ABSTRACT

The Georgia State Department of Education engaged in the development of three Career and Vocational Teacher Education Centers (located at the University of Georgia, Georgia State University, and Georgia Southern College) during the 1972-73 school year. Their primary purpose was to provide an interdisciplinary approach to their teacher education programs by offering more relevant short-term inservice training for teachers and administrators who were beginning to incorporate career education into their respective classrooms and schools. The centers presented workshops during the summer of 1972, provided technical assistance to school districts through onsite visits during the school year, and coordinated the efforts of their own institutional departments in terms of career education. In this final evaluation report, sections 1 and 2 describe the procedures used by the evaluation team in collecting and analyzing data obtained from the questionnaires mailed to both summer workshop participants and to nonparticipants. Sections 3 through 6 deal with data presentation, data interpretation, and evaluation findings on a component by component basis for each center. The data presentation and data interpretation for the questionnaire administered to superintendents and principals is described in section 7 along with the information obtained from the onsite interviews and related evaluation findings. Section 8 presents the major recommendations of the evaluation team based upon the evaluation findings. (WL)

Documents acquired by ERIC include many informal-unpublished materials not available from other sources. ERIC makes every effort to obtain the best copy available. Nevertheless, items of marginal reproducibility are often encountered and this affects the quality of the microfiche and hardcopy reproductions ERIC makes available via the ERIC Document Reproduction Service (EDRS). EDRS is not responsible for the quality of the original document. Reproductions supplied by EDRS are the best that can be made from the original.

OVERVIEW

The Georgia State Department of Education engaged in the development of three Career and Vocational Teacher Education Centers during the 1972-1973 school year. The Centers were established at the University of Georgia, Georgia State University and Georgia Southern College. Their primary purpose was to provide an interdisciplinary approach to their teacher education programs by offering more relevant short-term in-service training for teachers and administrators who were beginning to incorporate career education into their respective classrooms and schools. The Centers presented workshops during the summer of 1972, provided technical assistance to school districts through on-site visits during the school year, and coordinated the efforts of their own institutional departments in terms of career education efforts.

The State Department of Education, Office of Instructional Services, contracted with ALFRED J. MORIN AND ASSOCIATES (Evaluation Team) in January of 1973 to undertake an external, third party, evaluation and program audit of the training and follow-up services provided by the three Centers. The objectives of the State Department of Education provided for a) determination of the extent each Center accomplished its process and product objectives, b) determination of the extent each Center altered

the behavior of workshop participants, and c) determination of reasons why workshop participants did not alter their behavior if such a condition was identified by the Evaluation Team.

The activities undertaken to assess the evaluation objectives included the following:

- △ Review of each institution's program plan, workshop material, and related documents in order to identify process and project objectives.
- △ Completion of on-site visits at each institution's Center in order to verify the identified process and product objective.
- △ Development of separate questionnaire for each workshop component offered at each institution.
- △ Development of a questionnaire for teachers and administrators of school districts which participated in the summer workshop programs.
- △ Identification of a participant (target) sample to which the questionnaires were mailed.
- △ Identification of a non-participant (control) sample to which duplicate questionnaires were mailed for comparison purposes.
- △ Identification of superintendents and principals of school districts which participated in the summer workshops.
- △ Completion of on-site visits at the institutional Centers and State Department of Education to review and modify all questionnaires.
- △ Mailing of questionnaires to the identified sample groups.
- △ Tabulation of responses and computation of numbers and percentages of responses to individual items on all questionnaires.
- △ Computation of a Chi-Square statistical test on all questionnaire items which had both a participant and non-participant response.

- △ Completion of on-site interviews with superintendents (or their designated representative) of participating school districts to elaborate upon their questionnaire responses.
- △ Determination of the reliability of the questionnaires by the test-retest method utilizing a Pearson Product Moment Correlation.
- △ Completion of data analysis and interpretive narrative which described the evaluation findings for all components at the three Centers.

The interim report from the Evaluation Team presented information on the implementation of each of the three Career and Vocational Teacher Education Centers, the objectives identified for each workshop, the workshop enrollments, and the evaluation and program audit procedures already undertaken.

Sections 1 and 2 of this final report describe the procedures utilized by the Evaluation Team in the collection and analysis of the data obtained from the questionnaires mailed to both summer workshop participants and to non-participants. Sections 3 through 6 deal with data presentation, data interpretation, and evaluation findings on a component by component basis for each Center at the three institutions. The data presentation and data interpretation for the questionnaire administered to superintendents and principals is described in Section 7 along with the information obtained from the on-site interviews and related evaluation findings. Section 8 of this report presents the major recommendations of the

Evaluation Team based upon the evaluation findings reported in previous sections. A summary of major evaluation recommendations is provided in Section 8.

Section 1 - DATA COLLECTION PROCEDURES

The initial step in the data collection process was a visit to each of the three Centers which conducted workshops in Career and Vocational Education for teachers during the summer of 1972. Purposes of these on-site visits included a) obtaining copies of program documents and b) obtaining information from staff members relative to the implementation of the program including summer workshop planning and implementation phases and subsequent follow-up activities.

This on-site procedure was necessitated by the fact that the RFP/Contract process for the evaluation and program audit of the Center programs was not undertaken until four to six months after the completion of the summer workshops upon which the Evaluation Team had to focus.

Participant Questionnaire Development

Identification of the objectives for each workshop component which was presented at each of the three Centers was then undertaken by the Evaluation Team. Program objectives for each component were identified in the proposals and interim reports developed by each Center and submitted to the State Department of Education. This was done to assist in identifying changes in initial objectives and to identify workshop components which

had been revised or deleted from each Center's program. All objectives were reviewed with each Center Director and his staff. Changes in component objectives, and workshops which were eventually dropped that were identified by the Evaluation Team were already a matter of record and had received prior approval from the State Department of Education. Most other modifications to Center programs were also made available to the Evaluation Team.

The Evaluation Team experienced considerable difficulty in its initial interpretation of many of the component objectives at each of the three Centers. They were not always written in behavioral or performance oriented terms which is a requirement for the development of assessment instruments. Time did not allow for any defective objectives to be rewritten by the Centers' Staffs. Therefore, the Evaluation Team relied upon its previous experience and professional judgment in the development of specific questionnaire items. Those component objectives which required the workshop participant to only "...demonstrate an understanding ..." of a career and vocational education activity or concept did not lend themselves to easy development of questionnaire items to measure the degree of accomplishment.

A questionnaire was then developed for each workshop component presented at each institution. The questionnaires covered the training objectives for each component. When

possible, the same question was utilized for more than one component which had the same objective. This procedure provided a means of collecting information which could be compared across separate components for a single institution. Also, the same question was utilized for the same component for different institutions where feasible. In some cases, the same question was utilized for several components for more than one institution.

The specific numbers of components and, therefore, the number of different questionnaires which were developed for each institution are displayed in Table 1. Individual items included in each questionnaire are displayed in the data summary tables provided in the data presentation sections of this report.

When the questionnaires were developed, they were made available for review by the appropriate Center director with a request that the Center staff also review each instrument and return them to the Evaluation Team with any comments including suggested additions, deletions, or modifications. One Evaluation Team member reviewed the applicable questionnaire with the Center Director at two of the institutions. These same two Centers also provided excellent written suggestions which were incorporated into the instruments. The third Center Director did not meet to discuss the instruments and did not provide

written suggestions on their applicability. However, insight gained from the other two Centers relative to questionnaire modifications was also incorporated into the instruments developed for the third Center. The Evaluation Team also reviewed the questionnaires with the Project Director of the State Department of Education. All questionnaires were revised to include as many suggestions as possible as well as incorporate additional questions which were deemed appropriate by the State Department of Education Project Director.

The revised questionnaires were mailed to all participants of each component at each Center for which the instruments had been developed. An appropriate cover letter from the Center Director was included which identified the Evaluation Team, the reason for the evaluation, and included a positive statement encouraging the return of the completed instrument. The participants were requested to complete the questionnaire and return it within five days in the self-addressed, postage paid, envelope provided. A list of participants for Component F at the University of Georgia was not made available to the Evaluation Team although an evaluation instrument was developed.

Control Sample Identification

During the development of the questionnaires, a letter was sent to the Contact Person identified by the State Department

of Education for each of the school districts which participated in the summer workshops. The letter requested that the Contact Person identify the name, mailing address, and job position of professional staff members in the district who did not participate in the 1972 summer workshops. The names received from this mailing served as the control group or non-participant sample which the Evaluation Team used for the purpose of comparison to the experimental group or participant sample. A non-participant sample was identified for each component at each Center for which a participant sample had been identified. There were two exceptions for which a control sample was not utilized. These exceptions included Component H at the University of Georgia (Learning Evaluation Laboratories - for vocational and technical school staffs) and the questionnaire mailed to administrators (Superintendents and Principals) of school districts which participated in the 1972 summer workshops.

The control sample received the identical questionnaire which was mailed to the workshop participants. The instructions requested respondents to omit certain questions which had been identified by the Evaluation Team as being inappropriate for non-participants. The items to omit were already identified on the questionnaires. The cover letter from the Center Directors identified the Evaluation Team, the reason for the

evaluation, and that the respondent was part of the control sample which was to be used for comparison purposes. The questionnaire, cover letter, and a return self-addressed, postage paid, envelope were mailed to the control sample with instructions to return the instrument within five days.

The numbers of questionnaires mailed to participants, non-participants, and administrators comprised a 100% sample of all participants, a 20% sample of non-participants, and a 100% sample of administrators. The numbers of responses to each mailing are displayed in Table 1 also. Responses to all mailings were generally excellent (48% return) indicating a willingness to cooperate and an interest in career and vocational education.

Administrative Questionnaire and Interview Development

The questionnaire developed for administrators focused upon the factors which might possibly prevent workshop participants from implementing all or some of the activities and procedures which were presented at the various 1972 summer workshops. These included such factors as the economic environment of the local educational agency, the amount of money available for program implementation, the degree to which persons outside of the school staff were supportive of career and vocational education, and how the summer workshops were perceived

at the local level by administrative officials. This questionnaire was also reviewed by the State Department of Education Project Director prior to mailing. The mailing procedure was identical to that of the other questionnaires with the exception of one additional procedure. All superintendents were requested to identify a convenient time when they, or a knowledgeable member of their staff, would be available for an on-site interview conducted by an Evaluation Team member. Twenty-seven superintendents responded and the Evaluation Team conducted an on-site interview with all except two of these.

Each on-site interview lasted approximately an hour and focused upon an elaboration of certain items to which the Superintendent responded in the questionnaire. However, the interviewers also encouraged the interviewee to discuss other points or areas of interest which the person felt were relative to the local impact of the 1972 summer workshops. The interviewer followed up on general comments with more questions in order to elicit additional comments and to more completely ascertain the condition of career and vocational education within the local educational agency.

The interviews of administrators or their representatives were conducted by members of the Evaluation Team who were totally familiar with the documentation available on the 1972 summer workshops and the procedures utilized by the Evaluation

Team for assessment of the outcomes. The interviewers were trained in the procedures employed in conducting interviews as well as the specific questions on the interview checklist. These questions were reviewed to assure that all interviewers understood the intent of the questions and could explain the question to the person being interviewed. The procedures used to record the information obtained from the interview were also reviewed. It was stressed that the interview was to be flexible in terms of the topics of discussion and that the interviewer was to follow-up on any pertinent comments made by the interviewee. The training of the interviewers was conducted just prior to the actual interview sessions. Periodic review sessions were conducted with the interviewers during the three weeks of interviews to further assure the reliability of the interview process across interviewers. These sessions provided for a discussion of the questions and procedures to be employed as well as the resolution of any potential problems which might arise during an actual interview session.

TABLE 1: NUMBER OF 1972 SUMMER WORKSHOP PARTICIPANTS,
NUMBER OF QUESTIONNAIRES MAILED* AND PERCENT OF RETURNS

| COMPONENT | | GEORGIA SOUTHERN COLLEGE | GEORGIA STATE UNIVERSITY | UNIVERSITY OF GEORGIA |
|--|--------------------------|--------------------------------|--------------------------------|-----------------------------|

| | Percent of returns | 38% | 45% | 68% |

* Questionnaires were mailed to a 100% sample of participants and administrators.

** Components A & B were combined. Questionnaires for both A & B components were mailed to participants because a revised workshop plan with new objectives was not available for assessment purposes.

*** Component F was dropped.

**** List of Workshop Participants was not made available to the Evaluation Team. Questionnaire was mailed to non-participant sample only.

Section 2 - DATA ANALYSIS PROCEDURES

Several steps were involved in the analysis of the data obtained from the questionnaires mailed to participants, non-participants, and administrators. The procedures which were utilized by the Evaluation Team are described separately for the questionnaires and the interviews in the following paragraphs.

Questionnaires

The questionnaires were logged in as they were received by the Evaluation Team. They were then sorted by institution, by component, and divided into participant and non-participant groups. The numbers of responses for each item, for each component, for each institution were tabulated and percentages computed for both the participant and non-participant groups. These data are displayed on Tables 2 through 16 of this report.

Chi-square

A chi-square analysis was then made of the responses of participants (target group) and non-participants (control group) in the 1972 summer workshops. Chi-square is a statistical test which determines a comparison or relationship between numbers. It determines whether deviations between the two responding groups are due to sampling error or some interdependence or correlation among the frequencies.

Comparisons were made only when responses from both target and control groups were available. Each item in each component

for each group was analyzed to determine whether the differences that exist are due to chance or whether they are real because of factors that signify real differences between the two groups.

Probability levels were set at .05 and .01. If the result of the chi-square statistic is significant at the .05 level it is marked with one asterisk (*); at the .01 level it is marked with a double asterisk (**). When a single asterisk appears the Evaluation Team conclude with 95% probability that the differences between the target and the control group are real. Likewise a double asterisk allowed the Evaluation Team to make the same conclusion with 99% probability.

Interviews

The results of interviews were more difficult to analyze than the results of questionnaires because the interview responses were less structured due to the interviewees answering in their own words rather than selecting from among possible answers already provided. The data derived from the questionnaires provided to administrators were tabulated but the responses from the subsequent interviews were not. Instead, the Evaluation Team incorporated the interview findings directly into the data analysis narrative for objective No. 4.

Reliability

To determine the reliability of the responses to the questionnaires developed by the Evaluation Team, a test-re-test method was employed. A second set of questionnaires was mailed to a

sample of the respondents for each component at each institution approximately two weeks after the initial questionnaire was mailed. An appropriate cover letter explained the reason the individual was being asked to complete a second questionnaire and was enclosed along with a self addressed, postage paid, envelope and instructions to return the duplicate questionnaire as soon as possible. The procedure for identifying the sample for the reliability study involved the random selection of 20 respondents for each component for each institution.

The respondent questionnaires to the reliability mailing were hand scored as were the initial matching questionnaires mailed earlier. The questionnaire scores were compared using a Pearson Product Moment Correlation based upon a comparison between the score on the pre-test and the score on the identical post-test. It was determined that a high positive correlation (.873) existed between the two sets of questionnaires. It can be concluded that the instruments used were highly reliable.

General Comments

As stated earlier in this report, there was a general lack of criteria for determining the level of accomplishment of each Center's workshop objectives. Poorly stated and otherwise defective objectives required the Evaluation Team to establish its own criteria of accomplishment. The statements of individual component success or failure provided in this report are based

upon the following scale of participant responses to questionnaire items.

| <u>POSITIVE ITEM RESPONSES</u> | <u>DEGREE OF ACCOMPLISHMENT OF WORKSHOP OBJECTIVES</u> |
|--------------------------------|--|
| 80% or above | Much |
| 65-79% | Moderate |
| 50-64% | Little |
| 50% or below | Did not meet workshop objectives |

The component questionnaires were utilized for the evaluation of workshop objectives for both process and product. The Evaluation Team could not make on-site observations during the workshops (contract for evaluation was not let until January, 1973) and did not conduct classroom visits at individual schools. Therefore, the amount of accomplishment of process objectives could only be determined by questionnaire items requiring recall on the part of the participant. Direct observation on the part of the Evaluation Team was not provided since all workshop activities were already completed by September of 1972. Questionnaire items for process and product were analyzed in an identical manner. They were given equal weight in the interpretation of the data tables and no attempt was made to separate process objectives from product objectives in the discussion of the level of accomplishment for each workshop. The reader can easily identify those questionnaire items on the data tables which were designed to measure processes at work during the summer workshops.

It will become evident to the reader that the data tables

provide a source of information in excess of that which was needed to deal with evaluation of the objectives of the three Center workshops. The tables were designed to display individual item responses for participant and non-participant groups for each summer workshop. However, comparisons could also be made of individual items which were applied to several workshops, similar workshops at more than one Center, or even all workshops at all Centers. The Evaluation Team did not make comparisons of the overall effectiveness of workshops across Centers. The narrative section of this report is limited to a discussion of individual component objectives and their degree of accomplishment only. Information gained from the administrators questionnaire and on-site interviews with superintendents is presented where appropriate in the discussion.

It should be noted that 3% of the participants said that the questionnaire was more sophisticated than the material presented at their workshop. Since the questionnaires were developed from each institutional Center's proposal, replies of this type caused the Evaluation Team to question whether or not the workshops made their presentations at the same depth which they had described in their proposals. Additional comments on this topic are provided in the section of this report dealing with the administrators questionnaire.

Section 3 - DATA PRESENTATION

This section of the report displays the tables of data which have been reduced from the questionnaires mailed to participants, non-participants, and administrators. The format for each table is identical. The questionnaire item is displayed in the first column, and the number and percentage of responses for each forced choice are displayed in the remaining columns for all three institutions. The symbol (N/A) is used where there is not any data for a particular item in a particular column.

The summer workshop programs were quite similar for Component A at all three Centers with individual differences in topics becoming more pronounced from Component C through Component H. Summer Workshops for Components F, G, and H were not held at all three Centers. This was part of the original planning for each institution.

The tables displayed in this section deal with Components A through H and the administrators' questionnaire. The interpretations of the tables and supporting narrative are presented separately for each institution in the report sections following the tables.

Section 4 - GEORGIA SOUTHERN COLLEGE

Component A: Fusing Self and Career Awareness into the Curriculum

Seven objectives were identified for this component: 1) the development of two career oriented activities, 2) assist in developing a guide for integrating career oriented activities to the established curriculum, 3) development of a plan for implementing the guide, 4) conduct team activities to assist other teachers, 5) construct and employ a plan for guidance activities, 6) facilitate career related information in the classroom, and 7) implement a workable delivery system in the school setting.

All participants agreed that career oriented activities were presented and developed during the summer workshop. Role playing, field trips, and resource persons were the most popular activities that participants used with students.

A comparison between participants and non-participants indicates statistically significant differences in the number of career oriented activities developed. For example: seventy-five percent of the participants developed 3 or more activities as compared to only forty-six of the non-participants. Differences were also noted in the suitability of the activities for grade level, in the degree of student intent, and in the quality of the activities as written. The most significant differences between the two groups was in the capability of the activities to meet the individual needs of the students.

Eighty-nine percent of the participants stated the purposes

of the interlocking guide were presented and developed. However, ten percent did not respond to this question which indicates the possibility that some confusion might have existed in their minds concerning the meaning and intent of the guides. Seventy percent agreed they had moderate to great input into the guide. This input, as well as agreement about the number of activities offered in the guide, showed significant differences between the two groups.

An important aspect in the development of the guide was its implementation. Eighty-five percent of the participants felt the interlocking guide which was developed did integrate career activities with the established curriculum when implemented. Most agreed that plans for implementing the guide were presented and developed at the Summer workshop. Significant differences were noted between the responses of the participants and non-participants concerning whether or not a plan had been developed for implementing the interlocking guide and how flexible it was in dealing with different areas of specialization.

Group guidance activities were presented and/or developed at the summer workshop according to 98% of the workshop participants. Activities most frequently noted by the respondents included interviews, field trips, guest speakers, and paper and pencil tests. Control group responses for this item on the questionnaire were quite similar with no more than a 7%

variation in any category. Workshop influence for this particular objective is questionable if not non-existent.

Seventy-seven percent of the workshop participants stated that systems for delivering career information to students was presented and/or developed during the Summer workshop. The chi-square analysis showed the relationship of the responses of the participant and non-participant groups to equal a probability at the .05 level.

The high percentage of positive responses to items in the participant questionnaire indicate that the summer workshop for this component met its objectives. However, it does not tell us how challenging the workshop was and whether or not it was compatible with the objectives of the participating school districts. An on-site debriefing conducted by Center staff at each school district would provide the answer to these and related concerns. Specific subjective determinations along these and similar lines are discussed in Section 6 of this report.

Based upon the Evaluation Team's analysis of the questionnaire data, and information gained through on-site interviews, it can be concluded that all workshop objectives for this component were met to a high degree with the exception of two which had a lower level of success. The exceptions include the facilitation of career related information in the classroom and the implementation of a workable delivery system.

Component B: Preparation of Local Guide for Disadvantaged and Handicapped

The workshop objectives identified for this component required participants to 1) identify the characteristics of the disadvantaged and handicapped, 2) select and apply adequate test instruments to identify disadvantaged and handicapped, 3) develop individualized learning activities

4) develop a listing of courses offered under the title of vocational, pre-vocational, and academic subject areas in the school system, 5) define a list of nine terms, 6) participate in curriculum planning activities, and 7) contribute to a local interlocking guide.

All except two of the respondents agreed that procedures for identifying disadvantaged and handicapped students were presented and/or developed at the summer workshop. IQ tests, personality inventories and aptitude tests were the most frequently noted standardized tests utilized to distinguish disadvantaged and handicapped students. The non-participants also rated IQ and aptitude tests high and favored psychological tests more than aptitude tests. Fifty-five of the participant respondents indicated that instruments to assess disadvantaged and handicapped students were not developed in their school while the non-participant figure was 40%. Chi-square analysis did not indicate any probability relationships between these two groups for this objective measure.

Forty-one percent of the participants indicated they had not developed any individualized learning activities to meet the career orientation needs of handicapped students while only 18% responded the same for disadvantaged students. Several observations can be made relative to these percentages. The on-site visits conducted by the Evaluation Team tended to indicate that this may have been a too ambitious undertaking on the part of the Center. The basic concept of career education has to be accepted by superintendents, principals, and teachers prior to its acceptance for such specific groups as the disadvantaged and handicapped. However, the high percentage of respondents (60%) who had prepared one or more individualized learning activities for disadvantaged students indicates that this group is more

readily identified at the local level. This is due, no doubt, to local efforts to secure Title I funds at the Federal level. The Evaluation Team could not find evidence during its on-site visits that comparable effort exists which would allow for the identification of handicapped students. Therefore, the potential success of the emphasis for this type of component appears to be far removed from the influence of the sponsoring Center.

Most participants (75%) agreed that individualized learning activities or units had been presented and discussed at the workshops. Sixty-eight percent indicated that they had been developed for academic subject areas related to the vocational interest of students. The impact of the workshop is not clear for this objective as the non-participant group indicated a 75% response. Similar percentage relationships exist between the participant and non-participant groups in the areas of developing interim objectives and revising the learning activities. Two possible explanations exist for this similarity of response between groups; the local school districts may already have been involved in these specific aspects of career education or else the non-participant sample interpreted the questionnaire items to mean all areas of academic endeavor and not just career education. On-site interviews did not indicate a specific reason for these particular responses to the questionnaire.

Sixty percent of the participants indicated that they had listed the vocational, prevocational, and academic subject areas

in their school system. However, the non-participant group had a 70% response to this same item. No significant correlation existed between the two groups for this objective.

All participant respondents indicated they had developed definitions for terms related to career education per workshop objective. Similar responses also existed in the non-participant questionnaires which were analyzed.

Seventy-five percent of the participants indicated that they had been actively involved in curriculum planning activities. Only 45% of the control group responded in a positive manner to the questionnaire item for this objective.

The final objective called for the participants to contribute to a local interlocking guide. Analysis of the participant responses indicates that 54% took part in either writing philosophy developing objectives, or developing guidelines for a guide. Another 15% participated in implementing a guide. Sixty percent of the non-participants also responded in a similar manner. The Evaluation Team believes that this similarity between the participant and non-participant groups is due to the fact that the participants were encouraged to involve those teachers in their respective schools who did not attend the workshop. Many of these teachers comprised the non-participant or control sample.

The Evaluation Team believes that all but one of the objectives for this component have been met, namely the disadvantaged and handicapped objective did not approach its success criteria.

Component C: Management by Objectives

Four objectives were identified in this component; 1) the production of written statements of the purposes of career education, 2) the development of evaluation techniques for observing classroom teaching situations, 3) the development of a management guide and, 4) the preparation of a plan for in-service training programs.

Eighty-seven percent of the participants stated that written statements of the purpose of career education were presented and developed at the summer workshop. All had some part in the actual writing of these statements and all expressed the belief that these statements reflect the relationship of career education to the total educational program of the district.

Less than half of the non-participants took part in the writing of the statements of purpose. Almost half (40% saw no relationship between career education and the district's educational program. On this question, a significant difference existed between those who attended the workshop sessions and those who did not attend.

The second objective dealt with the identification and development of evaluation techniques for observing classroom teaching situations. Forty percent of the participants said that procedures for developing observations were not discussed. Only 13% felt that they had great input into the development process and 20% could not state what specific procedures were

developed. Those who did develop these procedures included group seminar (brainstorming) and the selection of an existing observation form as the most popular procedures. At the conclusion of the summer workshops, it was determined that an attempt should be made to assess the procedures used during the school year 1972-73 to identify teacher competencies. The following were the major procedures identified by the majority of the participants: classroom observation, an interview with the teacher, and a test of student knowledge.

In general, the reaction of the participants to the quality and appropriateness of the management guide, identified as the third objective in the component, was favorable. However, 25% said that the guide was not available to school staff members, and 32% said it actually was not being used.

The fourth major objective of the component workshop was to structure in-service training programs for the components of the total project in each school district. There was generally strong agreement among the participants with respect to the presentation of the plans for in-service activity at the workshops and the implementation of them during the school year. As a check to this important point of implementation, it should be noted that none of the non-participants stated the in-service work was not done. Hence, there was agreement between the two groups that this objective was met satisfactorily.

In the participant group all of the members had some contact with consultants; half the number had as many as four or

or more contacts. One-third of the non-participants had no contacts.

All objectives for this workshop component appear to have been met with a relatively high degree of success. None of the objectives were successful above the 93% level.

Component D: Designing a Model Job Placement Center

There were four basic objectives in this component which included 1) the demonstration of an understanding of, the need for, and the rationale underlying the operation of a school system based Job Placement program, 2) the identification of different components making up a Job Placement program, 3) understanding of the mechanics required to introduce, organize, coordinate, evaluate and report on a total Job Placement program locally, and 4) the production of a plan of action to structure the Job Placement program in the local school system.

All the participants agreed that possible rationales for the operation of a Job Placement program were presented and discussed during the summer workshop. All but one said the rationales were actually written. Their opinion of the comprehensiveness of the rationales was high insofar as they felt they covered all aspects of a job placement program. As many as 58% in this group stated in their opinion that the rationale covered all aspects of the program.

The second objective dealing with the component parts of the job placement program was fully presented and developed in the

summer workshop. There was close agreement between the two groups of respondents concerning the contributions of teachers, students, and administrators in the writing of descriptions of the various components.

Not all the components were developed in several schools. The majority of participants and non-participants felt that only some had been developed.

Approximately 75% of those who responded expressed positive opinions about the implementation of the components and the construction of plans to coordinate the activities of the various components.

It is evident that evaluation procedures were held in little regard by both groups of respondents in the development of a local job placement program. Less than one-third of the persons stated that all evaluation procedures were developed and implemented for the components of the program. Only 20% of the participants and 10% of the non-participants expressed the opinion that the evaluation results were successful.

A somewhat more favorable response was given to the reporting procedures developed, planned, and implemented.

Approximately 50% of the participants had up to at least four contacts with career education consultants; the remaining half had either five or six visits. The non-participant group had virtually no contact.

The purpose of the visits of the career education consultants was clear in the minds of the participants. They included the

following reasons for the consultants' visits: to follow-up on summer workshop practices, to respond to specific requests for assistance, and to generally review the use of workshop activities.

Only 60% of the respondents indicated they had produced a local plan of action for their job placement program while 27% did not respond. This was similar to the 67% response of the non-participants with 33% abstaining. Analysis of the Administrators Questionnaire (section 6) and on-site interview data indicate that definite reasons exist for this condition. Seventy percent of the administrators indicated they had received zero to little participation by local industry in job placement programs. Specific factors inhibiting such programs included "lack of understanding" (24%) and poor "lines of communication" (24%), according to superintendents responses. The conclusion must be made that while the workshop may have presented activities suitable for the development of a local job placement program, the prevailing conditions within the majority of the local school districts were not conducive to its implementation. This is a condition over which the institutional center has no control but must be taken into consideration in the development of future workshop offerings.

The Evaluation Team believes that the first three objectives for this workshop were accomplished and that the 4th objective was partially accomplished.

Component E - World of Construction

The eleven objectives for this workshop provided for participants to be able to do the following activities: a) Define the term career awareness, b) define the term "world of work", c) identify 50 construction industry occupations, d) identify 70 construction industry occupations to students, e) perform activities to demonstrate the 70 construction industry occupations, f) make known to students the minimum entry level educational requirements for construction industry occupations. g) assist students with hands on activities which will expose them to career concepts for this industry's occupations, h) plan and present hands on activities to students, i) make known to other educators in school system the activities used by students, j) order materials and equipment necessary to present the World of Construction, k) list three activities for math, science, and English that will bring about an interlocking of skills.

The small number of participants in this component (14) resulted in a correspondingly small number of respondents (7) upon which conclusions must be based as to whether or not the objectives were accomplished. The Evaluation Team makes the following determinations based upon its analysis of the specific item responses.

All objectives appear to have been accomplished. In several instances one respondent answered no to several of the

questionnaire items and one respondent did not respond in several other questionnaire items. While most of the responses were positive, there is no evidence that as many as 50 to 70 construction industry occupations were identified and demonstrated to students. The frequent no responses recorded for the small control sample tend to indicate that these teachers were not as familiar with the World of Construction curriculum requirements as were the workshop participants.

It should also be noted that the workshop participants said they had zero or one contact with career education consultants from the Center. Two participants indicated they had two and three contacts with consultants. This would indicate that consultants were able to visit some schools on a more frequent basis while other participants were not visited at all during the school year.

The Chi-square analysis indicated a probability of .05 in nine questionnaire response items and a probability of .01 in seven response items. This supports the Evaluation Team's contention that all objectives for this workshop were met even though the number of respondents for the participant group was only 50%.

Component G - World of Manufacturing

The objectives for this workshop required participants to demonstrate an understanding of the concepts of career awareness and the world of work, 2) demonstrate an ability to facilitate the students' understanding of himself, 3) implement a

world of manufacturing program, 4) select, organize, and initiate learning experiences for students, and 5) coordinate an interdisciplinary team effort with teachers.

The small number of participants in this workshop (11) resulted in a similar small number of questionnaire responses (5). There were only two instances where the Chi-Square analysis of items resulted in a significant statistic (items D7 and E1 in Table 8). Other item responses did tend to indicate that workshop objectives had been accomplished but the non-participant responses were also high in the same areas. The small number of respondents for both groups and the similarity of responses makes it virtually impossible for the Evaluation Team to make any valid statements on the degree of accomplishment for stated objectives.

Component H - Trade and Industrial Cluster

Five objectives were identified for this workshop component. They included 1) demonstration of an understanding of career awareness and the world of work, 2) demonstration of the ability to facilitate the students' understanding of himself, 3) development of a course of study on occupational orientation, 4) development of instructional plans to meet individual needs of students, and 4) selection, organization, and initiation of learning experiences for students.

The small number of participants in this workshop (19) resulted in a correspondingly small number of respondents (4).

However, there was little disagreement among respondents in all of the forced-choice categories. The assumption that all objectives had been accomplished could be made based upon the actual item responses. However, the small number of respondents does not necessarily allow the Evaluation Team to make a valid statement in regard to the degree of accomplishment of the stated objectives.

It should also be noted that the Evaluation Team did not receive any responses to the mailing of questionnaires to non-participants. The specialized nature of the target group for this workshop (trades and industries teachers and industrial arts specialists) made it difficult to identify a non-participant sample on the part of the local Contact Person. The Evaluation Team attained names for only three non-participants and none of these returned the questionnaire mailed to them.

Section 5 - GEORGIA STATE UNIVERSITY

Component A: Fusing Self and Career Awareness

The major objectives identified for participants in this workshop component include the following: 1) demonstrate an understanding of the concept of career awareness, 2) demonstrate an ability to facilitate the student's understanding of himself, 3) develop two career oriented activities, 4) assist in developing a guide to integrate career oriented activities into the established curriculum, 5) implement special guides developed for selected areas, 6) conduct team activities with other teachers; counselors will demonstrate a knowledge and understanding of their role 7) in a career education program through use of activities and 8) as a facilitator of career related information, and counselors will also 9) develop a workable delivery system.

Twelve questionnaire items subjected to the chi-square analysis proved to have a probability of .01 or .05 when compared to the non-participant response for the same item. One of these items, K-1 in Table 2, indicates an understanding of the concept of career awareness. Ninety-four percent of the respondents indicated the appropriate responses for this item. Several other items directly related to this objective also scored high and would tend to support the accomplishment of this objective, especially when one considers the difficulty in making an assessment of this particular objective.

Respondants indicated they felt that the degree of student

interest in their career oriented activities was average or better (62%). This may also indicate that students developed a better understanding of themselves although a direct measure of this objective by the Evaluation Team was virtually impossible. This may have been an overly ambitious undertaking on the part of the Center since any true measurement of success requires a direct contact with individual students with either tests or interviews.

Eighty-four percent of the participants developed two or more career oriented activities while sixty-four percent of the non-participant group also said they developed two or more activities. The chi-square analysis indicated a probability at the .01 level that the workshop caused a significant influence in the participant group for this objective.

Eighty-eight percent of the participant respondents said they had assisted in the development of an interlocking guide and eighty percent responded that the guide offered ten or more activities. Both of these item responses had a chi-square probability of .01 when compared to the non-participant responses.

Participants responded that sixty-nine percent had developed a plan flexible enough to deal with different areas of specialization. Chi-square analysis indicated a probability at the .01 level that participant responses for this item were influenced by the workshop.

Seventy-nine percent of the participants indicated that team activities to assist teachers in implementing career oriented activities were presented and/or developed at the Summer Workshop.

Responses to other items indicate the demonstration of a positive attitude toward the team activity concept.

The guidance counselors who responded to the questionnaire indicated that they had a knowledge and understanding of their role, that they had acted as a facilitator of career related information, and that a delivery system had been developed. The participant responses to these items were 97%, 62%, and 62% respectively. The low percentages for the last two objectives appear to be directly related to local constraints which were acknowledged in the administrators' questionnaires and during on-site interviews with superintendents. There were no superintendents or principals who indicated that the local career education program was the responsibility of the guidance counselor. Such responsibility was assigned to a central office person or to a vocational supervisor. The workshop objectives for counselors were accomplished up to the point where guidance counselors already had an existing operational system in their school. It would appear that district administrators were not willing to assign a new responsibility to guidance counselors until more definite commitments were forthcoming from outside the school district in the area of career education.

All objectives for this workshop component were accomplished with the exception of the second one for which the Evaluation Team did not have direct data upon which to base a valid judgment.

Component B: Interlocking Vocational and Academic Subjects

Objectives for this workshop required participants to 1) identify the nature and characteristics of disadvantaged and handicapped, 2) develop individualized learning activities, 3) assist in developing a local interlocking guide, and 4) conduct team planning activities.

The Evaluation Team did not assess whether or not the participants could identify the nature and characteristics of disadvantaged and handicapped students although it was determined that these areas were presented and/or discussed during the workshop.

Only fifty-six percent of the participants indicated that they had developed two or more individualized learning activities for disadvantaged students. Fifty-one percent of the non-participant sample also developed two or more individualized learning activities for the same group. The conclusion must be drawn that the workshop did not increase the local level of effort for the development of individualized activities for this specific group of students. The participant and non-participant responses for handicapped students were 29% and 44% respectively.

Only thirty-three percent of the participants helped prepare an interlocking guide. This objective was not completely accomplished based on the responses of the participant group.

Workshop participants thought that in-service team planning activities were valuable (75%) and that working as a team was more productive (81%). This is in direct proportion to the number of

respondants who indicated that procedures for team work were presented and/or developed during the workshop (82%). The objective for this component was accomplished.

Component C: Managing Career Education Programs

Five objectives were identified for this workshop component. They required the participant to 1) demonstrate an awareness of the concept of career awareness, 2) demonstrate the ability to recognize teacher competency for facilitating student understanding of himself, 3) develop a local management guide, 4) conduct in-service training, and 5) understand how to work with disadvantaged and handicapped students.

The Evaluation Team could not directly assess a participant's ability to demonstrate an understanding of the concept of career awareness. Nor was an assessment made of whether or not workshop participants could recognize teacher competency for facilitating student understanding of himself. Such an assessment requires direct contact with teachers and should include observation of their behavior. Such activity was not provided for in the Evaluation Team's overall plan. However, participants did indicate the types of procedures which were utilized (Table 3 - items B-1, B-4, and B-5). Eighty-two percent of the participants had some degree of input into the development of the observation procedures.

Only fifty-five percent of the participants indicated that a management guide was developed in their school/school district. Fifty-five percent indicated that the guide follows a sequential

order and fifty-five percent indicated that the guide defines realistic time lines to accomplish tasks.

Plans for in-service training were prepared in fifty-six percent of the participants' schools/school districts. However, fifty percent of the non-participant sample also responded positively to this questionnaire item. The low positive response to both this and the previous objective appear directly related to other questionnaire items. There was a fifty-six percent response when participants were asked whether or not a management model had been presented and/or developed at the workshop. This is consistent with participant responses already presented. There appears to be a large number of participants (estimated at 33%) who did not understand this aspect of the workshop material presented or who ended up being confused with some other aspect of the workshop.

It does not appear that these two objectives were accomplished to any high degree.

The Evaluation Team did not assess the participants' understanding of how to work with disadvantaged and handicapped students.

The Evaluation Team's judgment of the relative success of this component, based upon the data which was collected and analyzed, is that its overall achievement of objectives was not as high as in most other components.

Component D: Conducting Job Placement Service

Objectives for this component included the following: 1) demonstrate an understanding for the rationale of a school/system based

job placement program, 2) demonstrate an understanding of the different components making up a complete job placement system, 3) demonstrate an understanding of the mechanics required to develop a total job placement program, 4) produce a workable model of a total job placement program, and 5) produce a plan of action for a job placement program.

Sixty-eight percent of the participants indicated that a rationale for the operation of a job placement program has been written, with 16% responding "no" and 16% "no response". The same 68% also felt that the rationale covers all aspects of the program. Unfortunately, only 16% indicated that the rationale had been either evaluated or validated. This lack of a local evaluation effort is further substantiated by the administrators' questionnaire which revealed that fifty-five percent of the responding school districts conducted no internal evaluation of their career education programs. The Evaluation Team believes that internal evaluation is a low priority item in most school districts. The item responses for this part of the questionnaire tend to support the conclusion that most workshop participants are probably able to meet the requirement for the first objective of this component. The Evaluation Team did not collect any additional data which would tend to support this conclusion.

All participants (100%) who responded to the questionnaire indicated that descriptions of the various components of a job placement program were presented and/or developed during the workshop. Only thirty-two percent indicated that they had developed

any descriptions and only eleven percent indicated that they had been developed by teachers. Item B-5 in Table 5 indicates that only sixteen percent of the target respondents said that the components of a job placement program had been developed for their school or district. This workshop objective did not attain its anticipated level of accomplishment. This lack of accomplishment is supported by the administrators' questionnaire and the on-site visits conducted by the Evaluation Team. Seventy percent of the superintendents indicated that they had received "zero" to "little" participation by local industry in job placement programs. Specific factors inhibiting these programs were identified as "Lack of understanding" (24%) and poor "lines of communication" (24%). The lack of accomplishment of this workshop objective appears to be the result of conditions at the local level and not necessarily due to the poor performance of workshop participants or the materials presented by Center staff..

Eighty-four percent of the participants indicated that the steps involved in implementing a job placement program had been identified, one hundred percent of the participants indicated that "some" of them had been implemented, and one hundred percent indicated that plans had been developed to coordinate the activities of the various components. There was a significant statistic ($p < .05$) for the chi-square analysis of these three questionnaire items. This workshop objective was accomplished to a high degree based on the responses of workshop participants.

The questionnaire did not directly assess the participants' ability to produce a workable model of a total job placement program. However, the generally high number of positive responses on related items could lead to the conclusion that most workshop participants would be able to produce the required model.

Review of questionnaire items relative to implementing and evaluating a job placement program indicated that viable action plans exist for 80-100% of the workshop participants. Reporting procedures have been developed by only 32% of the participating schools/districts, but there was also a high "no response" to this item (52%). While several implications can be drawn from this data, i.e., participants did not understand, were hesitant to respond negatively, or wanted to be supportive of the workshop, it must be remembered that the total number of respondents for this component was extremely small. The Evaluation Team would be remiss to draw firm conclusions from what it considers to be insufficient data.

Component E: Teaching Disadvantaged and Handicapped Students in Office Occupations

Objectives for this component required participants to 1) demonstrate an understanding of the concept of career awareness, 2) demonstrate the ability to facilitate the students understanding of himself, 3) implement an office grade nine program, 4) select, organize, and initiate learning experiences designed to broaden the student's self-perception, and 5) coordinate an interdisciplinary effort with a team of teachers.

Chi-square analysis of items N-4 and N-5 (Table 6) resulted in a significant statistic ($p < .05$) indicating that participant understanding of the concept of career awareness as determined by those items was directly influenced by the kshop. There were zero "no responses", which tends to reinforce this conclusion. The non-participant group responded with a high (51%) "no response" to these same items.

A direct measure of participants' ability to facilitate student understanding of himself was not made through the administration of the questionnaire. However, eighty-two percent of the participants indicated that student interest was average or better while fifty percent of the non-participants indicated a "no response". The Evaluation Team concludes that this objective was accomplished as measured by the questionnaire items.

The questionnaire did not ask any specific questions in regard to the development of a grade nine office program. However, a guide for career oriented activities was developed in only ten percent of the participants' schools, it offered less than ten units, it did integrate career activities with the established curriculum, a plan was developed for its implementation, and it was used during the 1972-73 school year. Closer examination of the data for this component in Table 6, however, indicates that the guide was developed by only one participant (due to the small number of participants in this workshop). Even with such a small number it is concluded that this objective was not accomplished since all but one of the participants returned their questionnaire.

Responses by participants to the questionnaire items would tend to indicate that those participants who developed career oriented activities (92%) also assisted in their selection, organization, and initiation

Ninety percent of the respondents indicated that in-service planning activities are a valuable experience; sixty percent indicated that procedures were presented and/or developed during the workshop; and one hundred percent agreed that working as a team is more productive. It is concluded that workshop participants did coordinate an interdisciplinary effort with a team of teachers.

The objectives for this workshop component were accomplished to a very high degree.

Section 6 - UNIVERSITY OF GEORGIA

Components A and B were combined and offered as one workshop. However, a revised workshop plan was not available so the Evaluation Team developed separate questionnaires for these components. These were mailed to the single listing of workshop participants. Separate non-participant questionnaires were mailed to separate groups for comparison purposes. The analysis was conducted separately for each component.

Component A

The objective s for this component required participants to 1) demonstrate, in an oral presentation, an understanding of the concept of career awareness and the world of work, 2) elaborate the strategy to be used in facilitating students understanding of self, 3) develop two career oriented activities, 4) prepare written assessments of the potential of the local program of instruction, 5) identify team activities to be employed in fusing career oriented activities and 6) contribute to the development of an overall guide. Objectives for counselors included 1) development of an outline of individual and group guidance activities, 2) identification of ways in which the counselor can directly support the classroom teachers need for career related information, and 3) development of a delivery system for making career related information available to students.

The Evaluation Team could not ascertain whether or not the

workshop participants were able to demonstrate their understanding of the concept of career awareness in an oral presentation. This particular activity was completed during the summer workshop.

The high correlation of questionnaire items on student interest and suitability of activities to student grade level (Table 2 - items A4 and A5) tend to indicate that satisfactory strategies were developed by participants to facilitate student understanding of self. There were no direct measures for this objective, however.

Eighty-eight percent of the participants indicated they had developed two or more career oriented activities. Only 32% of the non-participants said they had developed two or more activities. Twenty-five percent of the participants developed six or more activities.

The identification of team activities to be employed in fusing career oriented activities took place during the workshop and could not be directly evaluated. However 81% of the respondents indicated that the finished guide did integrate career activities with the established curriculum. Little direct data is available to indicate the degree of accomplishment of this workshop objective.

Eighty percent of the participant respondents said they had moderate to great input in the development of an interlocking guide. Only 50% of the participants said that a guide was developed during the school year. This discrepancy of approximately 30% may be due

to some participants developing all or part of their guide during the workshop sessions.

Sixty-one percent of the counselor participants indicated that group guidance activities were presented and/or developed during the workshop. All participants designated one or more guidance activities which had been planned and implemented as a result of the workshop. This would also support the contention that during the workshop counselors had identified ways in which they could directly support classroom teachers. This objective could not be directly assessed.

Fifty-nine percent of the participants indicated that a plan had been developed for implementing the interlocking guide. Fifty-three percent of the participant respondents said that the plan had been used during the 1972-1973 school year. The delivery system for the implementation of the plan must have had significant impact at the local level because 60% of the non-participants also said that the plan had been used this year.

The Evaluation Team believes that all Component A objectives for this workshop were accomplished. However, the reader is cautioned that direct assessment of three objectives was not undertaken by the Evaluation Team.

Component B

The objectives required participants to 1) demonstrate to the program leadership team a perception of the nature and characteristics of disadvantaged and handicapped students, 2) develop at

least 12 individualized learning activities, 3) contribute to the development of a local guide, and 4) assist in identifying ways in which the interdisciplinary team can function in the local school.

Ninety-six percent of the participants stated that procedures for identifying handicapped and disadvantaged students were presented and developed. There was little disagreement that the following five methods were used to identify "in writing" handicapped and disadvantaged students: anecdotal records, check lists, case studies, interviews, and questionnaires. The first seemed to be the most popular.

Approximately one-fourth of the persons in each group stated they prepared no individualized learning activities to meet the career orientation needs of disadvantaged students. However, some 56% of the participants stated they prepared four or more activities. Sixty-two percent of the participants indicated they prepared no individualized learning activities for handicapped students.

Only 34% of the participants said they prepared four or more activities. Due to the large number of no responses in both groups to the question of implementation of individualized learning activities for both handicapped and disadvantaged students, it must be concluded that such implementation did not take place. In fact, the number of positive responses clearly indicating that implementation took place was under 50% for both groups.

Only 54% of the workshop participants assisted in the development of individualized learning activities. Participants also said that interim objectives had been included to assure successful

conclusion of the terminal objectives of the learning activities (51%). Data on the amount of direct participant involvement in the development of a guide is not available.

One hundred percent of the workshop participants said that procedures for teamwork were presented and/or developed during the summer workshop. Working as a team was deemed more productive by 90% of the participants. A high number of respondents (94%) said that a team was working within their school and 92% said that the team is relating aspects of the academic and vocational programs. This was a highly successful workshop objective.

Component C Management

The four objectives for this component required participants to 1) contribute to the development of a local management guide, 2) give written evidence that a knowledge of the concepts of career awareness has been acquired, 3) contribute to the development of a set of criteria for assessing the effectiveness of teaching strategies, and 4) contribute to the development of a plan for in-service training.

Ninety-one percent of the workshop participants said that a model for managing career and vocational education programs was presented and/or developed at the workshop. However, only 67% of the participants said that a management guide has been made available to school staff members. Sixty-two percent said they assisted in the development of the guide. Analysis of these questionnaire items indicated that this objective had little to

moderate degree of accomplishment.

Most participant respondents selected item choices (Table 4 - items G1, G2) which indicated a knowledge of the concepts of career awareness.

Only a few participants indicated they had any input in the development of observation procedures (42%). Only 71% of the respondents said that procedures for developing observations of classroom teaching situations were presented and/or developed. This objective may not have been fully explored during the workshop sessions.

Sixty-seven percent said that plans for in-service training programs have been prepared, 65% said that the plans provide for sufficient time to conduct in-service programs, 73% felt that the plans were designed to create an orderly presentation of program objectives, 73% said the plans have been implemented, and 67% said that the in-service appeared to meet the needs of the teachers. This objective appears to have been accomplished to only a moderate degree. On-site visits with the superintendents revealed that this is one type of activity which is difficult to undertake without considerable cooperation of all teachers and occasionally the need arises for extra funds in order to implement any extensive in-service training.

Component D - Job Placement

This workshop component required participants to 1) demonstrate an understanding of the need for a rationale for the operation of a

job placement program, 2) evaluate and identify existing placement activities, 3) utilize existing agencies for testing and placement, 4) understand and implement central coordination of job placement efforts, 5) demonstrate an understanding of work permits, child labor laws, and local school policies, and 6) demonstrate an understanding of establishing and maintaining employer-placement counselor relationships.

Ninety-three of the participant respondents said that possible rationale for the operation of job placement program had been presented and/or developed during the workshop. A similar high number (85%) of participants indicated that a rationale had been written and 66% said that it covered all aspects of their job placement program. Fifty-eight percent indicated that it had been evaluated or validated. However, 80% said that evaluation procedures have been developed for the job placement program, but only 73% said they had been implemented. Both of these objectives have been attained to a high degree.

Thirty-nine percent of the participants indicated that local agencies had been sought out for testing students and 83% said that local agencies had been sought out for placement. These placement efforts must have been highly effective because 73% of the participants said that the local agencies are providing job placement for students. Each of these three questionnaire items produced a significant statistic when subjected to Chi-Square analysis in comparison to the non-participant responses.

The high positive responses to the previous objective would also indicate that central coordination of job placement efforts also exists.

Ninety percent of the participants said they had identified federal and local laws which affect placement and 88% indicated they had considered these laws and regulations in developing their job placement program. The accomplishment of this objective is very high. Items for this objective produced a high probability statistic when subjected to Chi-Square analysis.

Workshop participants responded in the 91-95% range on the questionnaire items (Table 5 - G6, G7, G8) which dealt with employer-counselor relationships. Chi-Square analysis produced a significant statistic on all three of these items. This objective was accomplished to a very high degree.

All objectives for this workshop component were accomplished to a higher degree than almost any other component.

Component E Prevocational

The objectives of this component required participants to

- 1) demonstrate an understanding of career awareness,
- 2) demonstrate an ability to facilitate student's understanding of himself,
- 3) implement a mini-pre-vocational program,
- 4) select, organize, and initiate learning experiences, and
- 5) coordinate an interdisciplinary team effort.

Eighty-eight percent of the responding workshop participants said that concepts to develop career awareness were presented

and/or developed during the workshop. Eighty-one percent indicated that specific concepts have been identified or developed. This objective was accomplished based upon these questionnaire items. However, other items with high percentages of positive responses also support this contention.

Ninety-six percent of the participants indicated that activities designed to increase student understanding of self were presented and/or developed during the workshop. Eighty-nine percent said that such activities have been developed, 84% said they have been used by students, 81% said that student response to the activities was generally positive, and 87% said that some of the activities grew out of the activities and ideas presented at the workshop. All of these item responses indicate a high degree of accomplishment for this particular component objective.

A pre-vocational mini-course has been developed according to 81% of the participant respondents. Seventy-eight percent said the mini-courses have been used in the classroom, and 78% said that some of the mini-courses used were presented or developed at the summer workshop. However, 68% of these same respondents also said that the mini-courses need moderate to great revision. This should be a significant response for those individuals who are responsible for future teacher workshops at the institutional Center. This objective was accomplished to a high degree.

Eighty-eight percent of the participants have used learning

experiences with their students. Provisions have been made for revising the learning experiences (75%) and they need only little or moderate revision (90%). This component objective was also highly successful.

The formation of interdisciplinary teams only received a 46% positive response. While 94% of the respondents said that procedures for team work were presented and/or developed during the workshop, only 39% said that the team had developed procedures and guidelines. Thirty-four percent indicated that the team had provided assistance to other teachers. Little provision had been made to revise the work done by the team (35). Fifty-seven percent said that the procedures and activities developed by the team need moderate to great revision. The low level of accomplishment of this objective may be directly to local understanding of career education concepts and its relative priority in relationship to local goals and objectives.

Component G - World of Manufacturing

The ten objectives identified for this workshop component required each participant to 1) demonstrate orally or in a written report the concept of career awareness and the general relationship of local "World of Manufacturing" programs to the local career education model, 2) demonstrate orally the recent thrust of career education, 3) identify several sources of information concerning occupational requirements, 4) elaborate the strategies for placing manufacturing technology into the broader context of

industrial technology, 5) demonstrate in an oral presentation an understanding of the interrelationships between management, personnel, and production practices, 6) identify the vocations in manufacturing industries, 7) gain knowledge of selected student activities designed to promote student involvement, 8) design activities to develop responsible behavior and safe work attitudes in students, 9) select and organize learning experiences, and 10) set up a course outline for the school year.

The first three objectives listed above were not assessed by the Evaluation Team. They were short term process objectives which had to be evaluated during the workshop sessions.

Only 64% of the respondents said that procedures for relating manufacturing technology to industrial technology were presented and/or developed during the workshop. Sixty-eight percent said that procedures have been developed to make the relationships clear to students. The same percentage of respondents (68%) had moderate to great input into the development of these procedures and that they had been used in the classroom. Fifty-two percent said that the procedures needed little revision. This component objective had a moderate degree of success.

Objective five was demonstrated during the workshop but had significant relationship to the local implementation of the "World of Manufacturing" program. Eighty-four percent of the workshop participants who responded said that procedures for relating management, personnel, and production practices were presented and/or

discussed at the workshop. Only 68% identified the interrelationships and only 68% said that activities were provided within the instructional program to assist students in understanding the interrelationships. This objective for the workshop was only moderately successful.

The Evaluation Team could not assess whether or not workshop participants were able to identify the vocations in manufacturing industries (objective 6).

Sixty-eight percent of the workshop respondents indicated that activities have been developed to encourage student involvement, that student response to the activities was generally positive, that the activities resulted in greater student involvement, and that some of the activities grew out of ideas presented during the workshop. This objective had a moderate level of accomplishment and is directly related to objective seven relative to gaining a knowledge of selected student activities.

The Evaluation Team did not assess whether or not workshop participants designed activities to develop responsible behavior and safe work attitudes in students. This type of assessment would require direct contact with the students of workshop participants.

Many of the questionnaire item responses indicate that workshop participants did select and organize learning experiences. This is evidenced by the numbers of participants who developed activities for student involvement (68%).

Eighty-four percent of the respondents indicated that procedures for developing a course outline were presented and/or developed during the workshop. The same number of participants also said that a course outline or plan had been developed although only 68% indicated that it provides a clear picture of the levels through which students must move. Eighty-four percent said that the outline had been used in developing instructional plans. Only 52% said that the outline needed little revision, 32% thought it needed moderate to great revision. This objective was accomplished to a high degree.

SECTION VII

ADMINISTRATOR QUESTIONNAIRE and INTERVIEWS

A major objective of this evaluation and program audit was to "Determine, if participants in training sessions have not exhibited improved or increased career education practices, reasons why such desired behavior on the part of the participants has not occurred."

Two procedures were used in the assessment of this objective.

As displayed in Table I, a questionnaire was developed and distributed to 97 selected administrators. Forty-nine questionnaires were forwarded directly to Superintendents of school districts which participated in the 1972 Career Education summer workshops. Forty-eight were directed to principals in participating school districts. This distribution of the administrators' questionnaires was limited to just one principal in each district. Twenty-nine (59%) of the target Superintendents responded. Twenty (42%) of the target principals responded. The tabulated answers of the returned questionnaires are displayed in Table number 10.

The second procedure employed by the Evaluation Team was the completion of a semi-structured on-site interview with either the Superintendent or his designee. Evaluation Team members interviewed 25 of the 27 Superintendents who expressed a willingness to participate in such an interview. Scheduling

difficulties made it impossible to actually interview the remaining administrators.

Administrators Questionnaire:

Ninety-six percent of the responding administrators agreed with the three following statements:

1. Objectives developed by teachers who participated in the Career Education Summer Workshops have been implemented in local district curriculum.
2. Local information workshops for other school district personnel have also been held.
3. Various publics within the school district have been informed about local career education programs.

It must be noted that given an opportunity to select all appropriate publics, 24% of the responses identified that school boards were informed more often in regard to local career education programs. None of the other identified publics were seen as being informed of career education programs by more than 21% of the administrators.

Ninety four percent indicated that funds have been allocated within the schools or school district for further development of career education. The Evaluation Team suggests that the 6% who did not respond affirmatively may represent school districts where Summer Workshop objectives could not be attained because of the lack of local support for the total concept.

Several educators either wrote in separate letters or added comments to their questionnaires which offered some version of the following statement:

"We were unable to implement the program developed at the Summer Workshop because funds were not made available by the local board."

Given an opportunity to select all applicable answers, not more than 40% of the administrators identified a single item (field trips) having received supporting funds.

Eighty-seven percent of the responses indicated either moderate or great public support for career education. The 12% of the administrators that indicated little or no public support may well be employed in districts where the lack of such support blocked the implementation of programs developed during career education Summer Workshops.

One hundred percent answered that procedures to disseminate information about career education exist.

More than 9% of all respondees felt that the programs and materials of career education programs were relevant and that students considered such programs to be either good or excellent.

Given the opportunity to identify factors that support or inhibit local career education programs, not more than 1/4 of the respondees agreed on specific factors. Student/teacher involvement was called out as supportive while the need for

better lines of communication was identified as inhibiting more effective program implementation.

Ninety percent of the responses indicated that the career awareness and career education programs which have been developed reflect the economic needs of the geographical area served.

The fact that 80% of all answers demonstrates that area businesses and industry have been an integral part of the local career education programs might be interpreted as commendable. The Evaluation Team believes that 100% of the responses should be affirmative if recommended guidelines for the development of job placement programs had been followed. It appears that the lack of an effective advisory committee contributes to the failure of a school district in its development of career education programs. Such programs should receive maximum impact from local business and industry.

Responsibility for the local programs is assigned in 1/3 of the districts to a full time person. The same members of districts assign the responsibility to more than one part time person while 25% of the districts have a single part time person responsible for the program. The need for better lines of communication has been identified as an inhibiting factor in the development of career education programs. The

comparatively large percentage (33%) of districts identify a divided responsibility for the program appears to re-enforce the need for clearly defined lines of communication and responsibility.

Only 33% of districts responding assign the responsibility for career education to a common job description. Sixty-seven percent scattered responsibility across seven other job titles. Several local educators interviewed by the Evaluation Team made comments that appear related to this item. First they indicated a need to more accurately define "career education". Considerable discomfort was disclosed by certain local educators with what they termed as either the unwillingness or the inability of state-wide "experts" to define career education. This lack of definition appears to have contributed toward confusion as to what skills are required of persons responsible for district-wide program development. Several persons who were interviewed displayed concern that career education might be too closely identified with vocational education and thus fail to gain broad support from teachers in all areas of the school programs.

Several teachers who received control questionnaires wrote to the Evaluation Team to point out that as academic teachers they had no interest in, or responsibility for, career education.

Eighty-two percent said "no" to the following questionnaire item: As career education programs develop, they are self sustaining, i.e. able to continue operation without specific financial aid from other than ordinary school district funds. Most of the central office personnel interviewed agreed that local funds should be used for career education but pointed out that the program is too new and unproven to realistically expect the local district to accept financial responsibility. A small number of those interviewed pointed out that their district already contributed substantial support to career education.

Some 55% of the administrators reported that no internal evaluation procedure had been developed to date. Local administrators spoke with considerable feeling about the entire concept of program evaluation. Evaluation Team members were able to identify five separate and distinct evaluation efforts going on within most participating school districts relative to the institutional Center programs. Many local administrators believed the overall evaluation requirements to be excessive, sometimes ill conceived and most always poorly or improperly interpreted.

Questions 19 and 20 indicate that the development of internal evaluation procedures was a matter of low priority with the local school districts. Forty-nine percent of the

replies to item 19 and sixty-two percent to item 20 offered no response.

Eighty-three percent of the replies indicate that the career education program will be continued either as presently written or with only minor revisions. Eight percent indicated that major revisions would be made to insure the contention of the program.

Local administrators emphasized on several occasions the importance of making appropriate revisions in each program whenever the program is to be used with a different group of students. The need for this type of revision was also cited by more than 25 persons returning target questionnaires from the workshop component mailing.

Forty-three percent of the respondents indicated that the principal selected the participants for the Summer Workshops. Twenty-three percent reported that participants were selected from volunteers. About 1/4 of the administrators interviewed by the Evaluation Team specifically commented upon the selection process. The first comment indicated a belief that inadequate notice was given for the Workshop. Increased lead time would have allowed a more effective participant selection process at the local level. Concern was expressed about the entry level skills of workshop participants. Both administrators and educators

returning target questionnaires for components indicated that some workshop participants had already mastered the knowledge and skills which were presented at the workshop. Additionally, a somewhat smaller number of administrators and target questionnaire respondents indicated concern that the workshop trainers assumed that workshop participants had mastered skills and knowledge which, in fact, were beyond them.

Eighty-six percent of the respondents stated that participants in their district reacted either very favorably or favorably to the workshop. There is a possibility that at least some of the remaining persons who were either neutral or unfavorable toward the workshop were persons who already had highly developed skills in the areas presented.

Ninety-six percent of the administrators said that workshop participants tried new activities as a result of the workshop experience. Some 3% of the individuals who returned the workshop target questionnaires appended a note indicating that they did not try new activities as a result of the workshop because the activities discussed at the workshop were already an integral part of their program prior to workshop participation.

Responding administrators felt that the same eight different new activities were tried in their district in about

an equal ratio.

Although 32% of the administrators considered the workshop to be very effective, 62% considered them to be only somewhat effective. When compared with the fact that 40% of the administrators thought that the program should be continued with some modification, the indication is there is local concern at a fairly high level relative to workshop offerings.

The figures displayed for questionnaire items 29 and 30 indicate that university or college consultants did visit most school districts to follow up on Summer Workshop activities. A wide range in the number of visits was indicated and it appears that some of the geographically distant districts received fewer visits. Several administrators in southern Georgia also expressed concern about the great distance between the training center and their district.

Administrators' Interview:

Evaluation Team members visited twenty-five school districts ranging geographically from Ringgold in the northeast corner of the state to Blakley in the southwestern part of the state. Team members traveled more than 3500 miles as they visited with school district personnel throughout the state. The districts visited had all participated

in the summer training programs presented by each of the three institutional Centers.

Each interview initially focused upon thirteen questions directly related to their responses on the questionnaire. Additionally, each local administrator was encouraged to comment upon any aspect of his career education program which might not have been touched upon in sufficient detail in the questionnaire.

All except one administrator felt career education was important for students in grades 1-12. This one exception felt that career education was important in post-secondary years as well.

Although all of the administrators rated the training received at the workshops as satisfactory, at least half of them added some parathetical comment. Concern about matching workshop content to the entry skills of the participants was most frequently mentioned. Examples of training being too basic for workshop participants were frequently cited.

Every administrator felt that there were teachers within the school district that needed additional training in any of the several areas. Most administrators felt that academic teachers needed inservice training to understand the importance of career education. A small number of respondents felt that some vocational teachers needed in-service train-

ing to develop a broader understanding of the basic concept. Almost without exception, the administrators identified additional in-service training as one of the key activities needed in order to insure future programs.

Most administrators indicated that the funds available to support career education came from federal, state and local sources. Two administrators indicated that local funds were not involved. The Evaluation Team was led to believe that participating school districts obligated themselves to provide some specified level of financial support at the local level in order to participate in the Summer Workshop programs.

Many people not associated with local schools have been aligned with career education programs at the local level. Business and industry representatives have been quick to supply resource people for specific groups of students within the local schools. One firm has a program in which teachers are hired and provided an opportunity to become fully acquainted with the manufacturing operations. Most school districts were enthusiastic about the Governors Conference on Career Education and reported participation for lay people as well as professional staffs.

One question posed to Superintendents was, "Please identify the major accomplishments of career education:."

Respondents were about equally divided in stating "helping children learn the dignity of work", "causing teachers to recognize the need to create a relevant curriculum", and "provide students with a purpose for attending school".

When asked to identify an existing problem in the development of career education every administrator answered "money". Year-to-year funding without any indication of availability of continuation of funding for a specific program was identified as a major stumbling block in the long range development of career education programs.

The information made available to the Evaluation Team from the administrators' questionnaires and the on-site interviews basically supported the findings of the other procedures utilized during the evaluation and program audit. Many administrators provided some insight into the overall program and their comments are worthy of note.

Comment #1

"The program offered by our Center changed because one trainer left after only a single session and Dr. - - - - - did everything possible to provide the anticipated training. The questionnaire received from the Evaluation Team went into workshop detail to a greater degree than the contents of the actual workshop program." (As noted earlier, the target questionnaires were developed directly from workshop objectives as discussed with Center personnel.)

Comment #2

"The late announcement of the workshops made it very difficult to recruit appropriate staff members for participation and when the date and location of

the workshop was later changed, it then became virtually impossible to get participants who could attend."

Comment #3

"The consultants were sincere and knowledgeable about specific areas of career education. Unfortunately, they did not know:

- how decisions are reached at the local district level
- the entry skill level of workshop participants
- the problems of individual districts, or where our district was located."

Section 8 - SUMMARY OF EVALUATION FINDINGS AND RECOMMENDATIONS

The Evaluation Team's summary of the degree to which the three institutional Centers accomplished their workshop component objectives is displayed separately for each Center on Tables 11 through 13 at the end of this section. The reader should keep in mind that while initial examination of these tables may indicate a higher degree of accomplishment of objectives at one institution, there were many local school district influences upon participant behavior which could not be controlled by Center staff. Hence, in those instances where objectives were not accomplished, as indicated by evaluation findings, an examination must also be made of the local constraints which inhibited the organization and implementation of workshop models, concepts, and ideas.

There are definite recommendations which the Evaluation Team must make relative to its finding for the 1972-73 school year and the implications for planning for the 1973-74 school year. The specific recommendations are as follows:

1. Increased lead time needs to be provided when local school districts are to be notified that they are eligible for participation in summer workshops. This will allow time to select participants with qualifications and entry skills for which the workshop is designed. (At least one superintendent commented during the interview that there has been even less lead time this year in his district when compared to last year.)
2. Subject matter content of future summer workshop programs should be more closely related to the entry skills of participants and the local school district requirements for more skilled career and vocational education staff.

3. Improved participant selection processes need to be developed and displayed to local school districts participating in summer workshops, i.e., a French teacher should not be involved in a summer workshop on "World of Construction" curriculum development just because (s)he was the only professional staff member who had not yet made another commitment for the summer.
4. Workshop objectives should be compared to local school district objects for the same topic. On-site interviews indicated that priorities for objectives were not similar and that a particular workshop was bound to fail.
5. Changes in location and dates of summer workshops should not be made just prior to the originally scheduled time. Schedulers of summer activities for professionals should be sensitive to the fact that such changes on a short notice will eliminate many of the desired participants.
6. There should be a reduction in the number of evaluations to which summer workshop participants must submit; particularly when the participants want to learn more but not have to face three different evaluation groups as a result of being involved.
7. Future evaluation planning should consider placing more emphasis on processes rather than products. (Even though a workshop participant may be given a model for a job placement program he cannot implement it in his school district if (s)he does not understand the processes involved.)
8. Procedures should be developed which would allow workshop consultants to better familiarize themselves with local school district management processes, constraints placed upon local professional staff, and the degree of local commitment to the workshop/technical assistance subject matter area.
9. Consideration should be given to multi-year funding of local programs in order to allow school districts to plan more effectively and develop a more positive attitude toward career education programs.

10. Consideration should be given to locating an institutional Center in closer proximity to school districts located in the southern part of the state.
11. Serious consideration should be given by State and local education agencies to the idea of not accepting grant funds when they are made available late in the school year, do not provide for a reasonably comprehensive program, or cannot otherwise be effectively utilized due to local constraints.

TABLE II.

SUMMARY OF DEGREE OF ACCOMPLISHMENT OF
SEPERATE WORKSHOP COMPONENT OBJECTIVES
FOR GEORGIA SOUTHERN COLLEGE.

| OBJECTIVE NO. | COMPONENTS | | | | | | | | |
|---------------|------------|---|---|---|---|---|---|---|--|
| | A | B | C | D | E | F | G | H | |
| 1 | + | + | + | + | + | | * | * | |
| 2 | + | - | + | + | + | | * | * | |
| 3 | + | + | + | + | + | | * | * | |
| 4 | + | + | + | ± | + | | * | * | |
| 5 | + | + | | | + | | | | |
| 6 | ± | + | | | + | | | | |
| 7 | ± | + | | | + | | | | |
| 8 | | | | | + | | | | |
| 9 | | | | | + | | | | |
