ABSTRACT
              This study was designed to determine whether student
teachers receiving human relations training along with their student
teaching experience would show any changes in their self-concepts and
to see if these changes were significantly different from those of
student teachers involved in the student teaching experience only. A
30-hour, Carhuff-based, human relations training program was provided
for two groups of student teachers concurrently with their student
teaching experience. At the end of the program, participants showed
highly significant gains in self-concept as measured by the Tennessee
Self Concept Scale and favorable gains according to the Personal
Orientation Inventory. When compared to a control group of student
teachers who received no human relations training, results indicated
that student teachers receiving human relations training made
significantly greater gains in self-concept. These conclusions lend
support to the movement to include affective education in teacher
education programs. Attached are outlines for 15, two-hour, human
relations training sessions. (Author/MM)

A STUDY OF THE EFFECTS OF HUMAN RELATIONS TRAINING ON THE SELF-CONCEPTS OF STUDENT TEACHERS

Leila McCormick Acklen, Ed.D.

Memphis State University

PURPOSE OF THE STUDY

The major purpose of this study was to determine whether or not student teachers receiving human relations training along with their student teaching experience would show any changes in their self-concepts. A second purpose was to see if these changes were any different from those of student teachers who were simply involved in the student teaching process.

RATIONALE FOR THE STUDY

Positive, adequate self-feelings are fundamental to achievement, acceptance of self and acceptance of others. These same feelings of adequacy and self-acceptance are basic to the competency and self-reliance so needed by persons in the ever-changing times of today's world. One may be motivated to achievement and adequacy by slight deprivations but overwhelming feelings of inadequacy, negation and failure at acceptance lead to unhappy, unproductive and self-centered existence. The present study

1

was an effort at contributing to the development of positive self-other perceptions through the use of the human relations training. These differences in perceptions were measured by the Tennessee Self Concept Scale and the Personal Orientation Inventory.

PROCEDURES

Selection of the Sample

The sample consisted of 100 subjects selected from student teachers in the Teacher Education Program at Memphis State University in the fall of 1973. Student teachers in the Resident Intern Program (N=25) formed the experimental group. Students in this program combine methodology with classroom experience in a two-semester sequence. Because of this programming it was possible to add human relations training to the course schedule. The experimental group was divided in two subgroups: Experimental$_1$ (E$_1$) and Experimental$_2$ (E$_2$). E$_1$ (N=14) was made up of students in their first semester of experience and was located in the University Laboratory School. E$_2$ (N=11) was made up of students in their second semester of experience and was located in an inner-city school. Both groups of students received 30 hours of human relations training concurrently with their student teaching experience. None of these students had experienced this type of training previously. They were tested for self-concept levels before and after

3

the training. Students in the experimental groups cooperated fully with the study.

Students in the traditional teacher education program composed the control group (N=75). Because of the difference in the length of time spent in classroom experience, this group subdivided itself into two components: $Control_1$ (C_1) and $Control_2$ (C_2). $Control_1$ (N=38) did their student teaching for a nine-week period; $Control_2$ (N=37) was in the classroom for six weeks.

Source of the data

Data for this study were generated from the pretest and posttest scores secured from the administration of the two instruments, the Tennessee Self Concept Scale (TSCS) and the Personal Orientation Inventory (POI). The Tennessee Self Concept Scale, developed by Fitts (1964), is a measure of how one views himself, how one feels about himself and how one appraises his actions in relation to himself. The Personal Orientation Inventory by Shostrom (1966) measures psychological positive health based on personality growth theories.

Treatment

The experimental groups ($Experimental_1$ and $Experimental_2$) received 30 hours of human relations training carried out in two-hour sessions. The groups met for ten hours during the

first two weeks of intensive campus work at the beginning
of the semester and then each week for ten weeks in two-
hour sessions during their student teaching experience.
The investigator served as facilitator for both groups
and carried out comparable sessions.

The human relations training used in this study is
based on that presented in the Association of Teacher Edu-
cators Workshop in 1973 (see Attachment). It included
theoretical instruction as well as skill development. A
variety of classroom procedures were used in the develop-
ment of the course including small group exercises, audio-
taping, video-taping, and role playing. During the initial
ten hours of the course the human relations model was
presented. The remainder of the course centered around
the development of perceiving and responding skills with
emphasis being placed on the facilitative conditions of
empathy, respect, and warmth, and in the initiative
characteristics of action and confrontation.

Statistical Analysis of Data

The t-test was used in examining the data generated
in the experimental group between the pretest and posttest
for those receiving human relations training. The analysis
of covariance was used to test for differences between the
experimental group and the control group as well as the
control group and Experimental$_1$ (laboratory school setting)

and Experimental$_2$ (inner-city setting). Differences were also tested between the experimental group and the two controls groups, C_1 (nine weeks of student teaching), and C_2 (six weeks of student teaching). The .05 level of significance was used for the purpose of accepting or rejecting the hypotheses under investigation.

Whenever significant F-ratios were obtained in the analysis of variance, Duncan's Multiple Range Test was used to determine which means were alike and which were significantly different.

SUMMARY OF FINDINGS

Two hypotheses were tested for self-concept changes in relation to human relations training using two instruments, the Tennessee Self Concept Scale and the Personal Orientation Inventory.

Hypothesis 1. The first hypothesis (null form) that there would be no difference between the self-concepts of student teachers before and after receiving human relations training was rejected at the .001 probability level for Total Positive Scores. The data supports the notion that human relations training makes a significant difference in the way one feels about self and others. When examined individually the scores on criterion measures Behavior, Physical Self, and Personal Self were found to be highly significant reaching the .001 level of significance.

The scores on Self-Satisfaction and Social Criterion measures were slightly less significant at the probability level of .002. Identity and Moral/Ethical measures were significant at the .05 level of significance with only the measure for the Family failing to gain the .05 level of significance. On the Personal Orientation Inventory changes on all criterion measures were in the positive direction except for Feeling Reactivity. On one measure, Spontaneity, the t-value reached the probability level of less than .004.

Hypothesis 2. The second hypothesis (null form) stated that there would be no difference between the self-concepts of student teachers receiving human relations training and those not receiving such training. The hypothesis was rejected at the .01 level of significance for Total Positive Scores and for each of the criterion measures. The analysis of the data shows that there was a significant difference at the .01 level in favor of the group receiving human relations training.

Though significant gains were not found in the Personal Orientation Inventory scores, changes in the direction of the group receiving human relations training were recorded. The dimensions of the POI are deep-grained character traits which are developed and sustained over long periods of time. For significant changes to occur in these basic traits a longer training period would probably be necessary.

7

Additional analyses were made to determine the effects
associated with the location of student teachers in two
settings, the University Laboratory School and an inner-city
school. It was found that the means of the inner-city
group were higher than the University Laboratory Group but
not significantly so. The group assigned to the inner-city
school had had one previous semester of classroom experi-
ence but no prior human relations training. It is notable
that the classroom experience improved the self-concept
scores but not significantly. Whereas both groups of
students receiving human relations training showed signi-
ficant gains.

When the data were analyzed to determine the effects
of the length of student teaching experience on the control
groups it was shown that student teachers who had nine
weeks of student teaching experience showed higher means
than those who had six weeks of student teaching experience,
but not significantly higher.

CONCLUSIONS

The conclusions which follow are made on the basis of
the data compiled in this study and on the statistical
analyses made on these data. The conclusions are summarized
under the two hypotheses.

Hypothesis 1:

When given concurrently with student teaching and in concentration of approximately thirty hours, human relations training makes a significant difference in the self-concepts of student teachers as measured by the Tennessee Self Concept Scale. Though not to a significant degree, human relations training appears to tend to affect positively the deep-grained personality dimensions of student teachers when measured on the Personal Orientation Inventory.

Hypothesis 2:

Student teachers receiving human relations training showed significantly greater gains in self-concept than did student teachers not receiving human relations training. Though the personality dimensions did not change significantly in the group trained in human relations there was a change in the positive direction.

CONCLUSIONS NOT RELATED TO THE HYPOTHESES

Further conclusions to be drawn from the study are:

1. When the length of the student teaching experience is at least a nine-week period student teachers show overall gains in self-concepts. In shorter periods of student teaching self-concepts scores tend to fluctuate.

2. When student teaching is carried out for two semesters, the self-concepts of student teachers are not

significantly greater than the self-concepts of those stu-
dents experiencing one semester of student teaching.

3. The location of student teachers in inner-city set-
tings does not adversely affect the self-concepts of students
when accompanied by human relations training.

EDUCATIONAL IMPLICATIONS

Teacher educators and public school administrators in
analyzing the findings of this study will find many impli-
cations for teacher training. The more apparent and crucial
ones are:

1. Human relations training might well be a recognized
part of the teacher training program preparing teachers for
the classroom. All teacher education classes should be
conducted as a laboratory applying human relations prin-
ciples.

2. Human relations principles could be the basis for
the analysis of problems arising in teacher education prog-
rams both before and concurrently with experiences with
children.

3. The period of human relations training should be
such that the student teacher exhibits the ability to
perform in action according to human relations principles.

4. Human relations training should be included in the
in-service program for all teachers now working with
children. This could be done in a longitudinal way with

continuing evaluation and feed-forward of information coming from participants.

5. The human relations training sessions should be such that all participants experience success; thereby increasing the probability that it will improve self-concepts and be incorporated into the person's life style.

6. The student teacher's view of the teacher educator is apt to influence to a large extent his incorporation of various modeled behaviors. It is therefore important that teacher educators have acquired proficiency in human relations principles.

7. Teacher education institutions are laboratories in which ideas concerning teaching behaviors are acquired and changed. Institutions which allow and encourage maximum student teacher interaction are likely to produce students who view themselves in positive ways and therefore become creative productive teachers.

8. Since much behavior is acquired through modeling it becomes mandatory that teachers and teacher education institutions demonstrate positive regard for each other in the presence of students. This suggests the need to have active faculty-student decision-making committees.

RECOMMENDATIONS

The following recommendations are made for further research:

1.   That additional studies which correlate human
relations training, human relations skills in the classroom
and self-concepts be undertaken for pre-service and in-
service teachers.   Interaction Analysis should prove
instructive.

2.   That research which measures the effects of
teacher self-concepts and human relations skill level on
the self-concepts of children in the classroom be under-
taken.   This study should measure the effects at various
points in time over an extended period of time.

3.   Longitudinal investigations are needed to deter-
mine the sustained effects of teacher self-concepts and
human relations skill levels on the self-concepts of
children.   In this investigation children should be
assigned to teachers with particular self-concepts (high,
moderate, low) and particular skill levels (high, moderate,
and low) for several years.

4.   That research which measures the self-concepts
and human relations skill level of college supervisors and
cooperating teachers with the self-concepts and human rela-
tions skill level of student teachers be undertaken.

5.   That studies be undertaken to see if there is a
difference in the self-concepts of students at varying
points in their proficiency development.   Self-concept
tests could be applied at the end of Phase 1 when students

are proficient in empathy, respect, genuineness, at the end
of Phase 2 when they have added proficiency in appropriate
self-disclosure, and again at the end of Phase 3 when the
dimensions of confrontation and immediacy have been added
to their human relations skills.

6. That a study be undertaken to see if human rela-
tions training placed earlier in the curriculum and not
associated with student teaching would effect self-concept
changes. Additional later testing to see if self-concept
training has a lasting effect could be carried out.

7. That a study be carried out which relates student
self-concepts to interests and attitudes. This study could
be done prior to student teaching. Further studies could
relate these findings to success in the classroom in student
teaching.

8. That a replication study of this research be
carried out by persons with different self-concepts and
different human relations skill levels.

9. That a follow-up study to determine the effects
of the location in the inner-city on the self-concepts of
student teachers having human relations training and not
having previous student teaching experience be carried out.
Comparisons could be made with student teachers not having
human relations training and being located in the inner-city
for student teaching experience.

ATTACHMENT

Materials used in the Attachment were taken from the
Association of Teacher Educators Workshop with Dr. Thomas
L. Porter (1973). Additional resources were used from
Human Relations Development by George M. Gazda (1973), and
Human Relations Development: A Manual for Educators by
George M. Gazda, et al., Boston: Allyn and Bacon, 1973.

HUMAN RELATIONS TRAINING
Fifteen Two-Hour Sessions

TRAINING BEFORE STUDENT TEACHING

Session One: Need for Human Relations Training

    Objective: Student will be able to identify needs for
                  training in human relations
    Pretest: Index of Perception
                  Index of Communicating
    Methods: Large Group Discussion
    Text: Chapter 1

Behavioral Roots

    1.   People want to feel good about themselves. All
behavior can be explained here. Most of the things we try
won't work--drugs, alcohol, chrome on autos, suicide (I
hurt so bad I'd be better off not existing). List on board
in duscussion things people do to feel better about self.
NOTE: What works for one does not necessarily work for
another.

    2.   We can help each other by listening and responding
with understanding. But people don't listen. Failure to
listen is the root of most frustration and problems. Listen
to understand that people want to feel good about self--How
can I help him?

    3.   There is within man a basic need to be productive.
Work is part of man's struggle to survive. Laziness means
resisting. Behavior modification rewards positive behaviors.

Session Two: Building a Base of Understanding and Respect

    Objective: Student will be able to describe a base of
                  understanding. Student will be able to
                  tell factors that contribute to building a
                  base of relationship

    Method: Large Group Discussion
   Text: Chapter 2

Building a Trusting Relationship

    Before we can move into indepth relationships we must
develop a base of understanding and respect.
    We must reduce the distance between self and people
we want to help. We all know how to increase distance.

Brainstorm:
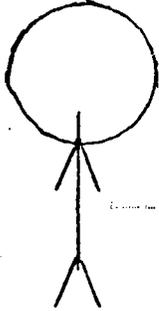

Things That Separate
Look Globally

Race	Age	Color
Hair	Speech	Taste
Politics	Likes	$
Sex	Education	
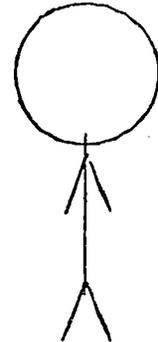

People relate best to   ho are like themselvs.
We are aid to relate be   who are within one
standard deviation of where we are.

One of the best ways to feel good about self is to help
others feel good about themselves. The best thing we can do
for any person is to develop with him a good caring rela-
tionship. If we can develop ways to help children to ade-
quate self feelings we have something to build on.

We can learn to communicate understanding and we can
teach people to communicate understanding.

	Facilitation		Action
Trust	Empathy		Confrontation
Base	Respect		
	Warmth		

Key ingredients must be present
(Figure 2, p. 25 text)

Confrontation

Confrontation deals ⊥th the discrepancies between wh ⇒
a person is and where a person could be

is   could be

Evaluation
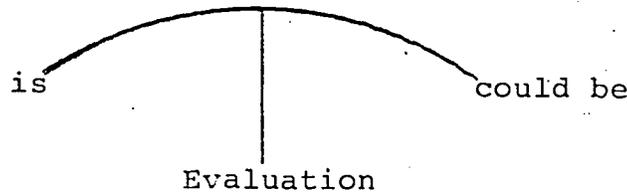

We fill the discrepancy with what know-how we have. Person
needs to experience success; he needs to feel self-enhanced.

Session Three: Presentation of Model

Objective: Students will be able to identify the major
              components of the model

                        Students will be able to discuss the mean-
                        ing of each component
         Method: Discussion
         Text: Chapter 3

   Ask students to think back on their experiences to the
teacher or teachers or other important persons in their lives
who had the greatest positive impact on them. Or ask class
to describe the characteristics of a person they would go to
for help.
   As the class relates these characteristics they seem to
fall in two basic categories. The first category will have
the characteristics which have to do with understanding him
and respecting him. The second group will have to do with
the significant person's willingness to be frank and honest
with the principles and direction which he gave to the
student from his own life. Thus variables such as concerned,
listener, understanding, honest, knowledgeable can be placed
in categories.
   List characteristics on board, then take what we have
found to be helpful and validate it.

         Facilitative   Action
         Empathy | Confrontation
         Respect   Expertise
         Warmth |
                     Concrete
                     Immediacy
                     Genuineness
                     Self-Disclosure

Eighty per cent of words listed come under facilitative and
respect gets most of the entries listed. This shows a
close relationship to feeling good about self.

                        Respect

   Respect is hard to identify, to teach. We know when
its not there. We can tell when it is present. When we
communicate understanding it is empathy but it comes out
respect. Empathy can be measured.

                  The Measurement Scale

4 Additive - deals with subtl
3 Interchangeable response - contents and feeling
2 Subtractive
1 Harmful, defensive, irrelevant

Threes allow a person to continue to explore. Ones beget ones. They say I am defensive and they cause other persons to get defensive.

<u>Sessions Four and Five</u>: The Act of Perceiving and Responding

Objectives: Students will be able to discriminate content as well as feeling
             Student will be able to respond with empathy
Method: .   Paper and pencil exercise
Text: Chapters 4 and 5

Each participant is asked to complete the following statement.
When it comes to my _____ (work, husband, child, car, grades) I feel . . . .
Statements are collected by leader. He says a little about empathy.
Empathy is a term for understanding. It is the ability to see the world through the eyes of the other person. In helping it means that the helper <u>feels</u> and experiences the world the way the helpee experiences it.
Statements are now distributed to class. Each student is asked to write a response aiming at a level 3 response which will enable person to be free to go on and explore feeling or problem.
Leader collects statements with responses. .

Group participates in:
Listening to each statement as leader reads.
Discriminating feeling and content in statement.
Listening to response written by student.
Person who owns statement feeds back effectiveness of response.
It will be noted that people give one major feeling. They may disguise it, garble it, distort it but the feeling is recurring. In responding to the feeling short responses are better than long ones. Positive statements are better than questions. Don't use statements like, "I understand what you are saying" or labels like "your statement is logical."

<u>Phases of Help</u>

	I	II	III
Helper Task	Listens until problem is defined (Facilitation)	Help evaluate and consider (facilitation and Action)	Reinforce Action (Facilitation and Action)

I	II	III
Helpee Explores Problem	Consider Alter-	Act on
Task	natives	Alterna-
		tives p. 29

Problem Solving Procedure:

1. Identification of problem
2. Defining the goals
3. Possible courses of action
4. Choosing course of action

TRAINING IN ASSOCIATION WITH STUDENT TEACHING

<u>Sessions Six and Seven</u>:   Perceiving and Responding

    Objective: Student is able to perceive surface and
                underlying feelings.
                Student is able to respond with care and
                empathy.
    Text: Chapters 4 and 5
    Procedure:

Each person has been asked to bring to class a school
problem. Write on 3 x 5 cards. Cards are distributed to
class members. Class is divided into dyads. One person
reads stimulus statement. All discriminate feelings.
Each person formulates response. Each person reads his
response to group. All evaluate response.

<u>Session Eight</u>:   Barriers to Effective, Helpful Communication

    Objective: Student will be able to discriminate
                responses which have depreciating effects
                upon communications.
    Methods: Discussion and Lab experience
    Text: Chapter 6

<u>Common Problems in Communication</u>

One common problem in perceiving is labeling or diag-
nosing. Words like "defensive," "inadequate," "inferior."
These words when placed in the sentence usually block com-
munication and build barriers. They should be discarded in
favor of words that more clearly communicate empathy and
understanding. Another problem which occurs is making
discrimination of a person's feelings externally, deciding
what he ought to feel or should be according to the helper's
attitudes, ideas or biases.

A further error in communicating is responding in a
way which requires a terminal reply, a reply which has a

tendency to stop the dialogue. Capping off in communication occurs when the dialogue is ended prematurely.

First experience:
Students will identify barriers to communication produced by stimulus statement by pupil

Stimulus statement: I'm sick and tired of being treated like a dog. Leader reads response, pupils identify:

1. Ordering or commanding: Stop feeling sorry for yourself; don't feel like that.
2. Admonishing: You'd better be thankful you didn't get expelled.
3. Threatening: You keep talking like that and you're going to the office.
4. Advising: If I were you I'd go talk to the counselor.
5. Instructing: Start thinking of yourself in other ways.
6. Criticizing: You're just making things worse on yourself by feeling that way.
7. Praising and agreeing: A lot of pupils feel that way; gee, I don't blame you.
8. Name calling: Listen boy, you've got to behave yourself like a man.
9. Interpreting: You're just unhappy.
10. Reassuring: You'll feel better, don't worry about it.
11. Probing or questioning: Why do you feel that way?
12. Diverting (often by humor): Treated like a what? Now that is silly!

Second Experience:
After examining responses, consider how they retard the goals of communication and deny the right of the person to own the feeling. They tend to close off understanding, put people off and make them feel you don't care or don't want to be involved. The person may well infer, "I'm not understood, I shouldn't have this feeling." This may generate frustration, anger, a power struggle between you and helpee.

A. Examine what person (in stimulus statement) is saying.
B. Try giving back to the helpee in a sentence using the words "you feel_____."

Session Nine: Non Verbal Behaviors

Objective: Trainee will be able to identify non verbal behaviors which are attending, and facilitative.

Trainee will be able to identify non verbal
indications of nervousness, unsureness,
lack of interest, etc.
Text: Chapters 7 - 10.

Non verbal behaviors are little analyzed and seldom
fedback in the American culture. We receive little or no
training on the subject, and yet from the way we ` :ld our-
selves to the way we walk we are revealing much about what
we ar feeling.

Exercise:
Students will draw non verbal communications listed
on slips of paper. Each communication will be role played
and group will identify it, listing messages which may be
contained in its use.

Sessions Ten and Eleven: Facilitative Communication Styles

Objectives: Trainee will be able to use a variety of
communication leads.
Trainee will be able to use appropriate
descriptions of perceived feelings.
Text: Chapters 11 and 12

"To understand another person's feelings and experi-
ences we need to be able to enter his phenomenal field, his
personal frame of reference through which he interacts with
his world." (p. 161 Gazda, 1973)
Definitive, limited, positive statements have a limited
understanding for many people whereas open more tentative
statements allow person to find his own place within the
response.
Students will choose a partner and alternately formulate
responses using phrases on p. 161 (Appendix D).
Students will write descriptions of situations which
apply to ten of the objectives found in Appendix E (p. 163).
Students will work through interaction mazes in
Appendix F (p. 168-195) to determine their progress at this
point. (Sessions were video-taped)

Sessions Twelve and Thirteen: Introduction of the Initiative
                                 Characteristic

Objective: Student will be able to define confrontation.
Student will be able to formulate confronta-
tion responses at a minimal level of 3.
Method: Discussion
Text: Chapter 13

To this point we have been examining skills which respond to the helper. We have resisted our tendencies t tell the helpee what we are feeling. This condition c concern. It has been more like w jigsaw puzzle where all the pieces are laid face u the table and you are turning one over at a time and describing what you see on the surface. What we do next is to begin to get some idea of how the pieces are related, what kind of pattern they are forming. Like the patterns of sky or tree or grass in the jigsaw puzzle. Moving to the additive level is putting the individual helpee statements together in an integrating theme that provides more understanding than just the sum of the parts. When the helper is able to communicate the integrating theme that he perceives in the helpee's statements, he is communicating at the additive level. Don't move too fast or jump to conclusions until the pieces fit.

Helper should give six or more interchangeable responses before moving to communication at higher levels. Then he is able to say "what I really hear you saying is that _____."

Role play in the large group using stimulus material in chapter 17.

The most common error in confrontation is overstating the discrepancy. Practice accurate confrontation in facilitative ways. (Sessions were audio-taped)

Sessions Fourteen and Fifteen: Communication of Full Responsive and Initiative Characteristics

Objective: Student will show proficiency in knowledge and use of Model
Method: Discussion, large group lab, and small group lab
Text: Chapters 14, 15, and 16

The third goal of helping is action. As you will recall, the first goal is exploration or base building; the second goal is understanding; and the third goal of helping is action. Present on blackboard the total helping model. Go through it with the class in detail pointing out the helper's function and what it facilitates the helpee to do in achieving the three goals of helping.

Posttest. Students are asked to take same test they took in beginning and redo answers checking to see what improvements they themselves made.
