ABSTRACT

This brief report presents data from the sixth triennial survey of adult education conducted as part of the May 1984 Current Population Survey. The narrative provides information on the characteristics of adult education participants, courses and providers, reasons for taking adult education courses, and adult education course costs. These data tables are included: adult education participation by selected characteristics (age, race/ethnicity, school years completed, annual family income, labor force status, regions, occupation); adult education courses by sex of participants; providers of instruction taken by participants in adult education; reason for taking adult education courses by sex of participants; and source of payment for adult education course by sex of participant. The methodology used to prepare the report and these data is also described. (YLB)

Participation in Adult Education, May 1984

Over 23 million people participated in more than 43 million adult education courses¹ during the year ending May 1984, according to the Center for Statistics (CS), U.S. Department of Education. These data are from the 6th triennial survey of adult education conducted for CS by the U.S. Bureau of the Census as part of the May 1984 Current Population Survey.²

For this report, adult education is defined as any course or educational activity taken part-time and reported as adult education by respondents 17 years old and over.

Adult Education Participants, Year Ending May 1984

Almost 14 percent of the Nation's adult population participated in adult education. Over 55 percent were women. Blacks and Hispanics had lower participation rates than did whites. Of the black and Hispanic populations, about 8 percent enrolled in adult education; of white population, 15 percent enrolled.

About half the participants were under 35 years old, with the largest concentration in the 25- to 34-year-old range. Over 80 percent of all participants were employed; 4 percent were unemployed, looking for work. Professional workers, administrative support (including clerical), and executives, administrators, and managers composed over half of the employed participants.

The income of 46 percent of participants was over \$30,000; 32 percent had incomes between \$15,000-\$29,999; 18 percent, less than \$15,000.

Almost 92 percent completed high school, compared to about 73 percent of the general adult population. About 31 percent of participants lived in the South, 28 percent in the North Central region, 24 percent in the West, and 17 percent in the Northeast.

Courses and Providers

Over 43 million adult education courses were taken

¹Participants reported taking 43.1 million adult education courses. However, because of the survey form design, detailed information was obtained on only 40.8 million courses. Though participants could report the total number of courses taken the year ending May 1984, the survey form was designed to obtain detailed information on up to

from May 1983 to May 1984, with each participant averaging about 2 courses. The most popular were business courses, followed by engineering, and health care. These three fields accounted for about half of all courses taken. Similar to full-time college students, adult education participants made traditional male and female course choices. For example, 23 percent of men chose engineering, compared to 8 percent of women; and 15 percent of women chose the health care fields, compared to 9 percent of men.

Adult education courses are taken at a variety of places. Most courses were taken at traditional education institutions such as 2-year colleges (17 percent), and 4-year colleges and universities (17 percent). Business and industry provided 23 percent of courses taken by men. Two-year colleges or technical institutes provided 8 percent of courses taken by women.

Reasons for Taking Adult Education Courses

Almost two-thirds of adult education courses were taken for job-related reasons, such as career advancement. Nearly 8.5 million courses, or about 21 percent, were taken for credit. Of these, 26 percent were taken for a 2-year college degree, 24 percent for a bachelor's degree, 22 percent for a post-baccalaureate degree, 17 percent for a vocational certificate/diploma, and 11 percent for high school completion or 8th grade certificate.

Adult Education Course Costs

Almost half of adult education courses were paid by the participants or their families. Participants' payments totaled nearly \$3 billion during the year from May 1983 to May 1984, at an average course cost of \$152. Another fourth of all adult education course costs were paid by business and industry.

4 courses taken per participant. If a participant took 5 or more courses (as 5 percent did), there was no way to collect detailed information on the 5th, 6th, or 7th course. So, course information is based on the 40.8 million courses for which detailed data are available.

¹Participants reported taking 43.1 million adult education courses. However, because of the survey form design, detailed information was obtained on only 40.8 million courses. Though participants could report the total number of courses taken the year ending May 1984, the survey form was designed to obtain detailed information on up to 4 courses taken per participant. If a participant took 5 or more courses (as 5 percent did), there was no way to collect detailed information on the 5th, 6th, or 7th course. So, course information is based on the 40.8 million courses for which detailed data are available.

²Less than .5 percent.

So, course information is based on the 40.8 million courses for which detailed data are available.

²The payments made by participants or their families totaled to nearly \$3 billion during the year ending May 1984, at an average course cost of \$152.

³Includes any combination of above, private sources, or sources not specified.

Note.—Details may not add to totals because of possible multiple answers.

Methodology

The estimates in this report are based on data collected in the May 1984 Current Population Survey (CPS) by the U.S. Bureau of the Census. The monthly sample covers over 629 areas in the 50 States and the District of Columbia, and includes 58,000 households.

All persons 16 years or over were asked screening items from the main CPS questionnaire (CPS questions 29-38). A person was considered eligible to be administered the Adult Education Survey supplement (CPS 680) if, between May 1, 1983 and the interview date, he/she had taken

- adult or continuing education courses, noncredit courses, or educational activities;
- courses provided by correspondence, television, radio, or newspaper;
- private instruction or tutoring;
- courses or educational activities given by an employer, labor organization, neighborhood center, church, or community group;
- instruction for adults who have not finished high school; or
- any other organized educational activities or courses during the past 12 months.

Full-time students who also took courses part-time were also included as participants in adult education.

Census Bureau interviewers were instructed to obtain

responses for the Adult Education Survey (attachment) from participants. Proxy responses from other household respondents were accepted only if the person who participated in adult education was not available after repeated callbacks.

Since the CPS estimates are based on a sample, they may differ from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling.

The standard errors given in the following tables are primarily measures of sampling variability: i.e., of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected and surveyed under identical conditions, and if an estimate and its estimated standard error were calculated from each sample, then about 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples. If size of estimate was 10,000, and the standard error was 5,000, then about 68 percent of the estimates would be between 5,000 and 15,000 ($10,000 \pm 5,000$).

Standard errors for estimated numbers of persons

Size of estimate	Standard error	Size of estimate	Standard error
10	5	750	42
15	6	1,000	49
25	8	2,500	77
50	11	5,000	108
75	13	10,000	149
100	15	25,000	223
250	24	50,000	282
500	35	100,000	282

Standard errors for estimated numbers of courses

Size of estimate	Standard error	Size of estimate	Standard error
10	7	750	59
15	8	1,000	68
25	11	2,500	108
50	15	5,000	154
75	18	10,000	191
100	21	25,000	223
250	34	50,000	373
500	48	100,000	416

Nonsampling errors can be attributed to many sources, such as inability to obtain information about all cases in the sample, definitional difficulties, differences in interpretation of questions, inability or unwillingness of respondents to provide correct infor-

mation, inability to recall information, errors made in collection of data, errors made in processing, errors made in estimating values for missing data, and failure to represent all units in the sample (undercoverage).
