AESTRACT
The 1973 report evaluates the Bilingual Education
Program of Harlandale Independent School District. The bilingual program is designed for Spanish speaking pupils in grades K-5 (1,517 children in 8 of the district's 15 elementary schools) who have limited English-speaking ability. The $1972-73$ project involved (1) development and revision of curriculum materials; (2) bilingual instruction in $K-5$; (3) preservice and inservice training of bilingual teachers and aides; (4) supervision of bilingual student teachers and student interns; (5) involvement of bilingual parents in their children's education; (6) increased community support for bilingual education; and (7) coordination of the cooperative efforts of 2 school districts and a teacher-training institution--Harlandale Independent School District, San Marcos Independent School District, and Southwast Texas State University. The 31 tables give results of tests used to evaluate the bilingual program--e.g., Peabody Picture Vocabulary Tests, Metropolitan Achievement Test, Prueba de Lectura, BEP Test in Social Studies and Science, Allocation of Time in Language Teaching (English and Spanish), and Inferred Self-Concept Scores. Eight recommendations are also included--e.g., the coordinator should emphasize to teachers the need to develop both English and spanish reading comprehension. (For related documents, see RC 007 267. 268.) (FF)

Although this program comprises two public school districts, Harlandale and San Marcos, and a university, Southwest Texas State University, separate evaluations are being performed for the two school districts this year in accordance with the changed U.S.O.E. directive Therefore, this report deals only with the Bilingual Education Program of Harlandale Indeperdent School District. There the program is primarily designed to provide bilingual education for Spanish-surnamed pupils in grades $\mathrm{K}-5$ who have Ilmited English-speaking ability. Objectives for these children are the following: (1) to reduce their educational deficit by instructing them in Spanish while their command of English is being developed; (2) to enhance their understanding and cognitive development in both languages;
(3) to give them the advantage of becoming literate in both languages;
(4) to instill in them knowledge of and pride in their bicultural heritage. The project, during 1972-1973, involves (1) development of and revision of curriculum materials for bilingual classes, (2) bilingual instruction in grades $K-5$, (3) pre-service and in-service training of bilingual teachers and aides, (4) supervision of bilingual student teachers and sturent interns in the program, (5) greater involvement of parents of bilingual children in the education of their children, (6) increased puhlic support for bilingual education within the communities, and (7) coordination of the cooperative efforts of two school districts and a teacher-training institution (Harlandale Independent School District, San Marcos Independent School District, $a n d$ Southwest Texas State University.)

In the fifty-five classrooms involved with the program, there are 1517 children in grades $\mathrm{k}-5$ in eight of the district's fifteen elementary
schools. (See Table I.) Ninety-nine percent of these children have Spanish surnames. That a majority of the Spanish-surnamed children speak Spanish as the dominant home language has been established by questionnaires completed by parents in all previous years of the program. The majority of these children come from lower socio-economic homes.

The project is managed by a director and an evaluatur from Southwest Texas State University, a coordinator from the district, and a curriculum specialist. Harlandale acts as fiscal agent for the project. Although the director administers the project, major policies are determined by the Consortium. (See Appendix for Organizational Chart.)

A major change in the program is the assumption of financing for the second grade as well as the first by the local di:trict. Title VII is contributing funding for only kindergarten and grades $3-5$ this year. Since this means that $47 \%$ of the total program is now funded by the local district itself, this appears a strong manifestation of support for the bilingual education concept and a promise of hope for its future after federal funding ceases.

This year there has been a major change in management personnel. Last year's director, Mr. Carlos Rodriguez, resigned in order to devote full time to directing the bilingual-bicultural program at Southwest Texas State University (a program emphasizing teacher-training for bilingual education.) The new director, Mr. Rene Gonzalez, who began his work in July, has a broad teaching background and an excellent knowledge of the Spanish language and of Spanish-American culture. Mr. González is the first director who has been able to devote full time to the project, although the position has always been a full-time job. Having a director

who is able to devote all his energies to the project is a decided asset and has resulted in increased efficiency. The director has been responsible for efforts to enhance community involvement with bilingual education, also.

## Bilingual Instruction for Grades K-5

The federal guidelines this year which advised curtailing of evaluation to the instructional component will be adhered to and other components, such as staff development, will be dealt with only incidentally as they affect instruction. Again in accordance with federal directives, standardized tests form the backbone of the evaluation this year, and consequently, other local performance objectives have been eliminated from the design.

Testing, in bilingual classrooms has proceeded on schedule. In September and again in March the testing team, composed of junior and senior rank student interns in the program who operate on a work-study basis as they prepare themselves to be elementary bilingual teachers, administered the Peabody Picture Vocabulary Test to ail project pupils In kindergarten and first grade under the evaluator's supervision. Prior to testing they had received a thorough briefing from the evaluator. These student interns astablished good rapport with the pupils and did an excellent job of administering both a Spanish and an English version of the test (Form B of the Spanish version and Form $A$ of the English version in the fall and the converse in the spring) to each pupil individually.* The advantages of such individualized testing on these two
*The Spanish versions were translated by a specialist in regional and standard Spanish. Gopies are foundin tie Appeniix. Information for obtaining copies is found in the Appendix.
gradc levels is immense. Following administration, the testing team scored the tests. Immediate feedback in terms of mental age was given teachers by the evaluator.

The scores for Peabody tests and scores for all other cvaluation instruments administered are put on cards and electronically processed. All evaluation instruments are scored by the student interns under the evaluator's supervision. As soon as possible the evaluator sends feedback on these scores to project teachers in order to aid them indagasing pupil weaknesses and beginning corrective action.

Grade level means were derived from fall leabody scores in the following manner: pupils whose scores on the two language versions were no further than five months apart were considered balanced bilinguals, and means were derived on both languages for this group; those pupils whose scores differed six months or more on the two languages were considered dominant in one language, and means were derived only for the dominant language for these pupils. These means and the means for 1971-1972 are presented in Table II. Both sets of figures present significant evidence as to the nature of the handicap the children in this project area bring with them upon entering school--a vital concept deficit. The balanced bilinguals are the most handicapped in concept development, being between two and three years behind in each language. The Spanish-dominant are quite handicapped too, being between one and two years behind. The Englishdominant bilinguals are less handicapped, being slightly more than one year behind. The deficit in concont development increases from kindergarten to first grade. The need for teachers to implement extensive measures to reduce this deficit is apparent. The figures from last year's evaluation

PEABODY PICTURE VCCABULARY TESTS*
FALL GRADE LEVEL MEANS
(These figures show mental age in months.)

| Grade/Year | English <br> Dominant | Spanish <br> Dominant | Balanced Bilingual <br> English | Spanish |
| :--- | :---: | :---: | :---: | :---: |
| K/1972-73 | 55 | 50 | 40 | 41 |
| Lst/1971-72 | 53 | 53 | 42 | 42 |
| Lst/1972-73 | 62 | 59 | 49 | 49 |

*Pupils who have less than six months difference in mental age between Erglish and Spanish scores are considered bilanced bilinguals, and both lancuage scores are used. Pupils whose scores in English and Spanish differ as much as 6 months are considered dominant in one language, and only the score for the dominant language is used.
and the necessity for taking corrective measures during this year were stressed in pre-service training by the evaluator.

From the fall Peabody scores, senarate means were derived for this year's first frade pupils who had been in bilingual kindergarten classrooms and for those who had been in nonbilingual kindergarten classrooms last year as well as for those who had not been in kindergarten at all. (These scores are shown on Tatle III.) These pupils are enrolled at Collier, a the only schnol having/Title VII tilinguni kindergarten last ycar. Fortythree pupils are in olved in ail. Those pupils who had been in the bilingual kindergarten were ahead of the other two groups from nine to eighteen months in English and eleven months in Spanish. This not only represents a very real accomplishment by the bilingual kindergarter. of last year but also indicates the validity of the bilingual kindergarten program for reducing the concept deficit suffered by these children when entering school.

Comparison of fall and spring Peabody scores of pupils in kindergarten reveals that $64 \%$ met the objective of the six month gain expectable between September and March in English but only $38 \%$ in Spanish. Again, 64\% of first grade pupils accomplished the objective in English, and 46\% succeeded in Spanish. Differences in percentages of pupils accomplishing the objective vary as much as $58 \%$ between specific classrooms. (Sce Table IV.)

Analysis of mean increase on Peabody scores (shown on Table V) is even more revealing: a gratifying approximate ten month gain in English for both grade levels, a satisfactory almost 6 month gain in Spanisin for first grade but only a 3.42 gain for kindergarten. This last figure is caused by three of the six kindergarten classrooms. Variation in mean

A COMPARISON OF BILINGUAL VS. NONBILINGUAL KINDERGARTEN CONCEPT DEVELOPMENT: FALL PEABODY FIRST GRADE MEANS FOR PUPILS FROM LAST YEAR'S KINDERGARTEN

|  | English | Spanish |
| :--- | :---: | :---: |

*Six months intervened between September pre-test and March post-test.
gains between classrooms runs from a -2.56 to a +11.37 in Spanish and from a +1.24 to $a+18.80$ in English. It is recommended that the coordinator take a very close look at this table, determine which teachers need help in teaching concepts in which language, and then work with these teachers to improve teaching of concept development next year because this vitally important area should not be neglected.

Determination of interquartiles and medians for fall and spring scores (Table VI) shows that whereas only the highest quartile on each grade level made better than satisfactory gains in Spanish, all quartiles shared in good to excellent gains in English. Overall, analysis of the Peabody scores shows that teachers in this project are successfully working to remedy the concept deficit (previously mentioned) that these children suffer upan entering school.

The 仵tropolitan Readiness Test, Form $A$, was given in kindergarten by the teachers in March. The kindergarten objective was that nalf of the pupils should reach the 40 th percentile. This percentile rather than the 50 th was picked because the test was given more than nine weeks before the end of school, and $25 \%$ of the school term remained. Sixty percent of the pupils reached this objective (See Table VJ.I) in spite of extremely low performance by two classrooms. Interquartiles whicll were computed for this test (Table XIXI) reveal that more than three-fourths of the purils performed above the 26th percentile; more than half, above the 48 th and one fourth, above the 77 th . This is a praiseworthy accomplishment by the rajority of the kindergarten teackers.

Metropolitan Achievement Tests, Primary I A, were administered by first grade teachers in March. (See Table VIII for results.) nverall,

LANGUAGE

better than $60 \%$ of the pupils attained the 1.6 grade equivalent objective (expectable for half the pupils) in all four categories, with percentages in word discrimination being somewhat lower and in math being somewhat higher. Interquartiles were computed and reveal that medians were approximately at the 1.6 level in all categories. (See Table XIV.) This is an excellent accomplishment by first grade teachers.

Teachers in grades 2-5 administered Form A of the appropriate Metropolitan Achievement Test in September and Form B in March. The objective was that half of the pupils should attain the 6 month gain in grade equivalent expectable between fall and spring testing. (See Tables IX - XII.) In second grade more than half attained the objective in word discrimination and in math, but only $34 \%$ and $29 \%$ succeeded in word knowledge and reading comprehension, respectively. Approximately one-half of the third graders succeeded in word discrimination, math computation, and language; however, percentages in reading comprehension (34\%), word knowledge (28\%), and problem-solving/concepts (20\%) range from $16 \%$ to $30 \%$ below expectations. Slightly less than one-half of the fourth graders succeeded in language and math computation; slightly more than one-third attained the objective in word knowledge, reading, and word discrimination; but only $22 \%$ did so in problem-solving. Close to half of the fifth-graders accomplished the objective in reading comprehension, language, and math computation; only about $35 \%$ were successful in the other four areas (word knowledge, social studies, science and problem-solving.) Generally speaking, amount of gain in the areas of word discrimination, language and math computation is good.

Metropolitan interquartiles and medians were computed for grade levels 2-5 and are shown on Tables XV-XVIII. Again as in prevdous years,
medians in word discrimination, math computation, and language usually run higher than those in word knowledge, reading comprehension, and math problemsolving/concepts. In second grade medians are even with national norms in grade equivalant in two areas and five months behind in the other two areas. As the grade level progresses upward, grade equivalent scores fall further behind until scores in fifth grade fall from one year to a year and a half behind, depending on the subject matter area. However, it must be borne in mind that no achievement test on the market at this time is constructer? for or is normed for the pupil population represented in this project. Comparison of quartile scores with percentages of pupils fulfilling the objectives on the Metropolitan at all grade levels is suggestive. There is a large variability between classrooms as to the percentage of pupil success. Also a large variability exists between classrooms as to the area(s) of pupil success. It is recommended that the coordinator take a very careful comparative look at percentages of success for the teachers at each grade level. Then teachers whose pupils did unusually well in specific areas could be consulted with in an effort to determine reasons for their expertise and to lead to a sharing of this expertise with their fellow teachers. Teachers whose pupils performed very poorly (in the problem areas, in particular) should be counseled with and possibly even directed to college course work which might serve to alleviate their shortcomings. Additional observations based on the classroom allocation of time observed by the coordinator will be discussed further on in this report.

In September and again in March teachers administered the InterAmericana Spanish reading test, the Prueba de Lectura, Form CEs in the fall and Form DEs in the spring. Level 1 of the test was given in second grade, level 2 in third grade and level 3 in fourth and fifth grades. This is a
rather difficult test, but it was the only one available at the commencement of this project and is still used so that a longitudinal study can be possible next year, which is the last year of the project.

Only raw scores are available for this test. Total possible raw scores on vocabulary and comprehension for second grade are 40 and 40 ; for third grade, 40 and 70 ; for fourth and fifth grade, 45 and 80 . The objective of a gain in raw score in vocabulary and in reading comprehension betmeen fall and spring was fulfilled by better than $50 \%$ of the pupils on all grade levels in all but ten instances. (See Table XIX.) Nine of these instances were on fourth and fifth grade levels, and seven of the ten were in the area of reading comprehension.

The tables showing fall and spring means and standard deviations (XXI) and mean increases in scores (XX) are more revealing as to difference in performance between classrooms. Scores vary from a -2.88 to a $\pm 18.31$. Good improvement is evident in a majority of the classrooms on second and third grade levels and in half of the fourth grade classrooms. Only one fifth grade classroom shows substantial improvement. -Again the variability in scores indicates that the coordinator should take a careful look at this table, determine which teachers are failing to help their pupils achieve significant success in this area and arrange that remedial measures be instituted, whether these be college coursework, in-service training or personal conferences.

In order to compensate for the lack of inclusion of social studies and salence on the Metropolitan in grades 1-4, those particular portions (previously, validity and reliability on these portions had been established) of the locally-developed Bilingual Education Program test were administered In grades 2-4 in September by project teachers and in grades 1-4 in March.

inalf of the classrooms were given the English version of the test; half vere given the Spanish version. (Copies of both versions are found in the appendix.)

Data is in raw scores, with total possible scores being 10 in each area for first grade, 20 for second, 30 for third, and 40 for four Li.. The objnctive for first grade pupils was to attain $60 \%$ correct in each area and for grades 2-4 an increase between fall and spring scores in both areas. From $48 \%$ to $100 \%$ of the pupils in first grade classrooms attained the cijective. Overall, better than $90 \%$ of these pupils attained the objective. Approximately two-thirds of the pupils in grades $2-4$ attained the objective with only four exceptions. (See Table XXII.)

In order tc ascertain whether accomplishment would be higher in English or in Spanish, means and standard deviations were derived for fall and spring scores (see Table XXIV), and mean increases between fall and $\operatorname{sprin}_{f}$ were computed for : : . $:$ pupils in grades 2-4 (see Table XXIII.) Difference between performance in Spanish and in English is small except for fourth grade level, where spring means reflect a higher increase in both social studies and science on the Spanish version of the test. This is a mitter of interest, and an effort will be made to explore this subject further next year. Again half of the classrooms will be given the test in English and half in Spanish. A t-test will be run to determine whether or not differences are significant.

In the course of thefr classroom observatirns during the year the coordinator and, to a lesser extent, the curriculum specialist as well filled out forms indicating the amount of time spent in each language in the subject areas of math, social studies and science. In addition, the forn provided

for a stipulation as to amount of time spent on each aspect of the language arts when English or Spanish were being taught. (A copy of the form is found in the appendix.) The data gathered from these forms appears in Tables XXV, XXVI and XXVII. Examination of the data reveals the following significant facts in relationship to 亡est results:

1) Fifty percent or more teaching in the areas of math, social studies and science was done in Spanish. Therefore, it is not surprising that scores on the Spanish version of the local test were as high as or Even slightly higher than those on the English version.
2) In English teaching a great deal of time was spent on spelling and phonics, as much as or more than that spent on reading comprehension. That fact is reflected in the poor results on the reading and problem-solving (which requires reading) portions of the Metropolitan tests.
3) In English teaching the additional concentration on vocabulary/ concept development is reflected in good results for the Peaboly tests and In improved results over last year for the word knowledge portion of the Metropolitan.
4) In Spanish concentration on sounds in oral language teaching and excessive expenditure of time on phonics and spelling (a great deal more than is spent on reading comprehension) is reflected to a certain extent by. Peabody results and to a greater extent ty Prueba results, especially those failures on fourth and fifth grade levels. It is recommended that the coordinator take extensive steps to assure that this situation is corrected, for the good of the program. One of these steps quite definitely should involve elimination of $\therefore \quad . \quad$ cuadernos for: pupils ${ }^{\circ}$ use beyond second grade level and provision of cuadernos for teachers' use, only for remedial measures, beyond second grade level.

Project teachers filled out inferred self-concept scales* for each pupil in their classrooms in October and again in April. The scale consists of thirty items and is based on an ordinal scale continuum from 1 to 5. Research with lower socio-economic level pupils in the traditional school program (which had been done by Dr. McDaniel in 1968-1969) indicated a decrease in self-concept for pupils during the school year and a succeedingly lower self-concept level in each progressively higher grade level. Due to measures designed to create a more positive self-image in pupils being implemented by teachers, an increase between fall and spring scores was predicted for the pupils in this project. In $64 \%$ of the classrooms $50 \%$ or more of the pupils made a gain. (See Table XXVIII.) In addition, taere was a mean increase between fall and spring scores on every grade level but one, kindergarten. (See Table XXIX.) This presents creditable evidence that the bilingual education program is indeed helping many Spanish-surnamed pupils to achieve a more positive self-image.

There has been a problem of pupil dropout from the program in past years because of various factors pointed out in last year's evaluation. This year we have again ascertained the number and percentage of pupil dropout from the program both by grade level and by school. The rate of pupil transfer out of the district has been established too. (This data appears in Table XXX.) It can be seen that some schools have a smaller percentage

| TOTAL | 362 | $30 \%$ |

+The program is confined to first and second grades in two schools, Gerald and Wright. If the dropout at the end of the second grade were added to these figures, the rates would read: Gerald $57 \mathrm{5} 9 \%$; and Wright 35
of pupil dropout than others. Moreover, the transfer rate accounts for an appreciable amount of this dropout in some schools, but not as much in others. Continual work on the problem is being done in two ways, through personnel recruitment and through programs designed to inform and to enlist the support of the principals.

The school district is involved ir a determined attempt to secure more well-qualified bilingual teachers in order to have enough to handle the increasingly large load of bilingual classrooms as the program expands. The two principals who were present at the pre-service training sessions were apprised of the need, once pupils have entered the program, to retain these same pupils in the program as they progress upward in grade level, rather than shifting them in and out in order to accommodate equalized classroom enrollment and other administrative considerations. Moreover, two project principals werepresent at a two day cunference taking place in November in Wimberley, Texas. This conference on the subject of bilingual-bicultural education was planned by Mr. Carlos Rodriguez, who was director of this project last spring and is now director of Bilingual/Bicultural Education at Southwest Texas State University. Mr. Rodriguez planned this conference in order to acquaint principals and other public school administrative personnel with purposes, practices, and problems of bilingual education. During this conference the importance of retaining pupils in the program was discussed. Forty-five central and south Texas administrators attende', this conference. A check of next year's pupil dropout numbers from the project should indicate whether or not these endeavors have been successful in reducing the problem.

## Comparison with Control Groups

In response to interest indicated by the U S. n. E. in setting up control grows taught in traditional classrooms to compare with experimental bilingual groups, an attempt was made to do so this year. In order to have any sort of meaningful results it was felt that pre-test and post-test should be compared in order to determine the gain made by each gror? on the Metropolitan Achievement Test. Since pre-tests were not administered to kindergarten and first grade, they were eliminated from this study. Fifth grade was eliminated from the study as well because no fifth graders had been in the program all their academic careers due to the fact that the program only commenced in 1959-1970. In the second, third and fourth grade bilingual classes which were used, pupils who had not been in the program full time (meaning every one of their years in school) were excluded from the study, necessarily.

There are two other severe liminations in the study: (1) only one control group was used for each grade level; (2) it was not possible to isolate the teacher variable within the resources of this study.

With all these limitations in mind, the study was conducted by using ana-ysis of covariance with chronolugical age and mental age as covariants in order to compare the mean gain in months of grade placement on the Metropolitan Achievement Test. Of sixteen comparisons only seven proved to be statistically significant (see Table XXXI): two in favor of the control group and five in favor of the experimental group. These figures seum to give a slight advaniage to the experimental group. Realistic assessment of this data, however, would postulate no advantage for either group since it is very difficult to assume that the results, were the result

TABLE XXXI

DATA FROM CONTROL AND EXPERIMENTAL GROUPS

| Grade | Group | Test Area | Mean Gain | Significance |
| :---: | :---: | :---: | :---: | :---: |
| 2 | Experimental | Reading Comprehension | 3.1 | .05* |
| 2 | Control | Reading Comprehension | . 2 |  |
| 2 | Experimental | Math Computation | 5.7 | . $05 \%$ \% |
| 2 | Control | Math Computation | 8.0 |  |
| 3 | Experimental | Word Knowledge | 2.0 | .01* |
| 3 | Control | Word Knowledge | -2.0 |  |
| 3 | Experimental | Math Computation | 6.1 | . $01 * *$ |
| 3 | Control | Math Computation | 11.3 |  |
| 3 | Experimental | Math Problem-Solving and Concepts | 1.8 |  |

| 4 | Experimental | Word Knowledge | 2.2 | .01* |
| 4 | Control | Word Knowledge | -. 4 |  |
| 4 | Experimental | Math Computation | 10.2 | .01* |
| 4 | Control | Math Computation | 4.2 |  |

*Favoring the experimental group. **Favoring the control group.
of different programs. This difficulty arises from the inability to control significant variables, particularly the teacher variable. For these reasons the validity of the study is highly questionnable.*

In future the only way to minimize the teacher variable would be by having much larger groups, particularly control groups Since this would necessitate having mental age data available for each pupil in the study and this data is presently unavailable, the cost of purchasing, giving and scoring tests to collect this data for such a large number of pupils in both control and experimental grouns would be prohibitive.

Other Project Components
Inasmuch as teacher performance is one of the principal determining factors in pupil performance, it would be remiss not to mention briefly the more important actions beirg taken in the interest of improving teacher performance. In line with conclusions reached in last year's evaluation, in pre-service trainjing teachers were alerted to the large concept deficit project pupils had on entering kindergarten and first grade and as to the vital importance of taking remedial measures at all grade levels. The evaluator also pointed out the connection between amount of time spent by teachers on various aspects of the language arts (as revealed in data gathered by coordinators) and pupil performance on the Peabody, Metropolitan and Prueba de Lectura tests. The importance of devoting more time to concept development and reading comprehension and less time to mechanics of form and other areas was emphasized.
*Computer printout from this study is on file in the evaluator's office.

The coordinator used two checklists* (one general checklist and one checklist for language-teaching) provided by the evaluator to assist her in determining quality of teacher performance in the course of her classroom observations. The coordinator utilized this information as well as teacher rating forms in her conferences with teachers in the attempt to improve teacher performance.

Another measure utilized in this regard was videotaping of teachers. The teachers were provided with a self-evaluation form by the evaluator to help in analyzing their own behavior as they viewed the playback. (See appendix for a copy of this form.) Two in-service training sessions were devoted to a discussion of varbal interaction analysis.** Teachers were then given the opportunity to participate in three of these analyses during the course of the year either by having personal classroom visits made by the evaluator or by making audiotapes of classroom verbal interaction and sending them to the evaluator for analysis. Teachers were promptly sent a feedback matrix (copy in appendix) by the evaluator. Eighty-eight percent of the teachers participated in one or more of these opportunities.

Parents of children ir the project this year manifested their interest in the bilingual educational program by their termendous involvment in school activities such as programs, field trips, and personal visits to and written and telephone contacts with classroom teachers. The community liaison reported over 140,000 parental contacts with the schools this year. Evidence of a staunch belief in the value of the program is found in typical comments of parents, a sampliag of which is found on the following page.
*Copies of the two checklists are provided in the appendix.
**Research indicates that pupils of a more indirect teacher are far beiter achievers than those of a more direct teacher. Research also reveals that the technique of yorbal interaction analysis is useful in helping teachers become more indirect in RIC $^{\text {tr work with pupils. }}$
(paraphrased and translated to English whre necessary)
" bilingual
$\qquad$ is an excellent/teacher and all students are learning very much. Teachers like $\qquad$ should be recognized.:
"I like my children to be in Bilingual Education because it has helped them in reading and writing. They also teach my husband and me how to read in Spanish."
"My child has learned a lot of songs and Mexican dances that he didn't know before. The children have also been given an opportunity to be on television, school programs, and the Folklórico."
"I like the materials in Spanish that the children are furnished with. My smaller children and I are trying to learn to read in Spanish."
"I think Bilingual Education is great because my child could only speak English and now she has had an opportunity to learn Spanish, which she speaks, reads, and writes."
"I am very pleased with what the Harlandale bilingual program is accomplishing. My children are from Mexico and did not know English but are learning it today."
"I think my children are getting a great opportunity by learning how to speak, read, and write in Spanish correctly."
"I am very glad that my children are getting a chance to learn to speak, read, and write in Spanish and English."

## Recommendations

1. The superintendent should keep his principals apprised of the continuing need to keep the pupil dropout-of-the-program rate as low as possible by retaining pupils in the program, once they have begun it.
2. The superintendent should keep the personnel director apprised of the continuing need for recruitment of bilingual teachers.
3. The coordinator should work with principals to ensure an adequate amount of time in both classrooms for the Spanish-language teacher in a teamteaching situation. At least two hours is recommended, especially on lower grade levels.
4. The coordinator should emphasize for teachers the immense need for concentration on concept development in both Janguages.
5. The coordinator should emphasize to teachers the importance of spending less time on phonics, spelling, and sound discrimination and more time on reading comprehension in both English and Spanish language arts.
6. The coordinator should see that dernos are not issued for pupil use and for teacher use only. In remedial measures beyond the second grade levelin order to reduce the excessive amount of time devotid to sound discrimination and phonics in Spanish language arts.
7. The coordinator should take a careful look at all tables to find which teachers are weak in Spanish teaching and work with teachers to improve this appect of the program in any necessary, whether it be further college coursework in Spanish and/or language teaching, or in-service training.
8. The coordinator should take a careful look at all tables which show comparative classroom performance. Teachers whose pupils did unusually well in specific areas could be consulted with in an effort to determine reasons for their expertise and to lead to a sharing of this expertise with their fellow teachers. Those teachers whose pupils performed poorly in specific areas should be counseled with, worked with closely, and possibly even directed to college coursework in an effort to alleviate their shortcomings.
