AESTRACT
The principal objectives of the College Bound Summer Program, funded under the Elementary Secondary Education Act Title $I$, were to improve student's reading and mathematics, increase their ability to do college work, and make the students' transition from junior high to high school easier. Program participants were selected on the basis of either performance on the Stanford Achievement test or recommendations from junior high school counselors. During each day of the program, students participated in three classes: remedial reading, corrective mathematics, and a reading or mathematics workshop. An ESL program with the same goals, and using the audiolingual approach, was a part of the program. For ESL classes all materials were in English and Spanish, and bilingual educational assistants were employed. It was found that the program produced significant gains in reading and mathematics for all groups of participants. (Author/JM)

## COLLEGE BOUND PROGRAM

Summer 1975

Chapter I: THE PROGRAM

The College Bound Summer Program was conducted for six weeks from July 1 through August 11, 1975. Clasges were held five days a week Eor three hours in the morning at the following New York City High Schools: Bushwick, Charles Evans Hughes Annex, John Jay, Morris, Walton, and George Washington Annex. Facilities were established to accomodate 1,150 9th and 250 loth grade students.

As its principal objectives, the program aought to overcome students' academic weaknesses in reading and mathematics, increase their potential for doing college work successfully,. and facilitate students' transition from junior high to high school. Students were selected for participation in the program based on scores falling below grade level on the stanford Ashievement Test administered to students in junior high and non-public schools in the spring of 1975, Linguistically isolated atudents were chosen on the basis of recommendations of their junior high school counselors.

During each day of the program, students participated in three one-hour classes, one each deroted to remedial or corrective reading, corrective mathematica, and a reading or mathematics workshop. Reading classes were structured to enhance the development of such skills as: vocabulary building, interpreting words in context, getting the main thought,

#### Abstract

finding and relating details, determining sequence, drawing inferences, and basic information gathering skills. Also, reading classes were equipped with a variety of general rasidng material, such as contemporary and classic novels and biographies.

In corrective mathematics classes, an effort was made to develop and reinforce basic mathematical skills, including factoring, understanding and solving equations, relating fractions to decimals and percentages, and perceiving relationships between. fractions and whole numbers. Attention was focused on the students' ability to read exponents, formulas, subscripts, equations, and reference tables.

A heavy emphasis was placed on the use of diagnostics to determine students' strengths and weaknesses in reading and mathematics. Individual reading and mathematics sub-test scores on the California Achievement Tests and the SRA criterion referenced test were used by teachers to earmark deficiencies. and, through a program of individualized instruction, concentrate on strengthening these academic weaknesses. In fact, individualized instruction was the principal teaching method in the summer program.

The reading and mathematics workshops consisted of activities selected with the purpose of doveloping and reinforcing reading and mathematical skills. Among these activities were the preparation of a class newspaper, solving mathematical puzzles and playing mathematical grimes, using calculators, learnisg about poetry, and engaging in dramaiic activities.

An ESL program, with the same goals and using the audiolingual approach, was a part of the College Bound Summer Program. Besides instruction, all materials were in both English and Spanish, and bilingual educational assistants were employed for ESL classes.

## Chapter II: EVALUATIVE PRÓCEDURES

Evaluation Objective \#l, To determine whether, as a result of participation in the Remedial Reading Program, the reading grade of the students showed a statistically significant difference between pretest score and posttest score in the positive direction.
l.l Subjects: All participants in the program.
1.2 Method and Procedures: The appropriate level of the California Reading Achievement Test was administered during the first week and again during the last week of the program.
1.3 Analysis of Data: Data were analyzed through the use of a t test for correlated data. Pre-posttest differences between raw score means were tested for statistical significance at the minimum . 05 level. Separate analyses were performed for 9th grade, loth grade, and ESL students.
1.4 Time Schedule: Pretest was administered during the first week and posttest during the last week of the program. Evaluation Objective \#2: To determine whether, as a result of participation in the Remedial Mathematics Skills Program, the mathematics grade of the students showed a statistically significant
differance between pretest score and posttest score in the positive direction.
2.1 Subjects: All participants in the program. Nethod and procedures: The appropriate level of the california Mathematics Achievement Test was administered during the first week and again during the last week of the program.
2.3 Analyois of Data: Data were analyzed through the use of a t test for correlated data. Pre-posttest differences between raw score means were tested for statistical significance at the minimum . 05 level. Separate analyses were performed for 9th grade, loth grade, and ESL students.
2.4 Time Schedule: Pretest was administered during the first week and posttest during the las: week of the program. Evaluation objective \#3i To determine if, as a result of participation in the program, 70 percent of the participants demonstrated mastery of at least one instructional objective, in reaing and mathematics, which prior to participation in the program, they did not master.
3.1 Shojects: All participants in the program at walton High School.
3.2 Methods and Procedures: All participants in the program were administered a criterion referenced test developed by SRA on a pre-posttest basis. For each instructional objective, data were compiled on the number of participants passing and failing on both the pretest and the posttest.
3.3 Data Analysis: Data were analyzed and presented in tabular
form showing the percentage of participants demonstrating mastery or non-mastery of each instructional objective (according to the SED classification system) at initial and final testing. Data were analyzed separately for 9 th and loth grade students, and separately for reading and mathematics.
3.4 Time Schedule: Initial testing took place during the first week of the program. Final testing took place during the last week of the program.
3.5

Instructional objectives: Table 1 presents a listing of the instructional objectives and the SED indices and SRA codes representing these objectives.

Evaluation Objective \#4: To determine, as a result of participation in the program, the extent to which students demonstrated mastery of instructional objectives.
4.1 Subjecta: All participants in the program at walton High school.

Methods and Procedures: All participants in the program were administered a criterion referenced test developed by SRA on a pre-posttest basis. Program personnel recorded pre-posttest results in the pass/fail mode by student and instructional objective on the Class Evaluation Record. A summary of these data was prepared.
4.3 Data Analysia: Data were analyzed and presented in tabular and narrative form in order to show each of the following: a. The distribution of students failing to demonstrate mastery prior to instruction and not receiving sufficient instruction to receive a posttest.

b. The distribution of students demonstrating mastery of objectives prior to instruction.
$+$
C. The distribution of student mastery as a result of instruction by instructional objectives.
d. The distribution of the number of objectives mastered as a result of instruction.
e. The distribution of the percentage of students achieving various levels of mastery of instructional objectives.

Data were analyzed separately for 9 th and loth grade students; and separately for reading and mathematics. Time Schedule: The pretest was administered during the first week of the program. The posttest was administered during the last week of the program.

Evaluation objective \#5: To determine the extent to which the program, as actually carried out, coincided with the program as described in the project proposal.
5.1 Subjects: All participants in the program.
5.2 Methods and Procedures: Operation of the program was observed by way of site visits. Personnel and participants were interviewed also.
5.3 Data Analysis: Information was analyzed to determine the extent of conformity between proposal and program. Significant discrepancies were described.
5.4 Time Schedule: Information was gathered throughout the duration of the program.

Note: It should be noted that not all participants in the program were represented in the data analysis." Posttesting was not done
for a relatively small percentage of participants (4\%) because of Justifiable reason, such as having to enter the hospital, being out of the city during testing, or discontinuing the program. Chapter III: FINDINGS

Evaluation objective \#l: To determine whether, as a result of participation in the Remedial Reading Program, the reading grade of the students showed a statigtically significant difference between pretest score and posttest score in the positive direction.

An examination of Table 2 reveals that each group tested for reading, 9 th grade, loth grade, and bilingual students, showed a highly statistically significant difference between pretest and posttest mean reading achievement score in the positive direction. Evaluation objective \#2: . To determine whether, as a result of participation in the Remedial Mathematics Skills Program, the mathematics grade of the students showed a statistically significant difference between pretest score and posttest score in the positive direction.

Results presented in Table 2 show that each group tested in mathematics, $9 t h$ grade, lOth grade, and bilingual students, demonstrated a highly statistically significant difference between pretest and posttest mean mathematics achievement score in the positive direction. Evaluation objective \#3: To determine if, as a result of partici-: pation in the program, 70 percent of the participants demonstrated mastery of at least one instructional objective in reading, and mathematics, which prior to participation in the program, they did not master.

## table 2

Results of Corre sdt Tests Between Pretest and
Posttest reicipants

|  | N | Pretest Mean | Posttest Mean | $t$ | signifi- cance. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 9th Grade Reading | 684 | 40.89 | 46.85 | 22.75 | $\mathrm{p}<.001$ |
| 9th Grade Math | 696 | 23.04 | 29.67 | 26.76 | 2<.001 |
| 10th Grade Reading | 208 | 44.87 | 50.06 | 9.67 | $\underline{p}<.001$ |
| 10th Grade Math | 205 | 26.94 | 33.45 | 14.69 | $\mathrm{p}<.001$ |
| Bilingual Reading (nil 9th Grade) | 76 | 28.71 | 34.19 | 7.93 | $\underline{p}<.001$ |
| Bilingual Math <br> (All 9th Grade) | 81 | 20.56 | 27.64 | 11.06 | p<.001 |

Results presented in Table 3 indicate that. 70 percent of both the $9 t h$ grade and loth grade students demonstrated mastery of at least one instructional objective, in reading and mathematics, that they had failed to master before exposure to instruction. Evaluation Objective \#4: To determine, as result of participation in the program, the extent to which asudents demonstrated mastery of instructional objectivea.

Table 4 presents the distribution ois students failing to demonstrate mastery of objectives prior to instruction and not receiving sufficient instruction to receive the posttest. Overall, the small number of $9 t h$ grade students in this category (no loth grade students) failed most of the instructional objectives.

Table 5 presents the distribution of students demonstrating mastery of objectives prior to instruction. Examination of this table reveals that most students falled more instructional objectives than passed them prior to instruction.

Table 6a presents the distribution of atudent mastery in reading as a result of instruction by instructional objectives. Table 6b presents the distribution of student mastery in mathematics as a result of instruction by instructional objectives. Examination of Tables 6a and $6 b$ reveals the instructional objectives that were athe most and least difficult to master. It is interesting that the $9 t h$ and loth grade students showeil similar patterns of difficulty in mastering the instructional objectives attempted.

Table 7 presents the distribution of the number of objectives mastered as a result of instruction. Comparison of the results presented in Table 7 (posttest) with those presented in rable 5

(pretest) shows a strong shift toward achieving greater mastexy of the instructional objectives in reading and mathematics for both the 9 th and loth grade students.

Evaluation objective \#5: TO determine the extent to which the program, as actually carried out, coincided with the program as described in the project"proposal.

Data pertalning to this objective were obtained thrcugh site visits to each high school, at which, classroom instruction and activities were observed, and teachers-in-charge, teachers, guidance counselors, educational assistants, and students were interviewed. The following narrative, besides bearing on discrepancies between the proposed and the actual program and the adequacy of the facilities and materials, includes observations and commentary concerning the program.

Without doubt the strongest component of the program was the individualization of instruction. Almost all teachers employed this method as their principal teaching technique. It is believed that the significant gains evidenced by the students in the program were in a large part attributable to the use of this method. Individualized instruction is especially effective with students needing remediation. It relies heavily on the technique of diagnosing weaknesses and applying extra effort to strengthen these weaknesses: Individualized instruction allows close contact between teacher and student, which may satisfy emotional needs of students. Moreover, it prevents a student from mentally tuning out a teamer or from "hiding" during a traditional class lecture and discussion. Erom observation of classroom behavior, it appeared that studentsisen not discouraged by long sessions of

$$
-17
$$

working by themselves.
The teachers almost universally appeared to be effective and dedicated to helping studerits improve skills. Most of them were Veterans of the College Bound Program. They showed a genuine concern for students and their academic progress, and they interacted well with students-a task made easier by the highly motivated, self-disciplined stuanants.

As far as the educational assistants were concerned, most teachers were happy with their above-average quality. Several educational assistants were teachers themselves. They appeared to be effective teacking assistants, and they interacted well with students. Educational assistants were especially important and useful for individualized instruction. Some of them were actually College Bound graduates.

The guidance counselors appeared to be doing a competent job. They had regular contact with students and parents. They gave prompt attention to problems, such as excessive absence. What is especially commendable about the College Bound counseling component is the extra effort in getting parents involved in students" behavior and academic progress. overail, the guidance counselors commented favorably on the job done by the family assistants in their role as liaison between home and school. A frequent complaint by counselors centered on information on students from feeder schools. This information was, in many cases, insufficient or sncorrect (for example, wrang adaresses and telephone numbers).

Eeedback from students was generally very positive about the
program. Many students indicated that the felt fortunate to be a part of the progra.... .urvation of their .room behavior showed that they were, for tae most part, hardworking, selfdisciplined, and highly motivated. Most seemed to take their work seriously and wanted to do well. Attendance was high. A major complaint was that class began too early, as many had to travel a long distance to school.

The workshop component of the program was perceived as highly successful. Observations showed that students were participating actively and appeared to be really enjoying the activities. Most workshop teachers showed indtiative in their selection of activities. There was, however, variation, with some teachers showing more imagination and creativity in their use and selection of materials. Besides mathematical and verbal games and puzzles, activities sometimes included photography, a class paper, or combining mathematics and art. Workshop teachers were not apprised of the students' pretest achievement scores. This information could have been used in programing. The distribution of calculators was spotty in mathematics workshops.

In general, materials acquisition and distribution was the weakest component of the program. Great variation was perceived in the amount and type of materials used from classroom to classroom. Some classes had a wealth of materials, while others were lacking in them. There were very apparent differences among teachers in initiative in securing or preparing materials. In many cases, delivery of materials was delayed too long. Sometimes sets were not complete. A number of reming teachers complained that the selection of paperbacks for supplementary reading needed
revision with more titles included which had relevance to studentg' experience.

The bilingual component worked well. The teachers were hardworking and dedicated. The students responded well to their teachers. A reading achievement test in English might not be the best choice. The variation in language ability would be prefudicial to a number of students in measuring their reading skill.

In reference to the criterion referenced test used at walton High srchool, some teachers voiced their unhappiness about the strict criterion for mastery (three out of three correct). It was indicated by some mathematics teachers that the strict criterion for mastery did not allow for possible careless arithmetic errors which did notreflect on comprehension of a concept. They suggested that perhaps two out of three or three out of four might be a better criterion.

A number of other important points should be mentioned. Class size was manageable in most cases (less than.twenty). Communtation among teachers between schools was lacking. 'The College Bound central staff showed excellent cooperation and involvement with personnel at the six high schools. They were responsive to their questions and needs. They also acted well on the feedback provided by the evaluator during operation of the program, seeking to incorporate suggestions of the evaluator on improving procedure. Finally, it is regretted that budget restrictions reduced the allocation of money for snacks.

Dr: Southworth, in his evaluation of last year's summer program, made the following recommendations: a greater recognition should be given to the wide variance that exists among students
who have the same' level of academic achievement according to standardized tests, and individualized instruction and differentiated assignments for these students were effective and should be continued with a greater emphasis on individual differences. These recommendations were implemented effectively in the program this summer. Achievement tests and criterion referenced tests were used as diagnostic instruments. Individualized instruction was employed to concentrate on individual needs and, thereby, strengthen academic weaknesses.

Finally, it should be mentioned that the program was successful in serving the needs of the specific target population for which it was designed, students functioning below grade level in reading and mathematics and linguistically isolated students. Also, other district programs did not cross-reference to or have impact on this program. The physical facilities were adequate for conducting the program.

Chapter IV, SUMMARY OF MAJOR FINDINGS, CONCLUSIONS, AND RECOMMENDATIONS
A. Major Findings and Conclusions

1. The 9th grade, loth grade, and bilingual students showed a highly statistically significant difference between pretest and posttest mean reading and mathematics achievement scores in the positive direction. It can be concluded, therefore, that the program was successful in producing significant gains in reading and mathematics for all groups of participants in the program.
2. At least 70 percent of both the 9 th and 10 th grade
students at walton High School demonstrated mastery of at least one instructional objestive, in reading and mathematics, that they failed to master before exposure to instruction. Also, the extent-of mastery in both reading and mathematics evidenced by students after instruction was substantially greater than that evidenced before instruction. It can, therefore, be concluded that the program was responsible for helping students master a significant number of instructional objectives in both reading and mathematics.
3. Because of the misimum departure found, it can be concluded that the program, as actually carried out, coincided well with the project proposal.
B. Recomiendations
4. The system of acquisition and distribution of materials needs reorganization. It is urged that the budget be passed as soon as possible to expedite the ordering process. Greater advanced preparation is needed so that all teachers will have all the materials they need on the first day of the program. Sets of materials should be complete. It should be made clear to teachers that they cannot depend totally on College Bound central staff to supply all materials needed. It is imperative that teachers take the initiative in bringing with them andor making some of their Own materials. It is suggested that the College

Bound coordinator, if possible, make.arrangements with principals for access by College Bound teachers to as much material as possible that is used during the regular school year.
2. It is recommended that two or three inexpensive calculators be provided for each mathematics workshop class. These are useful devices that teach as well as being enjoyable to operate.
3. It is highly recomended that two of the most valuable components of the program, individualized instruction and activities workshops, be a part of next summer's program.
4. In relation to bilingual students, a reading achievement test should be selected which would not handicap individuals who are having appreciable difficulty using the English language.
5. The selection of paperbacks used as supplementary reading needs revision. More popular titles and more books relating to students' experience should be included. The purpose of these books is the motivation of the student to read and derive pleasure from reading. Books that are relevant and intrinsically enjoyable to read should have principal consideration when the reading list is prepared.
6. It is recommended that a greater monetary allocation for snacks be made. Considering the probable breakfast that many students consume and the
energy needs for a morning of solid work, a substantial snack halfway chrough the morning would be of great benefit to the stulent and would have a definite educational value. It is also recommended that an effort be made to provide a lunch for students through college Bound or through some other source, such as a private company or community organization. Some schools had this lunch program. It is hoped it will be expanded. 7. It is recommended that workshop teachers be apprised of students" pretest scores so that they may be able to arrange activities for a student which would shore up particular weaknesses in mathematics or reading.
8. The College Bound Summer Program should be refunded for next summer. This program succeeded in achieving all its objectives this summer. It produced significant gains in reading and mathematics skills for all groups of participating students. Besides direct educational gains, the program produced other benefits for students. Students were given the opportunity to interact with other students; friendships were undoubtedly made, and students had close contact with a teacher in a warm, non-threatening atmosphere. Studenta engaged in useful and productive activity during the summer. Their abilities and taients could be brought out and enhanced. With
academic success, students' self-image was assuredly improved. The prospect of getting into and staying in College was a strong motivating factor which would also improve student self-image and show them that they could make a difference in their lives.
C. Suggestions for Improving the Project

1. It is suggested that an attempt be made to recruit educational assistants from the ranks of college Bound graduates. These individuals would be enthusiastic about the program and provide an example of success to students.
2. Teachers might be given, if budget allows, an extra one half to one hour each day to engage in preparation of materials, conferences among themselves, and meetings with the teacher-in-charge or the guidance counselor.
3. It is suggested that a librarian be included among personnel, or trips to the library be scheduled, so that skills in the use of reference materials might be enhanced.
4. is degree of flexibility could be inserted into programming the number of reading and mathematics classes a student takes so that a student who may be stronger in one area could have extra work in the weaker skill.
5. Teachers should be encouraged to supply imput recularly to College Bound central staff concerning
waye in which the program could be improved. Teachers have first-hand knowledge of problems in dealing with students and could be a valuable source of innovative ideas for useful changes in procedure. A mechanism might be set up to facilitate and centralize the gathering of recommendations and suggestions from,teachers.
6. It is hoped that the program could be expanded, thus providing as many students as possible with exposure to benefits of the program.
7. It is suggested that a conference be planned for the middle or end of the program which would allow teachers and other staff to share ideas, innovations, and solutions to problems, while they were still fresh in their minds, that might be applied to the program.

The College Bound Summer Program was designed to help educationally disadvantaged and linguistically isolated 9th and loth grade students improve skills in reading and mathematics. Students were exposed to three houra of instruction, five days a week, for six weeks. Each day's instruction consisted of a remedial or corrective reading class, a corrective mathematics class, and a reading or mathematics workshop. Individualized instruction, with the use of a pretest achievement or criterion referenced test as a diagnostic instrument, was the principal instructional method. An ESL program, utilizing the audio-lingual approach, was included. The major findings of the program evaluation were these:

1. The 9th and loth grade and bilingual students showed highly statistically significant gains in both reaining and mathematics achievement.
2. The 9 th and 10 th grade students who were administered a criterion referenced test showed considerably greater mastery of instructional objectives in reading and mathematics after instruction compared to their performance before 'instruction.
3. The program, as actually carried out, coincided well with the project proposal.

The positive reaults of the program can be attributed to the following factors the use of individualized instruction as the Chief teaching method, the use of diagnostic techniques to ferret out skills that needed atrengthening, the high quality of the College Bound staff, the highly motivated and self-disciplined students, and the appropriately and carefully structured individual components of the project, such as the workshops and ESL program. 42
