ABSTRACT

As part of a multiphased evaluation of vocational training provided by the Job Corps in fiscal year 1982, an assessment was made of the relative effectiveness of current Job Corps training operations. To arrive at an estimate of overall effectiveness, the researchers weighed the following factors: job-placement percentage, average wage of job, cost per training year, cost per job placement, absolute growth of new job openings from 1980 to 1990, and percentage of occupational growth for the same decade. Receiving the highest ratings were the following training areas: electronics technician, heavy equipment repairer, deckhand, clerk typist, machine operator, solar installer, auto body repairer, railway clerk, and kitchen helper. The following training programs were rated among the least effective: stenographer, nursery school teacher, duplicating machine operator, medical lab technician, and mail clerk. (Included in this report and its appendix are a series of tables detailing the relative effectiveness of Job Corps training provided for 108 occupations.)

## I. Introduction

This assessment and rating of current Job Corps occupations provides comparisons of current vocational offerings with each other, and, where it exists, a differentiation within occupations by major types of training providers. Thus, the review focuses on internal comparisons of vocational offerings. The study is not intended as an assessment of the overall effectiveness of the Job Corps vocational program.

To determine which of the vocational occupations in which Job Corps currently provides training have been relatively more effective than others, a method of comparing occupations was needed. A review of the literature was conducted to pick a suitable analysis system. The system chosen is based on ranking the performance of each occupation according to a predetermined set of criteria. Points are awarded to the occupation dependent upon its rank in relation to other occupations ranked on the same criteria. This method of analysis is well documented. The National Center for Research in Vocational Education called it the "Feature Analysis Method" and suggested that it be used for vocational program planning.<sup>1</sup> The Bureau of Labor Statistics (BLS) used a similar ranking system, employing decile scoring to rate occupations for "attractiveness" -- comparing them on growth, earnings and unemployment rates.<sup>2</sup>

---

<sup>1</sup>Using Labor Market Information in Vocational Planning, Research and Development Series No. 228, The National Center for Research in Vocational Education, Ohio State University, Columbus, Ohio.

<sup>2</sup>Wash, Patrick D., "Comparing Occupations: Four Measures," Occupational Outlook Quarterly, U.S. Department of Labor, Bureau of Labor Statistics, Fall, 1982.

Using a decile scoring system to compare training occupations is a method that is especially rational in a recession-plagued year. For example, between FY 80 and FY 82, overall Job Corps placement fell from 68% to 54%. If an arbitrary measure, such as a 50% job placement rate had been used to evaluate occupational training effectiveness, many programs would have been jeopardized. However, by scoring those occupations in relation to the performance of other occupations in the same year, the overall effect of the recession is eliminated and the need to make arbitrary judgments and cut-offs is alleviated. The decile system makes this comparison by awarding points to an occupation according to its rank on a chosen criterion. The higher the rank, the more points, the lower the rank the fewer the points.

## II. Methodology

The following criteria were used to rate Job Corps training occupations. They represent measures of success in past performance, relative cost, and future potential.

1. Percent Job Placed - The percent of corpsmembers (who were in Job Corps more than 90 days) placed in a job within three to six months after termination. High job placement rates denotes relative occupational effectiveness and is desirable.

2. Average Wage of Job - The average wage received by corpsmembers (in Job Corps more than 90 days) in each occupation who were job placed within three to six months after termination. The higher the average wage, the higher the ranking of the occupation.

3. Cost Per Training Year - All direct vocational training related costs, except capital costs, for each occupation divided by the number of corpsmembers years of training time in the occupation. (A corpsmember year may be one corpsmember trained for an entire year or three corpsmembers trained for four months apiece, etc.): Low training year costs are desirable.

4. Cost Per Job Placement - All direct vocational training related costs, except capital costs, for each occupation divided by the number of corpsmembers (who were in Job Corps for more than 90 days) placed in jobs. Low cost per job placement is desirable.

5. Absolute Growth 1980-90 - The Bureau of Labor Statistics' (BLS) projected number of new job openings from 1980 to 1990. The more new job openings, the better the rating of the occupation.

6. Percent Growth 1980-90 - The degree an occupation is expected to grow in relationship to its present size. If the BLS projected percentage growth is high, the rating of the occupation is high.

In FY 82, there were 80 distinct training occupations for which Job Corps trained at least 25 corpsmembers (who stayed longer than 90 days) nationally. Training in these occupations was procured by three different groups; Civilian Conservation Centers (CCC), National Contractors [unions and the National Association of Home Builders (NAHB)] and local centers. There were 66 center-contracted training occupations, 27 nationally contracted training occupations (19 union and 8 NAHB), 12 additional Civilian Conservation Center training occupations and three occupations which had more than 25 trainees

when the trainees from centers were added together with others from either CCC or national contractor training programs. These 108 training occupations, separated by type of training provider, were analyzed and scored according to their rank on each of the six criteria listed on the previous pages.

The following steps were taken to rank training occupations for relative effectiveness utilizing the BLS decile scoring system.

1. Each training occupation was ranked on each of the six criteria. The occupation scoring highest within each criteria was ranked first and the one scoring lowest, last (see Table V-A). Four of the criteria, percent job placed, average wage of job, cost per job placement and cost per training year, were used to rank all 108 training occupations which represented the 80 distinct occupations broken out by training provider (Center, CCC or national contractor). The two criteria dealing with labor force projections were used to rank only the 80 distinct occupations because the projections did not differ according to the training provider.

2. The six ranked lists were divided into deciles. For example, the list of 108 occupations, ranked according to percent job placed, was divided into 10 almost equal parts, with the first ranked 10 or 11 occupations in decile 10, the second 10 or 11 occupations in decile 9, etc. (see Table V-A-1). Following each ten ranked occupations a dividing line was drawn, unless the line would separate two occupations of equal or almost equal performance. In that case, the line was drawn after the 11th occupation. Therefore, two deciles contain ten occupations and eight contain 11 occupations for a total of 108 occupations divided into tenths, or deciles.

3. Training occupations were awarded points according to their decile ranking. If an occupation was in the tenth decile it received 10 points. Nine points were awarded an occupation in the ninth decile, eight points for the eighth decile, etc. The maximum point total an occupation could receive on a single criterion was ten -- the lowest was one (see Table V-A).

4. The decile scores for each criterion were added to obtain an unweighted effectiveness score for each occupation. (see Table V-B-1, total unweighted score.)

The unweighted score shown in Table V-B-1 would indicate the relative effectiveness of each of the training occupations if all six of the rating criteria were judged to be equally important. Using the unweighted score, average wage of job is just as important as percent job placed because an occupation can receive ten points for either variable dependent upon their decile ranking. However, most vocational educators would most likely judge percent job placed to be more important in judging the success of a training occupation than the average wage of the job, particularly in the case of entry-level occupations. Similarly, Job Corps professionals might view some of the criteria as being more important than others in rating effectiveness. For this reason, key administrators in Job Corps were asked to weight the six criteria according to their importance in judging Job Corps training occupation effectiveness.

According to the administrators, the most important variable in judging the relative effectiveness of an occupation within Job Corps was job placement. Two of the six criteria are directly related to job

placement--percent job placed and cost per job placement. They felt that because job placement is the immediate desired outcome of the Job Corps program, these variables should be weighted highest.

Average wage of the Job, while a valid factor in occupational effectiveness, was judged to be a less important criteria than job placement. It was acknowledged that entry level jobs traditionally are low paying and that the primary concern is to obtain employment and subsequent work experience for the corpsmembers.

Cost per training year was judged to be important for judging relative effectiveness but less so than cost per job placement.

The two projection variables were considered necessary for ensuring that Job Corps is training in occupations that will continue to produce an employment market for their trainees. However, general projections for the population as a whole were judged to be less important in rating an occupation than the proven placement rates of the Job Corps population.

Between the two projection variables, absolute growth, the number of jobs by which each occupation is expected to increase between 1980 and 1990, was considered to be more important than percentage growth. Large occupations, with high actual numbers of new job openings, were viewed to be better able to absorb Job Corps trainees than were smaller occupations, even if their percentage growth was large.

The six criteria represent a relative balance among the three considerations of past performance, relative cost, and future potential. Table A illustrates the weights of these variables as they were assigned by the Job Corps administrators.

TABLE A  
Weights of Variables

Criteria	Weight
1. Percent Job Placed	4
2. Average Wage of Job	1
3. Cost Per Job Placement	4
4. Cost Per Training Year	2
5. Absolute Employment Growth 1980-1990	2
6. Percentage Employment Growth, 1980-1990	1

### III. Analysis

The decile scores for each of the six criteria (Table V-B-1) were multiplied by their weight assignments to obtain a weighted score for each occupation on each criterion. These weighted scores were then added to obtain the total weighted score shown in the last column of Table V-B-1. The total weighted scores indicate the relative effectiveness of each occupation when compared to other Job Corps training occupations using this scoring system.

Table B shows the 108 training occupations ranked in order of their total relative effectiveness score. The table lists the number of trainees who were in Job Corps at least 90 days, the training provider (Center, CCC or National Contractor) and the total weighted effectiveness score for each of the training occupations. In case of a tie in the score, the equally scored occupations were ranked in order of number of trainees.

U.A.W.	United Automobile Workers
U.B.C.J.A.	United Brotherhood of Carpenters and Joiners of America

The maximum possible weighted relative effectiveness score was 140 and the minimum was 14. The top-ranked training occupation was Auto Parts Clerk with a score of 126. Twelve occupations had a point total of 100 or more. The occupation scoring the lowest was Mail Clerk with a total score of 29. Six training occupations had scores lower than 50. Half of the occupations scored 78 or above and half of them scored 78 or below (median score).

Value judgements are inherent in any weighting system. Therefore, the results of the weighted scoring system was checked against a ranked list produced by using the unweighted scores of occupations as reported in Table V-B. The unweighted ranked occupations are displayed in attached Table V-C. The final ranked list produced by the weighted scoring (Table B) showed results similar to the unweighted rankings (Table V-C). Only four of the 33 training occupations in the upper groups of the unweighted rankings were not also in the upper group in the weighted ranks. Only seven of the 36 occupations in the bottom group of the weighted rankings were not also in the bottom group of the unweighted list. The weights assigned made minimal differences in judging the comparative effectiveness of training occupations within Job Corps. This indicates that the weights provided by the Job Corps managers were relatively balanced between outcome measures and cost variables, but slightly less emphasis was placed on the labor market projections in the weighted scheme causing some minor shifts.

#### IV. Results

The 108 rated occupations were divided into three groups -- upper, middle and lower. The upper group, or those occupations scoring 85 points or more, are performing well in comparison to other Job Corps training occupations. To be in the upper group, these occupations have to have a good rating in either past performance, relative cost, future potential or some combination of these criteria. None of these occupations showed excessive cost per job placement (as indicated on Table B by "\$") or negative future growth (&). Those above the upper standard deviation line can be considered especially solid training occupations for the Job Corps population.

The middle group, those occupation scoring from 71 to 84, are considered acceptable training occupations. Either their past performance, relative cost or future potential was positive enough for them to be scored in this category. The occupations of Clerk Typists and Auto Service Repair, both trained by national contractors, are exceptions in this category. They each have cost per job placement rates exceeding twice the national average as indicated by the dollar signs (\$) on Table B.

The bottom group includes those occupations scoring 70 or fewer points. Occupations in this group have either relatively low job placement rates, relatively high costs and relatively low growth potential or some combination of these factors. Within this bottom group are several training occupations that also have excessive costs (\$) or negative growth (&). These occupations, along with the 16 occupations below the lower standard deviation line, are candidates for particularly close

examination at each local center which is providing the training.

The type of training provider or contract procurement group sometimes made a distinct difference in the relative effectiveness outcome and sometimes it did not. For example, Clerk General, trained by both national and center contractors, had scores of 98 and 96. Plumbers, also trained by these two groups had similar scores of 81 and 77. Electricians for both groups did well (scores of 99-90). Combination Welders did a least "fair" when training was procured by any of the three groups. Heavy Equipment Operators and Repairers were in the bottom third for both national and center contractors.

In other cases procurement type did make a difference in relative effectiveness score for a training occupation.

(1) Cement Mason training is in the middle group at CCCs but in the bottom group when provided by center and national contractors.

(2) Brick/Stone Mason training is in the upper group at centers and CCCs, in the middle group when provided by NAHB, and in the lower group when provided by the union contractor.

(3) Custodial Maintenance is in the middle group at centers and when provided by national contractors but in the bottom group at CCCs.

(4) Cooks are performing relatively better at centers than at CCCs.

(5) Auto Service Repair is in the upper group at centers and CCCs but has been flagged for excessive costs when provided by national contractors.

(6) Auto Mechanic Helpers are in the upper group at centers but in the bottom group at CCCs.

(7) Clerk Typist training is doing very well when procured by centers, shows high cost with National Contractors and is in the lower group and has high costs at CCCs.

Some of these differences may justify replacing one procurement group with another rather than eliminating the training occupation at the center.

This section of Documentation Report No. 5 has provided a summary of the findings of the comparative performance of the current Job Corps occupations according to a set of specified criteria. The Final Report contains specific recommendations regarding actions to be taken as a result of the findings of the review.
