## ABSTRACT

Development of the College Descriptive Index (Form C) is reported. The C.D.I. is an adjective sheck list that measures eight dimensions of students' satisfaction with college. The instrument was completed by 601 students at four colleges: providing information on satisfaction in each of the eight areas. Scoring procedures and a copy of the instrument are inciuded. Evidence is presented for C.D.I. multidimensionality, scale homogene,ity, and criterion related validity.

Notes
For further information concerning the C.D.I., contact Ronald G. Downey, Office of Educational Resources, 215 Fairchild Hall, Kansas State University, Manhatttan, Ks 66506.

The authors would like to thank the following persons for their assistance with this project: Don Ash, Terry Conley, John Guarracino, Rick Lennox, Marisa Melecca, Mary Riley, Tony Roig, Lee VanDusen.

The College Descriptive Index (C.D.I.): Deve Topment and Background Information Technical Manual - 1983

## INTRODUCTION

The College Descriptive Index (C.D.I.) was developed as a research instrument for the assessment of students' satisfaction with their college experience. The intent was to provide a measure which is standardized, multidimensional, simple to understand and complete, reliable and valid. The C.D.I. is structurally similar to the Job Descriptive Index (Smith, Kendall $\&$ Hulin, 1969). The C.D.I. taps eight aspects of the college experience:

1. Teachers
2. Parents
3. Your Self
4. Other Students
5. Courses
6. Finances
7. Administrators
8. Non-Course Activities

## DEFINITION OF SATISFACTION

Satisfaction/dissatisfaction is the subjective reaction of an individual to particular facets of his or her situation. In a college or university setting, satisfaction and dissatisfaction represent responses to the intellectual, social, emotional and physical environment in which the college student participates.

Satisfaction is a complex phenomenon in a complex milieu. College students are exposed to many new, different, and sometimes unsetting experiences. Often the stability of the familiar home, family, friends, and activities are absent. Students are simultaneously attempting to understand and respond to academic challenges, living arrangements, new acquaintances, sexual relationships, personal growth', and career exploration. Given this diversity of environmental influences, it is likely that satisfaction with college will be multifaceted.

Astin (1977) has discussed in detail the importance of satisfaction as an educational outcome variable. A psychometrically respectable measure should prove useful for both administrators (who could use a satisfaction measure as one type. of quality control indicator) and investigators (who could use a satisfaction measure to compare colleges, groups of students, and
relate the college experience to later life experience). To, accurately describe satisfaction, students' subjective reactions to an evaluations of their experience must be carefully assessed. The stumbling block, however, has been accurate measurement of satisfaction.

## MEASUREMENT OF SATISFACTION

Measurement of college satisfaction has taken many forms, but the literature has been dominated by two basic types. The approach most commonity used involves a single item (or small number of items) contained in a larger survey (e.g., "How satisfied are you with your college experience?"). A second approach involves several concerted attempts which have been made to develop procedures to assess college satisfaction in a standardized, reliable and valid fashion. These efforts have involved development of questionnaires, such as the College Student Satisfaction Questionnaire, CSSQ (Betz, Menne, \& Klingensmith, 1970), or the Transactional Analysis of Personality and Environment, TAPE (Pervin, 1967).

Both of these approaches, however, are limited in several respects. In the most typical, single item case, responses are typically made on 3-to 5-point scales with scales which frequently either lack end anchoring, or use ambiguous response levels. Reliability and validity of these measures is frequently unavailable. And, the single question used fails to encompass the complexity of satisfaction.

While the second approach is clearly superior, it too has several limitations: The CSSQ lack generalizability across environments, uses somewhat ambiguous response options, and appears to contain both ambiguous and complex items. The TAPE is probably more generalizable, using a semantic differntial structure. However, it relies on a discrepancy scoring procedure which defines.satisfaction or dissatisfaction as the degree of similarity between Self and Environment measures. We question the accuracy of this discrepancy scoring procedure, arguing that a student may report Self-Environment congruency, yet be dissatisfied, and vice versa.

The lack of consistency and comparability of satisfaction measures, coupled with the questionnable accuracy of so many measures, has led to contradictory results and confusion. Whi?e we are adding another measure to the long list, our specific purpose was to develop änew instrument which avoids problems notr.d above. The process began with the search for appropriate measurement criteria.

Smith, Kendall and Hulin (1969) proposed several general requirements for the measurement of satisfaction. They are:

1. Measures should be applicable to a wide spectrum of people. The general verbal level should be low. They should avoid long complicated attitude statements. Because of the ambiguity of interpretation of responses such as "strongly agree" and "strọngly disagree," these types of response options should be avoided.
2. Measures should be reliable.
3. Measures should be standardized. Clear instructions should be provided. The format should be standardized.
4. Measures should be multidimensional. Since satisfaction is assumed to be a complex construct, separate scores should be available for each facet tapped.
5. Measures should be valid. They should allow for prediction of individual differences in behavior. They should be understandable, allowing development of general laws and theory (Smith et al., 1969, p. 3-6).

The C.D.I. was developed in light of these measurement criteria.

## DEVELOPMENT OF THE COLLEGE DESCRIPTIVE INDEX

The C.D.I. was modeled after the Job Descriptive Index (Smith et al., 1969). The instrument collects students reactions to their experience of college life. Eight areas or domains were thought to be the primary influences in a student's experience -- teachers', courses, peers, activities, finances, family, administrators, and the self. These were, therefore, selected for inclusion in the instrument. (The inclusion of two dimensions seemed somewhat questionable at this point. First, many students have little contact with college "administrators," thus the utility of this scale was questioned. Second, while "parents" provide considerable financial support for many students, the extent of their impact on students' experiences varies widely. Both of these dimensions, however, were included for the sake of completeness.) It was expected that there would be differences in response and in importance from student to student and from campus to campus on each of these variables.

A number of descriptive adjectives were selected to compose a scale for each dimension, based on the a priori judgmen't of the authors that each adjective might be relevant to a parti'cular aspect of college life. Adjectives were assembled from such
sources as the Job Descriptive Index (Smith et al.; 1969) and the Adjective Check List (Gough, 1952). Approximately half of the items in each dimension were positively worded' (e.g., honest, creative, important); the remaining half were negatively worded (e.g., irrelevant, offensive, careless). We expected that students highly satisfied in an area would find most posit:ve adjectives descriptive of that area and find most negative adjectives unlike their experiences. We expected the opposite with highly dissatisfied students.

Each C.D.I. dimension appears on a separate questionnaire page to minimize cross-dimensional carry-over effects. The eight dimensions and corresponding number of items are:

This manual presents information on Form $C$ of the Coliege Descriptive Index (Reed, Lahey, \& Downey, 1980).

Form A was originally developed in 1978. It contained 211 descriptive adjectives distributed among the eight dimensions. Evaluation of the original instrumeni, based on a sample of Kansas. students, focused on elimination of redundant items and improving the internal consistency of scales. The first revision yitlded Form B, containing 129 items. A second evaluation of the C.D.I., with the same goals in mind, was based on a sample of students from New York. Form $C$ is slightly. longer than Form B, because items were added to several Form B scales to restore equal positive - negative item number balance. Additionally, several Form B items which appeared to be ambiguous or unclear were replaced with synonyms in Form C. (For detailed information on the development and evaluation of Forms $A$ and $B$, see Reed, Lahey, \& Downey, Reference Note 1.) The present version, Form C, contains 133 descriptive adjectives, grouped in eight areas. A copy of the C.D.I. is reproduced in the Appendix.

## SAMPLE

## Coll leges

Usable data were received from 601 undergraduate students enrolled at four different colleges. The colleges may be described as follows:
(a) a medium sized, coeducational, primarily residential, public liberal arts college in the north eastern U.S.;
(b) a small, coeducational, primarily residential, private liberal arts college in the north eastern U.S.;
(c) a-small, primarily residential, private liberal arts college for women in the middle atlantic U.S.;
(d) a medium sized, coeducational, heavily commuter, public liberal arts college in the midwest.

Because of the request of one college that it not be explicitly identified, data are not identified with particular institutions in this report.

## Students

Sixty-three percent (380) of the respondents were women, 37 percent (221) were men. The average age was 20.5 years ( $s=3.9$ years; Median = 19.5 years). Students represented all four college classes, although the largest proportion (49\%) were freshmen. The remainder of the sample included 19 percent sophomores, 14 percent juniors, and 18 percent seniors. Approximately 58 percent lived on campus; 42 percent lived off campus, approximately half of whom commuted from home. Thirty-six percent were attending a college within fifty miles of home.

## ADMINISTRATION AND SCORING

The 9 -page C.D.I . instrument contains explicit written instructions for respondents. These include both general instructions concerning the whole instrument on page one, and specific instructions for each dimension on the separate page

- which concerns that dimension. The C.D.I. may be administered individually, in groups, or as a mailed survey.

To complete the instrument, subjects are instructed (in part):
"...On the following pages you will see lists of adjectives which may or may not accurately describe your college experiences and your feelings about those experiences. The words are grouped in eight areas, concerning your Teachers, Parents, Self, Other Students, Courses, Finances,

College Administrators, and Non-Course Activities.
"... Think of your Teachers (Professors). How well does each of the following adjectives describe most of your Teachers this semester?. Circle:
$Y$ for "yes" if the word does describe your teachers,
$N$ for "no" if it does not describe your teachers,
? if you cannot decide. ..."

## Item scoring

A high C.D.I. score indicates satisfaction; a low score indicates dissatisfaction. Both positive and negative adjectives appear in each scale dimension. Thus, they must be scored in different fashions for consistency. Included in homogeneity analysis tables described below (Appendix Tables 8 through 15), are type indicators; negative adjectives are identified by a minus $(-)$ following the item number; positive adjectives have no indicator.

Each item is scored 1, 2, or 3-points; a 3 indicates satisfaction, a 1 indicates dissatisfaction. For positive adjectives, a "yes" response (indicating that the item describes his/her experience). is scored 3-points (e.g., "yes" my teachers are "articulate"). A "no" response to a positive adjective is scored 1-point, representing dissatisfaction since the item is not descriptive of the student's experience (e.g., "no" my teachers are not "helpful"). Negative items are scored in the opposite fashion; 3-points for a "no" response to a negative adjective indicating satisfaction (e.g., "no" my teachers are not "inconsiderate"); 1-point for a "yes" response (e.g., "yes" my teachers are "conceited"). Item scoring is summarized below.

Item Scoring Key
Positive Adjectives Negative Adjectives

$$
\begin{array}{ll}
Y=3 \text { points } & N=3 \text { points } \\
?=2 \text { points } & ?=2 \text { points } \\
N=1 \text { point } & Y=1 \text { point }
\end{array}
$$

## Scale scoring

Because scales were of varying lengths, the Dimension or Scale Mean was selected as the most accruate expression of a subject's score on a dimension. A Scale Mean score was computed for each C.D.I. dimension for each subject. This was accomplished by (a) summing the scores for all items in the dimension to which the
subject responded, and (b) dividing by the number of valid item responses. Blanks (failure to respond to an item) represent missing data and were omitted. If more than $25 \%$ of the items in a scale were omitted or otherwise invalid (e.g., multiple , response), the dimension score was not computed.

## PRELIMINARY NORMS

Combining subjects from the four-college sample described above, a preliminary norm distribution was constructed, as shown in Table 1. A Centile distribution is presented for scores in each C.D.I. Scale. Also included are group data for each dimension, including scale mean, standard deviation, median, and number of subjects on which the measures are based.

## RELIABILITY

Coefficients of internal consistency were computed for each C.D.I. dimension using Cronbach's Coefficient Alpha (Cronbach; 1951). Alpha coefficients for the eight C.D.I. dimensions are presented in Table 2.

Detailed information on items and scale homogeneity are included in Appendix Tables 8 through 15. Item information includes: adjective and indicator (-) if it is negative; item mean and standard deviation; squared multiple correlation with other items in the scale. Scale statistics provided include summative scale mean and variance, mean item mean and variance, mean inter-item correlation, scale alpha, and number of items in the scale.

In genéral, homogeneity indices are moderately high to high, ranging from .77 to .93. They indicate that each resulting scale can be used with a moderate degree of confidence.

## SCALE INTERCORRELATIONS

Intercorrelations of the eight C.D.I. scales were computed. The 28 correlations are presented in Table 3. In general, the correlations are moderately low. A striking exception is the relationship shown between the logically related scales Teachers and Courses ( $r=.53$ ).

## Table 1

## C.D.I. DIMENSIONALITY

Dimensionality of the 133 items was assessed using factor analysis to determine whether (a) items assigned logically to à scale were empirically related to other items in the scale; and (b) whether clusters of iteins important for one scale were independent of other scales.

Because of the total number of items in the C.D.I. and available computer resources, i+ was not possible to include all items in a single factor analysis. Therefore, items were grouped by scales, and three factor analyses were computed. Each scale (and item) was included in-two different analyses so that each scale was examined with each other scale at least once. Items within scales were grouped as follows: Analysis I, Teachers, Parents, Your Self, Other Students, Courses, Finances; Analysis II, Other Students, Courses, Finances, College Administrators, Non-Course Activities; Analysis III, Teachers, Parents, Your Self, College Administrators, Non-Course Activities. This analysis structure is illustrated conceptually in Appendix Figure 1. Attempting to enhance comparisons between the three analyses, each analysis was performed using Principal Axis factoring with communalities of 1.0 on the main diagonal of the correlation matrix, followed by varimax rotation.

Factor analysis results
Results of the factor analyses are included in Appendix Tables 16, 17, and 18. The three analyses were extremely consistent with each other. In each analysis, an approximation to simple structure was achieved. Most items on an a priori scale have high loadings on a factor common to other items on that scale, and relatively low loadings on all other factors.

The cleanest scales from the standpoint of low cross loadings and concentration of one scale on one factor were: Courses, Administrators, Parents, Non-Course Activities, Other Students, and Finances. The least clean scales were Teachers and Your Self, although there was Tittle overlap between these scales and other C.D.I. scales. The Teachers scale, unifactorial in Analysis III (Table 18, Factor IV), composed a strong Factor IV in Analysis I (Table 16), but spilled over to a separate weak factor IX. The primary focus of this second factor appears to be a pleasanthelpful dimension which is tapped in Factor IV to some extent. The more critical problem, however, was with Your Self. Although unifactorial in Analysis III (Table 18), it split into two relatively strong factors, VI and VIII in Analys is I (Table 16). Subscales were constructed based on Analyșis I results and homogeneity analyses were computed for each subscale. The maximum scale alpha computed for any Self subscale was .70, obtained by deleting items to form one 7 -item partial subscale (less than the total Your Self scale alpha). Given these results, and no
convincing explanation for subscale composition, both the Teachers and Your Self scales were treated as single entities in all subsequent anaiyses.

Recalling the diverse nature of the sample used (students from four different colleges, inclusion of both public and private institutions, and representation of all four college classes) we are pleased with these factor analysis results. These analyses indicate that the instrument is multidimensional, and that the eight scales are relatively homogeneous and independent of each other.

## VALIDITY

Three types of evicience for criterion-related validity of the C.D.I. were examined: ( $a^{\prime}$ ) Regression analyses were performed relating C.D.I. scales to three general satisfaction measures; (b) Bivariate correlations were computed between the C.D.I. scales and each of twelve criterion questions; (c) Scales were evaluated in terms of their ability to differentiate between demographic groups --e.g., gender differences, differences between colleges, and class-in-college differences.

The 12 items used as criteria are displayed in Table 4, which presents the text of each item, response options provided to the subject, and the point scoring system used for each item. These questions were contained in a survey accompanying the C.D.I. (see Reed, Lahey, \& Downey, Note 1;" Downey \& Lynch, Note 2, for further details).

Criterion prediction results
Three separate stepwise multiple regression analyses were computed using the eight C.D.I. scales as predictors. General satisfaction criteria used were taken from an accompanying survey sent to each C.D.I. respondent. The three criterion questions were each scored on a 5-point scale. The wording of each of these General Satisfaction items (A, B, and C) is provided in Table 4. A total of 560 usable cases were included in each analysis.

Table 5 reports the results of these analyses. Six C.D.I. scales combined to significantly predict the most general criterion, overall satisfaction (item C); the most patent predictor was Courses. Four C.D.I. scales combined to significantly predict the second criterion, progress toward life goals (item B); the most important predictor was Your Self. Four C.D.I. scales combined to predict the third criterion, a measure of satisfaction with the particular institution (item A) ; the best predictor of the likelihood that one would reselect this college was Non-Course Activities. Three C.D.I. scales (Teachers, Courses, and Non-Course Activities) were significant predictors of

| (Regression Constant) |  | $(-.64)$ | . |  | .40 | 1.48 | 27.0 |

Note: C.D.I. Scales are listed in order of entry into Regression Equations.
each general criterion. One C.D.I. scale (Parents) did not significantly contribute to prediction of any criterion.

## Correlations with other variables

In addition to the three general satisfaction questions discussed above, nine additional items were selected from an accompanying student survey. Those items represented specific aspects of the student experience and were thought to be somewhat indicative of satisfaction in each area. Those nine items are displayed in Table 4 in three general areas: academic issues, students, and other issues.

Bivariate correlations between C.D.I. scales and each of the 12 criterion questions are presented in Table 6. The Teachers and Courses scales were most strongly related to specific items in the general area of academic issues (items D, E, and F). Other Students and Non-Course Activities scales were most closely related to specific items concerning students (items G, H, and I). The Administrators scale was strongly related to item $L$, a measure of student satisfaction with the way the college is run. The Your Self scale was highly related to the question concerning progress toward life goals (item B). The Finances and Parents scales did not appear to be related to any of the criterion items used. (Relationships among the 12 criterion items, in the form of a bivariate correlation matrix, are presented in Appendix Table 19.)

## Group discrimination

Three separate Stepwise Discriminant Analyses were computed using C.D.I. scales as discriminating variables. Group membership predicted was based on three demographi v variables: (1) sex of the respondent, (2) college the student was attending, and (3) class standing in college. These results are presented in Table 7. Three scales contributed to significant discrimination between men and women. Five scales composed three discriminant functions to discriminate among the four colleges. Six-scales aided in differentiation on the basis of college standing.

## Index

In this questiona ire you will be asked about your college experfencos. On the following pages you will see lists of adjectives which may, or may not, accurately describe your college experiences and your feelings about those experiences. The words are grouped. In eight areas, concerming your Teachers, Parents, Self, Other Students, Courses, Finances, the College Administrators, and NonCourse Activities (extra-curricular activities). You should identify which of the adjectives accurately describes your situation in each area. Please answer each item.

Think of your Teachers (Professors), How well does each of the following adjectives describe most of your Teachers this semester? Circle:

Y for "YES" if the word does describe your teachers,
$N$ for "NO" if it does NOT describe your teachers,
? If you cannot decide.

TEACHERS (Professors)
Y ? N Understanding
Y ? N Inconsiderate
Y ? N Competent
Y ? N Articulate
Y ? N Helpful
$Y$ ? N Available
Y ? 4 Offensive.
Y ? N Humbrous'
Y ? II Conceited
Y ? N Knowledgeable
$Y$ ? $N$ Impractical
Y ? N Flexible
Y. ? N Biased
$Y$ ? $N$ Insensitive
Y ? N Enthusiastic
Y.? N Tactless
y ? 1 Opinionated
Y ? $N$ Dull
Y.? N Patient

Y? N Nitpicking

Think of your Parents (or Guardian). What are they like most of the time? How well does each of the following mords describe your Parents' attitudes and relationship toward you and your college experience, in general? Circle: --
$Y$ for "YES"-4f-the-word-does describe your parents,

- $N$ for "NO" if it does NOT describe your parents,
? if you cannot decide.

PARENTS (or Guardian)

Y ? N Intolerant
Y? N Thoughtful
Y ? N Closed-minded
Y ? N Unrealistic
Y ? N Affectionate
Y ? N Trusting
Y ? I Nosey
Y? I stubbom
Y ? . H concemed
Y? N Supportive
Y ? Fault-finding
Y ? N Understanding
Y ? N Dependable
Y ? N Sensible
V ? N Impatient

Think about Your Self. How do you feel most of the time this semester? Circle:

YOUR SELF

Y ? N Moody
y ? N Relaxed
Y ? N Foolish
Y ? N Confident
Y? N Aloof
$Y$ ? N Lazy
Y. ? N Frustrated

Y ? $N$ Eager
Y ? N Honest
Y ? N Optimistic
Y ? N Obstinate
i ? $N$ Helpful
Y ? N Timid
$Y$ ? N Successful
V?N Sarcastic
Y?N Organized
Y ? N Careless

31

Think of the Other Students you know and see regularly this semester. How well does each word describe most of those Students? Circle:

Y for "YES" if the word does describe other students,
N for "KO" if it does NOT describe other students,
? if you cannot decide:

OTHER STUDENTS

Y ? N Honest
Y ? N Sympathetic
Y ? N. Apathetic
$Y$ ? N Indifferent
Y ? N Lazy
Y ? N Responsible
$Y$ ? N Tolerant
y? N Obnoxious
Y ? N Mard-to-meet
Y ? N Friendly
$Y$ ? N Stimulating
Y ? N Inconsiderate
Y ? N Open-minded
Y ? N Complaining
y ? N Ambitious
Y ? N Imaginative
y ? N Confident
y ? N Unreliable
y ? N Prejudiced
Y ? N Aprogant
Y ? N Studious

Think of your Courses this semester. What are they like most of the time? Circle:

Y for "Yes" If the word does describe your Courses,
N for "NO" If it does. NOT describe your Courses,
? If you cannot decide.

## COURSES

Y ? N Creative
y ? $N$ Irrelevant
Y? R Routine
$Y$ ? N Interesting
Y ? N Ofsappointing
Y ? N Enjoyable
Y?N Repetitive
$Y ? N$ Disorganized
Y ? N Worthmhile
Y ? N Frustrating
Y ? N Boring
Y ? N Exciting
$Y$ ? $N$ Satisfying
$Y$ ? $N$ Unpleasant
$Y$ ? $N$ Challenging
Y ? $N$ informative.

Think of your Financial Sittuation this serescter. How well does each of the following words describe your finances? Circle:

Y for "Yes" if the word does describe your finances,
N for "WO" if the word does NOT describe your finances,
? if you cannot decide.

FINAMCES
Y ? N Broke
Y ? N Inadequate
Y ? N hell off
y ? N Secure
Y ? N Indebted
Y ? N Tight
Y ? N Satisfactory

33

Think of the College Administratorsm with whom you have had cortact (e.gi, Deans, Department Heads, Registrar....). How well does each of the following words describe them? Circle:
y for "yyes" if the word does describe Administrators, $N$ for "NO" if it does NOT describe Adurinistrators, ? if you cannot decide.

## COLLEGE ADMINSTTRTTORS

Y ? N Intelligent
Y ? N Admirable
Y ? N Intolerant
Y ? N Credible
Y ? N Ambitious
Y ? N Arrogant
Y ? N Impractical
Y ? N Deceptive
Y ? N Respected
Y ? N Unhelpful
Y ? N Impartial (fair)
Y ? N Competent
y ? N Honest
Y ? N Inconsistent
Y ? N Inflexible
Y ? N Cammon-sensical
Y ? N Conscientious
Y ? N Concermed
Y ? N Understanding
Y ? N Stubbom
Y ? N Disorganized

Think of the Non-Course (extran curricular) Activities in which you have participated. How well does each word describe those activities? Circle:
y for "YESS If the word does describe your activittles, N for "MOO" if it does NOT describe your activitites,
? if you cannot decide.

## NON-COURE ACTIVITIES

Y ? N Limited
Y ? N Important
Y ? N Tiring
Y ? N Creative
Y ? N Repetitive
Y ? N Disorganized
Y? H Fun
Y ? N Stimulating
Y ? N Relaxing
Y ? N Disappointing
Y ? N Exciting
Y ? N Horthless
Y ? N Easily-accessible
y ? N Relevant
Y? N The Pits
Y ? N Enjoyable
