ABSTRACT

This study investigated Chinese teachers' attitudes about the benefits of teaching small classes. Researchers administered a survey with open-ended questions to a sample of 54 teachers in a mideast Chinese urban school district. The study investigated their responses on issues related to the functions and benefits of having small classes for both teachers and students. Findings indicated that the Chinese urban teachers preferred teaching small classes, perceiving small class size as a beneficial factor not directly related to student achievement. They believed that small classes facilitated more individualized help from teachers, more student-teacher interactions, better classroom management, and a reduced teacher workload. They also believed in teachers encouraging and creating competition among students, which they regarded as important for students in large classes to succeed. Some cultural differences were also found. (Contains 19 references.) (SM)

Paper presented at the 22nd Annual Conference of the Eastern Education Research Association, Hilton Head, SC, Feb. 24-27, 1999

PO38838

Abstract

A survey with open-ended questions was conducted on a sample of Chinese urban teachers (N=54). The study investigated their responses on issues related to functions and benefits of having small classes for both teachers and students. Findings indicated that the Chinese urban teachers preferred teaching small classes, perceived small class as a beneficial factor, not directly related to student achievement. They believed that small classes facilitate more individualized help from teachers, more student-teacher interactions, classroom management, and reduce teachers' workload. They also believed in teachers encouraging and creating competition among students, which they regarded as important for students in large classes to achieve better. Some cultural differences were also found.

The Benefits of Teaching Small Classes

--The Chinese Perspectives

Small size classes are regarded as a better educational environment by educators, educational administrators, parents and government officials. Many parents and educators believe that small class size leads to more effective teaching and improves student achievement (Achilles, 1997; Costello, 1992; Johnston, 1989). Bracey (1995) notes that test scores rise when districts use money to reduce class size and hire experienced teachers. We have also learned that most students prefer small classes. However, some teachers believe that quality teaching is also possible in large classes (Litke, 1995).

Research literature provides mixed findings on the benefits of small classes. In one study, small classes were found to provide an ideal environment for teacher-student interaction (Nelson & Drake, 1997). British elementary school teachers interacted more with students when they taught in smaller classes (Hargreaves, Galton, & Pell, 1997). In the field of special education, smaller classes were found to have provided better environments for learning, especially at the elementary level (McCrea, 1996).

In a study to determine the effect of class size on reading achievement of first grade students, results indicated that students in small classes (N=17) made greater gains than those in large classes (N=27), (Costello, 1992). High school and college students in small classes performed better in long term retention

(Urion & Davidson, 1992). Boozer and Rouse (1995) reported that smaller classes at the 8th grade led to larger test score gains from 8th to 10th grade, and that differences in class size could explain approximately 15 percent of the black-white difference in educational achievement.

A large-scale, four-year longitudinal and experimental study on class size (Project Student Teacher Achievement Ratio--STAR) was conducted in Tennessee. In 1985, almost 7,000 kindergarten students were randomly assigned to either small classes (N=15), or regular-sized classes (N=24) with a full-time aide. Results indicated that the small classes had the highest student test outcomes; however, small class intervention did not remedy already defined test-score deficits after students had experienced regular classes (Achilles, 1993). With the same STAR project, small classes beginning in primary grades seemed to prevent later school problems; however, late application of small class treatment appeared to have limited value (Achilles, Nye, Zaharias, Fulton, & Cain, 1996). Other related studies reported that small class students from Project STAR scored significantly higher than regular-sized class students on all achievement measures (Folger & Breda, 1989; Nye et al, 1992).

In a follow-up study on fourth graders from Project STAR, significant small class carry-over effects were found on every achievement measure and significant participation differences in small class students (Finn, Fulton, Zaharias, & Nye, 1989). With respect to lasting effect, Achilles, Nye, Zaharias and Fulton

(1993) found that students who were in STAR small classes at least in grade 3 were statistically and educationally ahead of other STAR students. After a reanalysis of the STAR test data, Bingham (1994) reported that small class size appeared to make a bigger difference for minority students than for white students in primary school years.

The literature provides little knowledge on how teachers from other cultural backgrounds perceive the class size related issues. This study investigated a sample of Chinese teachers' responses to three questions: 1) How is class size related to student achievement? 2) To students and teachers, what are the benefits for having small classes in schools? 3) What should teachers and students in large classes do in order to teach and learn effectively.

Method

A survey of teachers was conducted in a mideast China urban school district, with 1,718 schools and 687,563 students. Generally, in this district, according to local educational administrators, a class with 50 or more students was considered "large," a class with 40 or fewer "small." The average class size of the secondary schools was a class with 48-50 students, while classes in the elementary schools were with 45-50 students.

Participants

The participants were full-time teachers in the schools of the urban school district. They had 10 or more years of teaching experience.

Design and Procedure

The first of every five schools was selected from the local school directory. With this method, 10 schools (5 elementary and 5 secondary schools) were selected for the sample. All these schools were ordinary schools, not different from other schools in the urban area, according to a school district official.

A survey package (with an anonymous questionnaire and an introduction letter explaining the purpose of the study) was stuffed in an unsealed envelope. A big manila envelope filled with 10 such packages was delivered by a project assistant to each of the 10 school principals. In a separate letter, the principals were requested to distribute the survey packages to his/her teachers with 10 or more years of teaching experience. In total, 100 surveys were sent out this way. In addition, the participating teachers were requested in the introduction letter to return the answered questionnaire in a sealed envelope to their principal. The project assistant went back to the principals and collected the data 2 weeks thereafter.

Instrument

The survey questionnaire was developed based on the research questions. Basically, the questions were open-ended. The questions were designed to collect the perceptions/opinions of Chinese urban school teachers on class-size related issues (see Appendix).

Results

Out of 100 surveys that were sent out, 54 were returned. The

return rate was 54%. The following is a summary of the findings.

With respect to Question 1--in terms of what size of class they preferred to teach, 50 of the 54 teachers responded with "Small classes." Two responded, "Mid-sized classes." One said, "Large classes."

The findings listed in Table 1 provides information on only the five factors identified by the highest percentage of teachers in their responses to each question. The number of factors that were actually identified to each question exceeded five factors. See Table 1.

Discussion

In terms of what size of class is considered "large or small," there seems to be a cultural difference here, on which American educators have a different standard. Nevertheless, it appears that most of the Chinese urban school teachers prefer teaching small classes. With respect to the relationship between class size and student achievement, the Chinese teachers appear to disagree with some American researchers. They do not believe that students in smaller classes will necessarily have better achievement. Of course, their perception of small class (N=40) in the Chinese context is so different from ours (N=15 to 17) in the US context. Perhaps they were comparing a class of 40 students with that of 50 or more.

According to the Chinese teachers, the main benefits for teaching smaller classes include: Small classes are easier for teachers to provide individualized help to students, easier to

Table 1 Chinese Urban Teachers' Responses on Class-Size Related Issues (N=54)

| Questions | Factors Identified by Highest % of Teachers* | % Responded |
|-----------|---|-------------|
| 2 | Student quality (intelligence, motivation, etc.) | 81 |
| | Teacher quality (knowledge, dedication, hard-working, teaching quality) | 63 |
| | Student effort | 59 |
| | Social influence, family influence | 48 |
| | School & classroom learning atmosphere | 30 |
| 3 | Large class being a negative factor/small class being a beneficial factor | 93 |
| | Non-related factor | 2 |
| | Not sure | 4 |
| 4 | Facilitates individualized help to students | 89 |
| | Facilitates classroom management | 44 |

| | Good learning atmosphere in school | 22 |
| | Organize more activities in class | 11 |
| | Students being eager to learn | 11 |

* Factors identified by smaller percentage of teachers not included.

manage; they help teachers to get to know students better, facilitate student-teacher interactions; and they mean less work for teachers, etc. Even though the teachers did not identify any causal relationship between class size and student achievement, these reasons seem to be sufficient for any educator to prefer teaching smaller classes. The reasons seem to be: Small classes benefit the teaching and learning process, and teachers' workfare, which warrants support from all educators.

The Chinese urban teachers regard the external (outside of school) influences, school and classroom learning atmosphere as important factors, which are closely related to student learning outcomes. On this issue, they appear to agree with American educators. It seems that they rank these factors as being more important than we do.

The data also indicate that the Chinese teachers believe in competitions among students and also create competitive class activities, which they believe facilitates student learning. Meanwhile they also believe that peer help is also an important factor for students' success in large classes. Many American educators seem to be shy from promoting competition among students, while encouraging peer help. This cultural difference warrants us to rethink about our beliefs on competition among students: Is it good or bad for students' learning? How can we use competitive activities to help students learn more effectively? Apparently, more research on this issue is needed.

One reason for a 55% return rate is that some Chinese urban school teachers are still afraid to be part of a project that is related to an American educator. As one teacher expressed, "I do not want to be in trouble some day." Approximately 20 years ago, it was commonly considered dangerous by Chinese people to have anything to do with a foreigner. By doing so, one could be readily suspected to be spying for a foreign country at that time.

Conclusion

The findings of the study indicate that the Chinese urban school teachers did not see a necessary link between class size and student achievement. However, they believed that small classes facilitate more individualized help from teachers, more student-teacher interactions, more teacher-guided practice, classroom management, and reduce teachers' workload. In other words, small classes facilitate the teaching and learning process and reduce teachers' workload. The Chinese teachers also believed that competition among students promote learning and large classes facilitate competition among students.

Appendix

Questionnaire
(Translation of a Chinese Version)

Please briefly answer the following questions. (You may write on the other side of the questionnaire.)

1. If you have a choice, what would you prefer to teach: small classes or large classes?
2. In your opinion, what are the main factors that determine students' achievement?
3. Is class size a main factor that is closely related to student achievement, or is it only a beneficial factor?
4. In your opinion, To Teachers, what are the benefits of teaching small classes?
5. In your opinion, To Students, what are the benefits of studying in small classes?
6. What should students in large classes do in order to achieve better?
7. What should teachers do in order to provide a quality education to students in large classes?
8. Please identify other factors that facilitates students' learning quality.

Thank you very much for your time and help!
