ABSTRACT

This report documents information concerning the money income of persons 14 years and older in the United States during 1975. "Money income" is defined as income received before tax and other deductions. The report does not include sources of non-money income such as food stamps, health benefits, and subsidized housing. The questionnaire used in the 1975 survey was modified from the 1974 version to include changes in the definitions of population control and metropolitan residences, in the collection of income and work experience data, and in question wording and procedure. Questions included in the survey characterize both families and persons according to family type, number of earners within the family, education level, age, work experience, housing tenure, sex, source, and type of income. In total, 11 income questions were asked, two more than in 1974. Questions were read aloud and an extension of the interview period and follow-up forms provided the respondent with time to gather more income information. Highlights note the overall trends and statistics which indicate the state of the economy in 1975. Definitions, explanations of terms, and changes in the questionnaire are listed in appendices. A facsimile reproduction of the four page questionnaire is included. The data was processed through a new system with expanded capabilities. The bulk of the report consists of detailed tables. (KC)

MONEY INCOME IN 1975 OF FAMILIES AND PERSONS IN THE UNITED STATES

(Advance data on the 1975 income of families and persons were issued in September 1976 in Current Population Reports, Series P-60, No. 103)

NOTE

In processing the data collected in the March 1976 Current Population Survey, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. The revised system also incorporates many improvements in the procedures used to process the data. A detailed discussion of these improvements and the subsequent revisions to the 1974 income data (for comparability with 1975 data) is provided in a later section, entitled "Revised 1974 Money Income Statistics."

HIGHLIGHTS

As indicated in the advance report on income, the 1975 median family income of \$13,720 represented an increase of 6 percent over the revised 1974 median. However, after adjusting for the 9 percent increase in prices between 1974 and 1975,¹ the 1975 median family income in terms of constant dollars decreased by \$360 or about 3 percent. Unrelated individuals had a median income of \$4,880 in 1975, also about 3 percent (or \$140) lower in real terms than the revised 1974 median.

The decline in real median income reflected the continued sluggishness in the economy during 1975, as evidenced by a decline of 2 percent in the real Gross National Product between 1974 and 1975.² During the same period, the average annual unemployment rate for the nation increased from 5.6 percent in 1974 to 8.5 percent in 1975.³ The rise in the unemployment rate was also accompanied by an increase in the number of persons who exhausted their unemployment benefits, from about 2.0 million in 1974 to 4.3 million in 1975.⁴

¹The percentage increase in prices between 1974 and 1975 is computed by dividing the annual average Consumer Price Index (CPI) for 1975 by the annual average value of the CPI for 1974.

²U.S. Department of Commerce, Bureau of Economic Analysis, Survey of Current Business, Volume 56, Number 7, July 1976, p. 1.

³U.S. Department of Labor, Bureau of Labor Statistics, Employment and Earnings, Volume 23, Number 1, July 1976, p. 19.

⁴Data were obtained from the U.S. Department of Labor, Employment and Training Administration, Office of Administration and Management.

Although real median income for all families declined between 1974 and 1975, the data do not indicate uniform movement in median income by race and ethnic origin. White families had a median income of \$14,270 in 1975, which represented a constant dollar decline of 3 percent below their revised 1974 median. The median income of Black families (\$8,780 in 1975) showed no statistically significant change in real terms. Sampling variability, however, was too large to reliably determine whether there was an actual difference between the percentage changes in median income for Black and White families. Families with a head of Spanish origin had a median income of \$9,550 in 1975, a decline in real terms of 8 percent below their 1974 median.

The 1975 median incomes of families in the Northeast (\$14,480) and North Central (\$14,540) regions represented decreases in real terms of 5 percent and 3 percent, respectively. Median income in 1975 of families in the South (\$12,240) and West (\$14,320) regions showed no statistically significant changes in real terms.⁵

Of the 56.2 million families in the United States in March 1976, 7.9 million or 14.1 percent received incomes of \$25,000 or more in 1975. There were 17.1 million families (30.3 percent) with incomes between \$15,000 and \$25,000; 12.6 million families (22.3 percent) with incomes between \$10,000 and \$15,000; 11.9 million families (21.1 percent) with

⁵The decline in real median income of families in the North Central region was not statistically different from the changes in real median income experienced by families in the other three regions.

incomes between \$5,000 and \$10,000; and 6.8 million families (12.0 percent) with incomes below \$5,000. (See table A.):

Median family income (\$13,720 in 1975) is defined as the amount which divides the income distribution in half—50 percent of all families having incomes above and 50 percent below this amount. For some sub-groups of the population, however, there were significant differences in their proportions in the lower or upper half of the distribution. For example, the lower half of the family income distribution (with income below \$14,000) encompassed 73 percent of Black families and 71 percent of Spanish families. In addition, 84 percent of families headed by a female, 75 percent of families with

heads having 8 or less years of education,⁶ 62 percent of farm families, and 94 percent of families with no earner had incomes below \$14,000. Young and elderly families were also concentrated in the lower half of the distribution. Eighty-one percent of families whose head is less than 25 years old and 78 percent of families headed by a person 65 or more years of age had incomes of less than \$14,000. On the other hand, some family groups were concentrated in the upper half of the family income distribution, largely reflecting their contribution to the economy of highly valued skills or additional work effort. Seventy-nine percent of families with heads having 16 or more years of education,⁶ and 61 per-

⁶The education data are restricted to families with heads 25 years old and over.

Table A. Families and Unrelated Individuals by Total Money Income in 1975

cent of two-earner and 82 percent of three-or-more-earner families had incomes of more than \$14,000 in 1975.

Both the increase in the number of families and in money income between 1974 and 1975 contributed to the growth in aggregate family income. Aggregate family income increased by 6.7 percent between 1974 and 1975, stemming from a 1.0 percent increase in the number of families (547,000 net additional families) and a 5.7 percent increase in mean income per family. However, aggregate family income in constant 1975 dollars was down 2.2 percent in 1975 compared with the revised 1974 estimate. Aggregate family money income amounted to \$874.4 billion in 1975.

Aggregate family income in 1975 was found to be distributed among families as follows: Families below the median family income (\$13,720) received 25.3 percent of the total aggregate. The lowest fifth of families, ranked by size of their 1975 income, received 5.4 percent of the aggregate money income of families; the second fifth received 11.8 percent; the third fifth received 17.6 percent; the fourth fifth received 24.1 percent; the highest fifth received 41.1 percent with the top 5 percent of families receiving 15.5 percent of the aggregate income. Families in the lowest fifth had incomes less than \$6,910, while the top 5 percent of families had incomes greater than \$34,140. Factors such as the number of persons and earners account for the differences between the lowest and highest fifths of families in terms of the share of income received. (See table 3.)

The survey showed that of all persons 14 years old and over, about 92 percent of the men and 72 percent of the women received income in 1975. Men and women who were income recipients in 1975 had median incomes of \$8,850 and \$3,390, respectively. The 1975 median income for men, expressed in real terms, showed a decline of about 4 percent below the 1974 median. In contrast, the real median income for women did not show a statistically significant change between 1974 and 1975. (See table F.)

Between 1974 and 1975, the proportion of male income recipients who were year-round full-time workers declined from 54.4 to 53.0 percent. The proportion for comparable women was about 29 percent in 1975, not significantly different from 1974. Although the median earnings of both male and female year-round full-time workers increased substantially between 1974 and 1975, the high rate of inflation during this period caused a slight decline in their real earnings. For men working year round full time, the median earnings were \$12,760 in 1975.

This represents a decline of about 2 percent in real terms from the 1974 median for comparable men. The median earnings (\$7,500) for women working year round full time declined 1 percent in real terms, not significantly different from the decline experienced by comparable males.⁷

These are some of the highlights obtained from the Census Bureau's Current Population Survey (CPS) of March 1976. The survey results cover both the civilian noninstitutional population and an estimated 914,000 members of the Armed Forces living off post or with their families on post in the United States. The March 1976 CPS population consists of 211,140,000 persons, of whom 56,245,000 were family heads, 134,385,000 were other family members (including 48,321,000 children under 14), and 20,510,000 were unrelated individuals, i.e., persons living alone or not related to others in the household (including 276,000 children under 14). The collection of income data in the survey, however, is restricted to persons 14 years or older. (See table B.)

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases as well as small differences between figures. Moreover, as in all field surveys of income, the figures are subject to errors of response and non-reporting. For further details, see below and page 278.

Data on consumer income collected in the CPS are limited to money income received before payments for personal income taxes and deductions for Social Security, union dues, Medicare premiums, etc.⁸ Money income is the sum of amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or

⁷ The decline in real median earnings for women working year round full time was significant at the 94-percent confidence level.

⁸ A facsimile of the income questions asked in the survey is shown on page 290.

that nonmoney incomes are also received by some nonfarm residents such as the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income.⁹ Underreporting tends to be more pronounced for income sources that are not derived from earnings, such as Social Security, unemployment compensation, public assistance, and net

⁹ The accuracy of reported and imputed CPS earnings and property income is discussed in a paper, "Measuring the Impact on Income Statistics of Reporting Differences Between the Current Population Survey and Administrative Sources," by Roger A. Herriot and Emmett F. Spiers, published in American Statistical Association, Proceedings of the Social Statistics Section, 1975.

income from interest, dividends, rentals, etc. Overall, income earned from wages or salary is much better reported than other sources of income and, when dollar imputations are assigned for nonreporting, total wage and salary income approximates independently derived estimates.

A study which attempts to adjust the CPS data for underreporting and to impute government "in-kind" transfer program benefits (such as food stamps, Medicare, and subsidized housing) to families in the survey, has recently been completed by the Congressional Budget Office (CBO).¹⁰ Statistical techniques were used to simulate eligibility and

participation of persons in the various programs. For simulated participants, the services received were given a money "value" based on the assumption that value of these services to the beneficiaries was equal, on average, to the government's cost.

The CBO report represents one attempt to measure and study the effects of adjusting for underreporting of money income and the inclusion of nonmoney transfer payments on the size distribution of income and poverty counts. The procedures used by the CBO have not been fully evaluated and there is a general lack of agreement of how to measure in-kind income. The interested reader may wish to consult a recent report¹¹ by a governmental interagency task force which discusses many of these issues.

The estimates presented in the CBO report are not entirely comparable with those presented in this report because the institutionalized population, members of the Armed Forces living in group quarters, and the population of Puerto Rico are included in the CBO report but are excluded from the estimates presented here. In addition, the reference period for the CBO estimates was adjusted to cover fiscal year 1976 rather than calendar year 1975.

SELECTED FAMILY INCOME CHARACTERISTICS

Type of family. In March 1976, about 84 percent of all families were husband-wife families, 13 percent were headed by a female with no husband present, and the remaining 3 percent were headed by a male with no wife present. The median income in 1975 of all husband-wife families was \$14,870. For husband-wife families with wives in the paid labor force the median income was \$17,240 or 35 percent higher than the median income for husband-wife families in which the wives were not in the paid labor force.

There were about five times as many families headed by a female with no husband present (7.5 million) as there were families headed by a male with no wife present (1.4 million). The median income in 1975 of families headed by a female

(\$6,840) was slightly more than one-half (53 percent) of the median income of families headed by a male with no wife present (\$13,000).

About 37 percent of all families headed by a female with no husband present had incomes below \$5,000 in 1975, compared with 13 percent for families headed by a male with no wife present. Approximately 8 percent of the husband-wife families had incomes below \$5,000. The reverse pattern is observed for families with incomes above \$20,000 in 1975; the proportions were 6, 20, and 29 percent, respectively. (See table C.)

Between 1974 and 1975, the median income of husband-wife families decreased by about 2 percent in real terms. Among husband-wife families, those with the wife in the paid labor force experienced less of a decrease (-2.6 percent) in real median family income than did families where the wife was not in the paid labor force (-4.5 percent). Similarly, the median income of families headed by a female decreased by approximately 3 percent in real terms, not significantly different than for husband-wife families. Sampling variability obscured whether or not there was a significant change in real median income for families headed by a male with no wife present.

Number of earners. Median family income is highly correlated with the number of earners per family. In 1975, the median income for the 2.5 million families with four or more earners was \$23,790 as compared with medians of \$20,530 for the 5.3 million families with three earners, \$16,060 for the 21.4 million families with two earners, and \$11,570 for the 19.5 million families with one earner. For the 6.8 million families with no earners, the median income in 1975 was \$5,230.

About 47 percent of all families with no earners had incomes below \$5,000 in 1975, compared to 13 percent for one-earner families and 6 percent for families having two-or-more earners. For families with incomes above \$20,000 in 1975 the pattern is reversed; 3 percent of no-earner families, 16 percent of one-earner families, 31 percent for two-earner families, and 56 percent for families with three-or-more-earners had incomes above this amount. (See table C.)

Educational attainment of head.¹² There is a strong positive relationship between educational

¹Restricted to families with civilian members.²Restricted to families with head 25 years old and over.³Excludes families with head in the Armed Forces.⁴Restricted to primary families.

attainment and income. For family heads with 8 or less years of education, median family income in 1975 was \$8,470. For families with heads who were high school graduates median family income was \$14,730, compared to \$20,850 for families with heads who had 4 years of college and \$23,480 for families with heads who had completed 5 or more years of college.

About 25 percent of the families with heads who had completed 8 or less years of school had incomes below \$5,000 in 1975, compared to 7 percent for families with heads who were high school graduates, and 3 percent for families with heads who had completed 4 or more years of college. The reverse was true for families with incomes above \$20,000 in 1975; about 9 percent of families with heads who had 8 or less years of education; 26 percent of families with heads who were high school graduates, 53 percent of families with heads who had completed 4 years of college, and 62 percent of families with heads who had completed at least 5 years of college had incomes above \$20,000. (See table C.)

Higher educational attainment of the family head, however, is no guarantee of higher family income. For example, one-fourth of the families whose head completed 4 years of college received less than the median income for families headed by high school graduates (\$14,730).

Age of head. Family life cycle studies indicate that income typically increases with age up to a certain age level and then gradually declines in the upper age brackets. The data for 1975 show that the median income of families with a head between 14 and 24 years of age was \$8,750. The median increases with age reaching a peak of \$17,570 for families with heads in the 45-to-54-age bracket. The age group having the lowest median income (\$8,060) is for families whose head was 65 years old and over. (See table C.)

The survey data indicate a relatively large concentration in the lower income brackets of families headed by younger and older persons. Approximately one-fourth of families with heads between 14 and 24 years of age and those with heads 65 years and over received less than \$5,000 in 1975. In contrast, families with heads between 45 and 54 years of age are more concentrated in the higher income brackets—approximately two-fifths of these families received more than \$20,000 in 1975.

Work experience of head. Although more and more families derive their income through the efforts of both the family head and other family members, in most instances the work experience of the family head is still the principal factor in shaping the level of family income. In March 1976, there were 55.5 million families with civilian heads, of whom 44.9 million (81 percent) worked at some time during 1975, 32.9 million (59 percent) worked 50 to 52 weeks at full-time jobs, and 1.3 million (2 percent) worked year round at part-time jobs. There were approximately 10.6 million family heads who did not work at all during 1975, 55 percent of whom were 65 years or older.

Although only about 7 percent of the families whose head worked at some time in 1975 had incomes below \$5,000, for those families in which the head did not work at all, about 36 percent had incomes below this amount. On the other hand, about 31 percent of families with heads who worked at some time during 1975, 37 percent of families with heads who worked year round full time, and 6 percent of families with heads who did not work in 1975 had incomes above \$20,000. (See table C.)

Tenure. Housing tenure varies greatly according to family income. Of the 56.1 million primary families interviewed in March 1976, 40.4 million (72 percent) lived in owner-occupied properties, 14.6 million (26 percent) were renters, and the remaining 1.1 million (2 percent) did not pay cash rent.¹³ The 1975 median income of families living in owner-occupied properties (\$15,460) was about 58 percent higher than the median for families in renter-occupied properties (\$9,780). This relationship is consistent for families living both inside and outside of SMSA's, but the difference is more pronounced for those living within SMSA's. In these areas, the median income of families living in owner-occupied properties (\$17,040) was about 66 percent higher than the median for families living in renter-occupied properties (\$10,240). In areas outside of SMSA's, the 1975 median income for families living in owner-occupied properties (\$12,690) was 49 percent higher than the median for families living in renter-occupied properties (\$8,530).

¹³ Since the household universe is comprised of primary families and primary individuals, all of the family income comparisons by tenure in this section are restricted to primary families.

Metropolitan-nonmetropolitan residence. In 1975, the median income of families in metropolitan areas (\$14,910) was about 29 percent higher than the median received by families in nonmetropolitan areas (\$11,600), and about 37 percent higher than the median income for farm families (\$10,850).¹⁴

Families living outside central cities of metropolitan areas had a median income (\$16,120) that was 24 percent higher than the median for families living inside central cities (\$12,990).

Large metropolitan areas (with a population of one million or more) had a median family income (\$15,550) that was 10 percent higher than the median family income (\$14,140) of smaller metropolitan areas (with fewer than one million persons). However, the difference in median family income between these two areas occurred primarily in the suburban portion, not in central cities. Suburban families of large metropolitan areas had a median income (\$17,160) that was 15 percent higher than the median of suburban families in smaller metropolitan areas (\$14,860). For families living inside central cities, the median income for those in large metropolitan areas (\$12,960) was not significantly different from the median for those in smaller metropolitan areas (\$13,030).

Source of income. Although earnings comprise the largest source of family income, only 13.8 million (25 percent) families indicated that their only source of income in 1975 was from earnings (wages, salaries and/or self-employment income). There were 35.7 million (63 percent) families who had other types of income in addition to earnings (e.g., interest, dividends, unemployment compensation, or pensions). The remaining 6.6 million (12 percent) families indicated that they had income only from nonearned sources. (See table C.)

The median income of families with earnings only was \$13,210 in 1975, as contrasted with a median of \$15,720 for families having both earnings and income other than earnings. Families with income solely from nonearned sources had a median income of \$5,320 in 1975.

As expected, families with income from nonearned sources tend to concentrate in the "lower"

¹⁴ The difference in the level of median income between farm families and those in nonmetropolitan areas was statistically significant at the 94-percent confidence level.

income brackets. There were 6.8 million families with income less than \$5,000 in 1975, of which 45 percent had income solely from nonearned sources. Of the remaining families in this income category, 36 percent had earnings and other income sources and 17 percent had income only from earnings.

The "middle range" of the income distribution is dominated by families that received earnings in addition to other income sources. There were 12.6 million families that had incomes between \$10,000 and \$15,000 in 1975, of which 63 percent had earnings and other income sources. In this income range, the proportion of families with earnings only was 31 percent while the proportion of families with income only from nonearned sources was 6 percent.

The "higher" income brackets are strongly dominated by families that received earnings and additional income sources. About 84 percent of the 7.9 million families with \$25,000 or more in 1975 had this source of income. The proportion of families in this income category with earnings only fell to 15 percent and only 1 percent of families received income solely from nonearned sources.

Type of income. Most families typically receive more than one type of income; however, the proportion of total income accounted for by each specific type of income varies greatly. For example, the mean total money income for the 47.1 million families that received wages or salary was \$16,880 in 1975 whereas their mean wage or salary income was \$14,260, or 84 percent of their average total income. For the 6.7 million families that received nonfarm self-employment income, the mean total income was \$19,830 compared to a mean for this type of \$8,520, or 43 percent of their mean total income. The 2.6 million families with farm self-employment income had a mean total income of \$15,780 in 1975, although the mean for this type (\$4,310) was only 27 percent of their mean total income.

The survey indicated that almost 25 million families (about 44 percent of all families) received some government transfer (cash) payments¹⁵ in 1975. About 22.0 million of these families had additional sources of income whereas 2.8 million received only government transfer payments. The mean total money income for families that received government transfer payments was \$12,650 in 1975.

¹⁵ Government transfer payments are limited in the Current Population Survey to cash payments under such programs as Social Security or Railroad Retirement, supplemental security income, public assistance or welfare, veterans' payments, unemployment and workmen's compensation, and government sponsored pensions.

The average income of such families varies greatly, however, depending upon whether or not these payments were the only source of family income. Families that received other income sources in addition to government transfer payments had a mean total income of \$13,730 in 1975. In contrast, the mean for families who received only government transfer payments was \$4,160.

REVISED 1974 MONEY INCOME STATISTICS

This report presents revised data for 1974, resulting from changes in processing and other factors as described below. These changes were made in an effort to reduce the nonsampling error in the estimates (i.e., certain response, enumeration, and processing errors); the differences between the original and revised 1974 estimates are due entirely to changes in the magnitude of the nonsampling error associated with the statistics. Overall, the revisions to the 1974 data resulted in an increase of \$66 in the estimate of median family income (from \$12,836 to \$12,902) and a decrease of 890,000 in the estimate of the number of persons in poverty (from 24.3 to 23.4 million).¹⁶ These differences, as well as the differences discussed in the following sections, are due to one or more of the following four factors: (1) changes in procedures which impute missing responses to the income and work experience questions on the March CPS questionnaire, (2) changes in the March CPS income and work experience questions, (3) changes in the number and detail of tabulated income intervals, and (4) the correction of several small errors found in the previous processing system.

Changes in Imputation Procedures

As in all household surveys which rely on the voluntary cooperation of the respondents in the sample, one of the more persistent problems encountered on the March CPS supplement has been a need to minimize bias resulting from nonresponses (complete or partial failure to obtain information requested on the questionnaire from respondents). In 1962, the Census Bureau began imputing missing responses to the income, work experience, and longest job questions on the March CPS supplement questionnaire, in an effort to reduce the bias resulting from nonresponses. This bias results from the fact that nonrespondents tend to have somewhat different economic and demographic characteristics than respondents. For example, nonrespondents tend to have higher than average incomes, are

classified in higher skilled occupations, and are more likely to work at full-time jobs. In addition, non-response varies by type of income and, therefore, may bias statistics for the lower end of the income distribution (where transfer payments are concentrated) and the upper end (where earned and property income are concentrated).

Since 1962, two major revisions have been made to the income, work experience, and longest job imputation procedures, the first in 1967 and the second, being discussed here, in 1975. In both 1967 and 1975, the revisions coincided with large scale changes in computer facilities at the Census Bureau and revisions to the March CPS supplement questionnaire. Although the imputation procedures have been updated twice since 1962, with revisions to the income data occurring each time, the basic strategy or approach used to make imputations has remained the same. This approach, commonly referred to as "hot deck" imputation, assigns to a sample person with missing responses the information from another sample person with "similar" demographic and economic characteristics who answered the questions.

The following is a simplified illustration of how the "hot deck" imputation system provides estimates for a person who did not respond to a specific income question on the CPS questionnaire:

A White male, age 38, who worked 52 weeks in 1975 as a carpenter refuses to provide the CPS interviewer with the amount of wages he earned during 1975. The imputation system is designed to seek out another person in the survey who is a White male, age between 35 and 44, who worked 50 to 52 weeks in 1975 as a carpenter and who reported his wages to the interviewer. If his wages in 1975 were \$12,000, for example, that value is then assigned as the wages for the person who declined to answer.¹⁷

The decision to make the current revisions to the imputation procedure was based on several considerations. First, the upgrading of the Bureau's computer facilities, while increasing the capacity to handle more information more efficiently, required modification of existing processing procedures. Second, changes in the Federal transfer payment programs necessitated changes in the questionnaire

¹⁶A detailed discussion of changes in the poverty statistics can be found in *Current Population Reports*, Series No. 103.

¹⁷In actuality, the imputation system attempts to locate a "similar" person in the survey using a more detailed set of characteristics (which are described later) than those used in the example. The example is intended to be an illustration of how the "hot deck" approach operates.

and processing procedures. Finally, there existed a pressing need to improve the handling of income nonresponses because it had become a large and growing problem.¹⁸

There were two main objectives in the revisions of the imputation procedures for income, work experience, and longest job. The first objective was to expand the detail and number of demographic and economic characteristics used to define respondents and nonrespondents as "similar." Since nonrespondents are assigned information from respondents with "similar" characteristics, the degree of bias due to nonresponse may be reduced by incorporating more detailed information in the imputation procedures. The second objective was to maintain—wherever possible—observed relationships for respondents among income, work experience, and longest job variables in imputing missing information for nonrespondents.

Among the major changes instituted in expanding the number of demographic and economic characteristics to define nonrespondents and respondents as "similar" are the following:¹⁹

a. Worker-nonworker status (for previous calendar year) is imputed using current labor force information for the respondent (pertaining to the week in March prior to the CPS interview), current labor force status of spouse, number of children, and more detailed age and family relationship information, when sufficient information is not available from the March supplement questionnaire to determine the worker-nonworker status. Characteristics used in the previous imputation system were restricted to age, race, sex, and family relationship (head/not head).

b. Assignment of missing longest job information is made from the current job held if the current job is available. The previous procedure

¹⁸ For a more detailed discussion of nonresponse research and efforts to reduce nonresponse, see a paper entitled, "Current Developments on Collecting Income Data in the Current Population Survey," by Mitsuo Ono, American Statistical Association, Proceedings of the Social Statistics Section, 1971. For a discussion of the characteristics of nonrespondents, see a paper entitled, "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, also in the Proceedings of the Social Statistics Section, 1971.

¹⁹ A detailed summary of the characteristics used for imputation of missing earnings and "unearned" sources of income in the old and new processing systems can be obtained by writing to Meyer Zitter, Chief, Population Division, Bureau of the Census, Washington, D.C. 20233.

• imputed a longest job using age and sex to define "similar" persons.

c. Missing earnings, work experience (weeks worked, full-time/part-time status, etc.), and longest job (if not assigned from current job) are imputed using a greater number of demographic and economic characteristics than previously. These added characteristics include educational attainment, labor force status of spouse, marital status, number of children, region, and type of residence (e.g., inside metropolitan areas of 1,000,000 population or more, farm residence, etc.). Characteristics used in the previous imputation system but expanded to provide more detail in the new system include age, family relationship, occupation of longest job, class of worker of longest job, weeks worked, full-time/part-time work status, and race-ethnic origin (Spanish origin included).

d. Expanded detail and numbers of characteristics were also used for the imputation of the "unearned" sources of income such as Social Security benefits, public assistance, unemployment compensation, dividends, etc. Characteristics added for use in the new imputation system for "unearned" income include years of school completed, weeks worked, reason for not working (nonworkers), marital status, number of children, total family earnings, region, type of residence, and, when available, the reported reciprocity pattern for the "unearned" sources of income. Characteristics used in the previous imputation system but expanded to more detail in the new one include age, family relationship, amount of earnings, and race-ethnic origin (Spanish origin included).

To achieve the second objective (the preservation of relationships among income, work experience, and longest job categories), the imputation system was designed to impute all missing information to a nonrespondent from the same "similar" respondent. The addition of current labor force information and for married persons—current labor force status of spouse, also helps to preserve relationships between "current" labor force status and job and "last year's" work experience, longest job, and earnings for individuals within the family. The previous procedure imputed missing work experience, longest job, earnings, and unearned income in separate stages. Although the revised procedure attempts to impute earnings, work experience and longest job in a single stage, a second stage is still required to impute the "unearned" sources. Several revisions were made to the imputation procedure to help preserve the distribution of "unearned" income

sources for individuals. First, the reported reciprocity pattern for "unearned" income is always used—when available—to impute missing dollar amounts. Second, husbands and wives are imputed missing "unearned" income information as a unit in order to prevent inconsistencies between the amounts and sources imputed to either the husband and/or wife.

In addition to the changes in the imputation procedures, three other factors are involved in explaining differences in the 1974 income statistics produced by the old and new processing systems. These are: (1) differences due to additional income questions asked in the March 1975 CPS, (2) differences in income intervals between the two processing systems, and (3) the existence of errors in the old processing system which have been eliminated in the new system.

Differences Due to Additional Income Questions

The March 1975 CPS questionnaire was expanded to a total of 11 questions on income for 1974, two more than on the March 1974 CPS questionnaire. This expansion involved: (1) addition of a separate question covering "interest on savings accounts or bonds" which was previously included in amounts collected for dividends, estates or trusts, and net rental income; and (2) addition of a separate question on Supplemental Security Income (SSI), a program which began in January 1974.

Even though the questionnaire format changed in March 1975, the old processing system was used to process the income data originally published for 1974 because the new processing system was not available at the time the data were processed. Using the old system to process data collected with the new questionnaire required that the new questions be collapsed into the old procedure. In some cases a question not requiring imputation, thus, eliminating an imputation that would have occurred in the new system. As a result, the new system imputed additional income amounts and shows a slightly higher nonresponse rate.

Differences in Income Intervals

Along with the new processing system, there were also revisions to the display tables including an expanded set of income intervals above \$10,000. As a result, estimates of median income exceeding \$10,000 are not strictly comparable to the previous published values because interpolation calculations are now performed using different size income intervals than used previously. *Ceteris paribus*, the

median values in the new tables will tend to be more accurate and somewhat lower because of the narrower size of the intervals. For example, if a comparable set of income intervals had been used in the old tables, the 1974 median family income would have been \$69 lower than the published figure of \$12,836. Correspondingly, the revised 1974 median would have represented an increase of \$135 instead of \$66, as shown in table D. In some cases, interpolation in different size income intervals is the primary factor causing differences in median incomes between the revised and original 1974 estimates.

Errors in the Old Processing System

In reconciling the two sets of statistics, two important errors were discovered in the old processing system. One error was the result of changes to the old programs in recent years to accommodate modifications to the questionnaire and field collection procedures. This error involved a misclassification of about 2.6 million part-year workers as full-year (50-52 weeks) workers. This difference was the result of three interrelated factors: (a) change in the questionnaire format for the work experience questions from those used in the previous year, i.e., March 1974 CPS, (b) interviewer errors in following the skip pattern on the March 1975 CPS questionnaire, and (c) a work experience edit which in interaction with interviewer errors, resulted in part-year workers being classified as full-year workers.

Since the majority of persons previously erroneously edited from "1 to 49 weeks worked" to "50 to 52 weeks worked" reported their income, neither their income nor their poverty status were affected by the new edit. There was, however, some impact on income and poverty levels resulting from income allocations made to and from these edited persons. It is estimated that the correction of this error resulted in a net decrease in the poverty count for 1974 by about 50,000 persons.

The second error resulted in the failure to assign dollar amounts to some respondents who indicated that they received particular types of "other income" but didn't know the amount of the income they received. All such sample cases should have been allocated a dollar amount of income under these conditions. This error affected about 600,000 persons (or 385 sample cases) in the March 1975 CPS. One of the most significant impacts of this error was that the dollar amounts allocated to these individuals in the new system, were responsible for moving at least 200,000 persons out of poverty for 1974.

COMPARISON OF STATISTICS FROM THE OLD AND NEW PROCESSING SYSTEMS

The introduction of the new processing system produced changes in the statistics for all groups, with sizeable changes occurring for some small groups. Overall, the median family income for 1974 increased by \$66 or about 0.5 percent compared to the previous estimates, however, the impact of the new edit and allocation procedures is more clearly discerned by comparing mean incomes under the old and new processing systems, rather than median incomes. As previously noted, the differences in median incomes under the two systems are due not only to the new edit and allocation procedures, but also to interpolation differences and hence are often not strictly comparable.

As a result of the revisions, the mean family income for 1974 rose from \$14,502 in the old system to \$14,711 in the new system, an increase of \$209 or 1.4 percent. The percentage increase in mean incomes for both Black and White families was the same, 1.4 percent. In contrast, families whose head was of Spanish origin now have a mean income which is 0.5 percent below the previously published estimate. (See table D.)

Families with heads having 4 or more years of college education have a 1974 mean income of \$23,248 in the new system, up 5.3 percent over the original estimate. The opposite situation occurred for families with heads having an elementary school education; their mean income was \$9,729, representing a decrease of 1.4 percent below the previous estimate. Families with heads having a high school education have a mean income of \$15,212 in the new system, up 1.0 percent from the original estimate. (See table D.)

In general, the largest percentage increases in mean income occurred for families in which the head was self-employed, in occupations such as professional, technical, and kindred workers (13.6 percent) and managers and administrators except farm (5.3 percent). (See table D.)

The share of aggregate income received by each fifth and top 5 percent of families did not change perceptibly between the old and new processing system. (See table 13.)

The revised 1974 income data for persons show, in general, more pronounced changes for males than for females. This occurs because males tend to be more dominant than females in categories which

were most heavily affected by the new procedural changes. The mean income for males rose from \$9,717 in the old system to \$9,861 in the new system, an increase of \$144 or 1.5 percent. The revised 1974 mean income for females was \$4,161, which represents an increase of \$19 or 0.5 percent above the previous mean. (See table F.)

The revised 1974 income data by educational attainment show a pattern of change for persons which is similar to that for families; however, more pronounced changes were again observed for males. For example, males with 4 or more years of college had a mean income of \$18,265 in the new system, or 6.1 percent higher than the previous estimate. The revised mean income (\$7,933) for comparable females was about 3.5 percent higher than the previous estimate. (See table F.)

The earnings of males were also affected more by the revisions than were the earnings of females. Among males, the occupation groups most affected were white-collar workers, particularly the professional self-employed, and service workers. The mean earnings for white-collar workers increased by \$307 or 2.3 percent, whereas the estimate for service workers decreased by \$98 and blue-collar workers' earnings were only \$5 below the previous estimate. For females, the changes in earnings by occupation group tended to be more moderate. (See table F.)

The revised procedures and the correction of the previously discussed error in the determination of year-round full-time work experience resulted in a decrease in the estimate of year-round full-time workers by about 2 million (1,043,000 females and 984,000 males). The effect on the mean income of this group was to raise the estimate for females to \$7,684 or \$273 above the previous estimate and to increase the estimate for year-round full-time male workers by \$393 to \$13,757 for 1974. (See table G.)

In summary, the revised money income and poverty estimates for 1974 reflect the use of more refined imputation procedures in the current system and the correction of editing errors in the previous processing system. The revised 1974 estimates show the largest increases in mean income for groups which were most heavily affected by the new procedural changes, such as families with a head who had 4 or more years of college or those where the head was in a self-employed occupation. Similarly, the largest declines in the number of poor persons occurred for the expected groups, such as poor persons in families with a head who worked year round full time or those in families with a head who completed 1 year or more of college.

Table D. Selected Characteristics of All Families—Number of Families, Median Income, Mean Income, and Standard Errors, by Race of Head and Spanish Origin of Head: 1975, 1974 (Revised), and 1974

(Families as of March of the following year. An asterisk (*) preceding percent change indicates statistically significant change at the 95-percent confidence level. For meaning of symbols, see text)

¹Based on revised methodology; for details see page 9.
²For the years 1975 and 1974, excludes families with members who are in the Armed Forces, therefore the difference in the number, median income, and mean income between 1974 and 1974 are not directly comparable.
³Employment status and occupation of head as of March of the following year.
⁴Based on Pareto estimate.

Table D. Selected Characteristics of All Families—Number of Families, Median Income, Mean Income, and Standard Errors, by Race of Head and Spanish Origin of Head: 1975, 1974 (Revised), and 1974—Continued

Families as of March 31 of the following year. An asterisk (*) preceding percent change indicates statistically significant change at the 95-percent confidence level. For meaning of symbols, see text.

Selected characteristics	1975				1974 ^a			Percent change (median income)		1974			Difference (1974 ^b -1974)

*Based on revised methodology. For details see page 9.
 †For the years 1975 and 1974, excludes families with members who are in the Armed Forces. Therefore the difference in the number, median income, and mean income between 1974* and 1974 are not directly comparable.

Table E. Selected Characteristics For Families With Heads Working Year Round Full Time—Number of Families, Median Income, Mean Income, and Standard Errors, by Race of Head and Spanish Origin of Head: 1975, 1974 (Revised), and 1974—Continued

Families as a percent of the total population in each race and Spanish origin of head. Percent change indicates statistically significant change at the 95-percent confidence level. For meaning of symbols, see text.

Selected characteristics	1975				1974 ^a			Percent change (median income)		1974			Difference (1974-1975)			
	Number (thousands)	Median income		Mean income		Number (thousands)	Median income	Mean income	Current dollars	In 1975 dollars	Number (thousands)	Median income	Mean income	Number (thousands)	Median income	Mean income
		Value	Standard error	Value	Standard error

¹Based on revised methodology; for details see page 9.

²Spanish origin may be of any race, but the vast majority are white.

³Amounts shown are median and mean earnings.

⁴Includes other occupational groupings not shown separately.

RELATED REPORTS

Current Population Survey. Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels, have been published in the Series P-60 reports, Nos. 1 to 104. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the **Special Labor Force Reports** of the Bureau of Labor Statistics. Series P-60, No. 103, "Money Income and Poverty Status of Families and Persons in the United States: 1975 and 1974 Revisions," contains advance 1975 income data cross-classified by various characteristics. Series P-60, No. 104, "Household Money Income in 1975 and Selected Social and Economic Characteristics of Households," contains 1975 income data on households. For a detailed analysis of the low-income population in 1974, in the United States, see Series P-60, No. 102. Series P-60, No. 103 contains advance data on the low-income population in 1975.

Projections of money income size distributions have been prepared from the Current Population Survey and appear in Series P-23, No. 47, "Illustrative Projections of Money Income Size Distributions for Families and Unrelated Individuals." Projections have been prepared for families and unrelated individuals by age of the family head or of the individual in 1971 constant dollars for the following years: 1975, 1980, 1985, and 1990.

Data on the educational attainment and income of men have been assembled from information collected in the Current Population Survey. These data appear in Series P-60, No. 92, "Annual Mean Income, Lifetime Income, and Educational Attainment of Men in the United States, for Selected Years 1956 to 1972." Included in the report are annual mean income and estimates of expected lifetime income in current dollars and in constant (1972) dollars, by educational attainment and age group, for all males and for male year-round full-time workers.

An historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper No. 17, **Trends in the Income of Families and Persons in the United States: 1947 to 1964**, published in 1967. This

report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini Ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm and farm. Similar data are shown for males and females classified by the amount of their own income and various personal characteristics.

Decennial censuses. Income data collected in the 1970 Census of Population appear in a number of published reports. Basic distributions of families and unrelated individuals by money income in 1969, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in **1970 Census of Population, Vol. 1, Characteristics of the Population**, chapter C, "General Social and Economic Characteristics." Statistics on income of persons 14 years old and over, households, families, and unrelated individuals in 1969 by detailed characteristics, including cross-classifications by age, weeks worked, education, type of family, etc., are presented in **1970 Census of Population, Vol. 1, Characteristics of the Population**, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States, and standard metropolitan statistical areas of 250,000 inhabitants or more.

Detailed cross-classifications of income of families and persons by social and economic characteristics are presented in Vol. II, Subject Reports: 8A, **Sources and Structures of Family Income**; 8B, **Earnings by Occupation and Education**; and 8C, **Income of the Farm-Related Population**. Other statistics on income are included in Vol. II reports on other subjects and in some reports of the 1970 Census of Housing. Reports of the 1960, 1950, and 1940 censuses also contain various statistics on income.

An important difference in the data content included in the 1970 reports versus the corresponding reports from the 1960 census is the cross-classification of most of the 1970 data for the Black population and the population of Spanish origin.

Although both the Current Population Survey (CPS) of March 1970 and the 1970 Census of Population used the same basic income concept, there were differences in the two collection systems and in the income data.

In the CPS, the institutional population and most members of the Armed Forces living on post were excluded. These two groups were included in the census. College students were generally enumerated

at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. The small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self-enumerated in the 1970 census. Moreover, income data in the CPS were based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within four of these questions, whereas in the census only six questions were used.

In general, the level of income reported in the census is slightly higher than that reported in the Current Population Survey. Thus, median family income reported in the 1970 census was about \$9,590, 1.7 percent above the comparable figure of \$9,433 derived from the March 1970 Current Population Survey. This difference is smaller than the difference of 4.5 percent between the medians compiled from the 1960 census and the March 1960 Current Population Survey. For a more detailed discussion of these differences see, "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing," by Mitsu Ono, published in the American Statistical Association Proceedings of the Social Statistics Section, 1972.

Survey of Income and Education

Between April and July of 1976, the Bureau of the Census conducted a special survey called the 1976 Survey of Income and Education (SIE). The SIE was conducted in each State and consisted of approximately 151,000 interviewed households for the nation as a whole. In compliance with the Education Amendments of 1974, preliminary estimates by State of the number of school age children below the poverty level in 1975 from the SIE have been released to Congress.

Additional data from the SIE will be available in forthcoming subject reports prepared by the Bureau of the Census. Two income reports are scheduled for release by late summer, 1977. One report will contain household income data by housing tenure and residence, and the other will be a more general report containing income data for families, persons, unrelated individuals, and the poverty population. Both reports will contain income distributions for the United States, regions, divisions, and States for several selected characteristics. An additional report

from the SIE is scheduled for release in the latter part of 1977. This report will show summary measures for a broad range of characteristics, including income, and comparisons will be made with the 1970 census data.

Data on income and poverty for calendar year 1975 from the SIE differ somewhat from those based on the CPS. In general, the estimates of median income from the SIE are slightly higher than comparable estimates from the CPS. For example, the median family income from the SIE was \$14,094 compared to \$13,719 from the CPS. Estimates of the number of persons below the poverty level by various characteristics from the SIE are generally lower than from the CPS. For example, there were 23,991,000 persons below the poverty level in 1975 from the SIE compared to 25,877,000 from the CPS.

Although two major aspects of these surveys were the same, the money income concept and the questionnaire wording and design, there were some significant procedural differences which probably cause the income estimates in these surveys to differ. These differences center on four main areas: (1) Survey objectives, (2) month of interview, (3) conditioning of respondents and mode of interview, and (4) interviewer experience.

1. **Survey objectives.** The major objective of the SIE was to collect accurate income information for each State and the District of Columbia. The primary purpose of the CPS is to obtain accurate statistics on the labor force; e.g., the unemployment rate with income information added as a supplement in March. Presumably the increased emphasis on collection of income data in the training of interviewers and the introductory letters to respondents led to better (i.e., more complete) reporting and thus contributed to differences in the results between the two surveys.

2. **Month of interview.** Virtually all interviews in the March 1976 CPS were conducted during the week of March 14 to 20. Only a small number of households were interviewed during the succeeding week. The SIE interviews took place, for the most part, in May and June, with a small number of interviews occurring in April and July. Since respondents often consult their tax returns in answering survey questions on income, the fact that the CPS interviews took place before the general April 15 deadline for filing tax returns may have disadvantages compared to the SIE survey. On the other hand, collection of data in May, June, and

July for the SIE may have created significant recall problems for income and work experience during 1975.

3. **Conditioning of respondents.** It has been well documented that the repeated interviews of CPS sample households result in decreased respondent cooperation as the number of interviews increases. The SIE did not encounter these problems since all households were, in effect, being interviewed for the first time. In addition, respondent cooperation to answer income questions is affected by the mode of interview. Interviewers tend to be able to secure more complete income information in a personal interview than a telephone interview.

Whereas extensive use is made of the telephone interviews in the CPS, almost all of the SIE data were collected in personal interviews.

Preliminary analysis of the SIE Data file indicates significantly lower nonresponse rates for income than those for the March 1976 CPS. Respondent conditioning and telephone interviews in the CPS are probably contributing factors to the differing income nonresponse rates.

4. **Interviewer experience.** It was necessary to hire a large number of new, temporary interviewers for the SIE. In contrast, the interviewers used for the CPS tend to be highly trained and experienced.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Table 1. SUMMARY MEASURES—SELECTED FAMILY CHARACTERISTICS BY TOTAL MONEY INCOME IN 1975,
BY RACE AND SPANISH ORIGIN OF HEAD

¹ Distributed by income levels of their families. ² Excludes families with members in the Armed Forces. ³ Upper limit of each quantile. Lower limit of each quantile.

NOTE: The reader is reminded that the lowest income class includes families with negative total money income due to business and property losses.

Table 4. FAMILIES WITH SPECIFIED CHARACTERISTICS AS A PERCENT OF ALL FAMILIES, BY TOTAL MONEY INCOME IN 1975

* BASED ON REVISED METHODOLOGY; FOR DETAILS SEE PAGE 9.

NOTE: FOR THE YEARS 1960 TO 1970, THE NUMBER OF WHITE AND BLACK AND OTHER RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS. THESE CONTROLS ARE NOT AVAILABLE BY RACE.

Table 12. FAMILIES BY TOTAL MONEY INCOME IN 1953 TO 1975, IN CONSTANT DOLLARS, BY RACE OF HEAD, FOR REGIONS

(In 1975 dollars. For meaning of symbols, see text)

*BASED ON REVISED METHODOLOGY; FOR DETAILS SEE PAGE 9.

NOTE: FOR THE YEARS 1960 TO 1970, THE NUMBER OF WHITE AND BLACK AND OTHER RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS. THESE CONTROLS ARE NOT AVAILABLE BY RACE.

DATA FOR 1959 THROUGH 1975 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1947 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 269.

Table 13. INCOME AT SELECTED POSITIONS AND PERCENTAGE SHARE OF AGGREGATE INCOME IN 1947 TO 1975, RECEIVED BY EACH FIFTH AND TOP 5 PERCENT OF FAMILIES AND UNRELATED INDIVIDUALS, BY RACE OF HEAD—Continued

(In current dollars For meaning of symbols, see text)

RACE OF HEAD AND YEAR	NUMBER (THOUS.)	INCOME AT SELECTED POSITIONS (DOLLARS)					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLLARS)	INDEX OF INCOME CONCENTRATION
		UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECONO FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT		
		LOWEST	SECONO	MIDDLE	FOURTH									
FAMILIES AND UNRELATED INDIVIDUALS—CON.

*BASED ON REVISED METHODOLOGY; FOR DETAILS SEE PAGE 9.

NOTE: FOR THE YEARS 1960 TO 1970, THE NUMBER OF WHITE AND BLACK AND OTHER RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS. THESE CONTROLS ARE NOT AVAILABLE BY RACE.

DATA FOR 1959 THROUGH 1975 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1947 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 269.

Table 13. INCOME AT SELECTED POSITIONS AND PERCENTAGE SHARE OF AGGREGATE INCOME IN 1947 TO 1975, RECEIVED BY EACH FIFTH AND TOP 5 PERCENT OF FAMILIES AND UNRELATED INDIVIDUALS, BY RACE OF HEAD—Continued

(In current dollars For meaning of symbols, see text)

RACE OF HEAD AND YEAR	NUMBER (THOUS.)	INCOME AT SELECTED POSITIONS (DOLLARS)					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLS.)	INDEX OF INCOME CONCENTRATION
		UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT		
		LOWEST	SECOND	MIDDLE	FOURTH

*BASED ON REVISED METHODOLOGY; FOR DETAILS SEE PAGE 9.

NOTE: FOR THE YEARS 1946 TO 1970, THE NUMBER OF WHITE AND BLACK AND OTHER RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS. THESE CONTROLS ARE NOT AVAILABLE BY RACE. DATA FOR 1959 THROUGH 1975 WERE CALCULATED USING UNGROUPED DATA WHILE THE DATA FOR 1947 THROUGH 1957 WERE CALCULATED USING GROUPED DATA. DATA FOR 1958 WERE CALCULATED BOTH WAYS. FOR DETAILS SEE PAGE 269.

Table 13. INCOME AT SELECTED POSITIONS AND PERCENTAGE SHARE OF AGGREGATE INCOME IN 1947 TO 1975, RECEIVED BY EACH FIFTH AND TOP 5 PERCENT OF FAMILIES AND UNRELATED INDIVIDUALS, BY RACE OF HEAD—Continued

In current dollars For meaning of symbols, see text)

RACE OF HEAD AND YEAR	NUMBER (THOUS.)	INCOME AT SELECTED POSITIONS (DOLLARS)					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLS.)	INDEX OF INCOME CONCENTRATION
		UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT		
		LOWEST	SECOND	MIDDLE	FOURTH

NOTE: MEDIANS WERE CALCULATED USING MORE DETAILED INTERVALS THAN THOSE SHOWN ABOVE, THEREFORE THEY WILL NOT BE SAME AS THOSE CALCULATED USING THE ABOVE INTERVALS.

APPENDIX

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 914,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces:

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The definition of farm and nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. In the present survey, farm residence was determined by responses to two questions: (1) "Does this place you (own/rent) have 10 acres or more?" and (2) "During the past 12 months, how much did sales of crops, livestock and other farm products from this place amount to (under \$50, \$50 to \$249, \$250 to \$999, or \$1,000 or more)?" The household was classified as in the farm population if either (a) the acreage response was "Yes" and sales amounted to \$50 or more, or (b) the acreage response was "No" and sales amounted to \$250 or more. All other households were classified as in the nonfarm population, which comprises persons living in urban areas and rural persons not on farms. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are classified as nonfarm population.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm. However, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

For detailed information on the effect of the above definitional change, see Series P-60, No. 35, pages 10 and 11.

In August 1975, the U.S. Department of Agriculture and the Bureau of the Census announced a change in the official definition of a farm. Under the new definition, as used in the 1974 Census of Agriculture, a farm is any place from which \$1,000 or more of agricultural products were sold, or would

normally be sold, in the reporting year. However, for purposes of comparability, the figures presented in this report are based on the definition in use from 1960 to 1975.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

Starting with this report, income data are shown for the 20 largest SMSA's; these figures are based on SMSA's as defined in the 1970 census. The counties (or towns and cities) which comprised these SMSA's in the 1970 census can be found in, U.S. Census of Population: 1970, Number of Inhabitants, PC(1)-A1, United States Summary.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000; the smaller of which must have a population of at least 15,000.

Geographic regions. The four major regions and nine Census divisions of the United States for which data are presented in this report represent groups of States, as follows:

Northeast:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

Middle Atlantic: New Jersey, New York, Pennsylvania.

North Central:

East North Central: Illinois, Indiana, Michigan, Ohio, Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota.

South:

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia.

East South Central: Alabama, Kentucky, Mississippi, Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, Texas.

West:

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, Washington.

North and West:

Northeast, North Central, and West regions combined.

Federal regions. The 10 standard Federal administrative regions for which data are presented in this report represent groups of States, as follows:

Region I, Boston: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

Region II, New York: New Jersey, New York.

Region III, Philadelphia: Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia.

Region IV, Atlanta: Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee.

Region V, Chicago: Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin.

Region VI, Dallas-Fort Worth: Arkansas, Louisiana, New Mexico, Oklahoma, Texas.

Region VII, Kansas City: Iowa, Kansas, Missouri, Nebraska.

Region VIII, Denver: Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming.

Region IX, San Francisco: Arizona, California, Hawaii, Nevada.

Region X, Seattle: Alaska, Idaho, Oregon, Washington.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Mobility status. The population of the United States 1 year old and over has been classified according to mobility status on the basis of a comparison between the place of residence of each individual at the time of the March 1976 CPS and the place of residence 1 year earlier. Nonmovers are all persons who were living in the same house at the beginning and end of the period. Movers are all persons who were living in a different house at the end of the period than at the beginning of the period. Movers from abroad include all persons, either citizens or aliens, whose place of residence was outside the United States at the beginning of the period, that is, in an outlying area under the jurisdiction of the United States or in a foreign country.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned (i.e., \$10,000 to \$15,000 was coded as \$12,500). Open-ended amounts were converted to designated specific amounts; e.g., over \$10,000 may be coded as \$15,000.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that wages and salaries tend to be much better reported than such income types as public assistance, Social Security, and net income from interest, dividends, rents, etc.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all

goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes, otherwise, inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. "Medicare" reimbursements are not included.

Supplemental Security Income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments such as aid to families with dependent children and general assistance.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or royalties include dividends from stockholdings or

membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Unemployment compensation, veterans' payments, or workmen's compensation include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private and government employee pensions include: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

Annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings—the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Income other than earnings—the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under \$2,000) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The medians for persons are based on the distributions of persons with income. The medians for wage or salary income, income from nonfarm self-employment, income from farm self-employment, and income other than earnings are based on the distributions of persons or families and individuals having these types of income.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families and unrelated individuals are based on all families and individuals. The means for persons are based on the number of persons with income. The mean for a particular type of income is based on the number of persons or families with that particular type of income.

Per capita income. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

Index of income concentration. The index of income concentration (or Gini Index) is a statistical measure derived from the Lorenz Curve. The Lorenz Curve is obtained by plotting the cumulative percent of units (families or unrelated individuals) on the abscissa against the cumulative percent of aggregate income on the ordinate as accounted for by these units. If all units had exactly the same relative income, perfect equality would be represented by the diagonal shown in the diagram. Curves drawn to actual data invariably fall below this line and the greater the inequality in the distribution of income, the greater the area between the diagonal line and the Lorenz Curve.

The index of income concentration is defined as the ratio of the area between the diagonal and the Lorenz Curve to the total area under the diagonal. This relationship can be expressed as follows, using the notation in the diagram above.

$$L = \frac{A}{A+B} = \frac{\text{area betw. curve and diagonal}}{\text{area under diagonal}}$$

The index of income concentration ranges from 0.0 to 1.0. As the index approaches the limit of 1.0, the inequality of the income distribution increases. For more detailed information on this measure, see *Trends in the Income of Families and Persons in the United States 1947 to 1964*, Technical Paper No. 17, published in August 1967 by the Bureau of the Census.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, hospitals, homes for nurses, convents, monasteries, and ships.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married

couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Unrelated individuals. The term "unrelated individuals," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the head of the household or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Primary families and individuals. The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If nobody in the household is related to the head, then the head himself constitutes a "primary individual." A household can contain one and only one primary family or primary individual. The number of "primary" families and individuals is identical with the number of households.

Secondary individual. A secondary individual is a person, such as a lodger, guest, or resident employee, who is not related to any other person in the household or group quarters.

Head of family. One person in each family was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Married, wife present. A man was classified as "married, wife present" if his wife was reported as a member of the household or group quarters, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration.

Married couple. A "married couple" is a husband and his wife enumerated as members of the same household or group quarters. In the category "married couples 62 years old and over" includes all

couples of which either member is 62 years old and over. In the P-20 reports on Household and Family Characteristics married couples are classified by the age of the husband only.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption.

Number of earners. This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. "Other races" are sometimes shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. It should be noted that persons of Spanish origin can be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is

that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 12.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Occupation, industry, and class of worker. The data on occupation, class of worker, and employment status in tables 35, 51, 56, and 57, refer to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The data on occupation, class of worker, and industry in tables 36, 37, 52, 53, 54, and 55 refer to the job held longest during the income year.

In several tables two or more of the major occupation groups are subdivided by class of worker into two groups: Wage and salary workers and self-employed workers. The former refers to persons working for wages, salaries, commissions, tips, pay "in kind," or at piece rates for a private employer, or for any governmental unit. The latter refers to persons working in their own business, profession, or trade, for profit or fees. Included in the self-employed groups in these tables are unpaid family workers, i.e., persons working without pay in a business operated by a member of the household to whom they are related by blood, marriage, or adoption.

The occupation and industry groupings included in the income reports beginning with 1971 were

based on the classification systems used in the 1970 Census of Population. These groupings, with minor differences in the group titles, were also used in the 1970 income report containing data compiled from the March 1971 survey. Between the 1970 and 1969 income reports which included data obtained from the March 1971 and March 1970 surveys, respectively, there were changes in the industry and occupation classification systems. The income reports from 1961 through 1969 utilized the 1960 census classification systems. However, beginning with the 1970 income reports, the 1970 census systems were used. For major groupings, especially for the industrial groupings, there is relatively little difference in comparability between the systems used in the 1960 and 1970 Censuses of Population. A detailed comparison of these two systems can be found in the Bureau of the Census Technical Paper 26, 1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements. Additional information may be obtained from a paper, "Changes Between the 1960 and 1970 Census of Population" by Stanley Greene and John Priebe presented at the August 1972 American Statistical Association meeting held in Montreal, Canada. Also see "Revisions in Occupational Classifications for 1971" by John E. Bregger in *Employment and Earnings*, Volume 17, No. 8, page 5, published by the Bureau of Labor Statistics, United States Department of Labor.

Starting with the March 1972 survey, a supplemental question, "What were your most important activities or duties?" was added in the questionnaire which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "crafts").

The major occupation groups are combined into four divisions, as follows:

White-collar workers.—Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

Blue-collar workers.—Craft and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

Farm workers.—Farmers and farm managers; and farm laborers and supervisors.

Service workers.—Service workers, excluding private households; and private household workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.)

Symbols. A dash "-" represents zero, and the symbol "Z" indicates that the figure is less than 0.05 percent. The symbol "B" means that the base for the derived figure is less than 75,000. An "X"

means not applicable, and "NA" means not available. The symbol "A" means less than 0.05 billions of dollars and the symbol "r" means revised.

Base figures. An estimate of the size of the base (number of units) of each distribution by income in 1975 is shown in most of the tables in this report. The base figures shown in this report for 1971 to 1975 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census. A more detailed description of this change can be found in an article entitled "Revisions in Current Population Survey" *Employment and Earnings*, Vol. 18, No. 8, February 1972, published by the Bureau of Labor Statistics.

Computation of Aggregate Income By Fifths. The data shown in this report on aggregate income and dollar cutoffs for fifths (and top 5 percent) of families, ranked by size of their total money income, were calculated using two different procedures. In table 3, aggregate income and dollar cutoffs by fifths were derived directly from the Current Population Survey micro-data file using actual income amounts. In contrast, the data shown in tables 13 and 14 were calculated using estimates from grouped data, as described below.

In calculating the aggregate income by fifths (and top 5 percent) of families using grouped data, the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For the top open-end interval (\$50,000 and over), a Pareto distribution was fitted to the data in the interval just below the open-end interval (\$25,000 to \$49,999). This fitted distribution was then extrapolated to estimate the number of families with incomes greater than \$100,000. The mean income of families with greater than \$100,000 was assumed to be \$100,000 exactly.¹ The mean income for the \$50,000 to \$100,000 interval was estimated from the same fitted Pareto distribution.

¹ Individual income amounts greater than or equal to \$100,000 are recorded as \$99,999 in the Current Population Survey.

Below the "\$50,000 and over" interval, a Pareto distribution was fitted to each separate income interval. If the absolute value of the slope parameter of the fitted Pareto distribution was greater than 1, the mean income of the interval was estimated from the fitted Pareto distribution. If the absolute value of the slope parameter was less than or equal to 1, the midpoint of the interval was used as the estimated mean of the interval.

The upper income levels (quantiles) of each fifth and the top 5 percent of families were estimated using either linear or Pareto interpolation depending upon the methods used to estimate the mean income in the interval in which the quantile was located (reference interval). After determining a particular quantile, the aggregate income above this quantile was calculated by estimating the aggregate income of the subinterval between the quantile and the next higher actual income interval and adding the result to the aggregate income above the reference interval. The aggregate income of the subinterval was determined using the method (either Pareto or linear interpolation) consistent with that used for estimating the quantile and the mean income of the reference interval. The aggregate incomes between the quantiles were determined by disaccumulating the aggregate income distribution.

The two methods for determining aggregate income and dollar cutoffs for fifths of families produce some slight discrepancies, particularly for the highest fifth and top 5 percent of families. For the current year, the data shown in table 3 are preferable, since no interpolation was involved.

For more information on the use of Pareto techniques, see *Mathematical Analysis for Economists*, by R.D.G. Allen, pages 407-408, published by St. Martin's Press, New York, 1968. Similar, but incomplete information can also be found in Technical Paper No. 8, *Trends in the Income of Families and Persons in the United States: 1947 to 1960*, pages 16 to 26 or its revision, Technical Paper No. 17, *Trends in the Income of Families and Persons in the United States: 1947 to 1964*.

Computation of constant dollar distributions. The adjustment for price change was made by converting the income distribution for families and unrelated individuals for each year (1947 to 1974) into 1975 dollars on the basis of the change in the Consumer Price Index. The indices used to make the constant

dollar conversions are shown in table A-1. In choosing a procedure to make this conversion, two fundamental assumptions concerning income data were made: (1) Price changes have the same proportional effect on various income levels and (2) the distribution within each income interval follows a Pareto distribution. The following procedure satisfies these two assumptions.

Table A-1. Consumer Price Index: 1947 to 1975
(1967=100)

Year	CPI	Year	CPI
1947.....	66.9	1962....	90.6
1948.....	72.1	1963....	91.7
1949.....	71.4	1964....	92.9
1950.....	72.1	1965....	94.5
1951.....	77.8	1966....	97.2
1952.....	79.5	1967....	100.0
1953.....	80.1	1968....	104.2
1954.....	80.5	1969....	109.8
1955.....	80.2	1970....	116.3
1956.....	81.4	1971....	121.3
1957.....	84.3	1972....	125.3
1958.....	86.6	1973....	133.1
1959.....	87.3	1974....	147.7
1960.....	88.7	1975....	161.2
1961.....	89.6		

Source: Monthly Labor Review, December 1976, Department of Labor, Bureau of Labor Statistics.

The first step required the accumulation of the income distribution starting with the highest income interval and cumulating to the lowest income interval. Next, the limits of each income interval were converted into 1975 dollars by adjusting them by a factor representing the change on the basis of that year's price index (1975 = 100). Finally, the number of families and unrelated individuals in each of the detailed class intervals were computed by logarithmic interpolation and then combined into broad income intervals.

The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices

have not been developed for families in different income class intervals. In addition, available data did not permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data cover also family savings and income tax payments. For these and other reasons, the constant-dollar figures, particularly in the income range over \$10,000, are to be regarded as approximations.

The constant-dollar distributions in table 12 were obtained by applying the same procedures as used for the Country as a whole to the current-dollar family income for each region. Previous studies indicated that regional price indices differed only slightly from the U.S. Index. The limitations noted earlier for the United States distributions in terms of constant dollars apply also to the regional distributions. It should also be noted that the adjustments for price change have been introduced in order to measure changes in real incomes within a region over time, and that they have limited use for the purpose of interregional comparisons. The available consumer price indices measure the relative change in price levels in each region and make possible a comparison of the relative changes of constant-dollar income between regions. These indices do not, however, reflect geographical differentials in price levels. Therefore, caution should be used when comparing the absolute levels of constant-dollar income between regions.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. **Income definition.** The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges.

These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. **Source of data.** The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 97 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. **Population coverage.** The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. **Average income.** The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men,

women, and children. Most of the census averages, in contrast, are for families (or for unrelated individuals or income recipients 14 years old and over).

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the Department of Agriculture, for several reasons. The Department of Agriculture publishes two major series on income of the farm population: (1) Personal income of the farm population and (2) realized net farm income of farm operators.

Because of the following reasons, the estimates of total money income of the farm population as published by the Bureau of the Census are not directly comparable to estimates of personal income data of the farm population as published by the Department of Agriculture:

1. The estimates of total money income exclude the value of farm crops and other noncash income as well as income from capital gains, whereas estimates of personal income include both of these items.

2. Estimates of total money income include contributions for social insurance by farmers and farm laborers and contributions from persons living outside the household, while estimates of personal income exclude these two sources of income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' realized net farm income per farm as published by the Department of Agriculture.

1. The estimates of farm self-employment income as published by the Bureau of the Census exclude nonmoney income such as crops grown for home consumption. However, these are included in the estimates of operators' realized net farm income per farm.

2. The estimates of the Bureau of the Census include in their universe, persons who do not live on a farm but who do have farm income, while the estimates of the Department of Agriculture exclude these people from their universe.

3. The agriculture series includes the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.

The estimates of the Department of Agriculture differ from the estimates of the Bureau of the Census methodologically, as well as conceptually. The Department of Agriculture estimates are based on data derived from farm, business, and governmental sources, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the Department of Agriculture estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, "Gross and Net Farm Income" released in Sept. 1969.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differs somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than \$2,350 (less than \$3,100 if 65 years old or over) and married couples receiving less than \$3,400 (\$4,150 if one spouse is 65 years old or over; \$4,900 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns, and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below:

1. The earnings of the following groups are not covered by the earnings record data: Many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and non-farm self-employed persons, some farm workers, and domestic servants.

2. Employees' earnings in excess of \$14,100 per employer are not covered by the earnings record data.

3. Income, other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, whereas the data presented in this report are obtained by household interviews.

COMPARABILITY OF ESTIMATES FROM MARCH 1976 CPS WITH ESTIMATES FOR PREVIOUS YEARS

Estimates from the March 1976 CPS are in some instances not strictly comparable with estimates for previous years due to several factors. Among these factors are changes in: (1) Population controls and metropolitan residence definitions; (2) collection of income and work experience data; (3) nonresponses and allocations; and (4) questionnaire wording and procedures. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

Population Controls and Metropolitan Residence Definitions

The data for 1971 through 1975 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providing some measure of the impact of the changes (see table 3, Current Population Reports, Series P-60, No. 91). Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings such as the total

number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, *Employment and Earnings*, Vol. 18, No. 8, February 1972.

The figures shown in this report for metropolitan areas are based on standard metropolitan statistical areas (SMSA's) as defined on the basis of the 1970 census. Those published prior to the March 1972 CPS referred to SMSA's defined on the basis of the 1960 census. There are significant differences in the population classified as metropolitan from each of these definitions. For the 1970 definition of SMSA's, see U.S. Census of Population: 1970, Number of Inhabitants, PC(1)-A1, United States Summary.

The median income in 1969 of families residing in metropolitan areas based on the 1970 definitions and procedures is 0.5 percent lower than that based on the 1960 definitions and procedures. This difference arises partly as a result of the inclusion of new and smaller SMSA's with lower income relative to previously defined SMSA's. The median incomes of men and women were 0.3 percent and 1.5 percent lower, respectively, based on the 1970 census definitions relative to those based on the 1960 census definitions.

Cross-Classification Of Income and Work Experience Data

This report presents data showing income of persons with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for

these nonmatches were migration, noninterviews, and coding errors. Beginning with the March 1970 survey, in order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together in the March survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions.

Estimates of the proportion of year-round full-time workers in specified subgroups in the population are shown in various tables in this report. All persons in the Armed Forces included in the March survey are excluded from the computation of the proportions of year-round full-time workers.

It should be noted that the proportions of year-round full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, "Work Experience of the Population." The difference exists because the proportions were not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but, also, many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

Nonresponses and Allocations

In the March 1976 CPS, no information was recorded for approximately 5 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 26 percent of all families and 23 percent of unrelated individuals 14 years old and over. Overall, about 20 percent of all persons 14 years old and over that were interviewed did not report complete income information.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association, Proceedings of the Social Statistics Section, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958 a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See *Current Population Reports*, Series P-60, No. 33, tables F and G.) For more details, see "Income Nonresponses in the Current Population Survey," by Mitsuo Ono and Herman P. Miller, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969.

Starting with the 1968 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of these procedures was a more refined method for imputing missing income data which expanded the use of information already known about that person. Among the major improvements made affecting the income data were the following: (1) An expanded set of social and economic characteristics within which the imputations were made; in addition to age, race, occupation, and weeks worked, the procedures included sex and type of family member as major variables within which the missing income items were imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the imputation procedure assigned missing earnings entries first and then utilized the earnings information to assign missing sources of income other than earnings. A more detailed description of the computer editing and allocation procedures may be found in a paper, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1969. See also "Current Developments on Collecting Income Data in the Current Population Survey," by Mitsuo Ono, published in the American Statistical Association, Proceedings of the Social Statistics Section, 1971.

In processing the data collected in the March 1976 Current Population Survey, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. The revised system also incorporated many improvements in the income allocation and edit procedures. A detailed discussion of these improvements and the subsequent revisions to the 1974 income data (for comparability with 1975 data) is provided in an earlier section entitled "Revised 1974 Money Income Statistics."

Questionnaire and Procedural Changes

Modifications in collecting income data in the March-April 1969 CPS. Several modifications were introduced in the collection of income data in the March and April CPS supplements. These include (1) extension of the interview period of the six rotation groups for which income questions were asked in March and the use of followup forms in these six groups to accommodate household respondents who

needed more time to obtain the required income information (it is estimated that some members of approximately 4,400 households, or 9 percent of the total relevant households, made use of these followup forms); (2) modification of the design and content of the questionnaire to allow for more detailed questioning of certain income items; thus, boxes for gross receipts, business expense, and net income have been added to the self-employment income questions to help the interviewer and respondent determine net income, and "yes-no" circles were added to the questions on income other than earnings in order to ascertain whether the respondent received or did not receive income; (3) field office editing procedures were extended to a 100 percent income edit of the CPS schedules; (4) training instructions were strengthened by including more detailed explanations and more examples; and (5) the interview group training session was shifted from February to March.

Modifications in collecting income data in the March 1970 Current Population Survey. The Bureau introduced modifications in the collection of income data for the March 1970 CPS supplement. These were: (1) An advance letter informing households about the collection of income data was mailed to all households except those in the first and fifth months. The latter households received special letters which explained the need for collecting both CPS and census data; (2) information on work experience and income was collected simultaneously for the full sample (in previous years, work experience information was collected separately from income data); (3) the interview period was extended one week for three-fourths of the sample (using follow-up calls and separate questionnaires). In addition, modified procedures which were incorporated in the March 1969 CPS supplement were also implemented in the March 1970 CPS. Overall, data indicate that the use of these procedures has resulted in some improvement in the collection of income data. The family income non-response rate has not only dropped by 5 percentage points (from 19 to 14 percent) but also it appears that the proportion of aggregate income amounts collected increased slightly in the March 1970 CPS Supplement as compared with the proportion collected in the March 1969 CPS supplement.

Modifications in collecting income data in the March 1971 Current Population Survey. The Bureau continued to use the improved procedures which

were incorporated in the March 1970 CPS. Procedural changes that were instituted in the March 1971 CPS, among others, were:

1. The interview period was extended one week for all households in the sample (using follow-up calls and separate questionnaires). In the previous year's survey, the interview period was extended for only three-fourths of the sample.

2. Income from net royalties was included in the question covering estates, trusts, or dividends, interest on savings accounts or bonds, and net rental income. In previous surveys, income from net royalties was included in the question covering private pensions, annuities, alimony, regular contributions from persons not living in this household, and anything else.

3. An additional regional office follow up was made by telephone to obtain income amounts for all follow-up cases containing one or more persons who were not interviewed during the original follow-up period, except for refusal.

Modifications in collecting income data in the March 1975 Current Population Survey. Several modifications in the design and content of the questionnaire were introduced in the March 1975 CPS to allow for more detailed questioning of certain income items. These changes were:

1. In the March 1974 CPS, income from aid to families with dependent children, old age assistance, and aid to the blind or totally disabled were asked in one combined question on welfare payments. Beginning in January 1974, the programs for old age assistance and aid to the blind or totally disabled were replaced by the Supplemental Security program. Therefore, in the March 1975 CPS a separate question was asked for the receipt of Supplemental Security income. Income from aid to families with dependent children or any other assistance was asked under the general category of public assistance or welfare payments.

2. In the March 1974 CPS, income from interest, net rental income or income from estates, trusts, or dividends was asked in one question. In the 1975 CPS these income types were asked as two questions with income received from interest on savings accounts or bonds included in one question and income from estates, trusts, or dividends in the other.

3. In the March 1974 CPS, income received from private pensions was asked along with alimony and certain other income items while income from government employee pensions was asked along with veterans' payments, unemployment compensation and workmen's compensation. In the March 1975 CPS, income received from both private and government employee pensions (including military retirement) were extracted from their previous categories and asked as one combined question.

UNDERREPORTING OF INCOME

As in most household surveys, the estimated total amount of income received by persons derived from the March CPS is somewhat less than estimated amounts derived from independent sources such as the Bureau of Economic Analysis, the Social Security Administration, Veterans' Administration, etc. The difference between the survey estimate and the independent estimate is termed "underreporting".

In order to estimate the magnitude of underreporting on the CPS, estimates of aggregate money income are made from independent sources (for each income source) by adjusting aggregate income figures from these sources to CPS money income concepts. One of the more important adjustments is the exclusion of "nonmoney" income amounts such as pay to employees in the form of food or lodging or imputed rent of owner-occupied housing from aggregate personal income figures obtained from BEA. A publication covering the general topic of income underreporting is *The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States*, prepared by T. Paul Schultz for use of the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964. For more details regarding the procedures for developing independent estimates of aggregate income, see "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in *Studies in Income and Wealth*, Volume 13, National Bureau of Economic Research, 1951; and "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

Because of the difficulty in obtaining reliable independent estimates of aggregate income for some individual sources of income collected in the CPS, the independent estimates shown in table A-2 do

not include figures for (1) estates or trusts, (2) alimony and child support, (3) contributions from persons not living in the household, and (4) the "anything else" category. Independent estimates of aggregate nonfarm and farm self-employment income are based on the BEA personal income series even though they pose some troublesome conceptual problems. It should also be kept in mind that the independent estimates are, themselves, subject to errors and conceptual differences for which no adequate adjustment is possible.

Table A-2 shows comparisons of CPS aggregate income amounts and independently estimated aggregate income amounts for each source of income collected in the CPS for 1974 and 1975. Due to the revised March CPS computer processing system, estimates are now available for each individual source of income specified on the March CPS questionnaire with the exception of those four sources for which no independent estimates are available. CPS proportions of the total independent estimates are also shown by reported and allocated status.

Comparisons of the CPS estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 10 percent. However, wide variations are found in the amount of underreporting by source of income. For 1975 it varied from slightly under 60 percent for interest income and workmen's compensation to only about 3 percent for wage and salary income.

Both the reported and allocated portions of CPS aggregate incomes are shown in table A-2. In 1975, \$204.2 billion, or about 20 percent of the total CPS aggregate was allocated as a result of nonresponses to the income questions. The data in this table reveal that the allocated portion of CPS aggregate income varies widely by income source. About 13 percent of the \$7.9 billion of the CPS public assistance or welfare income in 1975 was allocated whereas about 34 percent of the \$61.5 billion of nonfarm self-employment income was allocated. Other sources of income with allocated proportions of 30 percent or above include interest and dividends.

The reasons for underreporting of income in the CPS and in other household surveys are many and varied. Some of the more important of these reasons include: (1) respondent's overlooking income received, especially small amounts not regularly re-

ceived, (2) reluctance to reveal the receipt of certain income types, (3) reporting rounded amounts, (4) misunderstanding the questions, (5) lack of information especially covering family members not present during the interview, (6) interviewer's errors in recording information on the questionnaire, (7) biases in the allocation of nonresponses, and (8) errors resulting from the aggregation of the information collected from individual questionnaires.

For more details on income underreporting in censuses and surveys, see: (1) *Income Distribution in the United States* (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) *The Structure of Income*, by Irving B. Kravis, University of Pennsylvania, 1962 and (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964" cited earlier in this section.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates are based on data obtained annually in March of 1948 through 1976 from the Current Population Survey (CPS) of the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions have been asked every March since 1948 about money income for the previous year. Brief descriptions of the sources and the procedures by which the data were obtained are presented below.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below.) Samples for previous sample designs were selected from files from the census most recently completed at the time. The sample areas were chosen to provide coverage in each State and the District of Columbia.

The estimation procedure used for the monthly CPS data involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration, and

emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that the husband and wife of a household received the same weight.

Reliability of the estimates. Since the estimates in these tables were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. For estimates in this report, indications of the magnitude of sampling error are provided, but the extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and non-reporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of respondents to provide correct information, inability to recall information, mistakes made in collection such as in recording or coding the data, mistakes made in processing the data, mistakes made in estimating values for missing data, and failure to represent all units with the

Brief Description of the Current Population Survey

Time period	Number of sample areas	Households occupied		Households visited, not occupied
		Interviewed	Not interviewed	
Aug. 1972 to present.....	461	45,000	2,000	8,000
Aug. 1971 to July 1972.....	449	45,000	2,000	8,000
Jan. 1967 to July 1971.....	449	48,000	2,000	8,500
March 1963 to Dec. 1966.....	357	33,500	1,500	6,000
Jan. 1960 to Feb. 1963.....	333	33,500	1,500	6,000
May 1956 to Dec. 1959.....	330	33,500	1,500	6,000
Feb. 1954 to Apr. 1956.....	230	21,000	500-1,000	3,000-3,500
Aug. 1947 to Jan. 1954.....	68	21,000	500-1,000	3,000-3,500

¹Three sample areas were added to 1960 to represent Alaska and Hawaii after statehood.

Notes: Prior to 1966, income data were collected from approximately 75 percent of the sample households in CPS.

sample (undercoverage). The approximate magnitude of two sources of undercoverage in CPS is described below.

• Approximately 600,000 conventional new construction units were issued building permits prior to the 1970 census but building was not completed by the time of the census (i.e., April 1970); these units have no representation in the CPS sample. Conventional new construction, for which building permits were issued after the 1970 census, is represented. In addition to undercoverage of conventional new construction, CPS missed at least 200,000 new mobile homes. These are missed because there is no systematic sampling procedure to provide representation of mobile homes constructed since the 1970 census.²

In most cases the schedule entries for income are based on the memory or knowledge of one person, usually the wife. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding as to the scope of the income concept.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the

entire population was surveyed. As calculated, the standard error also partially measures the effect of certain response and enumeration errors; but it does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown in the report only when the bases are 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

²These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less.

Table A-3. Standard Errors of Estimated Numbers of Families and Unrelated Individuals: 1966 to 1975

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	10	5,000.....	72
250.....	16	10,000.....	99
500.....	23	25,000.....	147
1,000.....	32	50,000.....	182
2,500.....	51	60,000.....	187
		80,000.....	184

Note: To estimate standard errors for 1947 to 1954 multiply the above standard errors by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2.

Standard error tables and their use. Instead of providing individual standard error tables for each characteristic of interest, one generalized standard error table is provided for each set of characteristics which has nearly equal standard errors. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item. Standard errors for intermediate values not shown in the tables may be approximated by interpolation.

The figures presented in tables A-3 through A-6 provide approximations to standard errors of various estimates for families, unrelated individuals, and persons in the United States for income. Estimated standard errors cannot be obtained from tables A-3 through A-6 without the use of the factors in table A-7. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and the estimating procedure on the value of the characteristic. For example, to produce approximate standard errors for estimates of farm families for income characteristics use the factor 1.4. Thus from table A-3 the generalized standard error on an estimate of 2,200,000 families is 47,000; applying the factor 1.4, the standard error on an estimate of 2,200,000 farm families is $1.4 \times 47,000 = 66,000$ families. Standard errors of estimated means and medians are provided in the detailed tables.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where f is the appropriate factor obtained from table A-7, and σ is the standard error of the estimate obtained by interpolation from table A-3 or A-5. Alternately, standard errors may be approximated by the following formula, (2), from which the standard errors were calculated in tables A-3 and A-5. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in Table A-8 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators of the percentages, particularly if

Table A-4. Standard Errors of Estimated Percentages of Families and Unrelated Individuals: 1966 to 1975

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100.....	1.4	2.2	3.1	4.5	5.2
250.....	0.9	1.4	2.0	2.8	3.3
500.....	0.6	1.0	1.4	2.0	2.3
1,000.....	0.5	0.7	1.0	1.4	1.6
2,500.....	0.3	0.4	0.6	0.9	1.0
5,000.....	0.2	0.3	0.4	0.6	0.7
10,000.....	0.14	0.2	0.3	0.4	0.5
25,000.....	0.09	0.14	0.2	0.3	0.3
50,000.....	0.06	0.10	0.14	0.2	0.2
60,000.....	0.06	0.09	0.13	0.2	0.2
80,000.....	0.05	0.08	0.11	0.2	0.2

Note: To estimate standard errors for 1947 to 1954 multiply the above standard errors by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2.

the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \tag{3}$$

In this formula f is the appropriate factor obtained from table A-7, and σ is the standard error on the estimate from either table A-4 or A-6. Alternately, standard errors may be approximated by the following formula, (4), from which the standard errors in tables A-4 and A-6 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \tag{4}$$

Here x is the size of the subclass of persons or families or unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-8 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of use of standard error tables. Table 1.7 shows that in 1975 there were 821,000 families and unrelated individuals with incomes of \$50,000

or more. Table A-3 shows the standard error on an estimate of this size to be approximately 29,000. Applying the appropriate factor from table A-7 and using formula (1), the approximate standard error is $1.0 \times 29,000 = 29,000$.³ The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 29,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 58,000 (twice the standard error).

Of these 821,000 families and unrelated individuals with incomes of \$50,000 or more 227,000, or 27.6 percent, are located in the Northeast. Since the numerator of this percentage is families and unrelated individuals in the Northeast and the characteristic relates to income, the b parameter from table A-8 is 1221.5653; using formula (4) the standard error on an estimate of 27.6 percent is

$$\sqrt{\frac{1221.5653}{821,000} \cdot 27.6(100 - 27.6)} = 1.7 \text{ percent.}$$

Consequently, chances are 68 out of 100 that the estimated 27.6 percent would be within 1.7 percentage points of a complete census figure. Chances are 95 out of 100 that the estimate would be within 3.4 percentage points of a complete census figure, i.e., the 95 percent confidence interval would be from 24.2 to 31.0 percent.

³ Formula (2) gives a standard error of 29,500.

Table A-5. Standard Errors of Estimated Numbers of Persons: 1966 to 1975

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
100.....	12	5,000.....	87
250.....	20	10,000.....	121
500.....	28	25,000.....	184
1,000.....	39	50,000.....	241
2,500.....	62	100,000.....	282
		160,000.....	236

Note: To estimate standard errors for 1947 to 1954 multiply the above standard errors by 1.8; for 1955 to 1964 multiply by 1.4; and for 1965 multiply by 1.2.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 17 shows that the median income of families and unrelated individuals in the Northeast in 1975 was estimated to be \$11,674 while the estimated median income in the South for 1975 was \$10,027. Table 17 also shows the approximate standard errors on these estimated medians to be \$100 and \$89, respectively. To get the standard error of the estimated difference, $\sigma_{(x-y)}$, use the following formula:

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (5)$$

Therefore, the standard error of the difference of \$1,647 is

$$134 = \sqrt{(100)^2 + (89)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than \$134. The 68 percent confidence interval about the \$1,647 difference is, from \$1,513 to \$1,781, i.e., \$1,647 ± \$134. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is \$1,379 to \$1,915. Thus, we can conclude with 95-percent confidence that there is a significant difference between the 1975 median income for families and unrelated individuals in the two regions.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For

example, the mean number of persons per family is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class: as for example, the mean number of persons per family or the mean number of persons per family with a male head. For ratios of this kind, the standard error is approximated by the following formula:

$$\left(\frac{\sigma_x}{y}\right) = \sqrt{\left(\frac{\sigma_x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho\left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]} \quad (6)$$

¹These factors are provided for use in calculating standard errors of percentages only. For standard errors of estimated numbers the parameters in table A-8 and formula (2) must be used.

The standard error of the estimated number of families, σ_y , and the standard error of the estimated number of persons with the characteristic in those families, σ_x , may be calculated by the methods described above. In formula (6), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of ρ .

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age. For ratios of this kind the standard error is approximated by formula (6) but ρ is assumed to be

zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Standard errors of estimated means and medians. Estimated standard errors are provided for the means and medians of the published income distributions and do not need to be calculated by the user. However, some users may wish to combine two or more income distributions into a single distribution and compute means and medians for the combined distribution. The following sections are provided to enable the user to calculate standard errors for estimates of means and medians for the combined distribution.

Estimating the standard error of the mean. The standard error of a mean can be approximated by formula (7) below. Because of the approximations used in developing formula (7), an estimate of the

Note: For years prior to 1966, a standard error estimate computed with these parameters must be adjusted. For 1947 to 1954, multiply the standard error by 1.8; for 1955 to 1964, multiply by 1.4; and for 1965 multiply by 1.2.

standard error of the mean obtained from that formula will generally underestimate the true standard error. The formula used to estimate the standard error of a mean is

$$s_{\bar{x}} = \sqrt{\frac{b}{y} s^2} \quad (7)$$

where y is the size of the base and b is a constant which depends on the sample size, the sample design, the estimation procedure, and the type of characteristic. The b values are given in table A-8. The variance, s^2 , is given by formula (8):

$$s^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2 \quad (8)$$

where \bar{x} is the mean of the distribution;

c is the number of groups; i indicates a specific group, thus taking on values 1 through c ;

p_i is the estimated proportion of persons, families, or unrelated individuals whose values, for the characteristic (x -values) being considered fall in group i ;

$\bar{x}_i = (Z_{i-1} + Z_i)/2$, where Z_{i-1} and Z_i are the lower and upper interval boundaries, respectively, for group i .

\bar{x}_i is assumed to be the most representative value for the characteristic for persons, families, or unrelated individuals in group i . Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is $\bar{x}_c = \frac{3}{2}Z_{c-1}$.

When two or more distributions are combined the mean of the combined distribution is:

$$\bar{x} = \frac{1}{y} \sum_j \bar{x}_j v_j$$

where \bar{x}_j is the mean of the j th distribution, v_j is the base of the j th distribution, and $y = \sum v_j$. This mean must be computed by the user.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of a median is to determine an interval

about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of a 50-percent-of-persons-or-families-and-unrelated-individuals characteristic in the income distribution;
2. add to and subtract from 50 percent the standard error determined in step (1);
3. using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step (2).

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus or minus twice the standard error determined in step (1).

Note: When combining two or more income distributions the median of the distribution must be computed by the user. The median is the income of the person or family at the center of the income distribution for all persons or families and may be approximated by linear interpolation within the group which contains this person or family.

Illustration of the computation of a confidence interval for a median. Table 17 of this report shows the median family income in the United States in 1975 was estimated to be \$13,719. Table 17 also indicates the base of the distribution from which this median was determined is 56,245,000 families.

1. Using formula (4) the standard error of 50 percent on a base of 56,245,000 is about 0.22 percent.
2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 49.56 and 50.44, which corresponds to approximately 27,875,000 and 28,370,000 families, respectively.

3. From table 17 the income of 26,414,000 of the families in the United States was less than \$13,000 and 2,373,000 had incomes between \$13,000 and \$13,999. By linear interpolation, the lower limit on the estimate is found to be about

$$\begin{aligned} & \$13,000 + (\$1,000) \frac{(27,875,000 - 26,414,000)}{2,373,000} \\ & = \$13,616 \end{aligned}$$

Similarly, the upper limit may be found by linear interpolation to be about

$$\begin{aligned} & \$13,000 + (\$1,000) \frac{(28,370,000 - 26,414,000)}{2,373,000} \\ & = \$13,824 \end{aligned}$$

Thus, the 95-percent confidence interval on the estimated median is from \$13,616 to \$13,824.

CONTROL CARD CURRENT POPULATION SURVEY

7a. ADDRESS (Sheet _____ Line _____) What is your exact address? (Include House No., St., Apt. No., or other identification.)

7b. Is this your mailing address? (Enter "Same" or specify if different. Include ZIP code.)

7c. Special place name

AREA SEGMENTS ONLY

7d. YEAR BUILT

7e. When was this structure originally built?

7f. Before 4-1-70 (Cons. Div. rev. ed.)

7g. After 4-1-70 (Complete ed. and 10-1-72 when required and interview)

ASK DURING 1st AND 5th MONTHS OF ENUMERATION

8. ASK (in 1st and 5th month)

a. Are there any occupied or vacant living quarters besides your own in this building?

b. Are there any occupied or vacant living quarters besides your own on this floor?

c. Is there any other building on this property for people to live in - either occupied or vacant?

d. None

5. TENURE

Are you living quarters -

Owned or being bought by you or someone in your household?

Rented for cash?

Occupied without payment of cash rent?

10-12. LAND USE/FARM SALES

10. RURAL - Reg. units and Sp. pl. units coded 85-88 in item 7c, ask 11. URBAN (Code A) (Skip to cc item 14a)

Sp. pl. not coded 85-88 in 7c, skip to cc item 14a.

11. You told me your living quarters are (Read entry in cc item 9) Does this place you (own/rent) have 10 acres or more?

12. During the past 12 months, how much did sales of crops, livestock and other farm products from this place amount to? (Show flashcard)

\$1,000 or more (A)
\$ 250 to \$999 (B)
\$ 50 to \$249 (C)
Under \$50 (D)
