ABSTRACT
                An investigation of learning styles was jointly
conducted by the Fox Valley Technical Institute and the Center for
Vocational Technical and Adult Education at the University of
Wisconsin at Stout. After a study of learning styles, a computerized
model to manage an instructional system was developed. Analysis of
information necessary to manage a learning-styles-based instructional
system was used to develop a model consisting of
learner-instructor-computer interactions. A series of computer
programs written for a time-sharing system were designed according to
the model, and the computer management system was tested using a
basic physics program. (CH)

Acknowledgements

The researcher is indebted to Fox Valley Technical Institute and the Wisconsin Research Coordinating Unit for their support of the research described in this report. Special recognition is due Dr. Urban Oen, Director, Learning Styles Project at FVTI. His assistance and counsel were very helpful.

i

TABLE OF CONTENTS

I. INTRODUCTION

Summary

A learning styles project jointly proposed by Fox Valley Technical Institute, District 12, and the Center for Vocational, Technical and Adult Education at UW-Stout was funded by the Wisconsin Board of Vocational, Technical and Adult Education. During the 1972-73 academic year the University of Wisconsin - Stout sub-contracted with FVTI to conduct a portion of the research for the first phase of the learning styles project. (Banks, 1973) The second phase of that sub-contract involved the development of a computerized model to manage an instructional system in which information about student's preferred style of learning would be considered in prescribing learning activities corresponding to that style.

A model schema consisting of learner-instructor-computer interactions was developed by analyzing the types of information necessary to manage a learning styles based instructional system. A series of computer programs written in BASIC for the PDP-11 time-sharing system were designed according to the model logic. (The model could also be used to develop similar programs in other languages.) The computer management system was tested using the modules and alternative learning activities constructed for a basic physics program at UW-Stout.

The system performed all expected management processes and output unique learning prescriptions based on learning styles. A complete evaluation system was included in the model, however due to insufficient time and input data, that component was not tested.

1

Instructors who analyzed the system agreed that the management com-
ponent would be useful or necessary to manage a modularized instructional
system. Several instructors and administrators who reviewed the system
expressed concern over the procedure used to relate the learning activities
to learning styles and recommended a more systematic approach to that
process.

Rationale

Individualized instruction is recognized as an educational approach necessary to provide for the many individual differences that exist among students. This need to provide individualized instruction is suggested in learning theories and is the focus of much current educational research.

Although the need for providing individualized instruction has been recognized, some basic problems tend to deter its implementation. One of those problems involves the handling of large amounts of information connected with managing a system in which each student may be at different points in the course and require different materials to learn a given concept or skill.

Computerized systems are now available to help with all levels of this management task. By maintaining student records on a computer storage device and by continually monitoring a student's progress via on-line terminals, the teacher has access to daily progress reports. More sophisticated systems can provide a more detailed analysis of students' progress, suggest assignments and conduct on-line evaluation. With the present availability of moderately priced time-sharing equipment, the previously difficult bookkeeping problem involved in managing individualized instruction appears to be diminishing.

3

As the management of individualized, prescriptive, instruction becomes feasible another more fundamental problem concerning the criteria used to prescribe instruction must be considered. Learning style has been under investigation recently as a variable which tends to interact with various modes of instruction. As more evidence of this interaction becomes available, it appears that a computerized management system can be used, in fact, will be necessary, to prescribe those learning activities which best match the learning styles of the learner.

4

Problem

This project was part of a more comprehensive project involved with identifying learning styles of students and assessing their impact on learning in the post-secondary vocational-technical education program. (Oen, 1973) The problem for this sub-project was to develop a model for the computer logic required to store, summarize and retrieve the student and instructor information required to manage a learning styles based individualized instructional system.

5

Objectives

The specific objectives for this sub-project were to:

1. Develop a list of the information teachers and students need in order to manage and function within a learning styles based individualized instructional system.

2. Design an instructional information system model.

3. Identify the computer program logic, inputs and outputs required for the instructional information system.

4. Determine the feasibility of an on-line interactive terminal system for input and output of the instructional data used in the instructional information system.

6

II. REVIEW OF RELATED LITERATURE

In a review of research on computer-based instructional management systems, Baker (1971) briefly described several of the earlier management systems. Although each system described by Baker was designed to manage a unique instructional program, all systems included some degree of test scoring, diagnosing, prescribing and reporting. Also, each system incorporated a similar basic model and curricular approach. Objectives within a subject matter area were grouped into instructional units. Pretests were used to determine students' present level of achievement and aid in prescribing instruction. Post-tests were used to determine whether objectives were achieved and detailed computer generated reports were always available to aid teachers in the diagnosing and prescriptive process.

In summarizing his report, Baker indicated that although the reporting aspects of the systems were reported in detail, the procedures for diagnosis and prescription were vague or completely lacking. Baker continued to discuss the problem of prescriptive capabilities of the various systems emphasizing the need for better diagnostic and prescriptive procedures. He concluded that considerable applied and theoretical work was needed on procedures for diagnosing and prescribing in order to develop them to a level adequate for CBIM and CAI systems (Baker, p. 64).

7

The use of various forms of diagnostic learning prescriptions appear to be promoted by an increased use of computer generated tests. Franklin Prosser and Donald D. Jensen (1971) describe an extensive computer generated testing program at Indiana University in which students are permitted to keep the tests after they have turned in their answers. The students are then given the correct answers in return for their completed answer cards. This provides students with immediate feedback of results along with materials in the form of test questions for further study.

Descriptions of several existing computer generated testing systems include references to various ways in which test results are used to provide prescriptive feedback. Dudley (1973) describes a system in which a listing of the items missed, showing both the student's answer and the correct one, together with a reference to the course material is printed for the student. Hsu and Carlson (1973) use a separate program to print out exercise pages for missed objectives. Libaw (1973) described the MENTREX system which provides individual tutorial feedback and references to specific information sources to reveal what his test reveals that he has not yet learned.

Perhaps the most comprehensive work involving systematic prescriptive capabilities based in learning styles has been done by Dr. Joseph E. Hill (1971) at Oakland Community College in Bloomfield Hills, Michigan. Hill uses cognitive style mapping to obtain a profile of students cogni-

8

tive styles. That information can then be used to predict which learn-ing activities would be best suited for each student.

III. METHODOLOGY AND PROCEDURE

This project of constructing a learning styles based management system was undertaken in conjunction with another project in developing learning styles based curricular materials in the UW-Stout Physics de-partment. The physics project dealt primarily with modularizing several basic physics courses and designing various alternative learning act-ivities keyed to the objectives. Since the director of the learning styles project was also involved in the physics project, most of the initial testing of the computer programs utilized data which were gener-ated for the physics project. The physic modules were designed for stud-ents in technical programs; thus, many of the modules would be appro-priate for vocational-technical schools.

Descriptions of the method and procedure for each activity as list-ed in the project proposal are as follows:

Activity #1.

   Using a nominal group approach, determine the
instructional information and computer-output data
needed by teachers and students in order to create
an effective learning environment.

To identify the information involved with managing a learning system the director of this project worked closely with the following

9

people:

    a) Dr. Orville Nelson, Research Specialist
           Center for Vocational, Technical and Adult Education

    b) Dr. Steve Fossum, Associate Professor, Physics

    c) Dr. Mark Larchez, Assistant Professor, Physics

In individual consultation, Dr. Nelson provided the initial information used in outlining the project and identifying the limitations or boundaries of the information sought. His information was based on meetings with staff at FVTI and involvement in Banks (1973) project. Then, over a period of a few weeks, the director met regularly with Dr. Fossum and Dr. Larchez to discuss what specific information was necessary to develop an individualized instructional system based on learning styles. The information identified was classified according to whether it was associated with students or subject modules, and later formed the two major files in the management system. (See Appendix A)

Activity #2.

Create an instructional information system model.

The information system model was developed by first identifying activities required of instructors and students in a learning center environment where learning activities are prescribed according to individual styles of learning. Next, those activities such as generating learning prescriptions, record keeping, reporting and evaluation were

10

selected for inclusion in the basic model. The procedures dictated by
those activities were then flow charted and integrated to form the system
model.

Fundamental to the model is the role of the system as an extremely
efficient instructor's aid thereby permitting a greater degree of instruc-
tor-student interaction in the learning center. The system prescribes
learning activities and controls evaluation procedures while automatically
recording information to be processed and presented to the instructor.
The instructor uses that processed information to update instructional
materials and form the basis for better professional interaction with
individual students. (See Appendix B)

Activity #3.

Develop the computer program logic needed to handle

the instructional information identified in activity 2.

Using the information determined in activity #1 and the processes
identified in activity #2, a computer system consisting of three main
files and two groups of programs was planned. The three files included
an individual student file, a module file containing information and
learning activities for each module and a testing file containing the
test items for all modules. (See Appendix C for Module & Student File
Layouts) One group of programs which students would need to interact

11

with the system were outlined and another set of programs which instructors could use to retrieve reports and update the system were identified.

The computer programs necessary to provide adequate learner interaction with the system were identified by constructing a schema depicting the learner, system files and the types of input-output previously discussed. A flow chart of student activities was constructed to provide a sequence which was then used to explicitly define and interrelate each of the computer programs. (See Appendix D for Learner Interaction & Flow of Student Activities)

In the flow of student activities the student first plans his program of study by selecting those modules he plans to study and identifies each module with the date he plans to start that module.

The student then completes a learning styles questionnaire and takes a pre-test, the results of which are entered into the system via an optical reader. The learning styles information is used later to prescribe appropriate learning activities and the pre-test can be used in one of two ways.

The flow chart in Appendix D shows the pre-test used as a pre-entry instrument. In this mode the student demonstrates various entry skills before he is given a learning prescription and is permitted to enter a learning module. The other way in which the pre-test can be used is in testing out of modules. If the pre-test is equivalent to the module post-

12

tests, then the pre-test information may be used to determine if students can bypass modules.

After students have taken the pre-test and learning styles questionnaire they will enter their name and program of study into the system via teletype or CRT in the learning center. After a program of study (list of modules with starting dates) is entered by a student, that student may approach the system via terminals in the learning center at any time to do one of the following:

a) Change his program of study.

b) Print out his current program.

c) Print out a summary of progress and his current status.

d) Request a learning activities prescription.

e) Request a test on his current module to be taken on-line on a CRT.

(See Appendix D for a List of Computer Programs for Student Use)

The computer programs necessary for instructors to interact with the system were identified by constructing a schema depicting the instructor, system files and the types of input-output previously discussed. (See Appendix E for Instructor Interaction)

Computer programs which instructors needed formed two groups, those necessary to update information in the system and those used to output reports necessary for efficient management of the learning center. After

13

students were enrolled and had entered their programs of study, instructors could approach the system via terminals at any time to do one or more of the following:

a) update modules and learning activities in the module file.

b) update test items in the test file.

c) print out the following reports:

    1. Expected Module Entry.

    2. Current Module Use.

    3. Progress List for all students

    4. List of students enrolled.

    5. List and summary of modules available.

(See Appendix E for List of Computer Programs for Instructor Use)

Activity #4.

Write a computer program to simulate the information handling and processing required by the instructional information system.

The computer programs identified in activity #3 were written in the BASIC-PLUS programming language to be executed on the PDP-11 time-sharing computer system at UW-Stout. (See Appendix F for Computer Program Listings)

Two programs, TESTER and TESTUP, comprising the evaluation part of

the system were not written. The decision to continue without those programs considered the fact that an off-line computer generated testing system was already in use at UW-Stout. Therefore, the writing of those programs could be done quickly at a later time.. Also, the Center for Vocational, Technical and Adult Education was working with Fred Timm in developing a random test generation program for the Communications Skills courses at FVTI.

Activity #5.

Pilot test the computer program at UW-Stout.

As each computer program was written, it was debugged by executing the program with explicit input data which would produce predictable output. Also, when two or more computer programs comprising a sub-system were completed, they were executed with similar input data. The final system (excluding the evaluation component) was tested with the same input data with the resulting output being compared with the predicted output.

Activity #6.

Write and/or select alternative modes of instruction for a specific unit and place these in the instructional information system.

This activity was performed in cooperation with the concurrent

15

Physics Project in which modules with alternative modes of instruction were being written for a basic physics course. A 5 semester credit basic physics course was divided into 14 modules and each module was outlined according to a specific format. Such things as number, name, prerequisites, alternative learning activities, etc. were stated for each module in such a way as to be easily entered into the computer system. (See Appendix G for Module Format)

Two module entry requirements were considered important for this particular application. These requirements included a list of prerequisite modules for each module and a list of prerequisite entry skills for each module. Most of the modules had other modules as prerequisites, however a few modules had no prerequisites modules thereby providing several places (areas of study) where students could enter. The prerequisite skills became the pre-test items which were to be administered at the beginning of the course. (See Appendix H for Available Modules for Physics 221 and Prerequisite Skills for Physics Courses)

After all modules for the course were identified according to the module format, a set of explicit behavioral objectives were written for each module. (See Appnedix I for Module #125 Objectives) A general list of possible learning activities were selected for each objective. (See Appendix I for Module #125 Activities)

The process of prescribing only those activities which were most

16

21

closely matched to the student's learning styles required that each activity be associated with a set of styles. For this particular application two style continua (symbolic-concrete and unstructured-structured) were selected and each activity was assigned a two element array which placed that activity on the two continua. (See Appendix J for Use of Learning Styles to Prescribe Learning Activities)

The last step in preparing the system for operation involved entering the module information. Computer program 'MODADD' was used to enter the basic information about each module as listed in Appendix G. Then 'MODSUM' was used to enter the activities for module #125 as listed in Appendix I.

Activity #7.

Test the feasibility of the alternative modes of instruction as managed by the instructional information system. These tests will be conducted at Fox Valley Technical Institute by means of a portable remote-entry data terminal. This terminal will be placed on line with the PDP 11/40 system based at UW-Stout. Students and teachers will be able to utilize this system and will be requested to evaluate it in terms of its functionality and effectiveness in processing the data they need. A

17

<u>preliminary cost/benefit analysis will be conducted on the</u>

<u>instructional information system.</u>

Since the remote-entry data terminal was not available and FVTI's time-sharing system was not operational the feasibility test was not done at Fox Valley Technical Institute. However a test involving selected faculty and students at UW-Stout was conducted. A one page sample 'Information to Students' sheet was attached to the list of available modules and distributed to several faculty members and students so they could plan a program of study and enter that program into the system. (See Appendix K for Information to Students and a sample of the terminal interaction printout of a student entering and listing his program of study.)

After the students' programs of study were entered they were asked to run the computer program NXTMOD which would provide a Learning Activities Prescripton for their first module. However, since only the activities for module #125 were available in the system, only those students who were eligible for that module received a Learning Activities Prescription. (See Appendix L for samples of Learning Activities Prescription)

The computer programs producing the following reports to faculty were also run to complete the system test.

a) Expected Module Entry

b) Progress Report

18

c) Current Module Activity

d) Module Summary

(See Appendix M for samples of those reports)

In April and May, 1974 the researcher made two presentations to FVTI staff on the model, the system and the types of reports provided for teachers and students. No additional information needs were defined during these meetings.

During Professional Growth Week-II held at UW-Stout during the week of June 4 - 8, 1974, the researcher demonstrated the system and discussed applications with the vocational teachers in attendance.

IV. ANALYSIS

Most of the information determined to be necessary to individualize instruction based on learning styles was used in the model. The student's initial program of study was used to provide reports on expected module use, and all faculty members who tested the system agreed that those reports would be useful in managing instruction in a learning center environment. The learning styles information was used directly to match activities styles to student's learning styles. Actual accumulated pre-test and post-test information was not available for testing because the evaluation component of the system was not completed. However, dummy data was used for this accumulated information thereby permitting a more complete test of the system.

19

The particular application to which the model was tested used the pre-test component for determining entry requirements. To insure that students entering a particular module possessed those skills needed to perform the learning activities, a pre-test of those skills was given before starting a series of modules. That pre-test information was then entered into each student's file and the system controlled module entry based on the results of the pre-test.

With minor changes in some of the computer programs, the pre-test information could be used to bypass modules instead of permitting entry to those modules. This mode of operation would require that the pre-test test the objectives of each module the student was planning to study.

The key component of the learning styles based system is the output of learning prescriptions in which the activities for each objective are listed in sequence of decreasing compatability with the student's learning styles. Although the application in which the system was tested required that all activities be presented to all students, it is feasible to list only the first few activities for each objective, thereby prescribing only those activities which best match the styles of the learner.

Appendix L shows learning prescriptions for two students entering the same module. For the two style continua used in the test one student placed average on the symbolic-concrete continuum and toward the unstructured end of the other continuum. That student was given a supple-

mental reading as his best activity for objective #1. The other student placed toward the symbolic end of one continuum and toward the structured end of the other continuum. That student was given a taped mini-lecture as his best activity for objective #1. If the supplemental reading is more unstructured and the taped mini-lecture is more structured in nature one would expect those activities to be assigned to the respective students.

A critical phase in the prescriptive process concerns the procedure by which each activity was placed on the two style continua. For this test each activity was analyzed by the investigator and assigned a position on the style continua. Although analysis from several experienced teachers would be more valid, other methods utilizing feedback within the system should be considered.

APPENDIX A

INFORMATION NECESSARY TO INDIVIDUALIZE
INSTRUCTION BASED ON LEARNING STYLES

Information Associated With Each Student

1. Initial program, history of program changes and current status.

    a) List of modules in program.

    b) Planned dates of entry and exit from each module.

    c) Noted changes in program.

    d) Current status or amount of program completed.

2. Learning styles and accumulated styles information.

    a) Information from learning styles questionnaire.

    b) Accumulated data on styles actually used.

3. Accumulated module entry skills.

    a) List of basic or unique skills demonstrated before entry
       to each module.

4. Accumulated test results on current module.

    a) List of all items and responses that have appeared on
       tests on the current module.

    b) Information necessary for constructing subsequent tests.
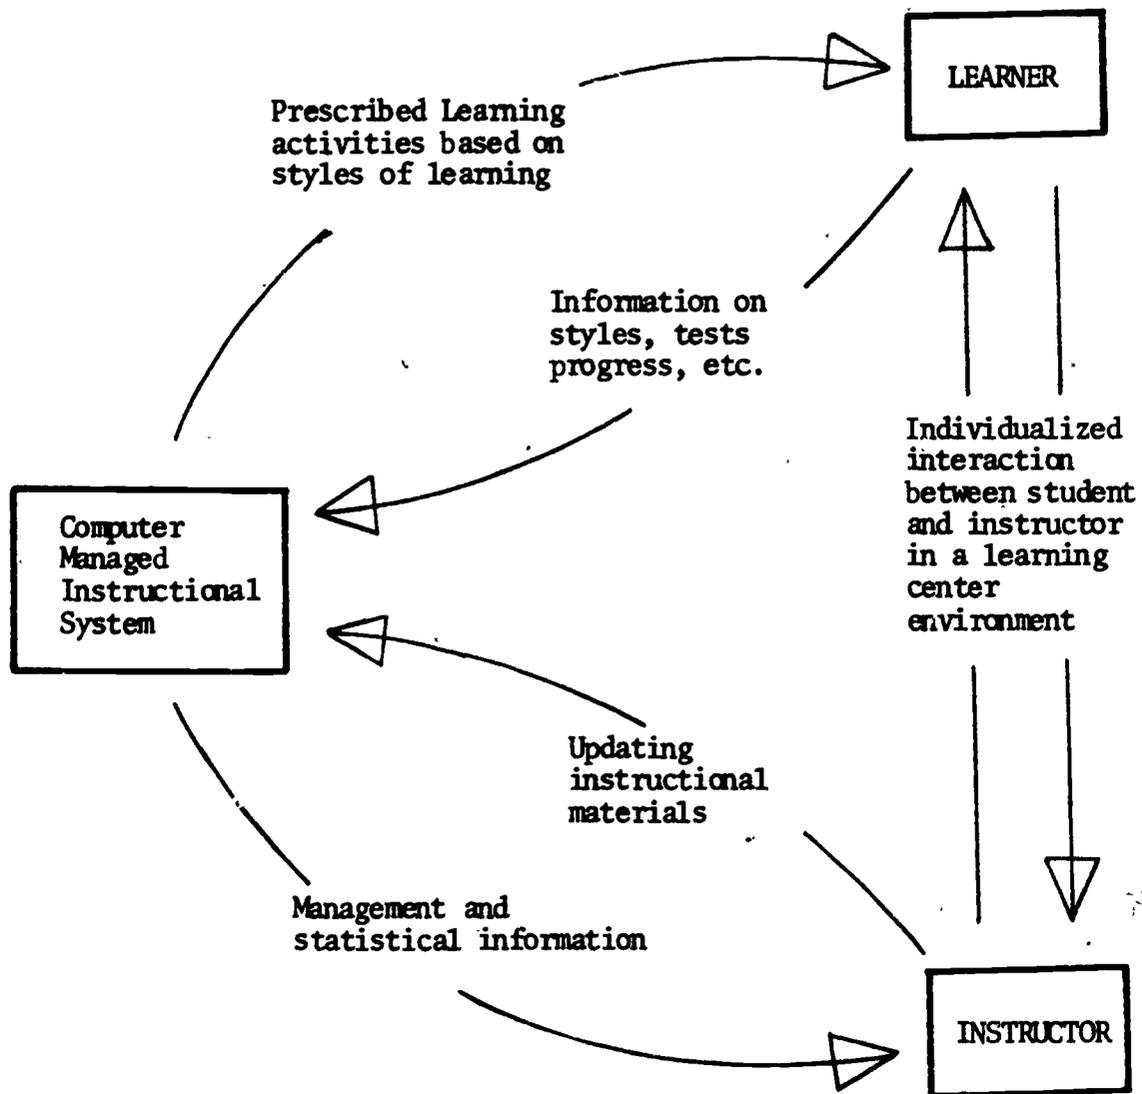

Information Associated With Each Module

1. Entry skills and prerequisites.

    a) List of prerequisite modules.

b) List of basic or unique skills used in the module and needed by students before entry to that module.

2. Objectives with available learning experiences.

   a) List of behavioral objectives.

   b) List of various activities associated with and/or keyed to the objectives.

   c) Information or algorithm relating the measured learning styles to the various learning activities.

3. Pool or test items.

   a) Several items for each objective.

4. Accumulated information on tests.

   a) Usage, difficulty and correlation of items and groups of items associated with objectives.

5. Accumulated information on use of learning activities.

LIST OF COMPUTER PROGRAMS FOR STUDENT USE

Program Name	Program Function

MAINST - - - main student program used to identify a student with his file and chain to the program he selects. After that program has been executed the system will chain back to this program and wait for another user.

ENROLL - - - enter a new name in the student file in alphabetical order and initialize an individual file for that name.

PROGRM - - - enter or change a program of study for a student. This program will be used by students to enter their planned program of study into their file and update any changes in that program.

PGMLST - - - list the program of study for a particular student. This program provides a list of planned modules and expected starting dates in a students program of study.

STATUS - - - print out a summary of the history and current status of a student. This program lists all of the modules a student has completed with dates of completion and the level of achievement for each module. The report includes the status of the student on his current module.

NXTMOD - - - print out the learning prescription for the next module of a students program. This program will use the learning styles information from the questionnaire to select those learning activities which most closely match the students style of learning.

TESTER - - - provides a mastery test on the current module. This program will present the student with a test on a CRT. As the student responds to the items, they are graded and the results are stored in his file. The program will either record if the student passes the module or provide feedback about which objectives require additional study.

Program: EXPUSE

EXPECTED   MODULE   ENTRY

- BY DATE -

DATE	- - - MODULE(NBR OF STUDENTS) - - -			
99 XXX 99	999(999)	999(999)	999(999)	999(999)
99 XXX 99	999(999)	999(999)	999(999)	999(999)
99 XXX 99	999(999)	999(999)	999(999)	999(999)

1. The dates are uniformly incremented in chronological
   order - possibly every Monday or every Monday and Wed.

2. The Mod(nbr of students) are listed from left to right
   in decreasing nbr of students.

EXAMPLE:

25 JAN 74	111(52)	301(25)	118(16)	403(12)
2 FEB 74	301(70)	112(32)		
9 FEB 74	120(35)	111(14)	301(5)	

MEANS:
   52 Students plan to start module 111 on or about Jan 25
   25 Students plan to start module 301 on or about Jan 25
    5 Students plan to start module 301 on or about Feb 9

etc.

APPENDIX G

MODULE FORMAT

Information describing each module of instruction is to be organized according to the following form to be entered into the computer.

1. NUMBER - _____

    This is any integer less than 30000 and will be used by the system to identify and order the modules.

2. NAME - - - - - - - - - - - - - - - _____

    This is any phrase less than 33 characters in length used to name the moudle and will be used to describe the moudle on output lists.

3. SIZE - _____

    This is any real number used to indicate the amount of material covered in the module. (possibly the percentage of credit the module is worth)

4. PREREQUISITE MODULES - - - - - - - - - - - - - _____

    This is a list of not more than three module numbers of the modules considered prerequisite to this module. Entry modules or 'stand alone' modules would have no prerequisite modules.

5. PRETEST NUMBERS - - - - - _____

    Mode A: This is a list of not more than ten integer numbers identify-ing the particular skills needed to perform the learning activities in this module. An activities prescription will be output upon demonstration of those skills.

    Mode B: This is a list of not more than ten integer numbers identify-ing those pretest items which test the objective(s) in this module. Satisfactory completion of those items on the pre-test will permit bypassing this module for credit. (no activities prescription will be output)

66

6. DATE - _____

7. DAYS - _____

   This is the availability of the module. Learning activities
   will not be available before this date and must be completed
   within the specified number of days.

8. OBJECTIVE(S) -

   The objective(s) text will not be entered in the computer but will
   be given to all students in a printed study guide. There is no
   limit to the number of objectives for each module.

9. LEARNING ACTIVITIES -

   The learning activities (maximum of 50) are designed to provide
   various modes of instruction and are keyed to the objective(s)
   and briefly described as follows:

       NUMBER - - - - - - - - - - - - - _____

          This is a 2 or more digit number in
          which the left hand digits are the
          same as the objective it references.

       STYLE 1 - - - - - - - - - - - - - - - _____

       STYLE 2 - - - - - - - - - - - - - - - _____

          The style numbers are integers re-
          lating this activity to particular
          learning styles. (see special instruc-
          tions for determining these numbers)

       ACTIVITY -

          This is any sentence less than 65 characters
          in length which states the activity to be
          performed.

APPENDIX I

Module #125   Energy and Momentum

OBJECTIVES:

1. State or identify a precise definition of potential energy.
    The concept òf 'work' as defined in physics is to be used in
    that definition. Also identify (kg m^2/sec^2), (nt m) and
    (joules) as equivalent MKS units for potential energy.

2. Given the description of an object moving in a given force
    field, state whether the potential energy of that object is
    increasing, decreasing or remaining unchanged.

3. Calculate the change in potential energy of a body which is
    displaced from one point to another in the earths gravitational
    force field. (At the surface of the earth, the earth's field
    exerts a force of 9.8 nt toward the center of the earth's on
    each kilogram of mass.)

4. Given information concerning the properties of a spring (how
    much force is required to compress that spring a given distance),
    construct a graph of force versus compression and determine the
    potential energy of the spring when it is compressed a given
    distance.

5. State or identify a precise definition òf kinetic energy. Also
    state or identify the precise functional relationship between
    the kinetic energy and the velocity of an object.

6. Apply the principle of conservation of energy to calculate each
    of the following:

    a)   the speed an object has after falling from a given height.
    b)   the speed an object has after being fired from a spring ·
         gun

    In each case you will be given the mass of the object, the geometric
    dimensions of the system and enough information to fully define
    the force.

7. Given a description of a frictionless system such as a roller
    coaster, car coasting on a hill or a cyclest on a loop-the-loop:

I-1

apply the principle of conservation of energy to predict maximum heights and/or velocities of the object when given the initial total energy of the object.

8. State or identify a definition of 'power', and recognize the units (joules/sec) and (watts) as equivalent MKS units of power.

9. Given the power output of some device, calculate how high that device can lift an object in a given time.

10. State or select a written definition of momentum and state or select a correct phrase describing the functional relationship between momentum and velocity. Also identify (ig m/sec) as correct MKS units for momentum.

11. Given a description of an explosion type system (rifle recoil and buttet) or a simple inelastic collision type system (bullet hits block of wood); use the principle of conservation of momentum to find an unknown mass of velocity when given all other masses and velocities.

12. State or select a definition of impluse and show how Newton's second law of motion (F-ma) implies that the impulse $(F\Delta t)$ imparted to an object is equivalent to the change in momentum $(m\Delta v)$ of that object.

13. Find the impluse imparted to an object when given a graph of the force applied to the object as a function of the time it was applied.

14. Find the average force involved in firing a projectile at a given speed when given the mass of the projectile and the time during which the force acts.

15. Find the average force involed in firing a projectile a given distance. Information to be given will include the geometric dimensions of the device, the angle of elevation and the mass of the projectile. (Evaluation of this objective will include questions concerning all steps of the solution.)

PROPOSED LIST OF LEARNING ACTIVITIES

1. Textbook Reading:
   a. Reading assignments selected from the textbook.

2. Supplemental Reading:
   a. Any reading assignment outside of the textbook.
   b. Available in the learning center or library as indicated in the activity. (LC, Lib, Lib Res, etc.)

3. Minilecture:
   a. Any taped discussion not involving lab apparatus.
   b. Available at the learning center desk with supplemental printed information.

4. Demonstration:
   a. Any piece(s) of lab or demonstration equipment available with short printed instructions on how to use and what to observe.
   b. Available in the learning center under an appropriate standardized sign. (possibly a list of currently available demonstrations can be maintained on the bulletin board)

5. Narrated Demonstration:
   a. Same as 'Demonstration' except a tape player with an appropriate tape would be included with the equipment at the demonstration site.

6. Film Loop:
   a. Single concept films and film loops.
   b. To be checked out from the learning center desk and used in projectors located in the learning center.

7. Narrated Film Loops:
   a. Same as 'Film Loop' except an audio tape would be attached to the cassette to be used in a player located by the projectors.

I-4

8. Printed Lab Activity:
    a. Any lab activity in which printed information is used
       to guide the student through a process of data
       taking and data analysis.
    b. The printed information is to be picked up at the
       learning center desk and the lab equipment will
       be set up in the learning center under an
       appropriate sign.

9. Narrated Lab Activity:
    a. Same as 'Printed Lab Activity' except an audio tape
       would be used to guide the student through a
       process of data taking and data analysis.
    b. The tape would be available to be checked out at the
       learning center desk and used with the designated
       lab equipment.

10. Exhibit:
    a. Any poster, pieces of equipment, etc. used to
       illustrate specific ideas or problems.
    b. Placed in appropriate positions around the learning
       center or display case. (possibly a list of
       currently available exhibits can be maintained on
       the bulletin board)

11. Special Problems:
    a. Any specially prepared printed problem.
    b. Available at the learning center desk or placed
       where students can pick them up.

12. Textbook Problems:
    a. Any problem selected from the textbook.

13. Group Discussion:
    a. There will be groups of students meeting to discuss
       this topic. Add your name to a sign-up sheet or
       find another interested student and post a new
       sign-up sheet.

14. Computer Assisted:
    a. Go to any available computer terminal. You will
       receive instructions when you have typed RUN(41,99).
       Always bring pencil and scratch paper when you go
       for this type of lesson.

I-5

15. Instructor Conference:
    a. You should meet with your own instructor at this time.
        Please tell him that you are at a part of your
        · lesson that calls for activity number XXXX.

16. Demonstration-Lecture:

I-6

APPENDIX J

Use of Learning Styles to Prescribe Learning Activities

Background

The following information is taken from the summary of the final report on Phase I of the learning styles project prepared by John Banks.

This project was jointly proposed and submitted by Fox Valley Technical Institute, District 12, and the Center for Vocational, Technical and Adult Education at the University of Wisconsin - Stout to the Wisconsin Board of Vocational, Technical and Adult Education. The project was undertaken to investigate the interaction of learning styles and types of learning experiences provided to students in vocational-technical education.

In June of 1972 the original project was funded by the Wisconsin Board of Vocational, Technical and Adult Education. In the fall of 1972 the University of Wisconsin - Stout sub-mitted a sub-proposal to the Fox Valley Technical Institute to identify a sub-set of learning styles and to determine their relationship with the acquisition of technical skills and knowledges.

This study specifically identified two learning style continuums relevant to vocational and technical education programs. These two continuums were labeled as (1) concrete/ symbolic and (2) structured/unstructured. To measure these continuums two instruments were originally developed, a semantic differential and a Likert scale. The pilot in-struments were administered at the Fox Valley Technical In-stitute. Based on data gathered from the instruments, an individual was placed somewhere along each of the continuums. The relative position on a continuum determined the extent the individual was influenced by a particular learning style. An individual who located near the continuum midpoint would be affected by a composite of the continuum learning styles. A position near a continuum end was determined to show the individual as being highly affected by that style.

Phase II

This phase of the learning styles project deals with the problem of utilizing students' learning styles to prescribe individual learning

styles to prescribe individual learning activities. A student highly affected by a particular learning style would prefer to achieve the course objectives through those activities which most closely match his style of learning. This requires an individualized environment in which each student may engage in a unique set of learning activities.

A computerized system for providing student with a set of activities which most closely correlates with their styles of learning has been constructed. To achieve this matching of activities with students requires the input of "styles" information on both student and activities.

Student Information

The two learning style continuums identified by John Banks will be used in Phase II. Also, the learning style opinionnaire constructed and tested by Banks will be used to place each student along the continuum of the two styles. The opinionnaire will be administered on the opening day of classes and the information which consists of two numbers/student entered into the system through a terminal. If an electronic device is used for summarizing the papers, the styles for a few hundred students can be entered into their personal records in a few hours.

Activity Information (for the physics project)

The learning styles opinionnaire was administered to 93 students enrolled in Physics 223 in the Fall semester 1973. The results are as follows:

symbolic 11 _____ ave = 37 s = 3.4 _____ 55 concrete

unstructured 11 _____ ave = 33 s = 4.2 _____ 55 structured

These data will be used to arbitrarily associate each proposed learning activity in the basic physics modules with a point on each of the two style continuums.

The activities will then be ranked according to the degree to which they correspond with the students styles and presented in that order. The first activity associated with each objective will then be the activity which most closely matches the students prefered styles of learning.

79

APPENDIX K

INFORMATION TO STUDENTS

This is a description of the procedures you must follow to select a course of study and become enrolled with the Computer Managed Instructional System. Each step outlined below must be followed in the sequence in which it is presented.

I. Pretest and Learning Styles Questionnaire

   1. Pretest--This test will be administered on the first day of class and the results will be entered into your record.

   2. Learning Styles Questionnaire - this is a short questionnaire which is designed to provide information concerning your preferred modes of learning. The results of this questionnaire will also become part of your record and will be used later to provide individualized learning prescriptions.

II. Constructing Your Program

   A list of available modules are attached to this information sheet. You are to select those modules which you want to be included in your program of study. Pay particular attention to prerequisite requirements and availability dates so your program and planned dates of starting each module do not conflict with the given information.

   Select your program and write the module numbers and expected starting dates below:

Module Nbr	Expected Starting Date Month	Day
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
_____	_____	____
