ABSTRACT

Information from the administration of the Basic Skills Assessment Program (BSAP) within the Charleston County (South Carolina) School District is presented. Tests are administered in the spring of each school year to students in grades 1, 2, 3, 6, and 8 as part of the BSAP. These tests have been administered statewide since 1981. BSAP tests were designed to assess student achievement in reading, mathematics, and writing. Reading and mathematics tests were administered in grades 1, 2, 3, 6, and 8; writing tests were administered in grades 6 and 8. Data are provided for 17,075 students administered the BSAP during the week of April 27 through May 1, 1987. Analyses presented in this report include: (1) district-wide results including the percentages of students meeting standards and median scale scores; (2) comparisons of district results with state results; (3) breakdowns of district test results by demographic characteristics of the students (including ethnicity, gender, and income); (4) historical results for the district and each school; and (5) percentages of district students mastering each BSAP objective and comparisons of district students answering each item correctly to students statewide answering each item correctly. Notably, second and third graders proved strong in reading and mathematics, while sixth and eighth graders performed relatively poorly in mathematics and eighth-grade students performed relatively poorly in writing. Fifteen tables and 10 figures are included, and eight appendices provide extensive tabulated data. (TJH)

EXECUTIVE SUMMARY

The Annual Report of Results from the Basic Skills Assessment Program, Spring, 1987, presents test information from the administration of the BSAP tests to students in Charleston County public schools. Analyses presented in this report include the following:

- Presentations of districtwide results including the percentages of students meeting standards and median scale scores.
- Comparisons of district results with state results.
- Breakdowns of district test results by demographic characteristics of the students: ethnicity; gender; income (defined by free/reduced lunch program participation).
- · Historical results for the district.
- Historical results for each school.
- Percentages of CCSD students mastering each BSAP objective, and comparisons of CCSD students answering each item correctly to SC students answering each item correctly.

Background

Tests are administered in the spring of each school year to students in grades 1, 2, 3, 6, and 8 as part of the Basic Skills Assessment Program (BSAP). These tests have been administered statewide since 1981. BSAP tests were designed to assess the extent to which students have attained statewide objectives in Reading, Mathematics, and Writing. Reading and Mathematics tests are administered at grades 1, 2, 3, 6, and 8, while Writing tests are administered at grades 6 and 8.

Districtwide Results

Percentages of students meeting state standards on the 1987 BSAP tests are as follows:

Subtest	Grade 1	Grade 2	Grade 3	Grade 6	Grade 8
Reading	82.2	87.5	93.6	83.8	78.7
Mathematics	84.2	89.2	87.6	74.5	69.6
Writing				77.4	73.1

Areas of relative strength (in which more than 85% of the students met standards) were second and third grade reading and second and third grade mathematics. Areas of relative weakness (in which less than 75% of the students met standards) were sixth and eighth grade mathematics and eighth grade writing.

Э

A higher percentage of Charleston County students scored above standard compared to their SC peers in 75% of the grade level-subject area combinations. A greater percentage of Charleston County students met Reading and Mathematics standards at grades 2, 3, 6, and 8. Greater overall differences were found for Reading than for Mathematics. At grade 1 where students performed below their SC peers, differences were greater for Reading (-2.1%) than for Math (-.8%). The only other area in which CCSD students showed a relative weakness compared to students statewide was eighth grade Writing where the difference between CCSD and SC students was -2.1%.

Compared to 1986 test results, 1987 performance levels in Reading and In contrast, 1987 Writing scores Mathematics represent an improvement. reflect a slight decline from last year. All grades showed significant improvements since BSAP testing began in 1981 for Reading and Mathematics and in 1983 for Writing. The greatest gains in Reading and Mathematics since 1981 have been at grades 6 and 8. In addition, Charleston County has shown greater increases in both subjects than has South Carolina. Improvements in Writing since 1983 have been comparatively less than those found for Reading and Mathematics over the same four-year period. Compared to progress statewide, CCSD sixth graders made slightly better four-year gains in Writing than SC students, while at grade 8, SC students made better progress than Charleston County students.

Performance by Demographic Subgroups

Gender. A greater proportion of females compared to males scored above the state standard on all subtests for all grade levels except grade 3 Mathematics where performance was approximately the same. Improvements over 1986 scores were demonstrated by males and females for all grade levels and subtests except for grade 1 males and females in Mathematics and grade 8 females in Reading. Both gender subgroups performed better than their South Carolina counterparts in all areas except for grade 6 females in Writing and grade 8 males and females in Writing.

Ethnicity. A higher proportion of white students compared to black students scored above the state standard in 1987 in Reading, Mathematics, and Writing at all grade levels tested. More than 80% of the white students scored above the state standard in all subject areas and for all grade levels tested. More than 80% of the black students scored above the Reading and Mathematics state standard in grades 2 and 3 only. Percentages of ethnic subgroups scoring above the state standard on Reading and Mathematics subtests were greater in 1987 than in 1986 with the exceptions of black first graders in Mathematics and white eighth graders in Reading. With one exception, greater percentages of CCSD white and black students met standards compared to students statewide. The one exception was for first grade black pupils in Reading.

Income. A higher proportion of students not being served by the free lunch program met state standards than students served by the free lunch program for all areas and grade levels tested. More than 90% of the students at grades 1, 2, and 3 not participating in the lunch program scored above the state standards in Reading and Mathematics compared to 75% of the students on free lunch. Among sixth and eighth graders, more than 79% of the students not participating in the lunch program scored above the state standard on Reading, Mathematics, and Writing subtests, compared to 55% of the students

on free lunch. Students in both subgroup categories made improvements in Reading and Mathematics with the exception of grade 1 Mathematics scores for students not participating in the lunch program. A decline in Writing scores resulted in smaller percentages of students in both categories meeting Writing standards. Greater percentages of CCSD pupils than SC pupils in both lunch groups scored above state standards for all subtests and grade level combinations with the exceptions of grade 1 Reading and grade 8 Writing for both lunch groups, and grade 1 Mathematics for students not participating in the lunch program.

PURPOSE OF REPORT

The Annual Report of the Basic Skills Assessment Program, Spring, 1987, presents the results from the administration of the BSAP to students in the Charleston County Public Schools. All students in grades 1, 2, 3, 6, and 8 were tested as part of the South Carolina Basic Skills Assessment Program. The primary reason for administering BSAP tests is to assess how well students perform on identified statewide objectives in reading, mathematics, and writing.

This report responds to three primary questions:

- 1. How are Charleston County public school pupils performing with respect to state achievement standards?
- 2. How does the achievement of Charleston County public school pupils compare to the achievement of other pupils in South Carolina?
- 3. How does achievement for Spring, 1987 compare to previous years?

Test data are presented for all students districtwide, as well as for students within demographic subgroups. Demographic variables include gender, ethnicity and income level (defined by lunch program participation).

This report also presents an analysis of students' responses to groups of items comprising objectives as well as to individual test items. By comparing the percentage of Charleston County pupils responding correctly in each skill area to percentages of students in the state responding correctly, areas of relative strength and weakness can be identified.

There are eight appendices to this report. Appendix A contains frequency distributions for each grade level and subject area tested. Appendix B reports the percentages of students at individual schools meeting BSAP standards for the years 1981-1987. Appendix C lists mobility indices, percentages of students on free lunch, and percentages of handicapped students for individual schools. Appendix D reports Fall 1986 readiness test scores and Spring 1987 BSAP scores for first graders enrolled in CCSD schools during the 1986-87 school year and present for both testing sessions. In Appendix E, District Demographic Reports giving the percentages of students in various demographic categories meeting standards are reprinted. District Summary Reports, reporting percentages of CCSD students meeting standards and needing improvement on each objective, are reprinted in Appendix F, while Appendix G provides the percentages of students needing improvement on each objective for individual schools. Item Response Summaries, giving a description of each BSAP test item and the percentages of CCSD and SC students answering correctly, are reprinted in Appendix H.

STUDENTS AND GRADE LEVELS TESTED

All strdents in the regular instructional program in grades 1, 2, 3,6, and 8 are tested each spring as part of the South Carolina Basic Skills Assessment Program. Students in all of these grades have been tested statewide since 1981; hence test results are available for the past seven years.

Handicapped students in grades 1, 2, and 3 were tested if their Individual Educational Plans indicated that testing was appropriate. All sixth and eighth grade students were tested to ensure practice for the Exit Exam. Scores of handicapped students are included in the analyses presented in this report as well as the analyses of state test data. Special education students were tested according to their nominal grade placement. Large-print editions of the BSAP were available for visually-handicapped students in all grades. Brailled and modified test versions were available for blind, hearing handicapped and orthopedically handicapped students in grades 6 and 8, as appropriate. Flexibility in test scheduling and setting was permitted for learning disabled pupils and other handicapped pupils, : needed.

The South Carolina Exit Exam and readiness test are considered part of BSAP. Results from these two programs, however, are reported separately.

All students were administered the BSAP during the week of April 27 - May 1.

The number of pupils enrolled, and the number and percent of students tested are provided below.

Grade	Number of Pupils Enrolled	Number Tested	Percent Tested	
1	4488	4360	97.1	
2	3745	3593	95.9	
3	3451	3291	95.4	
6	2984	2928	98.1	
8	3083	2903	94.2	

DESCRIPTION OF THE BASIC SKILLS ASSESSMENT PROGRAM TESTS

The Basic Skills Assessment Program (BSAP) tests are group-administered, criterion-referenced achievement tests. Criterion-referenced tests (CRTs) focus upon specific and precisely defined learning objectives. CRTs are designed to assess students "attainment" of specific knowledge or skills and to reference performance to a defined set of objectives. CRT scores are directly meaningful in terms of the degree of learning which the examinee possesses.

The BSAP tests were designed to assess the extent to which students have attained statewide objectives in reading, mathematics, and writing. Reading tests are administered to children in grades 1, 2, 3, 6, and 8 and consist of 36 multiple-choice items. Mathematics tests are administered to children in grades 1, 2, 3, 6 and 8 and consist of 30 multiple-choice items. Writing samples, written in response to a single prompt, are obtained in grades 6 and 8. BSAP tests are not timed.

BSAP Legislation

In 1978 the South Carolina Legislature established the Basic Skills Assessment Program. Part of the BSAP legislation provided for: (1) identification of basic skills objectives; (2) development of criterion-referenced tests in reading and mathematics for grades 1, 2, 3, 6, and 8; (3) development of criterion-referenced writing tests for grades 6 and 8; and (4) setting of minimum standards of achievement for grades tested on the BSAP tests.

Basic Skills Objectives

Sixteen statewide basic skills objectives were identified through a process that involved South Carolina educators and members of the general public. Each objective is repeated at each grade level, but at a different level of complexity. Brief descriptors of the objectives are presented below:

Reading

Decoding and Word Meaning (DW): The student can use word recognition skills and can determine the meanings of words.

<u>Details (DE)</u>: The student can accurately comprehend the details in a reading selection.

Main Idea (MI): The student can determine the main idea of a reading selection.

Reference Usage (RE): The student can locate and utilize desired information in reference sources.

Inference (IN): The student can make valid inferences about a reading selection.

Analysis of Literature (AL): The student can critically analyze a reading selection.

Mathematics

Concepts (CN): The student can apply numerical concepts.

Operations (OP): The student can compute accurately.

Measurement (ME): The student can apply measurement concepts.

Geometry (GE): The student can apply geometric concepts.

<u>Problem Solving (PS)</u>: The student can solve problems involving the use of mathematics.

Writing

Handwriting (HN): The student can write legibly.

Mechanics (MC): The student can spell, capitalize, and punctuate correctly.

Word Usage (WU): The student can use words appropriately.

Sentence Formation (SF): The student can compose sentences.

Composition (CP): The student can communicate ideas in writing.

Objectives are further defined at the subskill level. Subskills tested during a given year vary according to grade level and test form.

Achievement Standards

Minimum standards of achievement were set for writing prior to the Spring, 1981 administration of the BSAP test. Results for writing are given in raw score units. A score of 3 or above indicates adequate performance; whereas, a score below 3 indicates inadequate performance. These standards apply to all forms of the writing test.

Standards for reading and mathematics were established following the Spring, 1981 administration of the BSAP test. Results for reading and mathematics are reported in scale score units. Scale score units permit comparison between different forms of the test within a particular grade level. The minimum standard for reading and mathematics is 700 at all grades tested.

UTILIZATION OF BSAP TEST RESULTS

BSAP test results are utilized by a variety of audiences for various purposes. These include:

- 1. Providing the Superintendent and the School Board of Trustees with an assassment of the levels of achievement in the academic content areas of reading, mathematics, and writing.
- Providing principals with an assessment of their school's achievement in these content areas which can assist them in the identification of relative strengths and weaknesses for further study.
- 3. Providing teachers with an assessment of individual pupil's achievement to aid in the improvement of instruction through further diagnosis and/or counseling with students and parents.
- 4. Providing parents and students with information on students academic achievement.
- 5. Providing the Department of Curriculum with appropriate information about districtwide strengths and weaker areas so they can assist teachers and principals in improving their instructional programs.
- 6. Aiding in the identification of students for special programs, such as Chapter I and EIA Compensatory/Remedial programs.
- 7. Aiding in the evaluation of externally-funded programs, such as Chapter I and EIA Compensatory/Remedial programs.

CAUTIONS IN THE INTERPRETATION AND USE OF BSAP TEST DATA (Reprinted from A User's Guide to BSAP Score Reports, SDE, 1987.)

Criterion-Referenced vs. Norm-Referenced Tests

An understanding of the BSAP test results may be facilitated through a general understanding of the difference between criterion-referenced and norm-referenced tests.

Criterion-referenced tests, such as the BSAP tests, are designed to measure student performance against a desired criterion or standard. In contrast, norm-referenced tests are designed to provide a basis for comparing the performance of a student or a group of students with the average performance (norm) of a representative sample of students. In light of the inherent differences between norm-referenced and criterion-referenced tests, several cautions are presented in the ensuing discussion with respect to making comparisons and interpretations based on the BSAP data.

BSAP Tests as Measures of the BSAP Objectives

The BSAP tests were developed based upon the BSAP objectives and, consequently, are intended specifically for use in Social Carolina. Since the BSAP tests are administered only in South Carolina, there is no information available that indicates how students in other states or in the nation as a whole would perform on the tests. The BSAP tests can be used to compare student performance to the preset state standard, but they cannot be used to compare student performance to some national level of performance. The intended purpose of the BSAP tests, as stipulated in the legislation, is to assist in the improvement of instruction by identifying student deficiencies.

BSAP Tests as On-Grade Level Tests

The BSAP legislation requires the tests to be on-grade level and to be administered to all students at the specified grade levels with the exception of those handicapped students excluded from testing by their Individual Education Plans (IEP's). Consequently, caution must be exercised when interpreting test data for students whose instructional levels are below the grade level of the test they took. Since the match between the ability of the student and the test difficulty is not optimal for students who are below grade level, the test results are not likely to provide as accurate a description of such a student's performance as for a student whose ability is more closely aligned with the test difficulty.

Comparisons Across BSAP Tests

Another caution relates to the legitimacy of making comparisons across basic skill areas and grade levels with the BSAP tests. Since the difficulty of the tests may vary from the mathematics to reading to writing and from grade to grade, comparisons should not be made across different grades or

across different basic skill tests for a given grade. For example, a scale score of 680 on the Grade 8 BSAP Mathematics Test is not comparable to a 680 on the Grade 8 BSAP Reading Test. Since the tests are also not equated across grades, the scale scores are only comparable from one year to the next for the same basic skill area at the same grade level. Consequently, apparent decreases in the percentages of students meeting the standards across grades may be misleading. For example, if a student receives a scale score of 710 on the Grade 2 BSAP Reading Test, and the next year receives a score of 710 on the Grade 3 BSAP Reading Test, the assumption should not be made that the two scores have the same meaning.

Socioeconomic and Other Background Performance Factors

A frequent misuse of test data is the tendency to equate high test scores with educational quality. Users of the data should remember that test data constitute a single type of information that should be used in conjunction with other relevant information to evaluate educational quality. For example, entry characteristics of students such as socioeconomic background and the educational level of parents are factors which are strongly related to test performance. Comparisons of scores among schools and/or districts should not be made unless differences in the characteristics of students are accounted for in these comparisons.

Comparisons Among Student Subgroups

Caution should be exercised in the interpretation of differences in the performance of various subgroups (e.g., male versus female) within the total population at any grade. While data for various subgroups can provide information as to which of the subgroups as a whole may be most in need of additional instruction, the data cannot and should not be used as a basis for making cause and effect statements about the instruction offered to different groups.

Interpretation of Results for Each Objective

A final caution relates to interpretation of performance by objective on the BSAP tests. A small number of items is used to test each BSAP objective. Since these items reflect only a sample of the skills encompassed by each objective, the percentage of students needing improvement should be considered as approximate. For a particular year, differences in achievement across objectives measured by the BSAP Reading and Mathematics Tests can vary. These differences may be partially explained by the fact that the skills reflected in some objectives may be inherently more difficult and receive more instructional emphasis than those included in other objectives. Thus, comparing performance across objectives for a given grade (for example, comparing 6th grade performance across the six reading objectives) provides only an estimation of relative strengths and weaknesses. Additionally, caution must be taken when comparing objectives across years for a particular grade because test items and student populations taking the test change from year to year.

Interpretation of Item Response Data

The percentages of students responding correctly to each test item on the BSAP Reading and Mathematics Tests are included in Item Response Summaries. There are a number of points that should be kept in mind when reviewing data from these summaries. The items on any one test represent a sample of the skills encompassed by each objective and a particular skill may be measured by only one test item. Since the BSAP objectives encompass a range of skill difficulty, the performance of students on one item may not provide an accurate picture of skill performance. Thus, the item response data should be viewed as very tentative approximations of skill performance; and dramatic changes in instructional focus should not be made based on these data in absence of other information.

Performance of Charleston County Pupils in 1987

Table 1 reports the percentages of Charleston County School District (CCSD) students at each grade level tested meeting BSAP standards in reading, mathematics, and writing for 1987 as well as the median scale scores for each subtest and grade level combination. The median is determined by ordering test scores from low to high and locating the score in the middle of the score distribution. The median is therefore the mid-point of the distribution of the set of scores. Half the scores lie below and half the scores lie above the median.

In READING percentages of CCSD students meeting standards were 82.2 at grade 1, 87.5 at grade 2, 93.6 at grade 3, 83.8 at grade 6, and 78.7 at grade 8. The median scale scores for these grades were 805, 806, 799, 772, and 761, respectively. A direct comparison of these median scale scores across grade levels cannot be made.

In MATHEMATICS percentages of CCSD students meeting the state standards were 84.2 at grade 1, 89.2 at grade 2, 87.6 at grade 3, 74.5 at grade 6, and 69.6 at grade 8. The median scale scores for these grade levels were 778, 804, 796, 742, and 736, respectively.

In WRITING 77.4% of the sixth graders and 73.1% of the eighth graders in the county met the state standard. The median score for each grade level was 3.0.

A greater percentage of students at grades 1 and 2 met the mathematics standards than the reading standards, while a greater percentage of students at grades 3, 6, and 8 met reading standards. However, conclusions about the effectiveness of instruction in these content areas must be tempered by an understanding that the two tests are not comparable in terms of difficulty. Hence it would be inappropriate to state that mathematics instruction was more effective than reading instruction in grade 1.

Appendix A contains frequency distributions for each grade level and subject area tested. These distributions present the number and percentage of CCSD students obtaining each BSAP scale score on the 1987 tests. Cumulative frequencies and cumulative percentages are included as well. The tables found in Appendix A can be used to identify the percentage of CCSD students obtaining a perfect score on the BSAP tests. These percentages are as follows:

Grade	Reading	<u>Mathematics</u>	Writing
1	18.9	19.0	
2	15.0	21.4	
3	8.6	11.2	
6	3.4	1.5	15.9
3	5.6	0.3	18.1

.4 2(

Table 1

Basic Skills Assessment Program, Spring 1987
Charleston County
Percent Meeting Standard and Median Scale Score

Subtest	Grade 1	Grade 2	Grade 3	Grade 6	Grade 8
READING % above standard Median	82.2 805	87.5 806	93.6 799	83.8 772	78.7 761
MATHEMATICS % above standard Median	84.2 778	89.2 804	87.6 796	74.5 742	69.6 736
WRITING % above standard Median				77.4 3.0	73.1 3.0

Comparisons With the State Results

Comparisons of CCSD students' performance on the BSAP with the performance of other students in Scuth Carolina can be made by comparing the percentages of students scoring above standard and by comparing the median scale scores. Table 2 reports the percentages of CCSD and SC students scoring above standard on each BSAP subtest, as well as median scale scores for all grade level and subject area combinations. Figures 1-5 illustrate differences in the percentages of CCSD and SC students meeting standards on each BSAP subtest.

At grade 1 a greater percentage of South Carolina students than CCSD students met standards in Reading and Mathematics. The percentages of Charleston County pupils meeting standards at grades 2, 3, and 6 were higher than the percentages of South Carolina pupils meeting standards for all subject areas. A greater percentage of CCSD eighth grade students met standards in Reading and hathematics compared to students statewide; however, a slightly lower percentage of CCSD eighth graders met the Writing standards than their South Carolina peers.

Median scale scores for CCSD pupils in grade 1 were lower than for SC pupils. CCSD median scale scores for grade 2 in both Reading and Mathematics were lower than the SC scale scores even though a larger percentage of CCSD students met standards in grade 2 than South Carolina students. This indicates that more CCSD second grade students met standards, but their scale scores were not as high as students statewide. In grades 3, 6, and 8, CCSD students obtained higher scale scores than South Carolina students in Reading and Mathematics. The median raw scores for writing were the same for Charleston County pupils and South Carolina pupils in grades 6 and 8.

Historical Trends

Table 3 reports the percentages of students meeting BSAP standards for the years 1981-1987 for Reading and Mathematics and for the years 1983-1987 for Writing. As illustrated in Table 3 and Figures 6-10, the percentages of students meeting standards in Reading and Mathematics have steadily increased from 1981 through 1987 for all grade levels and subject area combinations. In Reading, six-year differences in percentages meeting standards for grades 1, 2, 3, 6 and 8 were +7, +20, +22, +29, and +31, respectively. In Mathematics, six-year differences in percentages meeting standards for the same grades were +13, +14, +22, +29, and +34, respectively. The greatest changes over the six year period were found at grades 6 and 8.

Although the percentages of students meeting the Writing standards are higher in 1987 compared to 1983, there have been fluctuations in the pattern of change. Scores increased for sixth graders from 1983 to 1986, followed by a slight downward trend in 1987. Eighth grade scores increased during the first three years of the program, decreased slightly in 1986, and continued to decrease in 1987.

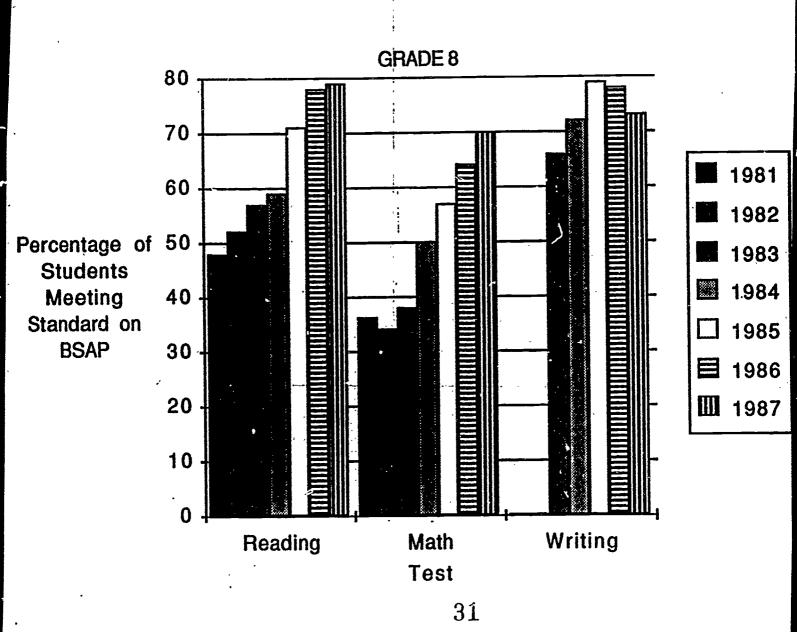

Figure 10. RESULTS FOR CHARLESTON COUNTY SCHOOL DISTRICT

Tables 4A - 4C summarize 1985-1987 data for each test content area by reporting percentages above standard and median scores.

Statewide trends in the percentage of students meeting standards are similar to those demonstrated by Charleston County pupils. Generally, improvements statewide from 1981 to 1987 were not as great as those demonstrated by CCSD at all grade levels except grade 1 where the increases were greater in South Carolina. Fluctuations in Writing scores were also apparent in the statewide scores.

Appendix B reports the percentages of students at individual schools meeting BSAP standards in Reading and Mathematics for the years 1981-1987, and for Writing for the years 1983-1987. Appendix C lists mobility indices, percentages of students on free lunch, and percentages of handicapped students for individual schools.

Comparison of Readiness Scores and BSAP Scores for CCSD First Graders. Appendix D reports Fall 1986 readiness test scores and Spring 1987 BSAP scores for first graders enrolled in CCSD schools for the 1986-87 school year and present for both testing sessions. The number of first graders who took both the CSAB and BSAP tests is reported for each school, followed by the percentage scoring 88 or above on the CSAB and the percentages meeting BSAP Reading and Mathematics standards.

Analyses of prior years' test data have demonstrated a relationship between performance on the CSAB and BSAP such that students who score above standard on the CSAB at the beginning of first grade tend to score above standard on the BSAP tests administered at the end of the year. Thus, percentages of students (taking both tests) meeting standards on the CSAB and BSAP should be similar for a particular school. A grater percentage of students meeting BSAP standards might indicate that instruction had been effective in first grade. However, a difference of 25 percentage points between CSAB standards and BSAP standards would be unusual and should be investigated further.

Among the groups of students taking both tests in 42 CCSD elementary schools during the 1986-87 school year, 31 schools showed an increase of 5 or more points in the percentage of students meeting BSAP Reading standards over the percentage meeting CSAB standards. Thirty-three schools displayed an increase of 5 o more percentage points in Math. One school (Memminger) showed a 10-point loss in Reading, and one school (Berry) showed a 10-point loss in Math. One school, Jane Edwards, showed an unusual gain of more than 25 points in the percentage of students meeting BSAP standards based on their CSAB scores. Similarly, Blaney displayed an unusually high gain in Mathematics.

Please note that while this analysis is appropriate for group data, individual students! CSAB scores should not be viewed as predictive of BSAP scores.

Table 4A

Basic Skills Assessment Program Charleston County School District Percent Above Standard and Median Scale Scores

READING

GRADE	% Above Standard	Median Scale Score		
. -	1985 1986 1987	1985 1986 1987		
1	80.4 80.0 82.2	785 783 805		
2	82.6 84.3 87.5	784 792 806		
3	89.5 91.4 93.6	787 799 799		
6	72.5 78.9 83.8	741 759 772		
8	71.4_78.0_78.7	740 759 761		

- The percentage of Charleston County pupils scoring above standard in Reading increased steadily from 1985 - 1987 for all grade levels except grade 1. First grade scores dipped slightly in 1986 then increased 2.2 percentage points from 1986 to 1987.
- Median scale scores for Charleston County pupils increased each year from 1985 - 1987 with two exceptions. The third grade median remained the same from 1985 to 1987 despite the fact that a greater percentage of students met standards. First grade medians dropped from 1985 to 1986, and rose in 1987.
- 3. The fact that a higher percentage of third graders met standards than students at other grade levels should not be interpreted to mean that third grade instruction is more effective than instruction at other grade levels. Test difficulty is not comparable across grade levels. While percentages of third graders meeting standards rose from 1986 to 1987, the median scale score did not. This may indicate that more students met standards with lower scores.

Table 4B

Basic Skills Assessment Program Charleston County School District Percent Above Standard and Median Scale Scores

MATHEMATICS

% Above Standard	Median Scale Score
1985 1986 1987	1985 1986 1987
83.0 84.3 84.2	791 79 8 778
86.4 87.0 89.2	789 794 804.
83.6 83.6 87.6	772 780 796
65.1 69.6 74.5	721 731 742
57.0 64.1 69.6	708 722 736
	1985 1986 1987 83.0 84.3 84.2 86.4 87.0 89.2 83.6 83.6 87.6 65.1 69.6 74.5

- The percentage of Charleston County pupils scoring above standard in Math increased steadily from 1985 - 1987 for all grade levels except grade 1. First grade percentages decreased by .1 from 1986 to 1987.
- Median scale scores for Charleston County pupils in Math increased each year from 1985 - 1987 for all grades except grade I where the median decreased from 1986 to 1987.
- 3. The fact that a higher percentage of second graders met standard than students at other grade levels should not be interpreted to mean that second grade instruction is more effective than instruction at other grade levels. Test difficulty is not comparable across grade levels.

Table 4C

Basic Skills Assessment Program Charleston County School District Percent Above Standard and Median Score

WRITING

GRADE	% Above Standard	Median Score
	1985 1986 1987	1985 1986 1987
6	73.5 79.0 77.4	2.9 3.1 3.0
8	78.7 77.5 73.1	2.9 3.0 3.0

- 1. The percentage of Charleston County sixth graders scoring above standard in Writing increased from 1985 1987; however, the percentage dropped from 1986 to 1987. The percentage of eighth graders scoring above the writing standard decreased steadily from 1985 1987.
- Median scores for Charleston County sixth graders in Writing followed the same pattern as the percentage above standard: scores increased from 1985 to 1987, and decreased from 1986 to 1987. Median scores for eighth graders increased from 1985 to 1987 and stayed the same from 1986 to 1987, despite a decrease in the percent meeting standard. These data, coupled with a comparison of frequency data in Appendix A to last year's data, indicate that a smaller percentage of students are scoring 1.5 or below and 3 and above, but proportionately more students are scoring 2. Hence the "below standard" students are scoring higher (and presumably writing better) than in the past.

Demographic Analysis

Table 5 reports percentages of CCSD students scoring above standard in 1986 and 1987 on the Reading, Mathematics, and Writing tests for demographic categories. Table 6 compares percentages of Charleston County students scoring above standard in 1987 to percentages of South Carolina students scoring above standard. Demographic variables include gender (male, female), ethnicity (white, black), and income level, defined by lunch program participation (no free/reduced lunch, free/reduced lunch). Approximate numbers of students tested appear in the right-most columns. Note that relatively small numbers of students on reduced-price lunch are reported; care must therefore be used in interpreting data regarding this subgroup. In the discussion below, data on students receiving reduced-price lunches have been excluded. The following sections summarize the demographic data:

Gender

- 1. For grades 1, 2, and 3, in 1987 more than 80% of male and female subgroups scored above the state standard in all areas with the exception of males in grade 1 where 79.1% of the males scored above the state standard in Reading. For grades 6 and 8 more than 70% of male and female subgroup populations scored above state standards in all areas with two exceptions. The exceptions were grade 8 males on the Mathematics subtest and grade 8 males on the Writing subtest.
- 2. A greater proportion of females, compared to males, scored above the state standard on Reading, Mathematics, and Writing subtests for all grade and subject area combinations except grade 3 Mathematics where females scored .7 percentage points below males.
- 3. Percentages of CCSD males and females scoring above the standard in Reading and Mathematics in 1987 were greater than or equal to percentages for 1986 with two exceptions. Grade 1 females showed a decline of .2 percentage points in Mathematics. Grade 8 females showed a decline of 1.1 percentage points in Reading. Percentages of CCSD males and females scoring above the state standard in Writing declined in both sixth and eighth grades.
- 4. CCSD students displayed greater percentages above standard than their SC peers with three exceptions. Proportionately fewer CCSD first grade males and females scored above state standards than other SC students. Grade 6 CCSD females lagged behind females statewide in Writing by .3 percentage points. Grade 8 males and females scored below their South Carolina counterparts in Writing.

Ethnicity

1. More than 80% of the white students scored above the state standard in 1987 in all subject areas and for all grade levels tested. More than 80% of the black students scored above the state standard only in grade 2 and grade 3 Reading and Mathematics.

- 2. A higher proportion of white students, compared to black students, scored above the state standard in 1987 in Reading, Mathematics, and Writing at all-grade levels tested. Differences between white students and black students range from 5.4 points (grade 3 Reading) to 28.4 points (grade 8 Writing). The subtest showing the greatest difference was Writing (averaging 25.4 points). The subtest showing the smallest difference was Reading (averaging 11.2 points). Differences between white students and black students were smallest at grade 3 and greatest at grade 8. For grades 1, 2, and 3 average differences between the achievement levels of black and white students were 8-12 points. For grades 6 and 8 average differences between the percentages of black and white students meeting standards ranged between 19 and 22 points.
- The percentages of white students and black students scoring above the state standard on Reading and Mathematics subtests were greater in 1987 compared to 1986 with two exceptions. A smaller percentage of black first graders met the Mathematics standard in 1987 than in 1986. A smaller percentage of white students in grade 8 scored above the Reading standard in 1987 than in 1986. Percentages of white students and black students scoring above state standards in Writing in 1987 were lower than percentages for 1986. In general, however, Writing scores were lower in 1987 than they were in 1986.
- 4. With one exception, greater percentages of CCSD white and black students met standards compared to students statewide. The one exception was for first grade black pupils in Reading. Positive (CCSD-SC) differences ranged from .1 percentage points for first grade Reading for white pupils to 13.2 points for black eighth graders.

Income

- 1. Data on students in grades 1, 2, and 3 categorized by lunch program participation indicate that more than 90% of the students at these grade levels not participating in the lunch program scored above state standards in Reading and Mathematics. More than 74% of the students on free lunch in grades 1, 2, and 3 scored above the state standard for Reading and Mathematics. Data on students in grades 6 and 8 categorized by lunch program participation indicate that more than 79% of the students at these grade levels not participating in the lunch program scored above the state standard on Reading, Mathematics, and Writing subtests. More than 55% of the students on free lunch in grades 6 and 8 scored above the state standard.
- 2. A higher proportion of students not being served by the free lunch program met state standards than students served with the free lunch program for all areas and grade levels. Differences between students not participating in the lunch program and students on free lunch range from 6.2 percentage points (grade 3 Reading) to 28.6 percentage points (grade 8 Writing). Differences were greatest for the Writing subtest (averaging 26.6 points) and least for Reading (averaging 14.98 points). Differences between the two groups of students were smallest at grade 3 and greatest at grade 8.

- 3. Students in both subgroup categories made improvements in Reading and Mathematics from 1986 to 1987 with the exception of grade 1 Mathematics scores for students not participating in the lunch program. A decline in Writing scores resulted in smaller percentages of students in both categories meeting Writing standards in 1987 than in 1986.
- 4. Greater percentages of CCSD pupils than SC pupils in both lunch groups scored above state standards for all subtests and grade level combinations with few exceptions. The exceptions were grade 1 Reading and grade 8 Writing for both lunch groups and grade 1 Mathematics for students not participating in the lunch program.

District Demographic Reports are reprinted in Appendix E. In addition to the demographic variables of gender, ethnicity and income level, the reports in Appendix E include data for handicapped, gifted and talented, and repeater groups.

BSAP OBJECTIVES ANALYSIS AND ITEM RESPONSE RESULTS

Objectives Analysis, 1987

Table 7 reports percentages of students at each grade level needing improvement on each Reading and Mathematics objective and percentages of students scoring below standard in Writing at grades 6 and 8 needing improvement on each Writing objective. Percentages are reported for both CCSD and SC for the Spring, 1987 test administration.

The percentage of students needing improvement on individual objectives varies across grade levels such that there are no patterns reflecting general weaknesses among the grades tested. Table 7, for example, shows that the percentage of CCSD students needing improvement in Inference ranges from a low of 7% at grade 3 to a high of 25% at grade 8. There is a general indication that greater percentages of students at grades 6 and 8 need improvement on the objectives. However, this trend can be explained by lower average scores achieved by middle school students compared with elementary school students. In reviewing Table 7, the reader should keep in mind that the BSAP objectives vary in difficulty, i.e., some objectives are by their nature, more difficult than others.

Skills strengths and weaknesses can be viewed from two perspectives. First, one may identify "Absolute" strengths and weaknesses by locating the objective(s) mastered by the highest percentage of students (strength[s]) and the objectives on which the greatest percentage of students needed improvement (weakness[es]). Instructional strategies, which focus on skills weaknesses identified in this manner, may improve student performance on the entire test and result in higher BSAP scores.

The second approach identifies strengths and weaknesses "Relative" to the difficulty of the individual objectives. In this method, difficulty levels of objectives may be established by the performance of students statewide. The percentages of statewide students mastering objectives or "needing improvement" become standards to which the performance of CCSD students can be compared to determine relative strengths or weaknesses.

These two methods of identifying strengths and weaknesses might not bear the same result; however, each serves a purpose. For example, utilizing CCSD data from Table 7, Operations appears to be the most problematic objective for first and second grade students. However, when these data are compared to SC data, smaller percentages of CCSD pupils need improvement with respect to Operations than SC pupils.

Tables 8A-8C list skills strengths and weaknesses based on the performance of CCSD students on each objective ("Absolute") and the performance of CCSD students as compared to SC students ("Relative"). "Absolute Strengths" identify the one or two objectives which the greatest percentage of CCSD students mastered. "Absolute Weaknesses" identify one or two objectives on which the greatest percentage of CCSD students need improvement. "Relative" strengths and weaknesses are determined by the

degree of discrepancy between the percentages of CCSD and SC students meeting standards on objectives. Only the greatest one or two strengths or weaknesses are listed for each objective. The degree of strength or weakness is denoted by asterisks. A single asterisk (*) indicates a difference of 1-2 percentage points; a double asterisk (**) indicates a difference of .3-5 percentage points; and a triple asterisk (***) indicates a difference of 6 or more percentage points.

In READING (Table 8A), Decoding and Word Meaning was a "Relative" strength at four of the five grade levels tested. "Absolute" strengths varied across grade levels. Students at grades 2, 3, 6, and 8 showed no weaknesses relative to the performance of students stacewide, while first graders showed minor "Relative" weaknesses in four of the six objectives. Details was the most problematic objective for first and second graders from the absolute perspective. "Absolute" weaknesses varied across other objectives for students in grades 3, 6, and 8.

In general, the same strength and weakness patterns were demonstrated by all students tested and by students scoring below standard. The most striking exceptions include: a) "below standard" students in grade 3 showed greater "Absolute" weaknesses in Details and Inference than in Main Idea, as identified for "all students," (b) sixth grade "below standard" students showed a "Relative" weakness in Analysis of Literature when compared to students statewide, and (c) eighth grade "below standard" pupils displayed "Relative" weaknesses in Details*, Main Idea**, Inference**, and Analysis of Literature**. Students scoring below standard must be remediated. Many of them are included in remedial programs (EIA, Chapter I), and this information may benefit instructional planning in those programs.

MATHEMATICS (Table 8B) illustrates possible "apparent" contradictions presented by these kinds of analyses. Objectives which appear as "Absolute" weaknesses at some grade levels, also appear as "Relative" strengths at the same grade levels. At both first and second grades, for example, Operations is designated as the "Absolute" weakness and as the "Relative" strength. Apparent contradictions, however, illustrate how this type of analysis puts data into perspective.

Operations was a "Relative" strength in both first and second grades, while Concepts was the "Absolute" strength at those grade levels. Geometry was the strength identified by both techniques at grade 3. At grade 6, Concepts appeared as a strength when both methods were used. At grade 8, different objectives were identified by the different methods.

Measurement was identified as a "Relative" weakness in three of five grade levels tested (grades 2, 6, and 8). Operations was designated as the "Absolute" weakness at grades 1 and 2. At grade 3, Problem Solving was identified as a weakness by both methods, as was Measurement at grade 6, and Concepts at grade 8.

Mathematics results were generally the same for below standard students and all students tested. The most salient change was that Concepts appeared as both an "Absolute" and "Relative" strength in first and second grade among students scoring below standard.

4.2

Objective data for WRITING (Table 8C) are only available for students who did not meet Writing standards on the overall test. Writing results indicate that Composition and Word Usage were the "Absolute" strength and weakness, respectively, in both grade levels tested, while Sentence Formation was the "Relative" weakness.

Appendix F includes District Summary Reports for each grade tested reporting percentages of CCSD students meeting standards and needing improvement on each objective as well as the Total Test for Reading, Math, and Writing. Percentages are given for All Students, Students Who Met Standards, and Students Who Did Not Meet Standards. District Summary Reports also provide summary statistics (mean, median, highest score, lowest score) for CCSD students.

Appendix G includes the percentage of students needing improvement on each objective for each CCSD school, as well as percentages meeting standards, means, medians and numbers of students tested.

Objectives Analysis, 1985-1987

For instructional planning, analyses of objective performance across several years is beneficial in distinguishing patterns from yearly fluctuations. Since the corposition of the BSAP test forms varies from year to year, analyses of objective performance over time can be misleading. This shortcoming can be modulated by making a comparison of the "Relative" weaknesses for several years, since "Relative" weaknesses should not be as subject to fluctuations in test content as "Absolute" weaknesses. Tables 9A-9C list "Relative" weaknesses in each subject area tested for the years 1985-1987.

READING data indicate that Details and Inference have been weaknesses in first grade Reading in 1985, 1986, and 1987; but Decoding and Word Meaning is the only objective not cited as a weakness in first grade Reading during this period. In all other grade levels tested, CCSD pupils outscored SC pupils on all Reading objectives.

In MATHEMATICS, patterns were not as visible. Geometry and Measurement appeared consistently as weaknesses in grade 2; Problem Solving was a clear weakness in grade 3; and Concepts was an eighth grade weakness in two of the three testing periods.

WRITING results indicate that Sentence Formation was a weakness for both grade levels tested in 1985 and 1987. CCSD students displayed no relative weakness in 1986.

Item Analysis

Item data which could be used for further analyses of skills strengths and weaknesses are given in Appendix H. The Item Response Summaries provide a description of each item on the BSAP tests, the percentage of students in the district answering the item correctly, the percentage of students in the state answering the item correctly, and the difference in state and district percentages.

The Item Response Summary reports data for individual items and should be used cautiously since a sample of one item does not provide adequate information for generalization to a subskill. Item difficulty is not constant across items.

When reviewing Item Response data, "Relative" and "Absolute" approaches can also be used. "Relative" strengths and weaknesses can be identified by the positive District-State differences (strengths) or negative District-State differences (weaknesses). "Relative" comparisons should be tempered by "Absolute" data such as the District or State Percent Correct. For example, the first item on the first grade test (1-DW 1 Identify a picture which represents a grade 1 sight word) might appear to be a weakness since a negative number appears in the difference column (-.1). However, 98.1% of the students in CCSD and 98.2% of the students statewide answered that item correctly. Similarly, Item 4-GE 2, Determine the Congruent Angles Using Given Angle Measures, might appear as a strength with a +1.0 District-State difference on the eighth grade test. However, only 39.5% of the students in Charleston and 38.5% of the students in the state answered correctly.

CONCLUSIONS

Spring, 1987 district BSAP data indicate that, in general, achievement levels of students at grades 1, 2, 3, 6, and 8 are higher than the achievement levels of South Carolina students with the exceptions of first grade Reading and Mathematics scores and eighth grade Writing scores.

Reading and Mathematics scores have improved for all grade levels tested during the six year period of BSAP implementation. The greatest changes have occured at the sixth and eighth grades. CCSD performance levels have improved more than SC performance during this time.

Although Writing scores have improved since 1983, they appeared to take a downward trend in 1987. CCSD and SC Writing score patterns mirror one another; however, CCSD score drops were greater than SC drops.

Objective Analysis results suggest that the following skills should be addressed districtwide: Details and Inference (Reading, grade 1); Geometry and Measurement (Mathematics, grade 2); Problem Solving (Mathematics, grade 3); Concepts (Mathematics, grade 8); Sentence Formation (Writing, grades 6 and 8).

APPENDIX H

Item Response Summaries

SOUTH CAROLINA BSAP ITEM RESPONSE SURVARY GRADES 1 - 8 READING

THE ITEM RESPONSE SUMMARY PROVIDES DESCRIPTIVE INFORMATION ABOUT GROUP AND STATEMIDE PERFORMANCE ON THE SPECIFIC ITEM USED TO ASSESS A SUBSKILL. AS YOU REVIEW THE INDIVIDUAL ITEM DESCRIPTIONS, YOU MILL NOTE THAT THERE IS A POSSIBILITY THAT OTHER DISTINCT ITEM TYPES MAY BE ELIGIBLE TO ASSESS THE SAME SUBSKILL. CONSEQUENTLY, INTERPRETATION OF BATA SHOULD RELATE TO THE SPECIFIC MATURE OF THE ITEM TESTED AND NOT EXTEND TO THE SUBSKILL ASSESSED. FOR A COMPLETE LISTING OF ALL ELIGIBLE ITEM TYPES FOR A GIVEN SUBSKILL, REFER TO THE SKILL DIFFICULTY CHARTS IN THE TEACHING AND TESTING OUR BASIC SKILLS OBJECTIVES MANUALS (TAT).

GENERATE AN INFERRED STATEMENT OF THE MAIN IDEA

. READING SELECTION.

MIEN THE MAIN IDEA IS NOT EXPLICITLY STATED IN A

THE PERCENT OF STUDENTS RESPONDING CORRECTLY TO EACH ITEM IS PROVIDED AT THE SCHOOL, DISTRICT, AND STATZ LEVELS. BY COMPARING GROUP TO STATEMIDE PERFORMANCE, SPECIFIC AREAS OF RELATIVE STRENGTED AND HEAKNESSES ON OBJECTIVES CAN BE DETERMINED.

SINCE THE BSAP MAS DESIGNED TO SAMPLE BEHAVIORS FOR EACH OBJECTIVE, THE REPORT DOES NOT PROVIDE COMPREHENSIVE DIAGNOSTIC INFORMATION. THE DISTRICT'S: HETHOUS OF PROVIDING CONTINUOUS ASSESSMENT FOR EACH INDIVIDUAL STUDENT SHOULD BE UTILIZED TO GATHER THIS TYPE OF DIAGNOSTIC INFORMATION.

ALS. CRITICAL ANALYSIS - THE STUDENT CAN DETERHINE

READING SELECTION.

RELATIONSHIPS BETHEEN STRUCTURAL ELEHENTS IN A

SOUTH CAROLINA BSAP ITEM RESPONSE SUMMARY CRADES 1 - 8 MATHEMATICS

THE ITEM RESPONSE SUMMARY PROVIDES DESCRIPTIVE INFORMATION ABOUT GROUP AND STATEMIDE PERFORMANCE ON THE SPECIFIC ITEM USED TO ASSESS A SUBSKILL. AS YOU REVIEM THE INDIVIDUAL ITEM DESCRIPTIONS, YOU HILL NOTE THAT THERE IS A POSSIBILITY THAT OTHER DISTINCT ITEM TYPES HAY BE ELIGIBLE TO ASSESS THE SAME SUBSKILL. CONSEQUENTLY, INTERPRETATION OF DATA SHOULD RELATE TO THE SPECIFIC NATURE OF THE ITEM TESTED AND NOT EXTEND TO THE SUBSKILL ASSESSED. FOR A COMPLETE LISTING OF ALL ELIGIBLE ITEM TYPES FOR A GIVEN SUBSKILL, REFER TO THE SKELL DIFFICULTY CHARTS IN THE TEACHING AND TESTING OUR BASIC SKILLS OBJECTIVES MARKIALS (TAT).

168

THE PERCENT OF STUDENTS RESUGNING CORRECTLY TO EACH ITEM IS PROVIDED AT THE SCHOOL, DISTRICT, AND STATE LEVELS. BY COMPARING GROUP TO STATEHIDE PERFORMANCE, SPECIFIC AREAS OF RELATIVE STRENGTHS AND HEAKNESSES ON OBJECTIVES CAN BE DETERMINED.

SINCE THE BSAP HAS DESIGNED TO SAMPLE BEHAVIORS FOR EACH OBJECTIVE, THE REPORT DOES NOT PROVIDE COMPREHENSIVE DIAGNOSTIC INFORMATION. THE DISTRICT'S HETHODS OF PROVIDING CONTINUOUS ASSESSMENT FOR EACH INDIVIDUAL STUDENT SHOULD: BE UTILIZED TO GATHER THIS TYPE OF DIAGNOSTIC INFORMATION.

	BELON IS A LIST OF THE SUBSKILLS TESTED AND THE SUBSKILL CODES USED ON THIS REPORT.
