ABSTRACT

This report offers highlights of the demographic and economic characteristics of women in North Dakota, 1950-1980. The report is based on data found in Bureau of Census publications. The median age of women in North Dakota has increased from 25.9 years in 1960 to 29 years in 1980. North Dakota women were slightly less likely to be married and more likely to be widowed or divorced. During this period, North Dakota women became more highly educated. By 1980, two-thirds of all North Dakota females, 25 years of age and over, had completed at least four years of high school, and about 13 percent had completed four or more years of college. The number of North Dakota women, aged 16 and over, in the labor force rose by 148 percent from 1950 to 1980, the largest percentage of whom were employed in technical, sales, and administrative support occupations. The 1979 mean annual earnings of all working women in North Dakota were \$5,772. Appendices include: (1) 19 tables; (2) 7 figures; and (3) an explanation of microdata. (SM)

PREFACE

This report offers highlights of the demographic and economic characteristics of women in North Dakota, 1950-1980¹. Data for this report, with the exception of Table 12, are found in Bureau of Census publications. The source for Table 12 is the 1980 Public Use Microdata Sample for North Dakota (see Appendix C). This sample was constructed by the U.S. Bureau of the Census from information obtained from the Census of Population and Housing for 1980. It is important to note that the numbers in Table 12 are estimates based on a sample; thus, the data may vary somewhat from those found in other census reports.

HIGHLIGHTS

Residence

*From 1950 to 1980, women in North Dakota have been somewhat more likely than men to live in urban areas. As North Dakota has become more urban, so have women. In 1950, 26.6 percent of all residents of the state lived in an urban area; 28.3 percent of all women were urban residents. By 1980, 48.8 percent of all state residents were urban and almost one-half (49.7 percent) of all women lived in urban areas of North Dakota (see Table 1).

Age

*The median age of women in North Dakota has increased since 1960. In 1960, the median age for women was 25.9 years. In 1980, the median age was 29 years. This change, in part, reflects the aging of the large cohort of females born during the baby boom era (1948-1962).

*Elderly women (over 65 years of age) constituted only 7.3 percent of all women in the state in 1950; in 1980 they comprised 13.8 percent of all females in North Dakota.

*Almost half (48.2 percent) of all females in North Dakota were under age 25 in 1950. By 1980, this youthful segment of the population accounted for 43.1 percent of all females (see Table 2 and Figure 1).

Fertility

*Fertility levels (as measured by the number of children ever born per 1,000 women in the population²) have been declining for younger women since the end of the baby boom era in 1962. In 1980, 305 children had been born per every 1,000 women aged 15 to 24 in North Dakota. This level was down from 525 children per 1,000 women aged 15 to 24 in 1960.

*North Dakota women aged 25 to 34 also displayed a drop in their fertility from 2,760 children ever born per 1,000 women in 1960 to 1,660 children ever born per 1,000 women of that age in 1980.

*Interestingly, older women aged 35 to 44 showed an increase from 1960 to 1970 in the number of children ever born both in North Dakota and in the United States. In North Dakota, the number of children ever born to women aged 35 to 44 rose from 3,289 per 1,000 women in 1960 to 3,691 children per 1,000 women in 1970. Yet during the 1970s the number of children ever born per 1,000 women aged 35 to 44 dropped 18 percent; by 1980 3,039 children had been born per 1,000 women in this age cohort.

*From 1950 to 1980, younger women in North Dakota (aged 15 to 24) had consistently lower birth rates than women of the same ages in the United States as a whole. In contrast, older women (aged 25 to 34 and aged 35 to 44) continuously had higher birth rates than women of the same ages in the entire country (see Tables 3-4).

Marital Status

*Women in North Dakota were slightly less likely to be married and were more likely to be widowed or divorced with each consecutive decade since 1950. In fact, the actual number of widowed women in North Dakota in 1980 grew by over 56 percent from the 1950 figures. This, no doubt, corresponds to the greater number of elderly women who lived in North Dakota in 1980. From 1950 to 1980 there was a 107 percent increase in the number of women in the state who were aged 65 or older.

*The number of divorced women living in the state increased 345 percent between 1950 and 1980, from 2,240 to 9,969. These figures, of course, can only indicate the number of women who were divorced in those particular census years. They fail to accurately depict how many women may have been divorced and remarried within each decade (see Table 5).

Race

*North Dakota women remained racially homogenous from 1950 to 1980. Although the proportion of white women declined slightly during this 30-year span, white women have consistently represented over 95 percent of the female population. The Native American female population in North Dakota grew by 95 percent from 1950 to 1980; however, they represented only 3.1 percent of the state's female population in 1980. Black women accounted for less than one-half of 1 percent of the state's female population in 1980, although their numbers grew by 636 percent from 1950 to 1980 (see Table 6).

Education

*Between 1950 and 1980, North Dakota women became more highly educated. The number of women with only an eighth grade education or less declined by almost 50 percent between 1950 and 1980, while the number of women with some college or with four or more years of college grew by 117 percent and 260 percent, respectively.

*By 1980, two-thirds of all North Dakota females (25 years of age and over) had completed at least four years of high school and about 13 percent of all women had completed four or more years of college (see Table 7 and Figure 2).

*While women in North Dakota made great educational gains in the decades from 1950 to 1980, men in North Dakota made even greater educational strides. In 1950, 4.1 percent of all North Dakota women and 4.8 percent of all North Dakota men had completed at least four years of college. By 1980, 12.5 percent of all North Dakota women and 17.2 percent of all North Dakota men had finished at least four years of college. While women in the state were more likely in 1950 and in 1980 to have completed some college or four years of high school, this educational gap between men and women was shortened by 1980 from an 11.9 percent difference to a 10.0 percent difference (see Table 8).

*In comparison with women in the United States in 1980, North Dakota women aged 25 and over were more likely to have less than an eighth grade education and less likely to be high school graduates. However, 12.5 percent of North Dakota women and a comparable 12.8 percent of women nationwide have completed at least four years of college (see Table 9 and Figure 3).

Labor Force Participation

*The number of North Dakota women (aged 16 and over) in the labor force rose by 148 percent from 1950 to 1980. In 1950 a little less than one-quarter (23.5 percent) of all adult women in North Dakota were in the labor force; 31.1 percent were in 1960; 35.4 percent were in 1970. Between 1970 and 1980 a dramatic growth (56 percent) occurred in the number of North Dakota women in the labor force. By 1980 almost half of all adult women (47.3 percent) were labor force members (see Table 10 and Figure 4).

*Men in North Dakota were much more likely than women to be members of the labor force in 1950 and 1980. However, while North Dakota women's labor force participation rate grew from 23.5 percent in 1950 to 47.3 percent in 1980, North Dakota men's labor force participation rates dropped from 83.1 percent to 75.6 percent (see Table 9 and U.S. Bureau of Census, 1952 [Table 66]; 1981c [Table 67]).

*Between 1950 and 1970, women in the state had consistently lower labor force participation rates than U.S. women as a whole. However, by 1980, there was little difference between the labor force participation rates of women in North Dakota and in the United States; about 47 percent of all North Dakota women and 51.5 percent of all U.S. women were members of the labor force that year.

*Married women's labor force participation rate has grown consistently in North Dakota since 1950 when 15.4 percent of wives were in the labor force. By 1970 33.7 percent of all wives were labor force members. During the 1970s, about 27,319 more married women joined the labor force. As a result, by 1980 close to half (47.1 percent) of all wives in the state were either employed or unemployed and actively seeking work (see Tables 11 and 12).

*Divorced women consistently have had higher rates of labor force participation (65.9 percent, 63.0 percent, and 71.6 percent in 1960, 1970, and 1980, respectively). Widows' labor force participation rates have constantly declined over the years from 26.5 percent in 1960 to 18.8 percent in 1980. This, no doubt, is due in part to the fact that more elderly women (aged 65 years and older) lived in the state in 1980 and that the labor force participation rates of women over age 65 have tended to decline markedly.

Occupations

*The largest percentage (42.6 percent) of the state's women were employed in technical, sales, and administrative support occupations in 1980. More specifically, 12 percent of all women were in sales and 27.2 percent were in administrative support positions, such as secretaries, stenographers, and typists who comprised 10.1 percent of all women workers in North Dakota in 1980.

*More than one in four (27 percent) working women in North Dakota were employed in service occupations in 1980. For example, 12.2 percent of all women workers were food service employees. A little over 20 percent of all women with occupations in 1980 were professionals, and most of these women were either teachers, librarians, and counselors or in health assessment and treatment occupations (e.g., nurses).

*Female farm operators and managers accounted for nearly 2 percent of all employed women in the state in 1980. An additional 1.5 percent of working women were employed as farm workers (or in related occupations; see Table 13).

Earnings

*The 1979 mean annual earnings of all working women in North Dakota were \$5,772. For those women who worked full time in 1979, their mean earnings amounted to \$7,304. Men in North Dakota who worked full time earned an average of \$14,022 in 1979. In other words, full-time female workers in North Dakota earned about 51 percent of what full-time male workers earned in 1979.

*Differences between men's and women's earnings persisted across all age categories. The discrepancy between mean annual earnings for full-time male and female workers is the least for those aged 65 and over; those women averaged 76.5 percent of what men age 65 and over earned in 1979. Women aged 18 to 24 earned an average of 63.1 percent of what men 18 to 24 years old earned in 1979.

*Women's wages as full-time workers may rise at a much slower rate over the life cycle than do men's wages; for those full-time workers aged 35 to 44, women earned an average of only 44.4 percent of what men 35 to 44 years of age earned in 1979 (see Tables 14-15 and Figure 5).

Poverty

*More than 15 percent of all North Dakota girls under 16 years of age lived in an impoverished home in 1979. Additionally, about 19 percent of young women in the state aged 16 to 21 lived in poverty in 1979.

*Poverty is found often among elderly women in North Dakota. Over 20 percent of adult women over 65 were poor in 1979; as many as 27 percent of women in North Dakota above age 75 were impoverished that year, according to government standards (see Table 16 and Figure 6).

*Females in North Dakota were more likely than males to be impoverished in 1979 (14.1 percent versus 11.2 percent). This economic difference held true for all ages of males and females. The greatest gap between the percentage of females in poverty and percentage of males in poverty in 1979 existed for women and men aged 75 years and over. Twenty-seven percent of these elderly women and 16.8 percent of these men were impoverished in 1979, which amounted to a 10.2 percent difference in poverty rates. Because there are far more elderly women than elderly men in North Dakota, this meant that there were 4,391 poor women aged 75 years old and over in the state in 1979, whereas there were 1,927 poor men of that age cohort (see Table 17).

*North Dakota women over 35 years old were more likely than U.S. women of similar ages to be poor in 1979, with the exception of women aged 60-69. In North Dakota, 2.6 percent more women aged 70-74 were poor than was the case nationwide; 5.6 percent more women aged 75 and over were poor than was the case in the United States as a whole (see Table 18 and Figure 7).

*Those living in female-headed families were more likely to experience poverty than were persons in married-couple homes. Over one-quarter (26.6

percent) of all women who headed families in 1979 in North Dakota had incomes below the poverty level.

*The younger female heads of families were most likely to be poor in 1979. Over half of the women aged 15 to 24 years old who headed a family in the state in 1979 were impoverished (see Table 19).

NOTES

1. Preparation of this report was aided by the helpful comments of Richard Rathge, Elaine Lindgren, Sheila Mammen, and Sandra Holbrook and the editorial assistance of Brenda Ekstrom.

Children ever born is a term used by the census to study women's fertility. The census questionnaire asked about the number of children ever born to women 15 years old and over. This excluded still-births, stepchildren and adopted children. *Children ever born* to a census respondent included children who were no longer living, children who were not living at home, and children who were still living at home.

The 1980 census data on children ever born is not strictly comparable to previous census reports. The 1980 census reports on children ever born to women included data on single women. Previous reports assumed that single women were childless even though it was known that some single women had children. Data on fertility for ever-married women in 1980 are comparable to earlier reports.

APPENDIX A: TABLES

TABLE 1. POPULATION OF NORTH DAKOTA BY GENDER, 1950-1980

	1950	1960	1970	1980
FEMALES	296,692	309,238	306,152	324,291

Other	**	**	0.1	0.5
TOTAL***	<u>100.0%</u>	<u>100.0%</u>	<u>100.0%</u>	<u>99.9%</u>

Note: The census obtains information on race through self-identification of the respondents. People are classified according to the race with which they identify. According to the U.S. Bureau of the Census, Spanish origin (e.g., Mexican, Puerto Rican or Cuban) is an ancestry, not a race. Information on ancestry also is obtained through self-identification of the respondents. In 1980, there were 1,871 females in North Dakota classified by the census as Spanish origin (U.S. Bureau of Census, 1981b [Table 18]).

*Not available.

**Less than 0.1%.

***Total does not equal 100 due to rounding error.

APPENDIX C: EXPLANATION OF MICRODATA

EXPLANATION OF MICRODATA

The data for Table 12 of this report are derived from the 1980 Public Use Microdata Sample for North Dakota. This probability sample was constructed by the U.S. Bureau of the Census from information obtained from the decennial census of population and housing for 1980. It contains information from a 5 percent probability sample of all North Dakota housing units in 1980 (N = 47,145).

The Public Use Microdata files contain unaggregated records of individuals and housing units in the state. This flexible format allows for tabulations of any combination of indicators from questions asked on the population and housing census questionnaire, an option not available from the summary tape files (STF). In addition, the samples are self-weighting; thus, estimates for the entire population can be calculated. Comparison with available published tabulations were made to verify the accuracy of the figures reported in this document; a 95 percent confidence interval was used.

It is important to note that the statistics in Table 12 are estimates based on a sample; thus, the figures may vary somewhat from those found in other reports or census documents. In addition, the reader should be aware that these data are subject to nonsampling bias (errors produced during reporting, coding, or handling of the questionnaires). Although accuracy checks were statistically made to ensure the reliability of the information, it is always wise to utilize caution. For a more detailed discussion of the data base and possible errors, see the following technical document:
