Regression, another mechanism studied by Sigmund Freud, has had much research, e.g., hypnotic regression, frustration regression, schizophrenic regression, and infra-human-animal regression (often directly related to fixation). Many investigators worked with hypnotic age regression, which has a long history, going back to Russian reflexologists. The early 1930's Russian-journal references are not included in this bibliography. But one of the Russians (Platonow) also published in English. Barker, Dembo, and Lewin (and later, Wright) did frustration-regression experiments which became very well known and which generated many comments. Sears and Yates evaluated regression and fixation. The studies included in this bibliography range from the mid 1920's to the mid 1960's.
