ABSTRACT

Results from the National Center for Education Statistics' (NCES) 1979 Residence and Migration survey that are particularly relevant to higher education policy issues are discussed. Data are provided on the rankings of states by net in-migration and net out-migration of first-time freshmen, and the net migration of first-time freshmen, undergraduate transfer students, graduate students, and first-time professional students. Foreign student enrollments, enrollment by control and classification of institution, and changes in migration since 1949 are reported. Findings include the following: (1) since 1938, New Jersey, New York, Illinois, and Connecticut have experienced substantial net losses of students to other states; (2) the top five ranked states for net in-migration of first-time freshmen students are North Carolina, Massachusetts, Tennessee, Texas, and Arizona; (3) Massachusetts, New York, Connecticut, and Pennsylvania heavily enroll out-of-state students in the private sector; (4) Arizona, California, and Texas heavily enroll students in the public sectors; and (5) in 1979, 87 percent of all first-time students remained in their home state to study. It is noted that residence and migration data are also useful at the institutional and intrastate level. (SW)

Working Paper Series

Working papers can cover a broad range of subjects and treat them at various depths. Primarily, they represent progress reports or initial investigations—a literature survey that we would like to share with others, for example, or a description of and rationale for a new concept on which we would like the research community to comment.

Additional copies of this and similar documents prepared in the course of research, development, and service projects at NCHEMS may be obtained at the prevailing cost of duplication and distribution. Because this is a working paper, individuals wishing to quote or reproduce it, in whole or in part, are asked to secure permission from NCHEMS. For a list of titles and current prices, write:

Enrollment Analysis Project

National Center for Higher Education Management Systems
P.O. Drawer P Boulder, Colorado 80302

An Affirmative Action/Equal Opportunity Employer

The work upon which this publication is based was performed by NCHEMS as part of the project on Enrollment Analysis at the State Level funded by The Ford Foundation. It does not necessarily reflect, however, the views of that agency.

Residence and Migration of College Students

Over the last decade, there has been little regard for the enrollment patterns of students. Now, however, these patterns are increasingly of interest to colleges, universities, state-level agencies, and legislative and executive staffs. The interest of these groups will grow as they develop policies to deal with the threat of unstable and shifting enrollments.

There are a variety of factors that influence enrollments in higher education. One of these factors is the demographics of the traditional college-age population. Trends now show that a 24 percent decline in this population can be expected over the next decade (WICHE 1979). Some regions of the country will be affected more sharply than others. A second important factor related to enrollments is the participation rate of the population going to college. The participation rate of the traditional college-age students, 18-21 year olds, peaked in 1974 at 33.5 percent and then decreased to 31.9 percent by 1979 (Tierney forthcoming). A third factor that influences enrollments, and a factor that is sometimes overlooked, is the mobility of students. This number has gradually been changing since 1949. A greater proportion of students now remain in their home states for their college education.

The third factor, like the second, is one that can be affected by educational policies. Granted the important role of economic issues such as the cost of transportation, it is also true that educational policies such as those relating to out-of-state tuition rates, admissions preferences, and specifics of student aid policies (for example, portability of state-funded student assistance) will clearly influence the extent and the direction of student migration. This report attempts to show current residence and migration patterns and suggests how these data can be useful.

The National Center for Education Statistics (NCES) conducts a survey at irregular intervals entitled "The Residence and Migration of College Students." This survey reports the numbers of students enrolled in each institution from each state. The most recent data now available were gathered as part of the Higher Education General Information Survey (HEGIS) of 1979-80. It will be some time before the data from the most recent survey, fall 1981, are available. Previous years in which the residence data were collected are 1949, 1958, 1963, 1968, 1972, and 1975.

The data collected in the fall 1979 survey differ from the data collected in previous years. In past surveys data were collected for all students enrolled in an institution by level, sex, and full-time or part-time status (or some variation of this). The fall 1979 survey collected data only on students enrolled for the first time in the reporting institution by level, and full-time or part-time status. The lack of consistency in the data collected makes direct comparisons difficult. It may be reasonable, however, to make general comparisons of trends. The format of the survey used in fall 1979 is to be the basic format of forthcoming surveys. This year can serve, then, as the base year for future analyses. See the glossary for the definitions used in the 1979 survey.

For the 1979 survey, 94.4 percent of the 3,188 institutions that were sent questionnaires responded to the survey. NCES estimated the enrollments for the nonresponding institutions (Smith 1981).

Nature of the Data

Since public institutions usually charge out-of-state tuitions, and private institutions typically do not, public institutions may have more accurate records than private institutions on home state residence. This could be reflected in the data reported. The accuracy of the data will also be influenced by the students' integrity in reporting their residence. It is very difficult to estimate the number of students who misrepresent their home state in order to pay in-state tuition rates.

Determining residency for college students presents difficult definitional problems. Generally it is easier to examine the residence and migration of first-time freshmen than of other student levels. The majority of first-time freshmen are the traditional college-age population (18-21 year olds) who have probably just graduated from high school. The data they report for their home state are likely to be more accurate than the data supplied by students at other levels. A student enrolling in graduate school will usually be classified as a resident of the state of his undergraduate degree. The same problem exists for transfer students. Frequently a student will go out of state his first year, but complete his education in his home state. Although he has been a resident of the state, he may be classified as an out-of-state student.

Data for part-time and full-time students have been combined into one category for the purpose of this report. The majority of the students reported will probably be full-time students, since the majority of students do not opt to attend an out-of-state school on a part-time basis. One exception to this rule is the commuter student who lives near a state border and attends school in the neighboring state.

Even though data on foreign students were collected as part of the survey, these data were excluded from many of the analyses in this report. It is believed that since every state receives some foreign student enrollments, that most states will have a net in-migration if the foreign and territorial students are included (Wade 1970). This situation could distort the picture of the migration of students from state to state, and it is the interstate flow of students which is the primary focus here. Thus, most of the tables include only the 50 states and the District of Columbia. In a number of cases, data collected about students going to or coming from the territories of American Samoa, Canal Zone, Guam, Puerto Rico, Trust Territory of the Pacific Islands, and the Virgin Islands were also excluded from the analysis. Unless it is specifically stated that students from foreign countries or territories are included, they are excluded from the analyses. There is a brief section devoted specifically to foreign student enrollments.

Results from the 1979 Survey

The results from the 1979 Residence and Migration survey that we consider most relevant to policy issues in higher education are included in this paper. For other aspects of the survey, see the NCES publication Residence and Migration of College Students Fall 1979.

First-Time Freshmen

Figure 1 is a map of the net migration of first-time freshmen. Net migration is calculated for each state using the following formula:

$$\text{Net Migration} = \text{In-migration} - \text{Out-migration}.$$

The figure is negative if the state is an exporting state (that is, if the state loses more students than it receives) and positive if the state is an importing state (gains more students than it loses). Although the net out-migration states are dispersed throughout all regions of the country, the north and central regions lose larger numbers of students than other regions.

Table 1 ranks the states by net in-migration and net out-migration of first-time freshmen. There are 17 states that are net exporters of students. Illinois is the only state ranked among the top five exporting states that is not in the northeast region.

Since 1938, New Jersey, New York, Illinois, and Connecticut have reported substantial net losses of students to other states (Steahr and Schmidt 1972). The 1979 survey continues the trend. These four states rank as the top four states in absolute numbers for the net out-migration of first-time freshmen. Note that the net migration from these exporting states is substantially larger than the net migration for the top ranked importing states. For example, New Jersey net exports 25,217 first-time freshmen, whereas, North Carolina, the leading state for importing first-time freshmen, net imports 6,345 students.

Three of the top five ranked states for net in-migration of first-time freshmen students are in the South: North Carolina ranks first; Tennessee, third; and Texas, fourth. Massachusetts, a New England state, ranks second, with Arizona (Southwest), fifth.

For all except five states (excluding Alaska and Hawaii), the largest number of first-time freshmen out-migrants enrolled in a contiguous state. The five exceptions and the states in which the largest number of their out-migrants enrolled are:

<u>Home State</u>	<u>Attended College In</u>
Colorado	California
Maine	Massachusetts
Montana	Washington
Texas	California
Washington	California

Note that two of these pairs of states are almost contiguous (Maine and Massachusetts, and Montana and Washington) and the other three pairs are western or southwestern states that export to California. This suggests that the majority of students who attend school out-of-state typically remain in their own region of the country.

There are several ratios that can be used to analyze the migration of students. Two ratios have been chosen for use in this paper:

$$(1) \frac{\text{Number of students leaving their home state to enroll out-of-state}}{\text{Number of students from that state enrolled anywhere in the U.S.}} = \text{Out-migration Ratio}$$

The out-migration ratio allows each state to determine the percentage of students it is losing to other states. As a policy issue, a state may decide to try to decrease that percentage by retaining more resident students in the state. This ratio will help a state express its objectives for retaining resident students in concrete terms, and over time will help determine if state policies and actions intended to change the pattern show results.

$$(2) \frac{\text{Number of students migrating into a state}}{\text{Total number of students enrolled in the state (excluding foreign students)}} = \text{In-migration Ratio}$$

The in-migration ratio shows the proportion of out-of-state students enrolled in a given state. This ratio could be used by a state considering raising out-of-state tuition. For example, if the in-migration ratio is high, that is, if out-of-state students are a significant factor in enrollment, the state may want to assess carefully the impact of a tuition hike on those students.

Examples of both ratios are given below, expressed as percentages, using data for the state of Alabama.

- (1) There are 33,823 first-time, Alabama freshman (table 2) enrolled within and without their home state. Of these students, 2,704 Alabama residents leave the state to study elsewhere (table 4). Thus, ratio 1, the number of students leaving the state to the number of state students enrolled is 8.0 percent.

California has the smallest out-migration ratio (3.1 percent) for first-time freshmen, with New Hampshire having the largest (35.2 percent).

- (2) For the state of Alabama, 37,948 first-time freshmen are enrolled in the state (table 3). 6,829 students enrolled in Alabama from another state (table 5). Thus ratio 2, the number of students coming into the state to the students enrolled in the state is 18 percent.

Vermont and the District of Columbia, both with small populations, have very high immigration ratios at 57.7 percent and 57.0 percent respectively. California with the smallest out-migration ratio, also has the smallest in-migration ratio at 4.3 percent.

Undergraduate Transfer Students

A map of the net migration of undergraduate transfer students enrolling in the reporting institution for the first time is shown in figure 2. There are 27 states that are net exporting states for transfer students. This includes 14 of the 17 exporting states for first-time freshmen, plus an additional 13 states. Montana, Oklahoma, and Florida are the three states that are exporters of first-time freshmen, but importers of transfer students. The turnabout could be related to the problem of classifying a home state for transfer students.

The states exporting and importing first-time undergraduate transfer students are ranked in table 6. For the five top-ranked, exporting states of transfer students, four of the five ranked among the top five states for exporting first-time freshmen.

Texas is the only state that is ranked in the top five states for importing both transfer and first-time freshmen students. Joining Texas (ranked third) as importing states are California, Oklahoma, Utah, and Alabama. Oklahoma is listed as an exporting state for first-time freshmen.

For transfer students there is less variation in the number of students entering and leaving the states, compared to the pattern for first-time freshmen. This disparity could be another example of the difficulty in classifying the home state of transfer students.

The two ratios discussed for first-time freshmen are also shown in tables 4 and 5 for undergraduate transfer students. The number of students going out of state in table 4 and the number of students migrating into the state in table 5 are listed under the column labeled N. Ratios for each are in the percentage column.

Graduate Students

The net migration map for graduate students is shown in figure 3. A slight majority (27) of states are net exporting states for graduate enrollments. Many of these states are also net exporting states for either freshmen or transfer students; however, three of the states that are large net exporters of undergraduate students are net importers of students at the graduate level. These states are Illinois, Michigan, and Ohio.

Table 7 ranks the states by net migration of graduate students. New Jersey and New York are the leading exporting states for first-time freshmen, transfer, and graduate students.

As with transfer students, there is a more even distribution in the numbers of students who are in-migrants and the number of students who are out-migrants. For example, New Jersey, the leading net exporting state, has a net migration of 3,354. The District of Columbia, as the top-ranked net importing state, has a net in-migration of 2,938 graduates.

The two analytical ratios for graduate students are shown in tables 4 and 5. The number of in- and out-migrants are listed in the N column; the ratios are listed as percentages.

Professional Students

The ranking of the states for the net migration of first-time professional students are found in table 8. Thirty-three of the states are net exporting states for these students. It is not surprising that first-professional students migrate out of state in view of the unequal distribution of opportunities for professional study across the states (Peterson and Smith, 1970). For example, Colorado, Florida, and Louisiana do not have schools of optometry in their states; therefore, students must leave those states if they desire to study in that field. The analytical ratios for the professional students are found in tables 4 and 5.

Unclassified Students

Although the NCES survey requested that the institutions report data on unclassified students, the data will not be commented on in this discussion. However, information reported on the unclassified students can be found in tables 2, 3, 4, and 5.

Total First-time Students

In the fall of 1979, 533,544 students migrated to an out-of-state institution. This figure includes only students migrating to one of the fifty states or the District of Columbia. The breakdown of the students by level migrating out of state is shown in table 9. The student's level of study appears to have a significant effect on the student's decision to enroll in his home state. As might be expected, first-professional students migrate out of state proportionately more than any other level, followed by graduate students, undergraduate transfers, and finally freshmen.

Foreign Student Enrollment

Foreign student enrollments made up 2.4 percent of all new student enrollments at institutions in fall 1979. Table 10 lists the number of new foreign enrollments in Fall 1979 by state. Also included in this table are the foreign student enrollments as a percentage of the total state enrollment; the range is from 0.3 percent in Alaska to 8.5 percent in the District of Columbia. The second percentage is foreign student enrollments, as a percentage of total foreign student enrollment in the United States. Over 42 percent of the first-time foreign student enrollment is concentrated in four states. California is the leader enrolling 22.1 percent of the total, followed by Texas with 8.2 percent, New York with 7.1 percent, and Florida with 5.2 percent of the foreign enrollments. The other 58 percent of the foreign enrollments are widely dispersed throughout the remaining states.

Enrollments by Control and Classification of Institution

With respect to the aggregate number of all of the in-migrating students (including foreign enrollments) that enroll for the first time at an institution, the private and public sectors enroll approximately the same percentage of students. However, as table 11 shows, migration to a public as opposed to a private institution varies according to region. For example, a student migrating into New England is more apt to go to a private institution, whereas a student migrating into the Far West will probably enroll in a public institution. The reason for this may simply be that there is a high concentration of private institutions in New England and proportionately more public institutions in the West. Private institutions, with a few exceptions, may also have a relatively higher profile in the East than in the West. In the Great Lakes and Plains, migrating students are about evenly split between public and private institutions.

Using the NCHEMS taxonomy for classifying types of institutions, we can see in table 12 that the largest portion (35.6 percent) of in-migrating students enrolling at an out-of-state institution attend a major doctoral institution. (Note that all students including foreign enrollments are included in this table.) The comprehensive, general baccalaureate, and two-year classifications enroll almost equal proportions of students, at 19.5 percent, 18.0 percent, and 18.2 percent respectively. Table 12 also provides a detailed breakdown of migration by type of institution within geographical region. For example, in New England, the Mid East, and the Great Lakes, less than ten percent of the students who migrate attend a two-year school. In the Far West this number is over 40 percent.

Tables 13 and 14 provide additional detail for the data in table 12. These two tables list the number of nonresidents (excluding foreign enrollments) in each state by the type of institution and by control: public or private.

A comparison of tables 13 and 14 reveals (total N) whether the public or private sector in such states attracts more out-of-state students. As might be expected, Massachusetts, New York, Connecticut, and Pennsylvania heavily enroll out-of-state students in the private sector. Correspondingly, Arizona, California, and Texas heavily enroll students in the public sectors.

Tables 13 and 14 show, by control of the institution, which classification of institution enrolls the most students. In Arizona, California, and Florida, all of which have large public community college systems, over half of the out-of-state students attending public institutions enroll in two-year institutions. Henderson (1977) identifies low tuition rates and the convenient locations of the two-year colleges as the attraction for prospective students.

Just as tables 13 and 14 allow administrators to know the types of institutions in their state to which out-of-state students are attracted, tables 15 and 16 allow administrators to know the types of institutions into which students from their state are migrating. Table 15 is for the public sector, table 16 is for the private. A comparison of tables 15 and 16 shows that students from a majority of the states attend public institutions.

Changes Over Time

The 1979 residence and migration data indicate that 87 percent of all first-time students remained in their home state to study. This percentage represents the latest in a series of gradual increases in the proportion of college students remaining in their home state since 1949 (Elden 1977; Linney 1979), as shown in the following data:

<u>Year</u>	<u>Proportion Enrolled in Home State</u>
1949	80%
1958	81%
1963	81%
1968	83%
1975	85%
1979*	87%

*1979 data included only first-time students whereas previous years also included continuing students.

Why are more students choosing to attend college within their home state? One reason might be the increased cost of going out of state. Tuition for nonresidents has risen dramatically at many public institutions. The problem is compounded by the increasing cost of living and travel costs to attend an out-of-state institution. Fewer students may be able to afford college outside of their home state.

Financial aid policies may also be a reason for fewer students leaving their home state. There is often a stipulation in state-supported financial aid that the aid is not portable to another state. Of course, this explanation does not apply in the case of federal financial aid for 1979, but the future cuts planned for federal aid may impact the mobility of students.

Some state agencies and state institutions are also discouraging out-of-state students from attending their schools. They have the philosophy that they must first take care of their own students. They may establish rules for admitting resident students first, or as noted earlier, set very high tuition rates for nonresidents. Some institutions also have set ceilings on the number of out-of-state students that can be admitted.

Other Levels of Analysis

Although this discussion has concentrated primarily on data relating to individual states or the country as a whole, the residence and migration data are also available and useful at the institutional and intrastate levels:

- (1) State agencies may be interested in determining which particular institutions are enrolling the students who migrate out of state and why. For example, it turns out that most of the students who migrate out of Minnesota attend institutions that are located within 50 miles of the Minnesota border. One factor that undoubtedly contributes greatly to this situation is that Minnesota has complete tuition

reciprocity with three of the contiguous states (North Dakota, South Dakota, Wisconsin) and a limited agreement with Iowa.

(2) An analysis by sector may also be useful. That is, when students leave the state, in what types of institutions do they enroll--public or private institutions, two-year or baccalaureate colleges, or research universities?

(3) At a somewhat higher level of aggregation, a state may also want to know which states are enrolling its outmigrating students. As mentioned earlier, most states export primarily to contiguous states, which is not surprising; but what is the attraction of other, noncontiguous states? Is it that they are also simply nearby, or can other factors be identified?

(4) Institutions can, of course, analyze their own data to discover where their students originate. Many institutions use data at the county level or other service areas in looking at the origins of in-state students.

In short, residence and migration data can be useful for analyzing enrollments, or employing marketing strategies, or making policy decisions in higher education. The data show patterns of student behavior that are interesting from a number of perspectives and levels of analysis.

Table 11

Percentage Of All First Time Students At An
Institution Migrating Into A Region
By Control of Institution
Fall 1979

Region Into Which Students Migrate*	Control	
	Public	Private
New England	20.1%	79.9%
Mid East	27.9%	72.1%
Great Lakes	53.4%	46.6%
Plains	50.3%	49.7%
Southeast	60.0%	40.0%
Southwest	71.9%	28.1%
Rocky Mountains	60.7%	39.3%
Far West	70.8%	29.2%
Outlying Areas (all regions)	52.2%	47.8%
All Regions	51.3%	48.7%

*The states defining the regions are as follows:

1. New England (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)
2. Mid East (Delaware, District of Columbia, Maryland, New Jersey, New York, Pennsylvania)
3. Great Lakes (Illinois, Indiana, Michigan, Ohio, Wisconsin)
4. Plains (Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota)
5. Southeast (Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, West Virginia)
6. Southwest (Arizona, New Mexico, Oklahoma, Texas)
7. Rocky Mountains (Colorado, Idaho, Montana, Utah, Wyoming)
8. Far West (Alaska, California, Hawaii, Nevada, Oregon, Washington)
9. Outlying Areas (Canal Zone, Guam, Puerto Rico, Virgin Islands, American Samoa, Trust Territory)

Table 12

Percentage Of All First Time Students* Enrolling At An Out-Of-State
Institution by NCHEMS Classification of Students by Region

Region	NCHEMS Classification						Total

Glossary

Definitions Used In the Fall 1979 Residence and Migration Survey

Home State. The state in which a student legally resides when first admitted to the institution at the current level. (Note that institutional policies and state laws may differ in defining a resident.)

Foreign Student. A student who is a citizen of a country other than the United States and who is in the United States on a temporary basis

First-time students. Students enrolled at the institution at the undergraduate, graduate, first-professional, or unclassified level, who have never been enrolled in the institution before

Undergraduate. Students enrolled in a four- or five-year bachelor's degree program, an associate's degree program, or a vocational or technical program; undergraduate students are further divided into:

(1) **First-time freshmen.** Entering freshmen who have not previously attended any college; this category includes students who first enrolled at the institution in the summer of 1979

(2) **Undergraduate transfer student.** Students transferring from another institution without a baccalaureate degree

Graduate students. Students holding a bachelor's or first-professional degree, and who are working toward a master's or doctor's degree

First-professional. Students enrolled in a professional program which requires at least two years of previous education for entrance and a total of at least six years for a degree

Unclassified. Students not enrolled for a degree, but enrolled in regular credit courses

Full-time students. Students enrolled with a course load of at least 75 percent of the normal full-time load

Part-time students. Students enrolled with a course load of less than 75 percent of the normal full-time load
