ABSTRACT
This paper presents i followup of selected studies on effective schools with a pupulation of bilingual and/or limited-English-proficient (LEP) students. Over 150 research papers on both effective schools and effective bilingual Lef instruction were reviewed. The literature was divided into three categories: studies with a population including linguistically and culturally different students within a bilingual or monolingual setting; (2) evaluations about the degree of effectiveness of mostly federally-funded bilingual programs; and (3) investigations of effective bilingual instructional practices or features. It is reported that the results of a survey of 97 of the research authors demonstrate the limited extent to which the research literature recognizes LEP students in its sample populations. Implications of these findings for the planning and development of effective instructional programs for LEP students are discussed, and recommendations for future research are offered. A 38-item bibliography is included. (MSE)

## EFFECTIVE SCHOOLS RESEARCH AND LANGUAGE INSTRUCTION PROGRAMS

## 

 This paper f.resents a follow up of selected atudies on effective schools with a population of bilingual ard/or hmicd. Iinglisit proficient atudents (1.I:Ps). It revisw the literature on both the effective school research, and the effactive bitingual/I I:P instruction research. It presents the findings of aurvey that demonstrates to the limited extent that the research literature recognizes LI:P studenis in its sample propulation. Th: paper dacusses the implications of these findings for the planning and development of effective inaiructional programs for I.LP sidudents. It offers recommendations pertaining to future rescarch efforts in the ficid.

## Statement of Purpose

This paper examines the literalure on effective schools to determine to what extent it provides information related to effective schooling for minority language, bilingual, and limited-English proficient students (LEPs). It focuses primarily on the literature on effective bilingual instruction and other language programs designed to meet the needs of iimited- English proficient students. It presents the findings of a survey that examined effective schools rescarch and selected studics which cite variables included on the effective schools literalure.

## Review of the Literature

The effective school literature which provides information regarding the education of minority language, LEP or bilirgua students can be divided into threc callegorics: 1) sudies with a population that includes linguistically and culturally different students within a bilingual or monolingual setling, 2) evaluations about the degree of effectiveness of mosily federally funded bilingual programs, and 3) investigations on cffeclive bilingual instructional practices or features.

A revicu of the literature revested that a limited number of effective scheols studies identify the target atudents in their sample population. It also demonstrated that the majority of them mashe no analysis of their findings RIC rding the identilicd variables and their relolionship to the acomemic
performance of this population. The rescarch brief prepared by the Educational Research Services, Inc. (1983) includes three of these studies: 1) Ellis (1975) research on elementary reading, 2) an early chldhood study completed by the California State Department of Education (1980) and 3) Armor's (1976) study of reading achievement. Ellis reported no specific finding and made no recommendations related to this population. The California SED study reported that there are inadequate or non-existent means fri: assessing LEP or NEP (non-English proficient) students, and for assessing bilingual education programs. Some findings were included by Armor in his study of a reading program in Los Angeles. He concluded that the achievement of the Mexican American student was significantly influenced by the particular school and classroom to which the student was assigned, and that the principal's assessmeat of the teacher was an accurate predictor of reading achievement (1976). However, this rescarch did not discern statistically significant relationships between any individual classroom policy/input measured and academic achievement.

The second category of reseasch studies related to effective instruction for I.EP students in the U.S. consists of evaluations of bilingual programs. Much of this literature describes typologies, and designs for program administration and implementation. These studies attempt to document the success or lack of it of particular bilingus! programs. The literature is rich in program evaluations that illustrate success storics (Pena-Huges and Solis, 1980, 81; Plante, 1986; Huzar, 1973; Olesini, 1971; Barik ct.al., 1979; Lagarretta, 1979). While particular language programs have been shown to be effective, the conclusions generally do not indicate the effect or relationship of specific variables on the academic achieyement of the LEP students. Examples include: 1) the Head Start study (LaBelle, 1979) that piesented achicvement gains as a result of students' participation in bilingual programs; and 2) the AIR (Danoff, 1978), and the Baker and Je Kanter reports (uapublished manuscript, 1983) which presented evidence against the effectivement of bilingual programs. Of these studies, only the AIR report attempted to provide some quantitalive findings on the relationship between achievement and instructional variables. While these two reports have been widely criticized for methodological חaws (Cervantes, 1979, McConncll, 1983; Garcia and Martinez, 1982; American Psychulogical Association, 1982), the findings have not been dismissed. Many educational researchers have taken these reports as a challenge to improve the quality of instruction and have suggested that the consequences described in these studies ne.essilate further research.

A Descriptive Phase Report of the National Longitudinal Evaluation of
the Effectiveness of Services for Language-Minority Limited-English Proficient Students (1984) estimated the number of LEPs served by these programs, and provided an analytic description of the services offered. A second phase of this study, will attempt to determine the effectiveness of these services.

The third category of studies on effective instruction for LEP students focuses on classroom practices. These studies cover aspects of language instruction such as language sequence, classroom management and organization, language(s) characteristics and use, attitudes, and socio-cultural variables. Investigations on curricular sequencing of languages (L1 and L2) include support for both positions: skills developed first in L1 will transfer to $L 2$ (Goldman, 1983), and the reverse. These findings had previously been supported in numerous studies in the field of bilingual education. Positive results in using the native language (L1) approach were confirmed in Mexico (Modiano, 1968), in Peru (Burns, 1068, 1970), and in the U.S. (Enrich, 1971; Gulub, 1978). Support for $L 2$ instruction and the transfer of skills to L 1 while students progress through school have been documented by researchers in Canada (Lambert and Tucker, 1972; Barik, Swain and McTavish, 1974) and in the U.S. (Cohen, 1974). In light of contradictory findings, explanations have focused on social and linguistic factors such as the: (a) status of the language taught and the national group it represents, (b) attitudes loward L1 and L2, and (c) degree of inilial language proficiency.

The review of the literature also showed that cognitive and cultural factors were found to be significant determinants of productivity and effectiveness in the classroom. Studies about cognitive factors (Cummins, 1978; Fishman, 1978; Duricy, 1971; (iiles, 1977), and cultural variables (Llanes, 1976; Ramirez et. al., 19) have demonatrated that there is a relationship between program praclices and the acquisition of language by LEP students. A significant study completed by Wong-Fillmore (1976) identified three factors closely related to effective classroom instruction: (1) the nature of the linguistic material from which the learners begin to construct their versions of the English language, (2) the role which social factors play in the acquisition process, and (3) sources of individual differences in the children's mastery of the new language. This study illustrated that: 1) children are able to use the new language in meaningful social settings before rule learning, (2) students must establish and maintain social contact with native speakers who can provide the help necded to learn the language, and 3) characteristics such as personality, interes:s, motivation, and language hatits can seriously affect the ability of the learner to take full
advantage of the opportunity to learn the language in the classroom.
Fillmore's three-year study on "Variation in Bilingual Instructional Practices and Second Language Learning" attempts to determine whether or not LEP students learn English better in an all English or bilingual program. Preliminary findings revealed considerable individual differences in how well and how quickly children learn an L , regardless of the instructional and program characteristics. This variability was observed in different types of clasintoms and appeared to be related to characteristies other than the learner's intelligence and motivation. The cultural background of the students and their initial proficiency in English were found to be important determinants of the learning behavior exhibited by particular groups of minority language students. The following additional instructional variables were highlighted: quality of teaching, quality of classroom environment; quality of instructional language (input), and availability of opportunitics to practice English in interactions with peers and teachers.

The bilingual intervention eflicacy literature, which focuses on process data rather than achievement outcome, identifies instructional strategies of significant impact on student achievement such as direct instruction and personalized systems of instruction. Research on home/ environmental variables for Sispanic students has demonstrated that, children who come from home environments and family backgrounds offering a greater varicly of stimulating experiences are those which rate high on measures believed to predict school performance. There is a high correlation between student reading in the home and academic achievement (Matuseck and 1faskin, 1978). There is also a high correlation between family interaction, language used, and language development (Hart, 1983; Beker, 1977; Weder and Fowier, 1984).

Affective factors have teen largely ignored in the literature on LEEP students' bilingualism. Collado-Heriell and Herrell (1980) demonalrated that affective meaning is an important component of bilingualism. Hansen (1983) identified confidence in learning a language lesson as a detcrminant of successful language learning.

A study designed to address the characteristics of eflective bilingual instruction reported findings of a three year nationwide investigation (Tikumoff, 1980). The specific variables examined consisted of: (a) staff, (b) congruence of the instructional intent with the organization and delicuery of instruction, (c) program eonsistency, (d) time spent on learning, (c) academic focus, () acting teaching behavior of teachers, and (g) school and community aspects. The study demonstrated that bilingual education shares many of the
same characteristics exhibited in other efective educational programs cited in the literature. Shared characteristics reported include: (1) a strong focus on academic work, (2) a high allocation of time to subject matter content and engagement time on tasks, (3) the use of active teaching practices, (4) the expression of high expectation for student performance, (5) an efficient classroom management, (6) the congruence between teacher intent and the organization of instruction, (7) the frequency of direct factual single-answer questions posed by the teachers instead of complex divergent questions, and (8) student involvement in large group instruction rather than unsupervised independent study.

In addition, the study described above provided support for two unique and significant bilingual instructional features: the use of two languages, and the use of Ll cultural information during instruction. It demonstrated that a substantial amount of the students' native language (L.1) is associated with positive learning behaviors for LEP students. The use of LI in itself provides an influential carricr of cultural information, which in turn, allows students to work with concepts in which they have had iirst-hand experience. It also allows students to identify with teachers, and it reduces discontinuitics between the home and the school. The use of L 1 also lessens possible status differences in languages, resulting in an increase in motivation toward learning.

The sum of rescarch evidence on effective instructional practices related to the successful achievement of LEP stueints points to: (1) instructional practices, beth shared with effective schools and unique bilingual/second language instructional practices, (2) individual learner characteristics, and (3) home-environment factors.

## Methodology

Over one hundred fifty (150) papers in effective schools and effective bilingual/LEP instructional practices were reviewed to identify successful instructional practices which address the educational needs of both monelingual and LEP/bilingual students. The review emphasied practices related to bilingual/LEP language and academic programs. In addition, 225 research authors were contacted to complete a survey questionnaire to follow up the findings of the literature review. Questionnaries were mailed to determine if the studies: (1) included non-English or LEP students in their population sample; (2)included bilingual students in their population sample; (3) considered whether schools identified as effective had $C^{\text {on-English, LEP or bilingual students; ( } 4 \text { ) explained if nom-Enelish. IFP or }}$
bilingual students were accounted and how, when classifying a school as effective; (5) excluded the target population for the purpose of classifying a school as effective or not; (6) established any differences between schwols that reported a bilingual population and those which reported non-English or LEP students; and (7) reported' language-minority students (Hispanics, Vielnamese, Native Americans) as part of the sample population. Each of the authors identified, received a follow up letter and an additional questionnaire if he/she did not answer the first questionnaire, or requested more information to complete the questionnaire. The authors selected consisted of persons who had completed studies on effective schools and authors of studies that included variables cited in the effective schools literature.

## Results

Ninety-seven questionnaires (43\%) were returned. One fifith (21\%) of the respondents were aware that their sludy included schools which repo ted language minority students. Ninetcen percent ( $19 \%$ ) included schools that identified LEP students, and less than ten percent (10\%) selected schools that reported bilingual stude'ts. Effective schools with LEP students represented eighteen percent ( $18 \%$ ) of the respondents. Effective schouls with bilingual students represented less than nine percent ( $8.6 \%$ ). Only three percent of the sludies accounted for the LEPs and one percent accounted for the bilingual students to determine whether a school was effective or not. Six percent accounted for the LEP or bilingual students to determine the effectiveness of the selected variables (s) on the instructional/educational process of the respective population. Four percent indicated that they excluded the LEP students and one percent stated that they excluded bilingual students from their study. Four percent indicated that they established a dificrence between schools and or classes that reported a bilingual vs. LEP population.

## Discussion

These findings illustrate that only a limited number of effective school studies indentified the target students in their sample population. An analysis of the findings demonstrated that the majority of the studies with LEP/bilingual students do not account for these students, and make no recommendation related to their needs. A more alarming fact revealed is that a significant number of sturlies did not consider the needs of these students an area of their concern. Comments that permeated these
responses include:

- We did not collect data which could enable us to answer these questions.
- My study was not fine enough to consider some of the relevant issues you raise.
- Schools are excluding LEP students when reporting scores for school improvement projects. ... I have no evidence to back this suspicion other than anecdotal evidence.
- School district policy pernitted the exclusion from testing of any student whose command of English was not sufficient to respond to the test items. This exclusion was at the discretion of the school principal.

The studies that accounted for the target pupulation stated iwo major reasons for it: to exclude students who did not score high enough to form part of the study or to design specific rescarch to study the larget group. The larger number of studies did not consider LEP and bilingual sludents an issue. It is also apparent that school districts have not established a policy regarding the exclusion or inclusion of these students when reporting scores.

Rescarch designed to study instructional practices for bilingual/LEP students identified "shared" fealures thol apply to scheols serving mainstream students. In addition, these studies singled out "unique bilingual ${ }^{\text {f }}$ features. They are: 1) the utilization of L 1 and L 2 to mediate instructional variables, 2) social contact with native- like L2 pecrs and teachers, 3) the use of L1 as a transnitter of cultural infornation, 4) language habits, 5) the quality of instructional language, and 6) the nature of linguistic material from which the child construes English. Significant home- environmenmial factors include: 1) homec altitude towards $\mathrm{L} 2,2$ ) cultural/ethnic indentificalion with $\mathrm{LI}, 3$ ) interlanguage use by the family, 4) reading practices at home, 5) richness of the home experiences, and 6) the status of Li. Charateristics of the learner which appear to the significant aste: 1) initial level of L2, 2) personality characteristics, 3) interest, 4) mosivation, 5) cultural background, 6) confidence and valued perceived in learning L2, and 7) attitudes loward L2.

## Major Issues

Effective shools research in monolingual and hilingual instractional programs points to a number of instructional variaties that relate to the academic achievement and language learning/acquistition of LEP students. Nevertheless, atiention must be devoled to the study of additional vatiables
and the bilingual/bicultural perspective through the use of appropriate research techniques. These research techniques most expose the unique characteristics of successful programs and instructional processes designed to meet the needs of LEP sludents and second language (L2) learners. In a comprehensive review of recent research and evaluation studies of programs designed to meet the needs of bilingual and LEP students, Baker and de Kanter (1983) rejected 135 and accepted only 39 investigations. A similar review by Zappert and Cruz (1977) rejected all but 12 of 184 studies and identified the following methodological weaknesses: no control for socioeconomic status, inadequate sample size, improper sample techniques or excessive altrition rate, no baseline or camparison data, no control group, and no control for initial language dominance. They also reported significant differences in ieacher characteristics and other confounding variables, and insufficient statistical information or improper statistical applications (p. 46).

Alleged deficiencies apparent in the research literature on effective schools can be identified in the majority of studies on effective instruction for LEP students. Problems identified include: (1) conceptual problems with the selection of instructional measures, (2) discrepancies with the definition of effectiveness, (3) limitations of the comparisons made to explain causality, deviation of the norm, the generalization of findings, and the importance of the relationship, and (4) problems with the plans suggested to translate research findings into improved programs outside the scope of the study.

It is significant to note that two of the effective bilingual instructional studies reported (Fillmore, 1976; Tikunoff, 1980) provided measures to account for some of the identified deficiencies in: 1) definition, 2) measures of effectiveness, 3) scope of effective instructional leatures, and 4) studemt academic, socio-economic, cultural and language backgrounds. One study (Tinkunoff, 1975) provided measures to ensure appropriate generalizations, and incorporated comprehensive suggestions for program improvement. Nevertheless, additional research efforts need to continue and expand to include:

- specific cultural and linguistic elements, and their significance as mediators of instructinal practices for LEP students;
- classroom participation structures and instructional features which are culturally and linguistically inllueneed;
linguistic and culturally determined behavioral norms which inflrance academic achicvement and language acquisition;
- instructic tal practices congruent with language developr ent activities and culturally determined learning
behavior;
- achievement of higher level skills in addition to language acquisition, and basic reading and math skills;
- achicvement of affective goals such as self sufficiency, positive attitudes, and ability to adap;;
- variables that demonstrate long term impact which is reflected in upper elementary and middle school education; and
- effective organizational variables and their relationship to achievement.
