IDENTIFIERS Anglo American Cataloging Rules; International Standard Bibliographic Description

ABSTRACT

Current trends are surveyed in the cataloging of nonbook materials and recommendations are made regarding local original cataloging while standard forms are being developed, with further suggestions about storage of these materials. It is recommended that the local cataloging format for nonbook materials be based on the Draft Revision of Chapter 12, Anglo-American Cataloging Rules which applies the International Standard Bibliographic Description to the cataloging of motion pictures and other media. One cataloging form is to be used for all media not yet authorized for computer input with provisions for variations in the physical description. It is further recommended that Library of Congress classification numbers be assigned in brackets for future use in computer retrieval and that a medium designator code plus a serial number be used in the call number. Sample media codes, cards, and work sheets are attached. (Author/DS)

Re: Investigations prior to the selection of a format for local original cataloging of nonbook materials. The goal was to find or to design a format that would be as compatible as possible with the current and projected Ohio College Library Center's formats so that a minimum of change and editing would be necessary when OCLC authorizes the computer input of nonbook cataloging.

ABSTRACT OF THE REPORT WHICH FOLLOWS

Current influences in the cataloging of nonbook materials and recommendations regarding local original cataloging while standard forms are being developed, with further suggestions about the arrangement, packaging, and storage of these materials

The development of standards for cataloging nonbook materials is, in many respects, still in a confused, fragmented, and controversial state. Consensus is not likely to come easily or soon in covering all types of media. In view of the unpredictable decisions and developments yet to come at the Library of Congress and at the Ohio College Library Center, it does not seem feasible at this time to try to approximate the workforms that might be used in the future for those types of materials not already authorized for computer input.

The International Standard Bibliographic Description seems to offer practical guidelines in the selection of the data elements to be recorded and their sequence. Therefore, it is recommended that the local cataloging card-form for nonbook materials be based on the Draft Revision of Chapter 12, AACR, which applies the ISBD to the cataloging of motion pictures and some other media, realizing that some editing probably will be needed eventually in order to conform to later developments at LC and OCLC. For the present at least, use one cataloging form for all media not yet authorized for computer input, with provisions for variations in the physical description.

Continued on the next page.

TWU Library, 1-10-75, to Dr. Marino from Virginia Clarke, page 2 of abstract.

It is recommended that the precedent set by the Library of Congress be followed in assigning in brackets LC classification numbers (not full LC call numbers) for future use in computer retrieval. The Library of Congress does not arrange projected materials and sound recording by LC classification, and most other major collections of nonprint materials are arranged by medium rather than by subject. Further it has been shown by studies conducted by Grace O. Kelley that contrary to the popularly held idea that classification brings all material about a subject together, the subject catalog is three times more effective in this respect. For these reasons and for storage considerations, it is recommended that a medium designator code plus a serial number be used in the call number, while at the same time the LC class number is recorded in brackets at the bottom of the card for future computer-retrieval purposes. More than one LC class number in brackets may be given at the bottom of the card to represent more than one subject area covered by the item being cataloged. The serial number in the call number would represent a title (not an item accession number), and all copies and parts of the same title would be grouped together.

Re: Investigations prior to selection of a format for local original cataloging of nonbook materials. The goal was to find or to design a format that would be as compatible as possible with the current and projected Ohio College Library Center's formats so that a minimum of change and editing would be necessary when OCLC authorizes the computer input of nonbook cataloging.

A REPORT

Summary of Findings and Recommendations

- 1 The development of standards for cataloging nonbook materials is still in a very confused, fragmented, and controversial state. Consensus is not likely to come easily or soon. Predictions are that it will take seven, ten, fifteen or more years to arrive at standards for all media.
- 2 In view of the unpredictable decisions and developments yet to come at the Library of Congress and at the Ohio College Library Center in regard to various media, it does not seem feasible at this time to try to approximate the workform that might be used.
- 3 The International Standard Bibliographic Description seems to offer some practical guidelines that we can follow in the selection of the

data elements to be recorded and their sequence. Recommendation: that we base our cataloging card-form for nonbook materials on the Draft Revision of Chapter 12, AACR, realizing that some editing probably will be needed eventually in order to conform to later developments at LC and OCLC.

4. Recommendation in regard to LC classification of nonbook materials: that we follow the precedent set by the Library of Congress in assigning in brackets LC classification numbers (not full LC call numbers) for future use in computer retrieval.
5. The Library of Congress does not arrange projected materials and sound recordings by LC classification, and most other major collections of nonprint materials are arranged by medium rather than by subject arrangement. Recommendation: that we use a medium designator plus a serial number as a call number for the nonbook materials. The serial number would be a number to represent a title. All copies of the same title would bear the same title number plus a copy number if there is more than one copy. Thus all copies would be together on the shelf or in the files.

SUPPORTING FACTS AND OPINIONS

Henriette D. Avram of the Library of Congress indicated in a talk made at the Southwestern Library Association meeting in Fort Worth 1970 that the intentions at that time were to develop MARC formats that would be compatible with each other to the extent that a data

field with a certain tag number (e.g. Tag 245 for title) could be used interchangeably in programs producing catalog cards in various formats for various materials.

"If the information described in the variable fields in any of the formats is identical, the same tags are used. In the fixed fields, identical information in different formats is found in the same character positions. The remaining character positions will contain data unique to each format. The structure of each MARC format is identical, but the content designators (tags, indicators, and subfield codes) may vary with the different types of materials being described." -- from the introduction to Films, a MARC Format . . . for Motion Pictures, Filmstrips, and Other Pictorial Media Intended for Projection, published by the MARC Development Office, Library of Congress.

With this in mind, a combined list was made to compare the fields and subfields now available in the MARC(F) format for films and other projected materials, the MARC(M) format for monographs, and the Ohio College Library System's version of MARC(M). The comparison indicated that the two MARC formats fit together without conflict. The same fields were used by both for the same type of data. Where data differ significantly between what is required for monographs and what for projected material, new discrete tags and subfield codes were assigned. It does appear that the original LC goal mentioned by Mrs. Avram is being realized, in which case, if one master computer program handled tagged fields of all formats interchangeably, it would

lend great flexibility to cataloging, and fewer formats would need to be developed.

In fact, it appears that by "borrowing" only 5 fields and 6 subfields from the MARC(F) for projected materials and adding them to the MARC(M) fields already activated by OCLC, it would be possible to catalog most if not all types of nonbook materials. See the table of comparison and the trial worksheets attached to this report. Also needed would be a subfield for the publisher's or producer's identifying numbers, e. g. the record number for phonodiscs, the plate number for music, and the corresponding identifying numbers for most other nonbook materials. The literature indicates that MARC for music has added subfield "d" in field 260 for plate or publisher's number. This is in the imprint field following the date. In the absence of this subfield, this information can be given in the first note.

However the possibility of using one master set of fields and subfields with one or a few formats seems not to be in the future of the OCLC development. Barbara Gates, regional coordinator for OCLC development, speaking at a meeting of the Interuniversity Council, Cataloger's Subcommittee in Commerce, Texas, October 29, 1974, stated that the OCLC plan is to use a completely separate format for each of the various kinds of media, that fields from different formats could not be merged, and that we shall have to wait development and implementation of the various formats. Further, she indicated that even though some libraries had jumped the gun and had made entries for tapes and

phonograph records using the present monograph format, they ran the risk of denying themselves certain future retrieval services. She suggested that OCLC strongly urges strict conformity to authorized and specifically designated use of formats, present and future. She indicated that implementation of MARC formats for serials and for projected materials would be forthcoming, also that OCLC would not wait much longer to authorize its own version of the format for music.

The OCLC attitude is understandable since strict and absolute conformity to LC cataloging copy is the true key to the system, even though variation is allowed seemingly at the member library's own risk. A plethora of formats probably would make conformity easier to maintain. The problem with nonbook material is that for the great bulk of it there is no LC copy to copy. MARC has not yet issued a format for sound recordings (tapes and phonograph records). The development of formats for other types of educational materials, etc. seems remote, possibly never, because the Library of Congress does not handle these types of material.

"The Library of Congress does not collect such material [dioramas, flash cards, multimedia kits or other instructional media] and has no competence to aid or advise in its proper control. . . This is not to deny the importance of such materials and the bibliographic control of them. . . . Rules for these materials should be developed by appropriate bodies in the fields of education and school librarianship." -- from a Library of Congress position paper read by Mrs. Avram, 1970, during the Southwestern Library Association convention in Fort Worth.

The Library of Congress has altered its position enough recently to include in its Draft Revision of Chapter 12, AACR certain materials intended mainly as instructional aids (charts, dioramas, flash cards, games, kits, microscope slides, models and realia), but this does not mean necessarily that the Library will ever collect and catalog these types of materials to any appreciable extent, if at all.

We had hoped to discover trends strong enough to justify tentatively cataloging nonbook materials on workforms modeled after the current OCLC form but allowing for the 5 fields and 6 subfields needed for nonbook materials. But computer input from a form that was nearly but not quite correct might be more troublesome and conducive to errors than input from a standard catalog card. Also in view of the unpredictable decisions and developments yet to come at LC and OCLC, it seems futile to try to approximate the future workform at this time.

Another recent development affecting the future of cataloging form is the International Standard Bibliographic Description (ISBD). The Anglo-American Cataloging Rules, North American Text, revised chapters 6 and 9, published this year by the American Library Association incorporates the the ISBD(M) for monographs. Beginning September 1, 1974, Library of Congress cards have been printed in this form, and entries in the ISBD form are already in the OCLC data bank, beginning with OCLC number 1055527. However, OCLC's "paragraph" mark seems to have replaced ISBD's prescribed punctuation (i.e. period space dash space) as a field terminator. Here again we have been faced with the unpredictable variation.

We received a copy of the Draft Revision of Chapter 12, AACR, which follows closely the new ISBD in the revised Chapters 6 and 9, AACR, mentioned above. The Draft Revision covers rules for motion pictures and filmstrips and some other instructional aids not presently covered by AACR. This draft was distributed at the Southwestern Library Association meeting in Galveston, October 15, 1974. It was done by the Library of Congress but has yet to be approved by the national library associations of the United States, Canada, and Great Britain. Basing her estimate on past progress in such matters, Vivian Schrader, Head of the Audio-visual Section of the Library of Congress, said at the SWLA meeting that she would expect these rules or their revision to become official within seven or more years. The development of standards for cataloging nonbook materials is still in a confused, fragmented, and controversial state. Consensus is not likely to come easily or soon.

Nevertheless, the ISBD does seem to offer some feasible guidelines that we can follow here in cataloging nonbook materials, at least in the selection and sequence of the data elements given in the body of the catalog entry. ISBD does not cover rules for entry headings. The only international standard so far as entry headings are concerned is that contained in the Paris Statement, 1961, i. e. the Report by the International Conference on Cataloging Principles, Paris, 1961, sponsored by the International Federation of Library Associations.

The ISBD begins with the printed title. It can be used alone as a

title entry, and there is a strong trend toward more title entries in American and British cataloging. Title entry is traditional in Eastern libraries and in many European countries. In ISBD, the author statement follows the title statement regardless of whether or not the author's name appears as an entry heading. In regard to much nonbook material, authorship (i. e. the person or corporate body principally responsible for the intellectual or artistic content or the work) is diffuse, indeterminate, or unknown, and therefore title entry would take precedence in the majority of cases even under present AACR.

The key features of the ISBD are to specify what data elements are essential, the sequence of the data elements, and special prescribed punctuation by which the computer can recognize and manipulate the various elements. The effect is that tagging for the computer is done by the descriptive cataloger in the process of original cataloging rather than by a special editor, thus eliminating an expensive step in preparing copy for machine cataloging. Another expensive step is eliminated when optically recognizable characters are used in the original typing of catalog copy, which can then be converted automatically to machine readable form without further keyboarding. This requires, of course, optical recognition equipment and appropriate computer programming.

It would seem that the ISBD pattern developed in the Draft Revision of Chapter 12, AACR, is the best guide we have at this time for data analysis and data sequence in nonbook cataloging. It is recommended,

therefore, that we follow this one form, as far as it goes, even though OCLC usage of the prescribed punctuation seems to vary slightly and even though there are not yet prescribed marks for separating the elements of entry headings. A little extra space could be left between elements of the headings for future punctuation editing if and when needed. We shall plan to use the IBM Mag Card Typewriter to produce card sets from original cataloging, at least until OCLC input for the various media is authorized, which may not be for many years in regard to some types of media.

Using one cataloging form for all media, with provisions for the necessary variations in the physical description, seems more efficient and expeditious than trying to guess at what may become the future official form for each type of material. This would be the ISBD form as title entry for the unit card. The added entries we use for author, composer, artist, performer, etc. would be in standard verified form of the name that could be transferred to main-entry position whenever that is necessary to conform to LC and OCLC policy at the time of input.

Another consideration is space on the unit card. Space is always at a premium on a typed card as compared to an LC printed card. Nonbook materials usually require more description for identification and more secondary entries (therefore more tracing) than do books. Using the ISBD title-form of entry would make one or two or sometimes three more

lines available on the unit card for the body of the entry and for notes. See the examples of alternate forms in cataloging Beethoven's Moonlight Sonata in Attachment VII of this report.

The above recommendations about cataloging form are in regard to original cataloging made necessary when no satisfactory printed cards are available. Library of Congress printed cards or Xeroxed copy of the corresponding NUC entries would be used whenever possible until OCLC nonbook formats are operational. Also there may be other sources of satisfactory printed cards for materials not cataloged by LC. This matter should be investigated thoroughly. Even though some items represented in the sample cards with this report have been cataloged by LC, they are recataloged here only to exemplify typical cataloging problems.

Another matter for decision is the kind of storage or shelving to be used for the various types of nonbook materials and the corresponding call numbers to be used. The OCLC format provides for the following fields, among others, all optional:

Tag	Field description
050	MARC call numbers (LC class number plus book number)
090	Local LC call number (Class number plus book number)
099	Local free text call number (Any call number not LC or Dewey)

At present, there are no MARC call numbers (i.e. LC class numbers plus book numbers or main entry numbers) for nonprint materials. The Library of Congress does not arrange its sound recordings, films

or other nonprint materials by LC classification. However, for the benefit of other libraries interested in subject control and retrieval by class number, the Library of Congress has been supplying in its catalogs recently one or more suggested LC class numbers (not call numbers, merely class numbers) enclosed in brackets. This policy began for projected materials in August 1971 and for sound recordings in January 1972. For music materials, these numbers represent secondary subject or form entries in a classed catalog. They are not intended as symbols for physical arrangement. When such entries are part of the regular classification schedule, they are enclosed in brackets. Numbers enclosed in parenthesis within brackets are part of a special supplementary series which is not part of the regular schedule. It would be advisable, probably, for us to follow a similar policy, i. e. to include the suggested LC class numbers when they are found in routine verification search and even to add class numbers ourselves for other materials.

The type of storage and shelving is another matter. Each kind of nonprint material poses its own unique requirements in regard to size; shape; protection needed from dust, heat, light, high or low humidity; special playback equipment, near which it needs to be stored; and special circulation factors including inspection. Although in recent years there has been some advocacy for classifying all materials by Dewey or LC schedules, even of intershelving audio-visual materials along with books (mostly in small and/or school libraries), there are several factors that point to the futility of this policy:

- 1 Contrary to the popularly held idea that classification brings all material about a subject together, studies have shown that a subject catalog is three times more effective in collocating information on the same or related subjects. An item can be classified in only one place on the shelves, giving but one linear representation of its subject matter, whereas it can be represented by multiple entries in the catalog.¹ Without a good subject catalog, which may be the case in some small and some school libraries, classification of nonbook materials may become of greater relative importance. Even so, a classified arrangement is of little use in locating a specific topic unless the library user has at hand a good index to the classification and has been well instructed in the structure, purpose, and use of the classification. This is seldom the case.

- 2 The process of subordination of subject matter at each step of classification separates from the whole, as Kelley points out, thus tending in considerable measure to defeat the purpose, of grouping like material together. Greater and greater detail in subdivisions may be expected to yield decreasing aid. This fact has not been duly appreciated, especially when a detailed classification such as that of the great Library of Congress is applied

¹Grace O. Kelley, The Classification of Books . . . Chapter IV: "Thirteen Elements which Affect the Usefulness of Classification." H. W. Wilson, 1937.

verbatim to much smaller collections. The result is one or two or at most only a few items per specific classification.

- 3 Incidental and accidental location of material by browsing has been the chief benefit of classified arrangement of books. Even this benefit is less with nonprint materials, which are not very browseable. It takes special equipment, often a darkened room to examine them. Perhaps "browsing" in the subject catalog would be more effective. Also we must recognize that special displays and special bibliographies are a necessary corollary to any type of library organization for bringing little-known items to the attention of the user.

Because of the diversity in the subject content of some books and of a great many nonbook items, the application of any scheme of classification is only partially effective. Music records are particularly difficult to classify. One disc often contains compositions in many forms from various periods of history, composed and performed by many different persons, with many different instruments. There may be a topic theme by which they would be classifiable as a whole, but would it be one looked for by the student or other user? Analysis by form of composition, by composer, by performer, by instrument, etc. in the dictionary catalog would be far more useful.

- 5 In view of the variety of relationships present in the minds of those who use the library and the variety of ways in which

content is put together by producers, the importance of any one detailed outline of classification should not be overstressed.

No imposed logical order by subject can be assumed to fall naturally within the current organization of a curriculum or within the outlook of the intelligent library user.

6. Intershelving nonbook materials with books in a classified arrangement requires much more shelf (storage) space, perhaps ten to twenty times more space, than the same materials sorted by medium and kept in specially designed cabinets, trays, etc. This is due to two factors. Extra space must be allowed throughout a classified collection at all times for shifting to insert new materials. And if nonbook materials are to be intershelved with books, all must be packaged, not only the kits but everything, in order to keep them from rolling off the shelf or getting shoved back and lost behind the books. Each package of necessity encloses a great deal of waste space.

Therefore it is recommended that we use a medium designator code plus a serial number as the call number for nonbook materials, using a separate series of numbers for each designated type of media, while at the same time recording the LC class number in brackets at the bottom of the catalog card for future computer-retrieval purposes. The serial number would represent a title. All copies of the same title would bear the same title number plus a copy or part number if there is more than one copy or part. Thus all copies and parts would

be together on the shelf or in the files.

One of the most recently proposed media designator codes is the one proposed by the Task Force of librarians and audiovisual specialists assembled November 10, 1972, with expenses underwritten by the Baker and Taylor Company. Pearce S. Grove, author and consultant in the field of nonbook media, was chairman. Among others on the task force were Vivian Schrader, Head of the Audiovisual Section, Descriptive Cataloging Division, The Library of Congress, and three members of the Information Science Committee of the Association for Educational Communication and Technology, that developed the Standards for Cataloging Nonprint Materials: William J. Quinly, Katharine Clugston, and Alma Tillin. ° Recommendation: that we seriously consider adopting this code as our principal guide, adding other designators and symbols as they may become needed.

The Task-Force code is a two-letter alpha code. See page 2 of Attachment II. When used in a library that classifies books by the Dewey numeric code, there is no confusion between call numbers meant for books and those meant for nonbook materials. However, in a library that classifies books by another alpha code or alpha-numeric code such as the LC classification, shelvees and library users might have some difficulty telling the difference.² In that case it may be better

²At the first library staff conference on the first draft of this report, it was decided to spell-out the specific medium designator in the nonbook call number to be used in the Texas Woman's Library. Two factors influenced this decision: (1) previous difficulties in instructing student shelvees, and (2) the fact that the microform collection already had been marked in this way.

to spell-out the medium designators rather than to use the two-letter code. See the sample cards in attachments to this report. Another solution is to prefix a third letter to the media code using a letter not used as a main-class designator in the LC classification, e. g., I, O, W, X, or Y. The library would decide which of the available letters would be used to indicate nonbook materials. If "I" were chosen, motion picture cartridge would be represented by "IMR" instead of by "MR". See the copy of the Tarrant County Junior College media code in Attachment II, page 6.

One of the media designators in nonbook codes is Kit. This term, as applied to instructional materials, has been defined and re-defined by various authors in various ways, sometimes with very surprising results. For the benefit of our own staff, we shall need to agree on one definition that can be clearly understood, one that can be applied easily and consistently in assigning call numbers.

Dictionary definitions of kit include the following: A set or collection in a container; the container and its contents. With this basic meaning in mind, it is recommended that the following definition be used for our purposes: An instructional materials kit is packaged, organized materials intended to be circulated and used as a unit. This definition can be applied to boxed sets in one medium as well as to boxed multimedia sets. It will be noted that kit is not a true medium but rather that it indicates a kind of packaging that could enclose any and all kinds of media. The

kit designation in the call number is particularly useful for boxed sets that do not fit into the type of storage units used for single items of the various media. For example, a boxed set containing a filmstrip, an audio tape, and a study guide will not fit into the usual storage equipment for single filmstrips, for single tapes, or for single pamphlets. It has to be stored somewhere else, and the call number should reflect this separate location.

This method of physical arrangement does not necessarily affect the descriptive cataloging. It is traditional to describe such a set as the one mentioned above not as a kit but as a filmstrip with sound and study guide. Some rules stipulate that the cataloger decide which medium in a multimedia set is dominant, which item is principally responsible for the intellectual content, and then to catalog that item (and its medium) designating the other items as accompanying materials. The Draft Revision of Chapter 12 gives the local cataloger some choice in this matter. We would continue to use LC copy as a guide in the descriptive cataloging but at the same time use our own discretion in packaging and in developing the call numbers. See the sample cards attached to this report.

In contrast to the sound filmstrip set mentioned above, a boxed set of disc records is of a size and shape to shelve naturally among single discs, and an audiodisc designator in the call number would be appropriate. Sometimes the nature of a set and the nature of its use

would dictate that it be broken up and its components be cataloged, stored, and used separately. See Attachment VIII, page 4.

For inventory purposes, a kit would be considered as one title, as one package (or more than one package if there were several copies of the kit). If desired, two columns of figures could be kept: one for title count and the other for the count of all items in the packages. But in any case, a medium loses its identity for inventory purposes when it is packaged in a kit and becomes merely a part of the kit.

Labels on the visible side of the kit-package (i. e. the visible side when shelved) need to show the following: (1) title statement as cataloged, (2) author or producer, (3) date if more than one edition is available in the collection, (4) contents of the kit so that it can be checked in circulation for missing parts, (5) special equipment (if any) needed for playback, and (6) call number.

A BRIEF RESTATEMENT OF THE RECOMMENDATIONS

- 1 Use LC cataloging copy if available (1) on cards, (2) in the National Union Catalog, or (3) in the OCLC data bank. Investigate to discover if other satisfactory catalog cards are available.
- 2 Do original cataloging when standard cataloging copy is not available.
- 3 Base original descriptive cataloging form on the ISBD in regard to

- (1) selection of data elements to be recorded, (2) sequence of data elements, (3) prescribed punctuation, and (4) title entry as primary entry for shelf list and catalog.
- 4 Use LC as authority for standard forms for secondary entries for (1) topic headings, (2) form headings, (3) personal names, (4) corporate names, and (5) geographic names when these are easily ascertainable. Establish as needed other names and headings, and keep a record of them.
 - 5 For the present at least, use one cataloging form for all media, with provision for variations in the physical description.
 - 6 Use IBM Mag Card Selectric Typewriter to produce card sets from original cataloging. Use Xerox System 1-2-3 to produce card sets from NUC copy.
 - 7 Use the media designations and codes recommended by the Task Force chaired by Pearce Grove, 1972, with additions as needed. The Task Force designators will be used in all call numbers and in descriptive cataloging unless there is conflict with LC cataloging copy, in that case, LC copy will take precedence (in descriptive cataloging only) in deference to OCLC requirements.
 - 8 Arrange the nonbook collection serially within categories determined by the type of medium and its storage.
 - 9 Each category will have a separate series of title numbers (to keep the serial numbers in call numbers from becoming any longer

than necessary)

- 10 A copy number will distinguish duplicate copies.
- 11 Spell-out the medium designations in call numbers (in keeping with the policy already established for microforms and to make a greater distinction between nonbook call numbers and the LC call numbers used for books).
- 12 Record in brackets on the shelf card suitable LC class numbers for possible future computer-retrieval purposes.
- 13 Define a materials kit as packaged, organized materials intended to be circulated and used as a unit. The materials may be all of one type or of mixed media. A monomedia set is designated as a kit only when the package will not fit conveniently into the regular storage equipment for singles in the same medium.
- 14 For inventory purposes, a kit will be considered as one title, as one container (if there is only one copy of the set). Mixed media lose their identity as separate mediums and become merely parts of the kit. Most statistical records for books include (1) the number of titles and (2) the number of volumes. In a similar fashion, inventory records for nonbook materials can show (1) the number of titles, and (2) the number of items, which could account for a total including all copies and all items in kits.

- 15 On kit labels, show (1) title, (2) author or producer, (3) date, (4) contents for circulation checks for missing parts, (5) any special equipment needed for playback, and (6) call number.

36	IFS.	Slide master (graphic from which a slide has been made)
37	IFT.	Overhead <u>transparency</u> master (graphic from which an overhead transparency has been made)
38	IC.	Packaged <u>course</u> developed in varying media and intended to be issued and shelved together in classrooms or departments where they are used
39	IFR.	Flat materials stored on <u>rollers</u> or in tubes

¹Other media from the Corbin list are:

Numeric code	Other designation	Category
01	LC call number	BOOK
01	Music call number	SCORE
02	Periodical	PERIODICAL
13	Microfiche	MICROFICHE
14	Microfilm	MICROFILM
		MICROCARD

Though microforms listed here are "projected" materials, the present collection consists of photographic copies of printed materials, mostly if not exclusively serial publications and government documents. These two big fields present their own difficult bibliographic control problems even in printed form. The microforms would need to be accessed through the periodical, newspaper, and document indexes the same as the original printed forms. Therefore, it would seem that their codes or call numbers would need to be similar or closely related to whatever is established for printed serials and documents.

²We were originally requested by the staff to make a distinction in the call numbers for art slides and other slides, and between music records and other records. We had at first used IPS.A for art slides; IPS. for all other slides. In like manner we had used IAD.S for speech and other nonmusical records; IDA. for music. But in the development of the Simms format, it was found not to be feasible to use the "A" and "S" symbols in this way, and even though the earlier materials are so marked, the "A" and the "S" symbols have been abandoned, and a system of colored dots under the call number has been substituted: a purple dot for art slides; a yellow dot for non-musical records.

³The code for vertical file can be expanded to indicate subdivisions by the use of an initial letter or short Cutter number for the type or subject after the period in the alpha code, thus:

IF.E	for <u>equipment</u> manuals
IF.G	for printed <u>guides</u> (teacher's guides, student study guides, and other printed matter to accompany audio-visual materials when these guides, etc. are not put in a kit (container) with the visual materials.

SAMPLE CARDS - MOTION PICTURE SET IN KIT

These very short films were on small 3-inch reels (not in cassettes or cartridges or cans) but they came from the producer packaged in a sturdy kit with a rather comprehensive study guide. Therefore the set was stored in its container and designated as a kit. The term "kit" is used in the call number to correctly indicate its storage and location, but "motion picture" follows the title to conform to current LC cataloging policy and OCLC's expected policy.

Kit
274

Rhetoric of the movie series. Set 1. [Motion picture] / Eastman Kodak Co.; [made by] Willard Pictures. -- Rochester, N. Y. : The Company, 1968.

6 reels (4 min. each) : si., col. : super 8 mm. & teacher's guide laid in container.

SUMMARY: For introductory classes in movie-making. Based on verbal language parallels.

(Continued on next card)

Kit
274
