## ABSTRACT

The Austin (Texas) Independent School District's Office of Research and Evaluation revised its surveying procedures in 1982. To reduce the demands on teachers and administrators, various surveys were consolidated and administered $c \cdot 2$ a regular basis. Teachers and administrators were surveyed every fall and spring, high school students in winter, and parents and graduates occasionally. Computers were used to sample subgroups and compile questionnaire items for each respondent. The information needs of administrators, the superintendent, and board members were solicited. Results were delivered on a computerized printout, and responses were positive. Procedures for producing answer sheets and coding the data were improved. It was also possible to quickly compile information needed for administrative planning. Items from the teacher survey and some copies of the Questions for Students questionnaire are appended. (GDC)

Paper presented at the American Educational Research Associution Annual Meeting, April 1986, San Francisco, California.

## DISCLAIMER

The opinions and conclusions expressed in this report are those of the author and do not necessarily reflect the position or policy of the Austin Independent School District or the Office of Research and Evaluation; no official endorsement should be inferred.

[^1]Everything They Ever Wanted to Know:
Information Gathering for Public School Decision Makers

In the 1980's those of us who deal with information and the public schools meet conflicting imperatives at every turn.

From the Board of Trustees: What does the community want? What do teachers think? Cut out paperwork.
From the administration: What do staff think? How are programs succeeding? What is happening in the schools? What do staff need? Cut paperwork.

From the teachers: Leave us alone and let us teach. Give us an opportunity to have input. Let us tell you how things really are. C̣ut paperwork.
From the evaluator: How are the programs going? Who has what opinions? How much paperwork is there?

Survey data can provide the obvious source of information for many of these needs, yet the natural conflict between the need for information and the real mandate to cut out excess paperwork may stall our best efforts.

In 1982 the Office of Research and Evaluation (ORE) of the Austin Independent School District (AISD) devoted resources to revising our survey procedures. In order to limit demands on teachers and administrators, we began to consolidate various District survey attempts into ORE, and produced a schedule of surveys which we would conduct on a regular basis. We planned for fall and spring teacher and administrator surveys, winter high school student surveys, and occasional parent and graduate surveys. Early efforts included developing programs for the District's IBM mainframe computer, accessing personnel and student data files to:

Select samples to meet designated requirements and identify each member of the sample by specified subgroups.
Assign specific questionnaire items (one at a time or in groups) to specific individuais, randomly assign general items to portions of the sample, and limit the length of eacl survey.
Print a unique questionnaire for each member of the sample, with the form identified only by a sequence number which matched a separate mail label.

We also began to communicate with central office administrators, the superintendent and board members, in an effort to accomodate their needs for information in our sehowing and producing surveys. These procedures were used for two years, printing the surveys on plain white paper with responses circled, checked, or written in. Retrieving the data was a complex process, requiring a unique number for each item and the responses keypunched or entered on a screen. We found very positive reactions among the decision makers, who much preferred a printout delivered to their desks to the effort of conducting their own surveys. We even found positive reactions among teachers, if we can interpret an $85 \%$ return rate as positive.

For the 1983-84 school year we had printed a "blank" continuous form answer sheet, with only an ID number field, and a response field for up to 24 individual item responses, able to be preprinted and scanned by the District's optical scanner. Our programmers then wrote programs to sample and assign items as before (a sample item assignment sheet is shown in Attachment A). They formatted the item printing to fit the new form, and to preslug the ID number as well as printing it. These forms were scanned when they were returned, the responses read to a tape, and analyses could be begun immediately. Open-response items were printed on a separate last sheet, kicked out by the scanner, and read and summarized as appropriate.

In fall 1985 ORE was requested by the superintendent to acquire information for planning, and from the first meeting to the date when printouts of results were delivered required only two months. This included time for staff review of items, and a reminder mailed to teachers who had not returned their surveys within ten days. This process provided information for staff planning without requiring a massive "new" data gathering effort, and convinced some staff that data gathered within a regular framework could meet their needs.

Three copies of the 1986 Questions for Students survey are attached to this document. Each survey is different - each student received a different assortment of items randomly assigned by the computer program. The surveys were printed in order by school, and then
in order according to the stuãent assignment for the period when the school prefered to administer the survey. The student surveys are printed with the teacher and studert names, so teachers can distribute the forms. Students are assured in directions furnished to the teacher that their responses are confidential, except on the vocational items, where names are provided to vocational counselors. Since this survey is used to furnish course interest information to vocational counselors, a printout of student names for each course by grade is provided to the counselor at each high school within a week after surveys are returned to ORE.

There are no canned programs for this process. It requires a computer data base, a programmer, and specially printed forms. It is probably not practical for a small school district. The philosophy behind the forms may te the important change for our District.

No longer are teachers and campus administrators in AISD bombarded with questionnaires for this study and that study from September to May. No longer are sheets of open-ended questions collected and stored. Data doesn't come too late, and if relevant answers are available on stable issues the questions are not repeated. All District information requests go through the central process. Items are edited for clarity, piloted as necessary, and assigned to the appropriate sample. Responses are reported to the decision makers in a timely manner, in a report format (Attachment B) they have been trained to understand. "Emergency" quick-turnaround efforts are possible, when routine procedures have not acquired data to address the latest crisis.

We may not be able to tell everyone "everything they want to know," but we can provide opportunities for staff input, get answers for decision makers, and cut down on paperwork, all at the same time.

Grade 9 students: Items 1, 3, 23, random 2 of group A, random 2 of group B, random 1 of group $C$
Grade 10 students: Items 1, 3, 23, random 2 of groip A, random 2 of group B, random 1 of group C
Grade 11 students: Items $1,3,23$, random 2 of group A, random 2 of group B, random 1 of group $C$, random 1 of group D
Grade 12 students: Item 3, random 3 of group B, item 18 to random $33 \%$ of students
PAL students: Appropriate grade level set, + group E

Group A: Items 4, 5, 6, 7, 8, 9 (Vocational)
Group B: Items 10, 11, 12, $13,14,15$ (General)
Group C: Items 16, 17, 18 (TEAMS)
Group D: Items 19, 20 (TEAMS grade 11)
Group E: Items 21, 22 (PAL)
