology was multiple choice - two exams; typing was tests and assignments;
office procedures it was on a manual that we did. The only thing I think
about the grading system, I'm quite happy to have it not in percentages,
but I would like to see four categories instead of three. There's too big
a gap between complete and outstanding. I think perhaps you can be complete
and you're pretty close to being outstanding without being outstanding. I
also think you can be complete, but just barely complete. I think outstanding
should be reserved for something really special, and I don't think it is
reserved for that.

Do you generally feel, then, that you are getting out of your program what
you wanted to get out of it?

I don't know. I'm not as happy at the college as I was when I came. I don't
feel that the atmosphere is as free. I think I'll probably get the qualific-
ations for a job. But as to being a 'new type of college', I don't feel
that's quite as true as it was in the beginning.

Okay, well let's look at a slightly different area then - that of student
government; student participation in the democratic process. Can you first
of all tell me what you feel should be the function of a students' union,
or student government in a college of this type? What sorts of things do

you feel they should be doing?

Well, I'd like to see them doing more liason between students and faculty.
I'd like to see them set up an evaluating structure. I'd like to see them
doing something about maintaining the philosophy of the college as it was
outlined in the beginning; complete inter-action between students and staff.

Do you find this is not so now?

I honestly don't know that much about the student government right now. I
know that I discussed this with a couple of people on student government who
didn't feel that this was being done. As I say, this was just a casual con-
versation with a couple of people involved in student government.

Do you feel that there is a bit of a problem in communication between the
faculty and the students?

I think it's the administration probably, not the faculty. I have no beefs
about the instructors. As I say, I was unhappy with one last year, but
the other instructors have, I think, really tried to give all the help they
possibly can. The administration, I don't know. We certainly need a new
time table or something. The time table this term is absolutely drastic.
We've had something like 5 to 8 changes in the time table. Yesterday I
didn't have a class scheduled for 10:00 o'clock, but by the time we finished
yesterday, I had a class scheduled for 10:00 o'clock. I think the time table
is absolutely dreadful. I don't mean to sound as though I'm really beefing.
I think what you want is the truth, not a whole bunch of wishy-washy.

Yes, that's right. You'd think they could get one, and stick to it, anyway.

Do you feel that the students' union should be filling some kind of a social
function - providing activities for students in free time?

No, I don't.

Okay. Well, let's look at the area of sports and recreation, and extra-
curricular activities. First of all for sports - are there any facilities

here for sports, not necessarily organized sports, space, equipment and time?
There aren't any in the school to my knowledge, but I believe they use St. Alphonu
school.

What about other sorts of leisure time activities, special interest groups
and clubs?

Well, we tried to get a library group going in the fall, but there wasn't
enough interest. I am not interested in participating because I find that
with the work required in my course plus my personal life I haven't any
other time for involvements.

Do you tend to find most of your extra-curricular activities outside of the
school?

Yes.

Okay. Well, if I can just get you to sum up and tell me what you feel are the
areas most in need of improvement in the school - what things would you like
to see changed, if anything?

I'd like to see really complete freedom between students and instructors, so
that you are free to speak your mind completely, as you would relate to
another individual, or to another student. I would like to see complete
freedom this way so that there would be no fear of retaliation. I honestly
don't see the need for a students' union, unless the students themselves
decide they want this and 'get with it', because I gather from comments
that they are not getting people to work in the students' union. To me
this is an indication that when people range in age, as they do here, from
eighteen to possibly sixty, that they may not need a students' union. But
if the students really want it, they'll get behind it and do something about
it. I would like it as it was set out in the President's address at the
beginning, having the rules 'No drugs, no alcohol' - I'd like to see it
stay like that, but there are no restrictions.

So in general you feel that the main problem is that the sort of philosophy
that started the whole thing is not really in effect any more?

No, I didn't say it's not in effect; I would say it is becoming in danger of
restrictions such as those in highschools. I just don't believe that this
is necessary.

Well, to turn the last question around then, and ask you to tell me what
you feel are the best features of the College.

It's size. I like it because it's small. In the bulk of our classes, I like
the freedom of thought - open discussion with instructors and other students.
I like the idea of little organized colleges in communities instead of one
great massive structure. I like the idea of training for the job, and get-
ting some experience at the job - which we will be getting - and which some
of the others are already getting; going out into communities a couple of
days a week, and actually working at your job - I think this is a very good
arrangement - it give students some confidence, particularly people who have
maybe been out of the labor field for a long time, it gives them a chance to
be in a working situation before they actually go out to find a job.

I think that's just about it then, unless there is something else you would
like to add.

No, I don't think so. I do want to say that I don't want to sound negative;
I don't feel negative about the College, it's just that I _care_ enough about
it that I don't want to see it become one more big institution.

Thank you very much for your time.

Grant McEwan

The first thing I want to ask you is what type of program are you in?

Library technician.

What stage of the program are you at now?

Second trimester.

What do you plan to do when you're finished with this program?

The present one I'm in?

Yes.

Continue again in the fall. It's a two-year diploma course.

So when you're finished with your two years, what do you plan to do?

Hopefully, find a job.

In a library?

Yes. I'm more interested in a medical or industrial library. In our th'rd

trimester we begin our practical, and that might give me some indication of

what resources there are, depending on where I get placed. I hope they'll

alternate us - that we'll have some time in a public library, some in a

school library, and some in a special library, which would include medical

and industrial and would give us more of an idea what is involved. Tnere is

also the Legislative library.

Can you give me an idea just in general, what were your reasons, first of all

for coming to this College, and secondly for choosing the particular program

that you're in.

Well, first of all, I'm an X-ray technician, and there are no jobs available.

I tried for a year. I am separated; I had to find a job to support myself

and my son. Therefore I turned first to my profession and the supply is

greater than the demand right now - there are twelve applicants for every

job, and have been for more than a year. Mr. A.B.C., who is also an X-ray
technician, told me that after waiting over a year there was no point in
waiting any longer. Therefore I felt I had to be re-trained in something;
there is no refresher course involved in radiography. I had read about this
program in the Journal; it interested me and I thought because I'd always
been interested in books and reading, I'd look into this and try another
profession. So you chose the course before you chose the college. I really
don't think it will be quite as exhausting as the X-ray field. You know
you're not on you feet continuously from eight in the morning until five-
thirty at night. I don't think I would have the patience to continue dealing
with the public under such trying and exhausting circumstances now.
Why did you decide to come to this College rather than say, going into
University?

Well, I suppose I wanted something that would put me into the working field
sooner. Librarian I think is a three or four-year course....

It's one year after a general degree.

There was the money factor too; if you have to apply for a student loan,
there is a limit on how much you can borrow. I had to consider that factor.
Did you receive any kind of counselling before you entered the program?
Oh, yes. I spoke to (I think) three counsellors at the administrative
office. This was not actually my first choice. We had three choices.
My first was psycho-technician, because it would get me back into the medical
field. Then I found out that this field, although it's predom iantly female,
they told me these women had two incomes coming in; they were concerned with
furthering their education, not necessarily finding a job when they graduated.
And this being a new field, the jobs are not ready for them; they still have
to find a creative need for these people. My second choice was day-care
worker, and there was a factor of age there; I found out they had more or

less decided upon 25 as the age group. They felt that it would be difficult
for an older woman to relate to the younger people and vice versa. I'm
:1ot having that problem - I'm having more difficulty relating to the people
of mv own age group than I am with the younger people. Also I have to con-
sider salary, since I'm going to be a supporting parent, therefore I have to
consider a field where financially I'll be able to do well, and in day-care
they don't. They're going to graduate so many students, and they haven't
got jobs.

So in general, then, you found your counselling quite helpful. Have you
had occasion to look into other counselling since you came here - vocational
guidance counselling.

No. I'm not interested in counselling. If I have any problems, I just go
to the individual instructor.

What about information about what to expect when you enter the labor force?
Where you can get a job?

Again, in speaking to the counsellors and to Dr. Blank (he was particularly
helpful) - as far as job availability was concerned - this was a question
that was uppermost in mind - I did not want to graduate and then not have a
job; he said that they would create jobs for most of these programs, of
course they would have to be worked out with the businesses and the instit-
utions concerned, but they thought in two or three years theywwould iron out
most of these difficulties, and this is why there were quite a few students
in the field, in their second year. He told me that of the three choices I
had meJe, library technician would have the greatest availability of jobs,
even though it was a new field and they are training them in Calgary, and
they have a college in Winnipeg that has been running for five years, and
one in Thunder Bay. But they don't graduate that many students that the
market is going to be overcrowded. Also I would have more freedom to travel;

I wouldn't have to stay in Edmonton, I could go to an outlying area - even
to a different city.

And this appeals to you?

Oh, yes. My home is in Winnipeg; if I was able to obtain a job there, I would
go there, or even to Calgary.

Let's look a little more closely at your program, then. First of all can you
tell me just generally, how you feel about your courses and your instructors?
This year, as far as the library science course is concerned, I think it's
going to be very beneficial. We're getting into the lab, and this is the
only way we're going to learn - the practical instead of so much from a
book. We have two library instructors - one was just hired this trimester.
She seems very self-conscious, not having instructed before, and probably
she goes too quickly; and she gives us a great deal of homework. We haven't
been able to work this out yet. The other instructor, although there were some
problems, they were mostly personality problems - I'm speaking just generally
of the whole class, I'm not just referring to myself (I find I can go along
with it), but there were communication barriers. I think these are all slowly
being worked out, and her classes are very interesting.

Do you find your instructors are usually available at times other than class
times to help students who are having a problem?

Well, I haven't encountered any of these yet.

You've talked a bit about practical work, and said that it's valuable. As
another sort of auxiliary service, how do you find the library here?

I couldn't give you too definite an answer on that. The resource centre
should have been equipped in September or October when our classes began,
particularly for library and I suppose other programs too. We are using it
now - I in particular am using it, but it's still inadequate. For example,
I had to go to the Cameron library on Monday to look up books which are

too expensive for this resource centre. Again, we'll have to go to the public library because they'll never be able to stock all the books that we'll need here.

Do you feel this is something that will be worked out in time?

Well, eventually they'll acquire more books, but they'll never have the vol- ume or the selection that the public or Cameron library will have. I think we'll always nave to do resource work at these other libraries. There has been a tie-up in our textbooks that we need for our lab courses, and these haven't even been obtained yet. There are ten volumes of one particular text that are now on reserve, and that's only one text. This is a little bad, on our program.

What about the grading system here, then? How do your instructors generally tend to allocate grades, taking your year's work and your final exam into consideration to arrive at a final grade?

Well, we had a choice last trimester of deciding whether we wanted a final exam or whether we'd be graded on class projects. We voted on the class projects, and the library instructor found out that we were having finals in some of our other subjects (this was not by choice). In psychology, for example we were told that this was the system. There was a multiple-choice exam half way through the year, and again at the end of the term, and this determined your mark - that's all there is to it - there's no term papers. And I think they're gradually getting away from the idea of too many class projects in library science. We're going to have these projects, mind you, but we're going to have periodic proofings. Whether or not we'll have a final exam - this hasn't been discussed.

But generally, you feel the grading system is quite fair, do you?

I would say so. I don't like multiple- choice questions such as we're getting in psychology. If the whole psychology department got together and

worked something out that was fair to all the students (mind you, you'd never please them all - some would feel they could do better on a term exam, and some would feel they could do better on projects). It came to my attention that in Social Services they were graded on term papers in psychology they never had a final exam. We were told 'this is it; this is the way we do it', and to me multiple=choice exam is where I fall down. I scraped through that exam, I don't know what the mark was because you never know the mark, but I really felt that I had failed. I worried about it until I got my mark. It was a hard exam - too hard. Most of us felt it was on the University level.

Generally, then, would you say that you are getting out of your program what you expected or wanted to get out of it?

We will now. I'm speaking now of my Library major. You only get out of it what you put into it; you have to apply yourself. But I think with the labs, combined with the theory, we'll certainly acquire a great deal of knowledge.

Let's just move along, then into the area of student government, students' participation in the democratic process. First of all, can you tell me just generally what you feel should be the function of a students' union, or student government in a college of this kind?

I haven't really followed the students' affairs, actually. I really don't have time to get involved.

What do you feel that the students' union should be doing for the students, generally, here?

Well, I suppose they have to organize some sort of a government. I feel there should be a 'grievance committee' or an individual or individuals to whom you could 'air' complaints about instructors, or how the work is being projected to them.

What are the ways of expressing complaints here, now?

I don't even know if they have a 'grievance committee'. I think you would
probably just have to go to the students' union. The secretary is in my
class, and I've never really asked her. No, I'm afraid I'm ignorant on that
point.

Do you have any opinion as to whether the students' union should be a means
of communication between the administration and the students?

Yes. I do, definitely.

Is this done, do you know?

I imagine it is. I don't know to what degree. They were having problems
keeping presidents on the students' union. I think they have a new president.
I believe they had a lot of inner conflicts themselves which had to be worked
out before they could give help to the rest of the students.

Do you also see the students' union as serving a social function, organizing
activities?

Oh, yes. They've organized several committees, but again I couldn't tell you
how good or bad these are because I haven't the time to get involved in these
things, much as I would like to.

Well, let's look at the extra-curricular activities then, sports and recreat-
ion - I understand there are really no facilities here in the building for
sports.

Well, they have organized a volley-ball club at St. Alphonsus School;
I believe they're affiliated with the University Ski Club, but what other
sports activities they have, I don't know

Well, what about other sorts of extra-curricular activities then - say special
interest groups or clubs?

Last fall there were various lists distributed with the names of the clubs
on them. There was one with the heading 'Library', and most of us on the
Library Tech. program enrolled in this, but we never heard anything further.

1.ere is also a newspaper which is mainly organized by those in the Journalism

course - this is functioning to some small degree. They really battled -

there was a great struggle going on last fall to get the money they wanted.

a certain allotment to establishea newspaper, and they seemed to think that

this should take precidence over all the other clubs. The newspaper won out,

I guess.

Is there anything   a drama club, or music appreciation - any of these

sorts of things?

Well, I've seen several notices on the bulletin board regarding student

cinema and drama club. Again I think these are probably being held at the

University, because there are no facilities here.

Mainly, then, for the extra-curricular activities students have to go outside

the school?

I think so.

Well, if I can just get you to sum up then for me - tell me what you feel are

the areas that are most in need of improvement; what things you would like

to see changed here, if anything.

I think the biggest gripe that those of us on our program had was the regis-

tering and setting up of time tables. We registered on the 15th of December,

and we had set up a time table into which each individual could fit their

two electives; we were told on our program that we could have two electives -

one from Business Administration and one from the academic, along with our

three Library majors. We had these all fitted in; most of -us (it was stressed

that we take Accounting because it would give us a good fundamental knowledge

of records in libraries), as for the other elective we could take English

which most of us took last trimester and didn't want to continue, or phil-

osophy, or law, or whatever they were offering - to get as broad a knowledge

as possible, in as many subject as possible. Well, since classes resumed

we haven't been able to fit most of these electives into our time table.

We're really having problems with our Library classes. As of yesterday
we did have a definite room assigned for our Library classes - I think only
because they have brought the shelves in to set up our lab. But this morning
we were looking for a classroom to fit in our Library class, and so we had
this problem of having a definite room assigned - there were too many instruct-
ors using the same rooms at the same times, and you'd have to give it up to
the biggest class. Secondly the problem was fitting in the electives that
you chose. In each of the electives there were three courses offered through
the week, and you were more or less compelled to attend those three - no
one checked your attendance, but to get credits, credit hours, you had to
have those three. Since the majority were taking Philosophy, we were only
getting two. So with the help of our Library instructor, we revised the time
table yesterday, which was satisfactory to most of us. There will always be
one person, you know, who is left with the short end of it - part time
students can only come in the mornings, and we don't like to short-change
them on the library subjects, but then some of us will get short-changed on
our electives. So we set this up temporarily, hoping that it will work out.
But you have that feeling every day; you come at a certain time and you
don't really know what's going to happen, or where you're going to be. Last
Friday, for example, I came at 9:00 o'clock for an Accountancy course, there
was a notice on the bulletin board that had been put up there about 3:00 or
4:00 in the afternoon of the day previously when there was only one from our
program here. So the majority of us were not phoned, so we were here at
9:00 o'clock, and the course had been moved up to 1:00. It's things like
these - you feel you lose a lot of time when you could be doing things at
home or at the library. If you could establish your program, you could set
up your program a little better so that things wouldn't conflict. So that's
the biggest grievance, and I know that it applies to most of the programs in

this college. For example the Secretarial Sciences instructor told me that

he has nearly every student in Secretarial enrolled in English, and he

had his complete time table revised and now he doesn't have one of those

students. Now maybe most of those students wanted to take English, they

were told they could take it, and now they have no choice of time, so

they drop it. Thus there are many, many unhappy students.

Yes, that would seem to be a major problem.

And it seems to be the experts that follow this up, and I know our library

instructor, she has

[end of tape; interview not complete]

GRANDE PRAIRIE

#132 Grande Prairie

The first thing I'd like to ask you is what type of program are you in?

It's University transfer.

One of the Universities in the province?

Well, I have applied to one in England.

Ah, .. that's exciting.

I haven't heard from the one I wanted to go to, but if I'm not accepted, I'll

go to U. of A.

What kind of a program are you in?

Science - majoring in science.

Can you give me a general idea of what your reasons were for coming to this

college, and secondly for choosing the kind of a program you are in.

Well, for the college - it was financial - I live in Grande Prairie. Since

coming here I've seen that absolutely the best way to start out for University

is by going to a small college. You can see how you have to work and study,

and this type of thing. It's a more personal atmosphere - you can get to know

the profs., whereas the university is so large that there's double the chance

of dropping out the first year.

Yes, it's very impersonal.

Yes, that's the main thing I like about this college - the profs.are all sc

friendly.

And why did you choose the particular program that you are in?

The sciences? I suppose because of job opportunity and interest, I guess.

Why did you decide to continue with your education rather than to work?

Because you get such boring jobs with only a Grade XII education.

Yes, that's right. It's pretty hard. Did you receive any kind of counsel-

ling before you decided to come here, from a teacher or counsellor in school

or from friends'

I came to Mr. L.M.N. when I was still in highschool, and talked to him.

And did you feel that you got adequate information from this.

Yes, and also from the information I got from friends who had been here last year.

Since you've been here, have you had occasion to look into other counselling - vocation guidance counselling, or information on other programs that you could go into, hwhat kind of a job you could get, and what you could expect from the job?

No.

Do you feel the need for this sort of information? Or have you not had the occation to look for it?

I don't know if it's available or not.

It's probably pretty early to be looking into that.

Let's look a little more closely, then, at your program. First of all can you just tell me generally how you feel about your courses and your instructors.

I think they have the idea here of pushing you much more than they do at U. of A., so that once you get out there, you won't be swamped. I think that's what they're trying to do, and I think I heard one of the profs. say that, too. It's discouraging a lot of times, but it's really a good idea.

So they do tend to keep you quite busy.

In general, do you find that your instructors are good teachers?

That's a very difficult question.

Do they tend to be available at times other than class times to help students who are having problems?

Yes, they're usually around, and they always encourage us to come and see them.

Okay. What about auxiliary services connected with your courses - things like labs or practical work, library, field work?

What in particular would you like to know?

Well, let's start with the library. Is the library a good place to study?

It's a little small, I think. But the variety of books is good. I've heard that there are more books here per student than at the U. of A.

So it's also a good place to do research, then?

Oh, yes.

Are you doing any lab or practical work?

Yes, all the science courses have a required lab; except I'm taking Chemistry 130, which is highschool Chemistry, and I don't think there's a lab for that.

How do you find your lab facilities?

Well, I've really nothing to compare them to, but I think that they're pretty good.

Do you feel that lab work or practical work is a valuable thing to be doing to help you to learn the material?

Well, if you're going to do research it's very necessary. Perhaps if you were taking it just as one of your compulsory courses it may not make that much difference to your understanding of the concept.

But does the lab work aid understanding the concept?

Yes, if you have someone to explain the objectives of the lab. If you just go in and look at a bunch of slides, and don't really know what you're supposed to be doing, then it's not that good.

Yes. Then it's pretty hard to get anything out of. Can you tell me a bit about the grading system here, how your instructors tend to allocate grades, taking into consideration your term work as well as a final exam, if there is one?

In both English courses 70% of the year is set on the final. We never have any exact percentages in our Science courses - but they're probably

pretty close to 70 - 30, and 60 - 40, more or less.

Do you agree with this system?

Oh, sure.

Okay, just generally, then, do you feel that you are getting out of your program what you wanted to.

Yes.

Okay, let's look at the area of student government, student participation in the democratic process, can you tell me first of all, what do you feel should be the function of a students' union, or student council in a college like this?

To make sure that the student voice is heard by the Board of Governors and that sort of thing; also to look after social functions.

So, you feel, then that one of the functions of the students' council is that of communication between the administration and the student body. Do you feel that they are effective in this area?

I haven't really had that much to do with students' council.

How is the communication between the students' union and the student body?

I think the only way they do it is just through bulletin for the students. There's nothing really organized they can do for communications, because the kids are all over the place at different times, so about the only thing they can do is put up notices.

Is there a student paper?

Yes there is.

So that would be one way.

What about channels, then, for expressing students' complaints? How would a student go about expressing a particular complaint in order to get some action on it?

I think he'd probably go directly to the counsellor.

And this would be effective, then?

Oh, I think so.

Do you feel, then that generally the administration are open to communication and feed-back from the students?

Yes, I do. They are easy to talk to, and they're really concerned for the kids, too.

The other function that you mentioned - organizing activities in the area, extra-curricular activities - let's look at sports and recreation. First of all, can you comment on the facilities for sports in terms of space, equipment and time? Not necessarily for organized sports.

Well equipment - I think they probably get about the biggest cut of the budget for the Phys. Ed. department here - it scares me. Of course, the gym is kind of small, but it's a small college.

In general, do you feel that the provisions that are made for sports are quite adequate?

Yes.

What about other sorts of leisure time activities, for example special interest groups, clubs - like a drama club or a music club?

There aren't that many clubs; I think they tried to start a lot more than there are, but there wasn't that much student interest. For music we have the college music room.

Do you feel that if there was a group of students who wanted to start a club in some area, that it would be possible for them to do this?

It is if they have enough kids interested. I know of a couple of instances where they have tried to start clubs and there just weren't enough kids interested. You have to have a certain number of members before you can get anything from the budget.

Is student apathy a bit of a problem here?

Yes, I think it is everywhere. Here it's about the same.

Do you have any suggestions as to what things might be done to overcome this?

I don't really think that now that we're in college that we have all that

much time to have all kinds of organized things. I think that we have our

time pretty well filled up.

Generally, then, do a lot of students tend to find their extra-curricular

activities outside the college?

Most of the kids that I know are involved with music or something, so there

isn't very much time.

The major problem is finding time.

Okay, if I could just get you to summarize then, I'll just get you to tell

me what you feel are the areas most in need of improvement - what things would

you like to see changed, if any?

I feel that if we do get the new colleg built that this will overcome most of

the inadequacies.

Things seem to be a bit crowded?

Yes.

I'll turn that question around, then, and ask you to tell me what you feel

are the best features of the college.

I think the fact that it's small and personal. And all the counsellors and

profs. are easy to talk to and concerned.

I think that's about it, then, unless there's something more you would like

to add. Thank you very much for your time.

S.A.I.T.

#32   <u>SAIT</u>

To begin with can you just tell me what sort of a program is it that you're
registered in?

I'm registered in the Business Administration program, a two year course.
And I get a diploma in it. As soon as I finish this two year course I get
an option, like I might stay over and do my RIA, registered industrial
accounting, or CTA, or maybe go down to the States and do CA, or I can go
back home and do my ACCA, which is equal to CA.

So you've got a lot of choices.

Yes. That's the only reason why I have picked accounting as a major.

In order to make it easier for you to get into these other programs. I see.

Right.

Can you tell me then what were your reasons for entering this program. Why
did you decide to do this?

Well, I finished my highschool at home. I'm from Kenya. There is no hope
at all of getting any further education. I worked in a bank as a teller,
and then I worked in the staff department making payrolls and looking after
the taxes, bonds and things like that, and then I went in bond for two
years with highschool, the school I had gone to all my life, and I worked
there as an accountant -- actually as a bursar, but I had to do accounting,
finance and all that too. Well, I got an official deal for coming over

for some studies. A friend of mine in Canada who had joined the college asked me if I wanted to come over. Actually, I'd say my bag is some technical line, but this is the only course I was suited for as far as my highschool grades were concerned. So that's how I came.

Is this why you didn't go to, say, the university instead of the technical school?

No, not necessarily. I couldn't have gone to university. As I said, I would have preferred to go to England.

Okay, let's go into some specifics, then about your program. First of all about your courses and instructors. Can you tell me how you feel about these?

All the courses are pretty good. Some of the instructors, I think, know what they are doing. There are others who just try to teach what little they know. Well, I guess they are okay. As far as the courses are concerned I think some of the courses that are offered shouldn't be there at all because there's too much pressure on us to start with, and there are courses that I don't think are necessary at all -- which we won't use at all after we get out of here. In the working world they won't be any good to us at all.

So then there are some courses which you feel aren't related to what you're trying to do.

Right.

What about the sort of auxiliary services connected with the courses -- things

like lab, library, field work, audio visual aids, these sorts of things?

They're pretty good. I'd say so because I'm comparing them with what we used to have at home, and I think the facilities that you get around here are just fantastic. I think it's a pity that quite a few kids around here don't take advantage of them. All the facilities on the campus are just fantastic.

And you think that a lot of people don't appreciate them?

Yes. I think that there are quite a number that don't appreciate them.

Yes, I think a lot of people tend to take this sort of thing for granted. What about, specifically then, about the library? How do you feel about the library here. Is it a good place to do research or look things up, in a particular area?

Well, I think they have good material in the library, but I'm not too happy with the staff who run the library. I think the majority of them don't know what they're doing. Off and on I've had some bad experiences with them. Well, I guess that's more because there are students who are working in the library, who shouldn't be there before they know what they're doing. Other than that I think it's pretty good.

Is it a good place to study?

Well, I wouldn't say so. No. It's too noisy to study. I would say they are not strict enough about noise in the library.

Are there other areas than the library where students can study?

I can't think of any.

Would it be possible for students to use a classroom to study at night or during the day when it wasn't being used?

Well, I don't think they allow it, so I guess not.

Okay. What about the sort of aides to teaching? Things like field work, and audio visual aides that instructors use to get the point across?

Well, as far as our course is concerned we don't need any of that at all. It's mostly theory and just lectures and classes. We get a chance to use the computers once in awhile. So I wouldn't be able to tell you much about that.

Do your instructors tend then to use a formal lecture method.

Yes. Most of them do.

Do you feel this is appropriate to the subject matter?

Yes, I guess so.

So you're not dissatisfied with that?

No, not at all. Though I'm not satisfied with the evaluation system here,

With the examinations?

Yes. At home we go under the British system, and I've been used to
more subjective-kind exams, and I think they do a little more good than
this objective-type exam used in Canada all the time. Because, when I say
objective, I mean multiple choice and any dumb fool can get into a class
and mark the right answers, or can guess and get 50% on it. He doesn't
show that he knows anything. Maybe he won't get the full 100%, but he
can get the minimum pass mark. You know, anyone can walk in and do that,
whereas if he gets a subjective exam like the one we have always been used
to, there you can tell whether the student knows his stuff. So I'm not
happy with the evaluation. Otherwise I think the lectures are okay.

Do you find that any of the instructors are available at times other than
class times, if the students have any problems?

Well, it depends on the instructor. Some of them are always available.
I guess we can always manage somehow to get help from them.

So if you really want to see an instructor, it wouldn't be impossible,
but sometimes it's difficult.

Yes, it is. Some of them who have other things to do other than just
teaching the class -- those are the ones that it's difficult to see.
Okay, well let's move on now into the area of student government - sort of
student participation in the democratic process, and students having a say
in decisions that effect the entire institution. Can you comment on this?

Well, to tell you the truth I wouldn't be able to because I haven't spent
any time in other activities because there's so much pressure as far as
studies are concerned that I never have time for any other activities,
or to get to know. So I don't think I'll be able to talk on this.

You find that your work keeps you pretty busy?

Pretty busy, yes.

Well, do you have any idea at all whether your student council is doing
an effective job?

What do you mean?

Yes. That's perhaps not a very good question. Do you feel that they're
expressing the students' views, and really representing the students on
any issue that comes up? That's not very clea , either perhaps.

I wouldn't say so, no. Like I say, I haven't got time for other things.
So if they were really 'ooking after our interests, they would have
approached me. They have never asked me how I felt, or what my problems
were. I've never heard of them approaching the students, so I think
that the students they represent fight their own battles, and have to look
after their own interests more than the students' council does.

Well, what about channels for expressing students' complaints, or ways of
letting the administration know that you feel that there is something wrong?
Are there ways to do this?

The only way is to go to the students union. That's the only thing I
can think of.

And you feel that this is not an effective way? How could it be done?
In the way that I said before, that they should approach us, rather than we
should go looking for them.

Okay, that's fine. The next general area is that of sports and recreation,
and I know that you've said that you don't really have too much time for
this sort of thing, but are you aware of the ,acilities that there are -
say for sports in terms of space, equipment and time. This is not necess-
arily organized sport.

I might not get time for other activities, but I love sports. And I tried
to get into sports, some sort of sport once a week or during the week-end.
There are quite a few activities going on in the recreation building --
there's table tennis which I love playing, and badminton; and then there
are all kinds of clubs you know - karate, or volleyball, football, and if
one has the time I think there's lots to do. As far as I'm concerned
it's the time factor that I can't beat. I love sports and I would be
willing to join a few more of the clubs.

So there's lots to do, but there's not enough time.

Yes, this is the biggest factor.

Yes, it always is. What about other sorts of leisure groups, then - special
interest groups and clubs, say for example a drama club?

I don't know much about the drama club, but I did once join the hypnotism club. It was just great. I really enjoyed it, it was very interesting, and it's a pity I didn't get any time for it. They used to hold meetings every Wednesday, and they used to teach you how to hypnotize, and you just paid $1.00 a year. I don't know if that club is still around, but it's the only one I ever went to. It was a good club.

Are there other sorts of clubs like this, that students can take part in? For example, if you want to be really far-out about it - a sewing club, or a stamp collectors club - things like this that reflect a special inte.est of a certain group of students?

Well I don't think there are very many around. But if there were you might get a chance of seeing what's going on. Like I've always loved handicrafts and woodwork and all that and if there ever was a club like that on the campus, I'd love to take part in it, but I don't think there is anything like that around at all.

Okay, that's fine. Well just as sort of a summary then, this is a list of basic human needs, and what I would like you to do is read through them and see if there is maybe something here that you feel is maybe a need of yours that is not being met, that we haven't talked about.

I'm afraid I don't understand.

The idea is that there may be something pressing, that we haven't discussed. Something the College should be doing, but isn't.

I don't know. This is a very general topic. I mean, what would you really want to know about?

any of
Well, do you feel that, these are needs of yours that are not being met here? And is there anything that you feel that this institution could be doing?

Well, I think that these are the things that call for a person's own initiative, and there aren't very many ways in which the college can help the kids out - it's all personal initiative. Look at things like avoiding failure or shame, or attracting attention to oneself. There's no instructor who can come and teach you how to attract attention. I think the person has to work at these things himself.

Do you feel that any of these things are needs of yours that aren't being met?

I don't have any problem with making friends. I think I'm getting all the needs here.

Well, would you like to summarize for me what some of your major complaints are about this institution?

Yes, to start with, some of the courses that are, should not be there. There should be less courses offered, or the course prolonged.

You mean the entire program, spread over three years instead of two.

Yes, because the way things are going now everything is being thrown at us, and we have to absorb it somehow. This doesn't necessarily mean that we know what we're doing. If we had a little more time we would know more about what we were doing. Again, as I mentioned, the library - I think there should be considerably more stuff than there is right now. Some instructors - I don't go along with their decisions. Like, I have had some contacts with one or two who just turned me off.

You were saying somet ing about decisions?

Yes, as far as the instructors are concerned. I wouldn't say 'decisions', but let's say their way of helping students out. I've experienced; and I know that some of the instructors help those that know their stuff more than the kids who don't, or who do require more help. And of course some of them are prejudiced, too, against certain students, against the sex, you know, in the sense that -- well let's put it this way: there's more favoritism than there should really be. Other than that I guess it's okay. I would say that this is one of the best technical colleges in Canada, and I'm glad that I'm with it.

So you're receiving a good training in your area?

Yes, I'd say so. I'd say, when I finish this course the Institute - RIA, or C.G.O., or C.A., is going to recognize these two years that I've put in. even though it's business administration, not just solid accounting. Well, let's say I have already put in a year's solid accounting, but the first year is just orientation on business. Even though it's a Business Admir-

istration course, they recognize it. And therefore looking at that I guess I am getting pretty good training here.

That's really good. Do you have anything else that you'd like to add?

No, I guess not.

N.A.I.T.

#90 <u>NAIT</u>

The first question then that I'll ask you is what type of a program are you in?

I'm in my second program here. I've taken one before, and I'm in Electrical Technology.

What did you take before?

Telecommunications.

Well--- what do you plan to do when you finish this program?

I hope to go into design, or consulting engineering - in that line.

Good. Can you just then give me a very general idea what your reasons were for entering this particular program?

For entering this program - from my experience of being here before, and then I worked as a graduate in '69 the first time, and I worked in industry the first time and I found a need. I wanted to learn to design, and rather than go to university for four years, this was my next best chance to take the paper work that I wanted. I worked for the government before in main-tenance and it was good for experience, but I didn't want to do it for the rest of my life. And to get into design, this was the best way to do it, I felt. Also I s getting two years' credit in it for one year's school, so there were quite a few advantages in coming back here.

So the program you're in now, what is it, a one-year program?

It's a two-year program, but I'm doing it in one year.

Okay, if we can go back then to your first program - what were your reasons for entering NAIT at that time?

Originally I had planned on going into an apprenticeship with Alberta Government Telephones, and when I went to see them and they looked at my highschool marks and advised me it would be much better to attend this school, to attend NAIT, rather than go into apprenticeship because when you finish NAIT you start where the apprenticeship finishes, so coming here was further on in your apprenticeship. That was my reason for coming the first time. I was counselled, or advised to do so, and I'm very glad I did, now that I see it at this time.

Right. Did you receive any other kind of counselling?

I did in highschool. I came to NAIT about three times. I had decided to go into apprenticeship because I was always advised to go into electronics. Electronics didn't appeal to me too much, and then when I got to telecommunications I found it much better. One's just a general area, and one's a branch of it.

Okay. Why specifically did you decide to come to to NAIT rather than go to university?

Where I went to highschool they didn't have matriculation and technical together. You either took one or the other, and I felt I was doing better

in a technical program, so when I went to Composite highschool in Ponoka,
I completed Grade XII and I also completed electronics - like half was
highschool and half was actually electronics; in the mornings I took electron-
ics and in the afternoons I took highschool subjects. So all I'm missing is
actually Math 30 and Physics 30, because I had to take Math 32 and Physics
32.

So you really didn't have the requirements then, to go to university?

No. That's the way it was set up then. Since then It's better, they have
changed it. You can still take matriculation and a technical program.

I see. So let's look at your present program then in a little more detail.
First of all, how do you feel about your courses and your instructors?

I would say the courses themselves are very much improved. As time goes
on the courses are constantly improving, and they are going to the Year I and
the Year II system, rather than the A,B, and C system which was normally a
three year program. Actually you could come to NAIT with Grade XI. I
think the new system is far better, and the courses are in combinations -
they're overlapping really. You're not taking totally unrelated subjects;
they can all relate to courses together, so you're getting actually an
overall picture, and they're trying to provide good programs, and also
in the Math courses they're being taught by a specific department. When
I took Math here before it was a completely different department that was
teaching it - Math and Drafting. So the person that took it actually knew
nothing about your technology, or very little. So you were taking Math
for the purpose of taking Math like you did in school, but now it's coming

to the point where you are taking Math which is orientated towards an
electrical end, in other words you get much more out of it. It's something
you're working with all the time. I think you feel much more confident
with the instructor if you're convinced that he knows more about the one
subject than you do. Because is you sort of doubt in one area, you doubt
in a lot of areas.

So your courses are all related to each other.

Yes. And they're working on it. In the time that I was out, I went to
two other schools - government sponsored schools in eastern Canada - and
I think there's one system there that could be implimented here and that
is there's no actual feed-back from students here, very little. And every
course there - when you got the course outline - it was just standard form
which you could change if you wanted to, but you put improvements or dis-
agreements at the end and you signed it, and you had to hand it in before
you got your marks for the course. This is good, and this didn't go to the
instructor - the instructor never saw these - they always went to the
department or section head. If a trend was established, I mean everybody
complains, it's usual and a lot of it's unjustified and it comes to no
real end because there's no real method here for feed-back. You can go and
see the department head on your own, but it's sort of wasteu time because
it sort of like one guy complaining if there is something seriously wrong.

Okay. What about your instructors, then - are they qualified and are they
good teachers?

I would say, overall they're all qualified I would think, and the majority

are good teachers, but there are a few who are not. I feel this personally.
To speak for the majority, I would have to answer 'yes'. And I think this
comes up - I have found in instructors the people who have taken apprentice-
ship programs and then come here and take the technology program and then
have been made instructors are actually far better instructors than people
(I have nothing against university) who have gone to university and then
come straight across here with a masters' degree. I mean they're very
qualified people, and everything but they don't have the experience. To us
when everything is so technical, experience means a great deal, and I find I
get a lot more out of the course rather than working strictly on theory.

Do you find your instructors are available at times other than class times
for the students who are having problems?

This comes to a point - only some instructors are. It always seems to be
the same instructors. I think that's got to be a personal thing, and that's
why these evaluation points would be good because these things would come
out, and it could be pointed out that they are not available. You see,
right now there's very little you can do about it. You could go and complain,
but how much good would it do? Whereas if there was some concrete orm of
feed-back it would help a lot more.

What about auxiliary services connected with your courses, things like labs,
the library, field work, study areas?

In this course it's getting very good, and they are improving all the time.
Now they've come to a problem here because we work in power with high voltage
equipment and it's not practical to have it in the school. So there's a

great number of field trips being done, a lot more than there used to be a few years ago, and also they're having the photographic section do a whole series of slides, on each area. This is shown as you go through it, rather than just being talked about as it was before. Now there is a whole set of slides that go with each course, and are maintained with the course and these are constantly ungraded. So you get much more out of it that way. So they are working towards improving. Actually the labs here are very good considering the amount of equipment. The only problem that comes up, as with any organization, if they order something it takes two years before it's here. And at the rate things are changing, in two years there is already more advanced equipment.

What about the library, then.

I think NAIT's library has gone downhill actually. And it ₃ one place, I'd be ashamed to say I was a student from NAIT, and bring somebody in and show them the library. I mean its' a very good library, but the way our library is run leaves a lot to be desired. You go to the library here, and go to the university library and you see the difference. This library - the telephone rings at least three or four times every hour anyway. The people in the library, although I have nothing against them personally, seem to make a lot of undue noise, moving around. During Christmas holidays, too - we weren't allowed into the library because they were decorating it for Christmas, you know, which seemed to be rather ridiculous.

There weren't any students here anyway.

No, there weren't any students here, but two of us had stayed to do home-

work, so you weren't allowed into the library because they were decorating it. Another thing is having the machines; the duplicating machine serves a very good purpose, but having it right in the middle of the library doesn't seen to be too practical.

So, it's not really a very good place to study.

No 'he material contained there is excellent. It compares in our specific areas as equivalent to the university library, but not the way the library itself is maintained or operated. I think it has actually deteriorated frcn when I was here before in '67.

What about study areas other than the library?

Well, actually there are none, really. There is a shortage of study area, because actually aside from the library there is no real study area, although there is the study hall where everybody eats their lunches and plays cards -or something. There are no real study areas around. That's one thinq there is a shortage of.

Okay. I'll ask a little different thing now. How do your instructors tend to allocate grades? Taking into consideration your term work and your final exam?

There was a lot of controversy over this here, from the point that at one time they used to count a final 70%, assignments 20% and quizzes 10% but a final can no longer count more than 30% or 40%, and it's 30% for quizzes and usualiy 30% for mid-term; it's broken down in that manner   , which I think

is better. Actually, with a final being 30% you could blow an exam, and this can happen to anybody, and still be excused from failing the course. I think generally the marking system has improved, and is improving.

Okay, then, let's look at a different area - that of student government; students having a say in decisions that effect the entire institution. Can you comment in respect to your student government here?

This is one area I'm very poor in because I've had very little to do with it. I would say there are avenues available, or they seem to be available, to apply through NAITSA, which is the students' council. Just before December there was a general assembly and the whole school was closed down one afternoon, and yet there was maybe 50 out of the entire student body that attended the general assembly, really. So that shows how much interest there is, so you can see why things tend to fall off in that area. We're in quite a heavy course and we have so much time taken up with school, we don't really have that much time to spend on student government.

What do you see as being the function of the students' union? What should they be doing?

I think the students' union should be more of a contact between the adminis-'ration and the students.

. I know it's a very hard thing to do. The idea is where to start, how to establish a line of communication. It would have to be a very direct line of communication.

Do you see the students' union fulfilling this function now?

I think the students' union is trying, but they have such a small amount of support from the student body as a whole, I think it's a very thankless job and I wouldn't want to do it because they are actually getting no support from the students. So I can see them becoming very discouraged at it.

What are the channels for expressing students' complaints? Are these channels available, and do students use them?

The first channel would be to actually go to the department or the section head of every department, or after that you would have to come to the general office here, and you would see I believe, the registrar and you would be directed to (I believe he's called) the superintendent of vocational education. But it's rather difficult, and I think there could be a better system set up. There should be a better system available, because right now it's too much. It's only with a great deal of effort that anything can be done.

This feed-back system that you mentioned would be one way.

Yes. This is one of the reasons for it because right now there is very little awareness of what is happening in the student body as a whole.

Communication then between the administration and the student body is not all that good?

You're all broken up into little areas and between the main administration

and the student body, I would say no, it's very poor.

Okay, fine. Let's move now into sports and recreation then; first of all, sports. Can you comment on the provisions that are made here in terms of space, equipment and time for not necessarily organized sports.

There are all the technology inter-mural sports. You always see the same technologies every year at the top of the score board, and the same group of technologies at the bottom. This reflects which class has time and which doesn't have time. If you want to, I think the sports are available to the sportsminded person, to the amount to satisfy them. I think it's quite good.

What about other kinds of leisure time activities, say special interest groups, clubs?

There are a number of clubs here, although - there are a few strong like the radio club, there's the drama club and a few in that area, and the judo but that's actually a sport. And I believe there's photographic. But again it all comes down to how much time - people here don't have that much time to spend. And you find that just about the same technologies are supporting these clubs again, like radio and TV arts or programs like that are orient-ated towards drama, whereas drama to myself would be really of no interest. Then they have the Institute of Electronic and Electric Engineers Student Branch here, but they just about had to drop it because nobody had - it would have been very worthwhile if the time could have been spent on it, but no-body really had the time, and that's where the problem comes up.

What would you say could be done about this, would you say advocate
lengthening some of the pro₂ ⸱s?

I would like tc see options come in, because pretty well everyone knows
right now what area they want to go into. I would hope that you would get
an option where you could go heavier into this area like say why not after
you graduate, why not stay for another month and that would allow you to
spend more time in that area, and aiso this would give you more time to get
involved, in your last year, In other areas. Because you would have an
idea what you were doing. Although it would mean graduates weren't
euqivalent any more, they would be specialized, but I think it would be
better.

Right. Well, if I can just get you to sum up, then and tell me what areas
you feel are most In need of improvement. What would you like to see
changed?

I would kind of like to see us coming back to this area of feed-back,
because communication is very poor at present. And I believe the adminis-
tration is not totally aware of what the general attitude of the student
body is, and this is one area that would have to be improved. And there
also seems to be dissension among Instructors from this point of view too.
Some instructors are trying to get class feed-back on their own, and yet
others don't really want to have anything to do with it. So I think this
is the main area that would have to be Improved. I think in time it could
become a problem in certain areas, because when a whole class gets depressed
about one area, the whole class seems to slip some. So it derates the course
in that way. Another area would be going Into options. Although most

technologies like to have every graduate the same, so that when

somebody has a diploma from that technology they can say to some employ-

er what they're qualified for and what they're not qualified for. But

because we're becoming so specialized, I believe that options could be taken af-

ter graduating then everybody with a diploma would be same, but they could

take more after graduation, and I think this would benefit a lot of people.

Anything else that you would like to add?

I can't really think of anything.

Okay, well I'll just turn that question around then, and ask you to tell

me what you feel are the best features of this school.

The best features of this school are the equipment provided, because I've

been to about four other schools, and this is one of the best. And the

courses - two courses I'm taking here are taught in no other institute in

Canada, so they are specialized courses. The training is very good, and

the people who are instructing in them are very well qualified in the subject,

and many of them are specialists in that area. So I feel that the level of

education is very good. Graduates are very well qualified when they do

graduate. Although assistance is being made harder, I think this is better.

It is better to have fewer graduates, and to have better graduates, than to

have a lot of lower-grade graduates. They are really improving the quality

of graduates, then, because competition is getting so heavy. I think that

is about everything.

That's about everything that I had to ask, unless there is something you feel

you would like to add.

No. I don't really think so.

OLDS

#6 - Olds

What I'm going to do is ask you some general questions and then we'll go into some things a little bit more specifically. The first thing is, what kind of a program are you in?

I'm in Farm and Ranch Production.

Farm and Ranch Production. Can you give me some general idea of what made you decide to enter this program?

Well, mostly about nine months ago my parents and us kids, we moved out into the country, bought a farm and everything, and got to talking and it was more or less my parent's idea that I come here and learn, or try to learn some things about agriculture. Really what I'm going to be going into is public trustee about Christmas time -- estates officer for the government most likely.

This is just more or less filling in time...

Well, more or less. You see it will be sort of a double job; my dad's doing that right now. He's working in the Attorney General's office for the Trustee and he's commuting back and forth and sort of running the farm and his job in the city. Most likely I'll be getting a job there too. I don't know for sure. If I don't, well I'm still here you see, and I'll be helping out at the farm.

Yes, well will you have to have any sort of specific training for this other job?

Not really. It's an assistant investigator, and I'll be learning on the job type of thing.

Well, that sounds exciting.

Yes, that's what I'd like to do...following in my father's footsteps I guess.

Yes, sort of in both of his footsteps.

Well, it was mostly my parent's idea, and they sort of talked me into coming here.

How do you feel about your program.

Oh, I like it I guess- it teaches you what you have to know about farming, actually. That's what it's there to do, and that's what it's doing. Some of the teachers here I feel are not..... like there's one teacher here that just started teaching right out of university, and he can't teach. I don't like that....I'll tell you right now I think we should have more qualified teachers.

Teachers with more experience.

Yes....more experienced teachers, because this teacher is real boring. Another one of my teachers doesn't break the course up enough. Like he taught from September right through to mid-terms.....no little exams just notes straight through and a big exam at mid-term. He didn't break up the subject enough. I think there should be an exam after every

chapter - this would make you study after every chapter.

Do you feel that the student would retain the material better?

Yes. You'd retain more. This way he just writes from day to day to day. He doesn't remember what he wrote in September when it comes up to October for the exams. Actually originally I was supposed to be going into a Phys. Ed. program, because I had up to Phys. Ed. 30 in school and I had all my other subjects. I could have gone through there, as well.

Why didn't you do that?

I don't know really. We moved just before I finished and things got complicated. I really like athletics. I'm taking a Phys. Ed course here. The teacher's teaching things, you know, like how to shoot -- and I could be teaching the course here myself. So that's how I came here -- because of my parents really. And I thought when I came up here and looked at the college, it looked really nice, the residence - modern; it appealed to me, the new buildings. I said, well it looks interesting, we'll give her a try -- can't lose anything, I'm learning something whether I flunk out or not. Even if I learn one paragraph, I still learn more than I had when I started.

Right. That's a very good attitude. Well, I guess the next area that
vocational
doesn't really apply to you then, is sort of career planning and guidance.

They kept asking me this question all the way through highschool and every-where -- what are you going to be when you grow up, and I couldn't answer it.

My mother still asks me that....

Yes. Well, I still don't know what I'm going to do when I get married,
or in seven years from now. I could be doing something completely
different than I ever thought of.

Do you feel that you should be getting some help in making this decision?

Well, I don't know how they could help me because I'm sort of stubborn.
Everybody asks, do you want to be a policeman, or do you want to be R.C.M.P.
or do you want ot be a farmer all your life, or do you want to be an engin-
eer (you know my uncle is second in command for petroleum someplace - a
really rich engineer) and my father works in the Attorney General's office
and so I've got all these professionals thinking I should be up there with
them, you know. I don't know what I want to be. I'd like to travel myself
to Europe and places before I even decide. I've thought at different
times that I might want to study different things, discover something,
but I still don't know what I want to be, for sure. I just don't know.

So you want to give it a little time.

If it was anything it would be sports. Because I would rather do sports
than schoolwork. Sport is a big thing, a really big thing for me. But I
just don't know what I want to be. But when the day comes that I know, I'll
do it.

But until then, you'll just play it by ear.

Yes. I don't know of anything that could help me -- social workers or anything -- how are they going to decide what I want to be? They can't make me do something that I don't want to, so I don't know.

Let's go into your specific program a little bit more. You've said that you think that some of the instructors could be improved. What about the course content? Do you feel it's relevant to what you're trying to get out of it?

Yes, I do -- everything that they're teaching us is relevant to what I'm going to be doing on the farm, like farm mechanization -- we learn about electric motors, how to clean and fix them and different voltages -- this is important on a farm because you do a lot with electricity, that's really good help, I'm going to need that. And Farm Management -- we've got a real good Farm Management teacher, Mr. So-and-So -- he's really fantastic. Because when we ask him questions he'll take five minutes to explain it right to the end. So he'll take the time to tell you and explain it to you, and he'll still ask you if you understand. He makes sure, he really comes out clear and explains each point. Well, then other teachers will just, you know -- such and such and such and such -- and when you stick up your hand, they'll say 'well, because', and go on to the next one, and they just don't answer them fully enough. They don't explain the course clear enough like some of the older teacher who have had more experience with kids.

Which sort of teacher would you say is in the majority?

Here? I'd say the younger teachers, by younger I mean maybe 28, 29, somewhere in there.

So they would be less experienced.

Yes. I don't know how old Mr. A.B.C. is, or Mr. X.Y.Z., they've both got
families -- I'd say they were in their twenties. But then there's
K.L.M. , Sociology teacher -- he is young, but he's really fantastic, he
really works with people, explains everything fully too. I like the
teachers that explain everything to the fullest. They come out clear
about what they're talking about.. they just don't look at a piece of
paper and say, well this is the lesson I've got to teach today, and
write it on the board and that's it. He looks at the sheet, and says,
'Making Friends', like on here and he'll explain right to the fullest
about making friends. You know, you just don't say 'You make friends
in this way and this way, and that's it' -- he'll carry it on, right to
the end. Teachers that explain, are the ones we need -- the ones that
are really going to get through to you.

The ones that don't just stand up in front of you and lecture.

Yes. The ones who just talk or write on the board.

It sort of has to be a two-way communication.

Yes. There are some that will sit up there and talk maybe about one thing
for a whole period. As long as you learn it and get it into your head.
You could talk about a tractor, or one specific part of a tractor, or
whatever -- or one specific part of making friends is to talk, you'd talk
about talking. And if it was a tractor you'd talk about the radiator
and you'd want to get that point across and he'd talk about that specific

thing all period if you had to, even if today's lesson was the whole

tractor, if nobody understood the radiator, then he'a < about that for

the whole period, just as long as he explained one full thing.

And make sure that you understand it.

Right. Instead of the teachers who just stand up there and write it on the

board. You've got to get the ones that are clear. And there are some of the

teachers here that I find are really fantastic. It gets to a point now where

highschool teachers are just -- well anybody can get in to teach highschool -

that type of thing --

If you can get a job.

Right. There's teachers all over the place now, they just get in, and they

just talk; they writr 't on the board. They write what they're going to

do tomorrow, they write it on the board and that's it. They talk, but they

don't explain it.

What about the auxiliary services to go with the program, the labs, the

library, field work and things like this.

Well, I haven't got any field work. I have a lab, a Botany lab, and I feel

that it's a real big help. And you can work with the actual thing. Like in

farm mechanization. .. one day he talked about the motor, explained it, and

the next day we got to work with it. So then you knew partly what it looked

like and you knew something about it and when you took it apart you could

see it. And this is where labs come in, when you can work with the object

or the material thing. You can see how it works instead of listening to

him explaining how it works, because if he's not a good explainer, like some

teachers, like I said you're not going to learn anything. Labs are fantastic.

What about the equipment and facilities and the room in the labs.

Fantastic. Really good, really good equipment here. This is a new college

and everything. But coming from a highschool -like I came from in the city -

they never had any of the equipment like this. Like they'd put something on

order to the government, and five months later after your course was over

it would come - a couple of slides or something. But here the microscopes

are all fantastic. You've got all the good equipment to work with. The

microscopes in highschool are good, but when you come here the ones here

are powerful and you can see just that much more with them. You can see

the specific parts of whatever you're looking at. Equipment plays a big

part. If you can work with something....like if you take a course in
                                        you might pass the theory part of it, but
sociology or something and you go out and work with the people, and talk-back

like a social worker....like it's the practical part that you're really

going to have to work at. Like, let's say, you can sit in a classroom and

learn all about a tractor and another kid can go out and work with a tractor

all his life, and you bring these two people together -- the person who

has worked with it, taking it apart, fixing it, is going to know how to do

it better than the person who has just learned - who says well you see, on

my paper it says this goes here, but when it comes to working with it --

the practical part I feel this is 60%, maybe more. Anybody, whether they've

had education or not, I feel can go into any job as an assistant -- like

say you have no scientific knowledge whatever and you went as an assistant

to a scientist, and you worked with him for years, you'd get to know a lot.
Like if you went over to learn a language all you have to do is stay there
for awhile, and you'd start speaking the language.

Yes. And you'd do it a lot better than somebody who learns it from a
textbook..

You don't need a blackboard if you do practical work, because you'll learn
right there. This is why I wonder if the blackboard in a couple of years,
or maybe ten years, will just go out. Then maybe you'll go out and work in
the field with somebody who knows it, and you'll do it practically. It
might even be that much better. That's what I feel.

How do you feel about the library here and other study areas?

The library is a good place to study. It's a small library maybe compared
to the one we had, but the references, the material is really good.
There are lounges, and they are quite good when there is no noise in the hall
and then you can always go to your room.

So in general you feel that there's a lot of.....

Sure, it's really good. Yes, it's fine. Of course I don't study that much,
myself.

Now, the next two points are examinations and teaching methods. I guess
we've already covered that. Do you think that in some cases there should
be more examinations?

Well, maybe not more examinations, but they don't break up the course
enough. They don't chop it up enough. They just rattle through half
the course, and then you'll get an exam -- one great big gigantic exam.
Then when I go back to studying, I end up studying a great big binder full
of notes. You can't study that much. Let's say the teacher has broken it
up, maybe one or two tests. Then you're going to remember, if you're made
to study for something by chopping it up, then when it comes to the final
exam it's not going to be that hard to study, because you won't have to run
over the things that you knew the first time - you'll know them. It's
the things that you didn't know the first time. So it won't be as hard.
If you had to write an exam after every chapter and study for it you'd
know each chapter fairly well if you passed each chapter. Then when it
comes to studying for the big test it's not going to be that hard. You
probably won't even have to study for it -- you'll know it. I think they
should break it up more instead of just one big fat exam, where you end up
studying a big pile of notes and by the time you've read through them once
you've already forgotten what's at the first again.

The next sort of general area has to do with student government and student
participation in the democratic process.

Could you explain that a little more fully?

Well, it really has to do with students having a say about major decisions
that have to do with the whole institution. Like this can go all the way
from deciding how late you can stay out from residence to course content.
Oh, I see. How much the students have a say in that? I feel around here

the students have quite a bit to say, because just lately we had a big

hassle about the girls having adult privileges, and the girls made a big

fuss, and eventually within two or three weeks they got their adult priv-

ileges. Then with visiting hours - the students voted and we got our

visiting hours 24 hours a day in the men's res. and from 4:00 to 11:00

in the girls' every day and 24 hours on the week-end, or something --

something like that. But with this, we had to make up our own disciplinary

committee -- students had to make up their own committee, so that if anyone

gets out of line then it's the students who are going to be down the students'

necks.

So that if you want to have the privileges, then you have to take the

responsibilities too.

Yes. So I say generally we've had quite a good say in things that have

been going on around this place - in residence, I dor.'t know about over here.

Do you think students should have more say in things that go on with the

administration?

I think mayby, yes. Because, myself as a single student going up to Mr. so-and

so, saying 'look sir, you don't break up your course enough. Could you do it?'

For one student, I don't think he'd change his course. But you see if a

whole bunch of students went up to him and said, 'look you're doing this

wrong'. He's going to say, 'well, there's twenty-five of you, that's quite

a few, so I guess I'll have to change.' I don't think we have that much

say in anything that goes on over here, I haven't heard of anything that

we've changed over. Over here it's quite high up, I wish we did have more

say in some of our subjects. I think we could make them better.

Well, are you then trying to say that the channels or ways for expressing students' complaints, specifically about courses, are not available?

Well, the channels might be there but they are long, bureaucratic, and so much red tape to go through to get it that by the time this session of students has fought together, they're not going to benefit -- it will be the other students who will benefit. You spend all year fighting for it, and you're not going to be able to use it. I think we should have more say in some of the things, maybe not the higher things, but maybe some of the courses. It may be a trial and error -- it might make them better, it might make them worse, but they can always go back to what they had before. Maybe we could change it for a little while.

So it's pretty difficult to express that kind of a complaint and get any-thing done about it.

Right. I could write on this piece of paper and hand it in. He might call me into the office and talk to me about it, and then just shove it under all the other papers.

It would sort of just get filed away, and forgotten.

Right. If we really wanted to get anything we'd have to go out and have a thing like the Amchitka Blast, and have a big protest around campus. It doesn't really......you get noticed, but you still don't get very far except for people getting hurt. The channels are just not open. You can talk to the head man, but whether you're going to get through to him is

a different thing. You have to have people who are going to be able
to convince him, and that's hard.

Well, would you see this, then as being one of the major problems, or do
people not worry about that too much?

Well, I haven't been myself, and I don't think people around here have been
worrying that much about courses, or how to make them better. I know there
are a lot of things that should be made better but I don't think that any-
body has taken the time off to do them. It's a pretty peaceful college.

What are some of the things that could be made better?

Let me see, some of the teachers, maybe more experienced teachers. Like I
could go out and say -- 'I want more experienced teachers'. Well, you're
just one student. It's not going to make a big difference. More experienced
teachers, or maybe some of the courses the way they're arranged. From
session to session, there's a big hassle. You see if you don't pass some-
thing in the first session and you need it to get something in the second
session. You see you have to take all those things, and you have to pass
one to get another, and if you don't pass that one you still have to take
some of the things in the second session, you get all mixed up and you
end up cramming all your courses. You go back to try and pass one again
and you're slowed right down again. You're cramming so that you can pass
that one in your second session. By that time you're in your third session
because you've taken time out to pass the one again in the first session.

I can see why you'd be confused in that.

Even if it's your fault that you flunked, you still end up cramming all

these sessions, and by the time you're taking your third session you're

here taking an extra year, and that costs a lot of money -- even if it's

your fault that you flunked. It's partly the student's fault, but you

end up cramming -- and there's got to be another way. I see the people

that have flunked Math 10, and have gotten into Math 20 (this is on high

school basis) and have passed Math 20 but still haven't passed Math 10.

So they have to go back and take Math 10.

Right. But they've passed Math 20, which is the next up you see, and

they don't even need Math 10. And it's the same thing here. You have

to pass Biology here to take Health Nutrition or Animal Husbandry, or

something. I could flunk Biology, but I could go into Animal Husbandry,

and it could be really interesting and I could take that and pass it

with an 80%, but I still don't have my Biology about genetics and things.

Do you see what I mean? And yet, they say, 'okay you've got to have

Biology, or else you can't take Animal Husbandry.' It has no relevance

because it might be just the basics, but if you're interested in one more

than the other.....

Well, let's get along a little bit to the sports and recreation, and the

facilities that are provided in this way -- gymnasiums, equipment and time

-- for sports. How do you now feel about these things in relation to

this particular.....

I think athletics out here are really fantastic.

Really good, eh?

Yes. I don't know about other colleges, but here it's really good. It's
got highschool beat because highschools have so many classes, but here we
haven't got so many, and the equipment is -- well, if you need equipment
you have to go through the government again... I do a lot of work over in
the Phys. Ed. office -- I help out a lot. You have to fill out maybe 8
forms, send them in to the government, and then by the time August rolls
around you've got your equipment. Ken's just getting stuff now that he
ordered in August -- butts for archery, and some lacross sticks, and volley-
ball, and he just got them now. He ordered them in August. Getting the
equipment here on time is the hard part. The government is so hard to get
to, there are so many forms to fill out, when really I don't see why you
couldn't just walk in and say 'we need three volleyballs' -- why can't we
have them, even if we pay for them. But the equipment here is really good.
The government really takes care of the gym, and we've got rings, and stands
and mats..

So in general the equipment is not really a problem,

Except getting it when you need it. And if you don't have the equipment,
this makes your athletics fail, because if you don't have the equipment
you can't run proper athletic field.

Well, then for someone who is as athleticly inclined as you are that would
come as quite a high commendation.

Yes, because you have to have the equipment. If you don't have it, it

goes back to where I say -- practical. You can sit there and tell the people how to use a bowl, but until they pick up a bowl, learn how to string it, how to fire it -- it's two different things. Telling them how to play soccer, and then getting them the ball. If you don't have a socker ball I could tell you all about soccer then I could give you a ball and say, 'okay, go to it. I just told you how to do it'. But when you've got to put your feet into action, that's a different thing. Like anything, you have to have the equipment to work with.

But you think that basically the equipment is pretty good.

Yes, it is. They might need some more mats, like for doing gymnastics. They've only got I think eight mats, and they need quite a few mats to do that, but generally the equipment is good.

What about the other leisure time activities, special interest groups and clubs -- things like that?

There aren't too many clubs right now. I think the only club there is right now is Rodeo Club in Agriculture. There was to be a Drama Club, but I don't know whether it has started. And then there's this rap session - it's called "Rap with Reason", you can go and rap and you talk about various things. There's a topic put up, and you go and give your views, you can really get into some heated arguments. They're talking at eight tonight on "Sin" - you go and talk about sin, in the chapel over there-

Wow

The chapel might be an appropriate place. That's where they have all their

sessions. It's a quiet place, and you can go there, and you can really

get arguing. You get seven people together and you really tear them apart,

then they tear you apart. It's that type of thing -- a rap session. You

really get down, and you really find out a lot of things about other

people and about things. That's a good club. And there's a jukebox

downstairs, it gets used fairly often when it's working; there is a pool

table and a shuffle board. Every other thing that's done is inter-mural.

I'm on the inter-mural committee too. You do like flag football, between

houses -- I guess you could call that a club between the various houses,

and you've got a lot of competition in the school itself. Like this

Friday, I think the social committee is getting together with the Phys. Ed.

committee athletic council, and they're going to charter a bus, and anyone

who wants to go to watch our basketball game on Friday can go on the bus.

Then after that they've made reservations at the Capri or something, or I

don't know whether they're going to come back here for a party, so it's

really good. The leisure time is really quite good around here. You can

go into the gym just about any time by yourself and ask for the keys, and

Ken will give them to you. You can get a basketball. Like say you're the

only person in the residence, everyone else is studying, and you want

something to do you can go down and ask for the keys and get a basketball,

or a badminton bird; or a couple of you can go in and get them.

So there is a lot of free time when you can use these facilities.

Yes. You can use them, and this is something that you can't do in the

high schools in the city. Either you're in class or you're doing Phys. Ed.

(which is a class). When it comes up that there is free time, there is

practices for basketball...there's that here too, but usually you have

free time between classes and practices. So it's really good.

It sounds like there's something for everybody. I have a check list here
of basic human needs, and I'd like you to just sort of read through them
and see if these are things that are being provided for or encouraged to
be fulfilled by the institution.

Just check them off?

No.. just sort of mention the ones that you think are not met.

...are not met here, you mean?

Yes.

By 'overcoming obstacles'- what do you mean by that? If you have problems,
you go to the dean?   It's number one on the list.

No.   That's sort of like doing it yourself. Like doing things that are hard.

Do you mean does the institution help to overcome obstacles, like studying
if you have a study problem?

Yes.

I think the first one - overcoming obstacles - the institution helps you
overcome some obstacles but with all the leisure time there is when you
could be studying, there's an attraction to go and play basketball - there's

a conflict there. I don't know how any institution could really help you overcome obstacles unless you have tutoring -- somebody down your neck all the time telling you to study.

Well it's just sort of the good feeling you get when you've accomplished something that's difficult.

Making friends -- that's really easy around this place, and I'll tell you the reason why. It's a lot easier to make friends in this college than say in N.A.I.T because of the size. I think the smaller the college, the easier and the more fun you have. Like in N.A.I.T. or the University of Calgary, or any big institution you go there and you maybe know people in your classes and some other people, but you really don't know all the people, and here it's really fantastic because you know everybody and everybody's your friend -- nobody's against you. It's really easy - there's only 400 students here, and I think it's really good to have a college this small. It might be cutting out a lot of other kids from coming here, but I think a small college maybe 400 or 500 is just right. It's small and you get some work done because it's not so big, and you make friends so it's much easier.

So that's one thing that's good about it.

Yes. Because it's small. And you know all the teachers because it's small also. If it's big, like the University of Calgary then you're not going to get to know many of the teachers personally. It's small, and that's why it's good.

For resisting influence or coercion? I don't follow number three.

Sort of a general thing of independence, making your own decisions, not being forced into something that you don't really want to do.

I don't think that they do that around here, not really. I haven't been forced into going to classes or forced into really anything.

So you're allowed to make your own decisions.

Right. If you don't want to go to school, you can quit school. You don't have to go to classes, they don't really force you to, or twist your arm. They might give you a little bit of advice, but that's about it.

No comment about No. 4. What about "exploring and asking questions" - is it the institution asking you?

No.

You exploring them. I don't think there's much of that.

It's not encouraged?

It's like what I was saying about standing up to the administration, but not anybody stands up to it. But maybe in residence, like for something that is really going to do you good, like for visiting or something, then there's a lot of exploring problems. The girls wanted their adult privileges, and everyone wanted their visiting hours, and liquor; we got the liquor that one night for cocktails and it really went over good. In the residence there's

a lot of exploring problems and a lot that they fight for. But when it comes to classes or big administration it's not really that explored. They just sort of pass it off.

Attracting attention to oneself - who, the kids ?

Everybody.

Like how?

Well, this is just sort of a thing that most people feel that they need. Most people feel that they need attention.

Oh, you can get a lot of attention around here because it's a small college. If somebody has a problem, all of the kids help out, they all have advice for him, and usually it helps. The deans are really good about that too, in the residence.

Yes. That's part of the next one, too then. Explaining and demonstrating. This also involves helping others.

Sure, there's a lot of that. Because everybody knows everybody. And if you're acting strange one day, they know you, and they know that's not the way you act, and they come up and say, "What's the matter?" There's a lot of that around here. It's really good, and it really helps out. And you wouldn't find that necessarily in a big college, not from everybody. I mean one person could care less if you had problems, but around here it's all for one and one for all type thing because it's small.

Avoiding failure or shame -- there could be a lot of that - I don't really know. I don't know if I'm avoiding failure - I think maybe I am. In some sugjects I don't really try, I guess. That's mostly because of teachers - I get really bored. I could really care less whether I passed it or failed it. I guess I'm avoiding it in some cases...don't want people to know.. Being tidy - organizing. Organizing - do you mean like groups?

Yes. But organizing not just people, but yourslf, your studies, your own personal time.

Oh, yes, sure. I keep my room really clean, and I take my notes and ke them in order. Also I organize a lot of clubs, like I myself organized our hallway - don't call it that way now. We got something going there, not just organizing everything. I'm really in for that. You see, I come from the city with all my Phys. Ed. and I know. I come here and it's not really known, and I can really do a lot of good work here. Like I can really get things going because I know. I'm on the Athletic Council, I'm on the Inter-Mural Council, I'm on the basketball team - I've got everything going for me - sports you know.

So you're really pretty well organized.

Yes. Today I'm doing that football pool for the Athletic Council, and oh, man, I'm involved in just about everything - track and field, cross-country team as well, organizing and everything so that's quite something.

Relaxing - there's a lot of time for relaxing. I watch TV.
Amusing oneself - well, go down to the bar on Thursday night - everybody

goes down to the bar. I think if it wasn't for the college kids the bars
would go broke; we call it 'suds' night. That can be part of amusing
yourself. You can go down and have a lot of fun. Relaxing - there's
always time for relaxing. Number 11 - I never ignore anybody, I never
exclude anybody either. I'm not that type of person that goes around
saying oh, Joe Blow he's no good, because he can't play basketball. I
think everybody is trying as hard as they can. From the Phys. Ed. point
of view, one guy's a super athlete and the other guy's still trying, but
he's not as good. But I might give them both the same mark, if they
try. Then there's the guy that could be really good, and he just sort
of slops off. He's going to get zero, but the guy that is lousy and tries
is going to get the good mark. I don't exclude or snub anybody off.
Explain number 12 to me - "seeking and enjoying sensuous impressions."

It's just sort of enjoying things from all of your senses - like music
would be one thing, color, light.

I have some colored -lights in my room, by the way, and different things.
I do up my room that way, I always have. And music I love. I love going
to dances because I love dancing and music. I think maybe the men's res.
should try to invest in a stereo record player, or something like that
and put it in one of the lounges. I know the girls have one. Maybe we
should go over and steal it one night or something. I think the men's
res should have something like that because I really love music. I could
sit down and listen - I've got tape decks and speakers all over the place.
I could sit down and listen to the Beatles or Janice Joplin or anybody --
just sit down and listen with two speakers -- really nice. Music, I love.
I love "being recognized for achievements"- like if I do something good

I love having my name in the paper. I guess I'm that way.

Do you get this kind of recognition here?

Yes, I do. Mainly because I'm so athletic. Basketball, cross-country -
I was number 1 on the team and got my name on the paper. I love being
recognized. It might sound conceited or something..

Oh, no. Everybody likes that.

But if I do something well, I love being recognized for it. But I don't
try to go out and be a star myself. When I play basketball, I would
rather give the ball to somebody else and let him make the points. I feel
you have to play as a team to win. Even in yourself, your muscles, your
breathing - everything has to work as a team if you're going to win - this
is what I feel. And if it turns out that I play well in a game, well then
I play as a team. I'd rather pass the puck to somebody else and see him
score, I'd rather assist him than maybe trying to hog the puck and go and
score myself. I love to just play as a team, because that's the only way
you can win - to work as a team, or as a country - understand the game in
Canada. And if you turn out to be more recognized in that game, or if you
sort of stand out in the game, then that's fine too.
Analyzing, defining, synthesizing information? Number fourteen?

Sort of putting it all together. like especially what we're thinking of
here is your courses - all the information in a course, and then all the
courses;   You know just putting it all together.

Putting it all together. I think that's pretty hard to do right now when you're just starting out. But maybe after a year or so you might be able to start fitting them together. It's just like taking a tractor apart and putting it back together. At first you might do it wrong, but after you have to do it a couple of times you're going to be able to put it together. It takes you a long time to put things together. If you're working on a problem of your own, say a boyfriend or something, you have to sit down and work it out four or five times before you can finally put it all together. You know, why did this happen -- and think about it, and put all these reasons together and shake them up, and after awhile you have to put it all together before you can find out what's wrong.

Yes. Well, I think that just about covers it then. Do you have anything more that you'd like to add?

Well, a further interview I wouldn't mind. I like to sit down and talk about things like this. And on the whole I think that this is a really fine campus, as long as it doesn't grow any larger or things happen to jeopardize it, it will be just fine. I think it's really good. It's modern, that's another thing that's really good about it. That's about all I can add. Also that I hope this interview does some good.

I'm sure it will. Thanks very much.

VERMILION

#72 <u>Vermilion</u>.

To start with I'll ask you what type of a program are you registered in?

Officially it's Renewable Resources and Land Ecology.

And what is it unofficially?

It has to do with land and raw materials, conservation and so on.

What stage of your program are you at now?

I've just completed my third session - one more to go.

So it's a two-year program? What do you plan to do when you finish?

Oh, it depends on how employment things go, I think after Christmas,
when everyon's budgets and that sort of thing come out. Probably find
a job through government, I imagine. That's the area it pretty well
involves...management, resources, and that - regulations.

Yes. What sort of counselling did you get before you entered the program,
or did you have any?

Very little. It was all pretty haphazard, actually.

Pretty well your own decision?

Yes. Originally I went to Olds, and I knew that I'd go through Olds, and

then to here perhaps, to finish. I wasn't too sure, but I knew the area
I wanted to get into. Like down there it was called Land Resources,
and was actually similar, except for the Wildlife end up here.

You had just a very vague....

Yes. Last year was more so than now; I'm sort of finding out more what's
going on.

Why did you decide to come to this type of an institution rather than take
a different course at a different type of a college?

Because, one thing, I like the small colleges, fairly small. Like going to
UBC, and that sort of thing - I didn't want to be a number. But now I might
change my mind - I might go there still, you know. And because I couldn't
get what I wanted in B.C., you see - they don't have Agricultural Colleges
in B.C. as such, and I would have been four or five years there for just an
Agricultural degree. I wanted to get into it and find out what was going
on before I put in four or five years.

Well, why did you decide on continuing your education rather than getting
a job?

I don't know. I'm not an 8:00 to 5:00 worker, I imagine. What was around
me, I could gather with the knowledge I had. I was finished highschool
and took a few courses, and that; crafts jobs didn't really appeal to me
so I thought if I worked it right I might get something along these lines.

Okay, can you just sum up for me generally, then and tell me the reasons for your entering this program?

Probably it was a change, for cne thing. A change of location, would probably mean i would have to work. Because of the new area and I'd probably get involved in my studies. And then because it was only two years, that's what I was looking for when I started - two or three years. This was as close as I could get, looking through calendars, and that sort of thing, with the resources that I had.

Have you had occasion to check into the vocational guidance facilities here, the provision and adequacy of information on other programs, job require- ments, job opportunities....

Do you mean, have f had the opportunity or have I made use?

Well, both.

I really haven't, no. Because I sort of know the other areas through other students, and that, by talking to students from the other small Agricultural colleges. And this is the only one that is interesting to me now.

What about job requirements, job opportunities?

Yes. They're real good here actually. That's one thing about smaller places, you can get through to them. You get to know the counsellor, the guy who is supposed to be handling it. Like here I plan to see

him right after Christmas and he knows I'm interested, so I'll work
through them.

Fine. Let's look at your courses and your instructors.

Pretty good on the whole. I imagine wherever you go you find some that
aren't -- you know -- in certain areas. They're good, on the whole, I
would say, really good. A lot of them are teachers here through choice,
not because they have too. They want to teach here because of the envir-
onment, so they're real good.

Do you find that you're getting out of your courses the things that you
wanted?

Yes. It's hard to know what you're supposed to be getting out of it, when
you're still a rooky in the whole area. You can't just go in and say, 'Well,
let's scuttle it'. But you know, I've learned an awful lot.

Is this what you'd expected?

Yes.

Do you find your instructors are usually available at times other than class
times for students who have particular problems.

Yes. That's one thing about getting back to small colleges again, one
advantage over a bigger institution. I did that just the other night -
I've gone over to their own home and worked things out.

Yes. This is an interesting set-up around here with all these houses.
Do all the staff live here?

A lot of them. Some of them live in town, some of them live here. But
on the whole they're pretty easy to get ahold of.

And then the other places are dorms?

No. That's all staff. Like they run the farm here too, so there are places
for the farm manager too. I don't know exactly how it's done.

But there are dorms here.

Yes. This building you're in is a dorm. This is the administration building
and there are dorms on either side, and the cafeteria is right below us.
It's an old building, but it works.

What about the auxiliary services that go along with your courses, things
like labs, library, field work?

I'd say labs are lacking here, lab procedure and that sort of thing.
Just the whole atmosphere of a lab -- you know what you're expecting,
but in a few courses like chemistry it's lacking there.

Are the facilities adequate?

You mean as far as equipment is concerned?

It's here, but in a lot of cases it's not put to use.

I see. What about the library, then?

There's nothing there at all. They're getting a few books in now -- I imagine it's budgets and everything, but if you really want to do a lot of things, you might as well head off to Edmonton.

Yes?

It's the same thing at Olds - people had to go to Calgary. But I don't know how many students would make use of it, anyway.

I see. What about the use of field work and audo visual aides? Do your instructors tend to make use of these things?

Yes, fairly well, I think. Like in this climate it's pretty hard to go out and do a lot of field work, but when it's good I've been on geographical and soil trips, and field ecology things. When I go into the next session that's when I'll have to get out -- like when _ go into general managerial courses where you have to get out. And some of them have survey courses and things like that that take you right out for three weeks.

Is the library a good place to study?

Not the library itself, but there's a reading room right across from it which isn't bad. I sometimes fall asleep in there, so it must be pretty quiet.

Are there study areas other than the library?

Not right here, no. Like we use the animal science building that has a
library in it - it's actually just a small room. And we use the classrooms
that are empty in the evenings. But in the dorms there's no way you can
study. At Olds they had study areas in the dorms, and things were quiet
around exam time. It was a newer dorm, so it was better there. But if
there was a building open, like farm science, I'd tend to go over there,
because I can't study when there is a radio sounding off -- that sort of
thing.

Yes. I think a lot of people are like that.

So you're always wandering from the new building to the building where the
classes are, to study.

Can you comment on the way grades are allocated here, the grading at examin-
ations versus course work, in making up a required grade?

That's usually determined by the individual instructor, I think. They give
them the borderlines, usually the classes are quite small, and the instructor
I think has an idea of how he wants the courses set up and how he wants to
mark it, but if there are any objections he'll change it. Like a lot of
the courses in different areas are marked differently, but I think they try
to grade it over the whole area, the whole session, which is the way it should
be, I think instead of having a big exam at the end. Because most courses are
such that this is the best way to mark them. So they're good that way.

Good. Let's look now at the area of student government - student participation
in the democratic process, and students having a say in the decisions that

affect the entire institution. Can you comment on that with respect to your student government here?

Right here now it's fairly good, but they don't approach you over major issues. I don't know if any have come up because I'm not involved there myself directly. But something . may happen - typical events like dorm things they'll get together and do it. They're handled quite well. But since I've been here nothing has really come up of much importance. They don't seem to bother too much the way things are, they just go along with them.

Do you feel they should go beyond these sort of minor issues?

I think so, yes. Especially here where you get to know and are so close to the administration. You can just walk in. It could be quite effective in this place.

But this isn't done?

Not a lot, I don't think, as far as I know.

How is the communication between the administration and the student body, both ways?

Quite good. They're always open - better than a lot of places, I think, because you can get right in. If you want to see the top man, Mr. A.B.C. here, I think you'd get a chance to see him even if you were just an ordinary student, which is good.

What about channels, then, for expressing students' complaints?

Fairly good. You have to go through the usual rigamarole, you know.

A lot of red tape?

Not a lot, it has to go through the regular procedure to get to them, but I think they listen.

Does it result in action?

Sometimes, I think. Like last year at Olds (I spent four years there) we got a lot of things done there. I feel that was really effective down there. And I think the same thing could be done here because it's so small, and it shouldn't take long.

Well, let's look now at the sort of leisure time things - sports and recreation. first of all, sports. Can you comment on the facilities that are provided in terms of space, equipment and time?

As far as space and equipment go, well it's a pretty poor year. The gym in this old building was built sixty years ago, or something. I play basket-ball, and to practice. We play our home games downtown here if possible in the highschool gym, which is better than ours, and worth mentioning, I think. Any other sort of facilities for gym use are quite poor. A lot of it is done through the students themselves - there is lack of funds, so they are raising it through projects, or just through th little sum they charge as a fee. Like I've been down to the main office and the whole bit, and most of that is where supplies come from. Everybody is just skimping along.

So this could be improved.

Oh, yes. Even the recreational staff and everything - like there is a Recreational director here, but he doesn't do that much as far as I can see. And it's a lot of a staff member coaching, because they've always played at sports and they're good so they carry on. It's sort of like the highschool thing, and I think it should be above that by now. But because of the money situation I think that's the only thing they can do. They can't just hire a coach to come in.

What about other sorts of leisure time activities, special interest groups, clubs?

That's quite open. A lot of students are gone on the week-ends here, it's pretty well empty. But there are a few things. If you get a group together it's pretty well half the student body. So it's pretty difficult to find enough people interested in any thing to make it worth while.

So this is lacking, but it's not particularly needed.

I don't think so. I think if it was needed you'd hear complaints. There are facilities here - there are rooms and places where you could have different clubs. I think there's photography, and that sort of thing going on.

Okay. Well just in general now we can sort of sum up. Can you tell me what areas you feel most need improvement? What are your gripes? Is that a hard question?

It's pretty big. For one thing there could be better use of the equipment; the effect of this could be to pick the school up in general, like it always does if you have a good place for people to let off their energy, proper organization and equipment, like a whole new field house, you know. I think they have plans for that here, but when they'll come through ....you know..... And I think a lot of the courses could be upgraded - the strictness of the course --

Made a little tougher?

Yes, in a lot of cases. Prerequisites to get into this place are not that high. They should be at least graduation from highschool sort of thing, you know, and they're not. People are now slipping into other courses, so that they have to drop the course to their level. You may get ten people in a class, and five of those are just sort of slipping into other places, and the other five could handle it a little tougher. So the instructor can't really pour on the material. If they've been let in, the instructor has to teach it. And there's a lot of that because there are such small classes so it's hard to just cut somebody out of class.

You would like to see then, a little stiffer entrance requirements.

Yes, I think so. Or at least .. n they get here and get them into courses, they could find out whether or not they can really handle it instead of babying them along for the first year, sort of thing. There are a lot of different courses down here too, like secretarial, animal science, technologies, two year courses. There's a lot of people think that these small colleges are just a joke, you go there for a lark. But it depends

what you want to get out of it. A lot of them get through without doing anything, you know. I feel that they should have to put something into it to get something out of it. If they think it's just a lark, they get by, and they pass, and one paper looks the same as another; but this is not good. I think a lot of them would pick up if they thought they were not going to make it at mid-term, but they know that they can just sluff off. There's too much boderline business, you know.

Is there anything else that you see that could be improved?

As far as physical facilities, like buildings and things, I think everybody is aware of that sort of thing - just waiting for money, and hassling and that. I think it would encourage a larger enrollment somehow. Here it is probably half of what Olds is, and I think Olds is a good size - about 500 or 600 students; here it's going to be a full length session, but they have some kind of Manpower business coming in, but like with two year courses they're going to have students around. Like here, they're almost to Saskatchewan -- like I wouldn't have come up here, unless some place I could have got the course. Because you have good instructors here, and everything else, but like people are more apt to go to Red Deer or Medicine Hat, or something like this..

The larger centres.

Yes. I don't know what their circumstances, but out here for courses like myself it's far superior to be taking courses way out here where you can get out on field trips and that sort of thing. Like at NAIT they're teaching the same course as I'm taking, they just started it, so I'm likely a year ahead of them. But I was talking to a fellow who is taking it, and

like right in the city how can you get out for a three-hour field trip.
Here, you're right out and there are farms around, and some of the
instructors own farms, and there is this provincial park over here, and
things like that. For my own line, I know, same as Animal Science,
they're right out here. They go out and follow the different operations
all around; they can give them the better ones and the poorer ones.

Right. You sort of get a better education.

How could you do that at NAIT where all you do is watch the planes come in?
In some courses it's fine where you do lab work, that sort of thing. They
can attract the students because of the city, but there's too much competition
between NAIT and all the Junior Colleges. Like here, they're scheduling
a community college in Lloydminster now, so there's no way of increasing
enrollment here for a long time. There's too much of that; that's why
they're so small. Like secretarial - you can get that anywhere; animal
science - they teach it at Olds and here,and they're both along the same
lines like livestock production and things. That's what I've found.

Just in general then, would you say that you are quite satisfied with the
college and with your programs or not?

I'm fairly satisfied, but not entirely. It's enough, but I think they could
put a lot more into it. I'm not looking at the employment area, like when
I get out how is it going to be to get a job - I'm not concerned with that.
Like I feel that they just sort of give you the basics and then you go out
and they can train you and that sort of thing. I won't know till I grad-
uate. After you graduate you'll know what was needed, but while you're here

you don't.

Well, I think that just about covers it unless you feel there is something
more you'd like to add.

No. I think that's just about all.

Okay, thanks I think that's just about all. It's been very helpful.

FAIRVIEW

#139 Fairview

The first thing I would like to ask you is what type of a program are you in?

I'm in first year Agriculture.

What do you plan to do when you finish?

Well, when I finish I have in the back of my mind -- my ma'n object is to go farming - not right now; I want to get out and hold down a job of some sort - a good job I hope.   That's the reason I'm here, for extra training in the field of agriculture.   I was raised on a farm; I'm the last boy out of five, and all the others have gone working out, so I guess I'm stuck with the home farm.   That's my main goal in life - to be a successful, educated farmer.

Can you give me an idea of what your reasons were, first of all for coming to this college, and secondly for choosing the particular program you are in.

Well, I was born and raised on a farm, and I always liked agriculture, and animals; I liked working with machinery.   I always had figured that it was a real challenge to farm and to try and produce something off the land.   The reason I came to Fairview is because I live seven miles out of town.

That's very handy, then.

I just drive back and forth to school.

So this was a logical choice.

Why did you decide to do an Agriculture course at this college, rather than go to University?

Well, I only have a highschool diploma, and I considered going to N.A.I.T. but I didn't give it really much thought.   I didn't really decide on going here unt.1 the Dean of Men came out and recruited me.

Was this the only sort of counselling that you had received before you decided to come here?

Mr. P.Q.R. had visited our school last year about half way through the
second semester, and he told what the Fairview College was like, and
what different kind of courses there were. He told us that the college was
here and the kids were not using it; everything is here that they want. But
most of the people go to Edmonton to take the same kind of a course; I guess
just to get away from the old surroundings and visit new people. But I
figured I'd come to Fairview - the college is here, and it's for me, so
there's no other place.

So you really had no lack of information about this college before you
decided to enroll.

Well the first I knew about what they taught at Fairview was on my last day
of highschool; other than that I didn't know what was going on here.

Did you feel that you could have used some information about the college
before?

Yes. I've driven by it for the last eighteen years - almost nineteen years;
I often wondered what in the world went on, and if the kids had to work hard
like they do in highschool, or is it different.

Okay, well let's look a little more closely then, at your program. First of
all can you just tell me in general how you feel about your courses and your
instructors?

Well, there are a few courses that I feel won't be of any use to us in the
future. It's hard to tell, though.

What sort of courses are these?

Well, something like Genetics, Botany - they might be used some, but not to
the depth you learn it. And the type of Economics that they teach wouldn't
be useful at all, I don't feel, to a farmer. But it's pretty hard to
tell in the first session because everything was really general. Botany and
Accounting were the only things that we delved into. Farm Machines were

things that a farm boy would know already. I probably gained something from it, but really I don't think it should have been counted as a course, it shouldn't even have been taught. Economics was to do with common markets and marketing, and markets in Canada - not of the farmer. It's something that a farmer can't touch down on, and he can't affect it in any way what-soever.

So some of your courses, then, you feel there wasn't too much of what you want. In general do you find, though, that your instructors are good teachers?

Yes, I think most of them are -- well, they have the qualifications -- they would have to have. But in general they're fair teachers.

Do they generally tend to be available at times other than class times to help students that are having problems.

Well, yes. Like here they've opened a lab for us in our spares; and we visit with them after school and during breaks. They're more willing than the students are, to come and visit them.

What about auxiliary services connected with your courses, things like the library, field work.

We didn't have any field work - it's pretty hard to in the winter time. But for Farm Machines we had machinery in the shop. We had different types of labs in Botany, and they have real good equipment for labs. But as far as the library is concerned, they have nothing. At highschool we had 150 highschool students, and about 200 elementary students and they were all using the same library, and we had at least five times as much as they have here.

So there's a lack of books, then.

There is, yes.

Is the library a good place to study?

Sure, there's not many people in there.

Are there study areas, other than the library?

The boys can go to their rooms, and there is a spare room in the east end of the college for studying. Then if you can't study in your room in the evening - if there's too much racket - you can always go down to the infirmary and study; it's always quiet there. I wouldn't know in the evenings, but in school there's quite a lot of studying done, but there's also a lot of talking done. But then I guess that's part of learning.

Yes, well you can't do without the social life.

Can you tell me a bit about the grading system, then - how your instructors allocate grades, taking into consideration your term work as well as a final exam, if there is one?

Do you mean percentages?

Yes. Just generally, how do they do it?

Well, they base the final exam on between 30% and 40% of your total mark. Labs are around 20%. They had class participation about 5%, quizzes 20% and mid-term exam 20% - somewhere around that. I don't know if that adds up to 100% or not. They mark a lot easier than they do in highschool, I found. But in general, most of your final grade would come from term work?

Do you agree with this?

I feel that more should be on term work and class participation and less on the final exam. Because you can fluff along all year and write a good final and make the course - 40% for a final exam is quite a bit. But it might also give a poor student a chance to 'pull up his socks'. For a student that really wants to learn he'll get good marks all through the year, and he'll study all through the year. A poor student will just crack down at the end. I think it's fairer to base more of the mark on your term work than on your final.

Just in general then, do you feel that you are getting out of these programs
what you wanted to get out of them.

I won't be able to tell you until this time next year.

It's too soon to tell now, is it?

Yes, because the first year you have to see what you want to major in. That's
another thing I have against it. We were told in highschool that the reason
you're going to school is to get a broad outlook on what is available for you
to go into. We came here, and that's exactly what they told us; and that's
what the first year is - to give us a broad outlook on what we want to go into.
I feel that you could come here and just take what they teach in the second
session, major in it and get your diploma; then if you want to come back
and take something else you could major in that. But the first year is just
too basic, really.

So you never really get down to the 'nitty-gritty'.

In this session we're taking ten courses, and it's just four 45 minute classes
a week in some courses. It's hard to learn that way, too. There's a little
bit of everything.

Okay. Well, let's move into the area of student government, student partic-
ipation in the democratic process. Can you just tell me first of all what
you think should be the function of a students' union or student council in
a college of this type?

Well, they have sports, social functions, bingo's; but other than the social
committee itself other people aren't getting involved. I didn't have to pay
student union fees w a I came here because I'm living out, so I don't really
have anything to do with the government of the shcool.

So the students' union, then is mainly for residents?

Right.

So you see their major function, do you, as being that of providing social
activity as an extra-curricular thing?

I don't really feel it's the social committee - it's more or less the
recreation director. I wouldn't know whether or not the students help
him out.

Can you tell me just a bit about sport and recreation here at the college -
first of all, sports - can you comment a bit on the facilities here in terms
of space, equipment and time?

They have all kinds of space for the amount of students they have here.
They have the equipment, and they have the time. The gymnasium is occupied
every night of the week. They have a recreation schedule, and it's occupied'
every night from about seven to eleven. They have a pool table, they have
shuffleboard, they have record players and jute boxes and ping pong tables;
they have everything - everything but colored TV.

There's really no lack of sports things to do, then.

Oh, no. And then they have curling for those who are interested.

Okay. What about other sorts of leisure time activities, then - special
interest groups or clubs?

I don't think that they have any. I didn't hear of any clubs that they
have in the school. The kids around here don't join any clubs from down-
town because it's just segregated, really. They don't mix with the kids
downtown - the college is for itself, and Fairview's for itself. So there's
no back and forth movement of the kids.

Do you feel there's a need for this sort of thing?

Oh, I think there's a need for it. They can get other teenagers' points
of view in life, what they think life is; the college kids could advertise
the Fairview college to the Fairview kids because they really don't know
what it is about.

This must make it a little difficult for you, being a Fairview kid.

Yes, I have to have two personalities. I have to have the personality of

a college kid when I'm at the college; when I go downtown I have to change into the old Fairview kid again. I tl. nk the real problem is that the college kids travel in a gang, say four or five kids; whereas the town kids travel in pairs, or single. If you ever go to a college hockey game by yourself and there's about five college guys there, well they just turn around and freak you out. I don't think the kids even want to be bothered going.

It's sort of a snobbery then?

It always has been that way in Fairview. I went to highschool last year, and we always had a negative look at the college kids. I don't know - maybe we haven't got the freedom that they have - they have quite a bit of freedom and they're taught to think on their own, and do what they think best, whereas the highschool kids - well it's sort of 'mummy and daddy, you do what they say, or else'. Maybe it because they're jealous of the freedom that we have here, which they don't have in highschool.

Do you feel that it would help to have activities that both groups could participate in?

They do have scholastic basketball, where the highschool plays the college; last year they had floor hockey where kids from the school used to come over and play in with, and on the same team as the college boys.

But this doesn't help?

No, it doesn't seem to.

If a group of students at the college wanted to start a club on some special interest, would it be possible for them to do this?

Oh, I think so. The instructors and deans are willing to do just about any-thing for the kids.

Would it be possible, then, to bring in highschool students also? Would any club that was formed here be exclusively for college students?

Probably would. Because I think the instructors want to think of the college as a school, and that's all. Just like the difference between the University and highschool, there's a gap there; and I think the instructors want this gap to remain, so that the college will stand out. Otherwise if they get involved with the highschool students, highschool and college would sort of acquaint together and there would be no real difference. Really, it isn't that much different than highschool, but the instructors would like to think that it is.

It's a shame that they can't recognize this. Okay, well, getting back to the students' union, do you also feel that one of ㅤe functions of the students' union should be to communicate between the students (the student body as a whole) and the administration and staff?

Students are trying their darndest to get the staff involved in their activities, but if a staff member says he doesn't like shows, and he never played basketball since he was in grade nine, then there's no way that the staff will get involved with the students and their activities. But we have a floor hockey league here - we have special teams based on what faculty you're in - you're either first year Ag. or second year Ag., or Mechanic and these teams have interested the staff - they're right in with the students.

Do you feel that the staff and administration are open to feedback or criticism from students.

Yes. They are, because we criticized some of the courses and they did take action.

What are the ways in which you would go about expressing a complaint?

Well, first of all we would discuss it amongst the students in the class. Then we go to our Dean of Men, and then from there on it's up to him to arrange with the instructors. If he thinks our problem is valid, he'll help us.

If he doesn't think your problem is a valid one, what would be the next

step, then - just forget about it?

Then we'd go to the instructor.

Directly to the instructor?

Yes.

Well, if I could just get you to summarize then I'll ask you to tell me

then what you think are the areas you think are most in need of improvement

what would you like to see changed, if anything?

Do you mean with respect to courses?

Anything to do with the college - parking, cafeteria.

The cafeteria - I want them to change the food; give us something better

to eat other than weiners and macaroni.

What did I miss for lunch today? I didn't have lunch here today.

You missed weiners and potatoes, then we had some sauerkraut -- you picked

a bad day to be here. Oh yes, we had tomato soup, chocolate milk, and for

dessert we had about a quarter of a banana.

So you'd like to see some improvements in the cafeteria?

Yes.

Okay, what other sorts of things can you think about that maybe could stand

some improvement?

Some of the courses. There are two courses here - Phys. Ed., which we

took last session, and we have Recreation. I feel they could put the two

together, and really teach something. Phys. Ed. was just doing other

things, and recreation is planning different kinds of activities. They

could put the two together and make one course out of it. I feel in the

second session they should drop a couple of courses and have about seven

courses instead of ten; or take some out of the second and put them in the

first and sort of balance the two sessions.

You feel that the second session is too heavy, then?

It's a lot heavier than the first year. It's supposed to be the heaviest

of the four - so if you make the second session you're going to just about

know whether you can make it or not.

You've mentioned things like student involvement, and college involvement in

the community. These are also things, I think, that could be improved.

What goes on here, and what goes on downtown - you just don't hear of it

around here. It's such a change from highschool. I went to highschool in

town here and everything that happened downtown you heard of in the school.

The first couple of days I really missed it around here. You just don't

hear of anything that goes on downtown, here. Maybe one of the main reasons

that the college is separate from town, is that the merchants are told to

watch out for the college kids for shoplifting and such things. That could

be the major problem.

So really the college is not involved in the community.

Well, it's getting more involved now. They have these Manpower courses,

up-grading for the farmers, and it's only now that the farmers are getting

to know what they do around here.

So it might make them a bit more tolerant towards the college. Okay, I'll

turn that last question around then and ask you to tell me what you feel

are the best features of the college.

The best features are the buildings that they have here, and I don't feel that

they are used to the full. The animal science building is sitting over there,

and probably about 30 kids see it each day, 15 kids some days. They have two

lecture rooms, and facilities there for 50 kids, and there are just 13 of us.

My brother came here in 1964, and I was just looking back at his report card.

In his classroom there was up to 50 - 52 kids, and now eight years later

there are 13 kids. It's quite a drop. It seems that Agriculture is on its

way out right now, or it's facing a depression.

Oh, I would hope not. My father is a farmer. Okay, well I think that's
about it then, unless there's something more that you would like to add.
Yes -- when are they going to build a new dorm. for the boys?
I don't know. You think they need one?
Oh, yes. It's pretty broken up. They built it in about 1950, and planned
it for twenty years.
So it's time for a new one?
Yes, and I think they need a new one quite badly. The reason why I'm
driving back and forth is that it's cheaper. And I think I get more study-
ing done. I'm not directly involved with all the other kids. I don't
have a chance to fool around much because there's only two kids at home.
I think I'm better off there - I get better meals, and I get to sleep.
Okay, well that's just fine then. Thanks very much.

CALGARY AVC

What sort of a program are you registered in?

I'm registered in Business Administration, or Business Ed. I guess it's
called.

And what do you hope to do when you finish with this program?

Be a secretary, I guess.

Can you tell me what kind of counselling you received before you entered
this program?

Well, I went down to Manpower and they suggested to me would I like to go back
to school and I said that I hadn't really thought about it, but I was faced
with the problem of probably working for the rest of my life, unless I ever
remarried, which is something you just don't take for granted. So when
they suggested this it kind of opened up everything new for me when I
could go back to school. I'd been a waitress all the years I was married,
and even prior to that - I'd done a lot of waitressing. It gave me an
opportunity to work at night, you know, and raise my children as well. And
so now that I'm alone, and I still have two children, this gives me an
opportunity to learn a different trade, learn something else, go to school,
and then spend evenings with my children, or at least have some time to
myself in the evenings rather than work for five or six nights a week.

Can you give me in a very general way what your reasons were for entering
this particular program?

Well, Manpower, as I say, suggested it in the first place. And when they suggested it, I didn't know whether I was coming or going - I'd had a bad upset in my own personal life, and when they suggested it it was basically a means to an end. So when I first came here the thought of going back to school scared the devil out of me, and I thought 'Oh my gosh, I don't want to go back to school'. But once I got over the initial hurdle of coming -- and it was just them saying that they could more or less re-educate me and put me into a business world rather than the nonprofessional world. And this gave me a great incentive - the fact that I would be learning something - it would be challenging, it would be something new, and that's the way I find it. I find it challenging, and a great privilege and a great honor to be able to go back to school. So many people can knock the institution, or knock going to school - even I think as a teen-ager they will knock going to school. But I think it's a privilege, a real privilege. There's not a ·lot of people who have this opportunity.

Right. Why did you decide to come here, then, instead of entering a college or a university?

Well, I didn't have the education to enter a college or a university. I had quit school halfway through grade nine, when I was thirteen. And since then I raised six children - five of my own, and I adopted one, so I just worked what with being married and raising a family. As I say, I waitressed it night to help bring in an extra income because my husband also wasn't a well-educated person. So what he gained was through knock after knock in the business world - the world that he was in, and he did succeed very well in it, basically. I guess in my own field, in waitressing I've succeeded very well because I worked myself up from just being a waitress

in a diner or a coffee shop, up to lounges, to the point now where I
still work part time - I have to work on week-ends, and I manage a cocktail
lounge on the week-ends. But still, I don't want to work nights for the
rest of my life - I still have a five year old and a fifteen year old at
home, and I want to be able to be home with them if I want to, or take
them out if I want to, or take them out myself. Whereas if I stayed in this
business it's strictly a job for nights. I had wanted when I first came
back to school, as I say I was kind of mixed up and when I first entered
I entered as Business Ed. and then I changed my vocational goal to dental
assisting, and I thought I'd really like this. I still think I'd really
like it, but I can't get my Chemistry - I just have no head for Chemistry
at all, so I switched back to Business Ed. I'm rather looking forward to
it, even though the fact that 'will I ever make it, will i ever be able
to type, will I ever be able to take shorthand,' and things like this.
So I guess what you're asking me is why I chose this. It was opportune,
and basically I guess it was the only one open to me, because I'd never
really heard of it before.

At what stage of your program are you, then? How much of it have you taken?

Well, I started school last June - the end of June, and I did two months
upgrading, so I don't know whether you'd call this my first semester.
Anyway, I finished my grade X completely, as of January, and then I'm into
Grade XI.

Good. Well, what about the vocational guidance then, at this institution.
The provision and adequacy of information on other programs, job requirements,
job opportunities?

I've never really looked into it that much. I'm type of person who I
guess goes along with the tide. If someone says this is here, and that's
there, and you're going to go that way, I never question, I just go.
And this could possibly be wrong. The only thing I know as far as
counselling, when I have needed to talk to somebody - like when I was in
trouble with chemistry, and I felt that I was just getting no place, and I
also felt very frustrated, and I came to the counsellors here and asked them
if I could change. They did everything in their power to help me, and to
help me decide which would be best. Other than that I haven't really had
the opportunity to inquire very much, maybe because I'm older, and maybe
because I feel as though I really haven't got a lot of time to spend in
school. If I was twenty years old again I would probably be looking for
all those opportunities or outlets ot whatnot, but as it is I feel I don't
have three or four years to spend in school.

But in the counselling that you have had here, you feel it adequate, then?

Oh yes. I found them really great.

Good. Okay, then let's look at your program a little more closely. First
of all, how do you feel about your courses and your instructors?

I have no complaints at all. I listen to complaints about some instructors,
and about some courses. But as far as I'm concerned - the only thing I did
feel was that in chemistry, I didn't see why you had to have chemistry to
be a dental assistant, but I'm not the Power-to-Be, you know. Other than
that, I have no complaints at all. MY counsellors, my courses, everything
is really good. And if I ever got in trouble I could always go to the

teachers and they were always more than willing to help, or show me the
way around a problem.

Then your instructors are available at times other than class time if you're
having a problem.

I've had my instructors tell me they'd even stay after school and help me if
I wished to do this.

Do you find that you're getting out of your courses what you wanted to get
out of them.

I think so. Because I never really thought of what I wanted to get out of
a course. As I say, I think I'm a wee bit blind, you know, and I used to
think I knew a fair amount. Now I find that I was really quite stupid....
I'm learning an awful lot. No, it's great. I have no complaints at all.

What about the other services that are connected with your courses - things
like your practical work, the library, field work, this sort of thing.

 don't
I ʌknow about the library they have in the school itself, but the teachers
or instructors themselves if they want us to do any library work or research
work at all, they're right with us to give us the time, to even go with us.
In English, we've been taught how to use the library, how to get the best
out of the library if we're looking for information at all. And there
again, it's been pretty good.

Well what about your practical work? Say in your typing courses?

I'm not there yet. I'm more or less just doing my grade X right now:
I'm doing my grade X in math and social studies, and I'm doing my grade XII
in English. There I was fortunate. I was able to go right through my up-
grading right to a Grade XII course in English. So, as I'm not in typing
I don't know.

Okay. How do your instructors tend to give grades? Say in terms of the
term's work versus the final exam. How do they rate?

There again, I'm not an authority. I just took my up-grading and that
was the only final exam that I had. I found the teachers very fair - more
than fair in grading. I've never found them tough at grading, to the point
that made it impractical for me. Yet I'm the type of person that the minute
someone says 'test' I freeze. No, they're very good.

How do you feel that the two of these should be weighted - your term work
versus your final exam?

I think it all has to be considered equally. I don't think that because you
do well through a term when you come to your final exam -- I don't know, if
you do well, or reasonably well all through the term, an exam shouldn't be
that more difficult. If you're having difficulty all through the term
and you find that you're having to cheat or do little extra things to get
around, then I would think that you'd have trouble with a final exam. But
ordinarily, as things as with me, I find that if I do run into trouble, I
go to a teacher; he helps me with it; I then find that if I'm in a particular

area of trouble and after they've helped me I can kind of work my way out
of it; I don't believe in cheating - it doesn't matter whether it's in
school or in an exam - because I'm only cheating myself. So therefore I
have to learn it, and I have to be the one that answers to it, even after I
get out of school. I have to be the one that knows. So I think that in
all the way around - in marking - I really haven't found that much trouble.

Okay. Well, let's look now at another area, that of student government.
Student participation in the democratic process - that is students having
a say in decisions that effect the entire institution. Can you comment on
this with respect to your student government here?

We don't have that great a student government here. A lot of times we
have an awful lot of complainers, but I don't think we have that great of a
student government here. But then, again maybe I'm from the old fashioned
school where I believe I really have no say in the matter. I believe that
there are people that are educated for this; that there are people that know
and they know how to get you there, because I'm not the educated one. It's
the same as me trying to diagnose a sickness in my child - I can't do that
I'm not trained for that. And so I'm not trained to govern a school body,
I'm just a student, and therefore I do feel that if they say, well this is
the best way you should go - this is the course that you should take in order
to get where you want to go, well then I don't think I have any right to
complain.

So you feel then, that students should not have too much of a say in things

No, I don't feel that students should have a thing to say; in fact that's

one thing I knock the whole school system for, even with my own children.
My children, as far as I'm concerned, have no say in how the school should
be run. I may be wrong, I don't know. But I feel that educators that know,
and they know how to do these things...it's not the students who know, other-
wise we'd be the educators.

Right. Okay. How do you find, or do you have any knowledge about commun-
ication between the adm .. 'm and the student body as a whole, both
ways?

I feel that there's a lot of communication. I think it's strictly up to
the student. Personally I've had no problem at all. As I say, I've
listened to people complain, and holler and whatnot; but they themselves are
putting themselves into the program. They'll.sit back and complain about
it, but they're not trying to get through. They figure 'well, it's some-
thing that's given to me, and it's my right'. Well, it's not a right,
it's a privilege. But as far as communication - I've had no problems in
communicating with anybody. If I want something, I ask. I have found
everybody here, especially in the administration and the teachers and
instructors, have bent over backwards to try and help me.

Does your students' union act as sort of a gobetween in this communication
business.

I have no idea even if there is a students' union here. And if there were
I think I'd still go on my own. Because once again, they're the educators,
I'm just the student. And I don't believe that there really should be a
students' union. We have enough problems with unions already.

Okay. What about channels, then, for expressing students' complaints
or ways of letting the administration know that you maybe feel that some-
thing is wrong somewhere?

Basically, I don't think there's that much to complain about. I might be
the easiest person to interview that you've ever had, but I have no complaints;
I am more than happy, and I'm more than satisfied. You can go through life
complaining about something, but once again if I've had a problem, or if
I haven't liked something I mention it to the person involved, and I haven't
had to go through one student to get a step up higher. If I want something
I can go and see Miss W. V. S., or Miss C. D. E . Miss W. V. S. is a
counsellor here, and Miss C. D. E. would be, I would say, the principal
of the school. Or even to my own instructor where I am having the particular
problem.

You'd go directly to the source, then. Would you find this an effective way
of dealing with a problem?

I have no complaints. Of course, I haven't had that great a problem. I tend
to go my own way, you know, and do the best I can. If I have had something,
I've just gone directly to them, and I've had no problem whatsoever. They've
been more than willing to communicate with me, and to listen to my problem,
and have been more than understanding about it. Of course, even in my own
personal life I'm not one to go to the middle man. I go directly to the
source.

Okay, well let's look now at extra-curricular activities - sports and recreation. First of all the sports. Can you comment on the facilities that are provided in terms of space, equipment and time?

Well, there again this isn't like a highschool I guess, where you have a lot of sports and where you have a lot of recreation. I know they have had volleyball games, and basketball games, and baseball games and things like that I have been invited to go to. I've never participated. I don't have the time. My own time is pretty well tied up with being the sole keeper of two children, and the keeper of a home, and trying to get an education, and trying to get some social life, and trying to be a mother, and so on. Therefore I've never been a sports enthusiast. But they do try to have different games - teachers versus students and things like this, which I guess those who have participated have had a real great time. I personally haven't had the time, so therefore I haven't bothered with the sports.

What about other sorts of leisure time activities, say special interest groups?

There again, I don't know if they have them here, and again I haven't the time. I think this basically applied to a lot of people here, because a lot of them are parents. You've got five hours in school, you have an hour's homework, maybe three - I've had maybe three and four. I want to spend time with my children, with my home, for myself and time for my part -time job. So time spreads pretty thin. So even if they did have clubs and activities here, I doubt if I personally would join them, because as I say, I just don't have time.

Right. So you then would find your leisure time activities tied up very much outside the school.

Oh yes.

Okay, well, would you like to just sum up for me and tell me what areas need improvement here - what things could be improved if anything?

There again, possibly in the building, but then they're moving to a new building, too, so you can't ask for improvement when they're trying to improve as soon as possible. As far as the teachers are concerned, I think they're great; as far as anything I've needed -- I'm possibly not very much help to you at all because I have no complaints about anything.

Oh, you're very much help to me.

Well, I just think that as far as the whole school, and as far as the people here are concerned, they're awfully nice people.

Well, can I just turn that question around then, and ask you what you feel to be the best features of this institution; what are the things here that you like the best - just again in summary.

I guess everything. Well, I guess because it's a different way of life for me, and because it's a challenge. I just like it all around. I think it's a great honor and a great privilege, and I think that I'm a very lucky person to be able to go back to school. There are not many times that when you're forty years old, someone says 'oh, would you like to go back to school?'

You think that they must be ki 'ding. But I have found that the teachers here have a kind of a way, at least the ones that I've been associated with, of bringing out the things that you know, and making the best of them. So I like everything.

I think that's just about everything, then, unless you have something more that you would like to add.

I think that sums it up completely, because the school can't really offer me any more. It would take me a week to think of even one little teeny thing they could offer me, and I'm quite satisfied.

Thanks very much, then.

EDMONTON AVC

#14 - Edmonton, AVC

Okay, then I'll just begin by asking you in what type of a program are you?

I'm in Business Education.

And you're hoping to get a job as soon as you're finished?

Yes, I'll be finished in February, and I hope to be able to get a job with this education.

Can you give me a sort of general idea what reasons made you enter this program?

Basically I was in a very good line of work. I was commissioned sales staff in a furniture store, and I was injured. Through the injury I was told that I wasn't suitable to return to my -- Workmen's Compensation won't cover me if I return to my former employment. So I was looking at some kind of retraining. Manpower tested me for interest ability and decided that I should go into business education.

So now if you'd just like to tell me how you feel about your program in general.

Basically, it is a very good program, although Manpower -- there's a breakdown between Manpower and the administration here. The way you are told about things at Manpower before you come, is not the way it is when you come here.

Can you elaborate a little bit?

Yes. I was told this was a course for people who had never had anything
to do with secretarial work. Like I took university entrance courses, I
had no commercial courses in highschool. And this was put to me as a
beginners' course. When I got here I found that out of 60 students there
were ten of us who had never seen a typewriter before. The rest of them
- some of them were very proficient typists, and the rest had at least
some knowledge of typing. It turned out in the end that those kids were
getting a bit of an advantage. This was not how it was put to us. It
was put as a beginners' course. So in the end you're graduating with ---
I've got very good marks, but in six months you can only type a certain
rate and there's no way you could get any higher -- it's something you
learn with practice, so the girls who have taken typing and come in at
          and are going out at 80,
50 words per minute, have a better chance at a job than I do.

So you're operating under a bit of a handicap.

Yes. You're operating under a handicap that you didn't realize you were
going to have. So it is a bit disappointing.

Yes, it is.

You come with the idea that you're going to start with everybody else
and after the first day I utterly panicked. I didn't know how to put
the paper in the machine, and everybody else was typing, and I didn't know
where the letters were, and I was really panicked. I think that some
people who take these courses have been on welfare for years, and they're

not really sure that this is what they want to do, and they are really
turned off. There was quite a dropout the first few weeks, and I think
this kind of thing shouldn't happen. There shouldn't be that breakdown.

Why would you say that this happened? That a number of the students
dropped out? Would it be inadequate counselling?

Various reasons. A lot of them are the type that have dropped out of a
number of other things... they've sort of dropped out of life. And this
is a try. There is nothing really to help these people here -- you have
to help yourself. I don't think there's really enough investigation when
somebody quits, even; like 'why do you want to quit', or 'is there some-
thing we can do to help keep you'. And the other thing that I know the
administration here does, and at Alberta College where I took my up-grading,
we are supposed to be adults -- a lot of us are parents, but you come here
and they treat you like a child. You know your class ends at 10:00 o'clock,
so you're working but at 10;00 o'clock you pack up your books and you go,
like you would on a job. And then you are informed that you have to wait
until you're dismissed. And, sitting in a class - the teacher isn't talking
so you go to the washroom, then you find out you have to ask permission to
go to the washroom. This kind of thing, although it really isn't that
important, to some people who have been out in the world working for say
ten years, this could really disturb them. And this is the kind of thing
that happens. All these things sort of pile up, and people quit.

Do you think this type of thing, treating you like a child, is true of the
entire institution, or just of your program?

I think it's possibly our own program. Because they have quite a little
speech they give you when you first come in about if you're training for
a secretary you must look like one. And they tell you how you must dress,
and you take a seven-week charm course that tells you the things that
you've been doing with yourself are al wrong - you know, you don't walk
right, you don't sit right, and maybe these things are important. But if
they'd look at the background of these people -- like on our floor on our
program I'd say 80% of the girls taking this course are deserted mothers
of some kind - either they're separated, divorced or deserted - they never
had a father for the child, or for some reason they're trying to raise
the family. And they're trying to get off welfare and get something to
get a job with, and these picky little things...... if you've been on
welfare for seven years, you don't have any clothes. This cheque maybe
that you got is the first cash money that you've had, and all of a sudden
they're telling you that you don't dress right, you don't walk right,
your makeup style is old -- you know. Maybe these things could be said
differently, or later - after the girls have had a chance with a few
cheques and a chance to buy a few clothes. Myself, it didn't really
affect this way because I had been working and I wasn't on welfare, but I do know that so many of
them are. If they were treated more like human beings they may stay off
the welfare rolls. But they look, and they say, "well, the girl on
welfare - she gets her clothing voucher, she's better off than I am,
maybe I should go back on welfare".

They're not really helped in the little ways.

It's the little things. The big things are there. You know the counsellor
is there and you can go see him, and maybe there isn't time. But there

isn't that personal contact that there should be. Being a teacher and
standing in front of a class, seeing the same girls day after day, you
should be able to tell if something is wrong, like a mother does with her
own children. You may be away working, but you get home, and you can
tell if there's something wrong with your child. You know, if they were
concerned in that way and caught these things before they came to a head
and_Aquit. the girls This is the sad thing, because when they quit they go back on
welfare, and it's even harder to try a second time.

Okay, what about the area in career planning, in vocational guidance?

They're very good there - very good. The testing I had was - they tested
me for what I was suitable for educationalwise and manual dexterity and such
things; they took into consideration my education and experience, and they
did come up with something --- now I wasn't sure about commercial courses.
When I went to school it was the last thing I ever wanted to do, and when
they told me that that was what I was suited for, I thought - 'oh, no'!
But I find that I am fairly suited to it, and they were quite correct,
and I think when you come out of a situation where you've been either doing
the same thing for ten years, and you're looking for a field, somebody
has to tell you what, because you don't really know what to go into.

Did you have your vocational guidance here, or was it through Manpower?

Through Manpower. I think it's about fifty-fifty. They either come from
provincial, and then I think they go through the counselling services here.
A lot of them come through counselling at Manpower.

I see. Do you know anything about the counselling here?

Here? Not right at the school, no I don't.

Say other than vocational counselling - personal counselling.

I have never been myself, but they've helped quite a few girls. Things like telling them where to go if they're short of money, for student's loan, you know - just go to the students' finance; so they make arrangements for them to go. These things the girls don't know - the biggest thing is not knowing where to go. And they're very good this way. Also Ithere are quite often notices on the bulletin board (from the counselling department): things like "Students who need legal help phone this number" and such things. And I think if you went in with an actual problem they would do their best to help. I don't think that's where the breakdown is. I think it's before that stage, or getting them to go. Sometimes people who have problems won't go to see about them. The people whose problems aren't that big will go to see about them.

So maybe the initial stages of the counselling shouldn't rest with the counsellors, but with the instructors who are in a better position to spot problems.

I think maybe a suggestion like, 'I think you should see so-and-so; she doesn't look well, or hasn't been responding', or something like that.

Can they do that? Can they call a counsellor in?

it right, we'd rather not be bothered, so the Business Education Corps

kind of opted right out of it. So the students' council does exist in fact,

and from what I've seen it's a very good thing. The administration had

quite a large meeting to form this new student's government not too long

ago, and this is when we opted out, but the administration itself seemed

quite interested in getting it going.

How did you go about opting out? Does this mean you just didn't vote.

We just didn't vote, and he came and asked us what this meant. So we just

said that we didn't have time. This is more or less what we all felt.

Does this mean that you will be denied some privileges?

Not in any way. No. They granted us all the same privileges. We have a

student's card, but it's a non-paying member card - in other words some-

thing that's 25¢ to the paid member is 35¢ to us because we aren't in the

students' council. But we're still granted anything - for instance there

was a Christmas party for the children of the staff and students, and the

tickets went on sale and we all got them. They're not going against us, or

anything.

They're not holding any grudge.

No. It's just that there's two different fields here. There's the vocational

preparation courses where they do the up-grading, and they're a lot younger

and they're going to be here for a longer time. They're starting maybe at

grade VII, and they're going to be here until they've taken grade X or XII,

and maybe they're going to go into business after that. They might be here

Yes. They wouldn't necessarily have to go, but that could work.

Okay, let's go into some specific things on your program. You've talked
quite a bit already about your courses and your instructors. Do you have
anything else to add in that sort of general area.

No. I think the course is well planned, and they're keeping up to date,
and the teachers are very good. It's a matter in my case, if I had another
six months at it, then I'd feel like I really had something. And there's a
lot of us.

Is it not possible to extend your course?

This is what I haven't found out yet. I intend to go down to Manpower to
find out because I feel myself that I'm getting out of here with nothing,
actually....a good basic, but not something I can go to an employer with
and say, 'I'm a secretary'. Whether our girls that have taken commercial
courses in school will be able to say that; this was a finishing off for
them, and for some it was getting certificates; they had the knowledge but
not the certificates. I'm going to end up with sort of empty certificates,
I'm afraid. But there's maybe 5% in the group that are in the same boat.

That's too bad. What about the auxiliary services to the courses - your
practical work, and the library.

Very good. Very good. A lot of facilities, even the machinery is all up
to date.

This is a very new institution.

It's a new school, and it's very well planned actually for that.

What about -- are you required to do any sort of homework?

Quite a bit, yes. Especially on the first courses in the course.

Are there other areas in which you can do this?

Oh yes.

And what about the library?

It's very good, very comprehensive.   It's a small library, but they've done well in choosing the books.

The next sort of general area, if we could just move along now, is student government, and student participation and decisions that affect the whole institution.

I'm kind of a poor person to ask because The Business Education Corps I opted out of it, for the simple reason that we found our course is a very - shall I say it's a two year course squashed into six months, and you're busy, and it's the longest course daywise in the building. We're here at quarter past eight and my course is over at quarter past four. And most of us have families, and we found it very difficult to give to students' council. And we felt that rather than going and not doing

for four or five years at this school, so they're more interested in student government, whereas with the Business Education course, you're finished your up-grading and you're taking your course, then you're going to go out and work in the world in maybe six or seven months, so it really isn't long enough for you to get involved. Maybe that's a snide way to look at things, but it's the way we all felt.

No. I've heard this feeling expressed before, and I think it's quite valid.

I think as an adult you have your own group, even for social activities. You have your own group that you've been in for years, so you're not that involved with the students. We leave here each day, and say goodbye, and that's it. We never see that person again after we leave the course, maybe.

What about channels for expressing students' complaints?

Well, apparently (I don't know too much about this issue); last year at Easter time the school was closed, and they never got paid for one day: apparently the students' council went to the administration here and they brought in a representative from Manpower to explain to these students why they didn't get paid, so it seems as if the channels are there, and they will act for the students union.

What about complaints about courses? Is there anything you can do about this?

You have a head of each department whom you could go see in a group. Like for us, we wouldn't go through students' council, we'd go right down to the

head of our department and say, "We have a problem". We haven't had a problem yet, but that's what we would do, and I'm sure we would be well received.

So the staff are very open.

Yes.

Good. That's very good. Okay, the next general area is sports and rec- reation, and what you've already said is that you find you don't have time for these things, or to take part in activities here.

I understand they don't have a place. Apparently they're clearing out a basement or something, but they don't have a place as yet. I know that they have volleyball teams going from the school in other places. And I think there's a room where they play cards and chess. They're always advertised, but like I say we don't have time to investigate these. Our time is filled with homework.

What about the other leisure groups - special interest groups, say for example, drama.

I don't know if there's anything here at all of that nature. It's a young school, and like I say the students' council has just got going, I imagine those things will come. I think this is the difficulty with this school in getting students together. The courses are all of different lengths. It doesn't run on a semester system like some schools. Like I started in June and I'll be through in February. Somebody started in September, they'll

be through in March. So the whole school is not there for a year.
This school runs through the summer, so the courses are alternating, the
people are alternating.

There's a tremendous turnover of students.

Yes, there is. In the actual training courses. In the preparation courses
they go for a longer period.

Now we're going to move along to this list. It's a list of basic human
needs. What I'd like you to do is sort of go through them and see if there's
anything that maybe is not being encouraged or provided for. It's just
sort of a check to see if there's anything that we've missed.

I don't think there's anything on there.....

You've got no specific comments then. Would you like to·just generally sum
up what you've said and what you feel are the best aspects of this instit-
ution.

I think one of the best aspects of this institution is that it was very
well planned. The courses are well planned and they're well executed, and
the teachers are well chosen. I haven't yet seen a poor teacher. The
only difficulty is that maybe students should be brought here before their
course starts and it could be explained what they are taking and what the
goals of the courses are, so that they could realize what is expected of
them before they come. I think people are coming with the wrong idea. I
think if people were told these things before, it would help a lot.

FORT McMURRAY AVC

What program are you in?

I'm in the Business Ed. program. You get all the training to be a
secretary, a stenographer or clerk/typist.

How do you like your program?

I really like it. Last semester I didn't enjoy it that much - I don't
know why, maybe it was just some of the subjects I had - I couldn't get
them in my head, but this semester I really like it.

Everything is sort of all fitting together now.

Yes, it is.

And you're just about finished your program I take it.

Yes, I'll be finished on February the 4th. And you're doing your on the job
training now until the 22nd of this month. And you're training at a school
here?

Yes. I've got Mrs. X.Y.Z. - she shows me what to do, and all that.

What sort of counselling did you get before you decided to enter this
program?

I was taking my up-grading first. And then one day Mr. P.Q.R. came to see
me and asked me if I'd like to take Business Ed. I thought about it, but I

really didn't think I could make it, but I thought I'd try it. I had wanted to be a nurse or something like that, or maybe a stenographer. What are you going to do, go in an office and type or something like that? So when they asked me, I took the test, and I passed.

So that was why you decided to enter the Secretarial Course? Did you have any other sorts of reasons?

I used to watch the girls working on the machines in typing and that, and I went to visit in the room, and I really liked it -- I really enjoyed it. This is my way of meeting people, I wanted to meet people because I used to be the shyest person in the world; I never could talk to people, and now I find that I can.

So you find this has been really helpful to you personally.

Yes, it has.

Why did you decide to come here to this AVC in Ft. McMurray instead of going to the one in Edmonton.

Well, I was going to school in Lac La Biche for two months, and they were talking about closing down then, or something like that, and they sent all of their students down here.

So you didn't really have a chance to choose.

No, but I don't mind it now. I've really gotten to like this place. I've

lived here now for two years, and it's just like my home.

Where are you from originally, then? Are you from Lac la Biche?

No. I'm from Goodfish Lake.

So you've come a long way. Well, let's look a little more closely then at
your program. Can you tell, me then, how do you feel about your courses
and your instructors?

My instructors I find all very helpful, especially Mr. A. B. C. , and
Miss L.M.N. . Mr. A. B. C.'s makes me a bit nervous. I don't know why.
Maybe it's because we don't have him that much for our subjects. I find
that if he comes around, I know he's there, and I feel he's going to be
watching me.

Does this make you nervous, then?

Sort of, yes. If I'm working on a machine and he comes in, I get nervous,
because I know he's a real perfectionist. And if he doesn't like the way
we're doing something he'll make us do it over again. Every time he comes
in I have to do my work just perfect or it doesn't satisfy me either.
And Mrs. X. P. Q., I didn't really get along with her last semester, because
we didn't really talk that much, and we didn't have her that much for
classes, but this semester I just really like her. And Miss F.G.H., I
only have her for record keeping - I don't know....sometimes I have problems
with her; I ask her to help me with a problem, and she doesn't really know
what it's about, too; I can't really talk to her.

Is this because you can't tell her what your problem is, or she doesn't know how to solve your problem?

She doesn't really know how to solve my problem. She has to just about read through the chapter herself to be able to tell me. And on that record keeping, all the forms and that, I ask her where should this go, and she really doesn't know herself. That's about the only problem that I've got.

In general, do you find your instructors very helpful and very well qualified?

Yes. I think so.

So you're getting what you want to get from your courses?

Yes.

Okay. What about the things that go along with your courses, say practical work, the library, things like this?

All the work I've been doing has been in the classroom, unless the teachers would bring me some work, maybe letters to type, tests to type, and that's about all the work I've been doing - typing stencils and letters and that. I wouldn't work in the library regarding the office deal, at all.

Do you use the library to look up books, or to study?

We've got all the reference books, and the secretary handbook all in our desks. We have all the books we need in the classroom.

So you don't need to use the library.

No. Only if I'm going to get out books, you know - free reading.

What about your practical work, say the equipment that is provided for you for your practical work, for your typing, office machines and this sort of thing.

The typewriters are all okay I think. We've got the collator, and it's real handy, you don't have to sort the papers out by hand. I think the machines are all okay. He's getting more equipment in and I think that's going to be a lot of help.

So you'll be able to get more training on other sorts of equipment.

Yes. One thing about machines is I can watch the instructor two or three times, and then I can work it. When I was at Turcott school, she showed me how to work the machines there, and now I can just go in there and do it by myself. It's easy, I don't know why.

You probably have some kind of mechanical ability.

Probably, I don't know.

Okay. Do you find that your instructors are available for you to talk to

at times other than class times if you have a problem?

Well, if they're not in the classroom, they're usually in the staff room. So if I have a problem, I just go down to the staff room and talk to them. They're usually around. All of the girls in the steno pool right now, each one of us knows a little bit about this machine and that machine, and they've broken down so many times you just get to know how to fix them, so if a machine breaks down and we can't fix it then we go down to see Mr. X. Y. Z.   But usually we can just help each other.

Okay, fine. But what about your student council here, students having a say in decisions that effect the entire institution. Can you comment on that with respect to your student government here?

Of all the officers in the students union, there are only about five or six that are really working. It's not like it was last year. Last year the whole school got into the act, but this year the students just don't seem interested. Maybe it's because they are all really young this year; I don't know why. Same with the girls in the dorms. They're all younger and when you want to get something done, I think it takes older girls to get it done. Older people are the people that are really interested. So, it's not really that good. But if we do have something to say, like we'll get one girl to talk, or write it down in a memo to the people.

Is there a lot of communication between the administration and the student body in general?

To a certain extent. I don't think it's that much though. If there is

any communicating to be done, it's the administration that does it, and then the students if they don't like what's happening, they have their say. Usually, though it's the administration.

So they start things, and then the students react to what the administration says. What about channels, or ways of expressing students' complaints, ways of letting the administration know that you might feel that there is something wrong?

We have the dorm representatives for both the dorms, and a room represent- ative for each classroom. If the students don't like something, they tell the representative who goes to the students' union meeting. He has his say, and that's how they get through.

Is this effective? Does this result in action?

I don't know about the school, but with our dorm it really has. The dean is a real fair guy. Some of the girls think it's stupid to have those kind of rules, but it really helps him.

Okay. Let's look now at the area of leisure time... sports and recreation. First of all for sports can you comment on the facilities that are provided in terms of space, equipment and time?

We've got a gym that we just finished building, and they've got weight lifting, basketball, volleyball, just about everything. And they have their soc. hops in there, it's really lovely. That's really helped. And we have hockey teams. And in the summer time they have a baseball field just out

in the back here. They were supposed to get something organized for all the students to get together - like a toboggan ride or hayride, or something.

Can anybody use the sports facilities at any time?

There's a schedule put up. They have phys. ed. for the students here too, and they go in at a certain time. And then at night you can have volleyball practice at certain times.

What about other sorts of leisure time activities then. I'm thinking in particular of certain special interest groups, or clubs - for instance a drama club, or a music club?

No. I haven't heard anything about that. There are Art classes, and there are night classes here too that some students go to. I think there are sewing classes. And they bring films down for the students to see.

Do you think that there should be more of these sorts of clubs?

I think so. But a lot of the students like to stay home, or maybe go up town. But especially in the winter time I think they should get something going, something that would interest all the students.

Yes, that would be pretty hard to do. Okay, well perhaps then I could just get you to sum up. Can you tell me what you feel are the major problems here, certain areas that could use improvement?

They need to get the students together more. Well, the boys do come to
visit in the girls' dorm. But they need something to make them really
interested in getting together, and just really help themselves. Some
of the students don't really care about their schooling and all that.
Maybe we can get something into this education program that would make
them interested, even if it's just - I don't know how to say it, really.
The ones in the lower levels, especially. I've heard a lot of them say
that they don't like this, and they don't like that because it takes too
long. Maybe they're lazy, or they just don't like the schooling.
Maybe they could put something in that would make them interested, even
if it's sort of a game or something, but it will teach them learn things.
I know when I was in that school prep, I used to sit in that correspondence
room all the time. Pretty soon I just got sick of it. If I got sick
of my work I'd do something else, but pretty soon the instructor would
come and say, 'You're not doing your work'. Even if you had a free period,
or fifteen minutes to do what you wanted, as long as it's practical, it
would be real nice.

Something to make the learning more interesting.

Yes. If they had more slides, or equipment to show them how this works,
how that works, it would be nice.

Okay, I'll just turn that question around now and ask you what do you feel
are the best aspects of this institution. What are the things here that
you like the best?

The instructors are real helpful. I really think they help everybody.

The facilities are real good, I think. This AVC has really helped a lot of people, a lot of people who care to get their education, who want to get into a field they like. I've seen a lot of students who have left, and they have commented on it, and I know they really liked it. It helped them a lot. This school has everything for anybody who wants to come in and start.

You've got to do it yourself.

Yes. That's one thing, too. You've got to do it yourself.

Well, I think that just about covers it then, unless you think there's anything more you'd like to say.

I'll be finished in February, and I just wish I wasn't, that's about all. I'd like to stay on, but I'd like to try and get a job, and see how that will work. And if I do need more education, I'll come back. Even if it isn't here - even if it's another school.

Okay, fine. Thanks very much

CONCORDIA

Okay, can you tell me first of all, in what type of a program are you registered?

I'm registered in a Teacher Training Program. I plan on taking up a job working in   Parochial school teaching next year.

Can you just give me a very general idea then of what your reasons were for entering this program?

I've always wanted to enter teaching and only recently I became a member of the Lutheran Church, and they have a good program for entering that. That's what I feel my calling is.

So what will you be doing when you finish with all of your education?

I'll be teaching, I hope, in Canada, with a major in Phys. Ed. and a minor in theology, I hope. But that's still to be seen. But I'll be teaching secondary school, secondary education.

Okay, fine. Why did you decide to come here instead of some other type of an institution?

As I said, I'm entering parochial school teaching, and with this year I will be well on my way to finishing the program that they have set out for a parochial school teacher. This is my third year here.

Your third year in the college program?

The third year at this college.

I see, so you did two years of high school here as well?

Right,

Okay, fine. Well, lets look at....oh, another thing, can you just tell me what sort of counselling you received before you decided to enter this program, or what sort of advice, and where?

I made up my mind to become a teacher in grade IX with the help of the guidance counsellor at my junior highschcol. After that I just made my own decision that I went into Lutheran school teaching without anything else other than perhaps my conversion to Lutheranism.

Okay, that's fine. Let's go now into more detail about your program itself. First of all give me a general idea about how feel about your program; how are things going for you now?

It's not quite what I expected, but it's a really good program. I'm learning a lot. I thought there'd be a lot more work to it than there is. Perhaps I'm just not applying myself.

So you're finding it pretty easy?

Not easy. It's just not as demanding as I thought it would be. I thought I'd be doing a lot more busy work than I am. I'm doing a lot more thinking work, perhaps - I can't think of another word - than I thought I would be doing.

Okay, how do you feel about your courses, then, and your instructors?
Can you comment on these?

Well, most of the instructors that we have here are well qualified. I
don'* believe that they have the best methods of teaching but they are
very well qualified. The courses, too, are what will be required for us
to know - just generally, for general knowledge even. But again, there
could be some changes in the curriculum outline for the subjects as well,
at least that's how I feel about it.

What sorts of changes would you see would be really valuable?

Making it (like the English course is what I'm thinking of) so that the
people taking the subject can give their own insights into the stuff
that we're taking, rather than having it all indoctrination.

Sort of thinking for yourself a bit, rather than being spoon-fed.

Right. This is how it is, and this is the only way it can be. Great.
but you don't learn very much.

Is this a general problem, or is this just with one specific course?

Well, that course, and our religion course. But then, I don't know if
there's another way to teach religion so that it isn't indoctrination.
Because this is a Lutheran college, so I don't think there's any way to
teach religion in a Lutheran college but their Lutheran way.

Do you feel that generally then, your courses are giving you what you want

to get out of them?

The education courses certainly are. The English course I'm not getting very much out of at all. I like the subject, but I'm having trouble with the prof, and I don't like the course content either.

Okay, well let's look at your instructors, then. What sort of a teaching method do they tend to use? Is it a straight lecture method, or are you allowed discussion.

The education courses all have a terrific amount of discussion. It's just beautiful. But the English again is just about straight lecture, or they'd like it to be. The English is straight 'ecture - the Religion you have a bit of controversy, but not much.

Do your instructors tend to be available at times other than class times to help students who have problems?

Yes. They're around a lot. But it's just knowing how to approach them with the problem.

Do you feel that maybe this is the fault of the instructors? That maybe they're too distant - that they are seen by students as being unapproachable?

Perhaps that's it. Yes, they are. You know they're so well-qualified, they're over-qualified. That's how it seems, anyway. They know their stuff so well that there's nothing you could say that would bring them down so that they could relate to you on the level where you could understand it.

So that they could really see that you are having a problem.

Right. It all has to be superficial, you know -- away from us.

Okay, what about the auxiliary services then - such as labs, library, fielu work, audiovisual aides?

We haven't got all that good of a library, but we have the basics here - things that we need. You can't go off into a lot of branches very easily, but the audiovisual things are very good. And our labs are quite good, as far as I know. Our library could use some improvement.

In what way?

We need more books on the different countries, and of course in the areas of psychology and special education . We have the basics, but there isn't anything more than that.

Do your instructors tend to make use of such things as field work, guest speakers and the audiovisual aides - make effective use of them as teaching aides?

We've never used anything, except in music. There he really puts them to good use. We haven't used speakers or anything in any other class that I've had this year.

What about films and tapes?

Oh, films....we've had a lot of films in one of my education courses. Other

than that, maybe two courses that we use anything even, outside of the class.

Do you feel that these things would be valuable in helping you understand the material as it's presented?

I see its value, but I don't know that there are any available.

That's always a problem. Okay. Well, let's move now into the area of student government - student participation in the democratic process, that is students having a say in decisions that effect the entire institution. Can you comment on this with respect to your student government here?

Our student council here is very well organized, perhaps overly organized, in that they too are above the general student body - you can tell them things, but they just get dropped in the shuffle if they don't agree with you. So it's kind of run by the student council, and if the student council decides that the student body should do something then it's done, but we don't always know what's going on. Again, there's communication barrier.

Do you see communication as one of the main problems?

Yes, I think so.

Between students and students, and students and faculty. Students and administration?

Right.

You would probably say, then that your student council is not doing an effective job of communicating between the administration and the student body.

Right. And they're not doing a very effective job of communicating within themselves either. Because there's always mass confusion. There are three people who do everything, and three people organize the banquets, and three people organize all the other activities, but other than that nobody does anything else.

Are they in general representative of the student body as a whole?

I don't think so. Peraps they are, but I don't feel that they represent the people who are supposedly the problem people on campus. They represent the people who do as they're told, you know 'good little students' who always get their homework done, and are on the honor roll, or honorable mention, or something. You know, everybody's not on honorable mention, and everybody doesn't always get their homework done.

What about channels, then, of expressing students' complaints, or ways of letting the administration know that you maybe feel something is wrong?

We used to have open forums. We haven't had one this year, but I think we need one. The student body divided up into groups, and each group met with a number of faculty members, and we'd talk about anything. That was the best way. But it hasn't happened yet, and we're still waiting, and the tension's growing.

Does the initiative to get something like this going have to come from the staff member, or can the students initiate this sort of thing?

It has to come from the staff members because it involves cancelling study hours, which is a prerequisite for being here. So that comes from the administration, it doesn't come from the students. The students just can't cancel it.

Couldn't they go to the administration and say 'Look, I think we need some forums'.

Yes. We've done that. But we're still waiting, and as we wait the tension builds.

Okay, perhaps we can just sort of break up the interview here a bit, and I'll ask you to tell me what are some of the main gripes - your main gripes, the student body's main gripes. What are the things that need to be improved?

Well, on the college level, I can't think of any, but then I'm not totally representative of the college level. But as I said, there are a few profs here who sure aren't fitting the bill as being teachers, even. And there's a lot expressed about them, about their incompetency as being instructors at all - just instructors, not even teachers. That's a really big thing right now.

It's causing some concern in your program, is it?

You can say that again!

That's one thing that a lot of kids here are really, really up-tight
about and a lot of them are thinking of giving up altogether.
The problem is that they are trying to tell us how to teach, but
they're not even teachers, that's a really big thing right now because
there's a lot of kids here whose future echelon depends on whether or not
they're going to pass the exams, and with some of the instructors we
have there's no possible way they can. The information hasn't even been
presented to them so they haven't got anything to work with. That's
one thing that a lot of kids here are really, really up-tight about, and
that's why a lot of them are quitting as soon as the semester is over.
Another thing is the religion emphasis that's put here. Everyone is
expected to go to chapel; everyone is expected to go to devotions at night;
everyone is expected to go to church on Sunday; everyone is expected to
display good Christian attitudes at all times; and everyone is expected to
be Christian all day long, and all night long. You know, if you don't see
it, then you have nothing to base how you're going to act. The faculty
don't always act as Christians, or as what they proclaim is Christianity.
So it's kind of hard - you know 'do as I say, not as I do' kind of thing,
so it kind of gets lost. You know, our great emphasis here is supposed to
be Christ but it's kind of hard to pronounce his name when you're kicking
somebody -- it's trivial, but still there's far too much of this stuff
where people say, 'well this is how it should be ideally, however ----'
You know you can just go along your little way, but be sure that -- you know

'we'll just close our eyes during chapel and you can go to your room, or go down the stairs and smoke and all that'. I think if they are going to make rules they should stand by them the whole time instead of being wishy-washy about it.

Okay, well, let's look at another specific area then - that of sports and recreation. Can you comment on the provision that's made here for sports in terms of space, equipment and time - not necessarily for organized sports?

Well, that's another one of my areas. We don't have enough room here for sports activities - and being as this is a highschool, highshool has precedence, so we have all kind of highschool sports, but college girls have absolutely nothing. Well, we have intermural volleyball right now, which is really cool beca.se there's only five or six college students in residence anyway, so it's really great.

You mean five girls?

Yes. You know, what can you do with five girls. And there's no time that they've given us so that we could get the day students involved in anything anyway - you know for an extra-mural team of volleyball, or basketball or anything else. Well, we'd like you to but -- Monday night we have boys' basketball and girls' basketball, and Tuesday night there's college boys, and Wednesdays there's -- well, there's just no time. We're sorry, but. The whole bit's fine and dandy.

So you would like to see some kind of an organized thing get going for

college girls in the area of sports.

Right. I'd like to see a college Phys. Ed. course presented here as one of the subjects we could take because right now I think we have four or five students who are entering Phys. Ed. as a major or minor, or entering Recreation, and we're not allowed to have any. We can't take it as a subject, so we're a year behind the kids at the university.

What about going into the gymn sium at other times and say just doing some individual physical exercise.

In the mornings you can go in if you don't have classes. I think the gym's open at 9:30 or something like that, and in the afternoons it's usually being used for classes. It's a good place to practice piano, though.

You find that even though you can go in there, this room isn't enough?

Well, you have your own work to do, too you know. If there were some time set aside like after school when you could go in - like when you're fin- ished your studies or whatever - and you could go in, but there's always something organized going on. There's basketball practice, or something else. There just isn't any time that you have free that you can go in, because there is always something organized that's going on.

Well, what about other sorts of leisure groups, say special interest groups or clubs?

We have a drama club, but our campus populatæon isn't such that anything else can be organized because there just isn't enough people. Well, basketball,well both teams and cheerleading involves about a third of the population, even though there is about another third who are day students they don't get involved. Well, who wants to come all the way out to Concordia for something.

Would you say then that most of the day students probably find their extra-curricular activities outside of the school.

Right. They sure don't hang around here, anyway.

Okay, then. Just to sort of sum things up, this is a list of basic human needs. What I'd like you to do is read through them and see if there is something in here that is perhaps a special need of yours that's not being fulfilled, or not being met, and something that we haven't yet talked about.

What's coercion?

It means one person forcing another person to do something against his will.

I can't see anything.

So you don't have any comments on any of these points?

I just wish it was easier to approach the faculty. We have advisors, and an advisor system here. I just wish it was easier to approach them. Then all these things would be involved in that. But there's such a distance.

Okay, perhaps you'd like to sum up for me then. You've already told me what your major gripes are. Let's just turn that around now and I'll ask you what you think are the best aspects of this institution.

Oh, man, there's a lot of fellowship here. It's strained sometime just like at any institution or school, but the true fellowship that you get here is absolutely fantastic. I've learned a lot here. You not only learn from being in classes, but you're at the dinner table, and you discuss things. It's just great. I never would have experienced anything like that being in a public school. And being in residence has developed a lot of individuality of my own. But it also has helped me to be more patient with people, and being proctor I have a lot of responsibilty too. That helps too. Being responsible for an entire group of girls in the entire building really develops a lot of responsibility that I'm sure is going to help me later, though I refuse to admit it now. It's going to really add a lot to the kind of person I will be.

So in general, then you would really seem to be satisfied with what you are getting out of this college, or an I wrong in putting it that way?

I'm satisfied with what I'm getting out of it, but I think the college could offer a lot more. It's got the facilities and the right setting to offer a lot more.

In what way, a lot more?

Concordia creates a lot of problems for a lot of students in that's it's centered around the church, that's true; but it sure could do a lot more in

spreading the gospel, because some kids here aren't even Christian. Every-
body goes along their merry way. But I really think it could be a large
power in not only presenting the gospel to kids around campus, but also
witnessing to people from the surrounding churches in the neighborhood.
But there's no program set up because everybody has their own little thing
to do, and nobody else wants to get involved with anything else.

So you feel that the college then isn't fulfilling part of its role in acting
as sort of a portion of the community.

Right. We're a community of ourselves here. We don't relate to anyone
else other than on Sunday morning if you go to another church. You know,
that's the only other time. Because everyone has their own little commun-
ities at home wherever they live. But Concordia is Concordia - you get
kind of cliquey after awhile, and you're right on. But you know, even
back on campus and you see that same person, you might not speak to him
for an entire week or an entire month. But it's just sort of being on
the street with all these other people, if you see him well you have some-
thing to associate, and that's good. Well perhaps it is, depending what
you think of it. It's hard to relate to other people then, because your
whole life centres around Concordia, and other than things that aren't
related, you know when you talk about people from Concordia it has to be
people from Concordia or they don't know what you're talking about.
Who want to talk about religion, so the only other subject that you can
talk about are the ones that don't involve anything of any substance.

Is there anything more, then that you would like to add before we close
this?

I don't think so.

Anything at all about your needs or your motivations.

Lack of motivation -- absolute lack of motivation.

No. I don't think that's true. You wouldn't be here if that were true.

Well, it could be I'm searching for motivation and just haven't found it yet.

Do you feel this is true?

I sure do. I know that I have the ability to be doing much better than I am.. but here you just kind of do what you want, and you get your marks and if they're not so good then you try a little bit harder, but you don't really put out. There isn't really any competition and nobody's at you all the time..... either you make the grade or you don't. It's 'if you don't make the grade well come and talk to me and we'll see if we can work something out so that you can raise your grade.' Well, whoopee, this is still not going to get you to do your work. So you're just going to be however you want. If you don't feel like doing anything, you don't have to. It's as simple as that. So that's what I do.

You like somebody to kick you in the pants once in awhile?

Yes., or just point out which way the line's supposed to be going, because I usually wander all over the place and you never really get down to brass

tacks and get anything done unless it's become really pressing. Like,
I have a paper to do tomorrow or something, so I'd better sit down tonight
and get it done.

Right.

But, other than that, I'm still doing alright, but I'm sure (I know) I
could be doing better. But who wants to put out when there's nothing to it?

Right. When they make it easy for you, there's no point in making it hard
for yourself.

Right, that's the whole problem with this place. They make it too easy for
you. So everybody passes, but you're not really passing because you're not
learning anything. And you know, you can get a low mark on an exam or a
paper or something, but you can learn more from that paper than you can
from the entire year. But still, it all depends.

Well, thanks. I think that's been really good and really helpful. Thanks
very much for your time and your opinions.

CANADIAN UNION

#144 CANADIAN UNION

The first thing I'd like to ask you then, is what type of a program are you
taking?

I'm taking secretarial and music.

What do you plan to do when you're finished?

That 's a good question. Probably find a job. I'd like to get music
and secretarial if I can, because it's going to be useful, and I can support
myself on it.

Okay, can you tell me very generally what your reasons were first of all for coming
to this college, and secondly for choosing the particular program that you
are in?

Well, I just live about half a mile from this school, and another reason is
the music program, which was the main deciding factor in coming here. Another
reason is that it's a Christian school, and I could get the education in that,
and I could have a part in the program that they offer there. The reason I'm
taking secretarial is that it isn't a long course, but it's useful and
practical, and wherever I go I can use it.

Okay, then why did you decide to come to a College rather than go to University?
Because this school has the Christian aspect that the University doesn't,
and also I think the University is very impersonal.

I think you're right. I think it is. Why, then, did you decide to continue
with your education rather than get a job immediately?

I didn't feel that I was prepared for a job. I'm sure that I could have
found one, but I wouldn't be satisfied in doing it, knowing that if I got
the training I could get a better job, and do a much better job at it.

Did you receive any kind of counselling before you decided to come to the College?

No. I just did it all 'under my own steam'.

Well since you've been here, then, have you had occasion to look into vocational guidance counselling, information on where you can get a job, what to expect from a job once you get into it, or other programs that you might go into?

I've read up on information, but I haven't talked to anyone about it.

Do you feel the need for this sort of information?

I think it would be a very good thing.

Do you know if this sort of thing is available at the College, or have you just not had occasion to look at it?

They have publicity weeks for students of other denominations when they have all kinds of different information on just about any class you might want to take, what the requirements are, how long the course will take - just about everything.

But so far as getting a job, once you leave the College....

No. I think that would be really good. I think a lot of times young people are afraid to decide on something because they really don't know what they're going to do once they've finished their course, or what the possibilities are. So this sort of information should perhaps be provided before students enter a program.

Yes. Because you may have a real good idea - but you don't know for sure.

Okay. Well, let's look a little more closely at your program. First of all can you just tell me generally how you feel about your courses and your instructors?

Well, I'm really not taking too much in secretarial. Mainly I'm concentrating on my music. I've been taking a lot of that. For the secretarial courses that I am taking I have Miss C.D.E. She works us like dogs, but I'm glad because I feel that I'm accomplishing something. Some teachers don't

make you work, and at the time you may be pleased - you may brag about it, even. But be happy if your teacher does make you work. Deep down inside you know that it is the best thing, and I'm glad that she does make us work because I feel that I'm applying myself the way I can, because I have to. Mr. K.L.M. I have for music, and he's fantastic. He's one of these people for whom music isn't just notes - it's a real experience. He can communicate to us, and also to other people. That was the main reason that I came back, so that I could play in the orchestras again.

What sort of a group is it?

It's just a small group - three trombones, first, second and third; clarinet and trumpet - I play both clarinet and trumpet, and sometimes string bass. And of course we have percussion. I guess we play all types of music. We started first last fall; we first went out about the end of November. We've been out to Victoria, and we've been up North.

It's a sort of concert band?

Yes. We've played for the Denomination, but we've also played around here at different schools and organizations. At the beginning of March we're booked to take a couple of workshops in the district out here. We have a fantastic amount of work and hours of practices; and on week-ends we have a lot of programs to put on. When we come back we're awfully tired, in fact we're often tired right in the middle of it, but we have to keep on going because it's our job. Once you get playing you get involved in what you're doing, and you don't think about how tired you are.

So you're really enjoying this part of your program.

Yes, I really do.

Good. What about auxiliary services connected with your courses - things like labs or practical work, the library, field work?

Well, I really don't have that much other than typing and shorthand. Of course, in typing she has us do a lot of things, and I think they are a useful type of thing - the things that we'd have to do if we had jobs. I think it's good to do them now, and get in the habit of doing them correctly every time, and knowing that it's right. For music, I guess the concerts would be my outside work, and I get quite a bit of that.

What about the library here? Do you use the library at all?

Occasionally. I haven't had much need for it this year. I used it a lot last year. I was taking my senior matric., so I used it quite a lot - mostly because it was quiet.

It's a good place to study?

Yes.

Do you find that it's also a good place to do research?

Yes. I think so.

Okay. Can you tell me a bit, then, about how your instructors allocate grades, taking into consideration your term work, as well as the exam, if there is one?

In my secretarial courses we don't have any exams, it's based completely on daily work. And the tests that we have in shorthand are unit tests. They count quite heavily, but so does our work. We have quizzes every day.

She really does work you, doesn't she?

She just allocates two or three or four things for us to learn each night. When we come back, she drills us on that; we take dictation, and transcribe, and get more work for the next night.

Do you generally agree with the way your marks or your grades are given to you?

I don't think she should have to mark as hard as she does. One day when I was thinking that she was marking awfully hard, so I worked out the percentage on this unit test - it came out to 92%, and I got a "B". So she marks fairly hard.

Do yr . generally feel, then, that you are getting out of your whole program

what you wanted to get out of it?

Yes.

We 1, let's move into the area of student government - student participation

in the democratic process. Can you tell me what you feel should be the

function of a students' union in a College of this type? First of all, do

you have a students' union here?

Yes, we do. I guess they do quite a bit, actually. They put on programs.

We actually have quite a bit to say about who does what; things for our

yearbook - that's entirely under the S.A. The student body chooses who

they want for the different officials, and different programs they take care

of too, as well as projects. This year they're thinking of a students' lounge,

which we haven't had, but this would be very good. Kids really have no place

to talk, unless you want to hang around the halls, which isn't a very good

idea - or go and use the library, where you'd just get kicked out if you

talk. I think that it's something that kids need - they have to talk; and they

have to have someone to listen to them. This is under the E.S.A. - they

have the ideas from kids. But the Faculty still has the handling of it,

about having supervisors and things - it would be volunteer work really,

cleaning up, keeping things in order. We don't want to have to pay any money.

So you feel then, that one of the major functions of the students' association

(is that what it's called here?) is that of providing social activities?

It also has the different phases, you know - the spiritual, the social, the

physical and the intellectual. We have phase leaders and workers under them.

We have different functions they take care of - different aspects of each of

these phases. They have committees to decide what they want, and how they're

going to do it. They get their workers so that they can get it done. It's

a full job, and takes a lot of people to take care of it.

What about communication generally, between the administration and the
student body as a whole?

I think there could be a lot more of that. I think there is a lack of
communication between anyone, really. You notice it more between the govern-
ing power, and those that are governed. It seems that the faculty is apt
to get into their own little groove where they have their own things to do,
and are not concerned about the students. And I don't think it should be
that way at all. There are some faculties that do take an interest in the
kids, and they are well appreciated; they get a lot more cooperation. Like
Mr. K.L.M., who teaches music, or rather the "band man", he has a really
good line of communication with the kids; he's interested in all the kids,
what they're doing, and he asks about it. He can arrange music, and practice,
and work, and go through absolute agony doing it. Then after that he can go
out and play football with the boys. He does things with the kids, and he
talks with them. Yet he's very strict in the band. The minute he steps up
on the platform there's silence. No one questions it -- that's just the way
it is.

That would seem to work to the advantage of both groups.

Oh, yes.

Okay. Do you feel the administration generally is open to feedback, or
complaints from students?

That's a difficult question, really. I don't think they are, as much as they
should be. I think there's a lot of room for improvement there. Some are,
but if they are they're afraid to say anything for fear of what the rest of
them are going to say. I guess they're all scared to 'stick out their necks' -
that's what it boils down to.

What are the channels for expressing students' complaints. How would you go about letting the administration or the faculty know that you thought something was wrong somewhere?

Go in and talk to them, or write a letter. You could take it to the academic dean, or the highschool principal, or you could take it to the president, that is if it was in connection with the school as a whole. If you were not satisfied with the social aspect, the entertainment, we have a suggestion box.

Generally do you feel that these methods are an effective way of dealing with the problem. Would this result in action on a particular point?

It would depend. If it's reasonable it's generally done. If it isn't, it's not.

Well, that makes sense. Just generally then, do you feel that your student government here is doing an effective job?

I think so.

Good. Well, let's look at the area of sports and recreation then. First of all for sports, can you comment on the facilities for, not necessarily organized sports, in terms of space, equipment, and time?

The bare essentials, really. There should be a lot more room and a lot more equipment, but we don't have the money, so we have to make do.

This is something that you think students in general would appreciate?

Oh, yes.

Okay. What about other sorts of leisure time activities, then - say special interest groups or clubs?

There isn't a whole lot of leisure time around here, because you're going from six till 'who knows when'. They have a club - they call it the 'Wilderness Ventures'. They go on outings. There are a whole bunch of different clubs (I can't even think of them now, but they do have them). They have their own organizations, faculty sponsors, leaders as well as the student

president, vice-president and so on.

So you feel that generally there is no lack of things to do.

Oh, no. If you want to do something, you can always find something to do.

Would you feel it was possible, for instance, for a group of students to get together and start a club.

Sure, if they wanted to.

Well, if I can just get you to summarize, then I'd like you to tell me the areas that you feel are most in need of improvement - what things would you like to see changed, if anything?

I'd like the music building changed. It's awfully small, and it isn't exactly sound-proof. It's quite difficult. You can tune-in to two bands, as well as different lessons and practicing. I was working there, and if you don't have the power of kind of turning off your ears, you can be in a bad way. It's too small, and it just isn't adequate at all. They are planning to build studios downstairs. I hope they are a lot better. That is a big need, right there. And in the line of recreation they could do quite a bit, too. I think that the communication between the students and faculty could be greatly improved if the faculty were convinced that they needed to have it. I think that they think they don't need it, or else they just don't think about it. But it is important. Other than that, I don't think there is anything.

Well, perhaps I can turn the question around and ask you what you feel are the best features of the College. What are the things that you like best here?

Well, of course the things that I like best are the things that interest me. I really like the music program. I haven't had anything to do with the choral program, so of course, I'm not too impressed with that. I don't think they have as good a leader there, as the band. He's really tops.

And I think that the secretarial department is good. We just got some new
typewriters - IBM Selectrics - they're wonderful. That part is really good.
Of course we could use a lot more equipment, like business machines, it's
really inadequate. I think that the different phases on campus are really
good.

Could I get you to explain a little more about these 'phases'?

Do you mean about the whole general program here?

Yes. I'm not too clear on that at all.

Well, the social phase - we have faculty sponsors, and then the S.A. has a
social phase leader and an assistant or two. There is a boys' club and a
girls' club, each of which have social phases - they have a social phase
leader and a helper. So all those together make the social committee.
Together they plan the Spring Banquet, which is the big social thing here.
Also they take care of all the Saturday night entertainment. Occasionally
they have something during the week - for instance when it's Valentine's
they may have a special supper or something, even if it isn't a really big
program - perhaps just have a candlelight supper when everyone dresses up,
which is a really good idea. Then we have the physical phase which takes
care of all the different leagues - the basketball teams, hockey teams, foot-
ball, everything of that nature. They make up the schedules and so forth.
As far as the academic phase, I don't know how much they do. I don't think
they have leaders for that. But for the spiritual phase they have leaders
and the clubs, and also again the S.A. And they plan "Weeks of Prayers",
and different "Out Reach" programs and different things. It's really a
challenge to do something different - something interesting. But the
students enjoy it and get something from it.

Good. That's really interesting. It sounds like it has covered every phase
of your college life.

Yes. I think it's well-rounded.

Good. Well, I think that's about it unless there is something more you
would like to add.

No. I don't think so.

Thanks very much. It's been very helpful.

APPENDIX C

Questionnaire Used

THE ALBERTA COLLEGES COMMISSION

in association with

THE ALBERTA HUMAN RESOURCES RESEARCH COUNCIL

Survey of Motivations and Needs
of Non-University Post-Secondary School Students

To the student·

This questionnaire has been developed to find out whether or not the existing non-university post-secondary educational facilities are meeting the needs of society, in general, and the students attending these institutions, in particular. It is anticipated that the results of this study will be used by the Colleges Commission for future planning.

All responses will be completely confidential; information given will be treated in a statistical manner only. We have selected a small number of students to answer this questionnaire, therefore it is essential that all those selected return their questionnaires in order for reliable interpretations to be made. Please help us help you.

Instructions:

For each question, select the alternative that best describes you or your present situation, and place a check mark (✓) in the box before that alternative. Choose one answer only.

Example: The question "What is your sex?"

☐ (1) Male
☑ (2) Female

would be marked as above if you are female. In some cases you are asked to rate a number of alternatives according to a particular scale; specific instructions are given preceding such questions.

Thank you for your help.

1 In which institute are you presently enrolled?
- □ (01) Olds
- □ (02) Fairview
- □ (03) Vermilion
- □ (04) Grande Prairie
- □ (05) Red Deer
- □ (06) Lethbridge
- □ (C7) Mount Royal
- □ (08) Medicine Hat
- □ (09) N A I T
- □ (10) S A I T
- □ (11) Camrose
- □ (12) Concordia
- □ (13) Canadian Union College (Lacombe)
- □ (14) Grant McEwan
- □ (15) Forestry School (Hinton)
- □ (16) Fort McMurray (AVC)
- □ (17) Grouard (AVC)
- □ (18) Calgary (AVC)
- □ (19) Edmonton·(AVC)

2. Under what category are you enrolled?
- □ (1) Full-time student
- □ (2) Part-time student
- □ (3) Short course student

3. In which of the following categories does your program fall?
- □ (1) University transfer
- □ (2) Business/commercial
- □ (3) Health services
- □ (4) Industrial/technical
- □ (5) Social sciences
- □ (6) Academic upgrading
- □ (7) Agriculture
- □ (8) Arts
- □ (9) Other (please specify) _____

4. In what year of your present program are you now enrolled?
- □ (1) First year
- □ (2) Second year
- □ (3) Third year
- □ (4) Fourth year

5. What is your sex?
- □ (1) Male
- □ (2) Female

6. What is your age as of September 1, 1971?
- □ (1) 17 years or less
- □ (2) 18-21 years
- □ (3) 22-24 years
- □ (4) 25-29 years
- □ (5) 30-39 years
- □ (6) 40-49 years
- □ (7) 50 years or over

7. What is your marital status?
- □ (1) Single
- □ (2) Married
- □ (3) Divorced
- □ (4) Separated
- □ (5) Widowed

8. What church do you attend?
- □ (1) Roman Catholic/Greek Catholic
- □ (2) Eastern Orthodox
- □ (3) Anglican/United Church
- □ (4) Other Protestant
- □ (5) Other Christian (e.g., Mormon, Seventh Day Adventist, etc.)
- □ (6) Jewish
- □ (7) Buddhist/Hindu/Moslem
- □ (8) Other non-Christian
- □ (9) No religious affiliation

9. To what ethnic or cultural group did your ancestors (on the male side) belong on coming to this continent?
- □ (1) British (England, Scotland, Wales, Ireland)
- □ (2) French
- □ (3) German
- □ (4) Other West European (including Scandinavia)
- □ (5) Ukrainian
- □ (6) Other East European
- □ (7) North American Indian/Metis
- □ (8) Asian
- □ (9) Other

10. Where were you born?
- □ (1) Alberta
- □ (2) Canada (outside Alberta)
- □ (3) United States
- □ (4) Great Britain
- □ (5) Western Europe
- □ (6) Eastern Europe (including Russia and the Ukraine)
- □ (7) Asia/Africa/Middle East
- □ (8) South or Central America
- □ (9) Other

11 What language did you learn to speak first?

(1) English

(2) French

(3) German

(4) Spanish

(5) Other West European

(6) Ukrainian

(7) Other East European

(8) Other

12. What is the highest level of your father's education?

(1) No formal schooling

(2) Elementary

(3) Junior high

(4) High school

(5) Some university

(6) University degree(s)

(7) College or technical school

13. What is the highest level of your mother's education?

(1) No formal schooling

(2) Elementary

(3) Junior high

(4) High school

(5) Some university

(6) University degree(s)

(7) College or technical school

14. From the following, choose the group which best describes the type of work in which your father has last been engaged since January 1, 1971 (or in which your **mother** has last been engaged since January 1, 1971, **if your mother is the main source of financial support for your family**).

(1) Self-employed farmer

(2) Teacher, nurse, social worker, clergy

(3) Doctor, lawyer, engineer, other professional

(4) Craft trade (e g carpenter, seamstress, bricklayer, baker, etc)

(5) Labourer

(6) Office worker (government or private)

(7) Armed forces, police, fireman, etc

(8) Managerial

(9) Self-employed (industrial and commercial)

15. Make an estimate of your father's and mother's combined annual income (before taxes).

(1) Below $2,000

(2) $2,000 - $4,999

(3) $5,000 - $6,999

(4) $7,000 - $9,999

(5) $10,000 - $14,999

(6) $15,000 or over

16 How many brothers and sisters do you have?

(1) None

(2) One

(3) Two

(4) Three

(5) Four or more

17. How many of your brothers and sisters have completed or are presently undertaking some form of education past the high school level?

(1) None

(2) One

(3) Two

(4) Three

(5) Four or more

18. How many of your brothers and sisters **who have not already done so** will probably take some form of education past the high school level at some time in the future?

(1) None

(2) One

(3) Two

(4) Three

(5) Four or more

19. Where do you live while attending school?

(1) Parents

(2) Friends

(3) Relatives

(4) Student residence

(5) Boarding house

(6) Own residence (rented or owned)

(7) Other

20. Where do you live when **not** attending school?

(1) Parents

(2) Friends

(3) Relatives

(4) Boarding house

(5) Own residence (rented or owned)

(6) Other

21. Which one of the following centres in Alberta is nearest to your permanent place of residence?

☐ (1) Edmonton

☐ (2) Medicine Hat

☐ (3) Lethbridge

☐ (4) Calgary

☐ (5) Red Deer

☐ (6) Grande Prairie

☐ (7) Vermilion

☐ (8) Fairview

22. Indicate which **one** of the following sources will make the **major** contribution to the costs of your education this year (including living expenses).

☐ (1) Parents

☐ (2) Wife (or husband)

☐ (3) Own part-time and summer work

☐ (4) Own savings

☐ (5) Scholarship or bursary

☐ (6) Grants or loans

☐ (7) Other

23. What is the highest level of education you have attained?

☐ (1) Junior high

☐ (2) High school

☐ (3) Some university

☐ (4) University degree(s)

☐ (5) Some college or technical school

24. Which one of the following reasons for completing high school was most important to you?

☐ (1) An interest and desire to succeed in my studies

☐ (2) The wishes of my parents

☐ (3) School pressure and influence of my friends

☐ (4) Interest and influence of my teachers

☐ (5) To complete prerequisites for further education

☐ (6) To prepare for a career or occupation

☐ (7) Nothing better to do

☐ (8) I did not complete high school

25. Choose the category below which best describes your academic standing in your last year of high school, compared to the rest of your class.

☐ (1) Top 10% of the class

☐ (2) Top 30% of the class

☐ (3) Around the middle, average

☐ (4) Lower 30% of the class

26. What types of events are most interesting to you?

☐ (1) Political and economic

☐ (2) Entertainment

☐ (3) Technical or scientific

☐ (4) Fashion events

☐ (5) Sports

☐ (6) Cultural

Following are several activities in which a person might engage in his or her free time.

LIST A

(1) Writing a play, essays, a short story

(2) Playing in a band or orchestra, or jazz or rock group

(3) Directing or acting in a play

(4) Doing painting, drawing or sculpture

(5) Building a car out of old parts, fixing things

(6) Designing furniture or clothes, decorating a room

(7) Working on an independent scientific project, inventing something

(8) Finding solutions for difficult problems

(9) None of these

27. ___ Choose the activity from List A above in which you would be **most** likely to engage in your free time, and write the number before it in this blank.

28. ___ Choose the activity from List A in which you would be second most likely to engage in your free time, and write the number before it in this blank.

Following is another list of spare-time activities.

LIST B

(1) Talking, having coffee with friends

(2) Going to a licensed lounge or tavern.

(3) Going on dates (to dinner, a movie, a dance)

(4) Playing cards or other games

(5) Athletic events (as a participant)

(6) Athletic events (as a spectator)

(7) Watching television, reading

(8) Listening to music

(9) None of these

29. ___ Choose the activity from List B, in which you would be **most** likely to engage in your free time, and write the number before it in this blank.

30. ___ Choose the activity in which you would be second most likely to engage in your free time, and write the number before it in this blank.

People have different ideas about what they look forward to in education after high school, or what they hope to achieve. Rate each of the following (items #31 to #38) in terms of their importance to you, as objectives of your present course of study.

Mark "1" beside the statement if this is something that is very important to you

Mark "2" if it is of some importance, but not really a major objective

Mark "3" if it is of little or no importance

31. ___ Getting prepared for marriage and family life.

32. ___ Having fun; enjoying myself socially and recreationally.

33. ___ Establishing meaningful friendships.

34. ___ Thinking through what kind of occupation and career I want, and developing some of the necessary skills.

35. ___ Mastering a specific field of study or set of skills in preparation for immediate employment upon graduation.

36. ___ Exploring new ideas—the excitement of learning.

37. ___ Developing a deep, perhaps professional grasp of a specific field of study, not necessarily with a particular career or occupation in mind.

38. ___ Finding myself; discovering what kind of person I really want to be, what values are important to me.

39. Which one of the following reasons was most important in your selection of this institution?

□ (1) Short length of studies

□ (2) Easier than other higher studies

□ (3) Quality of teaching; superior teaching methods

□ (4) Prestige of the institution

□ (5) Very good college for training in my field

□ (6) Good athletic program

□ (7) Not as expensive as other studies

□ (8) Other (please specify) _____ ___
_____ ___

40. Which one of the following was most important to you in choosing this institution to attend?

□ (1) Influence or wishes of parents

□ (2) Influence or wishes of high school teacher and/or counsellor

□ (3) Rewarding social life on campus; extra-curricular activities

□ (4) To be close to home

□ (5) To be someplace different than where others in my family or friends had gone

□ (6) Did not hold prerequisites for other training

□ (7) Easy to find a job afterwards

□ (8) Other (please specify) _____
_____

41. What was your one most important source of information about this institution?

□ (1) Teacher(s) in high school

□ (2) Family or friends

□ (3) Newspaper, radio or television

□ (4) Canada Manpower

□ (5) High school counsellor

□ (6) Visiting speaker or counsellor

□ (7) Career fair

□ (8) Brochures or calendars

□ (9) Graduates or other students who have attended this institution

42. Who influenced you most in making the decision to attend the institution you are presently attending?

□ (1) Parents or other members of the family

□ (2) Teacher(s)

□ (3) Guidance Counsellor(s)

□ (4) Friend(s)

□ (5) Canada Manpower

□ (6) Other(s)

□ (7) Nobody

What important needs did they (or you) see as needs that could be met by this institution? What needs cannot be met by this institution, but were disregarded as being unimportant for your decision? _____
_____
_____
_____
_____

43. What did your parents wish most for you to do after leaving high school?

□ (1) As I am doing now

□ (2) Other studies

□ (3) Start working immediately

□ (4) Go into the family business

□ (5) Travel

□ (6) Get married

□ (7) Other (please specify) _____

44. What did you yourself wish most to do after leaving high school?

- ☐ (1) As I am doing now
- ☐ (2) Other studies
- ☐ (3) Start working immediately
- ☐ (4) Go into the family business
- ☐ (5) Travel
- ☐ (6) Get married
- ☐ (7) Other (please specify) _____

Please explain what reasons made you come to this institution instead of doing something else.

_____

_____

45. What part would you say that your parents played in your decision to attend this institution?

- ☐ (1) It's largely at their insistence that I am here
- ☐ (2) Played a critical role in the decision—really helped me think it through
- ☐ (3) Played a supportive, encouraging role—were interested but I really thought it through myself
- ☐ (4) Were really against my decision
- ☐ (5) Had very little to do with it, not very important
- ☐ (6) Had nothing to do with it, it was all my own decision

46. Which one of the following reasons was most important for you in choosing the department or speciality in which you are presently enrolled?

- ☐ (1) A liking or preference for that area
- ☐ (2) Options taken in high school led to that choice
- ☐ (3) It offers a good professional training
- ☐ (4) Tests have indicated that I have an aptitude for the speciality
- ☐ (5) It offers favorable employment opportunities
- ☐ (6) It offers opportunity to be of service to others
- ☐ (7) Other (please specify) _____

47. How do you feel you will handle the work at this institution?

- ☐ (1) I feel entirely confident that I can handle my work
- ☐ (2) Generally speaking, I should be able to do the work, but I may have trouble here and there
- ☐ (3) I expect some trouble in most of my courses, but I should manage to get by
- ☐ (4) I think I may have a great deal of difficulty

Do you have any suggestions as to what **facilities** could be provided to make the work easier or more understandable?

_____

_____

48. How sure are you that you have made the right choice in coming to this institution?

- ☐ (1) Very sure
- ☐ (2) Fairly sure
- ☐ (3) Not sure at all

In the following section are a number of statements which generally describe a college or technical school. For each, consider whether the statement is generally characteristic of the **particular** institution in which you are enrolled, or generally **not** characteristic, to the best of your knowledge. Mark "1" beside the statement if you feel it is true or mainly true of your institution; mark "2" beside the statement if you feel it is false or mainly false concerning your institution

49. ___ Students here put a lot of energy into everything they do—in class and out.

50. ___ Students are encouraged to be independent and individualistic.

51. ___ Many students during their time here develop a strong sense of responsibility about their role in contemporary social and political life.

52. ___ Channels for expressing students' complaints are readily available.

53. ___ Students who work hard for the fun of it are likely to be regarded as fairly typical here.

54. ___ Most courses are well-organized and progress systematically from week to week.

55. ___ This college has an excellent reputation, which is well-deserved.

56. ___ Students are encouraged to criticize the courses and methods of teaching.

57. ___ Students often help one another with their work.

58. ___ Most students are extremely tense here expecially during exam periods.

Below is a list of facilities usually provided for the student by an educational institution. For each of the categories, rate the facilities provided by your institution in terms of their adequacy for meeting your needs.

Mark "1" beside the alternative if the facilities are completely adequate for your needs

Mark "2" if the facilities are good, but could be improved

Mark "3" if the facilities are not adequate for your needs

59. ___ Sports and recreation facilities.

60. ___ Cafeterias, student common areas.

61. ___ Opportunities for special interest groups, clubs.

62.___ Opportunities for student government.

63.___ Library facilities for study, research.

64.___ Classrooms, laboratories.

65.___ Study areas other than library.

Do you have any important needs that are not being met at present that you feel should be provided for in some way by this institution? If so, what are they? _____

_____

_____

66. What do you plan to do as soon as you finish your studies at this institution?

   ☐ (1) Other studies

   ☐ (2) Work

   ☐ (3) Travel

   ☐ (4) Housekeeping

   ☐ (5) Other

   ☐ (6) Don't know

67. Do you plan to continue your studies sometime in the future (after you finish your present program)?

   ☐ (1) Definitely yes

   ☐ (2) Probably yes

   ☐ (3) Probably not

   ☐ (4) Definitely not

   ☐ (5) Don't know

68. In the following choose the group which best describes the type of work in which you think you will be engaged upon completion of your present course of study.

   ☐ (1) Self-employed farmer

   ☐ (2) Teacher, nurse, social worker, clergy

   ☐ (3) Doctor, lawyer, engineer, or other professional

   ☐ (4) Craft trade (e g., carpenter, seamstress, bricklayer, baker, etc.)

   ☐ (5) Labourer

   ☐ (6) Office worker (government or private)

   ☐ (7) Managerial

   ☐ (8) Self-employed (industrial or commercial)

   ☐ (9) Have not yet decided

69. Make an estimate of what you believe will be your annual income level upon completion of your present course of study.

   ☐ (1) $3,000 - $4,999

   ☐ (2) $5,000 - $6,999

   ☐ (3) $7,000 - $9,999

   ☐ (4) $10,000 - $14,999

   ☐ (5) $15,000 or over

70. Which one of the following has been or will be most important to you in your choice of a career or occupation?

   ☐ (1) It is an area that will expand greatly in the near future

   ☐ (2) The work is very interesting to me

   ☐ (3) It is a well-paid profession

   ☐ (4) It is a profession with a great deal of social prestige

   ☐ (5) It provides opportunity to be of service to others

   ☐ (6) I will have a lot of free time

   ☐ (7) I will have a secure job

   ☐ (8) It will give me freedom to work as I wish

   ☐ (9) Other reasons (please specify) _____

   _____

71. To the best of your knowledge, how available are jobs in your area of specialization (now, and for the foreseeable future)?

   ☐ (1) There is a surplus of jobs, could have my choice of a number of jobs

   ☐ (2) Jobs are readily available; should not have too much difficulty in finding a job

   ☐ (3) Not too many jobs available; may have some difficulty finding a job

   ☐ (4) Jobs are scarce; may have great difficulty finding a job

72. In general, do you feel that the specializations offered by your institution are adequately preparing students to enter the labor force?

   ☐ (1) Yes

   ☐ (2) No

   ☐ (3) Don't know

From the following, choose two things that you expect will be most important to you in the future.

   (1) Career and occupation

   (2) Religious beliefs or attitudes

   (3) Marriage, relationship with my husband (wife)

   (4) Being a parent, relationship with my children

   (5) The world of ideas, the intellectual life

   (6) Friendships

   (7) Participation as a citizen in the affairs of my community

   (8) The world of art and music, the aesthetic life

   (9) Games and sports

73. First choice ___

74. Second choice ___

75. Would you be willing (at some time in the near future) to be interviewed in greater depth regarding your needs and motivations with respect to post-secondary education?

   ☐ (1) Yes

   ☐ (2) No

APPENDIX D

Need Systems

NEED SYSTEMS   - Malinowski

MALINOWSKI - Functional imperatives, needs both individual and social.

1.. Organic Needs of the Individual

    a. metabolism
    b. reproduction
    c. bodily comforts
    d. safety
    e. movement
    f. growth
    g. health

2. Instrumental Needs of Society

    a. economic
    b. social control
    c. education
    d. political organization

3. Integrative Needs of Society

    a. artifacts
    b. techniques
    c. organization
    d. symbolism

4. Recreative Needs of Individual and Social Group

    a. physical reactions to rhythm, sound, color, line and form
    b. manual skills and perfection in technology
    c. religion, magic, mysticism

<u>MASLOW</u> - Hierarchy of Needs

1. Physiological Needs

2. Safety Needs

   a. protection from illness
   b. predictable, orderly world
   c. protection from unmanageable, unfamiliar, strange stimuli

3. Love Needs - separate from sexual needs (physiological)

4. Esteem Needs

   - self-esteem and esteem of others

   a. desire for strength, achievement, adequacy, confidence
      in the face of the world, and for independence and freedom

   b. desire for reputation or respect, recognition, attention,
      importance or appreciation

5. Need for Self-Actualization

   - "what a man <u>can</u> be, he <u>must</u> be"

6. Need and Desire to Know and Understand

MURRAY - List of Needs

1. abasement - surrender, comply

2. achievement - overcome obstacles

3. acquisition - gain possessions, property

4. affiliation - form friendships

5. aggression - assault or injure (not necessarily physically)

6. autonomy - resist influence, coercion

7. blamavoidance - to Le well-behaved

8. counteraction - refuse admission to defeat

9. cognizance - explore, ask questions

10. construction - organize and build

11. deference - admire, follow a superior

12. defendence - defend against blam or belittlement

13. dominance - influence or control others

14. exhibition - attract attention to oneself

15. exposition - point and demonstrate

16. harmavoidance - avoid pain, illness, injury, death

17. infavoidance - avoid failure, shame

18. nurturance - nourish, aid, protect the helpless

19. order - betidy, organize

20. play - relax, amuse oneself

21. rejection - snub, ignore or exclude

22. retention - of things

23. sentience - seek and enjoy sensuous impressions

24. sex - erotic relationships

25. succorance - seek aid or protection

26. superiority - composite or achievement and recognition

27. understanding - analyze, discriminate, define, synthesize
