ABSTRACT

The National Council on Measurement in Education (NCME) members' expectations of teacher and student attitudes toward standardized testing are compared with the actual attitudes of these groups to ascertain whether the perceptions of test specialists are similar to those of test users. Of a random sample of NCME members, assigned systematically to three grade ranges, 59 percent responded to attitudinal questionnaires as they thought teachers and students would in grades K-4, in grades 5-8, or in grades 9-12. A comparison of the NCME responses is made with actual responses previously obtained from 3,306 teachers and 71,763 students (90% response rate) in grades K-12 who answered identical questionnaires immediately subsequent to an administration of a standardized achievement test. Highlights of results indicate: (1) teachers are actually more knowledgeable about, and supportive of standardized achievement tests than NCME members expect them to be; (2) grades K-4 students' attitudes are far more positive than expected; (3) grades 5-12 students' attitudes reflect that the tests are less difficult, less unfair, and less likely to stimulate stress than expected. Attitudes should be monitored in order to assist non-specialist test users successfully. (RL)

Abstract

Standardized Testing as Viewed by Test Specialists and Users

Michael D. Beck and Frank P. Stetz
The Psychological Corporation
New York, New York

"PERMISSION TO REPRODUCE THIS MATERIAL HAS BEEN GRANTED BY

M. Beck

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)."

NCME members' expectations of teacher and student attitudes toward standardized testing were compared with the actual attitudes of these groups. A random sample of NCME members completed the same questionnaire as was used in a previous nationwide study of teacher and student attitudes. NCME members were asked to respond as they believed teachers and students would. Results indicate significant discrepancies between actual teacher and student reactions and the attitudes expected of them by NCME respondents. Teachers and students reacted far more positively toward such instruments than NCME members expected.

Standardized Testing as Viewed by Test Specialists and Users

Michael D. Beck and Frank P. Stetz
The Psychological Corporation
New York, New York

Introduction

At last year's NCME and AERA annual meetings, Stetz and Beck (1979) and Beck and Stetz (1979) presented findings of a nationwide survey of public and nonpublic teachers and students in Grades K-12. Their inquiry, immediately subsequent to an administration of a standardized achievement test, dealt with such variables as: teachers' opinions and personal feelings toward standardized achievement tests, their opinions of the amount of standardized testing in their school systems, their personal use of such test results, and their predilection toward various test-related policies. In addition, students were asked such questions as "How many of you were nervous just before you took this test?", "How do you feel about the test now?", and "Would you like to take a test like this one next year?"

Their results showed, among other things, that standardized testing is viewed with some skepticism and anxiety. In general, however, test results are considered useful for certain purposes and cause less anxiety in students than teacher-made tests.

Objective

With the above in mind, a replication of the above study was conducted with a random sample of NCME members to ascertain whether the perceptions of test specialists are similar to those of test users. This question has been raised by various NCME members in the past (e.g., Olejnik, 1979; Stetz & Beck, 1978).

Instrumentation

The same teacher and student questionnaires used in the 1979 Stetz and Beck studies were used. The only modifications were 1) a reminder to NCME members at the top and bottom of each page to respond as they thought a random sample of teachers (or students) would, and 2) a request to respond in percents to certain student questions rather than ask for hand counts of students as was done in the original study.

Among other questions, the teacher questionnaire contained 11 semantic differential scales surveying NCME members' impressions of teachers' general opinions and feelings. Examples of the bipolar adjective descriptors included: helpful-harmful, unbiased-biased, calm-anxious, supportive-antagonistic. The student portion was originally administered orally by the teacher; teachers recorded the number of hands raised in response to the questions. In this survey, NCME members were asked to respond as they thought students would.

Method

A random sample of 500 NCME members was selected from the NCME membership list. The teacher and student questionnaires were segmented into three groups; in the questionnaire cover sheet, NCME members were asked to respond as they thought teachers and students would either in Grades K-4, in Grades 5-8 or in Grades 9-12. Assignment to grade range was done systematically.

Materials sent to each NCME member sampled included a cover letter, the questionnaire, and a postpaid return envelope. Approximately two

weeks later, a followup letter was sent to each sample member, urging their cooperation.

To control for response bias due to knowledge of the results of the original teacher and student study, the questionnaire was mailed well in advance of the 1979 NCME/AERA annual meetings. The deadline date was also prior to the annual meetings.

Results

Table 1 summarizes the number of respondents to the two surveys. The student and teacher counts represent a return rate of over 90% of those sampled; the response rate for NCME members was 59% of those contacted.

One of the questionnaire items asked about the amount of standardized testing that takes place in the teachers' own school system. Table 2 summarizes the results. Respondents indicated "too great," "about right," or "too little." NCME respondents thought many more teachers than was actually the case would feel there was too much testing in their system. Almost 60 percent of the NCME members thought teachers would reply "too much," while less than 20 percent actually did so.

A further question concerned teachers' personal use of standardized achievement test results. Respondents indicated whether they made "little," "some," or "considerable" use of such data. As opposed to the above results, the perceptions of NCME members were close to the teachers' ratings on this question. Slightly over half of each group indicated that "some" use was made, while just under 10 percent of both groups indicated "considerable" teacher use.

Table 1

Total Number of NCME Members, Teachers and Students Responding by Grade

Grades	NCME Members	Teachers	Students
K-4	103	1516	31,956
5-8	95	1210	28,246
9-12	86	580	11,561
Total	284	3306	71,763

Table 2

Comparisons Between NCME Members' Impressions and Teachers' Opinions of the Amount of Standardized Testing in the Teachers' School Systems

Amount of Testing in Your System:	NCME Members' Impressions of Teachers' Opinions		Teachers' Opinions	
	K-8	9-12	K-8	9-12
Too Great	60	57	20	16
About Right	39	38	70	64
Too Little	1	5	6	13
No Answer	0	0	4	7

Numbers expressed in percents.

Table 3 provides a comparison of teachers' personal feelings toward standardized achievement tests with the NCME members' expectation of teachers' feelings. Teachers are actually more interested in, calm, comfortable, and knowledgeable about, and supportive of standardized achievement tests than NCME respondents expected them to be. For most items, NCME members' impressions of teachers' attitudes were more negative than reality.

Another set of semantic differential scales provided additional comparisons of opinions concerning such tests. Teachers generally consider such tests more helpful, fair, and useful, less biased, but harder than NCME members expected them to.

Table 4 indicates the two groups' responses to four questions concerning moratoriums on various tests. Differences between the groups here are inconsistent. Overall, NCME members expected more teachers to favor moratoriums than was actually found. However, the differences between groups were small for reactions to moratoriums on all standardized tests and on standardized achievement tests. In contrast, about half as many teachers as expected by NCME respondents favor moratoriums on standardized intelligence and state-mandated tests. NCME members appear to consider teachers far more negative toward these two types of instruments than is actually the case.

Teachers' opinions concerning various other test-related practices are summarized in Table 5. NCME members' expectations and teachers' attitudes were somewhat discrepant in the use of tests for accountability,

Table 3

Comparisons Between NCME Members' Impressions and Teachers' Personal Feelings Toward Standardized Achievement Tests¹
(Grades K-12)

3-5	78	64
6-7	13	2
Not Knowledgeable		
Supportive		
1-2	3	32
3-5	83	63
6-7	9	5
Antagonistic		

¹Numbers are expressed in percents.

²Although the questionnaire used a seven-point scale, data were collapsed into a three-point scale range for summary purposes.

Table 4

Comparisons Between NCME Members' Impressions and Teachers Favoring Various Moratoriums on Standardized Tests (Grades K-12)

Percent of Teachers Personally Favoring a Moratorium on:	NCME Members' Impressions of Teachers Favoring	Teachers Favoring
All Standardized Tests	19	16
Standardized Intelligence Tests	58	26
Standardized Achievement Tests	20	19
State-Mandated Achievement Tests	62	31

Numbers expressed in percents.

Table 5

Comparisons Between NCME Members' Impressions and Teachers Favoring Various Test-Related Policies (Grades K-12)

Percent of Teachers Personally Favoring:	NCME Members' Impressions of Teachers Favoring	Teachers Favoring
The use of "competency" test results to determine high school graduation	42	62
Additional training of school personnel in test interpretation and use	77	61
Increased use of test results for school "accountability" purposes	12	26
Increased use of criterion-referenced tests	80	38

Numbers expressed in percents.

and additional training of school personnel in test interpretation and use. Their views were not greatly discrepant (42% vs. 62%) for using competency tests to determine high school graduation. Finally, more than twice as many NCME members expected teachers to favor increased criterion-referenced test use than was true.

The questionnaire listed a variety of purposes for which standardized achievement tests are used. Respondents indicated whether such tests were useful for these purposes. Table 6 summarizes the results. Arbitrarily using a difference of 10% as indicating "significance," the results indicate NCME members overestimate teachers' dispositions toward test use for reporting to newspapers, boards of education, and parents; for screening for special education; and for comparing students and systems with national reference groups. On the other hand, teachers react more positively than expected by NCME members to using test data for measuring "growth," planning instruction for individuals or classes, evaluating teaching methods and materials, and evaluating teacher performance.

Table 7 compares Grades K-4 students' impressions of standardized achievement tests with the reactions expected of them by NCME members. Overall, students' attitudes were far more positive--both before and after testing--than expected by NCME members.

Finally, Table 8 compares Grades 5-12 students' impressions of standardized achievement and teacher-made tests with the reactions expected of them by NCME members. NCME members greatly overestimate the difficulty of standardized tests and underestimate the difficulty of teacher-made tests. NCME members also overestimate students' negative percep-

Comparisons Between NCME Members' Impressions and Students' Opinions Toward an Administration of a Standardized Achievement Test (Grades 5-12)

Questions	NCME Members' Impressions of Student Opinions		Students' Opinions	
	Gr. 5-8	Gr. 9-12	Gr. 5-8	Gr. 9-12
	%	%	%	%
"Which type of test do you think is usually harder: type of test you just took or the type of test your teachers make up?"				
-Standardized Tests	60	65	36	16
-Teacher-made tests	32	26	54	73
-Don't know	8	9	10	11
"The test you just took is supposed to show what you already have learned and what you do not know yet. Do you think the test questions were generally fair?"				
-Yes	56	49	74	78
-No	33	38	16	11
-Don't Know	11	13	10	11
"How do you feel you did on this test?"				
-Well	17	16	25	31
-OK/All Right	49	45	48	48
-Poorly	20	21	8	5
-Don't Know	14	18	19	16
"In general, how do you feel about the type of test you just took?"				
-Positive	39	36	29	18
-Negative	27	36	27	29
-Neutral/Unsure	33	28	44	53
"Would you be interested in finding out your scores on the test you just took?"				
-Yes	76	76	90	84
-No	16	15	6	10
-Not Sure	8	9	4	6
"Would you like the chance to discuss with your teacher the correct answers to the test you just took?"				
-Yes	67	60	48	31
-No	22	26	39	55
-Not Sure	11	13	13	14
"How many of you get nervous just before you take a test like the one you just took?"				
	67	62	37	13
"How many of you get nervous just before you take the kind of test your teachers make up?"				
	59	56	61	71

tions of the fairness of the questions on standardized achievement tests. In general, NCME members' views and students' feelings on how students did on the test and students' general perceptions of such tests were similar. NCME members overestimated the number of students who would like the chance to discuss the correct answers to the test. Finally, NCME members overestimated the number of students who get nervous prior to taking standardized achievement tests.

Educational Significance

NCME is a professional association of measurement specialists that is, by design, practitioner-oriented. As such, it is important that its members be sensitive to the attitudes of test users toward assessment devices. This study highlights areas in which perceptions of specialists about user attitudes vary markedly from reality. It is important to monitor the relationship between perceived and actual attitudes if NCME is to be successful in assisting non-specialist test users in making better use of educational assessment. This study provides data for such a process and may help to direct the organization's resources toward shrinking the gap between perception and reality.
