Findings of research focused on children and youth at risk for child abuse and neglect are summarized in this report. Entries are organized under the following four general headings: (1) definition and incidence of maltreatment of children and youth, (2) explanations of maltreatment, (3) systematic dysfunctions in handling maltreatment cases, and (4) interventions and their effectiveness. The pages of the summary are organized in columns: the first column lists the findings, the second lists bibliographic information, and the third provides interpretations of the findings. (RH)
CHILDREN AND YOUTH AT RISK

A Synthesis of the Research and Comments

by

H. Frederick Brown
Jane Addams College of Social Work
University of Illinois at Chicago Circle
Introductory Comments

Since 1962 and the appearance of the "Battered Child Syndrome" in the American Journal of Medicine by F. Harry Kempe and associates, there has been literally a proliferation of studies addressing the complex topic of "Children and Youth at Risk." This paper synthesizes what are considered generally agreed upon findings and presents a format that other researchers may review in order to arrive at a consensus on the findings. Then, they may identify critical areas for additional evidence as needed and may consider research initiatives.

The flaw in this assignment, at least as it pertained to this investigator's efforts, is the assumption that there are, in the research on "Children and Youth at Risk," generally accepted findings. In almost every case of a major research effort in which findings are made, contradictory evidence exists that challenges the findings or the interpretations given to those findings by the individual researchers. Possibly the most serious problem has been the criticisms of the validity of the research methodologies employed, which, if accepted, would eliminate most, if not all, the research studies undertaken to date.

Many experts in the field have pointed out these methodological problems in summarization of research findings (Antler et al., 1980; Belsky, 1980; Bourne & Newberger, 1979; Gelles, 1973; Hutt, 1974; Light, 1973; Simpkins, 1978; Smith et al., 1980; Stein, 1979; White, 1973; and Zigler & Seitz, 1980). Briefly, these challenges to the validity of the research on vulnerable children and youth suggest that:

1. Studies, in most instances, are post hoc (ex post facto); providing little or questionable data on families prior to the onset of child maltreatment, usually focusing on one or two factors, and using a wide variation in sampling methods.

2. Wide disparity exists in definitions of child maltreatment that lack differentiation of various types of maltreatment, and use broad categories lacking specification.

3. Case records are used in many studies that are subject to inaccuracies that affect the validity of findings that include data from these sources.

4. Parent, child or professional recall is used to establish circumstances surrounding the maltreatment incidents that are subject to distortion.
5. There is lack of evidence in support of predicting likely future consequences of either specific parent or child characteristics or behavior.

6. The systemic labeling process, in which initial allegations are made and subsequent evidence gathered to substantiate those allegations, often overlooks substantive evidence of normal childrearing behaviors.

7. Discriminatory nature of reporting systems of child maltreatment in which lower social economic status families are more likely to be reported.

8. Systemic dysfunctions in the handling of child maltreatment by the variety of agencies and professionals operating on different criteria based on conflicting value orientations.

In general, this investigator supports these methodological criticisms but neither time, resources or present commitment exist to undertake a bold redirection of sponsored research in this complex area, nor are there assurances that more rigorous short- and long-range studies would provide the desired knowledge base regarding causation, appropriate policies, and effective multilevel interventions to assure a safe nurturing environment for children and youth who are identified at risk. At least, the present research findings have challenged some of the myths and assumptions that abound in this particular area, and we are more aware of what we do not know. Even though the present research cannot meet scientific empirical standards as a whole, many of the studies suggest insights into the complex phenomena and point up a beginning consensus when one attempts to synthesize and bring together these findings. It has to be said that this synthesis is more a work of art than an attempt at scientific analysis. Over 200 studies have been reviewed and organized under the following general headings:

I. Definition and Incidence of Maltreatment of Children and Youth
II. Explanations of Maltreatment
III. Systemic Dysfunctions in Handling Maltreatment Cases
IV. Interventions and Their Effectiveness
Findings

I. Incidence of Maltreatment

Best guess estimate that a minimum of 652,000 children (and youth) suffer some form of harmful maltreatment each year.

No difference between whites and blacks in the proportion of maltreated children.

Higher incidence occurs in lower socioeconomic classes with poor white children more at risk than poor blacks.

Incidence of adolescent abuse and neglect more than double the rate of younger children.

Roughly an equal number of abuse and neglect cases.

Source

Interpretation

Study emphasized actual harm rather than potential harm, which significantly altered previous estimates of incidents of maltreatment.

By excluding institutions, private physicians, private schools, mental health and other private agencies, estimates of incidence are considered low.

Classlessness myth of child maltreatment exploded.

More attention must be paid to adolescent abuse and neglect.

Use of actual harm standard reduces ratio of neglect cases (previously reported as 4-1) to abuse cases.
### Findings

- **Educational neglect** involved in 27.8% (181,500) of cases.

- Accuracy of detection...reluctance of persons to report...variability in statutory definitions from state to state.

- Abuse not increased...only the identification and reporting of abuse has increased.

- Serious abuse only small proportion of reported cases.

- 200,000 to 500,000 children abused annually...add neglect and sex abuse; 1 out of every 100 children are victims.

### Source

### Interpretation

- First time incidence of educational neglect has been documented.

- Difficult to have much confidence in studies of child abuse and neglect.

- Societal change would bring about reduction in incidence of child abuse rather than focusing on individual cases.

- Suggests availability of crisis centers...and community education of the general populace in a preventive effort.

Problems with incidence studies are that information from different states is not comparable; reports are subject to extent of public awareness, reflect an institutional bias with power classes over represented, estimates based on data from different sources and abuse and neglect incidents subject to misdiagnosis.
Definitions of Maltreatment

The existence of an adequate definition of abuse and/or neglect is central to the entire system of service delivery to abusive and neglectful families.

Legal definition of abuse and neglect falls far short of providing the operating definitions necessary for intervention decisions.

Provide wide discretion in interpretation and application.

Physical abuse of children is the intentional, nonaccidental use of physical force, or intentional, nonaccidental acts of omission on the part of caretaker, interacting with the child in his care, aimed at hurting, injuring, or destroying that child.

'Abuse consists of inflicted gaps or deficits between circumstances of living which would facilitate the optimal

Source

Gil, D.S. Violence against children, op. cit.

Interpretation

There is a gap between the broad definitions in the literature and the much narrower definitions used by child abuse and neglect programs.

Need to delineate specifically permissible bases for intervention... statutory grounds for coercive intervention should be defined as specifically as possible.

Definition includes societal agents as well as individuals as perpetrators of abuse.
Findings

The development of children to which they should be entitled and their actual circumstances, irrespective of the sources or agents of the deficits.

Neglect is a condition in which a caretaker responsible for the child either deliberately or by extraordinary inattentiveness permits the child to experience avoidable present suffering, and/or fails to provide one or more of the ingredients generally deemed essential for developing a person's physical, intellectual and emotional capabilities.

The social construction of child abuse is the process by which (a) a definition of abuse is constructed, (b) certain judges or gatekeepers are selected for applying the definition, (c) the definition is applied by designating labels "abused" and "abuser" to particular individuals and families.

Neglect is a failure in meeting community expectation of the duties of the parental role, but sustained by a number of factors -- some in the parents, some in their environment.

Interpretation

Neglect cases far outnumber abuse cases because of their more chronic nature, found to be more persistent and less amenable to treatment.

These factors affect who is labeled an abuser as well as what the causes of abuses are considered to be.

More exacting definitions of child neglect not needed...need to relinquish notion of child neglect as a static, discreet, diagnostic entity...as much a manifestation of social and community conditions...as any individual parent's pathology.

### Interpretation

An effort should be made to systematically educate parents about other means of behavioral control...while establishing clear-cut prohibitions against use of physical force in childrearing.

These areas of agreement can provide the basis for developing guidelines for handling maltreatment cases across essential disciplines.

Placing a child in a suspected abuse category is only a clinical judgment and only long-term followup with family will tell.
Findings

Out of 382 maltreating families receiving public assistance, only 28 showed no evidence of neglect. Centrality of material level of living, in a complex set of factors that result in child maltreatment, is the primary determinant of coping behavior. Neglect is identified as the more prevalent and/or severe problem.

Neglect is a form of cruelty that more often is caused or exaggerated by extreme poverty or ignorance. Abuse is related to deep-seated characterological or psychological causes rooted in the childhood experiences of abusing parents.

Evaluation of elements essential in child care. Opinions in society are surprisingly unified...the kinds of behaviors that social workers see as neglectful also are seen as deviant by the neighbors of those who engage in such behaviors.

Source.

Interpretation

The public child welfare system must be modified so that it is more responsive to the families it is established to serve.

Need for controlled, systematic longitudinal studies involving exploration of many factors...with systematic follow-up on the careers of large representative groups of normal families.

Parents who have low standards of child care are probably demonstrating individual incapacity to provide better care rather than following norms sanctioned by the same reference group.
Findings

II. Explanations of Maltreatment of Children and Youth
   A. Parental Problems and Background

   Economic stress is neither necessary nor sufficient to warrant abuse; rather, it is a defect in character structure that allows aggressive impulses to be expressed freely...thus, psychiatric factors are judged to be of primary importance.

   Parental problems not as important as expected. Maltreating parents showed more emotional stress and showed more likelihood of another adult living in the house.

   Only a small proportion of abuses in general are caused by a sadistic psychopathic parent but a high proportion of lethal abuse is.

   Assignment of perjorative labels and necessity of alleging parental wrongdoing is necessitated in order for the court to assume jurisdiction.

Source

Wolock, I., & Horowitz, B., op. cit.

Stein, T.J. Grant application: Child welfare research on intake and decision processes. Chicago, IL: University of Illinois at Chicago Circle, 1979.

Interpretation

Relieving stress by the low material level of living more crucial than emotional factors.

Essential to distinguish between abuse caused by pathological behavior and abuse which is essentially behavior of normal adults.

Now standard needed for social work and judicial decision making... We must question the appropriateness of intervention caused solely by parental conditions.
Findings

Abuse is not a product of psychologically disturbed parents, because normal parents use physical and corporal punishment, which is widely accepted in our society.

Predictive value of individual variables identified... is exceedingly limited... child maltreatment must be considered an interactive process.

Over half of abusive parents undergoing moderate or severe life crisis report severe physical punishment as children.

Punitive childhood history correlates with abusive or neglectful behavior in adulthood... only when coupled with high levels of stress resulting from excessive demands for coping with life change.

Inhibiting effect of painful feedback may be dependent on development of empathy.

Sense of power and/or compliance that follows aggressive act may serve to reinforce aggression.

Source

Gil, D.S. Child Abuse Prevention Act, op. cit.

Interpretation

Societal change would bring about reducing incidence of child abuse rather than focus on individual changes.

Changing family relationships where there is failure to meet role expectations provide basis for abuse if parent was punished severely as a child.

May explain why the victimized child's pain and suffering does not inhibit abusive behavior.

Emotional deprivation noted by clinicians as characteristics of childhood of child abusers may very well be responsible for parent insensitivity to the pain they cause their victims.
Findings

Ontogenic development predisposes parent to maltreat their offspring.

All of control non-neglecting parents felt wanted as child; over 1/2 of neglected parents felt unwanted.

Nurturance mothers reported receiving during their own childhood was one of the most consistent predictors of their child's own nonorganic failure to thrive in sample of 500 mothers studied from pregnancy through 2d year of child's life.

Physical abuse as child is insufficient itself to predict if one will be an abusive parent.

Only minor support that children who are abused grow into abusing parents.

Source

Wolock, I., & Horrowitz, B., op. cit.

Interpretation

The fact that abusive or neglectful parents often report being abused or neglected as children does not explain the fact that most abused or neglected children do not abuse or neglect their children.
### Findings

Abusive and neglectful parents' lack of knowledge and unrealistic expectations about children and their lack of child-rearing acumen...inappropriate values about relative legitimacy of their needs as compared with the child's and receive little support in making appropriate changes.

Abusive parents lack appropriate knowledge of childrearing...their child-rearing techniques set them apart from nonabusive parents...the abusing parents implement culturally accepted norms for raising children with an exaggerated intensity at an inappropriately early age.

Participation in both formal and informal social groups confirmed emerging picture of relative isolation among neglecting parents...neglecting parents revealed a previous history of social isolation in adolescence.

Potentially neglectful mothers had much greater interaction with neighbors...no. evidence that these women experienced extreme social isolation.

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Parke, R., &amp; Collmer, C.</td>
<td>Role of caregiver requires reordering of priorities concerning the gratification of needs.</td>
</tr>
<tr>
<td>Polansky, N., Chalmers, H., Buttenweiser, R., &amp; Williams, P., op. cit.</td>
<td>On the average, the neglectful parent was already starting to fall outside the mainstream in adolescence and can profit less from informal support systems that might prevent neglect.</td>
</tr>
<tr>
<td>Billingsley, A., Giovannoni, J. &amp; Purvine, M., op. cit.</td>
<td>Extensive neighborliness found among this group is in response to the many strains in their lives and lessened family support with reliance upon the nearest source of support which were neighbors.</td>
</tr>
</tbody>
</table>
Findings

Having relatives nearby was not associated with maternal adequacy, however, frequency and nature of contacts with these available relatives were. More adequate mothers had seen all of their relatives during the year. Less adequate mothers had seen few or no relatives at all.

Interpretation

If we consider the many strains on neglectful mothers and their relative lack of supports in the informal system—-one might anticipate a heavier reliance upon community services to meet their children's needs.

Undertake to teach the general population essentials of child care and the normal course of child development—-reduce incidence of child abuse by teaching parents how to parent.

Important for child protective services workers to listen carefully to parents to identify clearly the abusive interaction through eyes of the parents—-withholding judgment until the incident with its antecedents are seen in context with each other.

Zigler, E., & Seitz, V., op. cit.

Kadushin, A., Martin, J., & McGloin, J., op. cit.

Findings

Out of 20 battered infants, 1/3 were premature...more than 1/2 were mentally retarded and emotionally disturbed.

Premature infants had normal IQs. Most premature children are not abused.

The special child is at greater risk of abuse...current research does demonstrate that prematurity, physical handicaps, congenital malformations, and similar conditions are overrepresented in abused populations.

As age of the victim increases, the father is more likely to become the perpetrator than the mother. Adolescent cases tend to involve two parents instead of one.

Younger victims more frequently are victims of severe abuse, and teenagers are more likely to be victims of sexual abuse as the 2d most serious type of abuse.

Source

Elmer, E., & Gregg, G. Development characteristics of abused children. Pediatrics, 1967, 40:

Garbarino, J., & Carson, B. op. cit.

Interpretation

Mother may perceive a child as abnormal simply because it is premature.

Abuse is a product of a complex set of interactions, and assigning weights to any of its components is premature.

Supports contention that adolescent abuse and neglect is a separate phenomenon, and supports view that adolescent abuse contributes to the problem of runaways.
### Findings

Economic status of families in adolescent abuse cases substantially higher than families of younger victims of abuse.

Half of abuse of adolescents is a recent event, not a continuation into adolescence of prior abusive behavior.

Abused and neglectful adolescents are more likely to be labeled status offenders if referred to juvenile court and placed in an institutional setting if adjudicated.

Abusive and neglectful family environments induce many adolescents to run away from home.

Adolescent abuse more than double the rate of younger children.

### C. Family Interaction

Frequent observations that marital conflict and discord run high in abusive households.

### Source

Westat, Inc., *op. cit.*

### Interpretation

It appears that economic stress is not generally a contemporary factor in the life of families with adolescent victims.

More attention needs to be given to minimizing the impact on the child, particularly when victim of sexual abuse.

More attention needs to be paid to adolescent abuse and neglect.

To fully understand the role of the child in abuse can be achieved only by examining other aspects of the microsystem of the family.
### Findings

Marital disruption and neglect associated in all groups (white, black and Latino).

Children become targets of aggression when they intrude upon the spousal relationship...first child more likely target of abuse.

A child is a target of physical insults, he is part of the family, inevitably he is caught up in the stress and privation to which his family is prey.

In 80% of abusive families neither parent takes responsibility for decisions...live in disorganized homes with inconsistent discipline.

Welfare food allowances for children in their own homes is less than is allowed by foster parents, and considerably less than food allowances for children placed in institutions.

### Source

<table>
<thead>
<tr>
<th>Source</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Billingsley, A., &amp; Giovannoni, J., &amp; Purvine, M., op. cit.</td>
<td>Marital stress and conflict may simply spill over, contaminating the socialization process.</td>
</tr>
</tbody>
</table>
Findings

Determinants within the abusive family seem to be 1) the history of the acceptance of aggression toward children as acceptable, 2) the immediate antecedents that result in the abuse or neglect, and 3) the consequence that draws attention to the abusive or neglectful behavior.

In certifie abusive and neglectful families, there was less interaction between family members than there was in matched control families.

Tolerance of stress and the family's skill in martalling its resources to cope with adversity can reach absolute levels of stress with which a family can no longer tolerate.

One-half of fathers experienced joblessness in the year preceding abuse.

Ethnic, Cultural and Societal Context

Feelings of injustice alone will not produce aggression unless violent response has been learned as an appropriate behavior when one is frustrated.

Source

Change alone may not cause problems, but rather that particular sorts of change upset family equilibrium by disturbing the role expectations that parents have come to assume as just.

Belsky, J., op. cit.

This would partially explain why it is that among some families facing similar levels of social and economic privation, maltreatment occurs in some families and not others.

Unemployment and resulting stress on family may be related to increased abuse of children in family. Powerlessness when father no longer functions as the family provider might fuel intrafamily violence.

Bandura, A. Aggression: A social learning analysis.
Findings

In excess of 90% of parents reported employing physical force in upbringing of their children.

25% of mothers were spanking infants before age of 6 months; almost 50% were spanking children by age 12 months.

Close correlation of abusive parents... and characteristics of lower class impoverished families.

43% of reported abuse cases earned less than $5,000 a year.

SES deprived families use physical force in rearing their children more than middle class.

63% of 1,093 abusive incidents were the result of accidental disciplinary measures.

Source

Gil, D.S. Pediatrics, op. cit.

Emor, E. A follow-up study/ of traumatized children, op. cit.

Gil, D.S. Violence against children, op. cit.

Gil, D.S. Pediatrics, op. cit.

Interpretation

Need to establish clear-cut prohibitions against use of physical force in child-rearing.

One major factor contributing to high level of parent-child violence is the normative acceptability of hitting one's own children.

Childrearing among lower class involves children being repeatedly subjected to uncontrolled aggression at the hand of their caretakers.

Need to penalize corporal punishment for all parents.
<table>

</tr>
</tbody>
</table>
Findings

Institutional abuse of black children is serious problem that continues unabated.

High visibility, poverty and racism result in overreporting of black families.

White controlled agencies and institutions lacked a real understanding of the structure and needs of the black family and often imposed inappropriate solutions to misunderstood problems.

By all measures of social-economic status, abusive parents most had members in the highest status positions...higher income; independent source of income, with male head who had gone beyond high school...neglect families placed significantly lower in social-economic status.

Black families predominated the adequate care group...but also the poorest and most likely to be on welfare.

Source

Interpretation

Need to treat abuse and neglect in the black family as separate problem, which many believe is directly or indirectly result of institutional racism prevalent in American society. Need to fund programs that focus on institutional abuse, provide a guaranteed annual income for all families and comprehensive health insurance.

Programs needed that recognize and utilize informal family networks, provide legal recognition of current extra-legal kinship bonds and provide an emphasis on concrete help with less casework.

Poverty exposes parents to the increased likelihood of additional stress which may have deleterious effects upon the capacity to adequately care for their children.
Findings

Among black mothers, mutual aid activity such as babysitting and housecleaning appeared to be an important category.

A higher proportion of neglectful white mothers was on welfare. There was no relationship between source of income and neglect for black or Latino families.

Chicano family roles appear strong with support systems but need reinforcement in lieu of majority cultural domination.

There are significant differences that have emerged between 1.7 million Puerto Ricans living on the Mainland and the 3.7 million living in Puerto Rico.

Characteristic reactions of the Puerto Rican family to certain situations; e.g., explosive release of emotion in a stress situation...have not demonstrated negative consequences within the cultural context of the family.

Interpretation

For the practitioner, increased emphasis on the manipulation of the environment of poor neglectful mother...with supportive services such as the child protective services worker faces a stalemate.

Programs must encompass efforts to alleviate at least some of the ravages of poverty.

More effective programs make use of extended family networks present in the Chicano, Mexican and Puerto Rican family culture.

Need to emphasize linkages to the majority culture rather than change the basic patterns of family life.

Source

Findings

Most workers involved with Hispanic families are from other cultural backgrounds resulting in communication being a common problem.

Lack of academic and other professional training which adequately prepares the non-Hispanic as well as the Hispanic service providers with skills to treat adequately the Hispanic family.

Families of European ethnic origins undergo cultural conflicts and intrusions similar to those of other minority families in attempting to deal with the majority culture.

There has been a persistence of ethnicity with over 100 million Americans (white and nonwhite) who identify with an ethnic group.

Each ethnic group has its own cultural behavior patterns and its own diversity that make it unique:

For many, the inability to express themselves in English presents problems in communication.

Source

Interpretation

Services must be available generally in Spanish and work with Hispanics in a culturally responsive way.

Academic programs need to be prepared to train professionals to work effectively with various Hispanic groups.

Natural support systems and resources exist that can be expanded while still assuring cultural integrity.

Ethnic consciousness has stimulated the necessary process of redefining our society as pluralistic in nature.

Policies and programs must incorporate a sensitivity and responsiveness to ethnic differences.

Need to undertake research relevant to the ethnic variable in child abuse and neglect.
Findings

Children of ethnic families are experiencing cultural contradictions between the larger society and their family culture. Parents are becoming unsure of themselves in their parent role and find themselves having to learn adaptive techniques from their children.

Ecological Integration as an Explanation of Maltreatment of Children and Youth

Ecological space defined as:

a) what takes place in the context of the immediate household
b) forces at work in the larger social systems in which the family's embedded
c) overriding cultural beliefs and values

There is a structural relationship between individual, familial, community and cultural factors that have not been implicated by others as causative agents in the maltreatment process.

Support systems...have been linked to maltreatment of children whenever research has been designed to identify them.

Source

Interpretation

Support self-help, mutual aid, education, and prevention programs to achieve greater family stability among the ethnic groups.

Belsky, J., op. cit.

Teams of researchers at several levels need to undertake coordinated investigations.

Garbarino, J., op. cit.

More attention needs to be given to factors for improving functioning of support systems for parents.
### Findings

The potential for preventing and creating child abuse differs from one neighborhood to another.

### Source

### Interpretation

Child abuse can occur only when feedback and support are not being adequately addressed to persons in the role of caregiver.

Practitioners need to recognize the typology of neighborhoods...identifying those persons who comprise the natural problem solving methods of a given neighborhood.

---

#### III. Systemic Dysfunctions in Handling Maltreatment Cases

##### A. Reporting of Maltreatment

Social workers who determine the validity of a reported maltreatment case appear to respond more to the social status of the reporter than to the seriousness or the way in which the case was received.

Professionals lack awareness of child protective services reporting requirements and demonstrate resistance to reporting when known.

Scarcity of resources results in low reporting.

Nagi, S., op. cit.

Smith, C.P., Berkman, D., & Fraser, W., op. cit.

It appears that an important gatekeeping role is maintained by professionals in the process of labeling a child as maltreated.
Findings

Reported families are locked into the formal systems of agencies and professionals which prevent natural support systems from operating.

Initial recipient of report single most influential variable as to whether children reported as abused or neglected are removed from homes. 87% of children reported initially to police were removed from their homes compared with 7% initially reported to Child Protective Services.

78% of reports to the police occurred after hours.

Source

Interpretation

The entire success of a reporting statute is contingent on the nature of the agency charged with receiving reports.

Reports to law enforcement of child maltreatment heightened the probability of emergency protective custody and arrest of parent.

Police have capabilities of immediate 24-hour response to reports of child maltreatment.

Crisis intervention should be limited to situations where child has suffered or is likely to suffer serious maltreatment.

B. Removal of Maltreated Children and Youth from Their Homes

50% of neglect proceedings (inclusive of abuse and neglect) results in removal of child (or youth) from the home of the natural parents.

Source

Institute of Judicial Administration, op. cit.
Findings

43% of validated cases of abuse and neglect resulted in placement (four California counties). Lack of decision criteria regarding removal of children results in either risk to children's safety, unnecessary placement, and trauma for child, and/or undue hardship of families. Removal of child portrayed as helpful by agencies when it is really perceived as punitive by parents.

Children placed in emergency situations tend to remain in placement regardless of severity of abusive or neglectful incident.

Most common service was the placement of child in care of others.

Differing agency philosophy rather than case characteristics seen as determining decision to remove child.

Source

Giovanni, J., & Becerra, R., op. cit.

Nagi, S., op. cit.

Ibid.

Interpretation

Temporary placement is one of the weakest aspects of intervention in behalf of maltreated children.

Need to move toward decision making criteria standardization of definition and routinization of decision making.

Law enforcement is unaware, while child welfare agencies are more aware of the consequences of the child or youth taken from the home of the natural parent.

### Findings

**C. Involvement of Law Enforcement and Use of Criminal Prosecution**

In approximately half of the states, agencies other than the Department of Social Services (usually law enforcement) are mandated to receive reports. Police-investigated reports result in higher placement rates than those investigated by child welfare agencies regardless of severity of the incident, family characteristics, or other attributes of case processing.

Police are the only agency with 24-hour response capability. County attorney expects police to carry out the investigation on the grounds that a social services staff is not trained to gather evidence of legal value.

Police have no established guidelines, they lack training, they are not equipped to make the decisions they are often required to make regarding the welfare of a child.

CHILDREN AND YOUTH AT RISK

Prepared by: DHHS Staff
Findings

Stresses Common to High Risk Families

The most prevalent stresses for a population of multistressed families at risk of child maltreatment were found to be: isolation (63%), dysfunctional behavior (48%), poverty level income (45%), poor coping ability (45%), depression (41%), parent abused as child (38%), and the presence of a developmentally delayed child (37%).

Intervention Methodology

A multidisciplinary, multiphased, ecological intervention methodology is effective in preventing child maltreatment in a high risk population.

An effective approach should combine family stress reduction, improvement in parent-child interaction patterns, and enhancement of a child's development.

People Needing Social Services

Children and Youth at Risk

The most frequent and important problems presented by developmentally disabled children and their families to social service agencies were:

Source

Armstrong, K.A. A treatment and educational program for parents and children who are at risk of abuse and neglect. Paper submitted for presentation to the International Conference on Child Abuse, Amsterdam, Holland, April 1981.

Interpretation

This finding is consistent with other available research in the area of child maltreatment. It is interesting to note that of these seven stress factors, only one is absolutely not amenable to intervention.

An effective prevention strategy is one in which multiple interventions utilizing several disciplines occur simultaneously.

Interim Report #2. Results of the National Program and Training Surveys of Services to Developmentally Disabled Children and Their Families.

The special needs for home management of the developmentally disabled child present problems of stress for his/her family.
Findings

- Alternative living arrangements
- Respite care
- Behavior management
- Educational placement, and
- Transportation.

71% of the services offered by State social services agencies were described as inadequate to meet the needs of the developmentally disabled population.

Interpretation

Social service workers need training unique to these needs in order to reduce the stress and risk faced by these families.

Training and technical assistance in areas of service planning and provision need to be provided to improve service delivery.

Training and technical assistance in interagency activities are necessary to improve the quality of services delivery.
