ABSTRACT

The Food Stamp Program allows low-income households to purchase a nutritionally adequate diet through normal channels of trade. Because of the generally low income of hired farmworkers, food stamp assistance is an important addition to the economic and nutritional status of these workers and their families. This report presents a socioeconomic profile of approximately 207,000 hired farmworker families (including 9,000 migrant families) participating in the Food Stamp Program in November 1975 and identifies various factors related to program participation. Family income and size, ethnicity, and region were examined through comparative analyses of farmworker families, farmworker food stamp families, and U.S. food stamp families. Data were obtained in December 1975 from the annual Hired Farm Working Force survey and from the December 1975 Current Population Survey. These families contained approximately 1.1 million family members, averaging 5.3 members per family. Hired farmworker families were almost twice as likely to participate in the Food Stamp Program as all U.S. families. Family income and size, ethnicity, and region were highly associated with farmworker family participation. In addition, the socioeconomic characteristics of farmworker food stamp families differed considerably from those of all hired farmworker families and all U.S. families receiving food stamps.

FOOD STAMP PARTICIPATION OF HIRED FARMWORKER FAMILIES.
Leslie Whitener Smith and Gene Rowe. Economic Development Division, Economics, Statistics, and Cooperatives Service, U.S. Department of Agriculture. Agricultural Economic Report No. 403.

ABSTRACT

This report presents a socioeconomic profile of approximately 207,000 hired farmworker families (including 9,000 migrant families) participating in the Food Stamp Program in November 1975 and identifies various factors related to program participation. These families contained approximately 1.1 million family members, averaging 5.3 members per family. Hired farmworker families were almost twice as likely to participate in the Food Stamp Program as all U.S. families. Family income and size, ethnicity, and region were highly associated with farmworker family participation. In addition, the socioeconomic characteristics of farmworker food stamp families differed considerably from those of all hired farmworker families and all U.S. families receiving food stamps.

KEYWORDS Hired farmworkers, Food Stamp Program, Low income, Hispanic farmworkers, White farmworkers, Black and Other farmworkers, Migratory farmworkers, Employment.

ACKNOWLEDGMENTS

The authors wish to thank Greg Russell and Kenneth A. Riccini of the Demographic Surveys Division, Bureau of the Census, for their cooperation in planning the survey and supervising field operations and the tabulation of the data. Appreciation is also extended to John Braden, Gar Forsht, and Carolyn Merck of the Food and Nutrition Service and Reuben Altizer, Conrad Fritsch, Don Larson, Patrice McLamb, Sigurd Nilsen, and Peggy Ross of the Economics, Statistics, and Cooperatives Service for their assistance, critical review, and comment.

April 1978

PREFACE

This report was prepared at the request of the U.S. Department of Agriculture's Food and Nutrition Service (FNS). FNS administers the Food Stamp Program authorized by the Food Stamp Act of 1964 (P.L. 88-525) and its amendments. The program is designed to safeguard the health and well-being of the Nation's population and raise levels of nutrition among low-income households by providing an income supplement to economically needy families. The program allows low-income households to purchase a nutritionally adequate diet through normal channels of trade. Because of the generally low income of hired farmworkers, food stamp assistance is an important addition to the economic and nutritional status of these workers and their families. Thus, detailed information is needed on the sociodemographic characteristics and special economic problems of this population group.

The Economics, Statistics, and Cooperatives Service of the U.S. Department of Agriculture sponsors an annual survey of hired farmworkers conducted by the Bureau of the Census. The 1975 survey was utilized to collect information on farmworker families who participated in the Food Stamp Program in November 1975.

SUMMARY

Although farmworker families rank as one of the most economically disadvantaged U.S. population groups, only about 10 percent of them participated in the Food Stamp Program in November 1975, the period of this study. These 207,000 hired farmworker families receiving food stamps contained 1.1 million family members, averaging 5.3 members per family.

This low rate of participation in the program was significantly higher than the 6-percent participation rate of all U.S. families in that month. The greater use of food stamps among hired farmworker families is probably due to their lower economic status compared to others. However, several other factors, including ethnicity and region, were also associated with this increased participation.

According to the program eligibility criteria, most families with income below \$5,000 having six or more members would probably be eligible to participate in the program. However, only 59 percent of all U.S. families and 50 percent of hired farmworker families at these levels received stamps in November 1975. Several factors may have influenced this nonparticipation, including ownership of assets, in excess of program eligibility levels, lack of knowledge about the program, transportation problems, inadequate resources to meet purchase requirements, and negative individual attitudes discouraging participation.

Hispanic and Black and Other families, southern residents, and nonmigratory families were more likely to participate than other farmworker families. Participation rates were highest among the largest families with the lowest income.

While families headed by a farmworker are generally considered to be more economically disadvantaged than other farmworker families, these two groups were equally as likely to participate in the program. Differences in family size help to explain this. While nonfarmworker-headed families tended to have higher incomes than families headed by a farmworker, they also had larger families. Other factors could also be operating to encourage participation of farmworker-headed families while depressing participation of the other families.

All three groups examined—farmworker families, farmworker food stamp families, and U.S. food stamp families—differ in their socioeconomic composition. In terms of family income and ethnicity, farmworker food stamp families appear to be more like all food stamp families. In terms of region and family size, farmworker food stamp families more closely resemble hired farmworker families. These differences in composition suggest that different subgroups of food stamp families, including, for example, the elderly, minorities, and perhaps other occupational groups, have distinct characteristics and attitudes which may affect their participation in the Food Stamp Program. Additional research on these groups may suggest means of increasing the usefulness of the program for many of these economically needy people.

FOOD STAMP PARTICIPATION OF HIRED FARMWORKER FAMILIES

Leslie Whitener Smith, Sociologist
Gene Rowe, Agricultural Statistician

INTRODUCTION

This report presents a socioeconomic profile of hired farmworker families participating in the Food Stamp Program in November 1975 and identifies various factors related to program participation. Various characteristics, including family income and size, ethnicity, and region, among others, are examined through comparative analyses of farmworker families, farmworker food stamp families, and U.S. food stamp families. This study investigates three major questions:

- (1) Are hired farmworker families more likely than other U.S. families to participate in the Food Stamp Program?
- (2) What are the socioeconomic characteristics of hired farmworker families participating in the program?
- (3) Are these attributes unique to the farmworker population or common to all food stamp families?

Throughout its history, the Food Stamp Program has often generated controversy over administrative procedures and adequacy of program coverage (3, 5).¹ Increased concern over program evaluation and reform has led to a greater need for detailed descriptive data on the characteristics of food stamp participants (21). Recent studies (2, 14, 20, 21) have examined the socioeconomic attributes of all food stamp recipients, but little research has been done on selected subpopulations and their participation in the Food Stamp Program. This study takes a step toward filling that research gap.

Hired farmworkers are often identified as a low skilled, low income occupational group with particular problems and needs stemming in part from the seasonality and changing nature of agricultural work (8, 10, 25). They are one of the few occupational groups designated for special assistance under Federal legislation. The rules and regulations of Title III of the Comprehensive Employment and Training Act (CETA) of 1974 state:

"It is the purpose of Title III, Section 303 of the Act to provide manpower and other services for those individuals who suffer chronic seasonal unemployment and underemployment in the agriculture industry, which has been substantially affected by recent advances in technology and mechanization. These individuals constitute a substantial portion of the Nation's rural manpower problem and substantially affect the entire national economy" (24):

¹Italicized numbers in parentheses refer to references.

Because of their generally low-income status, hired farmworkers seldom have the opportunity or resources to improve their lifestyle or prepare for higher paying job alternatives. Thus, food stamp assistance is important to the economic and nutritional status of many hired farmworkers and their families.

Information on the characteristics of these families and the factors related to their participation in the Food Stamp Program will be useful in program evaluation and will contribute to an understanding of the relevancy of this program for a subpopulation of the working poor.

The Data

Most of the data used in this study were obtained in December 1975 from the annual Hired Farm Working Force survey conducted for the Economic Research Service, U.S. Department of Agriculture, by the Bureau of the Census as a supplementary part of the Current Population Survey (CPS). This sample includes coverage in each State and the District of Columbia, although it does not include Puerto Rico or other U.S. territories, and possessions where the Food Stamp Program operates. Information was collected from approximately 47,000 sample households of which about 1,300 contained persons doing hired farmwork. Weighted sample results are expanded to give estimates of the total civilian noninstitutional U.S. population. Additional data on food stamp families were obtained from the regular part of the December CPS.²

Data in this report are the results of an exploratory approach to gaining insights on hired farmworker families and their participation in the Food Stamp Program. Caution should be taken when interpreting these data since many are based on a relatively small number of sample cases. Standard errors were computed for point estimates, all statements of comparison appearing in the text of this paper, but not necessarily in the tables, are significant at the 2.0 standard error (95 percent) level unless otherwise indicated.³

Definitions and Terms

Food Stamp Program Eligibility Requirements

The Food Stamp Program offers assistance to economically needy families by providing them with an income supplement through the issuance of food coupons. These coupons are redeemable for food at a value greater than their purchase price. To be eligible for food stamps, families must either receive public assistance or Supplemental Security Income (SSI), or be below federally established maximum income and resource requirements. In November 1975, these

²About 875,000 U.S. families (1 percent of the total) and 12,000 hired farmworker families (less than 1 percent) did not respond to the food stamp question. These families were excluded from the following analysis.

³For more information on sample design and reliability of estimates, see appendix B.

monthly maximum levels ranged from \$215 for a one-person family to \$926 for a family of eight.⁴ The amount of assistance provided to families through the program's provisions varies inversely with family income relative to family size. For example, as of November 1975, the maximum monthly amount of food stamps available for purchase was \$48 for a one-person family and \$278 for an eight-person family. Families with very low or no income received their stamps free. Food stamp families include all families who participated in the Food Stamp Program during November 1975, the month preceding the survey month. Participation in the program was determined from response to the following question:

"Did you or any other person now living here receive or purchase government food stamps last month, that is during November?"

Thus, data here refer only to families who reported receiving food stamps in November.⁵ Comparable data for other months were not available. Consequently, this study does not measure seasonal variation in farmworker family participation or length of time farmworker families received food stamps.⁶

⁴The maximum allowable net monthly income standards and monthly coupon allotment by family size for the Food Stamp Program in November 1975 were:

<u>Size</u>	<u>Monthly allowable income</u>	<u>Monthly coupon allotment</u>
	<i>Dollars</i>	
1	215	48
2	300	90
3	427	128
4	540	162
5	640	192
6	740	222
7	833	250
8	926	278
Each additional member	+73	+22

For further information on Food Stamp Program eligibility criteria and maximum levels of assistance, see (17, 19).

⁵More recent data on the food stamp participation of farmworker families are not available. However, there is little reason to believe that variations in participation or characteristics of these families since 1975 would significantly change the findings and conclusions of this report.

⁶Estimates of food stamp families derived from the CPS consistently fall below figures published by the Food and Nutrition Service of the U.S. Department of Agriculture (2). For example, the number of families participating in November 1975 was estimated at 4,387,000 by the CPS. This was 84 percent of the 5,250,000 families reported by USDA as receiving food stamps in that month in the United States and the District of Columbia. Part of this variation is due to differing definitions of "families" used by USDA and the CPS (see 6, 14). Differences in numbers may also be attributed in part to errors of response and nonreporting on the CPS.

Family Income

Family income as defined in this study represents the combined total money income of the family head plus the income of all of his relatives 14 years of age and over who were family members at the time of the survey. Family income includes wages and salaries, net income from business or farm, pensions, dividends, interest, rent, social security payments, and any other money income received by members of the family during the 12-month period prior to interview. This represents the combined money income of the family before deductions for personal taxes, social security, bonds, and other items. This definition of family income is similar to gross household income under the Food Stamp Program (table 1). However, eligibility for participation in the program is based on gross monthly income less deductions allowed under the program.

According to Food Stamp Program regulations, families may deduct a number of household expenditures from their total family monthly income before it is used to determine eligibility. These deductions include the earnings of members under age 18, 10 percent of the earnings of the adult members (not to exceed \$30), mandatory payroll deductions, union dues, total medical costs in excess of \$10, tuition and mandatory educational fees, child care necessary for employment, court ordered support and alimony payments, various other unusual expenses, and shelter costs in excess of 30 percent of income after all other deductions are claimed. December CPS income data were not detailed enough to allow determination of deductible expenditures per family. Thus, family income as discussed in this report represents the family's gross income before deductions were made.⁷ The average amount of deductions claimed per household was about \$77 in September 1975 (20).

Hired Farmworker Families

Hired farmworkers included all persons 14 years of age and over in the civilian noninstitutional population who did farmwork for cash wages or salary at some time during 1975, even if only for 1 day. This work included production, harvesting, and delivery of agricultural commodities, as well as management of a farm if done for cash wages. Exchange work, work done by family members without pay, custom work, or work done exclusively for pay in kind were not included. A farmworker family was defined as any family with a member 14 years of age and over who did any hired farmwork during the year.⁸

⁷The money income level of families shown in this report may be somewhat understated. Income data are based on the respondent's estimate of total family money income for the preceding 12 months coded in broad, fixed income intervals. Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions (15).

⁸The survey household consisted of all people living and eating together in family style and sharing common space and facilities. However, the unit of analysis in this report is the family, and thus, any household members not related to the head are excluded from the analysis. Single-person households were designated as families.

Table 1—Comparison of family income definitions used in the December CPS and the Food Stamp Program

Sources used to determine family income	
CPS	Food Stamp Program
Money from wages and salaries	Compensation for services
Net income from nonfarm self-employment	Net income from self-employment, i.e. gross income minus the cost of producing
Payments from social security, railroad retirement, unemployment compensation, annuities, and workmen's compensation	Payments from annuities, pensions, retirements, and disability benefits, veterans benefits, workmen's compensation, social security, and strike benefits
Public assistance or welfare payments	Public assistance benefits
Regular contributions from persons not living in the household	Payments made on behalf of a household by persons not members of that household
Support and alimony	Support and alimony
Scholarships, education grants, fellowships, and veterans' educational benefits	Scholarships, education grants, fellowships, and veterans' educational benefits
Rents, dividends, interest, and royalties	Rents, dividends, interest, and royalties

Organization of the Report

The first part of this report examines differences in food stamp participation between all U.S. families and farmworker families, and suggests reasons for variation. The second part presents a socioeconomic profile of farmworker families receiving food stamps in November 1975 and makes comparisons with the larger body of hired farmworker families. Finally, selected characteristics of farmworker food stamp families are compared with those of all food stamp families to determine variations in composition among these groups. More detailed data on the characteristics and food stamp participation of families are presented in appendix A. These tables, for the most part, are organized by ethnic group, family income, and other selected characteristics to provide additional information useful for program review and evaluation. Appendix B contains a discussion of the survey coverage and reliability of estimates.

HIRED FARMWORKER FAMILIES AND THE FOOD STAMP PROGRAM

Economic Status of Hired Farmworker Families

In 1975, there were approximately 2 million families in the United States containing at least one hired farmworker. This group of families is one of several economically disadvantaged groups in the Nation. The median family income of hired farmworker families in 1975 was \$8,522, about 72 percent of that of all U.S. families (\$11,800).

However, if family income is to be useful as an indicator of economic well-being, income levels must be examined in relation to family size. Farmworker families tend to be much larger than all families, these differences in family size can further complicate the problems of low income. For example, of those farmworker families receiving income below \$5,000, the majority (54 percent) had at least three members and almost a fifth contained six members or more (table 2). In contrast, the majority of all U.S. families at this income level contained only one or two members. Farmworker families tended to be larger than all U.S. families at the higher income levels as well. Thus, hired farmworker families in general are more economically disadvantaged than all U.S. families in terms of family income and size.

Food Stamp Participation Rates

These differentials in economic status suggest that hired farmworker families experience greater economic need than other U.S. families and that food stamp participation rates⁹ for this group should therefore be higher. Data from this study indicate that farmworker families participated in the program at a greater rate than all families. About 207,000 farmworker families, or 10 percent of the total, received food stamps in November 1975, compared to the 6-percent participation rate of all U.S. families (table 2). Thus, farmworker families were almost twice as likely to participate in the program as all U.S. families.

Much of this increased participation is probably due to the lower economic status of farmworker families compared to others. Several other factors, including ethnicity and region of residence were also associated with this increased participation. Hispanics, Blacks and Others,¹⁰ and southern families were more likely to participate in the Food Stamp Program than other family groups (table 3). This was true for both the total and the farmworker population. However, Black and Other farmworker families were 1.5 times as likely to participate as all Black and Other families. Southern farmworker families were 2.5 times

⁹The Food Stamp Program participation rate is the percentage of the population group receiving food stamps.

¹⁰The somewhat awkward phrasing of "Black and Others" is used to keep the text consistent with the population classifications utilized in this study. See footnote 3, table 3 for ethnic categories.

Table 2—Food Stamp Program participation rates for all U.S. families and hired farmworker families by family income and size, November 1975

Family income and size	U.S. families ¹			Hired farmworker families ²

¹Excludes 875,000 families whose food stamp status was unknown.

²Excludes 12,000 farmworker families whose food stamp status was unknown.

³Participation rate is defined as the percentage of the population group receiving food stamps.

Percentages not shown where base is less than 50,000.

NOTE: Numbers may not add to totals due to rounding. See appendix tables 2 and 3 for additional information.

more likely to receive food stamps than were their counterparts in the total population. Since the majority of Black and Other farmworker families were located in the South, these combined factors may be contributing to the higher participation rate of farmworker families in general.

Table 3—Food Stamp Program participation rates of selected groups of U.S. families and hired farmworker families, November 1975

Selected groups	U.S. families ¹		Hired farmworker families ²	
	Number	Participation rate	Number	Participation rate

West	13,342	5.1	478	7.9

¹Excludes 875,000 families whose food stamp status was unknown.

²Excludes 12,000 farmworker families whose food stamp status was unknown.

³Hispanic refers to all those who identified themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic. White refers to White persons other than those of Hispanic origin. Black and Other includes Blacks, Indians, Chinese, Japanese, and others not of Hispanic origin. For simplicity of presentation, these mutually exclusive groups are termed Hispanic, White, and Black and Other.

NOTE. Numbers may not add to totals due to rounding. See appendix tables 2 and 7 for additional information.

Food stamp participation rates also varied by family income and size. As expected, the participation of farmworker families decreased consistently as income levels increased. About 24 percent of all farmworker families receiving incomes of less than \$5,000 participated in the program while 1 percent of families with incomes of \$10,000 or more received food stamps. These same declining rates were seen for all U.S. families. The highest participation rate among both groups of families occurred for those families receiving incomes less than \$5,000 with six or more members (table 2).

The participation rates of farmworker and all U.S. families did not differ significantly from each other by family size and income categories, with one exception. Farmworker families receiving an income of \$7,500 to \$9,999 with six or more members were much more likely than all families at this level to participate in the program. (Differences are significant at the 90-percent confi-

dence level.) While exact family size cannot be precisely determined, it is likely that these farmworker families were larger than all U.S. families at this level. Larger family size would, of course, have a negative effect on the adequacy of available income for family support.

This study was not designed to estimate the number of families who are eligible to receive food stamps under the program criteria but who do not participate. However, another examination of data in table 2 suggests that a large number of economically needy families are not participating in the program. According to program eligibility criteria, virtually all families with incomes below \$5,000 and six or more family members should be eligible based on income criteria alone. While this group of families has the highest participation rate of any other family size and income group, only 59 percent of all U.S. families and 50 percent of farmworker families at this size and income level received food stamps (table 2).

Some of these families will not be eligible to participate even though their family income and size meet the Food Stamp Program income criteria. Program regulations such as maximum allowable resources (assets), for example, can limit participation. One recent study estimates that about 13 percent of all households eligible by income criteria are not eligible because of the amount of owned assets (6). Work registration requirements can also exclude some low-income families from participation. Other factors may include lack of knowledge about the program, inadequate resources to meet purchase requirements (7, 27); transportation problems (4), limited participation in other public assistance programs (14), and negative attitudes toward welfare programs and the Federal Government (26). Additional research is needed to determine the effects of these factors on farmworker family participation. Once identified, barriers to food stamp participation for all families and subgroups of the population can be effectively addressed at the appropriate level of operation.

SOCIAL AND ECONOMIC CHARACTERISTICS OF FARMWORKER FOOD STAMP FAMILIES

The following section examines variations in socioeconomic characteristics of hired farmworker families and those farmworker families receiving food stamps in November 1975. The examination centers on differences in family income and size, ethnicity, region, family composition, and migrant status. Data on these characteristics can be an important input into the planning, operation, and evaluation of the Food Stamp Program, as well as other programs designed to assist low-income farmworker families.

Family Income and Size

The majority (60 percent) of farmworker families participating in the Food Stamp Program in November 1975 received a family income under \$5,000,

less than 5 percent had family incomes of \$10,000 or more. This finding directly contradicts recent charges that large numbers of middle income families have been participating in the Food Stamp Program. Several independent studies have also found that the majority of food stamp families receive gross incomes below \$5,000 (5, 20).

The low-income status of these farmworker food stamp families is further complicated by a generally larger family size. Of those families receiving less than \$5,000 in income, over a third had at least six members. Families with incomes over \$5,000 were even larger, about 67 percent had six members or more.

Hired farmworker food stamp families have smaller incomes and larger families than all farmworker families. While almost half of the food stamp families had at least six members, only 25 percent of all hired farmworker families were this large. Also, in 1975, the median family income of farmworker food stamp families was \$4,289, about half that of the entire hired farmworker family group (\$8,522).

Ethnic Group

Hispanic and Black and Other farmworker families had higher food stamp participation rates than White families.¹¹ Hispanics were three times as likely to participate as were White families, Blacks and others were over four times as likely to receive stamps (table 3).

Of the 207,000 hired farmworker families participating in the program in November 1975, 46 percent were White, 15 percent were Hispanic, and 39 percent were Blacks and Others. This distribution differed significantly from the ethnic distribution of all hired farmworker families. Of the approximate 2 million farmworker families in 1975, the majority (77 percent) were White, 8 percent were Hispanic, and 15 percent were Blacks and Others. Other studies have also found that Blacks and Hispanics are consistently overrepresented in the ranks of the poor (1, 11, 16).

Minority farmworker families in general are more economically disadvantaged than White farmworker families. This explains in large part the greater participation of those families. In 1975, White farmworker families received a median family income of over \$10,000, compared with \$5,939 for Hispanic and \$4,339 for Black and Other families. Also, only 22 percent of the White farmworker families had six or more members compared with 45 percent of the Hispanic and 31 percent of the Black and Other families (table 4). In addition, heads of minority farmworker families, whether they performed farmwork or not, completed fewer years of schooling than White family heads. In 1975, heads of White families had completed a median of 12.5 years of school compared with 6.1 years for Hispanic heads and 8.9 for Black and Other heads. Lower education levels of minority heads can restrict opportunities to move into higher paying jobs and limit opportunities to improve the family's economic status.

¹¹ See footnote 3, table 3.

³ Percentages not shown where base number is less than 50,000.

NOTE. Numbers may not add to totals due to rounding. See appendix tables 3 through 7 for additional information on ethnic groups.

Income levels did not differ significantly among the various ethnic groups of farmworker food stamp families. But minority families were significantly larger than White families, thus reducing per capita income. About 61 percent of the minority families contained at least six members while only 36 percent of the White families had six members or more.

Region

The largest proportion (39 percent) of hired farmworker families were located in the South and, in general, these families had lower incomes than farmworker families in other regions (table 5). In 1975, 41 percent of the farmworker families residing in the South had family incomes below \$5,000, compared with

about 15 percent in each of the other regions.¹² The median family income for farmworker families in the South was \$5,912 compared with \$9,439 in the West and over \$10,000 in the Northeast and North Central regions. This study as well as others (22, 23), confirms that the South's population, compared to other regions, contains a disproportionately large share of low-income people

NOTE. Numbers may not add to totals due to rounding. See appendix table 7 for additional information.

Because of the greater concentration of low-income farmworker families in the South, one would expect higher food stamp participation rates for farmworker families in this region. In November 1975, the participation rate for farmworker families in the South was 18 percent—more than twice the rate of any other region. About 68 percent of all farmworker families receiving food stamps were located in the South (table 5). Even among a generally low-income group such as food stamp families, regional differences in income persisted. About 69 percent of the southern farmworker families receiving food stamps

¹²The States included in each of the four regions are as follows: *Northeast*—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, and New Jersey; *North Central*—Ohio, Indiana, Illinois, Wisconsin, Michigan, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas; *South*—Maryland, Delaware, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas; and *West*—Montana, Wyoming, Idaho, Colorado, New Mexico, Utah, Arizona, Nevada, Washington, Oregon, California, Hawaii, and Alaska.

had family incomes below \$5,000, compared with only 38 percent of the combined non-southern regions.¹³

A number of factors contribute to the South's high food stamp participation rates. Wages are generally low in the South and this region has often been described as having lower quality and limited quantities of public services, including health care, education, vocational training, housing, and some welfare programs (18, 23), thus providing fewer opportunities to improve income or obtain needed assistance. In addition, a large proportion (40 percent) of the farmworker families in this region are minority families who are generally more economically disadvantaged than other families.

Migrant Farmworker Families

Labor demand in some areas intensifies during peak periods of agricultural activity. If this demand cannot be met by local workers, migrant labor is often recruited. While some migrant workers return home immediately after completing one or two short-term jobs, others travel greater distances to take additional farm jobs. A migrant farmworker includes any person 14 years of age and over who left home overnight to do farmwork in a different county or State with the intention of eventually returning home.

In 1975, there were 143,000 U.S. farmworker families (7 percent of the total) with at least one member who did migratory farmwork during the year. The social and economic problems of migrant farmworkers and their families are well known (8, 12, 25), and this group of families is often described as one of the most impoverished groups in the Nation.

The family income and size of migratory families did not differ significantly from all hired farmworker families. About 25 percent received incomes of less than \$5,000. They had a median family income of \$8,607 and averaged 3.7 members per family, compared to \$8,522 and 4.1 members per family for all hired farmworker families. (Table 6 presents data on the combined family income and size intervals for migrant farmworker families.)

However, increased travel costs, job insecurity, limited access to community services while traveling, and poor living conditions while in transit accentuate the low-income problems of migratory farmworker families.

About 9,000 or 6 percent of all migrant families participated in the Food Stamp Program in November compared with 11 percent of all nonmigratory families (significant at the 90-percent confidence level). The small number of sample cases in this study would not allow a more detailed examination of factors related to the participation of migrant families in the program. But additional data on this group of farmworker families are provided in appendix tables 8 through 12.

The food stamp participation rate of migrants may vary throughout the year. During winter months, many migrants are in their home bases where they

¹³The Northeast, North Central, and Western regions were combined to provide data cells sufficiently large for comparisons.

have greater access to assistance from family and friends and sometimes more stable employment. While traveling to do farmwork at other times of the year, their economic problems may be more severe due to increased living expenses and job insecurity. Over a third of the migrants in 1975 traveled over 1,000 miles to do farmwork, not including distance to return home (table 7). Food stamp participation could be higher at these times of greater economic need. Other factors, including lack of information, transportation problems, or short duration of time spent in one location, could also be operating to depress the food stamp participation of these workers and their families.

NOTE. Numbers may not add to totals due to rounding. See appendix tables 8 through 12 for additional information on migrant families.

Characteristics of Family Members

Approximately 1.1 million farmworker family members participated in the Food Stamp Program in November 1975, averaging 5.3 members per family. These members accounted for 13 percent of all farmworker family members. A large proportion of these were dependents. About 39 percent were children under the age of 14 years, another 2 percent were 65 years of age and over. In comparison, these two dependent groups comprised only 29 percent of all farmworker family members in 1975. Over two-thirds of the dependents in food stamp families were in minority families, 49 percent were in families receiving less than \$5,000 in family income.

Farmworker food stamp families were more often headed by a female than were all farmworker families. Approximately 29 percent of the farmworker food stamp families were headed by women, compared with only 10 percent of all hired farmworker families in 1975. While Black and Other families accounted for a large proportion of the female-headed food stamp families, there was a higher incidence of female heads among all ethnic groups of farmworker food stamp families.

Table 7—Distance traveled by migrant farmworkers to do farmwork, 1975)

Miles traveled	Total migrant farmworkers		Family heads		Other family members 14 years and over	
	Thous.	Pct.	Thous.	Pct.	Thous.	Pct.
Total:	188	100	81	100	107	100

1,000-1,499	26	14	12	15	14	13
1,500-1,999	13	7	5	6	8	7
2,000 or more	26	13	4	5	22	20

NOTE: Numbers may not add to totals due to rounding.

Farmworker food stamp families contained 293,000 persons who did farmwork at some time during the year, accounting for 27 percent of the family members. These farmworkers comprised 14 percent of the total hired farm work force of 1975. Sixty-one percent of these workers were not in the labor force most of the year but instead were keeping house or attending school. Only 20 percent cited farmwork as their year's principal activity. These findings were similar to those of all hired farmworkers.

The largest proportion of farmworkers in food stamp families did farmwork for less than 25 days during the year, 13 percent worked 150 days or more at farmwork. In comparison, one-fifth of all farmworkers did 150 days or more. (Differences are significant at the 90-percent level.)

Farmwork Status of Family Head

In 1975, about half of the 2 million hired farmworker families in the United States were headed by a person who did farmwork at some time during the year. The remaining families contained a family member other than the head who did farmwork. While these two groups were equally represented among farmworker families, the characteristics of each varied significantly.

Families headed by a farmworker appear to be more economically disadvantaged than others. About 37 percent of farmworker-headed families had family incomes of less than \$5,000 compared with only 14 percent of nonfarmworker-headed families (table 8). This lower economic status of farmworker-headed families were due in part to the family's greater dependence on the family head's earnings since he is largely responsible for family support. A large part of these earnings was from relatively low paying farm jobs. In contrast, many farmworkers who were not heads worked for a small amount of supplemental earnings and were not responsible for the major share of family support. A large proportion of these were students and housewives who did farmwork for a few weeks during the year. Their families, in most cases, received the bulk of family income from the earnings of the family head employed in nonfarm activities or from other sources.

Table 8 - Distribution of hired farmworker families and farmworker food stamp families by farmworker status of head and selected characteristics, November 1975¹

¹ Excludes 12,000 hired farmworker families whose food stamp status was unknown.

² See footnote 3, table 3 for ethnic categories.

NOTE. Numbers may not add to totals due to rounding. See appendix table 5 for additional information.

For example, in 1975, farmworkers who were not family heads earned an average of \$1,300 from all sources, the large proportion (51 percent) worked less than 25 days at farmwork. Their median family income was well over \$10,000. However, farmworker heads averaged \$4,500 in annual earnings with over half from farmwork, two-thirds did 25 days or more of farmwork. Their median family income was \$6,250¹.

These characteristics suggest that farmworker-headed families would be more likely to participate in the Food Stamp Program. However, there were no differences in participation rates among farmworker headed and other farmworker families. About 10 percent of each group received food stamps in November. Each group of families accounted for about 50 percent of all farmworker food stamp families.

One explanation for these equal participation rates may be differences in family size. While families not headed by a farmworker have higher incomes, they also have larger families. Over a third had at least six members compared with only 15 percent of farmworker-headed families. These two groups of

families may be equally disadvantaged and thus equally as likely to participate in the program. Differences in knowledge about the program, access to public assistance, or attitudes toward welfare programs, for example, could also affect the food stamp participation rates of these groups.

FOOD STAMP FAMILIES: A HOMOGENEOUS OR DISSIMILAR GROUP?

Previous analysis has shown that the socioeconomic characteristics of farmworker food stamp families differ considerably from the larger population of hired farmworker families. This section examines the question: Are the characteristics of farmworker food stamp families unique to the farmworker population or common to all food stamp families?

In general, hired farmworker food stamp families received higher incomes than all U.S. food stamp families. About 60 percent of the farmworker food stamp families had income below \$5,000, compared with 72 percent of all food stamp families (fig. 1). Most of this difference occurred at the \$1,000-\$2,999 level.¹⁴

At the same time, however, farmworker food stamp families tended to be larger than all food stamp families which, of course, affects the adequacy of income for family support. These farmworker families averaged 5.3 persons per family compared with 3.5 for all food stamp families. Almost 50 percent of the participating farmworker families had six members or more, only 4 percent were one-person families (fig. 2). In comparison, only 19 percent of all food stamp families had 6 members or more, and 20 percent were single-person units.

While farmworker food stamp families received higher incomes than U.S. food stamp families, much of this economic advantage is lost when family size is considered. Of the 79,000 participating farmworker families with incomes of \$5,000 and over, 67 percent had six members or more. Only a third of U.S. food stamp families at this income level had six members or more.

The ethnic composition of U.S. and farmworker food stamp families was similar, with both groups having large proportions of Hispanic and Black and Other families (fig. 3). Minority families accounted for about half of each group.

The largest proportion of both U.S. and farmworker food stamp families were located in the South, but the farmworker families were much more likely to be southern residents (fig. 4). About 68 percent of the farmworker food stamp families resided in the South, compared with 38 percent of the U.S. families.

Family income and size, ethnicity, and region are all associated with participation in the Food Stamp Program. Thus, both U.S. and farmworker food

¹⁴Due to the small sample size, similar comparisons were not made for migratory farmworker families. However, data are available in appendix tables 8 through 12 to permit further examination of the characteristics of these families.

stamp families are more likely to be low-income, minority members, residents of the South, and to have larger families than their nonparticipating counterparts.

These findings suggest that all three groups farmworker families, farmworker food stamp families, and U.S. food stamp families differ in their socioeconomic composition. In terms of family income and ethnicity, farmworker food stamp families appear to be more like all food stamp families. In terms of region of residence and family size, farmworker food stamp families generally resemble hired farmworker families.

These variations in composition suggest that different subgroups of food stamp families, including, for example, the elderly, minorities, the rural poor, and perhaps other occupational groups, have distinct characteristics and attitudes which may assist or complicate the operation and goals of the Food Stamp Program. As Mollie Orshansky notes:

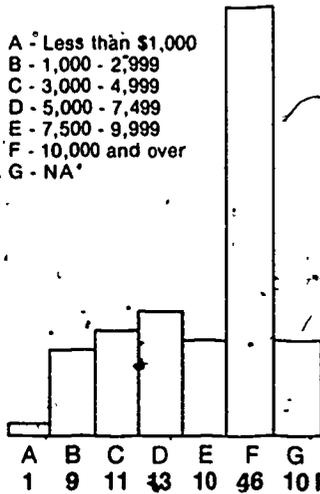

"Neither the present circumstances nor the reasons for them are alike for all our impoverished millions, and the measures that can help reduce this number must likewise be many and varied . . . Any complex of programs that does not allow for the diversity of the many groups among the poor will to that degree leave the task undone" (9)

The Food Stamp Program appears to be a relevant form of assistance for a large number of hired farmworker families. Additional research on these various groups may suggest means of increasing the usefulness of this program for many economically needy families.

APPENDIX A
STATISTICAL TABLES

	<i>Page</i>
1. Distribution of all U.S. families and hired farmworker families by food stamp status, ethnic group, and region, November 1975	26
2. Distribution of all U.S. families and hired farmworker families by food stamp status, family size, and income, November 1975	26
3. Comparison of all hired farmworker families with those receiving food stamps. Ethnic groups by family income and size, November 1975	27
4. Comparison of all hired farmworker families with those receiving food stamps. Ethnic groups by family income and age of household members, November 1975	30
5. Comparison of all hired farmworker families with those receiving food stamps. Ethnic groups by family income and farmwork status of head, November 1975	34
6. Comparison of all hired farmworker families with those receiving food stamps. Ethnic groups by family income and farmworker characteristics, November 1975	39
7. Comparison of all hired farmworker families with those receiving food stamps. Ethnic groups by region and family income, November 1975	45
8. Comparison of all migrant farmworker families with those receiving food stamps. Ethnic groups by family income and size, November 1975	48
9. Comparison of all migrant farmworker families with those receiving food stamps. Ethnic groups by family income and age of household members, November 1975	51
10. Comparison of all migrant farmworker families with those receiving food stamps. Ethnic groups by family income and farmwork status of head, November 1975	55
11. Comparison of all migrant farmworker families with those receiving food stamps. Ethnic groups by family income and farmworker characteristics, November 1975	60
12. Comparison of all migrant farmworker families with those receiving food stamps. Ethnic groups by region and family income, November 1975	65

Appendix table 1—Distribution of all U.S. families and hired farmworker families by food stamp status, ethnic group, and region, November 1975

Ethnic group and region	U.S. families				Hired farmworker families			
	Total ¹		Receiving food stamps		Total ²		Receiving food stamps	
	Thous.	Pct.	Thous.	Pct.	Thous.	Pct.	Thous.	Pct.
Total	72,113	100	4,387	100	1,999	100	207	100
Ethnic group: ³								
White	60,482	84	2,268	52	1,538	77	94	46
Hispanic	3,206	4	534	12	166	8	31	15
Black and Other	8,426	12	1,585	36	296	15	81	39
Region:								
Northeast	16,603	23	1,081	25	183	9	17	8
North Central	19,140	27	940	21	550	28	12	6

APPENDIX B

SOURCE AND RELIABILITY OF ESTIMATES

Estimates presented in this report are based on answers to supplementary questions asked of household respondents in the December 1975 Current Population Survey (CPS) conducted by the Bureau of the Census. The estimates were derived from expanded sample data using the CPS estimating procedures. The expansions used in the estimating procedures were based on statistics from the 1970 Census of Population; statistics on births, deaths, immigration and emigration; and statistics on the number of people in the armed forces. The sample included 461 areas comprising 923 counties and independent cities with coverage in each State and the District of Columbia. The information was collected by trained interviewers from approximately 47,000 households.¹⁵

Reliability of the Estimates

Since these estimates were based on a sample of households, the estimates may differ somewhat from figures that would have been obtained if all households had been contacted even if the same questions were asked, using the same enumerators and survey instructions. The differences that may be present between estimates in this report and figures obtained if all households had been contacted are usually referred to as differences due to nonsampling and sampling variability.

Nonsampling Variability

This type of variability occurs as a result of errors in responses and non-reporting. Usually, it is not possible to derive from sample data an indication of the amount of nonsampling variability that may be present in a particular sample estimate. This kind of variability can be attributed to many sources (for instance, inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability of respondents to recall information, mistakes made in collection such as in recording or coding of data, mistakes made in processing the data, mistakes made estimating values for missing data, and failure to represent all units in the sample).

Sampling Variability

Sampling variability or standard error is the variation that might occur by chance between sample estimates and figures from a complete census. As calculated for this report, the standard error also partially measures the effects of certain nonsampling errors, but does not measure any systematic biases.

¹⁵For a detailed explanation of the CPS sampling procedures, see (13).

Standard errors for most of the estimates in this report can be obtained from appendix tables 13 and 14. Standard errors are useful to indicate the confidence one may place in the accuracy of a particular estimate. The chances that an estimate is within one standard error of a figure based on a complete census is 68 out of 100. The chances are increased to 90 out of 100 if the standard error is multiplied by 1.6, and 95 out of 100 if it is multiplied by 2.

Estimating of Sampling Variability

The following tables contain estimates of standard errors for most of the estimates in this report. Linear interpolation can be used to derive standard errors for estimates not shown in the tables.

Appendix table 13—Standard errors for estimates in the report
(68 chances out of 100)

Size of estimate	Standard error
25,000	9,000
50,000	13,000
100,000	18,000
250,000	29,000
500,000	43,000
1,000,000	65,000
2,500,000	121,000
3,000,000	139,000

NOTE: To obtain approximate standard errors for Hispanic persons or workers multiply the above standard errors by 1.6.

To obtain approximate standard errors for number of families multiply the above standard errors by .9.

Appendix table 14—Standard errors of percentage distribution for workers
(68 chances out of 100)

Estimated percentage	Base of percentage in thousands							
	25	50	100	250	500	1,000	2,500	3,000
	<i>Percent</i>							
2 or 98	4.9	3.5	2.4	1.6	1.1	0.8	0.5	0.4
5 or 95	7.6	5.4	3.8	2.6	1.7	1.2	0.8	0.7
10 or 90	10.5	7.4	5.3	3.3	2.4	1.7	1.1	1.0
15 or 85	12.5	8.9	6.3	4.0	2.8	2.0	1.3	1.1
20 or 80	14.0	9.9	7.0	4.4	3.1	2.2	1.4	1.3
25 or 75	15.2	10.7	7.6	4.8	3.4	2.4	1.5	1.4
35 or 65	16.7	11.8	8.4	5.3	3.7	2.6	1.7	1.5
50	17.5	12.4	8.8	5.5	3.9	2.8	1.8	1.6

NOTE: To obtain approximate standard errors for Hispanic persons or workers, multiply the above standard errors by 1.6.

To obtain approximate standard errors for number of families, multiply the above standard errors by 0.9.

Illustration of Use of Standard Error Tables

Table 8 of this report shows that in 1975 there were 131,000 hired farmworker families of Hispanic origin headed by a farmworker. Interpolation of data in appendix table 13 shows the standard error for an estimate of this size to be approximately 20,000. The factor for families is 0.9. Thus, the standard error of an estimate of 131,000 for Hispanic hired farmworker families headed by a farmworker is approximately 18,000 (i.e., 20,000 x 0.9). Therefore, the chances are 68 out of 100 that the sample estimate of 131,000 would have been an estimate differing from a complete census figure by less than 18,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 36,000 (twice the standard error).

Standard Error of a Difference

In the narrative portion of the report, estimates from the survey were used to discuss highlights of hired farmworker families Food Stamp Program participation and to compare these highlights among different groups within the hired farmworker family population and with other families. These comparisons utilize only estimates that were significantly different by two or more standard errors unless otherwise indicated. The statistical test used to determine the significance of differences between estimates was as follows:

To obtain the standard error of the estimated difference, the following standard error of a difference formula, was used.

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2}$$

σ_x, σ_y = the standard errors of the two estimates being compared

$\sigma_{(x-y)}$ = standard error of their difference

Using the standard error of their difference, the absolute differences between two estimates had to be equal to or greater than the amount derived in the first two of the following three conditions before the estimates were compared in the narrative portion of this report.

Condition I: if the difference between the two estimates compared was equal to or greater than two times the standard error of their difference, then the estimates were considered significantly different.

Condition II: if the difference between the two estimates compared was equal to or greater than 1.6 times the standard error but less than twice the standard error, then the estimates compared were not considered as significantly different but as two estimates that may be different, or there was some evidence that a difference existed between the estimates.

Condition III: if the difference between the two estimates was less than 1.6 times the standard error of the difference, then the two estimates were not considered significantly different.
