## ABSTRACT

Compiled to provide a national picture of Chicanos in higher education, this report provides a profile of Chicanos in higher education, with emphasis on enrollment patterns. Based on census and office of Civil Rights data, the data are mainly for 1970, although information for other years both before and after 1970 is also included. Information pertains to: the response of higher education to Chicanos; Chicano representation in higher education; issues facing Chicanos in higher education (access, retention and attrition, faculty, administration, funding, instruction and curriculum, Chicano Studies, research, and survival): the eligible population; undergraduate and graduate enrollment; enrollment by fields of study; and brief case studies of select institutions. The data indicates that Chicanos are under-represented at all levels of higher education. The proportional representation of Spanish-surnamed people declines the higher the level of education. Relatively higher percentages of Chicano enrollment are found in Arizona, California, Colorado, New Mexico, and Texas uhich have the highest percentages of Chicanos in the general population. High percentages of Spanish-surnamed people are also found in the educational institutions of Florida and New York where the Cuban and Puerto Rican populations respectively are concentrated. These 7 states accounted for 83\% and 80\% of all Spanish-surnamed enrollment in higher education in 1970 and 1972 respectively. (NQ)

Documents acquired by ERIC include many informal unpublished materials not available from other sources. ERIC makes every effort to obtain the best copy available. Nevertheless, items of marginal reproducibility are often encountered and this affects the c If the microfiche and hardcopy reproductions ERIC makes available via the ERIC Document Reproduction Service (EDRS). EERIC not responsible for the quality of the original document. Reproductions supplied by EDRS are the best that can be made from the orginal.

## CHICANOS IN HIGHER EDUCATION:

## STATUS AND ISSUES

## ABOUT THE AUTHORS:

## Ronald W. López

Research Consultant in Education and Mass Media, formerly Director of Chicano Studies, Claremont Colleges. Received his Master of Arts in U.S. History from UCLA. Mr. López is currently consulting on a variety of projects and is functioning as a California State Inheritance Tax Referee.

## Arturo Madrid-Barela

Director of the Ford Foundation Graduate Fellowships Program for Mexican Americans, Native Americans and Puerto Ricans (1975-76), received his Ph.D. in Spanish from UCLA. Dr. Madrid is Associate Professor of Latin American and Chicano Literature, and Chairmon of the Department of Spanish and Portuguese at the University of Minnesota.

## Reynakjo Flores Macías

Co-Editor of Aztlán-International Journal of Chicano Studies Research received his B.A. in Sociology at UCLA and his M.A. in Education from that same institution. At present he is completing a doctorate in Socio-linguistics from Georgetow $\ddagger$ niversity, Washington, D.C.

## Preface

In January of 1974 Abel Amaya, who was at the time a Program Officer in the Division of Education and Research, The Ford Foundation, commented to a group of Chicano academics serving as the selection committee for the Ford Foundation Graduate Fellowships for Mexican Americans that Chicanos were greatly handicapped in their struggle to improve their educational situation as a result of the lack of information on Chicanos in higher education on a national level and due to the absence of a national organization which had as its primary concern the status of Chicanos in higher education. That lack of information and the need for a nationall organization which might address itself to the matter became rather acute to me in May of 1974, when Abel Amaya arranged a meeting between officers of the Division of Education and Research of the Ford Foundation and a number of Chicano academics and academic administrators in Denver, Colorado. At stake were questions of Ford Foundation policy planning in the area of minority education and the Foundation's decision to farm out the Graduate

Fellowship Programs for Mexican Americans, Native Americans, and Puerto Ricans. None of us present in Denver at that meeting had information which showed what the status of Chicanos in higher education was at the moment, or what the shape of the future would be. Clearly and painfully lacking was a Chicano organization which was dedicated to that purpose or which had the expertise, experience, and capability of assuming responsibility for administering the Graduate Fellowship Programs.

As a result of that meeting in July of 1974 I submitted a proposal to the Ford Foundation requesting a grant for the purpose of holding a conference to discuss the major issues facing Chicanos in Higher Education and to explore the possibility of creating a national organization which could address itself to those issues. This proposal was approved and funded by the Ford Foundation for a six month grant period beginning December 1, 1974. As called for in the proposal the Steering Committee met to set the date and site for the conference, to select the participants, and to make some decisions with respect to the nature of the meeting. In.a
departure from the original proposal it was decided to commission a report on the status of Chicanos in higher education rather than to solicit position papers. The report would be distributed to the participants before the meeting and would provide a basis for discussion and for any decisions which might be taken with respect to a national organization. Ron López, a well-known educational consultant from the Los Angeles area, was selected to prepare the report.

The Symposium on the Status of Chicanos in Higher Education took place in Los Angeles on May 10, 1975. The particinants discussed the report and the issues facing Chicanos in higher education. The need for a national..... organization was recognized and the participants voted to constitute themselves as the National Commission on Chicano Higher Education. The Commission then authorized the creation of an Executive Committee and charged it with incorporating the Commission as a nonprofit corporation and with preparing a proposal to be submitted to various agencies for funding. This charge was for the period of one year.

The reesent report is an edited and synthesized version of the original and is being published in the interests of sharing information with those persons concerned about the status of Chicanos in higher education. As Ron López indicates in his preliminary remainis, it should be understood that this report is first and foremost a resource document whirh provides information on the status of Chicanos in higher education and a bibliography of where that information can be obtained. Because it was commissioned on short notice and prepared in record time it does not involve original research and should be viewed principally as an introduction to the subject.

## Arturo Madrid-Barela

Chairman, Executive Committee of the National Cinicano Commission on Higher Education

Director, Graduate Fellowships Program for Mexican Americans, Native Americans and Puerto Ricans; Educational Testing. Service

## Acknowledgments

The publication of this report was made possible by funds privided by the Ford Foundation for the Symposium on the Status of Chicanos in Higher Edueation. Special note is taken here of the Educational Testing Service of Princeton, New Jersey, which administered the grant at no charge.

The support and counsel of Abel Amaya is gratefully acknowledged here, as are the services of María Baeza and Teresa McKenna in editing this document and preparirg it for publication. Thanks also to Carlos Arce for the information and bibliographic materials he so generously provided. For the aid and support of the UCLA Chicano Studies Center, especially that of Roberto Cabello Argandoña and the Chicano Studies Research Library whose bibliographic search was essential to the development of this document, we give our sincerest appreciation.

## Introduction

This repozt was initially prepared as a resource document for the Symposium on the Status of Chicanos in Higher Education, which was held in Los Angeles in May of 1975. The Symposium was sponsored by the Ford Foundation through a grant to Dr. Arturo Madrid-Barela, Director of the Ford Foundation Graduate FelLowships Program for Chicanos, Native Americans and Puerto Ricans. The report was to provide the Symposium participants with basic information on the status of Chicanos in higher education across the country in order to facilitate discussion of the principal issues which face Chicanos in higher education.

The report presents a general contert for the study of the status of Chicanos in higher education, describes the existing data base, addresses some of the data problems involved ia maiking such a study, and provides a profile of Chicanos in higher education with particular emphasis on enrollment patterns. In setting up the context for the data, numerous issues and concerns affecting Chicanos in the area of higher education are enumerated
and discussed. The discussion of these issues touches only the surface of the subject matter. As is frequently indicated in the text, the intent of this report is more to identify the principal issues than to attempt to resolve or argue specific solutions for them.

The issues, like the data, have a national rather than local frame of reference. The informed reader will find that some issues which would appear to be critical issues are not included and some which are included seem unrelated to local situations. This is partly because of a basic attempt to develop a national scope and partly the result of the limitations imposed by the data. Given the limited resources available and the deadife imposed by the Symposium date and the grant period it was not possible to make any special surveys. As a result, the report is confined to the data chat was readily available.

Special consideration should bè called to the fact that there is no single source of information that provides easily accessible enrollment figures on Chicanos in higher education. For this reason and in line with the
overall intent of the report, data is provided in a multitude of forms and breakdowns. The reliability of the data is discussed in the text. Suffice it to say that the data used in this report is as accurate as any data available for the national picture.

Another important consideration to be noted is that there are many issues and areas of concern for which there is no available national data. The subject of retention/attrition, for example, has not been studied on a national level. There are many similar voids in other areas. It is hoped that the gaps in knowledge revealed by this report will stimulate substantive research into those issues concerning Chicanos in higher education.

29

## Data Sources, Qualifications and Limitations

## Brief Review of the State of the Literature

A quick glance at the bibliography provided herein will give the reader an idea of the amount and scope of materials concerning Chicanos in higher education. Those readers who are familiar with Chicanos in higher edocation as a research subject will notice that while the resources are beginning to increase and that although substantive investigation of some topics has been undertaken in doctoral dissertations in recent years, the body of literature is still limited. The most importhant reason for this is that Chicano are a very recent phenomenon in higher education. As late as 1968 most campuses had no Chicanos enrolled and those campuses in areas of Chicano population concentration had as few as five or six enrolled.

Within the existing literature there are some recurring subjects. Perhaps the principal one involves the question of why Chicano are not represented in higher education. One point of view holds that Chicsucs are in a disadvantageous situation with respect to
higher education because of deficiencies in their preparation. Another view focuses on economic factors as an explanation for that condition. A very frequent subject is the problem of recicuitment and admissions. The matter of retention/attrition is also frequently addressed, as is also the question of Chicano performance on various "objective" tests.

There are, however, other problems beyond the paucity of materials. Much of the material is not readily available, since it takes the form of master's theses, doctoral dissertations, symposium, conference, or congress papers, and "in-house" or limitedcirculation institutional reports. The available materials are principally highly specific articles dealing with local or regional problems and situations and have a very + limited data base. There does not exist a general study which introduces the subject, identifies the various areas, or indicates the existing sources of information. Nonetheless, the existing materials not only indicate the need for research with respect to the status of Chicanos in higher education, but also point out the directions this research must take.

## Data Sources for This Document

This document was compiled to provide the basis for a national picture of Chicanos in higher education. The information presented here is either directly or indirectly based on Census and Office of Civil Rights data. This information should be viewed as an introduction to the status of Chicanos in higher education. No in-depth interviews were conducted nor were new surveys initiated. The report is limited to the existing information available. The bibliography appended was compiled from several bibliographies and from computer searches for dissertation titles and unpublished works.

## Problems of the Data

The data on the status of Chicanos in higher education presented here has the specific intent of illustrating in general terms the preserce of Chicanos in higher education. This data provides only a representative picture. There is no attempt to be totally comprehensive nor is there any attempt to delve deeply into the issues. The objective fiere is limited to showing basic information such as national enrollment figures at both the
undergraduate and graduate levels as well as supplementary data showing distribution both by academic field and geographic area. The bulk of the data is for 1970 although there is also information for other years both before and after 1970. The readily available 1970 data allows for a more detailed view of Chicano enrollment characteristics and is the base data for the undergraduate figures in particular. The historical data that is presented for overall undergraduate enrollment has a different sampling base than the 1970 data with the result that there are instances where figures do not match. Where appropriate, this data is given in a separate paragraph with accompanying qualifications.

Although the quantitative data presented here does not pretend to absolute and complete accuracy, the patterns and trends revealed by the available statistics are difficult to refute. For example, the 1970 Chicano population in graduate schools was $1.2 \%$. There would have to be a seven to ten percent error in the absolute number of Chicanos (with no change in total enrollment) for the Chicano percentage to change one tenth of one percent. It is unlikely that 33
there is an error of sufficient magnitude to significantly alter the relative representation.

Research on Chicanos in higher education invariably. requires several qualifications. Clarification of nomenclature is primary. A1though the term Chicano continues to mean different things to different people in different places, in this study it is used interchangeably with Mexican American and Spanishsurnamed. The reason for this is that some of the data used for this study was acquired from sources which indiscriminately identify people as Spanish-surnamed, as Chicano, or as Mexican American. In those instances where people are clearly identified as Cuban or Puerto Rican or Latin American (other than Nexican), distinctions will be made. Data presented in tabular form indicate the nomenclature used for the data acquisition.

There are other qualifications that must be mentioned. Office of Civil Rights data has distinct advantages in that the same questionnaire was used across the country, but disadvantages in that each institution was allowed to define the racial and ethnic
composition of their student population. The primary "problem" with the Census data is that the basis for these figures is a sample of the sample population and there is strong feeling that the Spanish-surnamed figures are generally low and urban-biased. Moreover, respondents were able to indicate more than one description. Thus the Spanishsurnamed category is likely to have some duplication. However, discrepancies discovered by Urban Education Inc. in their study (Minority Enrollment and Representation in Institutions of Higher Education; A Survey of Minórity Student Enrollment in Colleges, Universities, Graduate Schools and Professional Schools in 50 States and The District of Columbia, Conmissioned by The Ford Foundation, New York, N.Y., 1973), show that while Spanish-surnamed figures are often inconsistent (depending on the source), the differences were minimal.

A most important qualification is that any count of Chicanos or Spanish-surnamed is likely to be low and the greatest error is likely to occur in the general population characteristics. This means, of course, that

Chicanos may be even more greatly underrepresented in institutions of higher education than the data reflects. Also, the reader must keep in mind that the low representation of Chicanos in institutions of higher education renders moot most discussion of the accuracy of the data. As has already been mentioned, the magnitude of the error in the Chicano figures would have to be very large to alter the percentages even slightly. Furthermore, the error would have to be even larger to change global trends or patterns. One can conclude, therefore, that the percentages shown can be used with reasonable confidence and that the emergent patterns or trends merit even more confidence.

Limits or gaps in the data also present a problem. The 1970 Census was the first effort to identify Chicanos since l930. No serious effort to identify Chicanos in higher education on a national scale occurred until after the Civil Rights Act. Today, data developed by or for the Office of Civil Rights is probably the only attempt at a systematic national count other than the Census. Other attempts are normally done through sampling processes that begin with a limited universe.

Thus, while the data has multiple limitations there are no viable alternative sources.

## Importance of Representational Analysis

Throughout this presentation on the status of Chicanos in higher education reference is made to levels of representation, usually to under-representation or to parity. These levels of representation are based on comparisons between the total general population or the total majority population and the Chicano population. It is our chesis that the enrollment of Chicanos in higher education should be proportionally the same as that of the majority population. This thesis is based. on the assumption that abilities are distributed within the Chicano population in the same ratio as they are distributed in the majority population. Therefore, the level of representation of Chicanos in higher education is due to factors other than ability. This type of measure, in common usage today in affirmative action programs, is currently under attack as one which leads to a "quota" mentality and as one antithetical to the basic tenets of higher education. The principal argument against that measure is that

```
individuals should advance to higher levels
of education through demonstrated ability and
not as a result of pressures to bring abour
ethnic, racial, and gender balance. As an
ideal there is little reason to resist such
a proposition. Nonetheless, it is well-known
that advancement in education is dependent on
a series of complex factors, not least of
which is the ability to pay.
```

## The Status of Chicanos in Higher Education

## The Response of Higher Education to Chicanos

Higher education was traumatized during the $1960^{\prime} \mathrm{s}$ by student activism. In the late $1950^{\prime}$ s and early $1960^{\prime}$ s the United States' universities and colleges had furnished the manpower for the civil rights movement and had been the source of much of the criticism for the injustices throughout U.S. society. In time institutions of higher learning were forced to face the fact that they had violated civil rights to as great, if not greater, an extent as the rest of U.S.'s institutions. As a result of intense pressurest these institutions began to react internally to those wrongs they had criticized externally. When institutions began to respond to the pressures by attempting to admit minority students--particularly at the undergraduate level--it became clear that selecfive recruitment patterns were the determineing factor in the admissions process. In order to bring about changes in admissions patterns, "special admissions" programs emerged throughout the country. Students
were admitted using a wider criteria--but only under "special consideration." The traditional norms remained the rule. Those students admitted under "special consideration" had a lower achievement rate as measured by GPA and various test scores than those admitted on a regular basis. They subsequently revealed a higher attrition rate than the "normal" admittees. However these differences were small and remain small, thus raising significant questions that are generally ignored. If people who clearly do not meet normal admissions standards are more apt to succeed than fail, is it possible that "normal' admissions criteria are simply inappropriate for all students?

The argument that students who enter under different criteria do not perform as well asystudents who enter under traditional criteria has been a significant part of the rationale for not examining.the entire question of admissions criteria. Admissions people have reassessed the validity of criteria and method as applied to minorities, but to suggest that the traditional methods are in themselves lacking is something that has precious little support.

By not questioning basic premises and by avoiding close scrutiny of existing practices, institutions of higher learning have been able to maintain the status quo while at the same time projecting the image of being responsive and progressive institutions through the creation of "special" programs and the admission of minority students through "special" criteria. As a consequence, the rate of enrollment of Chicanos into higher education has remained relatively constant rather than increasing since 1970 . It is true that there have been gains, but the rate of growth in enrollment is minimal. The result is a minimal increase in the pool of people from whence graduate and professional schools draw. The data shows that the pool of people is not large either in absolute or relative terms.

Graduate institutions thus have been able to stave off demands for increased minority enrollment even more effectively than undergraduate institutions. Yet, when a genuine effort is made, genuine gains are realized. Medical schools are an excellent example. The data shows very clearly that.in

## 41

1970-71 the number of Chicano or Spanishsurnamed medical students was minimai. Yet between 1970 and 1975 enrollment of Spanishsurnamed students in medical schools increased steadily and meaningfully. If the trend were to continue--a trend now placed in jeopardy as a result of recent judicial action involving the medical school at the University of California, Davis--medical schools in this country would be the first graduate institutions to have reasonably equitable representation of Chicanos. Not far-fetched is to believe that medical schools would reach parity with the proportion of Spanish-surnamed people in the population before any other areas of graduate education. Perhaps medical schools, by virtue of their enrollment policies, are in a stronger position to adjust. The number of slots open for entering medical students has traditionally been far smaller than the number of "qualified" students who apply. When confronted with twice as many "qualified" students as space and finances permit, medical schools have utilized qualitative or "subjective" measures for their admissions decisions. Graduate Schools and other
professional schools bave similar practices, but they have not utilized them in the positive manner in which medical schools have. Because graduate and professional schools have not been as responsive as undergraduate institutions in the admission of Chicanos, the percentage of Chicanos that move from the undergraduate ranks into graduate programs is but half that of Whites. As a result the number of Chicanos in graduate schools remains depressingly small with little likelihood of increasing unless substantial reforms significantly alter the existing higher education establishment.

Chicano Representation in Higher Education
This initial discussion offers a précis of the data. There is no intent here to raise particular issues to prominence at the expense of others. The number of issues facing Chicanos in higher education is great and the prominence of an issue may vary from region to region, from university to university, and from year to year. Prominence given to selected issues in the text are directly tied to the data and should be so understood.

The earliest date for which we have
reliable data ou Chicanos is 1968. However, that data is sparse and difficult to work with because of the multitude of methods used in its acquisition. Our principal data source is 1970 census materials. An important value of the 1970 data is that the method of acquisition of that data was fairly uniform. Below are some observations taken from the data which is presented in Chapter Four.

## Student Population and Enrollment

1. The "drop-out" problem becomes dramatically evident in the $14-15$ age group. From ages 14 through 17 Spanish-surnamed enrollment in schools declines at two to three times the rate of the general population.
2. Spanish-surnamed enrollment in all institutions of higher education in the nation was $1.6 \%$ in $1968,2.1 \%$ in 1970 , and $2.3 \%$ in 1972.
3. A greater percentage of the Spanishsirnamed population in the 25 to 34 age bracket remain enrolled in school than do the rest of the population in the same age bracket.
4. Chicano enrollment in higher education is heavily concentrated in two-year institutions.
5. Chicanos are more likely to enroll in public institutions than in private ones.
6. In 1970 oniy eleven states had over $1 \%$ Spanish-surnamed enrollment; in 1972 there were fifteen.
7. In Arizona the Chicano undergraduate enrollment percentage is higher than the Chicano percentage of the general population.
8. For the five Southwestern states, Florida and New York, the 1970 data reveals an average attrition rate for the Spanishsurnamed student population by the fourth year of $80.4 \%$ as compared to $62.3 \%$ for the majority population.

Undergraduate Enrollment

1. Between 1971 and 1974 there has been a net gain of approximately $27 \%$ in Chicano freshmen enrollment in all institutions of higher learning (universities, fouryear and two-year colleges).

45
2. More Chicano freshmen enrolled at public institutions having a high selectivity level than in those with low or medium selectivity in 1973 and 1974. Selectivity level refers to the range of mean test scores on the ACT composite andor the SAT V \& M for entering freshmen.
Thus, an institutior with a ingh selectivity level is one whose freshmen class has a high mean score on the above mentioned tests. This mode of measure was devised by the Comparative Institutional Research Program of the American Council on Education and the University of California, Los Angeles. See Chapter Four, Undergraduate Enrollment; Freshmen Data.
3. Chicano enrollment in Catholic institutions of higher learning is predominantly in four-year colleges with a low selectivity level in the 1973 and 1974 aca-. demic years.
4. Chicano freshmen enrollment in four-year private, nonsectarian colleges (for 1973 and 1974) is greatest among those with a medium selectivity level.

Graduate Enrol1ment in Graduate and Professional Schools

1. Chicanos in Graduate Schools more closely approximate parity representatior in Education, the Humanities, and the Social

Sciences.
2. Spanish-surnamed first-year enrollment in Medical Schools more than tripled between 1970 and 1975.
3. The rate of enrollinent of Chicanos in Dental Schools remained constiant between 1970 and 1973.
4. The number of Chicanos in Law Schools increased nearly $50 \%$ between 1970 and 1974 .

The data indicates a number of patterns or trends that demand more attention. First, it is evident from the data that Chicanos are under-represented at all levels of higher education. In terms of both absolute and relative numbers, there are few Chicanos enrolled in higher education. While it is normal to expect fewer numbers at the graduate and professional school level, it does not follow that the proportionate level should also diminish. The proportional representation of Spanish-surnamed people deciines :he
higher the level of education. This pattern begins with the first year of enrollment in higher education and continues without interruption.

Relatively higher percentages of Chicano enrollment in higher education are found in the five Southwestern states having the highest percentages of Chicanos in the general population (Arizona, California, Colorado, New Mexico, and Texas). High percentages of Spanish-surnamed people are found in the educational institutions of two other states, Florida and New York, where the Cuban and Puerto Rican populations respectively are concentrated. The five Southwestern states plus Florida and New York accounted for $83 \%$ and $80 \%$ of all Spanish-surnamed enrollment in higher education in 1970 and 1972 respectively.

Issues Facing Chicanos in Higher Education
Access. The continuing question of access to institutions of higher learning is the fundamental issue facing Chicanos with respect to higher education. Access at the undergraduate level has once again become a critical issue as a result of the economic
crisis currently being experienced by U.S. institutions of higher education. A levelingoff in the rate of Chicano enrollment in higher education is already evident. Since graduate enrollment is directly dependent on undergraduate enrollment, graduate Chicano enrollment will not only level off very soon buc also begin to decline rapidly as funding y sources dry up and employment possibilities diminish.

Retention and Attrition. The data points to a diminishing proportion of Chicanos as the level of education rises. The rate of attrition for Chfocanos is higher than for any other group. The data does not reveal the reasons for this attrition and while it is safe to assume that attrition is due to a variety of socio-economic factors on the one hand, and to well-known structural limitations of educational institutions on the other, much research is needed in this area. Of interest are ney factors which have recently come into play, such as to what extent does entering a two-year institution affect Chicano chances of finishing a four-year program; and what effect does the presence
of other Chicanos, Chicano-related programs, and Chicano-focus courses on campuses have on Chicano enrollinent and retention rates.

Completion. The data does not reveal the attrition rate for Chicanos in graduate and professional schools. In view of the very low and very recent enrollment of Chicanos in these institutions it is too early to calculate a legitimate attrition figure. The real issue, moreover, is completion of the necessary requisites for a graduate degree. There is reason to be concerned about the low completion rate with respect to the doctorate. Many Chicanos have managed to complete all the requirements except the dissertation. It would be very useful to know how the completion rate of Chicanos compares with that of the majority population, which according to one recent study is only about $40 \%$ of those entering doctoral programs.

Faculty. The number of Chicanos occupying faculty positions in U.S. colleges and -universities remains very small despite the increases of the last five years. Although there are no exact figures available the total number of Chicano faculty does not
exceed 750. Most of those are not on tenure tracks and many do not hold the doctorat.e. Clearly one of the critical issues facing Chicanos is the need to increase the number of doctorate-holding, tenure-track Chicano faculty.

Administration. The number of Chicanos holding administrative posts in higher education is even smaller than those holding academic positions. Since most Chicano administrators in higher education occupy lowlevel positions in minority-oriented programs, Chicanos in first or sacond level administrative positions are even more rare a species. At this date there is one chicano president of a four-year institution; less than 10 Chicano presidents of two-year institutions; one academic vice-chancellor of a graduate institution; one vice-president for student affairs; two deans of four-year institutions; and less than 10 associate deans. Because institutional policy and activity is increasingly a function on institutional administrative structure rather than academic structure the need for Chicanos in academic administrative posts becomes even more acute.

Funding. Perhaps the critical factor in whether Chicanos will be successful or not in achieving adequate and equitable representation in higher education is funding. Nearly all endeavors in higher education are costly. It is clear from recent experience that the tolerance of institutions and society in general towards Chicanos is directly dependent on financial resources. To a considerable extent the resistance Chicanos and Chicano endeavors are experiencing in academia is the result of the fiscal squeeze that institutions of higher education have been feeling in the past few years. The following areas of concern directly affect Chicanos in higher education.

1. Financial assistance for students at the undergraduate level continues to be a must. A Chicano undergraduate at the University of California, to give but one example, requires nearly twice as much financial aid as does the average student. Although Chicanos constitute but a tiny percentage of the overall enrollment at the University of California, Chicanos constitute $39 \%$ of all
students whose family income is less than $\$ 6,000$ per annum. Yet Chicanos receive fewer grants and scholarships than student aid recipients as a whole and have twice the dependency on loans. While particulars of financial aid may vary from institution to institution, one thing does not--the overwhelming proportion of Chicano students who require aid. Increasing Chicano enrollment most definitely means increasing the amount of funds available for student assistance.
2. The need for financial assistance for Chicanos is equally as great at the graduate level. At Stanford University, in a survey conducted recently, it was discovered that $88 \%$ of the Chicano graduate students who responded to the survey were from families whose income was less than $\$ 10,000$. By the time Chicanos reach graduate school their level of indebtedness is very high, which makes continuing in school even more difficult.
3. Direct student support is only one area in which financial considerations
are primary. Counseling services, academic support programs, and instructional programs centered on Chicano needs also require continued funding. All too often such programs are on a special funding basis rather than constituting part of the regular institutional budget. In times of budget cutbacks and general retrenchment in the area of minority programs, this marginal importance reflected in budgetary allocations frequently results in the undermining or even elimination of these programs.
4. Funds are needed for research. This
is a critical issue for both graduate
students and faculty. For many graduate students the ability to complete the dissertation is often solely dependent on the availability of resources for researching and writing the dissertation. Clearly the availability of resources for research can have a dramatic effect on the time required for completion and on the nature and quality of the dissertation. Faculty need resources to increase their release time, to assist
them in the research process, and to facilitate the preparation of manuscripts for publication. Moreover, there is a close relationship between the amount of funds available to finance research and the quality of research which is produced.
5. With respect to Chicano publications, money is also an urgent need. Chicanos have quickly discovered that chances for publication of Chicano related research is tied closely to the whims of publishers, whether the materials are sale$a b l e$, or what is in vogue at the moment. Chicano administered publications that have a Chicano focus are the most desirable and realistic alternatives to facilitate and increase publications by Chicanos. The continued existence and succes: of Chicano publications requires ever-increasing financial resources.

Instruction and Curriculum. of prime importance is the issue of the nature and quality of the Chicano experience in higher education. What is the quality of instruction and course matter for Chicanos? To what extent are

Chicano subjects and concerns integrated into the curriculum? How much curricular alternative is there for Chicano students at all levels? To what extent do Chicano Studies courses fulfill institutional requirements? What validity do they carry in academic councils at both the undergraduate and graduate levels?

Chicano Studies. Chicano Studies programs, centers, and departments have played a major role in the struggle to improve the status of Chicanos in higher education. It is critical that Chicano Studies units be maintained in institutions where they exist and established in those where they do not. The potential for continuing pressure on institutions to increase the numbers of Chicano students, faculty, and staff is fequently tied to the vitality of Chicano Studies. Improvements in the nature and quality of the Chicano educational experience are strongly influenced by the existence of Chicano Situdies. The stimulus for research into the Chicano experience is principally prowided by Chicano Studies. The threat posed to the survival of Chicano Studies by the fiscal crisis is serious and
is a key issue for Chicanos.
Research. The quality of research on Chicanos is also a very critical issue. Chicano scholars are familiar with the poor quality of the work done in the past and acutely aware of the need to produce better studies. Much of the existing literature is steeped in stereotype, but "respectable" because it is written in "respectable" form and published in "respectable" journals. Anyone who attempts to inform him or herself about Chicanos is at best going to be faced with well meaning but gross misinterpretations of the Chicano experience. Such misinterpretations continue into the present and can only be combatted by stereotype-free studies which are based on new information along with criticism of previous research leading to the development of a new interpretative paradigm.

The Key Issue - Survival. As previously mentioned, it has not been possible to address all the issues that confront Chicanos in this report. Chicanos are faced with all the problems which face higher education in the United States today and more. The information available is extremely limited; the data available

$$
57
$$

```
is exceedingly djfficult to obtain. The is-
sues chat have been enumerated should be ob-
vious to all and most can name others. In
the last analysis, however, for Chicanos the
fundamental issue is one--survival.
```

## A Profile of Chicano Participation in Higher Education

The Eligible Population
Table 1 shows in numbers the race and ethnic distribution of the population by age groups and Table 2 shows the same data in percentages. The number of Spanish-surnamed between the ages of 18 and 24 and the percentage of the Spanish-surnamed population which that number constitutes is shown in Table 3. These figures are useful as a guide to the relative representation of enrollment in institutions of higher education. In this report the basis for comparison is the percentage distribution in the total populaticn. The rationale for using this basis for comparison is that this is the most common mode in use. If one uses the "college age" (18 to 24 years old) bracket for comparison, the disparities between the enrollment percefitages and the proportion in the population would be even greater since the Spanish-surnamed population is $5 \%$ of the 18 to $2 / 4$ years old bracket and only $4.6 \%$ of the total population.

Utilization of the more conservative interpretation of relative representation, however, allows more confidence in whatever differences appear and in inferences drawn from comparisons (See Tables 1,2 and 3).

The use of the conservative interpretation of relative representation is important. First, it gives institutions the benefit of the doubt. Second, it tends to dilute the possibility of someone shifting to an argument about "quotas" to avoid confronting the fundamental issue of low Chicano enroliment. Third, it keeps the discussion on manageable level by not introducing another parameter. Finally, it allows a far greater tolerance in the accsracy of the data since Chicanos in the "collega age" group are a greater percentage of that category than total Chicanos are a proportion of the toral population.

There is an additional cushion or margin of tolerance integreted into the data fresentatior. Comparative enrollment data is shown for years after 1970 but population data is not. The 1972 Current Population Survey (CPS)

conducted by the Bureau of the Census did not reflect new information about geographic distribution from the 1970 Census and did not include new categories used in the 1973 CPS that appear to have caused an increase in the total Spanish origin category of the Census. As a consequence the 1973 CPS is more in line with the 1970 census estimate. That data shows an increase of approximately $17 \%$ of the total Spanish origin population which translates into an increase of approximately $0.6 \%$ in the percentage of total population by 1973 (U.S. Department of Commerce, Bureau of Census, Persons of Spanish Origin in the United States: March 1973, Series P-20, No. 264, May 1974). Therefore it can be reasonably concluded that the magnitude of the difference between enrollment and population proportions utilized in this presentation is less than the actual disparity. This, of course, provides even stronger reinforcement for the validity of the parterns and trends that are reflected in the data.

Table 4 shows the percentage of individuals enrolled in school by age groups. It is apparent that at least one reason there
are so few Chicanos in higher education is low secondary school enrollment. Thesefigures make clear the secondary dropout problem is persisting among Chicanos. The attrition rate begins to show dramatically in the 14-15 years old age group. While the rest of the population loses between four and five percent from the level of enrollment in the 7-13 years old age bracket, the Spanish-surnamed population is losing eleven percent (II\%) or over two times as great a proportion. From the 14-15 years old to the 16-17 years old group the Spanish-surnamed group drops out at twice the rate of the rest of the population (19.5\% vs. 9. $8 \%$ and 9.9\%) . The 18-19 years old age group drops are relatively closer among the populations compared but by this time the attrition rate among Chicanos has already taken its toll. The transition period from 18-19 years old to 20-21 years old is difficult to assess. If a person survives in school until he or she is 17 years old, however, the comparison indicates that among the Spanish-surnamed population the likelihood of the individual remaining enrolled in school until age 21 is between two and two and a half rimes as great as his

Black or White counterpart. The tragedy, of course, is that by this time the ranks of the Spanish-surnamed in schools have been so thoroughly decimated that it could hardly be any other way. The data also shows that in the 22-24 years old group the percentage of Chicanos who remain enrolled in school, do so at nearly double the rate of Blacks and at approximately $88 \%$ the rate of Whites. A greater percentage of Spanish-surnamed in the 25-34 age bracket remains enrolled in school than do Blacks or Whites of that age group. Chicanos who survive high school tend to continue schooling at a higher rate than either Blacks or Whites (See Table 4).

Unfortunately this information was not compiled prior to the 1970 Census. The stereotype that Chicanos place schooling very low on their list of priorities might have been more adequately challenged. While it is dangerous to generalize too much from this data, it is difficult to avoid the temptation. One thing can be inferred from the data. At the time of the 1970 Census, there still existed a substantial incompatibility between schools and Chicanos in the 14-17

Table 4
Percentage of Individuals Enrolled In School
By Age Group And Race, 1970

| Age <br> Group | Total | Whites | Blacks | Spanish- <br> surnamed |
| :---: | :---: | :---: | :---: | :---: |

years old age group. Also, in spite of many changes that have occurred in recent years (e.g., the acceptance of Mexican American or Chicano Studies into the curriculum in many schools), patterns of enrollment very likely remain substantially the same.

## Undergraduate Enrollment

Distributicn by Type of Institution. The tremendous attrition of Chicanos during the
secondary school years portends what occurs in enrollment in higher education. Spanishsurnamed enrollment in 1970 in all institutions of higher education in the nation is $2.1 \%$ of the total enrollment (See Table 5). It should be noted that the Total Minority category in this and subsequent tables includes the Spanish-surnamed population. The enrollment figures show ciearly that Chicano enrollment in higher education is ccncentrated heavily in two-year institutions or community colleges. There are nearly two times as many Chicanos in two-year colleges as there are in universities and nearly one and a half times as many as in four-year colleges. By contrast there are over one and a half times as many Whites in universities as there are in rwoyear colleges and nearly two times as many Whites in four-year colleges as in two-year institutions. The Total Minority population, while not as heavily concentrated in universities as are whites, still fares better than Chicanos. For the Total Minority category there are nearly one and a. half times as many people in two-year colleges as in universities (compared to two times as many for Chicanos).

ERIC

Thus, while there remains a substantial discrepancy for the Total Minority population between enrollment levels at the universities and two-yeur colleges, the discrepancy for the Spanish-surnamed population is substantially greater. In the instance of four-year colleges, approximately one and a half times more total minority individuals are enrolled $\because \quad$ than in two-year colleges. The reverse of this is true for Chicanos (See Table 5).

If these enrollment figures are converted to percentages by group, they allow for the development of several arguments that can be reached inductively (See Table 6). The first is that Chicanos enroll in twu-year colleges at a substantially greater rate than do either the Total Minority or the White population. The Total Minority population is also enrolled in two-year institutions at a greater rate than are Whites. The White population enrolls in universities and four-year colleges at a greater rate than in two-year institutions. The White population not only dominates universities in numbers but individuals from that group are more likely to be enrolled in a university than in a two-year college. More

Chicanos are enrolled in all four-year institutions than in two-year colleges but only by a small margin. In contarst twice as many individuals in the Total Minority catagory are enrolled in all four-year institutions as in two-year colleges and three and a half times as many Whites are enrolled in all fouryear institutions as in two-year colleges. Chicanos who enroll in institutions of higher education are least likely to enroll in universities. Whites, on the other hand, are most likely to enroll in four-year colleges and substantially more likely to go to a university than to two-year coleges: (See Table 6).

Public institutions are more likely to enroll Chicanos than are private ones. While this is true for all groups, the relative rate of en rollment of Chicanos in private institutions is approximately half that of Whites and the Total Minority population (2.0 and 1.7 respectively). Chicanos, therefore, are most likely to be enrolled in public twoyear colleges. From an institutional perspective, Chicanos are most under-represented in private four-year colleges (See Table 5).

Histomical Comparison. The data available allows for some comparison of enrollment figures over a period of years. The offtie of Civil Rights has computerized a Universe File of Institutions of Higher Etucation who have responded tu their 1968, 1970, and 1972 surveys making it possible to produce compara.Eive data (See Table 7). A difficulty with the comparative data is that only those in= stitutions that responded to all three survers are ineluded." The figures for 1970 therefore, cre different in the comparative data than the data for the same year that is presented in other instances in this report. The relative percentages for the historicel data, however, are very close ro that presented in other instancess. In the previous section (See Tables 5 and 6j data $£ s$ resented for undergraduate entollment for public and private institutions. The datia for publicly and privately controllec institutions was not compiled in the same manner for the three surveys used in the historical comparison. Thus, the figures shown in Table 8 include both graduate and undergraduate enrollment.

The data shows that there has been an

increase in Chicano enrollment between 1968 and 1972 but it also shows that the relative increase has been minimal. The greatest growth has occurred in publicly controlled institutions with thrice as many Chicanos in 1972 as in 1968. But the real issue is still £rine relative rates of growth of enrollment. There is no question that there are more Chicanos enrolled today than there were in previous years. There is no question that there is a slight increase in that number each year. But the level of representation of Chicanos in institutions of higher education has remained nearly constant. If, for example, we look at the growth of the White population and compare that with the growth of Chicano enrollment we find that Chicano increase is only $3.6 \%$ of the White increase. While this is certainly a gain it is clearly not one of a magnitude that will significantly alter the percentage of the whole that Chicano enrollment constitutes in the near future. There is a simple set of conclusions that can be drawn. For every Chicano enrolled there are twenty-efgtht (28) White students. So long as that is che case it is
ludicrous to argue that Chicanos are taking away slots from Whites. There are more Chicanos in higher education now than before but there are also more Whites in higher education than before. The rate of growth is higher for Chicanos than for Whites but the relative presence of Chicanos has not significantly altered nor is there evidence that it soon will.
$\therefore$ Freshmen Data. Data available for freshmen from American Council on Education Research Reports is expressed as yeighted national norms and is valuable in showing trends or patterns for Chicanos as well as other groups. Table 9 presents freshmen data for Mexican American/Chicano and Puerto Rican American populations.
This data shows the same patterns and trends as the data previously presented. Additionally, the data shows very little change occurring from year to year. For Chicanos there has been a slight increase (from 1971 to 1972) in first year university students and more evident change in fouryear colleges (over two times as many freshmen in four years). The pattern in two-year

## Table 9

|  |  |  | 0.8 | 0.8 | 0.6 |

Source: American Council on Education, The American Freshman: National Norms for Fall 1971-74 (ACE Research Reports, Washington, D.C. and Los Angeles).

Note: This data is taken from four reports, one for each year (1971-74). For the first two years the reports were published in Washington, D.C. Reports are now developed at UCLA. The norms are computed from survey data which is provided by the students. In this instance students chose between identifying themselves as Mexican American/Chicanos, Puerto Rican American, or other. Institutions included in the sample are not all the same ones for each year (although most are), and the number of institutions in the sample vary slighty from year to year.
colleges, while not as smooth, shows a net gain in fres,hmen enrollment. Because of the gains in four- and two-year colleges, there has been a net increase of approximately $27 \%$ for all institutions. When the data for both Chicano and Puerto Rican Americans is aggregated, the patterns remain. The aggregate data shows a small increase in university freshmen, more than doubling of four-year college freshmen, half again as many freshmen in two-year colleges, and again of approximately $39 \%$ in the freshmen class between 1971 and 1974 for all institutions.

There is an inference ot differences of quality between the types of institutions mentioned. The common assumption is that the order of quality begins with universities and decreases to two-year colleges. The Cooperative Institutional Research Program of the American Council of Education and the University of California, Los Angeles have devised a measure of the selectivity of institutions that participate in their annual survey. This data can provide insight into the selectivity of institutions (and by inference, quality) in which Chicanos enroll.

```
See Table 10 for the measures utilized in determining selectivity level.
```

Table 10
Range Of Mean Test Scores For Entering Students By Selectivity Of Institutions Of Higher Education

| Selectivity Level | Approximate Range of Mean Test Scores |  |
| :---: | :---: | :---: |
|  | ACT Composite | SAT V \& M |
| Low | 22 or less | 999 or less |
| Medium | 23-25 | 1,000-1,149 |
| High | 25-28 | 1,150-1,249 |
| Very High | 28-greater | 1,250 or greater |

Tables 11 and 12 show Chicano and Puerto Rican American Freshmen enrollment in institutions by selectivity level. This data provides a valuable insight into Spanish-surnamed enrollment distribution. By making some

## $7:$

assumptions, some expectations can be extrapolated. First, the assumption is that the rate of attrition among colleges with different levels of selectivity increases slightly with the level of selectivity. Second, given survival in an institution, those who graduate from institutions with higher levels of selectivity will have a greater probability of continuing into graduate status (See Tables 11 and 12).

Persuing Table 11 it is evident that the aggregate Spanish-surnamed Freshmen population has enrollment patterns. In public universities for both years for both men and women, the percentage of Spanish-surnamed enrolled is greatest in institutions with the highest selectivity levels. This is especially true for the Chicano freshmen who have a far greater proportion of the Freshmen class in public institutions with high selectivity than in those institutions with medium or low selectivity.

In private universities there is a good
deal more inconsistency for both men and women. The one salient feature is that in

ERIC

1974, private universities with medium selectivity level took a much higher percentage of Chicano freshmen (male and female) than in the previous year and than public universities had for either year. The rate of enrollment tended to increase or remain relatively constant for most institutions between 1773 and 1974 with the exceptions of public universities with low selectivity (esp. for women) and private universities with high selectivity particularly for women.

The most dramatic figures for four-year colleges are for the Catholic institutions. For both years Chicanos are most represented by a considerable rate at those four-year Catholic colleges with low selectivity level. In the four-year private non-sectarian colleges with a medium level of selectivity the highest rate of enrollment and an increase from 1973 to 1974 is evident. This category viz., the four-year private non-sectarian colleges, has the least Chicano and aggregate ipanish-surnamed representation in those colleges with a low selectivity level. Puerto Rican Americans have their highest representation by a significant margin in public
four-year colleges with a marked increase from 1973 to 1974.

These two tables (Table 11 and Table 12) allow for some fairly conclusive generalities. Chicanos and Puerto Rican Americans and the combination of the two tend to constitute a higher percentage of the freshmen class in institutions with higher levels of; selectivity. The very notable excepions are four-year Catholic coilogea with low selectivity and private universyties with a medium level of selectivity for Ćhicanos and for Puerto Rican-Americans as well as four-year public colleges with a high level of selectivity. Four-year frivate non-sectarian colleges with high and very high selectivity levels have Chicaro and Puerto Rican American representation that is well within the median range for institutions of all types described above.

Geograpinc Distribution. Table 13 shows the 1970 undezgraduate enrollment for Spanishsurnamed and others in percentages and numoers by state. Interesting to note, all of the states have a measurable percentage of

Spanish-surnamed enrolled although only eleven states have $1.0 \%$ or above (See Table 14). As might be antitipated the highest percentage of indergraduate enrollment occuris in the five Southwestern states (New Mexico, Texas, Arizona, California and Colorado in that order) (See Tables 13 and 14).

However, comparing enrollment to population, the rank order of these states alters. Arizona, where the undergraduate enroliment percentage is slíihtly higher than the percentage in that state's populatinn, is first. Next come New Mexico, Texas, Colorado and finally California, all of which have rates ranging from enrollment figures being $40 \%$ of the population percentages to $48 \%$. Thus, with the exception of Arizona, by 1970 none of the other states in the Southwest had reached an anroliment level or percentage that was nalf of the fercentage of the Spanish-surnamed population in the state. F ${ }^{\text {l }}$ orida, where there is a large Cuban population, has, reached an anrollment level just over half (53\%) thar $\leqslant$ is in the state's population. In New York, where the Spanish-surnamed population is comprised primarily of Puerto

Rican Americans, the comparative rate is approximately $45 \%$ of the state's Spanishsurnamed population.

There are other states where the enrollment percentage is equal or highersthan the percentage in the population. In these instances the Spanish-surnamed poyulation in the state is less than onehalf of one percent. These stares are Alabama, Arkansas, Connecticut, New Hampshire, Pennsylvania, and South Carolina.

In 1972 the rank order of Chicano enrollment by state in absolute terms did not alter for the five Southwestern states. The rank order of the other staces did change although not dramatically (See Tables 15 ard 16). If we use the representetion rate by - comparing errollment to population there are changes in ihe seven states with a highly visible Chicano population. Arizona is still tie only state that has a higher percentage of Chicanos enrolled than the percentage of Cificanos in the general population but Ney York has moved into second position by a significant margin with over $69 \%$ relativ.

*1970 Census Data
representation. Texas and Colorado are approaching half ( 49.4 and $49.2 \%$ respectively) and New Mexico ropped in rank to fifth although there was a slight increase in the percentage of Chicanos enrolled. Florida was the only one of the seven states that showed a drop in the percentage of Spanishsurnamed people enrolled. In general all of the Southwestern states and New York increased the percentage representation of Chicanos enrolled but only New York had a dramatic increase.

It is fair to conclude that those states with a relatively high concentration of Chicanos did not significantly increase enrollment. So long as this is the case it is unlikely that there will be a major change in the relative presence of Chicanos in higher education in the nation. The fact that over $75 \%$ of the Chicanos enrolled in 1972 were enrolled in those seven states is indicative that the rate of enrollment in those states is a critical element to Chicano enrollment on a national level.

Normative data developed by the American

Council on Education for geographical distribution of fxeshmen between 1971 and 1974 shows very slight creste. While Chicanos are becoming slightiy more visible in institutions of higher education in the Midwest, the overwhelming majority remain in the West. Similarly, Puerto Rican Americans as would be expected, are concentrated in the East.

Select Stc"es. Table 17 shows data from select states for 1970 enrollment by year enrolled. The states included the thebles are the five Southwestern scota normally associated with Chicanos/Mextity Americans as well as Florida and New York because of the Cuban and Puerto Rican American populations, respectively (See Table isy.
?
Note that the figures in Table 17 differ slightly from those in Table 13 and 14 since different sources are involved.

From the figures in Table 17 , a pattern emerges for first year enrollment. Four of the Southwestern states (except New Mexico) have between $7.3 \%$ and $8.7 \%$ Spanish-surnamed. Arizona with an 8.0\% Spanish-surnamed Eixst year enrollment is over-represented in

*Percent in population
comparison with the population percentage (6.3\%). In contrast, the remaining states shown are substantially under-represented. Texas has the greatest imbalance with first year enrollment equivalent to $47 \%$ of the representation in the stace. California is next with $49 \%$, followed by Florida and New Mexico at $50 \%$ Colorado ( $56 \%$ ) ard New York ( $67 \%$ ) . The states with the greatest percentage of Chicanos in the gexeral population (New Mexico, Texas, and California in that order) tend to have the greatesf disparity between general population and first year enrollment percentages. From this we can induce a general rule. There is a cendency for the chances, of the rumber of Spanish-surnamed people to be enrblled in institutions of higher education, to diminish as the percentage of Spanish-surnamed people in the popriation increases. While this clearly is not an absolute rule (Florida being the notable exception), it is obviously a strong propensity.

Table 17 can also provide some insight into the subject of retent on and/or attrition. One must initially recall that Spanish-

$$
100
$$

surnamed individuals in the country as a whole are heavily concentrated in two-year colleges (See Table 5). Further, this is true for the years 1971-1974 as well as for 1970 (See Table 9). Although there has been a gain in four-year college enrollment, this does not affect the distribution. Because many individuals, regardless of their field of study, who enroll in two-year colleges do not continue beyond that experience, there will be a "natural" attrition. The concentration of Chicamos in the two-year colleges predisposes a higher rate of attrition than other groups less concentrated in two-year colleges. We cin, therefore, anticipate higher levels of attrition for Chicanos before a closer perusal of the data is made.

A good deal of caution needs to be exercised in generalizing from the data about reasons for attrition. The difference in attrition between spanish-surnamed and others is shown. In general terms the first two years in higher education have the highest rate of attrition for all groups. That is, once into the third year the attrition rate drops markedly,

## 101

A comparison of enrollment figures between the first and second year and between the second and third year shows differences in attrition between states. The drop"in enrollment between years one and two as compared with other years is the greatest in Arizona, Colorado and Texas. That is, within these three states the highest attrition occurs between the first and second years.. California, Florida, New Mexico and New York have their sharpest drop in enrollment between the second and third year with the single exception of Whites in California where the higher drop occurs between years one and two.

By the third year, there are only two instances in the data shown in Table 17 where the enrollment is half what it was in the first year. Those occur in New Mexico and New York for the White population. Over the seven states shown, the Spanish-surnamed enrollment by the third year has dropped an average of $75.3 \%$. This compares closely with the attrition for total minorities of $74.1 \%$. The data shows substantial disparity with the Whites whose average drop in the third year
is $57.1 \%$ of enrollment was for the first year.

Thus by the third year it is evident that Spanish-surnamed enrollment not only begins at a lower relative rate than does that of Whites, but also the retention rate is lower. The disparity between the two grows with each year of enrollment. By the fourth year the average drop for the seven states is as follows: Spanish-surnamed $80.4 \%$, Total Minority $78.8 \%$ and Whites 62.3\%. Over the four years the sharpest drops in Spanish-surnamed enrollment occur in New York ( $87.4 \%$ ), California ( $86.9 \%$ ), Colorado ( $85.9 \%$ ), and Arizona ( $82.3 \%$ ). The same pattern applies to Total Minorities with whom the Spanish-surnamed figures closely compare. The highest drops for Whites occur in Florida (68.1\%). California (68.0\%), Arizona (67.8\%), and Colorado (63.5\%) .

A comparison of the order or rank of first year enrollments relative to perceat in population, with fourth year enrollments relative to percent in population yields the following (listed in descending order with
those with undergraduate enrollment percentages most closely approximating general popHlation percentages occurring first):

Table 18

Rank Order By Percentage Of Spanish-surnamed First And Fourth Year And Total Undergraduate Enrollment By Select States, 1970

| First Year | Fourth Year | Total Enrollment |
| :--- | :--- | :--- |
| Arizona | Arizona | Arizona |
| New York | Florida | Florida |
| Colorado | New Mexico | New Mexico |
| New Mexico | Texas | New York |
| Florida | Colorado | Texas |
| California | Nalifornia | Colorado |
| Texas | New York | California |

In terms of enrollment of Chicanos in higher education, the comparison shows clearly that Arizona has the most relative success and California the least. Even this sion, however, is tentative.

104

80

The dita does not show actual attrition nor does it provide information about success and failure, A longitudinal study of Chicano enrollment is essential before valid assertions can be made about attritionfretention. While we do know that the percentages for entering freshmen have held relatively steady とetween 1970 and 1974, we do not have adequate data for the second, third, and fourth year. There is also a lack of information on the characteristics of transmission from two-year to four-year colleges. The data only gives a sense of what is occurring but reliance can be given to the general trends mentioned above.

The 1972 enrollment data that is available does not have a year by year breakdown, making comparisons for the first and fourth years impossible. It is possible, however, t. make a comparison for total enrollment, (See Table 19).

The order of status used in Table 19 is by reiative representation. Arizona continues to be more successful at overall enrollment. The table verifies that by 1972 the first year

$$

| Florida | New York |
| New Mexico | Texas |
| New York | Colorado |
| Texas | New Mexicc |
| Colorado | California |
| California | Florida |

enrollment activities reflected in Table 18
have begun to hold sway for New York and Colorado. It is difficult to understand the reasons for the shift in order but one thing is clearly suggested. California and Florida are not as aggressively pursuing Chicano-Spanish-surnamed enrollment as are the other of these select states.

Chicano enrollment patterns need to be subjected to croser scrutiny to allow for

106
82

more lintelligent assessments than are possible with the existing data. It may well be that recruitanentin the secondary schools is the main cause for limited growth in enrollment into higher education. The question of "qualifted" versus "special admission" students is nort an issue since community colleges are an alternative. It may well be that recruiting offices in higher education are the main cause of enrollment patterns or it may be the lack of adequate financial aid. All of these are involved to one degree or another but those that weigh heaviest must be determined if there is to be appropriate planning.

Enrollment by Field of Study. The data for enrollment by field of study is restricted to total enrollment for 1972. Table 20 shows the distribution for the nation. Table 21 shows Spanish-surnamed only and the percentage of total Spanish-surnamed that each field constitutes. The data is from the office for Civil Rights and includes both graduate and ündergraduate enrollment. All are presented in this section since most of the data lised
to discuss graduate enrollment of Chicanos are from other sources and are restricted specifically to graduates. Undergraduates constitute $95.9 \%$ of Chicano enrollment so the distribution figures shown here most certainly reflect the dominant trends in field of study for undergraduates. It is also important to note that the total enrollment reflected in the data in Table 20 accounts for only slightly more than $35 \%$ of total enrollment for 1972. In each field of study listed, save one, the White enrollment accounts for $89 \%$ or more of the people in the field. Since the provision of this information is voluntary there are several conclusions that can be reached. First, Chicanos and other minorities are more willing than Whites to provide this information. Second, among White students those in the Liberal Arts/Arts and Sciences category are the least likely to indicate their field of study. While the lack of response among White students in the Liberal Arts/Arts and Sciences compromises much of the potential significance of the data there are still some conclusions that can be reached by looking at the Spanish-
surnamed enrollment alone (See Table 21).
Most evident is an overwhelming majority ( $85.4 \%$ ) of Chicanos enrolled in the liberal Arts/Arts and Sciences. The second most popular field for Chicanos is Education ( $3.8 \%$ ) with Business and Physical Sciences/ Engineering/Applied Technology (3.1\%) not far behind. The fine Arts/Architecture is next ( $1.2 \%$ ) with the remainder all having less than one percent enrolled. Glearly a more even distribution is desirable but this data provides little insight into the reasons for the heavy emphasis on the Liberal Arts/Arts and Sciences, and t'ie poor distribution in the other fields.

## Graduate Enrollment

Tinnds evident from the perusal of en-
rollment in schools and in undergraduate in-
stitutions of higher education foreshadow what
occurs in graduate schools. The reader will
recall that the diminution of Chicano or
Spanish-surnamed enrollment in schools begins
to occur at a substantially greater rate than
others by the $14-15$ years old age bracket.

Further, the A b between Chicanos and others increases with time. That pattern continues to hold at the graduate level. Table 22 shows national figures for 1970 for the Sparish-surnamed and others in graduate and professional schools. Table 23 shows the 1972 data for graduate and professional schools. The 1972 data are presented differently since the "professional schools" category in 1972 has a different data base than does the 1970 data. While the Office for Civil Rights publication (OCR-74-13) does include some definitions it is unclear just precisely what is meant by "professional schools." The earlier publication (OCR-72-8) isolates medical, dental, and law school and these are certainly part of the sum of profescional school enrollment figures in OCR-74-13. It is evident, however, that they are not the totality. Thus, here again are data problems. The 1970 enrollment figures for "graduate schools" almost certainly include data tinat is counted in the 1972 survey under "professional schools." The result is that the only figures that are comparable from these two tables are the "totals." Later in this section
historical data is presented to provide a comparative perspective that utilizes data with a common base. In that instance it will be possible to see overall enrollment figures with graduate and professional enrollments combined since that is the only common base for the three surveys.

The total enrollment percentage of Chicanos in undergraduate status compared with the total enrollment percentage of those in graduate and professional status shows a significant drop in 1968 ( $1.7 \%$ to $0.8 \%$ ), 1970 ( $2.1 \%$ to $1.2 \%$ ), and in 1972 (2.4\% to 1.4\%) . In all of the surveys it is apparent that the percentage of Chicanos who matriculate into graduate status is less than that of others. Table 24, based on common sources of data, shows a comparison of total enrollments between graduate and professional and undergraduate status. The percentage of Chicano undergraduates who continue in school more than doubled between 1968 and 1970 but tapered off considerably between 1970 and 1972. The same is true for the Total Minority and Whites category. From the standpoint of relative

gair Chicanos have made very little progress. It would be interesting to find out why so few Chicanos continue in school. Is it because they do not apply? Is it because they do not qualify? Is it because of financial reasons? We know that the level of indebtedness for Chicanos by the end fondergraduate studies is higher than for others. More study is clearly needed in this area.
Chicanos evidently continue into graduate and professional school at a substantially lower rate than other minorities and at nearly hais the rate of Whites. Thus the trend that begins at the : 4-15 years old level continues into graduate and professional schools. The Spanish-surnamed population are not simply under-represented in enrollment in higher education but are increasingly under-represented as the level of matriculation advances.
Table 25 shows by state the 1970 distribution of spanish-surnamed emrollment in graduate anc frofessional schools (except medical, dental, and law).
As indicated earlier, the data on graduate and professional enrollment available for

1972 was compiled under a ifferent data base or type of control. That is, the 1972 data has separate. listings for graduate and professional. This, of course, makes comparisons impractical. Therefore, in order to avoid complications, the 1972 State Summaries data is presented in the appendix (See Appendix B).

Because of the greater propensity of graduate schools to recruit on a national and international bases, it is difficult to generalize about geographical distribution. As opposed to undergraduate schools, the number and capacity of graduate schools have different variability from state to state than do undergraduate schools. Still one is forced. to assume that states with a significant Spanish-surnamed population will have greater numbers and higher percentages of Spanishsurnamed individuals enrolled. Selecting the same states considered in the section on undergraduate enrollment, some comparisons can be made. The states are listed in two orders (See Table 26). They are shown in decreasing order beginning with the one with the highest percentage of total enrollment
as well as, in similar order, with the one whose percentage enrollment most closely approximates the percentage of Spanish-surnamed in the state.

The 1972 data for graduate and professional schools are similar to one another for percentage of total enrollment and differ somewhat from the 1970 data. Table 27 shows the 1972 ranking with the distinction between graduate and professional schools. As already mentioned, the value of these observations is questionable without additional data. It is interesting to note, however, that Arizona consistently is more successful at approaching "parity" in terms of proportionate representation than the other states of the Southwest.

Distribution by Eield of Study. Graduate enrollment distribution by field of study is difficult to assess with precision. Variations occur between data sources especially with regard to absolute sums. Also, the ability and incidence of occurrence for individuals to combine fields of study is difficult to assess. Among researchers grouping

of disciplines also vary from institution to institution. For example, one survey will combine the Physical Sciences and Mathematics while another will list the Physical Sciences separately. Also, data is presented for full and part-time enrollment and other for fulltime only. In either case full and part-time are defined in more than one way. In some Instances the responses to surveys are not complete and in other instances the sample population includes only doctoral-granting institutions. Because of the magnitude of the figures in each category, the differences described above can be meaningful. For these reasons data from different sources is presented and the reader is warned to exercise more caution in terms of the precision of the numbers with this data than with other data that has been presented.

The first data presented shows 1970 distribution for various ethnic groups in percentages (See Table 28). This data is from a portion (40\%) of a sample of schools, but the percentages show close agreement with data from other sources. The data shows the
percentage representation in seven general fields of study. The Spanish-surnamed are best represented in Education, Arts; Humanities and the Social Sciences. Whites, however, constitute over $90 \%$ in all of the fields shown. The highest Total Minority representation is 9.4\% in Education (See Table 29).

Table 29 is based on 1973 figures for Ph.D. granting institutions only. As can readily be seen, the percentages correspond fairly well with those in Table 28 with minor differences that are at lerst partly attributable to a different year and sample size. From the former table we are able to sense the percentage distribution within the Spanish-surnamed category (See Table 30).

Clearly the emphasis arong Chicanos is Education with the Arts and Humanities being the next misst chosen. The Life Sciences and Social Sciences are nearly equally represented while the Physical Sciences/Mathematics and Engineering fare poorly.

The trends indicated $f n$ the previous two tables are borne out when one looks at the

103
distribution by field of doctorates awarded in 1972-73 as reflected in two different studies. Once again there is the problem of the nature of the data, in this instance the discrimination between sampling size and definition of Chicano or Spanish-surnamed. In one instance the sample size is smaller and distinguishes between native-born and naturaiized U.S. citizens. In the other instance the sample size is larger but the category used is Latins which includes Spanish Americans/Mexican Americans/Chicanos/ Puerto Ricans. Nevertheless, the patterns as seen in Tables 31 and 32 , for example, hold fairly constant, that $i$, if the Psychology and Social Sciences figures of Table 32 are combined. The differences that appear between Education and the Arts and Humanities are also reduced if the Chicano and Puerto Rican categories in Table 31 are combined. Thus, in spite of the differences in methodology both tables show a consistent pattern of distribution by field.

The domination of Education and the Arts and Humanities over other fields is evident

Source: Comission on Human Resources, Minority Groups Among United States DoctorateLevel Scientists, Engineers, and Scholars, 1973, National Research Council, National Academy of Sciences, 1974, pg. 13 .
and appears consistently in the data. The greatest disparity between Chicanos or Spanish-surnamed and others is and will be for the next couple of years, in the Physical Sciences, Mathematics, and Engineering. Enrollment levels: show very clearly that Education will continue to dominate as a field of graduate study for Chicanos unless some dramatic incidents or influences alter the pattern. Arts and Humanities do not show a substantial margin over the Social and Life Sciences in doctorates awarded but have nearly twice as large a pool of students to draw from in the future.

It is interesting to note that Education is also dominant for the Total Minority enrollment and that the field of study with the next highest enrollment (excepting "others") is Arts and Humanities. As is the pattern for White enrollment except for one notable difference-the Physical Sciences and Mathematics, where White enrollment is as high as in the Social Sciences, the pattern of enrollment for Total Minority is very similar to that of the Spanish-surnamed. In general,

Whites have a more balanced enrollment than do the other categories.

Medical Schools. Data from different sources for enrollment in medical schools is more in agreement than data for graduate studies in general. Probably this can be attributed to the smaller number of schools and the lower total number of students as well as the more structured nature of medical. schools.

Tables 33 and 34 show the growth of medical school enrollment from 1968-69 to 1974-75 academic years. Table 33 includes first year enrollment from 1970-71 through 1974-75. These figures show dramatic changes occurring in medical schools. First, giowth of White enrollment has remained even in relation to the overall growth in medical schools. Over the five-year period shown in Table 33, the rate of growth of Total Minority enrollment, both in entering class and in overall enrollment, has been higher than the respective rates for Whites and for the total en rollment. In 1970-71 Total Minority enrollment was $5.7 \%$ of the total. By

1974-75 it-was $10.4 \%$ or nearly double.
The greatest rate of growth, however, has been in the Spanish-surnamed category.

The Spanish-surnamed percentage of first year enrollment has tripled and the percentage of total enrollment has risen by a factor of over three and a half. Clearly, the complexion of medical schools is changing and just as clearly the greatest rate of growth in enrollment is among the Spanishsurnamed.

It must be stressed, however, that in terms of actual numbers there is no likelihood that we will be faced with a glut of Spanish-surnamed medical. doctors. Spanishsurnamed individuals still only comprise $1.8 \%$ of the total and $2.4 \%$ of first year enrollment. Out of a total of 53,597 medical students there are only 968 Spanish-surnamed.

It should also be stressed that the rate of growth of White enrollment (both in first year and as a whole) and the rate of total enrollment (first year and total) is the same. This indicates the charge that minorities are taking slots from Whites is totally unfounded.

Table 35 shows medical school enrollment by state for 1970. States with higher absolute numbers of Spanish-surnamed in medical schools tend to correlate to those states with higher medical school enrollment in general. Exceptions are New Mexico and Florida. California had better representation of Spanish-surnamed in medical schools than in graduate schools. The same is true for Arizona, although this only involves four medical students. Colorado shows only five Chicanos in medical school. New York, which has the second highest number of medical schools in the country, shows $0.5 \%$ of its enrollments as Spanish-surnamed.

Generally, Chicano representation in medical schools across the country is growing but is still far from being representative. If, however, growth continues at the present rate (1971-75), Chicanos and Spanishsurnamed people in general will reach parity within the next five years. It should be emphasized, however, that already there are indications that this will not be the case. The recent California court decision involving

the University of California, Davis medical school admission policies will undoubtedly create the same pressures in medical schools that have been created in law schools by the DeFunis decision.

Dental Schools. A glance at Table 36 shows that the Spanish-surnamed enrollment is the same relative proportion of the total in the three year period, 1970 through 197273. Spanish-surnamed enrollment grew by nearly a third in absolute numbers over the 1970 figures. The only group that showed a substantial relative increase was Oriental enrollment. The relative representation of Chicanos in dental schools is the lowest of all graduate and professional school earollments.

Table 37 shows the distribution of dental school enrollment by state. Only three of the previously discussed states have dental school enrollments (California, New York, and Texas). California alone has $42 \%$ of the total Spanish-surnamed enrollments, Texas has $10 \%$ and New York $7 \%$ accounting for 59\% of Spanish-surnamed dental students. As

***Percentage of total.

140

116
is the case with medical schools, and perhaps much more so, the relationship of whe percentage of en rollment to the percentage of the total population in the state is an inappropriate measure because of the distribution of schools and the interstate character of enrollment in general. One would suspect, however, that those states with the larger number of dental students would reflect a similar pattern for Chicanos. It does not occur. With the exception of California (which does have both), the size of the total enrollment in the state appears irrelevant in predicting Chicano representation. For example, if the six states which immediately follow California in total enrollment are considered, there is an enrollment of 6,604 which accounts for $44 \%$ of total enrollment in the country. There are only 14 Chicanos who account for $0.2 \%$ of the total and $14 \%$ of total Chicano enrollment in dental schools.

The data presented here for 1970 and 1972-73 shows clearly that some efforts need to be made to make the situation more reasonable. The data does not indicate why the

situation in Dentistry is so poor compared to other graduate and professional schools.

Lav Schoozs. As an aggregate, Chicano and Spanish-surnamed representation in law schools has increased between 1970 and 197374 (See Table 38). In terms of percentages, by 1973-74, it is nearly half again what it was in 1970 and over twice (2.4) what it was in absolute numbers. Spanish-surnamed enrollment has grown more rapidly than enrollment as a whole and faster than the Total Minority enrollment and the White enrollment in terms of absolute numbers and percentages. Among Spanish-surnamed people, Puerto Rican Americans have had the greatest rate of growth both in absolute numbers and as a percentage of the total--a fact that was hardly avoidable given any recruitment at all. Chicano, Spanish-surnamed as an aggregate, and Total Minority enrollment have allincreased proportionately at a greater rate than either the White or the total enrollment. However, as must be apparent by now, the White and total enrollment figures are nearly always rdentical (because of the disproportionate majority of Whites).

** Law School and Bar Admisaion Requirements. A Review of Legal Education In the United Stateg-Fall, 1973. Chicago, American Bar Association, 1974.

The Spanish-surnamed enrollment in law schools began in 1970 at a substantially greater proportion on the whole than either medical or dental school enrollment. And while law school enrollment has grown, it has not grown at as rapid a rate as medical schools, but because of the initial margin, is likely reflecting a better Chicano situation (this was clearly the case in 1973-74).

Thus it is possible to conclude from the data that Chicanos have better representation in law schools than in medical or dental schools. Similarly we can anticipate that at the going rate, medical schools will soon demonstrate the most favorable rate of representation of all professional and graduate schools in terms of the proportion of Chicanos enrolled. And unless the rate. of growth of enrollment in law schools begins to grow, they will soon be in the same relative position as dental schools.

Table 39 shows full-time law school enrollment by state. In this instance, as is the case with graduate schools and to a far greater degree with professional schools, it

146

122
is dangerous to generalize too much. Law schools are more numerous than the other professional schools discussed. They also recruit on an interstate basis. Nonetheless, law school enrollment statistics reveal telling patterns in states with a significant Chicano percentage in the population.

The seven states previously considered (five Southwestern, Florida, and New York) have over $75 \%$ of the total Spanish-surnamed enrollment in law schools. With the exception of Colorado and New York the percentage representations within these states are the highest in the country. New Mexico has the highest representation of Chicanos ( $9.6 \%$ ), but the total enrollment is among lak owest in the country (only six other states have fewer law students enrolled). In contrast, New York with the largest number of law students in the country, has very poor Spanishsurnamed representation ( $0.9 \%$ ). The greatest number of Chicano law students are in California and Texas, which between the two, account for $50.6 \%$ of all Spanish-surnamed law

Brief Case Studies of Select Institutions
This section provides a brief glance at undergraduate and graduate enrollments in a limited number of educational institutions
in California and Texas. Because the available data is not uniform, the discussion varies in focus and range.

The University of California System. Table 41 shows Chicano enrollments from 1968 through 1973 for both undergraduates and graduates. The source is the University Ethnic Survey, the data of which is acquired through voluntary self-identification cards that are part of the registration packet which a student completes at the beginning of each academic period. The institutional data presented here covers the years 1968 to 1973, thus allowing comparisons over a period of time. The percentage of the total student body responding to the survey was approximately $85 \%$ in 1968-1970, $84 \%$ in 1971, $93 \%$ in 1972, and $95 \%$ in 1973.

As is the case with all the data presented in this report, there is good reason to have reservations about its accuracy. If for no other reason in this case, no distinctions were made between "Mexican" and "Spanish American" in the ethnic identification category which would identify Chicanos. Moreover,

surveys conducted by the Educational Opportunities Program of the University of California and by the President's Task Force on Chicanos and the University of California show a much lower Chicano representation for 1973-74 than should be the case if the data presented in Table 41 were to be correct. Nonetheless, the data does provide useful information and does reveal evident patterns. Specifically, the available information reveals that in 1973 only approximately $5 \%$ of total University of California student enrollment was Chicano. This percentage indicates that Chicano enrollment is far below what could be considered a reasonable level of representation, given that Chicanos constitute between 17 and $19 \%$ of the total population of the State of California
Chicano undergraduate enrollment in the University of California System, which was so low as to be nonexistent in some cases in 1968, grew substantially between 1968 and 1973. Major growth, according to the figures in Table 41, took place between. 1968 and 1969. With the exception of the San Diego
campus, the growth rate between 1969 and 1970 is less dramatic. Some campuses in factBerkeley, Davis, and San Francisco--experienced sharp declines. Subsequent growth patterns are more uneven. With the exception of Davis, the smaller campuses of the University of California System--Irvine, San Diego, Santa Barbara, Santa Cruz, San Francisco and Riverside--experienced higher growth rates in 1971 and 1972 than Berkeley. University of California, Los Angeles, on the other hand, is surpassed in growth only by Riverside, San Diego, and the Santa Cruz campuses. The highest percentage of Chicano undergraduate enrollment in 1972, for example, was at San Diego (6.9\%) with Riverside (6.6\%), Santa Cruz (6.5\%), and UCLA (6.3\%) close behind, in that order. The lowest percentages were recorded at Davis (2.5\%) and Berkeley (3.0\%) . The growth rate, however, began to level off somewhat by 1973, although Riverside and Santa Barbara continued to steadily gain Chicano enrollment. As of 1973, Riverside campus had the highest percentage ( $8 \%$ ) of Chicano undergraduate enrollment of any campus of the University of California System,
followed by San Dfego (97.1\%), Santa Cruz (6.4\%), and UCLA (6.1\%). In absolute numbers, however, UCLA is first: with Berkeley a distant second. The remaining cammuses have approximately the same absolute numbers of Chicanos (between 300 and 400 ), with the exception of San Francisco, which has approximately 500 total undergraduates.

Between 1968 and 1973 the percentage of Chicano undergraduate enroilment in the University of California System grew from $1.8 \%$ to $5.0 \%$. The general rate of growth was initially high and then tapered off. Only Kiverside and Santa Barbara campuses continued to experience substantial growth. San Francisco campus reveals continued growth through 1973, but the numbers are so small as to be insignificant. Two cam-puses-UCLA and Sants Cruz--show a drop in Chicano enrollment between 1972 and 1973. The remaining campuses--Berkeley, Davis, Irvine, and San Diego--show less than $1 / 2$ of 1 \% growth in Chicano enrollments between those two years.

The reasons for varying growth patterns
from campus to c:mp-s, although both interesting and significant, are not the subject of this section. Complex geographical, demographic, social, economic, political, and historical factors come into play in all of them, with the contradictory result that two of the most elite and most popular of the University of California campuses--San Diego and Santa Cruz--and two of the least elite and least popular--Riverside and Santa Barbara-experience the highest growth rates. The leading center, however, continues to be the Los Angeles campus, where vigorous Chicano leadership has surmounted the multitude of negative factors which had historically limited Chicanc undergraduate enrollment there.

It is reasonable to assume, given these patterns and the decline in financial aid over the past three years, that Chicano undergraduate enrollment at the University of California has peaked and is currently declining. This assumption is confirmed by the other University of California studies referred to eailier, which indicate that in 1973-74 there were fewer Chicanos enrolled

157
in the University of California System than the data on Table 41 indicates.

Graduate Chicano enrollment in the University of California System, according to the data in Table 41, also grew substantially between 1968 and 1973, from 1.6\% to $5.1 \%$. If the growth percentage was impressive, it was because prior to 1968 the number of Chicanos in the Graduate Division of the University of California System was negligible. Berkeley recorded less than 100 in 1968; UCLA slightly over 100; the rest of the campuses together, less than 100. Even allowing for those students who were not identified, the numbers are still pitifully smal.

Chicano graduate enrollment in the University of California System at large grew from $1.1 \%$ to $5.1 \%$ between 1968 and 1973, or 1/10th of a percentage point over the Chicano undergraduate enrollment growth. The percentage of Chicano graduate enrollment to total grajuate enrollment is higher than undergraduate Chicano enrollment to total undergraduate enrollment at both of the
major University of California graduate centers: Berkeley and UCLA. At Berkeley the comparative figures are $3.3 \%$ undergraduate and 4\% graduate. At UCLA they are 6.1\% undergraduate and 6.3\% graduate. Although the Chicano growth rates at the smaller campuses are large they represent miniscule numbers. UCLA alone has more Chicano graduate students than all the smaller campuses combined.

Graduate enrollment in the University of California System also begins to show signs of peaking and the beginning of a decrease by 1973. Where between 1971 and 1972 Berkeley increased its Chicano graduate population by $1.2 \%$, between 1972 and 1973 the growth rate dropped to . $5 \%$. UCLA also shows a drop from a . $5 \%$ growth rate in 1972 to . 2\% in 1973. Of the remaining campuses only Irvine, Riverside and San Diego increased their growth rate. Two campuses, Davis and Santa Cruz, actually dropped in Chicano graduate enrollment between 1972 and 1973. Numerous departments in the University of California System do not report any Chicanos
in either the 1974-75 class or in the 197576 class, which creates considerable and very real cause for concern.

A study made by the Graduate Studies office at Berkeley confirms the pattern of decreasing Chicano enrollment with respect to the Arts and Sciences. The growth experienced at Berkeley between 1968 and 1973 at the graduate level was in the professional areas. Table 42 shows the distribution of Chicano graduate students at Berkeley with respect to degree goal. The overwhelming majority, fully $60 \%$, are pursuing one or another professional degrees. Those numbers are still increasing, as is revealed in Table 43 , which shows the distribution of Chicanos at Berkeley by field of study for both 1973 and 1974. The Arts and Sciences enrollments either held steady or decreased between 1973 and 1974. The sole exceptions, Mathematics and Statistics, recorded an increase in the numbers of students from 3 to 7. The 1974-75 Arts and Sciences class thus either does not include any new Chicanos or new admissions are not

160
keeping pace with attrition and completion rates.

For a variety of reasons, the status of Chicanos at the University of California is a critical index of the status of Chicanos in higher education in general. First of all, the large Chicano population in California provides a large pool from which the Universities draw on. Second, the nature of the system, the fact that there is a variety of campuses in a variety of areas and with a variety of focuses make the University of California System very attractive to both instate and out-of-state Chicanos. Third, the University of California is a public system, which makes it a less expensive and--in theory, at least-a less exclusive institution than comparable first rank universities Fourth, the University of California was one of the first systems to feel the pressures of Chicano demands for access, and was also one of the first to respond to those pressures. Finally, the Jniversity of Califoria, although highly elitest, did also include in its administration and faculty large numbers

Table 42

162
of sympathetic and responsive individuals. Given these factors, Chicano enrollment should not only be higher but should still be increasing. That it apparently is not is yery troubling.

The Califormia State University and College System. The data used for this section is also based on voluntary ethnic identification cards. In this case, however, the data is not uniform. There are several sources and these vary from year to year in format and manner of reporting. Once again the qualification is made that although the accuracy of the numbers may not be absolute, the patterns that emerge are valid indicators of the status of Chicanos in this system.

By way of explanation it shoula be added that the California State University and College System (CSUC) is the second level of a three level higher education system in California. The first level, the California Community College System, is open to any student who has completed high school. The second level, the California State University and College System, is open to high school
students who graduate with a GPA of C or better and to graduates of the Community College System. The University of California System is limited to those students who rank in the top $12 \%$ of their high school graduating classes and to academically superior transfers from both the Community College and State University and College Systems. Although the California State University and College System has graduate programs in most fields, only the University of California System grants the doctorate or has law and medical schools.

Table l4 shows the enrollment for three different years. The 1967 data and the 1970 data are for full-time students only. The 1972 data is for both full- and part-time students, but includes all spanish-surnamed students, whether Chicano or not. The 1973 data is calculated from a $73.1 \%$ response to the ethnic survey. The percentage response for prior years is not available.

Despite some clear advantages (lower tuition and fees, greater accessibility, wider variety of locations, larger variety

|  |  |  |  |  |
| Undergraduate | - | 5.4 | 6.1 | 5.8 |
| Graduate | 2.9 | 5.1 | 5.5 | 5.3 |
| Total |  |  | 3.4 | 3.6 |

Sources: 1967 and 1970 data from López, Ronald W. and Darryl D. Enos, Chicanos in Public Higher EducaEion in California, Joint Comittee on Master Plan for Higher Education, California Legislature, 1972. 1972 data taken from CSUC Directors of Institutional Research, "Enrollment by Ethnic Group, Fall 1972."
of professional programs, less demanding standards, the CSUC System does not compare very favorably with the University of California System although it fares better than some of the individual campuses such as Davis and Berkeley.

Although the sources do not show the differences between gradvate and undergraduate
13.7
eniollment for 1967 and while the 2.9\% total given for 1967 may be underestimated, nonetheless comparative figures reveal a substantial increase in both the graduate and undergraduate student population between 1967 and 1970. Between 1970 and 1972 , however, the undergraduate population grew by only. $7 \%$ and the graduate by only. $4 \%$. By way of contrast, the University of California System growth figures were $1.4 \%$ and $2.2 \%$ respectively. The 1973 figures reveal a de* crease of $.3 \%$ in the CSUC System undergraduate enrollment versus a . 3\% in the University of California System undergraduate enrollment. These comparative statistics Ere cause for concern. Not only do they suggest that past-1972 University of California System Chicano enrollment growth has been at the expense of the CSUC System growth, but in addition they support the conclusion that Chicano undergraduate enrollment has peaked in California and may weil be decreasing.

At the graduate level, and it should be emphasized once more that the CSUC System
is restricted to the first post-baccalaureare degree, the data reveals a less favorable comparison. The available information reveals a graduate student population of $3.0 \%$ in 1970; which grows to $3.6 \%$ in 1973. The University of Califorria System, which records a $2.8 \%$ graduate student enrol?uens in 1970, grows to 5. $2 \%$ by 1973. Althoughthere are a number of fixtors which might serve to explain this gap--prestige, support funds,
 to wonder why the CSUC System has not becr able to capitalize on its various advańages.

Takie 't5 sinows the distribution by field of study for the 11,218 Chicanos who responded to the 1973 survey. The sane information, safontunately, is nct available for the Undverzity of California System and thus it is not possible to make useful comparisons. The undergrasuate ranks in the professional areas are dominated by Business and Management (12. $3 \%$ ) leading Equcation ( $9.2 \%$ ) by a wide nargin. The next largesí category is chat of the Social Sciences ( $26 \%$ ), whe: this category is expanded to 167
f.asinde thoise students categorized under Psyciology, Area Studies, and Interdiscifilnary Studies. The Fine and Applied Arts, combined with Letters and Foreign wanguages, which equating the Arts and Humestties category, rank behind the Social Sciences with $13.5 \%$ The Natural Sciences rank last, with approximate? $8 \%$ of the total enrollment. There is, however, a large group--approximately $14 \%-$ which is undeclared.

The distribution by field of study changes somewhat at the graduate level. Education becomes the principal area of concentration, with $23 \%$ of the total number of students, who have declared their degree and area of study intentions. Because the $\mathbf{2 6 \%}$ in the undeclared category includes persons who are pursuing a teaching certificate program, Education is clearly the preponderant fiénd of study of Chicano graduate students in the CSUC System. The remaining professional areas account for $18 \%$ of the total Chicano graduate student enrollment followed by the Social Sciences with $16 \%$, the Arts

Stanforä University. The final case study, thrt of Stanford University, also has severe Jimitations in that undergraduate enrollment was unfortunately not available for this report. Despite the limitations of the information, Stanford University is an important case to examine because it is a private and prestigious university which is very popular with Chicano students. The following discussion is based on data ávailable for Chicano graduate enrollment at Stanford University. The information presented in Tables 46 and 47 is taken from a report.prepared by a committee chaired by Maria BaezaSmith and Thomas Rhue, both of whom were Assistants to the Dean of Graduate Studies at the time of the preparation of the report in 1974.

Chicano graduate enrollment, which was negligible (a total of 20) in 1968, grew to 202 by 1973. This impressive increase should, however, be examined $i n$ another context. In 1973 the Chicano graduate student

171
population constituted less than half of the total minority graduate population (202 out of 465 , or $43 \%$ ). The total minority graduate population accounted for $9.6 \%$ of the total Stanford graduate student population. Chicanos thus constituted approximately 4.2\% of the total Stanford graduate population.

The majority of these graduate s: . Jents were pursuing professional degrees, in Law ( $18 \%$ ), Medicine ( $13 \%$ ), Business ( $12.5 \%$ ), or Engineering (7.5\%). The làrgest single group, however, was pursuing an advanced degree in Education ( $25 \%$ ). The remaining $25 \%$ were in the Arts anc Sciences.

The University of Texas, Austin. Although Chicano enrollment statistics at the University of Texas, Austin are available only for 1974, they are provided here in order to demonstrate the similarity of enrollment patterns despite differing geographic and socioeconomic contexts. Besides the time limitations, this information also has the reliability problems of the previous data. In this particular case the numbers included "Spanish-surnamed" students who may or may
not be Chicano.
The total enrollment at the University of Texas, Austin in 1974 was 40,917 students, of which approximately $90 \%$ were undergraduate and $10 \%$ graduate. Less than 2,200, or approximately $5.4 \%$ of the total, were Chicanos. Out of a total population of approximately 12 million Texans however, Chicanos number 2.5 million; that is, over $20 \%$ of the total population.

Of the 2,200 Chicanos at the University, approximately 1,900 ( $04.85 \%$ of the total Chicano enrollment) were undergraduates. Of those 1,900 , slightly over $50 \%$ were enrolled in one or another professional fields. The largest number was registered in the School of Business Administration (238) and the largest proportion was recorded by the School of Business Administration (14.7\%). In the Arts and Sciences the largest enrollments were in the Natural Sciences and in the Social and Behavioral Sciences. Together these fields accounted for $30 \%$ of the total Chicano enrollment at the University of Texas. Education and Business

Administration accounted for another 20\%.
At the University of Texas, Chicanos accounted for less than $4 \%$ of the total Graduate School enrollment, less than $2 \%$ of the total Graduate School of Business Administration, and only $4.1 \%$ of the total Law School enrollment in 1974. Their total numbers were less than 300 , or approximately $15 \%$ of the total Chicano population.

Two-thirds of the Chicanos engaged in graduate work at the University of Texas in 1974 were enrolled in a professional field. Education and Law accounted for over half of all graduate enrollees. The large undergraduate enrollments recorded in the Natural, Social and Behavioral Sciences were not reflected in the Graduate School. The Social and Behavioral Sciences, for example, recorded only 22 Chicano graduate students, as opposed to 315 undergraduates. The Natural Sciences recorded only 7 , as compared with 358 undergraduates.

Since the University of $T{ }^{-1}$ figures are not available for other yeat, and since
figures are not available for field distribution for the University of California System, no meaningful comparisons can be made. Two items stand out, however, and should be Insisted on again Chicanos enrolled in the University of Texas is decidedly out of proportion to their numbers in the population at large. Second, despite surprising concentrations of Chicano undergraduate numbers in the Natural, fraial and Behavioral Sciences, very few are reported at the graduate level.

Table 48

## Summary

By comparison, at the University of Texas, $22 \%$ of the Chicano graduate student population was in Law, $22 \%$ was in the Arts and Sciences, $12 \%$ was in professional fields, and $34 \%$ were in Education. The University of California, Berkeley statistics show a similar pattern, with $58 \%$ of Chicano gradutes in the professional areas (including Education), $16 \%$ in the Social Sciences, $17 \%$ in the various sciences and mathematics fields, and $9 \%$ in the Humanities. Several general conclusions can be made from the enrollment patterns demonstrated by the data from the University of California System, University of Texas and Stanford. The trend towards the professional fields appears to be consistent with national enrollment statictics. There is a clear preference on the part of Chicanos for the study of Law, Medcine, Education and other professional areas. To illustrate this point, at the University of Texas, $22.8 \%$ of the Chicano graduate student population was in Law, at the University of Berkeley, $26.4 \%$ and $7.9 \%$ at Stanford.

## Conclusion

In the past ten years major changes have taken place with respect to Chicano partictpation in higher education. Where once the Chicano presence $\ddagger n$ institutions of higher learning 'was limited to small numbers of maids, janfitors and gardeners, even smaller numbers of studerts, and miniscule numbers of graduate students and faculty, today Chicanos are $v$ fetbly present in most Western colleges and siniversities not only as employees but also as students. During this period sipportive and educational programs have betn developed in many universities to address the needs and interests of Chicano students. Chicano faculty now hold appointments in ethnic studies programs and in traditional departments. Here and the=e Chicanos can be found occupyiny positions of responsibility in college and university administration. Although Chicanos have experienced major gains in higher education in the form of increased enroinments, development of Chicano-oriented programs, and faculty-staff appointments, these gains are
aignificant principally because previously shere was little or no representation of Chicanos in institutions of higher learning. Comparative statistics reveal that Chicanos
'1. do not have representation in higher yacstion which corresponds to their propor-
. of the general population. The information available indicates furthermore that the Chicano enrollment rate in undergraduate institutions has already leveled off and may alread" be declining. : The implications of such a decrease are serious. Smaller enrollments will be used by university administrations to justify further cutbacks in Chicano-oriented programs, will result in a reduction in the number of Chicanos who ill finish the Bachelor's degree program and move into post-baccalaureate degree programs, and will bring about a decrease in the number of Chicanos who will enter doctoral programs and pursue a career in higher education.

Although to some extent the leveling off of Chicano enrollments may reflect the disillusionment with higher education currently
present in American society, the primary reason for the decline in the rate of Chicano enrollments is an economic one. Since the Chicano population is primarily a low income population it has suffered the effects of unemployment and inflation more grievously than the majority population. The change in edu ational financial aid packages from outright grants to combinations of loar s..... and grants to predominantly or exclusively loan packages have seriously affected the educational plans and aspirations of many Chicano students.

At the graduate level the state of the economy, the level of indebtedness of Chicano students at the end of the Bachelor s degree program, and the increasing unavailability of scholarship and fellowship monies are beginning to affect Chicano enrollments. To cite but one example of the latter, the Ford Foundation Gradnate Fsilowships Program, which has supported graduate study leading toward a career in higher education for approximately 400 Chicanos since 1968, will make "ts final initial awards this year
":
(1975-76). To these very concrete condiEions must be added the very serious problems posed by signs of reduced access to 5 post-baccalaureate educational institutions and, for those interested in a career in higher education, very real fears about employment possibilities.

While in the past decade the number of Chicanos cccupying faculty and staff positions in institutions of higher learning have grown, this increase is currently in jeopardy. The cutbacks in Chicano-oriented programs will reduce the number fifrent appointments. Furthexmore th sistance of institutions to the developi..... of new programs togetner with the increasingly reduced number of ivailable positions fin traditional programs and departments mey mean that we will scon reach a peak in Chicano faculty-staff appointments and thint those numbers will thereafter decline.

The future of Chicanos in bigher education is, as a cons querces, less trighe today - than it was at the beginni. $\mathfrak{z}$ of this decade. Not only must Chizanos fight to freserve
present gains, to say nothing about mining further ones, but they must also do it under less favorable conditions than have been prosect in the past 10 years. A faltering economy, ar: antagonistic society, and an unsympathetic and sometimes hostile academe present major sbstacles to Chicano aspiratiors. It has Eecome clear in recent years that the tactics and strategies of the past may not serve Chicanos well in the future and that the structures which were developed In the past may be inadequate for the struggles which face Chicanos today. However bleak the future may seem, nonetheless Chicanos twiay have a greater interest, a more substaritial presence, and a higher level of participation in higher education. than ever before. The knowledge, experience, and expertise Chicanos have gained in the last ten years, together witil the interest, presence and participation which has been generates suer that period, should be usied In the struggle for contin!acd access, funding, and appointments and for continuine improvement in the quality of education for Chicanos.
