ABSTRACT

DISISS (Design of Information Systems in the Social Sciences) is a research project based at the University of Bath. The objective of the project is to carry out research necessary for the effective design of information systems in the social sciences, whether by the creation of new systems or the modification of existing systems. Analysis of citations in monographs is necessary as a check on the lists of "core" journals provided by analysis of citations in journals, and as a means of identifying particular titles, authors and categories of monograph likely to be in heavy demand or of special importance. The study described in this working paper is designed to identify the main characteristics of citations in social science monographs and other non-serial literature. This paper describes the objectives, methods and preliminary analyses associated with the study. The citation data is taken from social science monograph sources drawn at random from the British, American, French and German book outputs in 1951, 1961, and 1971. This study of citations in monographs complements the data already collected from social science journal sources; comparative analyses are made on the two data files. (Author/NH)

PREFACE

This working paper is the result of the joint efforts of members of the DISISS team. The paper was drafted by Mr. Roberts with assistance from Mr. Brittain and Miss Skelton. Mr. Line read through the various draft versions of the paper making many helpful comments, supplying additional material, and proof-reading. Other help was given by Mr. Bradshaw, Mr. Nicholas and Miss Ritchie.

The members of the DISISS team are as follows:

Project Head:	M.B. Line
Senior Research Fellow:	J.M. Brittain
Research Fellow:	S.A. Roberts
Assistant Research Officer:	Miss B. Skelton
Programmer/Analyst:	R.G. Bradshaw Mrs. C. Arms (part-time)
Consultant Systems Analyst:	W.Y. Arms, Lecturer in Mathematics, Open University

Members of staff of the Polytechnic of North London, School of Librarianship, associated with DISISS are as follows:

Research Assistant:	D. Nicholas
Research Assistant:	Miss M. Ritchie
Lecturer at PNL:	Mrs. P. Layzell Ward

1.0 INTRODUCTION

DISISS (Design of Information Systems in the Social Sciences) is a research project based at the University of Bath. The objective of the project is to carry out research necessary for the effective design of information systems in the social sciences, whether by the creation of new systems or the modification of existing systems. The project, which is financed by OSTI, commenced in January 1971 and will run until the end of 1973. A substantial part of the research is concerned with the size and structure of the primary and secondary literature, and in this the counting and analysis of citations play an important role.

While much work has been done on citations in journals, particularly with the aim of identifying "core" journals, very little work has been done on citations in monographs. This is necessary as a check on the lists of "core" journals provided by analysis of citations in journals, and as a means of identifying particular titles, authors and categories of monograph likely to be in heavy demand or of special importance. Studies of this kind provide moreover information on the use of literature in foreign languages, on obsolescence, and on subject scatter - all important factors in information system design.

The preliminary work on counting of citations in social science monographs is reported below. Work on other parts of the Project has been reported in a number of working papers which are listed in Appendix F. These working papers, together with an outline of the work carried out in 1971, can be obtained from the Library, University of Bath.

The study described in this working paper is designed to identify the main characteristics of citations in social science monographs and other non-serial literature. This paper describes the objectives, methods and preliminary analyses associated with the study. The citation data is taken from social science monograph sources drawn at random from the British, American, French and German book outputs in 1951, 1961 and 1971. This study of citations in monographs complements the data already collected from social science journal sources; comparative analyses will be made on the two data files.

1.1 Definition of monographs

AACR 1967 defines "monograph" as a "non-serial publication¹, either complete in one volume or intended to be completed in a finite number of volumes²".

Various dictionary definitions of "monograph" would appear to exclude some categories of publication, such as many government publications³, conference proceedings and reports, but for the purpose of this paper "monograph" is held to include all non-serial publications, with the exception of report literature (which in the strict sense of technical report literature is not listed in the bibliographies chosen as sampling frames in this study).

Monographs can for convenience be divided into two sub-categories:

(i) Scholarly monographs.

A treatise on a single aspect of a subject; usually a single volume or definite number of volumes dealing systematically and in detail with one single subject⁴. Precise definition is difficult in this case, but in the main, scholarly publications usually involving sustained research work in their preparation are included in this category.

¹The Anglo-American Cataloguing Rules (1967) provide a working definition of serials as follows: "a publication issued in successive parts bearing numerical or chronological designations and intended to be continued indefinitely. Serials include periodicals (e.g. newspapers, journals and the memoirs, proceedings, transactions, etc., of societies), and numbered monographic series". Simply by definition, non-serials are taken as those publications which do not fall into the class of serials.

²Anglo-American Cataloguing Rules (British text). London, The Library Association, 1967, pp.267-268.

³In fact, the sampling frames used have very poor coverage of government publications, so that although they are not excluded deliberately for the purpose of this study, they are by no means fully represented.

⁴Laundau, T. Encyclopaedia of librarianship. London, Bowes and Bowes, 1966, with minor modification.

(ii) Other non-serial publications.

In the present study, excluding technical report literature (and many government publications: see above).

These sub-categories are required as a basis for the classification of source monographs. Scholarly monographs and other types of monograph are likely to have different citation characteristics and the observed differences will be taken into account in the analyses of citation data; citation records will be tagged accordingly by form and subject (see section 2.3).

1.2 Objectives of study

The main uses to which the data obtained will be put are:

(a) A description of the characteristics of citations in monographs.

The parameters considered include date of publication, country of publication, subject and the proportion of citations to serials, monographs, and other forms of material, for example archives, unpublished sources, reports, etc. Using data on these parameters, an attempt will be made to identify the pattern and structure of citation in social science monographs.

(b) A comparison of the characteristics of citations in monographs and serials using the data on the parameters in (a) above and data from citation files based on journal sources (DISISS, Science Citation Index).

(c) Comparisons of the characteristics of citations from social science monograph sources in 1951, 1961 and 1971.

(d) Assessment of the role of the monograph literature in the social sciences, and the part it plays in the accumulation and transfer of knowledge, by making a study of:

- (i) most frequently cited authors and monograph titles
- (ii) the distribution and structure of citations across and between social science and other subjects
- (iii) the obsolescence rate of monographs measured by the dates of publication of cited monographs
- (iv) citations from English, French and German language monograph sources and comparisons of the patterns observed.

(e) The relationships between citation characteristics, citation behaviour¹ and the size of the literature base. Citation data and bibliometric data on the size and growth of the literature can be related to each other; citation characteristics (for example, the subject scatter of citations, the form of citations) and the size of the literature base may not be related, and this may be due to the concentration of citations, for example, on "core" journals, accompanied by relatively low frequency of citation to, but significant use of, a large non-serial literature, for example, handbooks, reference sources, unpublished materials, ephemeral publications and reports, which do not contribute to the citation pattern. Use of literature is related to both citation and size characteristics and could be studied by taking account of data on library use, inter-library loan requests, and book borrowings.

(f) Application of clustering techniques to citations in monographs. Some of the citation data from social science monograph sources is suitable for the application of citation clustering techniques. Citations to journals can be clustered just as citations to journals from journal sources can be; however a monograph source is less able to generate comparable densities of citation than journal sources and for effective clustering some grouping of monograph sources may be necessary. Theoretically, it is possible to cluster citations to monographs from monograph sources and this will be attempted if suitable data results from the citation analyses.

1.3 Scope of studies

About 15,000 citation records will be collected from social science source monographs published in 1951, 1961 and 1971. The sampling frames for source monographs are: British monographs (British National Bibliography), United States monographs (American Book Publishing Record), French monographs (Bibliographie de la France), and German monographs (Deutsche Bibliographie and/or Deutsche Nationalbibliographie).

The number of source monographs from each country and date is shown in Table 1. To ensure that the various parametric analyses are valid it was felt

¹Citation behaviour refers here to the motivation for and activity of citing by authors. No reliable data exists to feed in to the analyses proposed in this study, but note will be taken of the hypotheses which exist and an attempt made to explain citation practice, ethics, etc.

desirable to collect at least 1,000 citations in each of the main categories. In each source monograph every 10th citation is recorded; in order to obtain at least 1,000 citations in each category a minimum of 65 sources are required in each category, given that, on average, a monograph source contains 150 citations¹.

In collecting citation data with fairly limited resources, it has been decided to concentrate on breadth of coverage from a large number of sources, rather than collect a greater number of citations from fewer sources. A broad based citation collection should give a more valid picture of citation characteristics, covering more or less the whole field of the social sciences.

The table shows that greater coverage is given to English language sources in 1971, and for all sources in 1971, compared with earlier periods: this should enable more detailed results to be obtained for the most recent period. Fewer French and German sources are taken in view of potential difficulties in obtaining copies.

Table 1. Distribution of source monographs (number of source items).

Year	English language		French	German	TOTAL
	British	United States			
1951	65	65	65	65	260
1961	65	65	65	65	260
1971	150	150	100	100	500
Total	280	280	230	230	1020

¹A pilot test on social science monographs gave an average of 180 citations per source; the values for the range were between 0 and 556. An average value of 150 citations per source has been used in calculations of number of sources required.

2.0 DATA COLLECTION

2.1 Sample of source monographs

The first stage of the study consists of collection of citations from British and American social science monographs published in 1971 and chosen by random sampling. The two samples drawn so far list 150 or more monograph items in each; additional titles have been collected in excess of the values in Table 1, to allow for such contingencies as further rejection of items on inspection, due to deficiencies in form, content, audience level characteristics and unavailability.

The British sample for 1971 is listed in Appendix A, and the United States sample in Appendix B. An analysis of the samples is presented in Appendices C and D.

2.1.1 British monographs

The sampling frame used is the British National Bibliography (1971). British National Bibliography (BNB) attempts to list every new work published in the British Isles, using material received by the Agent for the Copyright Libraries. BNB provides the most comprehensive¹ listing of monographs published in Britain gathered into one source book. Very few categories of publication are excluded (for example, periodicals, except for the first issue, and first issue under a new title; music; maps; most government publications¹; and publications without a British imprint, except those published in the Republic of Ireland).

Material in the BNB is classified by the Dewey Decimal classification, and for the purpose of this study the sources are drawn from the following classes, which contain the bulk of material relevant to the social sciences²: classes 150-159, 300-339, 350-354, 360-365, 370-399, 400-419, 572, 614, 658, 711-719, 900-912, 914-919, 940-999.

¹An estimated 10 per cent of British government publications are listed, including the most significant HMSO publications. More detail is given in the Preface of the annual cumulation of the BNB.

²A full list of subject headings is given in Appendix C.

In drawing the sample the entire sampling frame (the relevant classes stated in the preceding paragraph) has been used. The sampling procedure was as follows: the number of entries in the social science classes was counted (about 10,580 in all, including some which were eventually rejected, because of duplication and other reasons mentioned below). Although only 150 items were required for the final source list, nearer 300 items were drawn at random from 10,580. The sample was drawn and examined, and non-relevant items were rejected. The entries were recorded on index cards and form part of a master list of source monographs, containing bibliographic details about each source item.

The 1971 BNB used as a sampling frame consisted of two four-monthly cumulations and 13 weekly parts, since the annual volume was not published in time for the study. Entries in each of the 15 sections are in full classified sequence. This arrangement makes no difference to the random sample drawn and in the drawing procedure the entries are treated as one sequence.

Two main reasons for rejecting material from the sample drawn were (i) the form of certain items, and (ii) the effect of time lag in entry. Entries referring to new serial publications, changes in serial titles, juvenile works and certain annuals and irregular serials were rejected. Decisions as to which categories to exclude were made with some difficulty. It was finally decided to exclude certain categories of monograph in the sample: for example reprints, facsimile reprints, "readings", some collections of essays, most conference proceedings, most biographical works and "personal" observations¹, school texts and works published in more than one place (of which one is in the UK) at different dates.

New translations into English, new editions, published lectures², a number of biographical works³ and new editions or works published simultaneously in the UK and other countries in 1971 were retained in the sample.

¹This category includes "first-hand" accounts, memoirs, reminiscences and popular autobiographies.

²Mainly individual lectures (e.g. inaugural lectures) and published lecture series.

³A distinction is made between popular and scholarly biographical works; on the whole the former are excluded and the latter included.

The effect of time lag in entry must be taken into account. The 1971 BNB contains a fairly large proportion of entries relating to 1970, and any of these drawn in the random sampling were rejected. In order to state that the sampling frame consisted of all 1971 imprints listed in BNB it would be necessary to draw items from both the 1971 and 1972 issues of BNB; it would be possible to extend the sampling to include 1971 imprints listed in 1972, although this is not planned at present.

One additional problem was created by added entries. In the 1971 BNB any item can be recorded with several added entries under different class numbers. Before 1971 added entries were unnumbered in BNB, so they could be identified easily and excluded from the sampling frame. It is necessary to know the total number of items in the frame when drawing numbers from a table of random digits. It was not considered worthwhile making the extra effort to distinguish added entries, and any duplicate items have been rejected from the final sample as they occurred.

2.1.2 United States monographs

The sampling frame used is the American Book Publishing Record (ABPR) (1971). The classification is based on the Dewey Decimal classification, and with only minor adjustments can be made compatible with 1971 BNB.

The physical arrangement of ABPR is virtually the same as BNB; as no annual cumulation is yet available the sample was drawn from twelve monthly issues. The sampling procedures, types of item rejected and problems encountered are similar to those already mentioned for BNB.

2.1.3 Non-English monographs

If resources allow, citations will be collected from some French and German language monographs. The possible sampling frames are being evaluated, but sampling procedures similar to those described earlier should be applicable. Bibliographie de la France and Deutsche Bibliographie and/or Deutsche Nationalbibliographie should provide suitable sampling frames.

2.2 Sampling citations

Every 10th citation will be collected from each source monograph; this was

felt to be the most convenient method of collecting citations and is considerably easier than random sampling of citations, which involves a good deal more clerical and administrative effort.

Taking every 10th citation over approximately 1,000 sources, and generating some 15,000 citations in the process, should provide ample and valid data for analyses (section 3.0). The sampling interval is wide enough to overcome any effect of order and location of citations on sampling. Interval sampling is a pseudo-random method quite adequate for the study.

Within monographs, citations can be found in a great variety of places (separate bibliography, end of each chapter, text, footnote) and arrangements (numerical, classified, alphabetical); this however should have no effect on the sampling of citations. By taking every nth citation, the number of citations sampled is proportional to the total number of citations in the monograph. Where the nth citation occurs on a multiple reference (indicated by *ibid.*, *op. cit.*, etc.) the interval rule is relaxed and the next full citation taken; subsequent counting follows the original interval; this procedure was adopted for convenience and to ensure that every citation collected is unique.

The citation record is the same as used for citation studies involving journal sources. Data collection record cards are reproduced in Appendix C. Two modifications have been made: field(8) is replaced by a two letter code for the country of origin and field (9) by a two letter code for subject content. After modification the record format for citations from monograph sources consists of the following fields:

- (1) Record number
- (2) Source code (Year, volume and page number omitted when citation taken from a monograph source)
- (3) Authors of source item
- (4) Authors of cited item
- (5) Title of cited document
- (6) Form of cited document
- (7) Year of publication of cited document (In data collection this is normally the date of edition cited)
- (8) Country of origin
- (9) Subject content

When a citation refers to a serial publication the top left-hand corner of the data collection card is removed, and data fields (8) and (9) refer to volume number of cited document and page numbers of cited items respectively.

Pilot tests have been made to determine the accuracy of judgement for country and subject coding and to estimate the time taken and effectiveness of editing and checking. Adequate subject coding is most difficult to achieve; it requires bibliographical checking which is very time consuming.

The subject coding given to both source monographs and cited monographs (field 9) cannot be assigned with complete objectivity. The coding used for the citations is a broad classification of the social sciences by major disciplines. The source monographs are pre-coded by the schemes used in the sampling frames (Dewey Decimal classification or broad subject terms); in particular, topography and history are given special recognition, whilst government publications are also separated.

3.0 ANALYSIS

3.1 Types of analysis

The data is suitable for input to a machine readable file. Manual analysis will supplement the computer output. Data on citations to both monographs and serials is used in the analysis.

Analyses include:

(a) Calculation of the percentage of citations accounted for by monographs and serials. In view of the variety of source monographs used, some source types, for example, topography, history, government publications and scholarly monographs are tagged so that variations in characteristics of citation between sources can be identified in the analyses.

(b) Compilation of a ranked list of cited journals from monograph sources. Comparison of ranked list with similar lists generated from journal sources.

(c) Identification of the most frequently cited monographs and authors.

(d) Measures of the characteristics of citations based on:

(i) date of publication of cited monographs. Calculation of median citation age and half life of a sample of citations. In some cases the original date of publication will be hard to establish. Pilot studies have shown that checking and tracing date is a time consuming bibliographical task. Where later editions are involved, the date of edition cited will normally be used.

(ii) country of origin and subject classification of cited monographs. Attempts will be made to rank citations to monographs by subject, place of publication and country of origin; and, although crude, the results may show patterns relating to the different types of source monograph.

(iii) relating citations to monographs to bibliometric data on size, subject and geographical distribution of monograph literature.

(e) Comparison of measures based on (d) (i), (ii) and (iii) with citations to monographs and journals in journal sources.

(f) Comparisons of the characteristics of citations from journal and monograph sources over time periods 1950/51, 1960/61 and 1970/71. (Data from journal sources was collected for 1950, 1960 and 1970 and from monograph sources for 1951, 1961 and 1971).

(g) Application of clustering techniques to citation data from monograph sources may be attempted. Citations from monographs to journals and monographs to monographs can be used. Technical difficulties involving the density of citations and grouping of sources will need solving before reliable results can be expected.

APPENDIX A

Source sample of British monographs, 1971

The titles listed below were selected from the British National Bibliography (1971) according to the criteria given in section 2.1.1. Classification is taken from the 18th edition of the Dewey Decimal Classification.

Advisory group on shipbuilding on the Upper Clyde Report of the Advisory Group	338.4'7'62382009414
An aid to pedestrian movement	711'.7'0942132
Ankerman, R.C. Approaches to beginning reading	372.4'14
Appleton, Ted Hitch-hikers guide to Europe	914'.04'55
