## ABSTRACT

Statistics are presented on the current status of teacher supply and demand trends in Illinois. This report reviews and discusses the factors affecting teacher supply and demand, changes in student enrollment, teacher retirements, changes in state mandates, and opportunity for employment. An analysis of the data collected on teacher employment results in the following conclusions: (I) a long-time trend of decreasing supply and demand for teachers in Illinois has ended; (2) critical teacher shortages will occur only if demand continues to increase and the supp-y of new teachers and those in the reserve pool fail to materialize to meet the increase in demand; (3) differences exist in the supply/demand balance of individual teaching specialties as well as in different geographic locations; (4) moderate shortages exist in the fields of special education, mathematics, natural sciences, foreign languages, and bilingual education; (5) increases in student enrollment are expected to create a moderate, but temporary, need for additional teachers; (6) state mandates will create an immediate need for reading specialists, preschool teachers, and kindergarten teachers; and (7) the supply of new teachers and the reserve puol of experienced teachers is expected to be sufficient to prevent a critical teacher shortage in Illinois during the next two to four years. Ted Sanders
State Superintendent of Education

Illinois teacher supply and demand information is collected annually by the Illinois State Board of Education. This report represents an update and expansion of relevant statistics previously published. It is hoped that the information provided in this publication will facilitate informed planning and decision making regarding the preparation and employment of teachers.

This report was prepared by Dr. Lee Bartolini from the Research and Statistics Section, Department of Planning, Research, and Evaluation. The interpretations and conclusions expressed herein do not necessarily reflect the position or policy of the State Board of Education.

Ted Sanders
State Superintendent of Education

## Introduction

A series of reports during the last two years by the National Commission on Excellence in Education, the Education Commission of the States, the Twentieth Century Fund, and others has brought national attention to the problems facing American education. State Boards of Education, state legislators, state and national professional education associations, teacher unions, and independeiic educational organizations have responded by proposing numerous reforms to improve public education.

Central to the educational reform movement are issues concerning the quantity and quality of the American teaching force. A renewed interest in teacher supply and demand has peaked in recent months because of newspaper headines announcing imminent, critical teacher shortages. The purposes of this report are to review and analyze Illinois teacher supply and demand trends in light. of these pronouncements. Illinois statistics will be compared with national data and interpreted against recent developments concerning the factors which affect the teacher supply/demand balance.

Information for this report comes from a variety of sources, but supply data come primarily from the deans' offices in those Illinois colleges and universities that prepare teachers. Teacher supply and demand information is also collected from college and university placement offices. Demand data come from Teacher Service Record forms completed annually by all local school districts and collected by the Illinois State Board of Education.

## Definitions

Teacher shortage and teacher oversupply are not easy terms to define. There is no magic ratio of supply to demand by which shortage or oversuppiy is determined. The terms are relative and must be interpreted against past trends and future developments. A local school superintendent who is accustomed to having ten or morf applicants for each vacant teaching position may very likely declare that there is a teacher shortage if the number of applicants drops to five. From the perspective of legislators or teacher certification boards, however, a ratio of five certified applicants for each vacancy may be considered to be a sahstantial oversupply.

Quality of applicants frequently enters into the determination as to whether there is a teacher oversupply or a teacher shortage. For some superintendents, a person who holds a valid state teaching certificate may be minimally qualified, but when compared to district standards and criteria, the person may not be a suitable candidate. For these superintendents, an abundance of such applicants might still be viewed as a "teacher shortage."

The terms teacher shortage and teacher oversupply are also misleading if used in a general manner to include all teaching subjects and all geographic locations. Frequently, sharp differences exist in the availability of candidates among specific teaching specialties and in different locations throughout the state. These differences must be taken into consideration when conclusions concerning the shortage or oversupply of teachers are made.

The relative nature of the terms shortage and oversupply is usually not made clear in most articles and reports on teacher supply and demand. Operationally, however, the term shortage is used when there is an
insufficient number of qualified candidates to fill all available positions. The term oversupply is used when the number of qualified candidates is considered to be more than sufficient to fill all vacancies.

The use of other terms which relate to teacher shortages can also confuse an issue if they are used inconsistently. The following terms and their definitions are used in this report.

Teacher Supply. The term supply refers to the number of persons trained as teachers and who are available to fill educational positions in Illinois elementary and secondary schools. Special emphasis is given to the number of new graduates prepared annualiy by Illinois colleges and universities and to those previously trained teachers who are eligible to enter for the first time or to reenter Illinois schools.

Teacher Demand. The term demand refers to the number of full-time teachers hired during any one schoo year or total incoming teachers. Teacher demand includes beginning teachers (those who have never taught before and are employed for the first time) and reentering teachers (teachers who have taught in the past, have left teaching for at least one year, and are again employed as teachers).

Teacher Turnover. Teacher turnover in any given year is defined as the number of full-time teachers who leave Illinois schools and do not return during the following year. This figure represents total teacher separations for any reason.

Downstate Illinois Public Schools. The phrase "downstate Illinois public schools" includes all ITlinois public schools except the Chicago Public School system and is used in reference to data regarding teacher demand. "Downstate Illinois public schools" will hereafter be referred to simply as "downstate schools." Likewise, the phrase "downscate Illinois public school teachers" includes regular full-time teachers in ali Illinois public school districts except Chicago and is often referred to simply as "downstate teachers" when describing teacher demand. The phrase does not include part-time teachers unless such teachers are specifically identified.
Full-Time Teachers. Full-time teachers are reachers employed during the entire school day throughout the entire, regular (nine-month) school year. Teachers who are not employed for a nine-month school year are considered part-time teachers.

## The National Perspective

During the summer of 1985, at least three major journals reported current or coming teacher shortages. The Nall Street Journal (June 20, 1985) quoting statistics on increasing school enrollments and decreasing numbers of education graduates, focused upon specific cases where critical shortages currently exist. Broward County, Florida; Los Angeles, California; Houston, Texas; and the state of New Jersey were identified as locations where teachers are critically needed. Time magazine (July 22, 1985) also reported shortages in the most populous sunbelt states. Agair, Texas, Florida, and California, especially Los Angeles, were selected as examples where special efforts are currently undei way to recruit teachers. On August 14, 1985, the Chicago Tribune included an article on predicted teacher shortages in

Illinois. A major focus of the Tribune article was the fact that $25 \%$ of the current teaching force is expected to retire between 1990 and 1995.

While limited in scope, each of the journal articles identified one or more factors which have an effect on the supply/demand baiance of teachers; student enrollments, number of teachers prepared, and the number of teachers retiring. None, however, provided a comprehensive analysis of all possible factors. While the shortages reported in specific pockets of the sunbelt states are real, geographic locations where supply of teachers is sufficient to meet demand were not discussed.

A more comprehensive analysis of teacher supply and demand was included in a study by the Rand Corporation in July, 1984. The report, Beyond the Commission Reports, The Coming Crisis in Teaching, concludes that unless there is a dramatic restructuring of the teaching profession, the nation will be faced with a widespread shortage of qualified teachers in a very few years. A major emphasis of the study is that teaching is not an attractive career for talented individuals, and as other professions draw more from the potential pool of graduates who may have become teachers in past years, particularly women and minorities, the teaching profession will be forced to recruit the least academically able students to fill vacancies.

The Rand study suggests that low salaries and a lack of professionalism allowed in the work structure will discourage potential teacher candidates from entering the profession. It notes that supply is currently not responding to demand, even in those areas where shortages are widely publicized. Opportunity for employment, in other words, will not be a sufficient reason for persons to choose teaching as a career.

While suggesting that current shortages of math and science teachers are expected to grow into a more generalized shortage during the next few years, specific geographic differences in the supply/demand balance of teachers are not reviewed in the Rand study. While not stating so explicitly, the study suggests that there will be a sufficient number of certificated persons to fill available posit.ions in most teaching specialties, but those who do become certificated will be the less able students.

Other studies by tree National Center for Education Statistics (NCES), the Association for School, College and University Staffing (ASCUS), and the National Education Association (NEA) provide additional data on changing supply/demand balances for teachers. NCES (1984) reports that "beginning in the mid-1980's, the demand for additional teachers is projected to exceed the supply of new teacher graduates." Most of the demand (two-thirds) is expected to be in elementary schools. The NCES report does not discuss that part of supply made up of experienced, reentering teachers--the reserve pool of teachers.

ASCUS (1985) reports that "teachers can expect increased job opportunities for the 1985-86 school year." This study is an annual undertaking of ASCUS and consists of a poll of selected teacher placement officers from all regions of the country. Subject areas most in need of teachers include mathematics, physics, chemistry, computer programming, and data processing. Physical education is identified as the only teaching specialty with a
substantial surplus of teachers. Regions where optimism is highest for employment opportunities in all subject areas include the Great Lakes, South Central and Southeast regions of the United States.

The National Education Association ceased publishing an annual report on teacher supply and demand in 1983. The last NEA Research Memo (1983) on the subject included data for the 1981-82 school year. At that time, it was concluded that a large number of persons, not currently teaching, had completed training programs for becoming public school teachers, even though that number had been decreasing each year since 1972. It was further concluded that the attractiveness of jobs in teaching had decreased during the 1970's, both in terms of salaries and job satisfaction. Nevertheless, the number of teacher education graduates was expected to increase if the teacher job market improved.

One further study currently being conducted by a committee of the Council of Chief State School Officers is designed to obtain data to better understand differences in regional and subject-area teacher supply and demand balances. Approximately $56 \%$ of the states reporting indicate that teacher supply and demand are periodically studied or assessed. Preliminary findings from 43 of the 50 states suggest that about one-third are experiencing either slight or extreme overall teacher shortages. One third of the states report that supply and demand are about equal, and the final one-third report a slight or extreme oversupply of teachers. Subject areas where teacher shortages currently exist (in up to two-thirds of the states) and where shortages are expected to continue include mathematics, natural sciences, special education, and foreign languages. Subjects areas where oversupplies currently exist include regular (self-contained) elementary grades, the social sciences, and physical education.

The national studies and journal articles help to illustrate the difficulties with making general statements about the existence of a teacher shortage or a teacher oversupply. Differences exist among specific teaching specialties and in various locations throughout the country. These reports describe how teacher supply and demand balances are affected by a large number of factors, e.g., opportunity for employment, salary, student enrollment, teacher retirements, number of teacher education graduates, number of teachers in the reserve pool, job satisfaction, and the attractiveness of the profession. These studies also illustrate how the terms shortage and oversupply are often defined using different criteria, e.g., employment opportunity and number of graduates.

## The Illinois Perspective

Statements about teacher supply and demand in Illinois are subject to the same limitations and qualifications as statements about national teacher supply and demand balances. Variations exist among specific teaching fields, among different geographic locations, and among individual districts, depending upon the unique qualifications and responsibilities of each available teaching position. Neverthe!ess, specific statistics can be reviewed for purposes of making informed judgments about current or expected areas of teacher shortage and teacher oversupply. These rata include statistics on teacher demand (both beginning, first-time teachers and reentering, experienced teachers), teacher supply (the number of new teacher graduates each year and the reserve pool of experienced teachers), changes
in the total teaching force, teacher turnover, and the percentage of teacher graduates employed as teachers a year after graduation. Elementary, secondary, and special education teachers are reviewed separately.

## Elementary Teachers

Despite recent reports of changing supply and demand balances in other parts of the country, 1984-85 is the first year in over a decade that substantial changes in trends have been documented in Illinois. Prior to 1984-85, both supply and demand had been decreasing steadily. Demand, however, has experienced a sharp increase in 1984-85 while supply has remained about the same. Other statistical indicators also show that the relatively stable balance between elementary teacher supply and demand has changed.

Tables 1 through 3 show that the number of persons completing preparation programs in elementary education has leveled off in recent years. 1 The number of graduates completing preparation for standard teaching certificates at the elementary level in 1984-85 was 2,296, only 11 more than in 1983-84 and only 39 more than in 1982-83. Deans and chairpersons of education at Illinois colleges and universities report that they do not expect this number to change significantly during the next two years.

Jemand for teachers consists of the number of first-time teachers hired and the number of experienced, reentering teachers hired. 2 Demand for elementary teachers increased by 665 in 1984-85, from 2,622 to 3,288. Both beginning demand and reentering demand experienced an increase, but the rate of increase was greater for beginning teachers. Nevertheless, $62 \%$ of those hired at the elementary level were from the reserve pool of experienced teachers. Total teacher demand at the elementary grades returned to a level comparable to that experienced in Illinois schools during 1981-82. (See Tables 4-6.)
T. Tables 1, 2 and 3 provide detailed information on the number of personnel prepared to be teachers for the first time in Illinois. Table 1 shows the number of persons prepared during 1983-84 and in 1984-85 in major areas of preparation by degree status (bachelor's vs. master's) and by sex. Table 2 also shows the number of personnel prepared in selected teaching areas, but provides this information for a five-year period of time by type of institution (private vs. public.) Table 3 provides trend data for the number of persons prepared at the bachelor's and master's degree levels for past years and projects the number expected to be prepared in Illinois during the next two years.
2. Demand data for specific assignment's at the elementary level during 1984-85 are presented in Table 4 for downstate schools. Changes in the total number of teachers and the turnover of teachers by assignment area are also provided. A comparison of teacher demand to the total teaching force in downstate schools and Chicago schools by sex of teacher is provided in Table 5. Table 6 provides elementary supply and demand trend data for all school districts, including Chicago, for the years 1975-76 through 1984-85. Changes in the total teaching force, the potential teaching force (estimated by adding the number of new persons prepared to the number of experienced, reentering teachers hired), and demand as a percent of the total teaching force are also presented.

* Because of the difficulties in determining whether master's degree graduates were completing preparation for standard teaching certificates for the first time, the numbers representing master's degree graduates should be considered as estimates.
NOTE: Only "totals" were provided by respondents for the years 1985-86 and 1986-87 for each category of teacher. The number of bachelor's and master's degrees for these two years were, therefore, calculated using the percentage of bachelor's and master's degrees in each category for the year 1983-84.

All information was provided by Illinois university and college personnel on the "New Supply of Illinois Instructional Personnel" form collected annually by the Illinois State Board of Education.

NOTE: Information on the new supply of teachers was provided by Illinois university and college personnel on the "New Supply of Illinois Instructional Personnel" form collected annually by the Illinois State Board of Education. The total number of teachers and the demand data are taken from the Teacher Service Record forms completed by local districts and collected by the Illinois State Board of Education and include full-time regular teachers only, including teachers in the Chicago Public School District.

## DEFINITIONS:

TOTAL NUMBER OF TEACHERS The total teaching force employed during a given year in Illinois public schools.

NEW SUPPLY New teacher graduates prepared by Illinois colleges and universities.
POTENTIAL SUPPLY An estimate of total supply: New teacher graduates and previously trained teachers in the reserve pool. Potential supply is estimated by adding new supply to the number of reentering teachers hired each year.

NEW (BEGINNING) DEMAND Persons hired as teachers for the first time (with no previous experience).

REENTERING DEMAND Persons hired as teachers who have taught in the past, have left teaching for at least one year, and are again employed as teachers.

TOTAL DEMAND Estimated total incoming teachers (beginning and reentering) in Illinois public schools.

Changes in the total teaching force provide one indication of the need for additional staff. The total aumber of elementary classroom teachers decreased slightly in 1984-85, from 55,579 to 55,331 . Demand, as a percent of the total teaching force, reached an all-time low of $4.7 \%$ in 1983-84. This percentage increased in 1984-85 to $5.9 \%$. This statistic, in addition to changes in the total teaching force, provides an indication as to whether demand is responsible for a greacer or lesser share of those employed. A substantial increase, as shown for 1984-85: is an important indication of a changing trend.

Teacher turnover also provides an important clue to changes in the teacher supply/demand balance. Increases in turnover, the number of teachers who leave teaching and do not return, suggest that more teachers will need to be hired to replace those who leave, assuming that the total teaching force remains the same. Changes in teacher turnover for downstate schools and Chicago schools are presented in Table 7. Turnover by type of teacher is presented in Table 8. At the elementary level, turnover decreased from 7.5\% to $6.5 \%$, continuing a trend which has existed since 1975-76.

A final statistic which provides strong evidence of changing supply/demand balances is the percentage of graduates employed as teachers one year after gruduation. This figure, for any given year, may not be a meaningful statistic. But when viewed over time, it is a major indicator of changing market conditions. The percentage of graduates who entered teaching one year after graduation in 1984-85, as well as the percentage of graduates who entered other occupations, are provided in Table 9. Changes in the percentage of graduates entering teaching since 1967-68 are provided in Table 10. College and university placement directors report that $42.6 \%$ of the 1983-84 elementary teacher graduates entered teaching during 1984-85. Approximately $35 \%$ were teaching in Illinois, and another $7.6 \%$ found employment as teachers out-of-state. This is approximately the same percentage of graduates employed as teachers during the previous year, 42.4\%. It is possible that fewer teacher education graduates seek employment as teachers after graduating when compared to past years, but a 43\% employment rate is in sharp contrast to the over $80 \%$ rate experienced during the late 1960's, a period of time when it was generally conceded that critical teacher shortages existed.

Changes in elementary teacher supply and demand are illustrated graphically in Figure 1. Total demand has always been greater than the new supply at the elementary level, but persons involved in the training and employment of elementary teachers do not consider elementary instruction to be an area of critical shortage. This is because of the significant reserve pool of teachers. Nevertheless, substantial changes in the supply/demand balance for elementary teachers have been documented for the 1984-85 school year. In 1983-84 the ratio of new teachers prepared to first-time elementary teachers hired was almost 3 to 1 (2.7 to 1). In 1984-85, this ratio decreased to approximately 2 to 1 ( 1.8 to 1 ).

There are still a substantial number of persons prepared to teach at the elementary level when compared to the number hired, but the data are subject to conflicting interpretations. Despite a stable teaching force and relitively low turnover, demand increased starply, while supply remained about the same. The percentage of graduates employed as teachers a year after graduation remained stable, but demand as a percentage of the total

teaching force increased. These data suggest that, generally speaking, supply may be sufficient to meet demand in the immediate future, i.e. the next 3 or 4 years. Further increases in demand, however, without cor, esponding increases in supply, will create a better market for those seeking employmert at the elementary level, while making it more difficult for school district superintendents to find qualified candidates.

## Secondary Teachers

The supply and demand for secondary teachers has shown a greater imbalance than for the elementary level for a number of years. As with elementary teachers, both supply and demand have been decreasing for over a decade, but the new supply of secondary teacher graduates from Illinois colleges and universities has been substantially greater than total demand during each of those years. The year 1984-85, however, marks the end of that trend. Demand for secondary teachers has increased. Supply remained relatively stable. Other statistical indicators suggest an increase in employment opportunities for secondary-level teachers.

The number of Illinois graduates completing preparation for standard teaching certificates at the secondary level in 1984-85 was 2,066, an increase of 49 over 1983-84, but 42 less than the number prepared in 1982-83. (See Tables 1, 2, and 3). These numbers are expected to remain relatively stable during the next two years.

Demand for secondary teachers increased by $47 \%$ in 1984-85. The number of teachers hired was 1,595, an increase of 509 over 1983-84. Increases were experienced for both beginning teachers and reentering teachers, although reentering teaches still accounted for about 3 out of every 5 teachers hired ( $58 \%$ ). The demand in 1984-85 was comparable to the number of secondary teachers hired in Illinois in 1981-82 (see Tables 11 and 12).

The ratio of new secondary teachers prepared to the number of new secondary teachers hired has been over 5 to 1 during recent years. That ratio dropped to 3 to 1 in 1984-85. The increase in demand and the drop in the ratio of newly prepared personnel to newly hired personnel provide evidence of an increase in employment opportunities for secondary teachers.

Other indicators regarding supply and demand also suggest an improved market for persons preparing for teaching positions at the secondary level. The total teaching force, 28,904 , remained about the same, increasing by only 12 over 1983-84, but demand as a percent of the total teaching force increased from $3.8 \%$ to $5.5 \%$. Though the teaching force increased very slightly, primarily because of increases in staff in the City of Chicago, this was the first increase in over 10 years. (See Tables 5 and 11).

Tables 7 and 8 show that turnover of secondary teachers decreased slightly at the end of the 1983-84 school year, both in absolute numbers and as a percentage of the teaching force. While turnover varies considerably among specific subject areas, the overall rate for secondary teachers in downstate schools was 6.6\%.

A very positive indicator of greater job opportunities for secondary teachers was an increase in the percentage of graduates employed one year after graduation. Placement directors reported that $42.8 \%$ of the 1983-84 graduates were employed as teachers during 1984-85. Only $36.2 \%$ of the graduates were hired a year earlier.

NOTE: Information on the new supply of teachers was provided by Illinois university and college personnel on the "New Supply of Illinois Instructional Personnel form collected annually by the Illinois state Board of Education. The total number of teachers and the demand data are taken from the Teacher Service Record forms completed by local districts and collected by the Illinois State Board of Education and include full-time regular teachers only, including teachers in the Chicago Public School District.

DEFINITIONS:
TOTAL NUMEER OF TEACHERS The total teaching force employed during a given year in ITlinois public schools.

NEW SUPPLY New teacher graduates prepared by Illinois colleges and universities. POTENTIAL SUPPLY An estimate of total supply: New teacher graduates and

Figure 2 shows changes in the supply and demand for secondary teachers from 1975-76 to 1984-85. The increase in demand, as well as the other statistics discussed above for 1984-85, are the first major indication of a changing trend during this period of time. However, because the number of persons prepared to teach high school has been so much greater than the number of persons hired during recent years, general shortages are not expected during the next 3 to 4 years in Illinois. There are, nevertheless, major exceptions among specific teaching specialties. These exceptions are reviewed in a different section of this report. Prospective high school teachers, however, will find that opportunities for employment have substantially increased in 1984-85.

## Special Education Teachers

Trends in the supp?y and demand for special education teachers in Illinois have been more erralic than trends in the supply and demand for elementary and secondary teachers. Current 1984-85 data, however, show that overall demand for teachers in this specialty also increased, breaking a three-year trend of decreasing demand. A moderate to severe shortage of special education teachers, depending upon the specific assignment, had previously been reported in Illinois. The increase in demand in 1984-85 suggests that this teaching field, more than the elementary and secondary levels, will experience a greater need for teachers in the immediate future.

The new supply of special education teachers has decreased only slightly since 1980-81, but the declining trend has continued during the last academic year. Approximately 1,257 new teachers were prepared to fill special education classes in 1984-85, a decrease of only 25 from 1983-84 (see Table 14). The numbers, however, vary considerably within specific teaching specialties. (See Tables 1 and 13.)

Total demand for special education teacher, has fluctuated below and above the number of new persons prepared during the last 10 years. In fact, 1983-84 demand had decreased by $50 \%$ from 1980-81. In 1984-85, however, demand for special education teachers was 1,336, 330 more than in 1983-84 and 79 more than the number of new persons prepared during this same year. (See Table 14.)

As with elementary and secondary teachers, more special education teachers were hired from the reserve pool than from the beginning pool. Table 14 shows that well over ha?f (56\%) of the 1,336 teachers hired in 1984-85 were experienced, reentering teachers. The total demand was slightly less than the number of special education teachers hired in 1981-82 (1,527).

During recent years almost three times as many new special education teachers were prepared as were hired (2.9 to 1). In 1984-85 the ratio of newly prepared special education teachers to newly hired first-time teachers was 2 to 1. This change, together with the fact that the total teaching force in special education increased by 243 and that demand as a percent of the total teaching force increased from $9.0 \%$ to $11.7 \%$, suggests that the need for special education teachers has become greater in 1984-85. (See Tables 13 and 14).

Turnover for special education teachers decreased slightly, from $9.6 \%$ to 9.1\% (Table 8), and the percentage of new Illinois teacher graduates who entered teaching (45.7\%) represents a decrease of $6.8 \%$ from 1983-84. (See

NOTE: Information on the new supply of teachers was provided by Illinois university and college personne? on the "New Supply of Illinois Instructional Personnel" form collected annually by the Illinois State Bcard of Education. The total number of teachers and the demand data are taken from the Teacher Service Record forms completed by local districts and collected by the Illinois State Board of Education and include full-time regular teachers only, excluding teachers in the Chicago Public School District.

DEFINITIONS:
TOTAL NUMBER OF TEACHERS The total teaching force employed during a given year in Illinois public schools.

NEW SUPPLY New teacher graduates prepared by Illinois colleges and universities. POTENTIAL SUPPLY An estimate of total supply: New teacher graduates and previously trained teachers in the reserve pool. Potential supply is estimated by adding new supply to the number of reentering teachers hired each year.

NEW (BEGINNING) DEMAND Persons hired as teachers for the first time (with no previous experience).

REENTERING DEMARiD Persons hired as teachers who have taught in the past, have left teaching for at least one year, and are again employed as teachers.

TOTAL DEMAND Estimated total incoming teachers (beginning and reentering) in Illinois public schools.

FIGURE 3
A Comparison of Teacher Supply and Demand in Illinois Public Schools: Special Education

POTENTIAL SUPPLY: An Estimate of Total Supply - New Teacher
Graduates And Previously Trained Teachers in The Reserve Pool.

NEW SUPPLY: New Teacher Graduates Prepared by Illinois Colleges And Universities.

TOTAL DEMAND: Estimated Total Incoming Teachers (Beginning And Reentering) In Illinois Public Schools.

NEW (BEGINNING) DEMAND: Persons Hired As Teachers For The First Time (With No Previous Experience.)

NOTE: This graph was constructed using data presented in Table 14.

Table 10.) Normally, these changes would suggest a corresponding decrease in demand, but, as noted, there was an increase in demand. However, both the turnover of special education teachers and the percentage employed as teachers a year after graduation while showing decreases in 1984-85, are still greater than comparable statistics for elementary and secondary teachers.

The supply and demand balance for special education teachers can be described as one in transition, but also as one that is less predictable than balances for elementary and secondary teachers. Quickly chanying demand, as illustrated in Figure 3, requires that conclusions about employment opportunities for special education teachers be qualified. Nevertheless, shortages of special education teachers currently exist. Data suggest that the need for teachers in this specialty will continue and perhaps become greater in the immediate future.

## Exceptions to General Trends

The terms teacher shortage and teacher oversupply must be qualified if used in a general manner to include all teaching subjects and all geographic locations. Frequently, major differences in the supply/demand balance exist among specific teaching specialties and in different geographic regions. These statements are especially true about supply/demand balances for teachers in Illinois.

Illinois is a large state with great differences in the size and wealth of its 1,000 operating schcol districts. There is a high correlation between size, location, and level of teacher salaries (ISBE, 1985). Generally, large urban and suburban districts have higher salary levels than small, rural districts. It is logical to assume that larger districts are better able to employ teachers with training in just one field of concentration. Superintendents in smaller districts :nay have to search for teachers with two or three teaching specialties to better meet the needs of their districts. Both of these factors suggest that, in general, the smalier, rural district is going to have a more difficult time recruiting and hiring qualified candidates, even during periods oí general statewide oversupply of teachers. Certainly, during periods of teacher shortage, the smaller, lower-paying districts will experience greater difficulty in finding qualified staff.

While difficult to quantify, this situation seems to prevail in Illinois. Frequently, during professional meetings of school superintendents and directors of personnel, persons representing small, rural communities cite problems in finding a sufficient number of qualified applicants for their vacant positions. At the same time, directors of personnel from the larger, better paying metropolitan districts are announcing that there is no shortage of teachers--of any kind. Frequently, statistics are quoted indicating that as many as 3,000 applications may be received for as few as 100 job openings. Shortages experienced by smaller, rural districts under these circumstances may be because of an unequal distribution of available candidates not an insufficient number of persons prepared to teach.

Similar distribution problems exist among the different teaching specialties found in Illinois. The identification of teacher oversupply or teacher shortage among various subject fie?ds is relative, depending upon the ratio
of the number of persons prepared to the number of available positions. Table 15 provides this comparison, showing the number of persons prepared to teach in selected subject areas and the number of beginning teachers employed in Illinois public schools. The data in Table 15 suggest that the teaching fields where there is the greatest need for teachers include mathematics, natural science, English-language arts, foreign languages, and special education. Areas where there is a relative oversupply include health education, physical education, the social sciences, art, and perhaps industrial/vocational education and elementary-regular instruction. The presentation of these data does not take into account the reserve pool of teachers in these specialty areas. However, it provides one indication of where general oversupply and shortage exist.

Table 16 provides more detail than Table 15 for specific teaching areas in special education. While an index cannot always be calculated for these teachers because of the existence of teaching assignments which cross the boundaries of traditional certification endorsement areas, it is clear that when compared to assignments such as those for teachers of the severe/ profoundly handicapped or multihandicapped, there is a relative oversupply of EMH and TMH teachers.

These findings are further supported by data presented in Table 17. It is shown that college and university placement directors, based upon their experiences in finding qualified applicants for available teaching positions, r:ite physical education, health education, art, the social sciences, and perhaps, elementary instruction as areas of teacher oversupply. Shortages are identified in mathematics, the natural sciences, special education, and the foreign languages. In most other areas, including positions for siministrators, supply and demand are more equal. More detail on the number $0^{\circ}$ : persons prepared and hired as administrators is presented in Table 18, but again, indices cannot be calcuiated because of the ability to use adninistrative certificates for a large number of different types of administrative positions.

Additional sources of information on areas of teacher shortage include reports of unfilled teaching positions. Table 19 shows the number and types of vacancies reported by local school superintendents during the fall of 1985. The total number of vacancies, 512, is double the number reported in 1984, 275, but the unfilled positions include licensed personnel such as physical or occupational therapists used as special education staff, as well as certificated personnel. The data represent different time periods of the school year. The 1984 figure represents vacancies as of November 1; the 1985 figure represents vacancies during the first week of school in the fall. The data nevertheless, indicate an increase in employment opportunities.
Specific teaching specialties most frequently identified as vacant by school superintendents include special education, 285 positions (especially Behavior Disorder Teachers and teachers of the speech aid language impaired) and bilingual education, 42 positions.

Statewide trends do not provide information about specific subject-area or geographic needs. Smaller, rural, low-paying districts will have a more difficult time attracting and keeping qualified teachers. Given the increase in demand this year, these districts will be the first to experience more severe teacher shortages if supply does not increase accordingly.
Nevertheless, all districts may currently compete for a limited number of applicants in mathematics, natural sciences, special education, and the foreign languages. Competition is expected to be less severe for teachers of health education, physical education, the social sciences, and art.

Table 15

## Factors Affecting Teacher Supply and Demand

Historically, a number of factors have influenced the balance of teacher supply and demand. These factors include teacher turnover, decisions by the school district to increase or decrease course offerings, financial resources, teacher salaries, expectation or opportunity for employment, student enrollment, ease or difficulty of completing required training for entry into the profession, state requirements, job satisfaction, and the attractiveness of the profession. Come of these factors have increased or decreased in importance over time. Several, however, are frequently listed in articles and reports as having more significance. They include changing student enrollment, the aging teacher force and increased retirements, changes in State of Illinois mandates, and opportunities for employment.

## Changes in Student Enrollment

Newspaper articles often identify an expected increase in student enroliment as a factor which will greatly affect the need for additional teachers. Frequently, those articles fail to distinguish between regional differences. A recently published report by the Illinois State Board of Education (1985) on public school enrollment states that an increase in student enrollment in Illinois is expected to be moderate and temporary. It states that "Total illinois public school enrollment ( $\mathrm{K}-12$ ) is expected to continue to decline through 1989-90, then increase gradually for about 5 years, and subsequently decline again through the turn of the century." The changes in enrollment will first affect the elementary grades, then the secondary grades. Increases in elementary grades are expected to begin in 1986-87 at an average of 5600 students per year for seven years before declining again. (See Appendix A.) At an assumed ratio of 21.1 students per teacher (the current pupil/teacher ratio), an estimated 267 additional teachers or an average of about one teacher for every three districts with elementary grades, will be needed per year statewide during that period of
time.

The increase in enrollment at the secondary level is expected to begin in 1991-92 at an average increase of 7,450 students per year for a six-year period. (See AppendixA.) Again, at an as'rmed ratio of 18.3 students per teacher, the current ratio, an estimated 407 additional teachers, or an average of about two teachers for eyery three districts with secondary grades, will be needed per year statewide duriag this time period..

These increases in student enci: In ant will : zriainly create an increase in the demand for teachers, but they are one sed to be moderate and will occur graduaily, allowing districts tiric to pian and adjust for staff changes. In any event, they wil: be temporary, and districts will have ir, plan for decreases in subsequent years. This analysis, of course, does not consider variations from district to distrist, and variations have been great among Illinois school districts relative to enrollment changes over the past 13 years.

Large changes in student enrollment in norpublic schools could also have an effect on demand, but staff needs ir: nonpubiic schools are difficult to document. The State Board of Education collects information on teacher demand in nonpublic schools (See Table 20), but the data are less reliable than for public schools. While nonpublic schools frequentiy hire
certificated staff for teaching positions, they are not required to do so, nor are nonpublic schools required to report staff statistics to the State E`ard of Education. Validity checks on staff statistics collected for nonpublic schools frequently identify a substantial amount of error relative to teacher demand. Nevertheless, nonpublic schools reperted that 1,667 teachers were hired in 1984-85, and unlike demand in the public schools, $68 \%$ were first-time, beginning staff.

## Teacher Retirements

The teaching force is getting older. The mean age of all teachers, currently 41.6, has been increasing slowly, but steadily during recent years. This fact has prompted some to suggest that sudden, massive teacher retirements will create a sudden, critical need for teachers. The data, however, suggest that while increases in retirements will, in fact, increase the need for additional teachers, changes will be moderate and gradual rather than sudden and massive.

The percentage of all certified educational personnel retiring decreased from $1.8 \%$ to $1.3 \%$ from 1973-74 to 1978-79. Since then, the percentage increased to 1.9\%, with the most dramatic changes occurring during the last two years (see Appendix B). The actual number of persons retiring increased by 328 in 1982-83, but by only 42 in 1983-84.

This same pattern is evident for classroom teachers. Apprcximately 1.7\% retired in 1973-74. This percentage decrease! to $1.2 \%$ in 1978-79 and has since increased to $1.7 \%$. While changing very little from 1977-78 to 1981-82, the number of retirements increased hy 218 in 1982-83, but by only 40 in 1983-84.

Why there was a relatively big increase in retirements in 1982-83 but a small increase in 1983-84 is unknown. The percentage of the teaching force eligible to retire (those of age 55 or older) during these years did not increase substantially (see Appendix C). Approximately $9.6 \%$ of the teaching force was age 55 or older in 1978-79. This percentage increased gradually to $11.1 \%$ in 1983-84 and is still $11.1 \%$ in 1984-85. The total number of teachers, however, has been decreasing during this time period, so the actual number of persons of age 55 or older has changed very little during the last three years.

Given the sitight increases in the percentage of those eligible to retire, as well as the siligh increases in the percentage of those actually retiring during the last fwo years, it is reasonable to assume that increases might continue, tut not necessarily suddenly or dramatically. Increases in retirements. fevertheless, might provide a gradually increasing need for teachers in the near future.

## Chany:s in State Mandates

Changes in teacher supply and demand may result due to new State mandates. Some new programs incorporated in the schcol reform package recently passed by the legislature (Public Act 84-126) are obviously going to have an impact. Three programs which can be expected to increase demand for specific types of teachers are the Reading Improvement Program, the Pre-kindergarten Program for At-Risk students, and the Full-Day Kindergarten Program.

The Reading Improvement Program authorizes the State Board of Education to fund a School District Reading Improvement Program to provide reading specialists, teacher aides, and other personnel to improve reading and study skills of children in public schools. About $\$ 38$ million has been allocated to this program.

The Pre-kindergarten Program for At-Risk Children provides grants to public school districts to conduct preschoul education programs for children ages 3 to 5 screened and found to be at risk of academic failure. Approximately $\$ 12.1$ million has been allocated to this program. Last, Illinois law has been changed to permit the offering and funding of full-day kindergarten programs. Thus, an increase in the demand for kindergarten teachers is expected.

A prograni that will have a positive effect on the supply of teachers is the Teacher Shortage Scholarship program. This program provides for teacher shortage scholarships to persons preparing to teach in areas of identified staff shortages. Following the completion of the schoiarship recipient's programs of study, the individual must accept employment within one year in a school district and teach for a period of at least three years. Individuals who fail to comply with this provision shall refund such scholarships.

The possible effect of other initiatives are less obvious. A proyram to highlight the positive aspects of teaching is intended to increase the attractiveness of teaching as a career and, therefore, to enhance recruitment efforts. On the other hand, a program to test teacher candidates for basic skills before issuing a certificate might limit the number of prospective teachers. The effects of these programs are not expected to be immediate.

## Opportunity for Employment

Past studies of teacher supply and demand in Illinois (ISBE, 1977 and 1978) have shown that changes in supply follow changes in demand, although changes in supply tend to lag two to three years behind changes in demand. This findirg was also reported by the NEA (1983) in its research memo on teacher supply and demand. If this generalization is true and if demand continues to increase, then increases in supply can be expected as news of opportunities for employment become known. This would have the effect of blunting critical teacher shortages in the long run.

However, not all researchers believe that supply will follow demand as it has in the past. The Rand study, cited earlier, suggests that conditions have changed. Many of those persons who might have entered the teaching profession in the past when opportunities for employment existed, particularly women and minorities, will now choose alternative careers as opportunities in other fields become available. The fact that teacher candidates have not responded to needs already identified is given as an example.

An increase in opportunities for women and minorities in other careers, however, is not the only condition which has changed. The educational reform movement is currently widespread. If this movement results in increased salaries, better working conditions, higher standarus for teachers, better teacher education programs, etc., the net result could be an increase in the attractiveness of teaching as a career. If so, an increase in tile number of prospective teacher candidates can be expected.

Summar; and Conclusions
A long-time trend of decreasing supply and demand for teachers in Illinois has ended. For the first time in over a decade, substantial increases in demand have occurred while supply has remained relatively stable-thus increasing opportunities for employment. The total demand for elementary, secondary, and special education teachers increased by over 30\% in 1984-85. In addition, the number of vacancies reported in the fall of 1985 was iwice the number of vacancies reported in 1s83-84 (512 ys. 275).

The increase in demand, by itself, does not mean that there will be an overall critical shortage of teachers. Historically, changes in the supply of teachers have followed changes in the demand, although shanges in supply tend to lag two to three yoars behind changes in demand. In receat years, over $60 \%$ of the teachers hired in Illinois came from the pool of previously trained, experienced teachers. Newly prepared teachers still outnumber inexperienced teachers hired for the first time by almost 2 to 1 in elementary education and special education, and by 3 to 7 at the secondary level: Critical shortages will occur only if demand continues to increase and the supply of newly prepared teachers and those in the reserve pool fail to materialize to neet the increase in demand.

Differences exist in the supply/demand balance of individual teaching specialties, as well as in different geographic locations thrcughout the state. It is believed that small, rural districts have a more difficult time finding qualified candidates for all available vacancies than do larger urban arid suburban districts. In addition, moderate shortages exist throughout the state in the fields of special education, mathematics, natural sciences, foreign languages, and bilingual education. In all other areas, supply appears to be sufficient to meet demand, especially in health education, physical education, the social sciences, and elementary instruction.

Historically, a number of factors have influenced the balance of teacher supply and demand in Illinois. Three, however, are expected to have a combined effect of increasing demand in the immediate future. Increases in student enrollment are expected to create a moderate, but temporary, need for additional teachers. Teacher retirements, as well, may create a small, but gradual increase in demand during the next few years. Changes in State mandates will create an immediate need for reading specialists, preschool teachers, and kindergarten teachers. On the other hand, a teacher scholarship program will help to recruit teacher candidates in identified areas of shortage.

The supply of newly prepared teachers and the reserve pool of experienced teachers is expected to be sufficient to prevent a critical teacher shortage in Illinois during the next two to four years, although the need for more teachers will gradually become great if demand continues to increase at the rate experienced in 1984-85. District administrators can expect increased difficulty in finding qualified candidates for all available teaching positions. Nevertheless, shortages in Illinois are expected to be less serious than in other parts of the country, particularly in some of the larger cities in the sunbelt states. Certainly it would be appropriate to encourage prospective teachers to enter the profession.
