ABSTRACT
The female share of the older work force has nearly doubled since 1950. In 1987, the 6.2 million women aged 55 and over in the labor force constituted 4 of every 10 older workers. Because young women today have a stronger work attachment than aid their mothers and grandmothers, the female share of the older work force is likely to continue to increase. The employment characteristics of older women roday refiect not only age-related factors but also lifetime work patterns and attitudes unique to the group; i.e., women were not expected to work after marriage, whereas unmarried women usually worked. Over the past several decades, fundamental changes have occurred in women's work life patterns. Three decades ago, only about 3 in 10 young women worked, whereas today 7 in 10 women between the ages of 25 and 34 are in the labor force. Women reaching their fifties or sixties several decades from now will have much more sork experience than the women born before them. However, these women, as their predecessors, are still concentrated in three occupational groups--sales, administrative support, and services--which usually pay low wages. Therefore, their retirement benefits, althougn betier than those of older women of today, will still be lower than men's and will affect their work life in their older years. (Data were gathered from the Current Population Survey.) (KC)

# Employment in Perspective: Women in the Labor Force 

Third Quarter 1988
U.S. Depa.، ment of Labor

Bureau of Labor Statistics
Report 758

## Employment of Older Women

The female share of the older work force has nearly doubled since 1950. In 1987, the 6.2 million women age 55 and over in the labor force constituted 4 of every 10 older workers. Because young women today have a stronger work attachment than did their mothers and grandmothers, the female share of the older work force is likely to continue to increase. Data in this report come from the Current Population Survey, and were discussed in some detail in a September 1988 Monthly Labor Review article. ${ }^{1}$

The employment characteristics of older women today reflect nct only age-related factors but also lifetime work patterns and attitudes unique to this group. Many women currently in their fifties and sixties first reached working age in the 1940's or 1950's, when women were often neither expected nor encouraged to work and when employment opportunities for them were limited (especially prior to World War II). Marital status often determined worklife experiences; most married women remained out of the labor force, worked intermittently, or chose abbreviated work schedules. In contrast, unmarried women often worked full time for many yerrs. Also, black women were much more likely to work than were white women. (See table A.)

Over the past several decades, fundamental changes have occurred in women's worklife patterns. Comparing the labor market experiences of women in their twenties and thirties today with those of older women when they were that age points out striking generational differences. Three decades ago, for example, only about 3 in 10 young women worked. In contrast, more than 7 in 10 women between the ages of 25 and 34 were in the labor force in 1987. Differences

[^1]according to marital status have also changed dramatically; participation rates of young married and never-married women differed by more than 50 percentage points 30 years ago; today, that gap is only 13 percentage points.
Clearly, women reaching their fifties or sixties several decades from now will have had much more work experience than the women born before them. Other employment characteristics, however, may not change as much. In 198\%, a majority of both older and younger women worked in three occupational groups-sales, administrative support, and services. These jobs often pay low wages. While young women have increased their representation in some nontraditional fields, such as law and medicine, most employment growth continues to be in traditionally female occupations.
Partly reflecting their cccupational distribution, women of all ages earn substantially less than their male counterparts. For many reasons, the "earnings gap" is greatest for the oldest workers; women age 55 to 64 who worked full time and year round in 1987 earned only 56 percent as much as men the same age. Those age 25 to 34 who worked fill schedules earned 73 percent as much as their maie ccuinterparts.
Some of the labor force experiences of older women in 1987 may not be repeated. When the young women of today reach their fifties and sixties, they will have had much more work experience than either their mothers or grandmothers, and their retirement decisions will be more similar to men's. However, women's occupational and earnings profiles, which have been changing only gradually, will continue to affect their work activity at age 55 and beyond.

NOTE: Due to rounding and indepe int seasonal adjustment, some components may not add to totals.

## Technical Note

Data in this table are from the Current Population Survey, a national sample survey of 55,800 households. The information obtained from this survey relates to the employment status of persons 16 years old and over in the civilian noninstitutional population. Seasonally adjusted data for the 5 most recent years are subject to revision at the end of each year, based on recomputation of the seasonal factors to reflect an additional year of experience. For a detailed explanation of the Current Population Survey, including sampling reliability and more complete definitions than those below, see Employment and Earnings, published monthly by the Bureau of Labor Statistics.

## Brief definitions

The civilian labor force comprises all persons classified as employed or unemployed.

The civilian employed are all persons who during the survey week: (a) Did any work at all as paid civilians; (b) worked in their own business or profession or on their own farm; (c) worked 15 hours or more as unpaid workers in a family business; or (d) were temporarily absent from their jobs due to illness, vacation, bad weather, etc.

Unemployed persons are those who had ru employment during the survey week, were available for work at that time, and made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be classified as unemployed.

Not in the civilian labor force are all pu.sons not classified as employed or unemployed.

The civilian labor force participation rate is the civilian labor force as percent of the civilian noninstitutional population.

The civilian workers unemployment rate is the unemployed as a percent of the civilian labor force.

Full-time workers are those who usually work 35 hours or more per week. Part-time workers are those who usually work 1 to 34 hours per week.
