## The Nation's Report Card Mathematics 2003

## What is The Nation's Report Card ${ }^{\text {TM }}$ ?

THE NATION'S REPORT CARD ${ }^{\mathrm{TM}}$, the National Assessment of Educational Progress (NAEP), is a nationally representative and continuing assessment of what America's students know and can do in various subject areas. Since 1969, assessments have been conducted periodically in reading, mathematics, science, writing, history, geography, and other fields. By making objective information on student performance available to policymakers at the national, state, and local levels, NAEP is an integral part of our nation's evaluation of the condition and progress of education. Only information related to academic achievement is collected under this program. NAEP guarantees the privacy of individual students and their families.

NAEP is a congressionally mandated project of the National Center for Education Statistics within the Institute of Education Sciences of the U.S. Department of Education. The Commissioner of Education Statistics is responsible, by law, for carrying out the NAEP project through competitive awards to qualified organizations.

In 1988, Congress established the National Assessment Governing Board (NAGB) to oversee and set policy for NAEP. The Board is responsible for: selecting the subject areas to be assessed; setting appropriate student achievement levels; developing assessment objectives and test specifications; developing a process for the review of the assessment; designing the assessment methodology; developing guidelines for reporting and disseminating NAEP results; developing standards and procedures for interstate, regional, and national comparisons; determining the appropriateness of all assessment items and ensuring the assessment items are free from bias and are secular, neutral, and non-ideological; taking actions to improve the form, content, use, and reporting of results of the National Assessment; and planning and executing the initial public release of NAEP reports.

## The National Assessment Governing Board

Darvin M. Winick, Chair
President
Winick \& Associates
Dickinson, Texas
Sheila M. Ford, Vice Chair
Principal
Horace Mann Elementary School
Washington, D.C.

## Francie Alexander

Chief Academic Officer, Scholastic, Inc. Senior Vice President,
Scholastic Education New York, New York

David J. Alukonis
Chairman
Hudson School Board
Hudson, New Hampshire
Amanda P. Avallone
Assistant Principal \& Eighth-Grade Teacher Summit Middle School Boulder, Colorado

## Honorable Jeb Bush

Governor of Florida Tallahassee, Florida

Barbara Byrd-Bennett Chief Executive Officer Cleveland Municipal School District Cleveland, Ohio

Carl A. Cohn
Clinical Professor
Rossier School of Education
University of Southern California Los Angeles, California

Shirley V. Dickson
Educational Consultant
Laguna Niguel, California
John Q. Easton
Executive Director
Consortium on Chicago School Reform
Chicago, Illinois
Honorable Dwight Evans
Member
Pennsylvania House of Representatives Philadelphia, Pennsylvania

David W. Gordon
Sacramento County
Superintendent of Schools
Sacramento County Office of Education
Sacramento, California
Henry L. Johnson
Superintendent of Education
Mississippi Department of Education
Jackson, Mississippi

Kathi M. King
Twelfth-Grade Teacher Messalonskee High School
Oakland, Maine
Honorable Keith King
Member
Colorado House of Representatives
Colorado Springs, Colorado
Kim Kozbial-Hess
Fourth-Grade Teacher
Fall-Meyer Elementary School
Toledo, Ohio
Andrew C. Porter
Professor
Leadership Policy and Organizations
Vanderbilt University
Nashville, Tennessee
Luis A. Ramos
Community Relations Manager
PPL Susquehanna
Berwick, Pennsylvania

## Mark D. Reckase

Professor
Measurement and Quantitative Methods Michigan State University
East Lansing, Michigan
John H. Stevens
Executive Director
Texas Business and
Education Coalition
Austin, Texas

Mary Frances Taymans, SND
Executive Director
National Catholic
Educational Association
Washington, D.C.
Oscar A. Troncoso
Principal
Socorro High School
Socorro Independent
School District
El Paso, Texas
Honorable Thomas J. Vilsack
Governor of Iowa
Des Moines, Iowa
Michael E. Ward
Former State Superintendent of Public Instruction
North Carolina Public Schools
Jackson, Mississippi
Eileen L. Weiser
Member, State Board of Education
Michigan Department of Education
Lansing, Michigan
Grover J. Whitehurst (Ex officio)
Director
Institute of Education Sciences
U.S. Department of Education
Washington, D.C.

## able of Contents

Executive Summary ..... xv
Chapter 1
Introduction ..... 1
Overview of the 2003 National Assessment of Educational Progress in Mathematics ..... 2
Framework for the 2003 Mathematics Assessment Instrument ..... 3
The NAEP 2003 Mathematics Assessment Instrument ..... 4
Description of School and Student Samples ..... 5
Reporting the Assessment Results ..... 6
The Setting of Achievement Levels ..... 6
Mathematics Achievement-Level Descriptions for Each Grade ..... 8
Trial Status of Achievement Levels ..... 10
Interpreting NAEP Results ..... 12
Overview of the Remaining Report ..... 13
Chapter 2
Average Mathematics Scale Score and Achievement-Level Results for the Nation and States ..... 15
Overview ..... 15
National Mathematics Scale Score Results ..... 16
National Mathematics Scale Scores by Percentile ..... 17
National Mathematics Achievement-Level Results ..... 18
Mathematics Results by Region of the Country ..... 19
Mathematics Results for States and Other Jurisdictions ..... 22
Mathematics Scale Score Results by State/Jurisdiction ..... 22
Cross-State/Jurisdiction Mathematics Scale Score Comparisons ..... 26
Mathematics Achievement-Level Results by State/Jurisdiction ..... 29
Cross-State/Jurisdiction Mathematics Achievement-Level Comparisons ..... 35
Chapter 3
Subgroup Results for the Nation and States ..... 39
Performance of Selected Subgroups for the Nation ..... 40
Gender ..... 40
Race/Ethnicity ..... 43
Student Eligibility for Free/Reduced-Price School Lunch ..... 50
Parents' Highest Level of Education ..... 54
Type of School ..... 58
Type of Location ..... 64
Performance of Selected Subgroups by State ..... 66
Gender ..... 66
Race/Ethnicity ..... 72
Student Eligibility for Free/Reduced-Price School Lunch ..... 86
Chapter 4
Average Mathematics Scale Scores and Achievement-Level Results for Districts Participating in the Trial Urban District Assessment ..... 93
Scale Score Results for Urban Districts ..... 94
Scale Scores by Percentiles for Urban Districts ..... 96
Achievement-Level Results for Urban Districts ..... 97
Performance of Selected Subgroups for Urban Districts ..... 98
Gender ..... 98
Race/Ethnicity ..... 102
Students' Eligibility for Free/Reduced-Price School Lunch ..... 106
Student-Reported Highest Level of Parents' Education ..... 111
Chapter 5
Sample Assessment Questions and Student Responses ..... 115
Grade 4 Sample Assessment Questions and Results ..... 116
Grade 8 Sample Assessment Questions and Results ..... 127
Maps of Selected Item Descriptions on the NAEP Mathematics Scale-Grades 4 and 8 ..... 136
Appendix A
Overview of Procedures Used for the NAEP 2003 Mathematics Assessment ..... 139
Appendix B
Subgroup Percentage Appendix ..... 197
Appendix C
State and Urban District Subgroup Appendix ..... 217
Appendix D
State- and District-Level Contextual Variables ..... 249
Appendix E
Members of the NAEP Mathematics Standing Committee ..... 255
Acknowledgments ..... 256
Chapter 1: Figures
Figure 1.1
Structure of the NAEP 2003 mathematics assessment ..... 4
Figure 1.2
Policy definitions of the three NAEP achievement levels ..... 7
Figure 1.3
Descriptions of NAEP mathematics achievement levels, grade 4 ..... 8
Figure 1.4
Descriptions of NAEP mathematics achievement levels, grade 8 ..... 9
Chapter 2: Tables and Figures
Figure 2.1
Average mathematics scale scores, grades 4 and 8: 1990-2003 ..... 16

## xecutive Summary

The National Assessment of Educational Progress (NAEP) is an ongoing nationally representative sample survey of student achievement in core subject areas. Authorized by Congress and administered by the National Center for Education Statistics (NCES), within the Institute of Education Sciences of the U.S. Department of Education, NAEP regularly reports to the public on the educational progress of fourth-, eighth-, and twelfth-grade students.

This report presents results of the NAEP 2003 fourth- and eighth-grade mathematics assessments for the nation, for regions of the country, for participating states and other jurisdictions, and for participating urban districts. Assessment results are described in terms of students' average mathematics score on a $0-500$ scale and in terms of the percentage of students attaining each of three achievement levels: Basic, Proficient, and Advanced.
The achievement levels are performance standards adopted by the National Assessment Governing Board (NAGB) as part of its statutory responsibilities. The achievement levels are a collective judgment of what students should know and be able to do for each grade tested. The law requires that the achievement levels are to be used on a trial basis until the Commissioner of Education Statistics determines "that such levels are reasonable, valid, and
informative to the public." ${ }^{1}$ Until that determination is made, the law requires the Commissioner and the Board to state clearly the trial status of the achievement levels in all NAEP reports. However, both NCES and NAGB believe these performance standards are useful for understanding trends in student achievement. They have been widely used by national and state officials and others as a common yardstick of academic performance.

Approximately 190,000 fourth-graders from 7,500 schools and 153,000 eighthgraders from 6,100 schools were assessed in 2003. The national results reflect the performance of students attending both public and nonpublic schools, while the results for participating states and jurisdictions, and for participating urban districts, reflect the performance of students attending public schools. In addition to providing average scores and achievement-level percentages in mathematics for the nation, states and other jurisdictions, and selected urban districts, this report provides results for subgroups of students defined by various background characteristics.

A summary of major findings from the NAEP 2003 Mathematics Assessment is presented on the following pages. Comparisons are made to results from previous years in which the assessment was administered. In addition to the 2003 results, national results are reported from the 1990, 1992, 1996, and 2000
assessments. Results for states and other jurisdictions are also reported from the 1990 (eighth grade only), 1992, 1996, 2000, and 2003 assessments. Results for participating urban districts are reported for 2003.

The more recent results, from 2000 and 2003, are based on more inclusive samples using administration procedures in which testing accommodations were permitted for students with disabilities and limited-English-proficient students. Accommodations were not permitted in earlier assessments. Comparisons between results from 2003 and those from 2000, in which both types of administration procedures were used, are discussed in this executive summary based on the results when accommodations were permitted.

Changes in student performance across years or differences between groups of students in 2003 are discussed only if they have been determined to be statistically significant at the .05 level based on t -tests adjusted using the False Discovery Rate (FDR) multiple comparison procedure. Beginning with the reading sample in 2002, the NAEP national samples were obtained by aggregating the samples from each state, rather than obtaining an independently selected national sample. As a result, the size of the national sample increased and smaller differences between years or between subgroups of students were found to be statistically significant than would have been detected in previous assessment years.

Overall Mathematics Results for the Nation, Regions of the Country, and States and Other Jurisdictions

Mathematics Results for the Nation
At grade 4
■ The average fourth-grade mathematics score was higher in 2003 than in all the previous assessment years.
$\square$ Scores at the 10th, 25th, 50th, 75th, and 90th percentiles were higher in 2003 than in any of the previous assessment years, indicating improvement for lower-, middle-, and higherperforming students. Gains detected between 2000 and 2003 ranged from approximately 5 scale score points for students performing at the 90th percentile to 13 points for students at the 10th percentile.

- In 2003, 32 percent of fourth-graders performed at or above the Proficient level. The percentages of fourthgraders performing at or above Basic, at or above Proficient, and at Advanced increased between 2000 and 2003, and were higher in 2003 than in 1990. The percentage at or above Proficient increased by approximately 19 points between 1990 and 2003.

## At grade 8

■ The average eighth-grade mathematics score was higher in 2003 than in all previous assessment years.
■ Scores at the 10th, 25th, 50th, 75th, and 90 th percentiles were higher in 2003 than in any of the previous assessment years, indicating improvement for lower-, middle-, and higherperforming students. Increases detected between 2000 and 2003 ranged from approximately 3 scale score points at the 90th percentile to 7 points at the 10 th percentile.

- In 2003, 29 percent of eighth-graders performed at or above the Proficient level. The percentages of eighthgraders performing at or above Basic and at or above Proficient increased between 2000 and 2003, and were higher in 2003 than in 1990. The percentage at or above Proficient increased by approximately 14 points between 1990 and 2003.

## Mathematics Results for Regions of the Country

Prior to 2003, NAEP results were reported for four NAEP-defined regions of the nation: Northeast, Southeast, Central, and West. As of 2003, to align NAEP with other federal data collections, NAEP analysis and reports have used the U.S. Census Bureau's definition of "region." The four regions defined by the U.S. Census Bureau are Northeast, South, Midwest, and West.

## At grade 4

■ The average fourth-grade mathematics score was higher for students in the Northeast and Midwest than for students in the South and West. The average score for students in the South was higher than for students in the West.

■ The percentages of fourth-graders performing at or above the Basic and Proficient levels were higher in the Northeast and Midwest than in the South and West. Higher percentages of students performed at or above Basic and Proficient in the South than in the West.

## At grade 8

■ The average eighth-grade mathematics score was higher for students in the Northeast and Midwest than for students in the South and West. The average score was higher for students in the South than for students in the West.

- Higher percentages of eighth-grade students performed at or above Basic and Proficient in the Northeast and Midwest than in the South and West. A higher percentage of eighth-graders performed at or above Basic in the South than in the West.

## Mathematics Results for the States and Other Jurisdictions

Results from the 2003 assessment are reported for fourth- and eighth-grade students attending public schools only in 50 states and 3 other jurisdictions that participated in the assessment. (Throughout this report, the term "jurisdiction" is used to refer to the states, the District of Columbia, and the two Department of Defense system schools that participated in the NAEP mathematics assessment.)

## At grade 4

- All 43 jurisdictions that participated in both the 2000 and 2003 fourth-grade assessments showed increases in average scores. Similarly, each of the 42 jurisdictions that participated in the 1992 and 2003 assessments had a higher average score in 2003.

■ Kansas, Massachusetts, Minnesota, New Hampshire, North Carolina, Vermont, and Wyoming were among the jurisdic-
tions with the highest average scores. Average fourth-grade scores in Connecticut and Virginia were lower only in comparison with New Hampshire.

■ The percentage of fourth-graders performing at or above Proficient was higher in 2003 than in 2000 for all 43 jurisdictions that participated in both years. The percentage of fourthgraders at or above Proficient was higher in 2003 than in 1992 for all 42 jurisdictions that participated in both years.

## At grade 8

■ Of the 42 jurisdictions that participated in both the 2000 and 2003 eighth-grade mathematics assessments, 28 had a higher average score in 2003. Each of the 38 jurisdictions that participated in both the 1990 and 2003 assessments had a higher average score in 2003.

■ In 2003, Minnesota had the highest average mathematics score at grade 8 . Eighth-graders in Department of Defense Overseas schools, Kansas, Massachusetts, Montana, New Hampshire, North Dakota, South Dakota, and Vermont all had higher average scores than the remaining jurisdictions except Minnesota.

■ Among the 42 jurisdictions that participated in both the 2000 and 2003 eighth-grade assessments, 18 showed an increase in the percentage of students performing at or above Proficient. The percentage of eighthgraders at or above Proficient was higher in 2003 than in 1990 for all 38 jurisdictions that participated in both years.

## Mathematics Results for Student Subgroups in the Nation and in the States and Other Jurisdictions

In addition to overall results, NAEP reports on the performance of various subgroups of students. In interpreting these data, readers are reminded that the relationship between contextual variables and student performance is not necessarily causal. There are many factors that play a role in student achievement in a particular subject area.

## National Results

## Gender

- At both grades 4 and 8, the average scores for both male students and female students were higher in 2003 than in any of the previous assessment years.

■ In 2003, male students outperformed female students by 3 points on average at grade 4 and by 2 points on average at grade 8 . The male-female gap in 2003 was not measurably different from the gap in any of the previous assessment years since 1990 for either grade.

- At both grades 4 and 8 , the percentages of male students and female students performing at or above Proficient were higher in 2003 than in any previous assessment year.

## Race/Ethnicity

Based on information obtained from school records, students who took the NAEP mathematics assessment were identified as belonging to one of five mutually exclusive racial/ethnic subgroups: White, Black, Hispanic, Asian/ Pacific Islander, American Indian/Alaska Native, or Other.

- At both grades 4 and 8, Asian/Pacific Islander students scored higher on average than White students in 2003. Both White students and Asian/Pacific Islander students had higher average scores than Black, Hispanic, and American Indian/Alaska Native students at both grades. Hispanic students and American Indian/Alaska Native students also scored higher on average than Black students at both grades.
- At grade 4, White, Black, and Hispanic students all had higher average scores in 2003 than in any of the previous assessment years. American Indian/ Alaska Native fourth-graders had a higher average score in 2003 than in 2000. The average score for Asian/ Pacific Islander fourth-graders was higher in 2003 than in 1990.
■ At grade 8, White, Black, and Hispanic students all showed increases in average scores between 2000 and 2003. The average score for Asian/Pacific Islander eighth-graders was higher in 2003 than in 1990.
- At grade 4, the score gap between White students and Black students decreased between 2000 and 2003, and was smaller in 2003 than in 1990. The gap between White fourth-graders and Hispanic fourth-graders also narrowed between 2000 and 2003, but there was no measurable difference between the gap in 2003 and the gap in 1990.
- At grade 8, the score gap between White students and Black students was narrower in 2003 than in 2000, but the gap in 2003 was not measurably different from that in 1990.
- At both grades 4 and 8 , the percentage of students performing at or above the Proficient level was higher in 2003 than in any of the previous assessment years for White, Black, and Hispanic students. The percentage of Asian/Pacific Islander students performing at or above Proficient was higher in 2003 than in 1990.

Eligibility for Free/Reduced-Price School
Lunch
NAEP collects data on students' eligibility for free/reduced-price lunch as an indicator of family economic status. Eligibility for free/reduced-price lunch is determined by students' family income in relation to the federally established poverty level. The mathematics results since 1996 are reported for students classified by their eligibility.

■ In 2003, the average mathematics scores for fourth- and eighth-graders who were eligible for free/reducedprice lunch were lower than that for students who were not eligible.

- For students who were eligible and those who were not eligible, the average mathematics scores for fourthgrade and eighth-grade students increased between 2000 and 2003 and were higher in 2003 than in 1996.
■ At both grades 4 and 8 , the percentage of students at or above Proficient was higher in 2003 than in 2000 and 1996 for both students who were eligible and those who were not eligible.

## Parents' Level of Education

Eighth-grade students who participated in the NAEP mathematics assessment were asked to indicate the highest level of education completed by each parent. Information about parental education was not collected at grade 4. Results are reported based on the highest level of education reported for either parent.

■ Overall, in 2003, there was a positive relationship between student-reported parental education and student achievement: the higher the parental education level, the higher the average mathematics score.

■ Average scores for eighth-grade students increased from 2000 to 2003 and were higher in 2003 than in 1990 for each level of parental education reported.
■ The percentage of eighth-graders performing at or above Proficient was higher in 2003 than in 1990 regardless of the level of parental education students reported.

## Type of School

The schools that participate in the NAEP assessment are classified as either public or nonpublic. A further distinction is then made between nonpublic schools that are Catholic schools and those that are some other type of nonpublic school.

■ In 2003, fourth- and eighth-grade students in nonpublic schools had higher average scores than students in public schools. Eighth-grade students in Catholic schools had lower average scores than eighth-graders in other nonpublic schools.

- At both grades 4 and 8, the average mathematics scores for students in public and nonpublic schools (including Catholic and other nonpublic schools) increased from 2000 to 2003 and were higher in 2003 than in 1990.
- The percentages of fourth- and eighthgraders performing at or above Proficient were higher in 2003 than in 1990 for students in public schools, Catholic schools, and other nonpublic schools.

## Type of Location

The schools from which NAEP draws its samples of students are classified according to their type of location (central city, rural/small town, or urban fringe/large town). The methods used to identify the type of school location in 2000 and 2003 were different from those used for prior assessment years; therefore, only the data from the 2000 and 2003 assessments are reported.

■ In 2003, fourth- and eighth-grade students in schools located in urban fringe/large town and rural/small town locations had higher average mathematics scores than those in central city locations, and students in urban fringe/large town locations scored higher on average than students in rural/small town locations.

- The average mathematics scores in all three location types were higher in 2003 than in 2000 for both grades 4 and 8 .

■ The percentage of students at or above Proficient increased between 2000 and 2003 in all three types of locations at grade 4.

## State and Other Jurisdiction Results

 Gender■ In 2003, male fourth-graders scored higher on average than female fourthgraders in 24 jurisdictions. At grade 8, the average score for male students was higher than for female students in Massachusetts, South Carolina, and Department of Defense Overseas schools.
■ The average scores increased between 1992 and 2003 for both male and female fourth-graders in all 42 of the jurisdictions that participated in both assessments. For the 38 jurisdictions that participated in both the 1990 and 2003 eighth-grade assessments, 36 showed increases for both male and female students and Montana and North Dakota showed increases only for female students.

## Race/Ethnicity

■ At grade 4, average scores were higher in 2003 than in 1992 for White students in 42 jurisdictions, for Black students in 35 jurisdictions, for Hispanic students in 20 jurisdictions, for Asian/Pacific Islander students in 11 jurisdictions, and for American Indian/Alaska Native students in 3 jurisdictions.

- At grade 8, average scores were higher in 2003 than in 1990 for White students in 37 jurisdictions, for Black students in 25 jurisdictions, for Hispanic students in 12 jurisdictions, for Asian/Pacific Islander students in 7 jurisdictions, and for American Indian/Alaska Native students in 5 jurisdictions.

## Eligibility for Free/Reduced-Price School Lunch

■ In 2003, students who were eligible for free/reduced-price lunch scored lower on average than students who were not eligible in all 52 jurisdictions for which data are available at grade 4 and in 51 of the 52 jurisdictions for which data are available at grade 8 .

■ The average fourth-grade mathematics score increased between 1996 and 2003 both for students who were eligible and students who were not eligible for free/reduced-price lunch in 44 jurisdictions and for students who were not eligible in North Dakota. The average eighth-grade mathematics scores increased between 1996 and 2003 for both students who were eligible and students who were not eligible in 22 jurisdictions, for eligible students in Montana, and for students who were not eligible in 10 jurisdictions.

## Urban District Results

The 2003 Trial Urban District Assessment (TUDA) included nine urban publicschool districts (Atlanta City School District, Boston Public School District, Charlotte-Mecklenburg Schools, City of Chicago School District 299, Cleveland Municipal School District, Houston Independent School District, Los Angeles Unified School District, New York City Public Schools, and San Diego City Unified School District) plus the District of Columbia. Results for the urban districts are compared with results for public schools in the nation and public schools in large central cities.

## Overall Mathematics Results <br> for the Urban Districts

## At grade 4

- Fourth-graders in all the participating districts except Charlotte scored lower on average than fourth-graders in the nation. Fourth-graders in Charlotte had a higher average score than public school students in the nation, large central cities, and the other participating districts.

■ With the exception of Charlotte, fourth-grade scores at the 25 th, 50 th, 75 th, and 90 th percentiles were lower in each of the districts than in the nation. Scores at the 10th, 25th, 50th, 75th, and 90th percentiles were higher in Charlotte than in the nation and in large central cities.
■ The percentage of fourth-graders in Charlotte performing at or above Proficient was higher than the corresponding percentages in both large central cities and the nation.

## At grade 8

$\square$ Eighth-graders in all the participating districts except Charlotte scored lower on average than eighth-graders in the nation. Eighth-graders in Charlotte had a higher average score than public school students in the nation, large central cities, and the other participating districts.

- Scores at the 25th, 50th, 75th, and 90th percentiles in all the districts except Charlotte were lower than in the nation. In Charlotte, eighth-grade scores at the 10th, 25th, 50th, 75th, and 90th percentiles were higher than the scores in large central cities, and the scores at the 75th and 90th percentiles were higher than the corresponding national scores.

■ The percentage of eighth-graders in Charlotte at or above Proficient was higher than the corresponding percentages in both large central cities and in the nation.

## Results for Student Subgroups in Urban Districts

## Gender

- At grade 4, the average scores for both male and female students in Charlotte were higher than those for their counterparts in the nation and in large central cities. Male and female fourthgraders in Atlanta, Boston, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores than their counterparts in large central cities and in the nation.
- At grade 8, the average scores for both male and female students in Charlotte were higher than the corresponding average scores for male and female students in large central cities. Both male and female eighth-graders in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores than their counterparts in large central cities and in the nation.

## Race/Ethnicity

- At grade 4, the average scores for White students in Charlotte, the District of Columbia, and Houston; Black students in Boston, Charlotte, Houston, and New York City; and Hispanic students in Charlotte and Houston were higher than the corresponding scores in large central cities. The average scores for fourth-grade White students in Boston, Chicago, and Cleveland; Black students in Chicago and the District of Columbia; and Hispanic students in Boston, the District of Columbia, Los Angeles, and San Diego were lower than the corresponding scores in large central cities.
- At grade 8, the average scores for White students in Atlanta, Charlotte, and Houston; Black students in Charlotte, Houston, and New York City; and Hispanic students in Houston were higher than the corresponding scores in large central cities. The average scores for eighth-grade White students in Cleveland; Black students in Atlanta, the District of Columbia, and Los
Angeles; and Hispanic students in the District of Columbia, Los Angeles, and San Diego were lower than the corresponding scores in large central cities.

## Eligibility for Free/Reduced-Price Lunch

- At grade 4, the average scores for students eligible for free/reducedprice lunch in Charlotte, Houston, and New York City were higher than the average score in large central cities. The average scores for eligible students in Atlanta, Chicago, the District of Columbia, and Los Angeles were lower than the average score for eligible students in large central cities.
- At grade 8, the average scores for students eligible for free/reducedprice lunch in Boston, Houston, and New York City were higher than the average score in large central cities. The average scores for eligible students in Atlanta, the District of Columbia, and Los Angeles were lower than the average score in large central cities.

## Parents' Level of Education

- In 2003, the average score for eighthgraders who indicated that at least one parent graduated from college was lower in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles than the average score for students in the same parental education category in public schools in large central cities and in the nation. The average score for eighth-graders who reported at least one parent graduated from college was higher in Charlotte and San Diego than for students in large central cities.

## Introduction

Mathematics provides the basic processes for quantifying information. Using quantities is essential everywhere in our society, in every aspect of our daily lives-at home and in school, for commerce, travel, communications, entertainment, and medicine. Even if mathematics were not important as a key to understanding the structure of our world and universe, it would still be one of the key competencies for personal, civic, and economic engagement. Students need to understand and be able to apply mathematical skills and concepts in order to function effectively in daily activities such as understanding financial information and evaluating product pricing.

Great importance has long been placed on ensuring that students acquire mathematical skills and concepts and these skills have increasingly come to be expected of all students. This report presents major results from the National Assessment of Educational Progress (NAEP) 2003 mathematics assessment of the nation's fourth- and eighth-grade students. In addition, the report provides results for fourth- and eighth-grade students in 53 states and other jurisdictions and for the nine urban school districts that participated in the Trial Urban District Assessment. This report is intended to inform educators, policymakers, parents, and the general public about students' achievement in mathematics.

## Overview of the 2003 National Assessment of Educational Progress in Mathematics

For more than 30 years, NAEP has regularly collected, analyzed, and reported valid and reliable information about what students know and can do in a variety of subject areas. As authorized by the U.S. Congress, NAEP assesses representative national samples of fourth-, eighth-, and twelfth-grade students. Since 1990, NAEP has also assessed representative samples of fourth- and eighth-grade students in states and other jurisdictions that participate in the NAEP state-by-state assessments. NAEP is administered and overseen by the National Center for Education Statistics (NCES), within the U.S. Department of Education's Institute of Education Sciences.

The content of all NAEP assessments is determined by subject-area frameworks that are developed by the National Assessment Governing Board (NAGB) in a comprehensive process involving a broad spectrum of interested parties, including teachers, curriculum specialists, subjectmatter specialists, school administrators, parents, and members of the general public. The framework for the NAEP 2003 mathematics assessment, which was updated in 1996, is essentially the same framework that has guided development of the NAEP mathematics assessments since 1990.

This report describes the results of the NAEP 2003 mathematics assessment at grades 4 and 8 . National results for 2003 are compared to those from 1990, 1992, 1996, and 2000. Using the same test as that used nationally, state-level assessments were conducted at grade 4 in 1992, 1996, 2000, and 2003. At grade 8, state-level assessments were conducted in 1990, 1992, 1996, 2000, and 2003. Results for the nine
districts that participated in the Trial Urban District Assessment (TUDA) are reported for 2003 only. Comparisons across assessment years are possible because the assessments were developed under the same basic framework and share a common set of mathematics questions.

Prior to 1996, administration procedures for the NAEP mathematics assessments did not permit the use of accommodations (e.g., extra time; individual rather than group administration) for students with special needs who could not participate without them. For the 1996 national assessment, however, administrative procedures were introduced that allowed expanding participation in NAEP through the use of accommodations by students with disabilities (SD) and limited-Englishproficient (LEP) students (see appendix A). A split-sample design was used at the national level in 1996 and 2000 and at the state level in 2000 , so that both administration procedures could be used during the same assessment, but with different samples of students. This made it possible to report trends in students' mathematics achievement across all the assessment years and, at the same time, examine the effects of including students assessed with accommodations on overall assessment results. Based on an examination of how permitting accommodations affected overall population results, it was decided that, beginning with the 2003 assessment, NAEP would use only one set of proce-dures-permitting the use of accommodations.

During the period in which accommodations were not permitted, students with special needs could only be included in the assessment if it was determined by school staff that they could be assessed meaningfully without accommodations. The change in administration procedures
makes it possible for more students to be included in the assessments; however, it also represents an important altering of procedures from previous assessments. (See the section on Students with Disabilities and/or Limited-English-Proficient Students in appendix A for a more detailed discussion.) The reader is encouraged to consider the difference in accommodation procedures when interpreting comparisons between the two sets of results.

The charts and tables throughout this report distinguish between results from assessment years in which accommodations were not permitted and results from assessment years in which accommodations were permitted. In the tables and charts that display results across assessment years, all previous assessment results that were found to be significantly different (at the . 05 level based on t-tests adjusted using the False Discovery Rate (FDR) multiple comparison procedures) from 2003 results are marked with an asterisk (*). Two sets of results are presented for assessment years in which both administration procedures were used (accommodations not permitted and accommodations permitted). Both sets of results may also be notated, if found to be significantly different from 2003. The text that accompanies these tables and charts indicates which previous assessment results were significantly different from 2003. Comparisons between the 2003 results, when accommodations were permitted, and the 1990 and 1992 results, when they were not permitted, are discussed in the text. However, for previous assessment years with both accommoda-tions-not-permitted results and accommo-dations-permitted results, the text describes comparisons only between the accommodations-permitted results and 2003.

## Framework for the 2003 Mathematics Assessment Instrument

The NAEP Mathematics Framework is the blueprint that has specified the content and guided the development of each NAEP mathematics assessment since 1990. The framework resulted from a national process involving many organizations and individuals concerned with mathematics education. This cooperative effort was directed by the National Assessment Governing Board (NAGB) and managed by the Council of Chief State School Officers (CCSSO). In 1996, the framework was refined so that the 1996, 2000, and 2003 assessments could better reflect recent curricular emphases in mathematics, while maintaining the connection to the 1990 and 1992 assessments in order to measure trends in student performance. ${ }^{1}$

The framework calls for questions based on five mathematics content areas: 1) number sense, properties, and operations; 2) measurement; 3) geometry and spatial sense; 4) data analysis, statistics, and probability; and 5) algebra and functions. Questions were categorized according to two additional domains: mathematical abilities and mathematical power. The first domain, mathematical abilities, describes three types of knowledge or processes required for a student to successfully respond to a question: conceptual understanding; procedural knowledge; and problem solving, the ability to synthesize several processes when confronting a mathematical situation. The second domain, mathematical power, reflects the three processes stressed as major goals of the mathematics curriculum: the ability to reason, to communicate, and to make connections between concepts and skills either across the mathematics content areas, or from mathematics to other curricular areas. Figure 1.1 summarizes the structure of the 2003 assessment.

1 National Assessment Governing Board. (2002). Mathematics Framework for the 2003 National Assessment of Educational Progress. Washington, DC: Author.

Figure 1.1 Structure of the NAEP 2003 mathematics assessment

SOURCE: National Assessment Governing Board. (2002). Mathematics Framework for the 2003 National Assessment of Educational Progress. Washington, DC: Author.

A breakdown of the percentage of questions in each content area prescribed by the framework for the 1990, 1992, 1996, 2000, and 2003 assessments is provided in appendix A (see table A.1). The framework also incorporates the use of calculators (four-function at grade 4 and scientific at grade 8), rulers (at grades 4 and 8 ), protractors (at grade 8 ), and manipulatives such as spinners and geometric shapes (at grades 4 and 8). The use of these ancillary materials and the use of calculators were incorporated into some parts of the assessment, but not all. Calculator use was permitted on approximately one-third of the test questions.

## The NAEP 2003 Mathematics Assessment Instrument

The NAEP mathematics assessment is the only federally authorized, ongoing, nationwide assessment of student mathematics achievement. As such, it is necessary for the assessment to reflect the framework
and expert perspectives on the measurement of mathematics performance. During the development process, the assessment undergoes stringent review by teachers and other educators, as well as by state officials and measurement specialists. All components of the assessment are evaluated for curricular relevance, developmental appropriateness, and fairness concerns.

The assessment comprised 50 booklets at each grade. Each booklet contained two separately timed 25 -minute sections of mathematics questions. The total numbers of test questions used in the 2003 mathematics assessment at grades 4 and 8 were 181 and 197, respectively. Typically, a section, or block, contained approximately 16-20 questions, but there was considerable variation depending on the balance between multiple-choice and constructed-response questions.

The mathematics blocks include both multiple-choice and constructed-response questions designed to assess the framework objectives. Approximately 50 percent of student assessment time is devoted to constructed-response questions. Two types of constructed-response questions are used: 1) short constructed-response questions that require students to provide answers to computation problems or to describe solutions in one or two sentences, and 2) extended constructed-response questions that require students to give more detailed responses or explanations. Additional information about the design of the 2003 mathematics assessment is presented in appendix A.

In order to ensure reliable and valid scoring of constructed-response questions, a unique scoring guide describing the specific criteria for assigning a score level to each student's response is developed for each question. Expert scorers go through extensive training to understand how to apply these scoring criteria fairly and consistently. During the scoring process, scorers are consistently monitored to ensure that scoring standards are being applied appropriately and to ensure a high degree of scorer agreement (i.e., interrater reliability). In addition, for those constructed-response questions that were used in previous assessments, monitoring of scorers includes checking to make sure that scoring standards remain consistent from year to year.

In order to minimize the burden on any individual student, NAEP uses a procedure referred to as matrix sampling in which an individual student is administered only a small portion of the entire assessment at any grade. For example, at grades 4 and 8 , each student is given only one of the 50 different grade-specific test booklets, each containing only two 25 -minute blocks. Because each block is administered to a
representative sample at each grade, the results can then be combined to produce average group and subgroup results based on the entire assessment. In addition to completing the two 25 -minute blocks in each student's test booklet, students are asked to complete two sections of background questions that ask about their home or school experiences related to mathematics achievement. The time required for each student to participate in the NAEP mathematics assessment is approximately one hour.

## Description of School and Student Samples

The NAEP 2003 mathematics assessment was administered to fourth- and eighthgraders at the national and state levels. At the national level, results are reported for both public and nonpublic school samples. At the state or jurisdiction level, results are reported only for public school students. All 50 states and jurisdictions that participated in the 2003 assessment met the minimum guidelines for reporting their results.

In order to obtain a representative sample of students for reporting national and state or jurisdiction results, approximately 190,000 fourth-graders from 7,500 schools and 153,000 eighth-graders from 6,100 schools were sampled and assessed in 2003. Each selected school that participated in the assessment and each student assessed represents a portion of the population of interest. The national samples for mathematics were larger in 2003 than in previous assessment years because they were based on the combined sample of students assessed in each participating state, plus an additional sample from nonpublic schools. In the 1990-2000 assessments, the national samples were drawn separately from the state samples and were smaller than the samples resulting from aggregating the state samples.

For information on sample sizes and participation rates for the nation and by state or jurisdiction, see tables A.6-A. 9 in appendix A.

Results from the 2003 Trial Urban District Assessment (TUDA) are reported for the participating districts for publicschool students at grades 4 and 8 . The TUDA employed a larger-than-usual sampling rate within the districts, making reliable district-level data possible. The samples were also large enough to provide reliable estimates on subgroups within the districts, such as female students or Hispanic students.

## Reporting the Assessment Results

Results from the NAEP mathematics assessment are presented in two ways: as scale scores and as percentages of students attaining the various achievement levels. The scale scores, indicating how much students know and can do in mathematics, are presented as average scale scores and as scale scores at selected percentiles. The achievement-level results indicate the degree to which student performance meets the standards set for what they should know and be able to do. Results are reported only for groups or subgroups of students; individual student performance cannot be reported based on the NAEP assessment.

Average scale score results are based on the NAEP mathematics scale, which ranges from 0 to 500 . To calculate students' average scores on the NAEP mathematics assessment, the first step is to determine the percentage of students responding correctly to each multiple-choice question and the percentage of students responding at each score level for both the short and extended constructed-response
questions. The determination of average scale scores entails summarizing the results on separate subscales for each of the five content areas in mathematics and then combining the separate scales to form a single composite scale. (See appendix A for more information on scaling procedures.) Results by separate subscales are accessible through the NAEP Data Tool on the NAEP web site (http:/ / nces.ed.gov/nationsreportcard/naepdata/).

Achievement-level results are presented in terms of mathematics achievement levels as authorized by the NAEP legislation and adopted by NAGB. For each grade assessed, NAGB has adopted three achievement levels: Basic, Proficient, and Advanced. For reporting purposes, achieve-ment-level cut scores are placed on the mathematics scale, resulting in four ranges: below Basic, Basic, Proficient, and Advanced. The achievement-level results are then reported as percentages of students scoring within each range, as well as the percentage of students at or above Basic and at or above Proficient.

## The Setting of Achievement Levels

The 1988 NAEP legislation that created the National Assessment Governing Board directed that the Board establish achieve-ment-level goals for all the subjects assessed by NAEP. ${ }^{2}$ The NAEP 2001 reauthorization reaffirmed many of the Board's statutory responsibilities, including "developing appropriate student achievement levels for each grade or age in each subject area to be tested. . . ." ${ }^{3}$ In order to follow this directive and to achieve the mandate of the original NAEP legislation, NAGB undertook the development of student performance standards (called "achievement levels"). Since 1990,

2 National Assessment of Educational Progress Improvement Act, P. L. 100-297, 20 U.S.C. § 1221 et seq. (1988).

3 No Child Left Behind Act of 2001, P. L. 107-110, 115 Stat. 1425 (2002).
the Board has adopted achievement levels in mathematics, reading, U.S. history, world geography, science, writing, and civics.

The Board defined three levels for each grade: Basic, Proficient, and Advanced. The Basic level denotes partial mastery of the knowledge and skills that are fundamental for proficient work at a given grade. The Proficient level represents solid academic performance. Students reaching this level demonstrate competency over challenging subject matter. The Advanced level presumes mastery of both the Basic and Proficient levels and represents superior
performance. Figure 1.2 presents the policy definitions of the achievement levels that apply across grades and subject areas. The policy definitions guided the development of the achievement levels established in all subject areas. Adopting three levels of achievement for each grade signals the importance of looking at more than one standard of performance. In the Board's view, the overall achievement goal for students is performance at the Proficient level or higher as measured by NAEP. The Basic level is not the desired goal, but represents partial mastery that is a step toward Proficient.

Figure 1.2 Policy definitions of the three NAEP achievement levels
Achievement Levels
Basic This level denotes partial mastery of prerequisite knowledge and skills that are fundamental for proficient work at each grade.

Proficient This level represents solid academic performance for each grade assessed. Students reaching this level have demonstrated competency over challenging subject matter, including subject-matter knowledge, application of such knowledge to real-world situations, and analytical skills appropriate to the subject matter.

Advanced This level signifies superior performance.

SOURCE: National Assessment Governing Board. (2002). Mathematics Framework for the 2003 National Assessment of Educational Progress. Washington, DC: Author.

The achievement levels in this report were adopted by the Board based on a standard-setting process designed and conducted under a contract with ACT. To develop these levels, ACT convened a cross-section of educators and interested citizens from across the nation and asked them to judge what students should know and be able to do relative to a body of content reflected in the mathematics framework. This process of setting achievement levels was reviewed by an array of individuals including policymakers, representatives of professional organizations, teachers, parents,
and other members of the general public. Prior to adopting these levels of student achievement, NAGB engaged a large number of people to comment on the recommended levels and to review the results.

The results of the achievement-levelsetting process, after NAGB's approval, became a set of achievement-level descriptions and a set of achievement-level cut scores on the $0-500$ NAEP mathematics scale. The cut scores are the scores that define the boundaries between below Basic, Basic, Proficient, and Advanced performance levels at each grade.

## Mathematics Achievement-Level Descriptions for Each Grade

Specific definitions of the Basic, Proficient, and Advanced mathematics achievement levels for grades 4 and 8 are presented in figures 1.3 and 1.4. As noted previously, the achievement levels are cumulative; therefore, students performing at the Proficient level also display the competencies associated with the Basic level, and students at the Advanced level also demon-
strate the competencies associated with both the Basic and Proficient levels. For each achievement level listed in figures 1.3 and 1.4, the scale score that corresponds to the lowest cut score within that level on the NAEP mathematics scale is shown in parentheses. For example, in figure 1.3, the scale score of 249 corresponds to the lowest score in the range defining the grade 4 Proficient level of achievement in mathematics.

Figure 1.3 Descriptions of NAEP mathematics achievement levels, grade 4

## Grade 4 <br> Achievement Levels

| $\begin{aligned} & \text { Basic } \\ & \text { (214) } \end{aligned}$ | Fourth-grade students performing at the Basic level should show some evidence of understanding the mathematical concepts and procedures in the five NAEP content strands. |
| :---: | :---: |
|  | Fourth graders performing at the Basic level should be able to estimate and use basic facts to perform simple computations with whole numbers, show some understanding of fractions and decimals, and solve some simple real-world problems in all NAEP content strands. Students at this level should be able to use - though not always accurately -four-function calculators, rulers, and geometric shapes. Their written responses are often minimal and presented without supporting information. |
| Proficient <br> (249) | Fourth-grade students performing at the Proficientlevel should consistently apply integrated procedural knowledge and conceptual understanding to problem solving in the five NAEP content strands. |
|  | Fourth graders performing at the Proficient level should be able to use whole numbers to estimate, compute, and determine whether results are reasonable. They should have a conceptual understanding of fractions and decimals; be able to solve real-world problems in all NAEP content strands; and use four-function calculators, rulers, and geometric shapes appropriately. Students performing at the Proficient level should employ problemsolving strategies such as identifying and using appropriate information. Their written solutions should be organized and presented both with supporting information and explanations of how they were achieved. |
| Advanced <br> (282) | Fourth-grade students performing at the Advanced level should apply integrated procedural knowledge and conceptual understanding to complex and nonroutine real-world problem solving in the five NAEP content strands. |
|  | Fourth graders performing at the Advanced level should be able to solve complex nonroutine real-world problems in all NAEP content strands. They should display mastery in the use of four-function calculators, rulers, and geometric shapes. These students are expected to draw logical conclusions and justify answers and solution processes by explaining why, as well as how, they were achieved. They should go beyond the obvious in their interpretations and be able to communicate their thoughts clearly and concisely. |

[^0]Grade 8
Achievement Levels
Basic Eighth-grade students performing at the Basic level should exhibit evidence of (262)

## Proficient

Advanced
(333)
conceptual and procedural understanding in the five NAEP content strands. This level of performance signifies an understanding of arithmetic operationsincluding estimation-on whole numbers, decimals, fractions, and percents.
Eighth graders performing at the Basic level should complete problems correctly with the help of structural prompts such as diagrams, charts, and graphs. They should be able to solve problems in all NAEP content strands through the appropriate selection and use of strategies and technological tools-including calculators, computers, and geometric shapes. Students at this level also should be able to use fundamental algebraic and informal geometric concepts in problem solving.
As they approach the Proficient level, students at the Basic level should be able to determine which of the available data are necessary and sufficient for correct solutions and use them in problem solving. However, these eighth graders show limited skill in communicating mathematically.

Eighth-grade students performing at the Proficient level should apply mathematical concepts and procedures consistently to complex problems in the five NAEP content strands.
Eighth graders performing at the Proficient level should be able to conjecture, defend their ideas, and give supporting examples. They should understand the connections among fractions, percents, decimals, and other mathematical topics such as algebra and functions. Students at this level are expected to have a thorough understanding of basic-level arithmetic operations-an understanding sufficient for problem solving in practical situations.
Quantity and spatial relationships in problem solving and reasoning should be familiar to them, and they should be able to convey underlying reasoning skills beyond the level of arithmetic. They should be able to compare and contrast mathematical ideas and generate their own examples. These students should make inferences from data and graphs, apply properties of informal geometry, and accurately use the tools of technology. Students at this level should understand the process of gathering and organizing data and be able to calculate, evaluate, and communicate results within the domain of statistics and probability.
Eighth-grade students performing at the Advanced level should be able to reach beyond the recognition, identification, and application of mathematical rules in order to generalize and synthesize concepts and principles in the five NAEP content strands.
Eighth graders performing at the Advanced level should be able to probe examples and counterexamples in order to shape generalizations from which they can develop models. Eighth graders performing at the Advanced level should use number sense and geometric awareness to consider the reasonableness of an answer. They are expected to use abstract thinking to create unique problem-solving techniques and explain the reasoning processes underlying their conclusions.

[^1]
## Trial Status of Achievement Levels

The law requires that the achievement levels are to be used on a trial basis until the Commissioner of Education Statistics determines "that such levels are reasonable, valid, and informative to the public." ${ }^{4}$ Until that determination is made, the law requires the Commissioner and the Board to state clearly the trial status of the achievement levels in all NAEP reports. In 1993, the first of several congressionally mandated evaluations of the achievement-level-setting process concluded that the procedures used to set the achievement levels were flawed and that the percentage of students at or above any particular achievement-level cut point may be underestimated. ${ }^{5}$ Others have critiqued these evaluations, asserting that the weight of the empirical evidence does not support such conclusions. ${ }^{6}$

In response to the evaluations and critiques, NAGB sponsored an additional study of the 1992 reading achievement levels before deciding to use them for reporting NAEP 1994 results. ${ }^{7}$ When reviewing the findings of this study, the National Academy of Education (NAE) panel expressed concern about what it saw
as a "confirmatory bias" in the study and about the inability of this study to "address the panel's perception that the levels had been set too high." ${ }^{8}$ In 1997, the NAE panel summarized its concerns with interpreting NAEP results based on the achievement levels as follows:

First, the potential instability of the levels may interfere with the accurate portrayal of trends. Second, the perception that few American students are attaining the higher standards we have set for them may deflect attention to the wrong aspects of education reform. The public has indicated its interest in benchmarking against international standards, yet it is noteworthy that when American students performed very well on a 1991 international reading assessment, these results were discounted because they were contradicted by poor performance against the possibly flawed NAEP reading achievement levels in the following year. ${ }^{9}$
NCES and NAGB have sought and continue to seek new and better ways to set performance standards for NAEP. ${ }^{10}$

[^2]For example, NCES and NAGB jointly sponsored a national conference that explored many issues related to standard setting in large-scale assessments. ${ }^{11}$ Although new directions were presented and discussed, a proven alternative to the current process has not yet been identified. NCES and NAGB continue to call on the research community to assist in finding ways to improve standard setting for reporting NAEP results.

The most recent congressionally mandated evaluation conducted by the National Academy of Sciences (NAS) relied on prior studies of achievement levels, rather than carrying out new evaluations, on the grounds that the process has not changed substantially since the initial problems were identified. Instead, the NAS panel studied the development of the 1996 science achievement levels. The NAS panel basically concurred with earlier congressionally mandated studies. The panel concluded that "NAEP's current achievement-level-setting procedures remain fundamentally flawed. The judgment tasks are difficult and confusing; raters' judgments of different item types are internally inconsistent; appropriate validity evidence for the cut scores is lacking; and the process has produced unreasonable results." ${ }^{12}$

The NAS panel accepted the continuing use of achievement levels in reporting NAEP results on a trial basis, until such time as better procedures can be developed. Specifically, the NAS panel concluded that ". . . tracking changes in the percentages of students performing at or above those cut scores (or in fact, any selected cut scores) can be of use in describing changes in student performance over time." ${ }^{13}$

NAGB urges all who are concerned about student performance levels to recognize that the use of these achievement levels is a developing process and is subject to various interpretations. NAGB and NCES believe that the achievement levels are useful for reporting trends in the educational achievement of students. ${ }^{14}$ In fact, achievement-level results have been used in reports by the President of the United States, the Secretary of Education, state governors, legislators, and members of Congress. Government leaders in the nation and in more than 40 states use these results in their annual reports. However, based on the congressionally mandated evaluations so far, NCES agrees with the NAS panel's recommendation that caution needs to be exercised in the use of the current achievement levels. NCES has concluded

[^3]that these achievement levels should continue to be used on a trial basis and be interpreted with caution.

## Interpreting NAEP Results

The average scores and percentages presented in this report are estimates based on samples of students rather than on entire populations. Moreover, the collection of questions used at each grade level is but a sample of the many questions that could have been asked to assess the skills and abilities described in the NAEP mathematics framework. As such, the results are subject to a measure of uncertainty, reflected in the standard error of the estimates-a range of a few points above or below the score-which accounts for potential score or percentage fluctuation due to sampling and measurement error. The estimated standard errors for the estimated scale scores and percentages in this report are accessible through the NAEP Data Tool on the NAEP web site (http://nces.ed.gov/nationsreportcard/ naepdata/). Examples of these estimated standard errors are also provided in appendix A, tables A. 23 to A. 27 , of this report.

The differences between scale scores and between percentages discussed in the following chapters take into account the standard errors associated with the estimates. Comparisons are based on statistical tests that consider both the magnitude of the difference between the group average scores or percentages and the standard errors of those statistics.

Estimates based on subgroups with smaller sample sizes are likely to have relatively large standard errors. As a consequence, some seemingly large differences may not be statistically significant. That is, it cannot be determined whether these differences are due to the particular makeup of the samples of students who were selected, or to true differences in the population of interest. When this is the case, the term "apparent difference" or "no measurable difference" is used in this report. Differences between scores or between percentages are discussed in this report only when they are significant from a statistical perspective.

Beginning with the reading sample in 2002, the NAEP national samples were obtained by aggregating the samples from each state, rather than obtaining an independently selected national sample. Consquently, the national sample size increased and smaller differences between years or between subgroups of students were found to be statistically significant than would have been detected in previous assessment years. In keeping with past practice, all statistically significant differences are indicated in this report. All differences reported are significant at the .05 level with appropriate adjustments for multiple comparisons. The term "significant" is not intended to imply a judgment about the absolute magnitude or the educational relevance of the differences. It is intended to identify statistically dependable differences in average scores or per-
centages to help inform dialogue among policymakers, educators, and the public.

While the score ranges at each grade in mathematics are identical, the scale was derived independently at each grade. Therefore, average scale scores across grades cannot be compared. For example, equal scale scores on the grade 4 and grade 8 scales do not imply equal levels of mathematics achievement.

Comparisons of performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in NAEP samples. Percentages of students excluded from NAEP may vary considerably across states or districts, as well as across years. Comparisons of achievement results should be interpreted with caution if the exclusion rates vary widely. The percentages of students who were identified and assessed or excluded based on their disability or limited-English-proficient status are presented in appendix A.

The results presented are meant to describe some aspects of the condition of education. They are best viewed as suggesting various ideas to be further examined in light of other data, including state and local data, and in the context of the large research literature elaborating on the many factors contributing to educational achievement.

However, some readers are tempted to make unwarranted causal inferences from simple cross tabulations. At the risk of sounding dogmatic, it is almost never the case that a simple cross tabulation of any variable with a measure of educational achievement is conclusive proof that differences in that variable are a cause of differential educational achievement. The old adage that "correlation is not causation" is a wise precaution to be kept in mind when viewing the results presented
here. Experienced researchers routinely formulate multiple hypotheses to take these possibilities into account and readers of this volume are encouraged to do likewise.

Additional NAEP data are available in the NAEP data tool and in restrictedaccess research databases. Researchers and policy analysts are free to make use of the data (subject to various confidentiality restrictions) as they wish. However, as part of the Institute for Education Sciences, NCES has a responsibility to try to discourage misleading inferences from the data presented and to educate the public on the difficulty of making valid causal inferences in a field as complex as education.

## Overview of the Remaining Report

This report describes the mathematics performance of fourth- and eighth-graders in the nation, participating states and other jurisdictions, large central city school districts, and selected urban school districts. Chapter 2 presents overall mathematics scale scores and achievement-level results across years for both the nation and participating states and other jurisdictions. Chapter 3 discusses national results for subgroups of students by gender, race/ ethnicity, students' eligibility for free/ reduced-price school lunch, parents' highest level of education (for grade 8 only), type of school (public and nonpublic), and school's type of location (central city, urban fringe/large town, rural/small town). State and jurisdiction results are reported by gender, race/ ethnicity, and eligibility for free/reducedprice lunch. Overall and subgroup results for selected urban districts that were part of the TUDA are presented in chapter 4.

Chapter 5 presents sample assessment questions and student responses at each grade level, including samples of multiple-
choice and constructed-response questions. A table showing the percentage of students at each achievement level who answered the questions successfully accompanies each sample question. In addition, item maps for each grade level describe the skill or ability needed to answer particular mathematics questions and show the score points at which individual students had a high probability of successfully answering particular questions, thereby indicating the relative difficulty of each question.

The appendices of this report contain information to expand the results presented in chapters $2-5$. Appendix A contains an overview of assessment development, sampling, administration, and analysis procedures. Appendix B presents the percentages of students in each of the subgroups reported for the nation, states and other jurisdictions, and other selected urban districts. Appendix C includes tables with additional state-level and district-level subgroup results. Finally, appendix D shows state-level and districtlevel contextual data from sources other than NAEP.

## Average Mathematics Scale Score and Achievement-Level Results for the Nation and States

## Overview

This chapter presents the NAEP 2003 mathematics results at grades 4 and 8 for public and nonpublic school students in the nation as a whole and by region of the country, and for public school students in participating states and other jurisdictions. The NAEP mathematics composite scale ranges from 0 to 500; the mathematics achievement levels are Basic, Proficient, and Advanced.

In addition to the results from the 2003 mathematics assessment, national results are presented from 1990, 1992, 1996, and 2000. Results for participating states and other jurisdictions are included for three previous years at grade 4 (1992, 1996, and 2000) and four previous years at grade 8 (1990, 1992, 1996, and 2000). The national sample at each grade in 2003 comprised the combined sample of students assessed in each participating state plus an additional private school sample.

Results presented in the figures and tables throughout this report distinguish between two different reporting samples. The most recent results, based on administration procedures in which testing accommodations were permitted for special-needs students (national results between 1996 and 2003 and state-level samples for 2000 and 2003), are denoted by solid lines or shading. Results from administrations where accommodations were not permitted (national
results between 1990 and 2000; statelevel results from 1992 to 2000 at grade 4 and 1990 to 2000 at grade 8) are denoted by broken lines or unshaded areas. See chapter 1 for more information on the change in administration procedures.

Both types of administration procedures were used in 1996 and 2000 at the national level and only in 2000 at the state level. Therefore there are two different sets of results in those years. Comparisons with data from 2003 are based on administrations where accom-
modations were permitted. Comparisons between the two sets of results in the years when both procedures were used are discussed in detail in other NAEP reports. ${ }^{1}$

## National Mathematics Scale Score Results

Figure 2.1 displays the average mathematics scores from 1990 to 2003 for fourth- and eighth-grade students. Average mathematics scores were higher in 2003 than in all the previous assessment years at both grades 4 and 8 .

Figure 2.1 Average mathematics scale scores, grades 4 and 8: 1990-2003

## Grades 4 and 8

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. [^4]
## National Mathematics Scale Scores by Percentile

Another way to view students' performance is by looking at how scores have changed across the performance distribution. An examination of scores at different percentiles on the $0-500$ mathematics scale at each grade indicates whether or not the changes seen in the overall national average score results are reflected in the performance of lower-, middle-, and higher-performing students. Figure 2.2 shows the average mathematics scale scores for students scoring at the 10th, 25th, 50th, 75th, and 90 th percentiles at grades 4 and 8 . The percentile indicates the percentage of students whose scores fell below a par-
ticular point on the NAEP mathematics scale. For example, the 75 th percentile score at grade 4 was 255 in 2003, indicating that 75 percent of fourth-graders scored below 255.

At both grades 4 and 8 , scores at the 10th, 25th, 50th, 75 th, and 90 th percentiles were higher in 2003 than in any of the previous assessment years. At grade 4, gains detected between 2000 and 2003 ranged from approximately 5 scale score points for students performing at the 90th percentile to 13 points for students at the 10th percentile. At grade 8, increases since 2000 ranged from approximately 3 scale score points at the 90 th percentile to 7 points at the 10 th percentile.

## Grades 4 and 8

* Significantly different from 2003

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

## National Mathematics Achievement-Level Results

In addition to reporting average mathematics scale scores, NAEP reports mathematics performance by achievement levels. The mathematics achievement levels are Basic, Proficient, and Advanced. Discussion related to the setting of achievement levels is covered in chapter 1.

Figure 2.3 tracks the percentages of students performing at or above Basic and at or above Proficient-the level identified by the National Assessment Governing Board (NAGB) as the level at which all students should perform-across assessment years. Table 2.1 presents the achievement-level results in two ways for each grade: as the percentage of students performing within each achievement level and as the percentage of students at or above the Basic level and at or above the Proficient level. The percentages at or above specific achievement levels are cumulative. Included among the percentage of students performing at or above the Basic level are those who have
achieved the Proficient and Advanced levels of performance. Included among students at or above the Proficient level are those who have attained the Advanced level of performance. Although significant differences in the percentages of students performing within achievement levels are indicated in the table, only the differences at or above Basic, at or above Proficient, and at Advanced are discussed in this section.

In 2003, 32 percent of fourth-graders and 29 percent of eighth-graders performed at or above the Proficient level. Table 2.1 shows that the percentages of fourth-grade students performing at or above Basic, at or above Proficient, and at Advanced increased from 2000 to 2003, as did the percentages of eighth-graders performing at or above Basic and at or above Proficient. Further, the percentages of fourth- and eighth-graders performing at or above Basic, at or above Proficient, and at Advanced were higher in 2003 than in 1990.

Figure 2.3 Percentages of students at or above Basic and Proficient in mathematics, grades 4 and 8: 1990-2003

## Grades 4 and 8

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. ## Mathematics Results by Region of the Country

Prior to 2003, NAEP results were reported for four NAEP-defined regions of the nation: Northeast, Southeast, Central, and West. As of 2003, to align NAEP with other federal data collections, NAEP analysis and reports have used the U.S. Census Bureau's definition of "region." The four regions defined by the U.S.

Census Bureau are Northeast, South, Midwest, and West. Figure 2.4 shows how states are subdivided into these regions (the two Department of Defense Educational Activities jurisdictions are not assigned to any region). As a result of this change in the region variable, the following section presents the results by region of the country for the 2003 assessment only. (See figure A. 2 in appendix A.)

Figure 2.4 Map of regions of the country according to U.S. Census

SOURCE: U.S. Department of Commerce, Economics and Statistics Administration, U.S. Census Bureau.

Average mathematics scale scores by region are shown in table 2.2 for grades 4 and 8 . At both grades 4 and 8 , average mathematics scores were higher for students in the Northeast and Midwest than for students in the South and West,
and no measurable difference was detected between scores for students in the Northeast and Midwest. Average scores for students in the South were higher than for students in the West at both grade levels.

Table 2.3 displays achievement-level information by region for fourth- and eighth-graders both as the percentages of students performing within each achievement level and as the percentages of students performing at or above the Basic and Proficient levels.

At grade 4, the percentages of students performing at or above the Basic and Proficient and at Advanced levels were higher in the Northeast and Midwest
than in the South and West. Higher percentages of students performed at or above Basic and Proficient in the South than in the West.

At grade 8, higher percentages of students performed at or above Basic and at or above Proficient in the Northeast and Midwest than in the South and West. A higher percentage of eighth-graders performed at or above Basic in the South than in the West.

## Mathematics Results for States and Other Jurisdictions

In addition to the national results, mathematics performance data were collected for fourth- and eighth-grade students attending public schools in 50 states and 3 other jurisdictions that participated in the 2003 assessment. ${ }^{2}$ At both fourth and eighth grades, all jurisdictions met NCES participation rate standards. Variation in exclusion rates should be considered when interpreting state results, and is discussed in detail in the section on Students with Disabilities and Limited-English-Proficient Students in appendix A.

Statistically significant changes across years are indicated when examining only one jurisdiction at a time $(*)$, or when using a multiple comparison procedure based on all the jurisdictions that participated (**). Differences discussed in this report are based on statistically significant findings detected using either comparison procedure (see appendix A for a more detailed discussion of comparison procedures).

## Mathematics Scale Score Results by State/Jurisdiction

Average mathematics scale scores by jurisdiction are shown in table 2.4 for grade 4 , and in table 2.5 for grade 8 . Whereas the national and regional results presented in the previous sections of this chapter represent both public and nonpublic schools combined, the national and state average scores shown in the following tables and figures represent the performance of public school students only. The overall national public school results include the results for the District of Columbia, but not the results for the Department of Defense schools.

In 2003, average fourth-grade scores ranged from 205 to 243 . Out of the 43 jurisdictions that participated in both the 2000 and 2003 fourth-grade assessments, all showed increases in average scores. Similarly, all 42 of the jurisdictions that participated in the 1992 and 2003 assessments showed average score increases.

Average eighth-grade scores ranged from 243 to 291 in 2003 . Of the 42 jurisdictions that participated in both the 2000 and 2003 assessments at grade 8, 28 had higher average scores in 2003. All 38 jurisdictions that participated in both 1990 and 2003 had higher average scores in 2003.

- Not available. The jurisdiction did not participate or did not meet minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990,
1992, 1996, 2000, and 2003 Mathematics Assessments.

The maps in figures 2.5 and 2.6 compare jurisdictional to national average mathematics scores for public school students in 2003, at grades 4 and 8 , respectively. In 2003, 26 of the 53 jurisdictions that participated at grade 4 had average scores that were higher than the
national average and 16 had average scores that were lower than the national average. Of the 53 jurisdictions that participated at grade 8, 30 had average scores that were higher than the national average and 16 had average scores that were lower than the national average.

Figure 2.5 Comparison of state and national public school average mathematics scale scores, grade 4: 2003

## Grade 4

State/jurisdiction had higher average scale score than nation.
State/jurisdiction was not found to be significantly different from nation in average scale score.
State/jurisdiction had lower average scale score than nation.

## Cross-State/Jurisdiction Mathematics Scale Score Comparisons

Figures 2.7 and 2.8 display the differences in the NAEP 2003 average mathematics scale scores between any two participating jurisdictions at grades 4 and 8 , respectively. These figures are set up similarly to mileage charts on travel maps. On the line across the top of the figure, find the name of the target jurisdiction and follow the column below the target jurisdiction to the jurisdiction chosen for comparison. If the cell of the comparison jurisdiction is not shaded, no statistically significant difference between the scale scores of the two jurisdictions was detected. If the cell of the comparison jurisdiction is lightly shaded, the average scale score of that jurisdiction was higher than the average scale score of the target jurisdiction named at the top of the
column. Darkly shaded cells indicate that the average scale score of the comparison jurisdiction was lower than that of the target jurisdiction.

At grade 4, New Hampshire, North Carolina, Vermont, Minnesota, Kansas, Massachusetts, and Wyoming were among the highest performing jurisdictions. Any apparent differences in average scores between the seven top-performing states were not found to be statistically significant. Average fourth-grade scores in Connecticut and Virginia were lower only in comparison with New Hampshire.

At grade 8, Minnesota was the highest performing state. Eighth-graders in North Dakota, Massachusetts, New Hampshire, Montana, Vermont, Department of Defense Overseas schools, South Dakota, and Kansas were outperformed only by their counterparts in Minnesota.

Figure 2.7 Cross-state comparison of average mathematics scale scores, grade 4 public schools: 2003
Grade 4
Instructions: Read down the column directly under a jurisdiction name listed in the heading at the top of the figure. Match the shading intensity surrounding a jurisdiction's abbreviation to the key below to determine whether the average mathematics scale score of this jurisdiction was found to be higher than, not significantly different from, or lower than the jurisdiction in the column heading. For example, note the column under Connecticut: Connecticut's score was lower than New Hampshire, not significantly different from all the jurisdictions from North Carolina through Washington, and higher than the remaining jurisdictions down the column.

## Mathematics Achievement-Level Results

## by State/Jurisdiction

Achievement-level results for jurisdictions are presented both as the percentage of students scoring within each mathematics achievement-level range and as the percentage of students performing at or above the Proficient level. The percentage of students within each mathematics achievement-level range for participating jurisdictions in 2003 is presented in figure 2.9 for grade 4 and in figure 2.10 for grade 8 . The shaded bars represent the proportion of students in each of the three achievement levels (Basic, Proficient, and Advanced), as well as the proportion of students who performed below the Basic level. The central vertical line divides the proportion of students who fell below the Proficient level (i.e., at Basic or below Basic) from those who performed at or above the Proficient level (i.e., at Proficient or at Advanced). Scanning down the horizontal bars to the right of the vertical line allows comparison of jurisdictions' percentages of students at or above Proficient. Jurisdictions are listed in the figures in three
clusters based on statistical comparison of the percentage of students performing at or above Proficient in each jurisdiction with the national percentage of public school students performing at or above Proficient. The jurisdictions in the top cluster of each figure had a higher percentage of students who performed at or above the Proficient level compared to the nation. The percentages of students in jurisdictions clustered in the middle were not found to be measurably different from the national percentage. Jurisdictions in the bottom cluster had percentages lower than the national percentage. Within each cluster, jurisdictions are listed alphabetically.

Figure 2.9 shows that, at grade 4, 18 jurisdictions had higher percentages of students performing at or above Proficient than the nation and 16 had percentages that were lower than the nation.

In figure 2.10, the results for grade 8 show that 24 jurisdictions had higher percentages of students performing at or above Proficient than the nation and 17 had percentages that were lower than the nation.

Figure 2.9 Percentage of students within each mathematics achievement level, grade 4 public schools: By state, 2003

```
Grade 4
The bars below contain percentages of students in each NAEP mathematics achievement-level range. Each population of students is aligned at the point where the Proficient category begins, so that they may be compared at Proficient and above. Jurisdictions are listed alphabetically within three groups: the percentage at or above Proficient was higher than, not found to be significantly different from, or lower than the nation.
```

[^8]Figure 2.10 Percentage of students within each mathematics achievement level, grade 8 public schools: By state, 2003

[^9]The percentage of fourth-graders performing at or above the Proficient level for each jurisdiction that participated in the 1992, 1996, 2000, and 2003 assessments is presented in table 2.6. The percentage of fourth-graders performing at or above the Proficient level was higher in 2003 than in 2000 for all 43 jurisdictions that participated in both years. The percentages also increased from 1992 to 2003 for all 42 jurisdictions that participated in both of those assessment years.

The percentages of eighth-graders performing at or above Proficient for jurisdictions that participated in 1990, 1992, 1996, 2000, and 2003 are presented in table 2.7. Among the 42 jurisdictions that participated in both the 2000 and 2003 eighth-grade assessments, 18 showed an increase in the percentages of students performing at or above Proficient. The percentage of eighth-graders performing at or above Proficient was higher in 2003 than in 1990 for all 38 jurisdictions that participated in both years.

Table 2.6 Percentage of students at or above Proficient in mathematics, grade 4 public schools: By state, 1992-2003

- Not available. The jurisdiction did not participate or did not meet minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## Cross-State/Jurisdiction Mathematics Achievement-Level Comparisons

Figures 2.11 and 2.12 display the same type of cross-state/jurisdiction comparisons that were presented earlier for scale score results, but the performance measure being compared in these figures is the percentage of students performing at or above the Proficient level in 2003 for grades 4 and 8, respectively.

At grade 4, New Hampshire, Vermont, Minnesota, Kansas, Massachusetts, Connecticut, North Carolina, New Jersey, and Wyoming were among
the jurisdictions with the highest percentages of students at or above Proficient. The percentages of students at or above Proficient were not found to differ significantly between the nine jurisdictions.

At grade 8, Minnesota had a higher percentage of students at or above Proficient than any other jurisdiction. The percentages of students at or above Proficient in Massachusetts, North Dakota, Connecticut, Wisconsin, Vermont, and Montana were not measurably different from each other and were lower only than the percentage in Minnesota.

# Figure 2.11 Cross-state comparison of percentage of students at or above Proficient in mathematics, grade 4 

 public schools: 2003Grade 4
Instructions: Read down the column directly under a jurisdiction name listed in the heading at the top of the figure. Match the shading intensity surrounding a jurisdiction's abbreviation to the key below to determine whether the percentage of students at or above Proficient for this jurisdiction was found to be higher than, not significantly different from, or lower than the jurisdiction in the column heading. For example, note the column under Washington: The percentage of students at or above Proficient in Washington was lower than New Hampshire, Vermont, Minnesota, Kansas, Massachusetts, Connecticut, and North Carolina, not significantly different from all the jurisdictions from New Jersey through Illinois, and higher than the remaining jurisdictions down the column.

## THIS PAGE INTENTIONALLY LEFT BLANK.

## Subgroup Results for the Nation and States

In addition to reporting on the performance of all students, NAEP also provides results for a variety of subgroups of students for each grade level assessed. The subgroup results show not only how these groups of students performed in comparison with one another, but also the progress each group has made over time. The information presented in this chapter provides an indication of how well the nation is progressing toward the goal of improving the achievement of all students.
This chapter includes average mathematics scale scores and achievement-level results for subgroups of students in the nation and participating states and jurisdictions at grades 4 and 8 . National results are reported by gender, race/ethnicity, students' eligibility for free/reduced-price school lunch, parents' highest level of education, type of school, and type of school location. Results for participating jurisdictions are presented by gender, race/ethnicity, and students' eligibility for free/reduced-price school lunch. The weighted percentage of students corresponding with each subgroup reported in this chapter can be found in appendix B. Tables with additional subgroup results by jurisdiction are presented in appendix C.

Differences in students' performance on the 2003 mathematics assessment between demographic subgroups and across years for a particular subgroup are discussed only if they have been determined to be statistically significant. The reader should bear in mind that the estimated scale score for a subgroup of students does not reflect the entire range of performance within that group. Differences in subgroup performance cannot be ascribed solely to students' subgroup identification. Average student performance is affected by the interaction of a complex set of educational, cultural, and social factors not discussed in this report or addressed by NAEP assessments.

## Performance of Selected Subgroups for the Nation

## Gender

A substantial body of research indicating that male students tend to outperform female students in mathematics has been documented. ${ }^{1}$ A 1998 study of California students showed gender differences in mathematics performance in fourth- and sixth-graders. ${ }^{2}$ Another study, based on an international sample, found gender differences at grades 8 and 12 were small but consistently showed higher performance by males. ${ }^{3}$ The NAEP 2003 mathematics assessment findings were consistent with other research studies, showing that male students scored higher on average than female students at grades 4 and 8 .

As shown in figure 3.1, at grades 4 and 8 , the average scores for male and female students were higher in 2003 than in any of the previous assessment years.

[^10]Figure 3.1 Average mathematics scale scores, by gender, grades 4 and 8: 1990-2003

## Grades 4 and 8

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Another way to view trends in student performance is to determine whether the score "gap" that exists between subgroups of students has narrowed or widened across assessment years. The scale score gaps between male and female students are presented in figure 3.2.

In 2003, male students outperformed female students by 3 points on average at grade 4 and 2 points on average at grade 8. The gender gap in 2003 was not found to be measurably different from the gap in any of the previous assessment years.

Figure 3.2 Gaps in average mathematics scale scores, by gender, grades 4 and 8: 1990-2003

\# The estimate rounds to zero.
NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Score gaps are calculated based on differences between unrounded average scale scores. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. Negative numbers indicate that the average score for male students was lower than the score for female students. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Table 3.1 displays achievement-level information for the national sample of fourth- and eighth-graders both as the percentages of male and female students performing within each achievement-level range and as the percentages of male and female students performing below Basic and at or above the Basic and Proficient levels.

Consideration of the differences in performance between male and female students in the fourth and eighth grades
in 2003 shows that higher percentages of male students than female students performed at or above Basic and Proficient and at Advanced. At grade 4, the percentages of males and females performing at or above Basic and Proficient levels were higher in 2003 than in any previous assessment year. At grade 8, the percentages of male and female students performing at or above Basic and Proficient levels were also higher in 2003 than in all previous assessment years.

NOTE: Detail may not sum to totals because of rounding. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

## Race/Ethnicity

In recent years, a great deal of research documenting differences in academic achievement between students of different racial/ethnic backgrounds has been published. Some efforts to narrow the
long-standing performance gaps between these subgroups have met with some success; however, significant performance differences can still be noted for a variety of mathematically related skills. ${ }^{4}$

[^11]Based on information obtained from school records, students who participated in the NAEP mathematics assessment were identified as belonging to one of the following mutually exclusive racial/ethnic subgroups: White, Black, Hispanic, Asian/ Pacific Islander, American Indian (including Alaska Native), and Other (i.e., students whose race based on school records was "other race," or, if school data were missing, who self-reported their race as "multiracial" but not Hispanic, or did not self-report race/ethnicity information). The results presented here for 1990 through 2000 differ from those presented in earlier mathematics reports in which results were reported for five racial/ ethnic subgroups based on student selfidentification.

Between 1990 and 2003, the percentage of Hispanic students increased from 6 percent to 18 percent at grade 4 , and from 7 percent to 15 percent at grade 8 . During the same period, the percentage of White students decreased from 75 percent to 60 percent at grade 4 and from 73 percent to 63 percent at grade 8 . The percentage of Black students, which has changed less over the years, was approximately 17 percent in 2003 at grade 4 and 16 percent at grade 8 . Students categorized as "Other" made up approximately 1 percent of the students at each grade. (See table B. 3 in appendix B. $)^{5}$

Figure 3.3 shows the average mathematics scale scores of students in each of the six categories at grades 4 and 8 . Results were not reported in 1990 and 1992 for American Indian/Alaska Native students at grades 4 and 8 and for American In-
dian/Alaska Native students at grade 8 in 1996 because the sample sizes were insufficient to permit reliable estimates. Further, data for Asian/Pacific Islander students at grade 4 in 2000 and grade 8 in 1996 were not available because special analyses raised concerns about the accuracy and precision of the results. Sample sizes were also insufficient to report results for students whose race/ethnicity was categorized as "Other" in 1990, 1992, and 1996 at grade 4, and in 1990 and 1996 at grade 8.

At both grades 4 and 8, Asian/Pacific Islander students scored higher on average in 2003 than White students. Both White students and Asian/Pacific Islander students had higher average scores than Black, Hispanic, and American Indian/ Alaska Native students at both grades. Hispanic students and American Indian/ Alaska Native students also scored higher on average than Black students at both grades.

At grade 4, White, Black, and Hispanic students all had higher average scores in 2003 than in any of the previous assessment years. American Indian/Alaska Native students had higher average scores in 2003 than in 2000 at grade 4. Average scores for Asian/Pacific Islander students were higher in 2003 than in 1990 for fourth-graders.

White, Black, and Hispanic eighthgrade students all showed increases in average scores between 2000 and 2003. At grade 8 , average scores for Asian/Pacific Islander students were higher in 2003 than in 1990.

5 In addition to reflecting a shift in the racial/ethnic composition of the student population, a portion of the differences may be due to the composition of the accommodated and nonaccommodated samples.

Figure 3.3 Average mathematics scale scores, by race/ethnicity, grades 4 and 8: 1990-2003

## Grades 4 and 8

* Significantly different from 2003.
${ }^{1}$ Special analyses raised concerns about the accuracy and precision of national grade 8 Asian/Pacific Islander results in 1996 and grade 4 Asian/Pacific Islander results in 2000 . As a result, they are omitted from this report.
${ }^{2}$ Sample size was insufficient to permit a reliable estimate for American Indian/Alaska Native students in 1990 and 1992 at grades 4 and 8, and in 1996 at grade 8.
${ }^{3}$ Sample size was insufficient to permit a reliable estimate for "Other" students in 1990 and 1996 at grades 4 and 8, and in 1992 at grade 4. "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Average scale score gaps between White students and Black students and between White students and Hispanic students are presented in figure 3.4. At grade 4, the score gap between White students and Black students decreased between 2000 and 2003, and was smaller in 2003 than in 1990. The gap between White fourthgraders and Hispanic fourth-graders also narrowed between 2000 and 2003, but the gap in 2003 was not found to be measurably different from that in 1990.

At grade 8, the score gap between White students and Black students was narrower in 2003 than in 2000, but the gap in 2003 was not found to be measurably different from 1990. The score gap between White eighth-graders and Hispanic eighth-graders in 2003 was not found to be measurably different from the gap in any of the previous assessment years.

Figure 3.4 Gaps in average mathematics scale scores, by race/ethnicity, grades 4 and 8: 1990-2003

* Significantly different from 2003.

NOTE: Score gaps are calculated based on differences between unrounded average scale scores. In addition to allowing for accommodations, the accommodationspermitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Achievement-level results across assessment years for racial/ethnic subgroups are shown in table 3.2. As with the scale score results, comparison of the performance of racial/ethnic subgroups in 2003 reveals higher percentages of White and Asian/ Pacific Islander students performing at or above the Basic and Proficient levels and at Advanced than of Black, Hispanic, and American Indian/Alaska Native students at grades 4 and 8 . Higher percentages of Asian/Pacific Islander students than White students performed at or above Proficient and at Advanced at grades 4 and 8.

At grade 4, the percentages of White, Black, and Hispanic students performing at or above the Basic and Proficient levels
were higher in 2003 than in any of the previous assessment years. The percentages of Asian/Pacific Islander students performing at or above Basic and Proficient were higher in 2003 than in 1990. The percentage of American Indian/Alaska Native students at or above Basic was higher in 2003 than in 2000.

At grade 8, the percentages of White, Black, and Hispanic students performing at or above Basic and Proficient were higher in 2003 than in any of the previous assessment years. The percentages of Asian/ Pacific Islander students performing at or above Basic and Proficient were higher in 2003 than in 1990.

\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate. Special analyses raised concerns about the accuracy and precision of national grade 8 Asian/Pacific Islander results in 1996 and grade 4 Asian/Pacific Islander results in 2000. As a result, they are omitted from this report.

* Significantly different from 2003.

1 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Detail may not sum to totals because of rounding. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## Student Eligibility for Free/Reduced-Price

 School LunchNAEP collects data on students' eligibility for free/reduced-price lunch as an indicator of family economic status. Eligibility for free and reduced-price lunch is determined by students' family income in relation to the federally established poverty level. Free lunch qualification is set at 130 percent of the poverty level, and reduced-price lunch qualification is set at between 130 and 185 percent of the poverty level.

NAEP first began collecting information on student eligibility for this program in 1996; therefore, cross-year comparisons to 1990 and 1992 cannot be made. The percentage of eligible students varied by grade. In 2003, 40 percent of fourthgraders and 33 percent of eighth-graders were eligible for free/reduced-price
lunch. Information regarding eligibility was not available for 10 percent of fourthgraders and 11 percent of eighth-graders. (See table B. 4 in appendix B.) If school records were not available, the student was classified as "Information not available." If the school did not participate in the program, all students in the school were classified as "Information not available."

As shown in figure 3.5, the average mathematics score in 2003 for students who were eligible for free/reduced-price lunch was lower than that of students who were not eligible at both grades 4 and 8 . The average mathematics scores for fourth-grade and eighth-grade students were higher in 2003 than in the 2000 and 1996 assessment years for students who were eligible for free/reduced-price lunch and for those who were not eligible.

Figure 3.5 Average mathematics scale scores, by student eligibility for free/reduced-price school lunch, grades 4 and 8: 1996-2003

## Grades 4 and 8

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Information on students' eligibility in 2003 was not available for 10 percent of fourth-graders and 11 percent of eighth-graders. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

Figure 3.6 shows the scale score gaps between students who were eligible and students who were not eligible for free/ reduced-price lunch. At grade 4, the average score gap decreased from 2000 to 2003, but the gap in 2003 was not found to
be measurably different from the gap in 1996.

At grade 8, there was no measurable change detected in the gap in 2003 in comparison to any of the previous assessment years.

Figure 3.6 Gaps in average mathematics scale scores, by student eligibility for free/reduced-price school lunch, grades 4 and 8: 1996-2003

* Significantly different from 2003.

NOTE: Score gaps are calculated based on differences between unrounded average scale scores. In addition to allowing for accommodations, the accommodationspermitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1996, 2000, and 2003 Mathematics Assessments.

The previous results presented for students within different racial/ethnic subgroups and by eligibility for free/ reduced-price lunch are explored in more detail in table 3.4. Average scores for students within different racial/ethnic categories are presented for students who were either eligible or not eligible for free/ reduced-price lunch, as well as for students for whom eligibility information was not available. By presenting the data in this manner, it is possible to examine the performance of students in different racial/ethnic subgroups, while controlling for one indicator of socioeconomic sta-tus-eligibility for free/reduced-price lunch.

The percentages of students who were eligible for free/reduced-price school lunch in 2003 were higher among Black and Hispanic students than among White and Asian/Pacific Islander students at grades 4 and 8 (see table B. 5 in appendix B).

At both grades, White and Asian/Pacific Islander students outperformed Black, Hispanic, and American Indian/Alaska Native students, and average scores for Hispanic students were higher than those of Black students when students were eligible as well as not eligible for free/ reduced-price lunch. While overall results for racial/ethnic subgroups show no measurable difference between the average scores of American Indian/Alaska Native students and Hispanic students at either grade 4 or grade 8 in 2003, American Indian/Alaska Native students who were not eligible for free/reduced-price lunch scored higher on average than Hispanic students who were not eligible at both grades. While Asian/Pacific Islander students scored higher on average than White students overall at grade 8, there was no measurable difference detected between these two groups for students who were eligible.

Table 3.4 Average mathematics scale scores, by student eligibility for free/reduced-price school lunch and race/ethnicity, grades 4 and 8: 2003

[^12] 2003 Mathematics Assessment.

## Parents' Highest Level of Education

Eighth-grade students who participated in the NAEP 2003 mathematics assessment were asked to indicate the highest level of education they thought their parents had completed. Five response options-did not finish high school, graduated from high school, some education after high school, graduated from college, or "I don't know"-were offered. The highest level of education reported for either parent was used in the analysis of this question. Fourth-graders' replies to this question are not reported because their responses in previous NAEP assessments were highly variable, and a large percentage of them chose the "I don't know" option.

Almost half (48 percent) of the eighthgraders who participated in the 2003 mathematics assessment reported that at least one of their parents had graduated from college, and 7 percent indicated that neither parent had graduated from high school. Eleven percent of the students indicated they did not know their parents' level of education (see table B. 6 in appendix B).

Average eighth-grade scores for studentreported parental education levels are shown in figure 3.7. Overall, in 2003, there was a positive relationship between student-reported parental education and student achievement: The higher the parental education level, the higher the average mathematics score. Average scores for eighth-grade students increased from 2000 to 2003 and were higher in 2003 than in 1990 regardless of the level of parental education reported.

Figure 3.7 Average mathematics scale scores, by student-reported parents' highest level of education, grade 8: 1990-2003

## Grade 8

$\square=$ Accommodations not permitted

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Achievement-level results by level of parental education are presented in table 3.5. The percentage of students performing at or above Basic was higher in 2003 than in 2000 for eighth-graders who reported that at least one parent had graduated from high school. The percentages of eighth-graders performing at or
above Basic and Proficient in 2003 were higher than in 1990 regardless of the level of parental education students reported. The percentage of students performing at Advanced was higher in 2003 than in 1990 for students who reported that at least one parent had graduated from college.

Table 3.5 Percentages of students, by mathematics achievement level and student-reported parents' highest level of education, grade 8: 1990-2003

\# The estimate rounds to zero.

* Significantly different from 2003.

NOTE: Detail may not sum to totals because of rounding. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

## Type of School

The schools that participate in the NAEP assessment are classified as either public or nonpublic. A further distinction is then made between nonpublic schools that are Catholic schools and those that are some other type of nonpublic school. Results for additional categories of nonpublic schools are available on the NAEP web site (http://nces.ed.gov/nationsreportcard/ naepdata). In 2003, the great majority of students attended public schools (90 percent of fourth-graders, and 91 percent of eighth-graders). The remaining onetenth of students was almost evenly split between Catholic schools and other nonpublic schools. (See table B. 7 in appendix B.) Families who send children to private schools may differ from other families in ways that affect student achievement and may or may not be measured by NAEP.

The average mathematics scores of fourth- and eighth-grade students by the type of school they attend are presented in figure 3.8. Performance results in 2003 show that, at grade 4 , students who attended nonpublic schools had higher average scores than students who attended public schools.

In 2003, eighth-grade students in nonpublic schools had higher average scores than eighth-graders in public schools. Eighth-grade students in Catholic schools had lower average scores than eighth-graders in other nonpublic schools.

The average fourth-grade and eighthgrade mathematics scores for students in public and nonpublic schools increased from 2000 to 2003 and were higher in 2003 than in 1990. Average scores also increased from 2000 to 2003 for students in both Catholic and other nonpublic schools, and were higher in 2003 than in 1990.

NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Achievement-level results by type of school are presented for grades 4 and 8 in table 3.6. In 2003, the percentages of students performing at or above Basic and Proficient and at Advanced were higher at grade 4 for students attending nonpublic schools than those in public schools.

The 2003 results for grade 8 show that public schools had lower percentages of students performing at or above Basic and Proficient and at Advanced than did nonpublic schools. The percentages of students performing at or above Proficient and at Advanced were lower in Catholic schools than in other nonpublic schools.

At grade 4, the percentages of public, nonpublic, and Catholic school students performing at or above Basic and Proficient increased between 2000 and 2003 and
were higher in 2003 than in 1990. The percentages of other nonpublic school students performing at or above Proficient were higher in 2003 than in 2000 and 1990. The percentage of other nonpublic school students performing at or above Basic increased between 2000 and 2003.

At grade 8, the percentages of students performing at or above Basic and Proficient were higher in 2003 than in 1990 for students in public, nonpublic, Catholic, and other nonpublic schools. Since 2000, the percentages of students performing at or above Basic increased for public schools only, and the percentage of students performing at or above Proficient increased for public, nonpublic, and Catholic schools.

|  | 2003 | 17 | 36 | 35 | 12 | 83 | 47 |

* Significantly different from 2003.

NOTE: Detail may not sum to totals because of rounding. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

The results presented for students in public and nonpublic schools and by highest level of parent's education are explored in more detail in table 3.7. Average scores of eighth-graders in public and nonpublic schools are presented for each level of parental education. By presenting the data in this manner, it is possible to examine the performance of students in the two types of schools, while controlling for parental education.

At grade 8, nearly three-quarters (71 percent) of the students attending nonpublic schools reported that at least
one parent had graduated from college, while less than one-half ( 45 percent) of the students attending public schools reported that at least one parent graduated from college. Students who reported each of the other levels of parental education were more likely to attend public than nonpublic schools (see table B. 8 in appendix B). The average mathematics score for eighth-grade public school students was lower than the average score for nonpublic school students, regardless of the reported level of parents' education.

Table 3.7 Average mathematics scale scores, by student-reported parents' highest level of education and type of school, grade 8: 2003

| Grade 8 | Less than <br> high school | Graduated <br> high school | Some education <br> after high school | Graduated <br> college | Unknown |

## Type of Location

The schools from which NAEP draws its samples of students are classified according to their type of location. Based on U.S. Census Bureau definitions of metropolitan statistical areas, including population size and density, the three mutually exclusive categories are central city, urban fringe/ large town, and rural/small town. The methods used to identify the type of school location for the 2000 and 2003 assessments were different from those used for prior assessments; therefore, only the data from the 2000 and 2003 assessments are reported. More information on the definitions of location type is given in appendix A .

The average mathematics scores for fourth- and eighth-grade students, by type of location, are presented in figure 3.9. In 2003, at both grades 4 and 8 , students in schools in urban fringe/large town and rural/small town locations had higher average mathematics scores than those in central city locations. Students in urban fringe/large town schools had higher average scores than students in rural/ small town schools at both grades. Average mathematics scores in all three location types-central city, urban fringe/large town, and rural/small town-were higher in 2003 than in 2000 for both grades 4 and 8.

Figure 3.9 Average mathematics scale scores, by type of location, grades 4 and 8: 2000 and 2003

## Grades 4 and 8

* Significantly different from 2003.

NOTE: In addition to allowing for accommodations, the accommodations-permitted results (2000-2003) differ slightly from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2000 and 2003 Mathematics Assessments.

Achievement-level results by type of location are presented in table 3.8. In 2003, at grade 4, higher percentages of students performed at or above Basic and Proficient in urban fringe/large town and rural/small town locations than in central city locations. Also, higher percentages of students performed at or above Proficient and at Advanced in urban fringe/large town locations than in rural locations. At grade 8 , higher percentages of students performed at or above the Basic and Proficient levels in urban fringe/large town and rural/small town schools than in
central city schools; in urban fringe areas, higher percentages of students performed at or above Proficient and at the Advanced level than in rural/small town areas.

At grade 4, the percentages of students at or above Basic and Proficient and at Advanced were higher in 2003 than in 2000 in central city, urban fringe/large town, and rural/small town locations. At grade 8, the percentage of students at or above Basic was higher in 2003 than in 2000 in central city, urban fringe/large town, and rural/small town locations.

## Performance of Selected Subgroups by State

Results for public school students in participating states and jurisdictions are presented in this section by gender, race/ ethnicity, and eligibility for free/reducedprice lunch. Additional data for participating jurisdictions by subgroup (including percentages at or above Basic and average scale score gaps by gender and race/ ethnicity) are included in appendix C. Since results for each jurisdiction are based on the performance of public school students only, the results for the nation that appear in the tables along with data for participating jurisdictions are based on public school students only (unlike the national results presented earlier in the chapter, which reflect the performance of both public and nonpublic school students combined).

In addition to results from the 2003 assessment, results from earlier assessment years in which data are available are presented by these subgroups for participating jurisdictions.

## Gender

Tables 3.9 and 3.10 present the average mathematics scores for male and female students in participating jurisdictions at
grades 4 and 8, respectively. In 2003, male fourth-graders scored higher on average than female fourth-graders in 24 jurisdictions. At grade 8, average scores were higher for male students than female students in Massachusetts, South Carolina and Department of Defense Overseas Schools.

Between 2000 and 2003, average scores increased for both male and female fourth-graders in all 43 of the jurisdictions that participated in both assessments.

For those jurisdictions that participated in both the 1992 and 2003 fourth-grade mathematics assessments, all 42 showed score increases for both male and female students.

For the 42 jurisdictions that participated in both the 2000 and 2003 eighthgrade assessments, 17 showed increases for both male and female students, 6 showed increases only for male students, and 5 showed increases only for female students. For the 38 jurisdictions that participated at grade 8 in both the 1990 and 2003 assessments, scores increased for both male and female students in 36 of the jurisdictions and increased for female students only in Montana and North Dakota.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

Tables 3.11 and 3.12 present the percentages of male and female students who performed at or above the Proficient level for the participating jurisdictions at grades 4 and 8, respectively. In 2003, higher percentages of male students than female students performed at or above Proficient in 31 of the jurisdictions that participated at grade 4 , and 10 of the jurisdictions that participated at grade 8 .

At grade 4, increases in the percentage of students performing at or above Proficient were detected between 2000 and 2003 for both male and female students in 38 jurisdictions, only for male students in Michigan, New Mexico, and Department of Defense domestic schools, and only for female students in Montana. The percentage of students performing at or above Proficient in 2003 was higher than in 1992
for both male and female students in 39 of the jurisdictions that participated in both years and for male students only in Maine and New Mexico.

Between 2000 and 2003, 12 jurisdictions showed increases in the percentages of both male and female eighth-graders at or above Proficient; Illinois, Maryland, and Rhode Island showed increases only for male students; and North Carolina and Tennessee showed increases only for female students at this performance level. At grade 8, the percentages of both males and females performing at or above Proficient increased between 1990 and 2003 in 36 jurisdictions, increased for male students in the District of Columbia, and increased for female students only in Montana.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }_{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using
unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## Race/Ethnicity

The average mathematics scores of the racial/ethnic groups in each participating jurisdiction are presented in table 3.13 for grade 4 and in table 3.14 for grade 8 . At grade 4, average scores were higher in 2003 than in 2000 in all 43 jurisdictions with valid data for White students, 29 out of 35 jurisdictions for Black students, 21 out of 24 jurisdictions for Hispanic students, 9 out of 14 jurisdictions for Asian/ Pacific Islander students, 1 out of 5 jurisdictions for American Indian/Alaska Native students, and 2 out of 2 jurisdictions for students identified as "Other."

At grade 4, average scores were higher in 2003 than in 1992 for White students in all 42 jurisdictions with valid data, for Black students in all 35 jurisdictions with valid data, for Hispanic students in 20 out of 21 jurisdictions, for Asian/Pacific Islander students in all 11 jurisdictions with valid data, for American Indian/

Alaska Native students in 3 out of 5 jurisdictions, and for students identified as "Other" in the 1 jurisdiction with valid data.

Between 2000 and 2003 at grade 8, average scores increased for White students in 25 out of 42 jurisdictions, for Black students in 13 out of 31 jurisdictions, for Hispanic students in 4 out of 22 jurisdictions, for Asian/Pacific Islander students in 2 out of 12 jurisdictions, and for students identified as "Other" in 1 out of 2 jurisdictions.

Between 1990 and 2003 at grade 8, average scores increased for White students in all 37 jurisdictions with valid data, for Black students in 25 out of 29 jurisdictions, for Hispanic students in 12 out of 15 jurisdictions, for Asian/Pacific Islander students in 7 out of 10 jurisdictions, for American Indian/Alaska Native students in 5 out of 7 jurisdictions, and for "Other" students in the 1 jurisdiction with valid data in both years.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }_{2}^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }_{3}^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }_{4}^{3}$ Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000 , due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
Department of Defense Dependents Schools (Overseas)
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

The percentages of students who performed at or above Proficient in the different racial/ethnic subgroups across jurisdictions are presented in tables 3.15 (grade 4) and 3.16 (grade 8). The percentage of fourth-graders performing at or above Proficient increased since 2000 for White students in 41 out of 43 jurisdictions, for Black students in 16 out of 35 jurisdictions, for Hispanic students in 12 out of 24 jurisdictions, for Asian/Pacific Islander students in 6 out of 14 jurisdictions, and for students identified as "Other" in the 2 jurisdictions with valid data.

The percentage of fourth-graders performing at or above Proficient increased between 1992 and 2003 for White students in 41 of 42 jurisdictions, for Black students in 28 of 35 jurisdictions, for Hispanic students in 14 of 21 jurisdictions, for Asian/Pacific Islander students in 10 of 11
jurisdictions, for American Indian/Alaska Native students in 2 out of 5 jurisdictions, and for students identified as "Other" in the 1 jurisdiction with valid data.

The percentage of eighth-graders performing at or above Proficient increased between 2000 and 2003 for White students in 17 out of 42 jurisdictions, for Black students in 5 out of 31 jurisdictions, for Asian/Pacific Islander students in 1 out of 12 jurisdictions, and those classified as "Other" in 1 out of 2 jurisdictions.

The percentage of eighth-grade students performing at or above Proficient increased between 1990 and 2003 for White students in all 37 jurisdictions with valid data, for Black students in 14 out of 29 jurisdictions, for Hispanic students in 11 out of 15 jurisdictions, for Asian/ Pacific Islander students in 5 out of 10 jurisdictions, and for American Indian/ Alaska Native students in 2 out of 7 jurisdictions.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }_{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
\# The estimate rounds to zero
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
2 Department of Defense Domestic Dependent Elementary and Secondary Schools.
3 Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

## Student Eligibility for Free/Reduced-Price School Lunch

NAEP collects data on students' eligibility for federally funded free/reduced-price school lunch as an indicator of family economic status at both the national and jurisdictional levels. Students in Department of Defense overseas schools did not participate in the free/reduced-price lunch program in 2003; therefore, data for that jurisdiction are not available. Tables 3.17 (grade 4) and 3.18 (grade 8) present the 1996-2003 average mathematics score results for participating jurisdictions by students' eligibility for free/reduced-price school lunch.

In 2003, students eligible for free/ reduced-price lunch had lower average scores than did students who were not eligible in all 52 jurisdictions for which data are available at grade 4 and in 51 of the 52 jurisdictions for which data are available at grade 8 .

Since 2000, fourth-grade average scores increased for both those students who were eligible for free/reduced-price lunch and those who were not eligible in 40 out of 42 jurisdictions with valid data. Average scores increased for eligible students in the District of Columbia and for students who were not eligible in Connecticut over the same time period. At grade 4, average scores increased between 1996 and 2003 for both eligible students and students who were not eligible in 44 out of 45 jurisdictions, and for students who were not eligible in North Dakota.

Eighth-grade average scores increased since 2000 for both eligible students and students who were not eligible in 13 out of 41 jurisdictions, for eligible students in 9 jurisdictions, and for students who were not eligible in 8 jurisdictions. At grade 8, average scores were higher in 2003 than in 1996 for eligible students and for students who were not eligible in 22 out of 42 jurisdictions, higher for eligible students in Montana, and higher for students who were not eligible in 10 jurisdictions.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
3 Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1996, 2000, and 2003 Mathematics Assessments.

The percentages of students performing at or above the Proficient level by students' eligibility for free/reduced-price school lunch are presented for participating jurisdictions in tables 3.19 (grade 4) and 3.20 (grade 8). Since 2000, the percentage of fourth-graders performing at or above Proficient has increased both for eligible students and for students who were not eligible in 35 jurisdictions, for eligible students in Tennessee, and for students who were not eligible in 5 jurisdictions. The percentage of fourth-graders performing at or above Proficient increased since 1996 both for eligible students and for students who were not eligible in 43 jurisdictions, for eligible students in the District of Columbia, and for students who were not eligible in Wisconsin.

At grade 8, the percentages of students performing at or above Proficient increased between 2000 and 2003 both for eligible students and for students who were not eligible in 8 jurisdictions, for eligible students in Nevada, and for students who were not eligible in 7 jurisdictions. The percentage of eighth-graders performing at or above Proficient increased since 1996 both for eligible students and for students who were not eligible in 15 jurisdictions, for eligible students in Alabama and Texas, and for students who were not eligible in 10 jurisdictions.

$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }_{3}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

Average Mathematics Scale Scores and Achievement-Level Results for Districts Participating in the Trial Urban District Assessment

This chapter presents the results of the NAEP 2003 Trial Urban District Assessment (TUDA) in mathematics at grades 4 and 8 . TUDA, a special project in NAEP, was instituted in 2002. After discussion among the National Center for Education Statistics (NCES), the National Assessment Governing Board (NAGB), and the leadership of the Council of the Great City Schools, Congress appropriated funds for this district-level assessment in 2001. NAGB passed a resolution approving the selection of five urban districts (Atlanta City School District, City of Chicago School District 299, Houston Independent School District, Los Angeles Unified School District, and New York City Public Schools), all of which voluntarily participated first in the NAEP 2002 reading and writing assessments at grades 4 and 8. ${ }^{1}$

In the second year of the TUDA project, the same five districts plus four more voluntarily participated in the NAEP 2003 reading and mathematics assessments at grades 4 and 8 . The additional districts

[^24]were Boston School District, CharlotteMecklenburg Schools, Cleveland Municipal School District, and San Diego City Unified School District. ${ }^{2}$ Results are also included for the District of Columbia, which has regularly participated in NAEP state-wide assessments and is also reported in the preceding chapters. All the districts met the minimum participation guidelines for reporting results in 2003.

The TUDA sampled only public school students in both years. This chapter displays results only from 2003, the first year that results of the NAEP mathematics assessment were reported by urban districts. In addition, tables in this chapter display results for public school students in the nation as a whole and for public school students in large central cities.
"Large central city" is a geographical term used by NCES for a central city with a population at or above 250,000 . It is not synonymous with "inner city." The Charlotte and Los Angeles districts include schools in locations that do not fit the NCES definition of large central city areas (i.e., urban fringe and rural areas). In those two districts, one-quarter to onethird of the students sampled attended schools that were not in large central cities. ${ }^{3}$

## Scale Score Results for Urban Districts

The NAEP mathematics assessment was the same for the districts in the TUDA as for the states. Average mathematics scores are reported on a $0-500$ scale. The average scores for the districts that participated in the NAEP mathematics assessment in 2003 are displayed in figure 4.1 for grade 4 and figure 4.2 for grade 8 . These figures also show the corresponding results for public school students in the nation and for public school students attending schools located in large central cities. Because the percentage of students excluded from the assessment may vary considerably across districts, comparisons of achievement results should be interpreted with caution. (See tables A. 20 and A. 21 in appendix A for district exclusion rates.)

At grades 4 and 8, students in all participating districts except Charlotte scored lower on average than students in the nation. Students in Charlotte had higher average scores than those in the nation, large central cities, and the other participating districts at both grades 4 and 8 .

At grade 8, students in Charlotte and New York City scored higher on average than students in large central city public schools.
${ }^{2}$ In the remainder of this chapter, the districts participating in the TUDA are referred to as Atlanta, Boston, Charlotte, Chicago, Cleveland, Houston, Los Angeles, New York City, and San Diego, and statements regarding "the districts" include the District of Columbia.
3 Although "central city" data were reported in the 2002 Trial Urban District Assessment reports, the "central city" category is defined differently from "large central city" here.

## Scale Scores by Percentiles for Urban Districts

An examination of the scores at different percentiles on the $0-500$ mathematics scale for each grade can give more detail about the score distribution for districts that participated in 2003, reflecting the performance of lower-, middle-, and higher-performing students.

Table 4.1 shows the 2003 percentile results for participating urban districts at grades 4 and 8 . At grade 4, the score in most districts was lower at the 10th percentile than that of public schools in the nation, except for Charlotte, where the score was higher than in the nation, and in Houston, where no measurable difference from the nation was detected. The scores for all of the districts except Charlotte were lower than those of public schools in the nation at the 25th, 50th, 75th, and 90th percentiles.

At grade 4, the scores at the 10th and 25th percentiles were higher in Charlotte, Houston, and New York City than in large central cities and lower in Atlanta, Chicago, Cleveland, the District of Columbia,
and Los Angeles than in large central cities. The scores at the 50th, 75 th, and 90th percentiles were higher in Charlotte than in large central cities and lower in Boston, Chicago, Cleveland, the District of Columbia, and Los Angeles than in large central cities.

At grade 8 , the score at the 10 th percentile for most urban districts was lower than in the nation, with the exception of Charlotte and Houston, where the score was not found to be measurably different from the nation. At the 25th, 50th, 75th, and 90 th percentiles, the scores for all of the districts except Charlotte were lower than those of public schools in the nation.

At grade 8, the score at the 10th percentile in Charlotte and Houston was higher than in the large central cities; the score in Atlanta, the District of Columbia, and Los Angeles was lower than in the large central cities. The scores at the 75th and 90th percentiles were higher in Charlotte than in large central cities and lower in Atlanta, Chicago, Cleveland, the District of Columbia, Houston, and Los Angeles than in large central cities.

## Achievement-Level Results for Urban Districts

Table 4.2 shows the percentages of students in each participating urban district performing within each achievement level and the percentages of students at or above Basic and at or above Proficient for grades 4 and 8 .

At grade 4, the percentages of students in Charlotte performing at or above Basic, at or above Proficient, and at Advanced were
higher than the corresponding percentages in both large central cities and the nation. The percentages of fourth-graders at or above Basic in Houston and New York City were higher than the percentages in large central cities.

At grade 8, the percentages of students in Charlotte at or above Proficient and at Advanced were higher than the corresponding percentages in both large central cities and the nation.

## Performance of Selected Subgroups for Urban Districts

## Gender

Average mathematics scale scores for male and female fourth- and eighth-grade students in 2003 are displayed in table 4.3. Male students scored higher on average than female students nationally in both grades.

At grade 4, the average scores for both male and female students in Charlotte were higher than those of their counterparts in the nation and in large central cities. Male and female fourth-graders in Atlanta, Boston, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores than their counterparts in large central cities and in the nation.

At grade 8, the average score for both male and female students in Charlotte was higher than the corresponding average score for large central cities. Both male and female eighth-graders in Atlanta,

Chicago, Cleveland, the District of Columbia, and Los Angeles had a lower average score than their counterparts in large central cities and in the nation.

* Significantly different from large central city public schools.
** Significantly different from nation (public schools).
NOTE: NAEP sample sizes have increased in 2003 compared to previous years, resulting in smaller detectable differences than in previous assessments. Significance tests were performed using unrounded numbers.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

The scale score gaps between male and female fourth- and eighth-graders in the participating urban districts are presented in figure 4.3. Numbers marked with asterisks indicate statistically significant differences between the gap recorded in urban districts and those recorded in large
central cities and the nation. Note that these marked numbers can represent a narrower or wider gap than those recorded for comparison groups.

In 2003, male public school students in the nation scored higher on average than female students by 3 points at grade 4 and

2 points at grade 8 . At grade 4 , the score gap between male and female students in the District of Columbia was the reverse of the gap in the nation and large central cities (i.e., female students' average score was apparently higher than that of male students). The score gap between male and female students in Los Angeles was
wider than that in the nation. At grade 8, there was also an inversion of the score difference for male and female students in Atlanta, Boston, and the District of Columbia (i.e., female students' average scores were apparently higher than those of male students).

Figure 4.3 Gaps in average mathematics scores, by gender, grades 4 and 8 public schools: By urban district, 2003

Male average score minus female average score

\# The estimate rounds to zero.

* Significantly different from large central city public schools.
** Significantly different from nation (public schools).
NOTE: NAEP sample sizes have increased in 2003 compared to previous years, resulting in smaller detectable differences than in previous assessments. Score gaps are calculated based on differences between unrounded average scale scores. Significance tests were performed using unrounded numbers. Negative numbers indicate that the average score for male students was lower than the score for female students.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

The percentages of male and female students performing below Basic, at or above Basic, at or above Proficient, and at Advanced at grades 4 and 8 are presented in table 4.4. At grade 4, the percentages of male and female students performing at or above Proficient in public schools nationally were higher than the percentages for all districts except Charlotte, where the percentages of both male and female students at or above Proficient were higher than for the nation. Compared with male and female students in large central city public schools, higher percentages of male and female fourth-grade students in Charlotte performed at or above Proficient.

At grade 8, a higher percentage of male students in Charlotte performed at or above Proficient than in public schools nationally and in large central cities. A higher percentage of female eighth-grade students in Charlotte and New York City performed at or above Proficient than did students in large central city public schools. The percentages of male and female students at or above Proficient were lower in Atlanta, Chicago, Cleveland, the District of Columbia, Houston, and Los Angeles than in large central city public schools.

## Race/Ethnicity

Average scale scores by race/ethnicity for grades 4 and 8 in urban districts are displayed in table 4.5. In each of the urban districts assessed, Black students and/or Hispanic students constitute the majority or the largest racial/ethnic public school sample groups (see table B. 17 in appendix B). This distribution differs from that for the national public school sample, in which White students constitute a majority- 58 percent of the fourth-grade sample and 62 percent of the eighth-grade sample.

At grade 4, the average scale score for White students in Charlotte, the District of Columbia, and Houston; Black students in Charlotte and Houston; and Hispanic students in Charlotte and Houston was higher than the corresponding scores in large central cities and the nation. The average score for Black students in Boston and New York City was higher than that in large central cities. The average scores for fourth-grade White students in Boston, Chicago, and Cleveland; Black students in Chicago and the District of Columbia; and Hispanic students in Boston, the District
of Columbia, Los Angeles, and San Diego were lower than the corresponding scores in large central cities and in the nation.

At grade 8, the average scale score was higher for White students in Charlotte and Houston; Black students in Charlotte and Houston; and Asian/Pacific Islander students in Boston than the correspond-
ing scores in large central cities and the nation. The average score for eighth-grade White students in Cleveland; Black students in Atlanta, the District of Columbia, and Los Angeles; and Hispanic students in the District of Columbia, Los Angeles, and San Diego was lower than the corresponding scores in large central cities and the nation.

[^26]The average score gaps in 2003 between White students and Black students and between White students and Hispanic students are presented in figure 4.4. Numbers marked with asterisks indicate statistical differences between the gaps recorded in urban districts and those recorded in large central cities and the nation. Note that these marked numbers can represent narrower or wider gaps than those recorded for the comparison group.

At grade 4, the gap between White students and Black students in Boston and New York City was narrower than that in large central cities; the gap in Atlanta and the District of Columbia was wider than the gap between White students and Black students in large central cities. The gap between White students and Hispanic
students was wider in the District of Columbia than the gap in large central cities.

At grade 8, the gap between White students and Black students in Cleveland was narrower than the gap in large central cities, and the gap in Atlanta and Charlotte was wider than the gap between White students and Black students in large central cities. The gap between White students and Hispanic students for eighthgraders was wider in Boston and San Diego than in large central cities. In Chicago, the gap between White students and Hispanic students was narrower than that in large central cities and the nation; this gap was wider in Charlotte than in the nation.

* Significantly different from large central city public schools.
** Significantly different from nation (public schools).
NOTE: NAEP sample sizes have increased in 2003 compared to previous years, resulting in smaller detectable differences than in previous assessments. Score gaps are calculated based on differences between unrounded average scale scores. Significance tests were performed using unrounded numbers.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

Mathematics achievement-level results for racial/ethnic subgroups are presented in table 4.6. At grade 4, the percentage of students performing at or above Proficient was higher for White students in Atlanta, Charlotte, the District of Columbia, and Houston; Black students in Charlotte and New York City; and Hispanic students in Charlotte than the corresponding percentage in large central cities. The percentage of fourth-grade students performing at or above Proficient was lower for White students in Boston, Chicago, and Cleveland; Black students in Chicago, Cleveland, and the District of Columbia; and Hispanic students in Boston, the District of Columbia, Los Angeles, and San Diego than the
corresponding percentage in large central cities.

At grade 8, the percentage of students at or above Proficient was higher for White students in Atlanta, Boston, Charlotte, and Houston and for Black students in Charlotte and New York City than that of their counterparts in large central cities. The percentage of eighth-grade students at or above Proficient for White students in Cleveland; Black students in Atlanta, the District of Columbia, and Los Angeles; and Hispanic students in Boston, the District of Columbia, Los Angeles, and San Diego was lower than the corresponding percentage in large central cities.

## Students' Eligibility for Free/Reduced-Price

## School Lunch

Table 4.7 displays the average scale scores for public school students in the nation, large central cities, and the participating urban districts by free/reduced-price lunch eligibility. Note that Cleveland chose to define all of its students as eligible for the lunch program. (See table B. 18 in appendix B for the percentages of
students by eligibility status.) At grade 4, the average score for students eligible for free/reduced-price lunch in Charlotte was higher than the average score for large central cities and the nation. The average score for eligible students in Houston and New York City was higher than in large central cities. The average score for eligible students in Atlanta, Chicago, the District of Columbia, and Los Angeles was
lower than the average score for eligible students in large central cities and the nation.

At grade 8, the average score for students who were eligible for free/reducedprice lunch in Boston, Houston, and New

York City was higher than the average score for large central cities. The average score for eligible students in Atlanta, the District of Columbia, and Los Angeles was lower than the average score in large central cities and the nation.

Figure 4.5 displays the gap in the average scores between students who were eligible for free/reduced-price lunch and those who were not eligible in the urban districts. In 2003, public school students in the nation who were not eligible for free/ reduced-price lunch scored higher on average than eligible students by 23 points at grade 4 , and by 28 points at grade 8 .

At grade 4, the gaps in Boston and Houston were narrower than the nation's. At grade 8, the District of Columbia, Houston, and Los Angeles had narrower score gaps than large central cities and the nation, while Charlotte had a wider gap in the average score than the gaps found in large central cities and in the nation.

Score gaps are calculated based on differences between unrounded average scale scores. Significance tests were performed using unrounded numbers. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

Achievement-level results by eligibility for free/reduced-price lunch for grades 4 and 8 are shown in table 4.8. At grade 4, the percentage of students eligible for free/reduced-price school lunch who performed at or above Proficient was higher in Charlotte and New York City than in large central cities. The percentage of eligible students at or above Proficient was lower in Atlanta, Chicago, the District of Columbia, and Los Angeles
than in large central cities and the nation.
At grade 8, the percentage of students eligible for free/reduced-price lunch who performed at or above Proficient was higher in Boston and New York City than in large central cities, and higher in New York City than in the nation. The percentage of eligible students at or above Proficient was lower in Atlanta, Cleveland, the District of Columbia, and Los Angeles than in large central cities and the nation.

## Student-Reported Highest Level of Parents' Education

Eighth-grade students who participated in the NAEP 2003 mathematics assessment, including those in the TUDA, were asked to indicate, from among five options, the highest level of education completed by each parent. The percentage of eighthgrade public school students who reported at least one parent had graduated from college was 45 percent nationally, 38 percent in large central cities, and ranged from 24 to 55 percent in the participating districts. (See table B. 19 in appendix B.)

Table 4.9 displays the average score for eighth-graders who chose each category as the highest level of education for either parent. In 2003, the average score for students who indicated that a parent graduated from college was lower in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles than the average score for students in the same parental education category in public schools in large central cities and the nation. The average score for students who reported that a parent graduated from college was higher in Charlotte and San Diego than for comparable students in large central cities across the nation.

Table 4.9 Average mathematics scale scores, by student-reported parents' highest level of education, grade 8 public schools: By urban district, 2003

| Grade 8 | Less than <br> high school | Graduated <br> high school | Some education <br> after high school | Graduated <br> college | Unknown |

| San Diego | $250^{* *}$ | $256^{* *}$ | $270^{* *}$ | $278^{*, * *}$ | $249^{* *}$ |

[^28]Table 4.10 displays achievement-level results by the student's report of the highest level of education for either parent for eighth-grade students in the urban districts. In 2003, the percentage of students performing at or above Proficient who indicated that at least one parent had graduated from high school was not found to be significantly different for Charlotte and New York City than for the nation. The percentage of students at or above Proficient in this category was lower for all other urban districts than the percentage for the nation.

Among students who reported that a parent graduated from college, the percentage of students performing at or above Proficient was higher in Charlotte and San Diego than for comparable students in large central cities across the nation. In this same category, the percentages of students performing at or above Proficient in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles were lower than in large central cities.

## Sample Assessment Questions

## and Student Responses

This chapter presents sample questions and examples of student responses from the NAEP 2003 mathematics assessment. Six representative questions, including both multiple-choice and constructed-response questions, are provided for each grade. For each question, the content area and mathematical ability being assessed, as described in the framework, along with a brief commentary and the scale score indicating where the question falls on the NAEP item map, are given at the end of this chapter. For multiple-choice questions, the oval corresponding to the correct answer is filled in. Constructed-response questions are accompanied by scoring guides with the correct answer, a summary of the scoring criteria for each response level, and sample student responses with assigned scores and brief commentary. The student responses presented in this chapter were selected to illustrate how questions were scored. Additional questions, as well as student performance data, detailed scoring guides, and sample student responses from the current and previous NAEP assessments, are available on the NAEP web site (http:// nces.ed.gov/nationsreportcard/itmrls).
To indicate how students performed on the sample questions, each question included in this chapter is accompanied by a table presenting two types of performance data: (a) the overall percentage of students who answered successfully and (b) the percentage of students who answered successfully within specific score ranges on the NAEP mathematics scale. The score ranges correspond to the three achievement-level intervals-

Basic, Proficient, and Advanced-as well as the range below Basic.

The sample questions are also marked on the item maps at the end of this chapter. The location of each four-option multiple-choice question on the item map represents the average scale score of students who had a 74 percent probability of answering the question correctly. The location of each five-option multiplechoice question represents the average score of students who had a 72 percent probability of answering the question correctly. The location on the item map of each constructed-response question
represents the average scale score of students who had a 65 percent probability of receiving the score level being mapped.

## Grade 4 Sample Assessment Questions and Results

Sample questions from the fourth-grade mathematics assessment include four multiple-choice questions, one short constructed-response question, and one extended constructed-response question. Information about the content area and mathematical ability for each question shows where the question fits into the NAEP mathematics framework.

## Grade 4

Sample Question 1 (multiple-choice)
In sample question 1, students were asked to add two 3-digit numbers. Students are expected to be able to compute with numbers at each grade level assessed by NAEP. Some questions, such as this one, are administered in a block that does not permit calculator use. For this question, students are instructed to add; however, for other questions, presented in the context of a story problem, students must decide whether to add, subtract, multiply, or divide. Computation exercises are presented in both calculator and noncalculator blocks. This question was easy for the students, with 89 percent of fourth-graders choosing the correct answer. This question appears on the item map at scale score 172.

In sample question 2, students were asked to locate two points on a coordinate grid. By the fourth grade, students are beginning to learn how to plot points such as $(2,5)$ on a grid. However, their experience in plotting points is limited and they may need to be reminded that the first number in a pair is plotted along the horizontal axis and the second number is its location along the vertical axis. So, for this question, the location of $(2,5)$ is given and the student is asked to locate two other points. It is important that students learn how to plot points because, in later years, they will be graphing equations and investigating relationships between numbers in scatterplots. Answers to this question were scored either as "Correct" (both points were located correctly), "Partial" (only one of the two points was located correctly), or "Incorrect." This question was of moderate difficulty for the students, with 71 percent of fourthgrade responses scored as "Partial" or better and 44 percent of fourth-grade responses scored as "Correct." This question appears on the item map at scale score 265 for students whose response was scored as "Correct."

A point is shown on the grid below. The coordinates of the point are $(2,5)$.

First Number
On the same grid draw the point with coordinates $(4,7)$ and the point with coordinates $(8,0)$.

## Sample "Correct" Response

The following sample response was scored as "Correct" because the points $(8,0)$ and $(4,7)$ were both plotted correctly.

A point is shown on the grid below. The coordinates of the point are $(2,5)$.

First Number
On the same grid draw the point with coordinates $(4,7)$ and the point with coordinates $(8,0)$.

In sample question 3, students were asked to interpret information presented in a pie chart and use this information to solve a problem. This question required students to bring together reasoning skills and problem-solving strategies. Students at the fourth-grade level have worked with various representations of data, including pictographs, bar graphs, pie charts, and line graphs. For this question, the student first needed to recognize that the two hours spent on mathematics accounted for $1 / 4$ of the time spent on homework. The student then needed to use this information to determine that the total amount of time spent on homework was eight hours. Fourth-grade students could arrive at this answer using informal reasoning skills and knowledge of fractional parts. This question was of moderate difficulty for the students, with 51 percent of fourth-graders choosing the correct answer. This question appears on the item map at scale score 268.

The pie chart above shows the portion of time Pat spent on homework in each subject last week. If Pat spent 2 hours on mathematics, about how many hours did Pat spend on homework altogether?
(A) 4

- 8
(C) 12
(D) 16

## Grade 4

## Sample Question 4 (multiple-choice)

In sample question 4, students were asked to determine the length of one side of a square given the perimeter. Students at the fourth-grade level have been taught properties of common geometric figures, including how to find the perimeter. To solve this problem, the student needed to know that a square has 4 sides of equal length. In order for the perimeter to be 36 inches, each side must be $36 \div 4=9$ inches long. This question was somewhat difficult for the students, with 47 percent of fourth-graders choosing the correct answer. This question appears on the item map at scale score 273.

The perimeter of a square is 36 inches. What is the length of one side of the square?
(A) 4 inches
(B) 6 inches

- 9 inches
(D) 18 inches

## Grade 4

## Sample Question 5 (multiple-choice)

In sample question 5, students were asked to solve an inequality involving whole numbers. In the early grades, students begin to have informal experiences with algebraic thinking. For example, there is an emphasis on "completing number sentences" instead of "solving equations." The inequality in this question involves subtraction. Although this increases the difficulty of the question, students could obtain the correct answer by "testing" the values given in the answer choices. In this question, it was important for the student to know that the value 5 , for which $8-\square=3$, is not part of the correct answer. This question was difficult for the students, with 24 percent of fourthgraders choosing the correct answer. This question appears on the item map at scale score 290.

What are all the whole numbers that make $8-\square>3$ true?

$$
\begin{aligned}
& \text { (A) } 0,1,2,3,4,5 \\

In sample question 6, students were asked to demonstrate an understanding of equivalent fractions in the context of a pictorial representation of the fractions. In the early grades, students begin to develop an understanding of fractions by relating them to various models. For example, each of the models below can be used to represent $1 / 3$.

This question uses a shaded-region model in which three rectangular regions of equal length are divided into 6 equal parts, 2 equal parts, and 10 equal parts, respectively. Students are told that the first fraction strip shows 3/6 and are asked what fraction the other strips show. The expected answers are $1 / 2$ and $5 / 10$. By asking, "What do the fractions shown in $A, B$, and $C$ have in common?" the question assesses students' understanding of equivalent fractions. Students are also asked to shade two other strips to represent different fractions that are equivalent to the ones shown.

Five responses were required for this question: (1) part B, (2) part C, (3) what the fractions have in common, (4) the first fraction strip to be shaded, and (5) the second fraction strip to be shaded. Answers to this question were scored as "Extended" (all five responses were correct), "Satisfactory" (any four responses were correct), "Partial" (any three responses were correct), "Minimal" (any one or two responses were correct), or "Incorrect." This question was difficult for the students, with 30 percent of fourth-grade responses scored as "Satisfactory" or better and only 19 percent of fourth-grade responses scored as "Extended." This question appears on the item map at scale score 293 for students whose response was scored as "Extended."

The shaded part of each strip below shows a fraction.

This fraction strip shows $\frac{3}{6}$.

The shaded part of each strip below shows a fraction.
A.

This fraction strip shows $\frac{3}{6}$.
B.

What fraction does this fraction strip show?

What fraction does this fraction strip show?

What do the fractions shown in $A, B$, and $C$ have in common?

Shade in the fraction strips below to show two different fractions that are equivalent to the ones shown in $A, B$, and C .

## Grade 8 Sample Assessment Questions and Results

Sample questions from the eighth-grade mathematics assessment include four multiple-choice questions, one short constructed-response question, and one
extended constructed-response question. Information about the content area and mathematical ability for each question shows where the question fits into the NAEP mathematics framework.

## Grade 8

## Sample Question 7 (short constructed-response)

In sample question 7, students were asked to divide a three-digit number by a two-digit number. Students are expected to be able to compute with numbers at each grade level assessed by NAEP. By the eighth grade, students are expected to be able to carry out long division. This sample question is presented in a constructed-response format because, as a multiple-choice question, students could use the choices and work backwards by multiplying to find the answer. This question was in a block that did not permit calculator use; however, other questions in both calculator and noncalculator blocks require significant computing in problem-solving situations. Unlike this sample question-which does not provide a context and specifies the method of computation to be used-other NAEP exercises involve situations that require the students to determine exactly which computation operations need to be employed to reach a solution. This question was scored as either "Correct" or "Incorrect" and was fairly easy for the students, with 73 percent of eighthgraders providing the correct answer. This question appears on the item map at scale score 252 for students whose response was scored as "Correct."

Divide: $2 1 \longdiv { 5 0 4 }$

## Sample "Correct" Response

The following sample response was scored as "Correct" because the correct answer is 24 . Although this response contains complete work for the long division and for checking the answer by multiplying, checking the answer was not required for a "Correct" response.

Divide: $2 1 \longdiv { 5 0 4 }$
$\qquad$

## 24

Answer:

## Grade 8

## Sample Question 8 (multiple-choice)

In sample question 8 , students were asked to identify a value of $x$ that satisfie a given inequality condition. Algebraic concepts are included in the mathematics curriculum before eighth grade. In fact, more than 50 percent of eighthgrade students are enrolled in algebra or prealgebra at the time they take the NAEP assessment. This sample question uses the variable $x$ in the expression $x+2$. The student is asked to identify a value of $x$ that would make $x+2$ less than 12. Of the choices listed, only 8 is a value that satisfies this condition. This question was fairly easy for the students, with 77 percent of eighth-graders choosing the correct answer. This question appears on the item map at scale score 262.

If the value of the expression $x+2$ is less than 12 , which of the following could be a value of $x$ ?

| (4) | 16 |
| :--- | ---: |
| (B) | 14 |

| 52 | 95 | 99 |  |

[^31]In sample question 9, students were asked to identify an algebraic expression that represents the average of three different values. This question illustrates how a question can address multiple NAEP content areas-in this case both "Data Analysis, Statistics, and Probability" and "Algebra and Functions." At the eighth-grade level, students begin to have experience with variables and formal algebraic representation. Translating between verbal and symbolic statements is an important skill for further mathematics study. This question was of moderate difficulty for the students, with 58 percent of eighth-graders choosing the correct answer. This question appears on the item map at scale score 292.

Tetsu rides his bicycle $x$ miles the first day, $y$ miles the second day, and $z$ miles the third day. Which of the following expressions represents the average number of miles per day that Tetsu travels?

$$
\begin{aligned}
& \text { (A) } x+y+z \\
& \text { (B) } x y z \\
& \text { © } 3(x+y+z) \\
& \text { (1) } 3(x y z) \\

In sample question 10, students were asked to use information given in a figure to find the degree measure of $\angle A B C$ in a triangle. The question itself uses few words, but the problem-solving process requires students to use what they know about angles related to a triangle to find a missing angle measure. The expected solution involves finding the measure of $\angle A C B$. This angle measure is $180^{\circ}-135^{\circ}$, or $45^{\circ}$. Because the sum of the degree measures of all angles in a triangle is $180^{\circ}$, the measure of $\angle A B C$ is $180^{\circ}-25^{\circ}-45^{\circ}$, or $110^{\circ}$. Students who have a deeper understanding of geometry may recognize that the measure of the external angle $\left(135^{\circ}\right)$ is the sum of $25^{\circ}$ and the measure of the angle of interest. However, eighth-grade students are not expected to know this relationship. This question was difficult for the students, with 33 percent of eighth-graders choosing the correct answer. This question appears on the item map at scale score 334.

In the triangle, what is the degree measure of $\angle A B C$ ?

| (A) | 45 |

## Sample Question 11 (multiple-choice)

In sample question 11, students were asked to reason using a scale along a line. To answer this question, the student could observe that there were 4 equal intervals along the line representing a distance of 60 miles, so each interval represented 15 miles. The student could then conclude that the total distance from Bay City to Yardville, which was represented by 7 equal intervals along the line, was 105 miles. Proportional reasoning of this type is an important concept in mathematics. This question was difficult for the students, with 39 percent of eighth-graders choosing the correct answer. This question appears on the item map at scale score 340.

On the road shown above, the distance from Bay City to Exton is 60 miles. What is the distance from Bay City to Yardville?
(A) 45 miles
(B) 75 miles
© 90 miles

- 105 miles

Table 5.11 Percentage scored correct for multiple-choice sample question 11, by achievement-level range, grade 8: 2003

[^34]In sample question 12, students were asked to draw and explain three different ways to divide an L-shaped region to determine the area. The areas of some geometric figures cannot be calculated directly, but the figures can be partitioned into simpler figures whose areas can be easily determined. One way to partition the hallway is shown and the corresponding area is $50+35=85$. Students are asked to show 3 other ways the hallway can be divided and, for each of these, to show how the area can be calculated. Although units are not given for this question, other questions specify units such as inches or centimeters. Answers to this question were scored as "Extended" (three figures were divided correctly with no incorrect labels and three correct expressions for area), "Satisfactory" (three figures were divided correctly with no incorrect labels and two correct expressions for area), "Partial" (two figures were divided correctly with no incorrect labels and one or two correct expressions for the area of those figures, or three figures divided correctly with no incorrect labels and one correct expression for area), "Minimal" (one figure divided correctly with no incorrect labels and correct expression for the area of that figure, or two or three figures divided correctly with no incorrect labels and no correct-or missing-expressions for the area of the figures), or "Incorrect." This question was very difficult for the students, with only 10 percent of eighth-grade responses scored as "Satisfactory" or better and only 6 percent of eighth-grade responses scored as "Extended." This question appears on the item map at scale score 417 for students whose responses were scored as "Extended."

10

Ted wants to purchase floor covering for the hallway shown above. He knows there are many ways to find the area of the hallway. One way is to divide the hallway into the sections shown below and then add together the area of each section.

```
Area of Hallway \(=\) Area of Region I + Area of Region II
    Area \(=(5 \times 10)+(7 \times 5)\)
```

Use the figures below to show 3 other ways that Ted can divide the hallway to find its area. Below each figure explain what numbers and operations Ted could use to calculate the area.

## Sample "Extended" Response

The following sample response was scored as "Extended" because the three figures were divided correctly and the expressions for computing the areas associated with each figure were correct.

$$
35+50=85
$$

$(5 \times 12)+(5 \times 5)$
$=25+60$
$=85$
$(5 \times 5)^{\frac{5}{(5 \times 6)}(5 \times 6)}$

$$
25+60
$$

$(7 \times 5)+(5 \times 5)+(5 \times 5)$
$=85$
$=35+50=85$

Maps of Selected Item Descriptions on the NAEP Mathematics Scale-Grades 4 and 8
Item maps show particular items at the position along the NAEP mathematics scale where the items are likely to be successfully answered by students who attained that score or higher. ${ }^{1}$ The descriptions focus on the mathematics skills or abilities needed to answer the questions. For multiple-choice questions, the description indicates the skill or knowledge demonstrated when students select the correct option. For constructed-response questions, the description reflects the skill or knowledge specified by different levels of the scoring criteria for that question.

For each description on the map, students whose average scale scores fell above the corresponding scale point had a higher probability of successfully answering the question; students whose average scale scores fell below that scale point had a lower probability of successfully answer-
ing that question. For the purpose of mapping each question, the probability level was set at 65 percent for constructedresponse questions and 74 percent for multiple-choice questions. ${ }^{2}$ For example, when a multiple-choice question like the fourth-grade sample question 1 in figure 5.1 maps at 172 on the scale, fourth-grade students with an average score of 172 or more have at least a 74 percent chance of answering this question correctly. In other words, out of a sample of 100 students whose average score was at or above 172 , at least 74 would be expected to have answered this question correctly. Students who score above the scale point have a higher probability of successfully answering the question; however, it does not mean that every student at or above 172 always answered this question correctly, nor does it mean that students below 172 always answered the question incorrectly.

1 For details on the procedures used to develop item maps, see Allen, N. L., Donoghue, J. R., and Schoeps, T. L. (2001). The NAEP 1998 Technical Report (NCES 2001-509). Washington, DC: U.S. Department of Education, Office of Educational Research and Improvement, National Center for Education Statistics.
2 The probability convention is set higher for multiple-choice questions to correct for the possibility of answering correctly by guessing.

## Appendix A

## Overview of Procedures Used for the NAEP 2003 Mathematics Assessment

This appendix provides an overview of the NAEP 2003 mathematics assessment's primary components framework, development, administration, scoring, and analysis. A more extensive review of the procedures and methods used in the mathematics assessment will be included in the assessment procedure section of the NAEP web site (http://nces.ed.gov/nationsreportcard).

The NAEP 2003 Mathematics Assessment
The National Assessment Governing Board (NAGB), created by Congress in 1988, is responsible for formulating policy for NAEP. NAGB is specifically charged with developing assessment objectives and test specifications. The mathematics framework used for the 2003 assessment had its origins in a framework developed for the 1990 mathematics assessment under contract with the Council of Chief State School Officers (CCSSO). The CCSSO project considered objectives and frameworks for mathematics instruction at the state, district, and school levels. The project also examined curricular frameworks on which previous NAEP assessments were based, consulted with leaders in mathematics education, and considered a draft version of the National Council of Teachers of Mathematics (NCTM) Curriculum and Evaluation Standards for School Mathematics. ${ }^{1}$ This project resulted in a

[^37]"content-by-ability" matrix design used to guide both the NAEP 1990 and 1992 mathematics assessments. The design was reported in Mathematics Objectives: 1990 Assessment. ${ }^{2}$

Prior to 1990, mathematics was assessed based on an earlier framework, which also was used to develop NAEP long-term trend assessments. Because the long-term trend assessments all use the same test booklets, it is possible to compare students' performance across many assessment years. However, the NAEP main mathematics assessment that was administered in 2003 is comparable only to the other assessments based on the 1990 framework-1990, 1992, 1996, and 2000.

The 1996 assessment was based on the first update of the NAEP 1990 mathematics framework since the release of the NCTM Curriculum and Evaluation Standards for School Mathematics in 1989. ${ }^{3}$ This update was conducted by the College Board and reflected refinements in the earlier framework specifications, while ensuring comparability of results across the 1990, 1992, and 1996 assessments. Since the 2003 framework is the same as the 1996 update, the assessment results from 1990 to 2003 can be compared. The refinements that distinguish the framework used in the 1996, 2000, and 2003 assessments from the assessments conducted in 1990 and 1992 include the following:

- moving away from the rigid content-byability matrix (forcing items to be classified in cells of a matrix limited the possibility of assessing students' ability to reason in rich problem-solving situations and to make connections among the content areas);
- including the three achievement
levels-Basic, Proficient, and Advanceddescribed in chapter 1 of this report;
- allowing individual questions to be classified in more than one content area (since the option to classify questions in more than one content area provides greater opportunity to measure student ability in content settings that more closely approximate realworld situations);
- including the mathematics ability categories (conceptual understanding, procedural understanding, and problem solving) as well as the process goals (reasoning, communication, and connections) from the NCTM standards;
- including more constructed-response questions in the 1996, 2000, and 2003 assessments than were included in 1990 and 1992; and
- revisiting some of the content areas to make sure they reflect recent curricular emphases.
Figure A. 1 describes the five content areas that constitute the NAEP mathematics assessment. These content areas apply to each of the three grades assessed by NAEP. The questions designed to test the various content areas at a particular grade level tend to reflect the expectations normally associated with instruction at that grade level.

[^38]Figure A. 1 Descriptions of the five NAEP mathematics content areas
Number Sense,
Properties, and
Operations

## Measurement

Geometry and Spatial Sense

Data Analysis, Statistics, and Probability

This content area focuses on students' understanding of numbers (whole numbers, fractions, decimals, integers, real numbers, and complex numbers), operations, and estimation, and their application to real-world situations. At grade 4, the emphasis is on the development of number sense through connecting various models to their numerical representations, and an understanding of the meaning of addition, subtraction, multiplication, and division. At grade 8, number sense is extended to include positive and negative numbers, as well as properties and operations involving whole numbers, fractions, decimals, integers, and rational numbers.

This content area focuses on an understanding of the process of measurement and the use of numbers and measures to describe and compare mathematical and real-world objects. Students are asked to identify attributes, select appropriate units and tools, apply measurement concepts, and communicate measurement-related ideas. At grade 4, the focus is on time, money, temperature, length, perimeter, area, capacity, weight/mass, and angle measure. At grade 8, this content area includes these measurement concepts, but the focus shifts to more complex measurement problems that involve volume or surface area or that require students to combine shapes and to translate and apply measures. Eighth-grade students also solve problems involving proportional thinking (such as scale drawing or map reading) and do applications that involve the use of complex measurement formulas.

This content area is designed to extend beyond low-level identification of geometric shapes to include transformations and combinations of those shapes. Informal constructions and demonstrations (including drawing representations) along with their justifications take precedence over more traditional types of compass-and-straightedge constructions and proofs. At grade 4, students are asked to model properties of shapes under simple combinations and transformations, and to use mathematical communication skills to draw figures from verbal descriptions. At grade 8, students are asked to expand their understanding to include properties of angles and polygons. They are also asked to apply reasoning skills to make and validate conjectures about transformations and combinations of shapes.

This content area emphasizes the appropriate methods for gathering data, the visual exploration of data, various ways of representing data, and the development and evaluation of arguments based on data analysis. At grade 4, students are asked to apply their understanding of numbers and quantities by solving problems that involve data. Fourth graders are asked to interact with a variety of graphs, to make predictions from data and explain their reasoning, to deal informally with measures of central tendency, and to use the basic concepts of chance in meaningful contexts. At grade 8, students are asked to analyze statistical claims and to design experiments, and they are asked to use simulations to model real-world situations. This content area focuses on eighth graders' basic understanding of sampling, their ability to make predictions based on experiments or data, and their ability to use some formal terminology related to probability, data analysis, and statistics.

This content area extends from work with simple patterns at grade 4 to basic algebra concepts at grade 8. The grade 4 assessment involves informal demonstration of students' abilities to generalize from patterns, including the justification of their generalizations. Students are expected to translate between mathematical representations, to use simple equations, and to do basic graphing. At grade 8, the assessment includes more algebraic notation, stressing the meaning of variables and an informal understanding of the use of symbolic representations in problem-solving contexts. Students are asked to use variables to represent a rule underlying a pattern. Eighth graders are asked to demonstrate a beginning understanding of equations and functions and the ability to solve simple equations and inequalities.

[^39]The assessment framework specifies not only the particular areas that should be assessed, but also the percentage of the assessment questions that should be devoted to each of the content areas. The target percentage distribution for content areas as specified in the framework is presented in table A.1. The distribution of items among the content areas is a critical feature of the assessment design, since it reflects the relative importance and value given to each.

The target percentages at eighth grade differ from those at fourth grade because of a shift in curricular emphasis. For example, in grade 4 there is more emphasis on number sense, properties, and operations than on algebra and functions. In grade 8 , the percentage of algebra and functions items increases, and the percentage of number sense, properties, and operations items decreases. The actual content of the assessment is close to the targeted distribution.

Table A. 1 Target percentage distribution of items, by content area and grade: 1990-2003

| Grades $\mathbf{4}$ and $\mathbf{8}$ | Grade $\mathbf{4}$ |  | Grade $\mathbf{8}$ |  |
| ---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1 9 9 0}$ and 1992 | $\mathbf{1 9 9 6 - 2 0 0 3}$ | $\mathbf{1 9 9 0}$ and 1992 | $\mathbf{1 9 9 6 - 2 0 0 3}$ |

## The Assessment Design

Each student who participated in the NAEP 2003 mathematics assessment received a booklet containing four sections: two sets of cognitive questions, a set of general background questions, and a set of subject-specific background questions. Assessments for each grade consisted of 10 sets of cognitive questions or "blocks." Some items from the 1990, 1992, 1996, and 2000 assessments were carried forward to 2003 to allow for the measurement of trends across time. Two new blocks were developed for the 2003 assessment as specified by the updated framework.

Three types of questions are used in the assessment: multiple-choice, short constructed-response, and extended constructed-response. Table A. 2 shows the distribution of questions administered from 1990 to 2003 by type for each grade level. The total number of questions administered has varied somewhat across the assessment years due to the inclusion of special study blocks in certain years. The number of questions used in the main scaling, however, has remained relatively consistent.

Table A. 2 Distribution of questions administered, by question type and grade: 1990-2003

| Grades 4 and 8 | Grade 4 |  |  |  |  | Grade 8 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1990 | 1992 | 1996 | 2000 | 2003 | 1990 | 1992 | 1996 | 2000 | 2003 |
| Multiple-choice | 102 | 99 | 81 | 87 | 114 | 149 | 118 | 102 | 100 | 129 |
| Short constructed-response | 41 | 59 | 64 | 50 | 59 | 42 | 65 | 69 | 51 | 58 |
| Extended constructed-response | $\dagger$ | 5 | 13 | 8 | 8 | $\dagger$ | 6 | 12 | 9 | 10 |
| Total | 143 | 163 | 158 | 145 | 181 | 191 | 189 | 183 | 160 | 197 |

${ }^{\dagger}$ Not applicable. No extended constructed-response questions were included in the 1990 assessment.
NOTE: Short constructed-response questions included in the 1990 and 1992 assessments were scored dichotomously. New short constructed-response questions included in the 1996, 2000, and 2003 assessments were scored to allow for partial credit.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1990, 1992, 1996, 2000, and 2003 Mathematics Assessments.

The assessment design allowed maximum coverage of mathematics abilities at each grade, while minimizing the time burden for any one student. This was accomplished through the use of matrix sampling of items in which representative samples of students took various portions of the entire pool of assessment questions. Individual students are required to take only a small portion of the assessment, but the aggregate results across the entire assessment allow broad reporting of mathematics abilities for the targeted population.

In addition to matrix sampling, the assessment design used a procedure for distributing blocks across booklets that controlled for position and context effects. Students received different blocks of questions in their booklets according to a procedure that assigned blocks of questions balancing the positioning of blocks across booklets and balancing the pairing of blocks within booklets. Also, every block of questions was paired with every other block. The procedure also cycles the booklets for administration so that, typically, only a few students in any assessment session receive the same booklet.

In addition to the student assessment booklets, three other instruments provided data relating to the assessment: a teacher questionnaire, a school questionnaire, and a questionnaire for students with disabilities (SD) and limited-Englishproficient (LEP) students. The teacher questionnaire was administered to the mathematics teachers of the fourth- and eighth-grade students participating in the assessment. The questionnaire took approximately 20 minutes to complete and focused on the teacher's general background and experience, the teacher's background related to mathematics, and classroom information about mathematics instruction.

The school questionnaire was given to the principal or other administrator in each participating school and took about 20 minutes to complete. The questions asked about school policies, programs, facilities, and the demographic composition and background of the students and teachers at the school.

The SD/LEP questionnaire was completed by a school staff member knowledgeable about those students selected to participate in the assessment who were identified as having an Individualized Education Program (IEP) or equivalent plan (for reasons other than being gifted
or talented) or having limited English proficiency. An SD/LEP questionnaire was completed for each identified student regardless of whether the student participated in the assessment. Each SD/LEP questionnaire took approximately three minutes to complete and asked about the student and the specialeducation programs in which he or she participated.

## NAEP Samples

## National Sample

The national results presented in this report are based on nationally representative probability samples of fourth- and eighth-grade students. The 2003 national sample consisted of the combined sample of public-school students assessed in each state and an additional nonpublic school sample. This represents a change from earlier assessments in which the national and state samples were independent. The combined sample was chosen using a stratified two-stage design that involved sampling students from selected schools (public and nonpublic).

Each selected school that participated in the assessment and each student assessed represents a portion of the population of interest. Sampling weights are needed to make valid inferences between the student samples and the respective populations from which they were drawn. Sampling weights account for disproportionate representation of students from different states and for students who attend nonpublic schools. Sampling weights also account for lower sampling rates for very small schools and are used to adjust for school and student nonresponse. ${ }^{4}$

Unlike the 1996 and 2000 national assessments, which featured the collection of data from samples of students where assessment accommodations for special-needs students were not permitted and from samples of students where accommodations for special-needs students were permitted, the 2003 national assessment has only samples of students where accommodations were permitted. (See page 175 for information on the types of accommodations permitted.) NAEP inclusion rules were applied and accommodations were offered when a student had an Individualized Education Program (IEP) indicating the need for accommodation because of a disability, was protected under Section 504 of the Rehabilitation Act of 1973 because of disability (SD), was identified as being a limited-English-proficient student (LEP), and/or was normally offered accommodations in other assessment situations. ${ }^{5}$ All other students were asked to participate in the assessment under standard conditions. Prior to 1996, testing accommodations (e.g., extended time, small group testing) were not permitted for specialneeds students selected to participate in the NAEP mathematics assessments.

Table A. 3 shows the number of students included in the national samples for the NAEP mathematics assessments at grades 4 and 8. The 2003 mathematics assessment had only one sample of students, for whom accommodations were permitted. For the 1996 and 2000 assessments, the table shows both the number of students in the sample in which accommodations were not permitted and

4 Additional details regarding the design and structure of the national and state samples will be included in the technical documentation section of the NAEP web site (http://nces.ed.gov/nationsreportcard).
5 Section 504 of the Rehabilitation Act of 1973 is a civil rights law designed to prohibit discrimination on the basis of disability in programs and activities, including education, that receive federal financial assistance.
the number of students in the sample in which accommodations were permitted. The table shows that the same non-SD/ LEP students were included in both samples in 2000; only the SD and/or LEP students differed between the two samples. The 1996 design differed somewhat, in that the two samples did not include all the same non-SD/LEP students. Although there was some overlap, not all of the non-SD/LEP
students were included in both samples, as was the case in 2000 . The 1990 and 1992 design differed from more recent assessment years in that the SD and/or LEP students were assessed in standard conditions and accommodations were not permitted. The sample sizes and target populations for the 2003 mathematics assessment are listed for the nation and states in table A. 4 and for the participating districts in table A.5.

Table A. 3 Number of students assessed, by sample type, special needs status, and accommodation option, grades 4 and 8: 1990-2003

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

Table A. 6 provides a summary of the 2003 national school and student participation rates for the mathematics assessment sample. Participation rates are presented for public and nonpublic schools, both individually and combined. Four different rates are presented. The first rate is a student-centered, weighted percentage of schools participating in the assessment, before substitution of demo-
graphically similar schools. ${ }^{6}$ This rate is based only on the schools that were initially selected for the assessment. The numerator of this rate is the estimated number of students represented by the initially selected schools that participated in the assessment. The denominator is the estimated number of students represented by the initially selected schools that had eligible students enrolled.

[^41]The second school participation rate is a student-centered, weighted participation rate after substitution. The numerator of this rate is the estimated number of students represented by the participating schools, whether originally selected or selected as a substitute for a school that chose not to participate. The denominator is the estimated number of students represented by the initially selected schools that had eligible students enrolled (this is the same as that for the weighted participation rate for the sample of schools before substitution). Because of the common denominators, the weighted participation rate after substitution is at least as great as the weighted participation rate before substitution.

The third school participation rate is a school-centered, weighted percentage of schools participating in the assessment before substitution of demographically similar schools. This rate is based only on the schools that were initially selected for the assessment. The numerator of this rate is the estimated number of schools represented by the initially selected schools that participated in the assessment. The denominator is the estimated number of schools represented by the initially selected schools that had eligible students enrolled.

The fourth school participation rate is a school-centered weighted participation rate after substitution. The numerator is the estimated number of schools represented by the participating schools, whether originally selected or selected as a substitute for a school that did not participate. The denominator is the estimated number of schools, represented by the initially selected schools that had eligible students enrolled.

The student-centered and schoolcentered school participation rates differ if school participation is associated with the size of the school. If the studentcentered rate is higher than the schoolcentered rate, this indicates that larger schools participated at a higher rate than smaller schools. If the student-centered rate is lower, smaller schools participated at a higher rate than larger schools.

Also presented in table A. 6 are weighted student participation rates. Some students sampled for NAEP are not assessed because they cannot meaningfully participate. The numerator of this rate is the estimated number of students who are represented by the students assessed (in either an initial session or a makeup session). The denominator of this rate is the estimated number of students represented by the eligible sampled students in participating schools.

Table A. 6 National school and student participation rates, by type of school, grades 4 and 8: 2003

|  | School participation |  |  |  |  | Student participation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Student-centered weighted |  | School-centered weighted |  | Number of schools participating | Student weighted percentage | Number of students assessed |
|  | Percentage before substitution | Percentage after substitution | Percentage before substitution | Percentage after substitution |  |  |  |
| Grade 4 |  |  |  |  |  |  |  |
| Combined national | 98 | 98 | 92 | 93 | 7,488 | 94 | 190,147 |
| Public | 100 | 100 | 100 | 100 | 6,914 | 94 | 184,325 |
| Nonpublic | 79 | 80 | 74 | 76 | 539 | 95 | 4,718 |
| Grade 8 |  |  |  |  |  |  |  |
| Combined national | 97 | 98 | 90 | 91 | 6,095 | 92 | 153,189 |
| Public | 100 | 100 | 100 | 100 | 5,527 | 91 | 147,600 |
| Nonpublic | 74 | 76 | 75 | 78 | 558 | 95 | 5,073 |

NOTE: The number of schools and students in the combined national total at grades 4 and 8 includes students in the Department of Defense domestic schools located within the U.S. and Bureau of Indian Affairs schools that are not included as part of either the public or nonpublic totals.

## State Samples

The results provided in this report of the 2003 state assessment in mathematics are based on state-level samples of fourthand eighth-grade public-school students. The samples were selected using a twostage sample design that first selected schools within each state or other jurisdiction and then selected students within schools. The samples were weighted to allow valid inferences about the populations of interest. Participation rates for the states and other jurisdictions were calculated the same way that rates were computed for the nation. Tables A. 7 and A. 8 contain the unweighted number of participating schools and students, as well as weighted school and student participation rates for the state samples at grades 4 and 8 , respectively.

## District Samples

Results from the 2003 mathematics assessments are also reported (on a trial basis) for district-level samples of fourthand eighth-grade students in the large urban school districts that participated in the Trial Urban District Assessment (TUDA)-Atlanta, Boston, Charlotte, Chicago, Cleveland, Houston, Los Angeles, New York City, and San Diego. The sample of students in the urban school districts represents an augmentation of the sample of students who would usually be selected as part of state samples. These samples allow reliable subgroup reporting in these districts. Furthermore, all students at "lower" geographic sampling levels are assumed to be part of "higher-level" samples. For example, Houston is one of the urban districts included in the TUDA. Data from students tested in the Houston sample were used to report results for Houston, but also contributed to the Texas and national estimates. Participation rates for the urban district samples are presented in table A.9.

Table A. 7 School and student participation rates, grade 4 public schools: By state, 2003

| Grade 4 | School participation |  |  |  |  | Student participation |  |

${ }^{1}$ The student weighted participation rate is calculated as follows: The numerator of this rate is the estimated number of students who are represented by the students assessed. The denominator of this rate is the estimated number of students represented by the eligible sampled students in participating schools. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trial Urban District Mathematics Assessment.

## Standards for State Sample Participation and Reporting of Results

In carrying out the 2003 state assessment program, NAEP established participation rate standards that jurisdictions were required to meet in order for their results to be reported. Participation rates before substitution needed to be at least 80 percent for schools and at least 85 percent for students. In the 2003 mathematics assessment, at both the fourth and eighth grades, all jurisdictions met NAEP participation rate standards.

The nonresponse bias analyses for nonpublic schools showed significant differences between responding and nonresponding schools in terms of reporting group, census region, and racial/ ethnic composition of the schools. Nonresponse weighting adjustments have completely accounted for differences in reporting group, and largely accounted for differences in census region. These adjustments are unlikely to have fully accounted for differences in race/ ethnicity.

Further information on the NCES guidelines used to report results in the state assessments, and the guidelines for notations when there was some risk of nonresponse bias in the reported results prior to the 2003 assessments, can be found in the NAEP 2000 mathematics report card (see appendix A, "Standards for Sample Participation and Reporting of Results").

## Students with Disabilities (SD) and/or Limited-English-Proficient (LEP) Students

It is NAEP's intent to assess all selected students from the target population. Therefore, every effort is made to ensure that all selected students who are capable of participating in the assessment are assessed. Some students sampled for participation in NAEP can be excluded from the sample according to carefully defined criteria. These criteria were revised in 1996 to communicate more clearly a presumption of inclusion except under special circumstances. According to these criteria, students who had an Individualized Education Program (IEP) or were protected under Section 504 of the Rehabilitation Act of 1973 were to be included in the NAEP assessment except in the following cases:

- the school's IEP team determined that the student could not participate,
- the student's cognitive functioning was so severely impaired that she or he could not participate,
- the student's IEP required that the student had to be tested with an accommodation or adaptation that NAEP does not allow and the student could not demonstrate his or her knowledge without that accommodation.

All LEP students who received academic instruction in English for three years or more were to be included in the assessment. Those LEP students who received instruction in English for fewer than three years were to be included unless school staff judged them to be incapable of participating in the assessment in English.

## Participation of SD/LEP Students

 in the NAEP SamplesTesting all sampled students is the best way for NAEP to ensure that the statistics generated by the assessment are as representative as possible of the performance of the entire national population and the populations of participating jurisdictions. However, all groups of students include certain proportions that cannot be tested in large-scale assessments (such as students who have profound mental disabilities) or who can only be tested through the use of testing accommodations such as extra time, one-on-one administration, or use of magnifying equipment. Some students with disabilities and some LEP students cannot show on a test what they know and can do unless they are provided with accommodations. When such accommodations are not allowed, students requiring such adjustments are often excluded from large-scale assessments such as NAEP. This phenomenon has become more common in the last decade and gained momentum with the passage of the 1997 Individuals with Disabilities Education Act (IDEA), which led schools and states to identify increasing proportions of students as needing accommodations on assessments in order to best show what they know and can do. ${ }^{7}$ Furthermore,

[^44]Section 504 of the Rehabilitation Act of 1973 requires that, when students with disabilities are tested, schools must provide them with appropriate accommodations so that the test results accurately reflect students' achievement. In addition, as the proportion of limited-Englishproficient students in the population has increased, some states have started offering accommodations such as translations of assessments or the use of bilingual dictionaries as part of assessments.

Before 1996, NAEP did not allow any testing under nonstandard conditions (i.e., accommodations were not permitted). At that time, NAEP samples were able to include almost all sampled students in standard assessment sessions. However, as the influence of IDEA grew more widespread, the failure to provide accommodations led to increasing levels of exclusion in the assessment. Such increases posed two threats to the program: 1) they threatened the stability of trend lines (because excluding more students in one assessment year than in another might lead to apparent rather than real differences) and 2) they made NAEP samples less than optimally representative of target populations.

NAEP reacted to this challenge by adopting a multipart strategy. The program had to move toward allowing the same assessment accommodations that were afforded students in state and district testing programs in order for NAEP samples to be as inclusive as possible. However, allowing accommodations represents a change in testing conditions
that may affect measurement of changes over time. Therefore, beginning with the 1996 national assessments and the 1998 state assessments and up to 2000, NAEP assessed a series of parallel samples of students. In one set of samples, testing accommodations were not permitted; this allowed NAEP to maintain the measurement of achievement trends. In addition to the samples where accommodations were not permitted, parallel samples in which accommodations were permitted were also assessed. By having two overlapping samples and two sets of related data points, NAEP could meet two core program goals. ${ }^{8}$ First, data trends could be maintained. Second, parallel trend lines could be set in ways that ensure that in future years the program would be able to use the most inclusive practices possible and mirror the procedures used by most state and district assessments. Beginning with the 2002 reading assessment, NAEP has used only the more inclusive procedures, in which assessment accommodations are permitted. In mathematics, national and state data from 1990, 1992, 1996, and 2000 are reported for the sample in which accommodations were not permitted. National and state data for the sample in which accommodations were permitted are reported for 2000 and 2003. Nationalonly data for the accommodated samples are reported for 1996.

In order to make it possible to evaluate both the impact of increasing exclusion rates in some jurisdictions and differences between jurisdictions, complete data on exclusion in all years are in-

[^45]cluded in this appendix. Since the exclusion rates may affect trend measurement within a jurisdiction, readers should consider the magnitude of exclusion rate changes when interpreting score changes in jurisdictions. In addition, different rates of exclusion may influence the meaning of state comparisons. Thus, exclusion data should be reviewed in this context as well.

Percentages of SD/LEP students for the national sample of public and nonpublic schools in which accommodations were not permitted are presented in table A.10. The data in this table include the percentages of students identified as SD/LEP, the percentage of SD/LEP students excluded, and the percentage of SD/LEP students assessed. Tables A. 11 and A. 12 show similar information by jurisdiction. Percentages of these students in the national sample where accommodations were permitted are presented in table A.13. The state and jurisdiction results where accommodations were permitted are shown in tables A. 14 through A.19. The data in these tables include the percentages of
students identified as SD and/or LEP, the percentage of SD/LEP students excluded, the percentage of SD/LEP students assessed, the percentage assessed without accommodations, (calculated as the percentage of all students sampled minus those who were excluded and those asssessed with accommodations), and the percentage assessed with accommodations. Similar information for districts that participated in the Trial Urban District Assessment is presented in table A. 20 for grade 4 and table A. 21 for grade 8.

In the 2003 national sample, 4 percent of SD/LEP students at grade 4 and 3 percent of SD/LEP students at grade 8 were excluded from the assessment (see table A.13). Across the various jurisdictions that participated in the 2003 state assessment, the percentage of SD/LEP students excluded ranged from 1 to 7 percent at grade 4 (see table A.14) and from 1 to 9 percent at grade 8 (see table A.17). At the district level, between 1 and 8 percent of SD/LEP students were excluded at grade 4 (see table A.20) and between 2 and 9 percent were excluded at grade 8 (see table A.21).

Table A. 10 Students with disabilities and/or limited-English-proficient students identified, excluded, and assessed, when accommodations were not permitted, grades 4 and 8 public and nonpublic schools: 1992-2000

| Grade 4 | $1992{ }^{1}$ |  | 1996 |  | 2000 |  |

| Assessed | 88 | 1 | 68 | 2 | 341 | 2 |

${ }^{1}$ In 1992, the identified and excluded students were combined across subject areas. Although their weighted percentages are comparable to 1996 and 2000, the row numbers of students are not.
${ }^{2}$ Students with disabilities.
${ }^{3}$ Limited-English-proficient students.
NOTE: Detail may not sum to totals because of rounding. Within each grade level the combined SD/LEP portion of the table is not a sum of the separate SD and LEP portions because some students were identified as both SD and LEP. Such students would be counted separately in the bottom portions but counted only once in the top portion. SD/LEP information is not available at the national level in 1990.

\# The estimate rounds to zero.
${ }^{1}$ Students with disabilities.
${ }^{2}$ Limited-English-proficient students.
NOTE: Detail may not sum to totals because of rounding. Within each grade level the combined SD/LEP portion of the table is not a sum of the separate SD and LEP portions because some students were identified as both SD and LEP. Such students would be counted separately in the bottom portions but counted only once in the top portion. The sample sizes are larger in 2003 than in previous years because the 2003 national sample was based on the combined sample of students assessed in each participating state, plus an additional sample from nonparticipating states as well as a sample of nonpublic schools.

Investigating the Potential Effects of Exclusion Rates on Assessment Results

Variation in the rates of exclusion of students with disabilities and limited-English-proficient students introduces validity concerns for comparisons over time or between jurisdictions. The essential problem is the differential representativeness of samples, which could impact the comparability of cross-state comparisons within a given year and state trends across years. Since students with disabilities or limited-English-proficient students tend to score below average on assessments, excluding students with special needs may increase a jurisdiction's scores. Conversely, including more of these students might depress score gains. In 2003, exclusion rates varied among jurisdictions. In addition, cases of both increases and decreases in exclusion rates occurred between 2000 and 2003, making comparisons over time within jurisdictions complex to interpret. Tables A. 14 to A. 17 on the preceding pages display the rates of exclusion in 2000 and 2003 in each jurisdiction for grade 4 and grade 8, respectively.

As shown in table A.14, of the 53 jurisdictions that assessed mathematics at grade 4 in 2003, four jurisdictions had exclusion rates of 6 percent or greater, while the majority had exclusion rates of less than 6 percent. Table A. 17 displays the corresponding data for grade 8 . Of the 53 jurisdictions that assessed mathematics at grade 8 in 2003, five jurisdictions had exclusion rates of 6 percent or above, and one of these had an exclusion rate of 9 percent.

One factor that contributed to the variability in exclusion rates across states is that the percentage of students who are identified as having disabilities or limited English proficiency varies across jurisdictions. Reasons for the variation include 1) lack of standardized criteria for defining students as having specific disabilities or as being limited in their English proficiency; 2) changes or differences in policy and practices regarding implementation of the Individuals with Disabilities Education Act (IDEA); and 3) differences in the percentage of students classified as limited English proficient and, to a lesser extent, as students with disabilities.

With regard to cross-state comparisons, the correlations between rates of exclusion and average 2003 mathematics scores were not found to be significant at either grade $4(-.003)$ or grade $8(-.05)$. In other words, higher exclusion rates were not associated with higher average scores in 2003. With regard to state trends, the correlations between changes in the rate of exclusion of students with special needs and changes in average mathematics scale scores from 2000 to 2003 were not found to be significant at grade 4 (-.01) and were detected to be significant at grade 8 (-.31).

Because the representativeness of samples is ultimately a validity issue, NCES has commissioned studies of the impact of assessment accommodations on overall scores. NCES has also investigated scenarios for estimating what the average scores might have been had the excluded students been assessed. Two alternative
statistical scenarios have been proposed, based on different hypotheses about how excluded students might have performed. Combined with the actual performance of students who were assessed, these scenarios produce results for the full population (that is, including estimates for excluded students) in each jurisdiction and each assessment year. These techniques provide some indication as to which statements about trend gains or losses might be changed if exclusion rates were zero in both assessment years and if the hypotheses about the performance of missing students are correct.

One scenario was developed by Donald McLaughlin of American Institutes for Research, and predicts what the performance of excluded $\mathrm{SD} / \mathrm{LEP}$ students might have been had these students been tested. The basic assumption underlying this approach is that these students would have performed as well as included SD/ LEP students with similar disabilities, level of English proficiency, and background characteristics. ${ }^{9}$

The other scenario was developed by Al Beaton of Boston College and similarly makes an assumption about what the performance of excluded SD/LEP students might have been had they been tested. The idea of Beaton's scenario is to calculate median rather than average scores. A "median" is the score reached or exceeded by fifty percent of the
student population. This statistic is not influenced by extreme values. Beaton's assumption is that all $\mathrm{SD} / \mathrm{LEP}$ students would score below Basic or below the median of the group being analyzed. This assumption lowers the median score for every group.

The methods used to construct the scenarios are still under development. NCES is continuing research into different procedures for reducing the percentages of students excluded from NAEP. In addition, NCES will continue to evaluate the potential impact of changes in exclusion rates on score gains.

## Types of Accommodations Permitted

Table A. 22 displays the percentages of SD/LEP students assessed with the variety of available accommodations. It should be noted that students assessed with accommodations typically received some combination of accommodations. The percentages presented in the table reflect only the primary accommodation provided. For example, students assessed in small groups (as compared with standard NAEP sessions of about 30 students) usually received extended time. In one-on-one administrations, students often received assistance in recording answers (e.g., use of a scribe or computer) and were afforded extra time. Extended time was considered the primary accommodation only when it was the sole accommodation provided.

[^53]Table A. 22 Students with disabilities and/or limited-English-proficient students assessed with accommodations, by type of primary accommodation, grades 4 and 8 public and nonpublic schools: 1996-2003

## Data Collection and Scoring

The NAEP 2003 mathematics assessment was conducted from January to March 2003 by contractors to the U.S. Department of Education. Trained field staff from Westat conducted the data collection. Materials from the 2003 assessment were shipped to Pearson, where trained staff evaluated the responses to the constructed-response questions using scoring rubrics or guides prepared by Educational Testing Service (ETS). Each constructed-response question had a unique scoring guide that defined the
criteria used to evaluate students' responses. The extended constructedresponse questions were evaluated with four- and five-level guides, and many of the short constructed-response questions were rated according to three-level guides that permitted partial credit. Other short constructed-response questions were scored as either correct or incorrect.

For the 2003 mathematics assessment, 4,719,464 constructed responses were scored. This number includes rescoring to monitor interrater reliability. The
within-year average percentage of exact agreement for the 2003 national reliability sample was 95 percent at both the fourth and eighth grades.

## Data Analysis and IRT Scaling

After the professional scoring, all information was transcribed into the NAEP database at ETS. Each processing activity was conducted with rigorous quality control. After the assessment information was compiled in the database, the data were weighted according to the population structure. The weighting for the national and state samples reflected the probability of selection for each student as a result of the sampling design, adjusted for nonresponse. ${ }^{10}$

Analyses were then conducted to determine the percentages of students who gave various responses to each cognitive and background question. In determining these percentages for the cognitive questions, a distinction was made between missing responses at the end of a block (i.e., missing responses after the last question the student answered) and missing responses before the last observed response. Missing responses before the last observed response were considered intentional omissions. In analysis, omitted responses to multiplechoice items were scored as fractionally correct. ${ }^{11}$ Omitted responses for con-structed-response items were placed into the lowest score category. Missing responses after the last observed response were considered "not reached" and treated as if the questions had not been presented to the student. In calculating response percentages for each question,
only students classified as having been presented the question were included in the denominator of the statistic.

It is standard NAEP practice to treat all nonrespondents to the last question in a block as if they had not reached the question. For multiple-choice and short constructed-response questions, this practice produces a reasonable pattern of results in that the proportion reaching the last question is not dramatically smaller than the proportion reaching the next-to-last question. However, for mathematics blocks that ended with extended constructed-response questions, there may be extremely large drops in the proportion of students attempting some of the final questions. Therefore, for blocks ending with an extended con-structed-response question, students who answered the next-to-last question, but did not respond to the extended con-structed-response question, were classified as having intentionally omitted the last question.

Item Response Theory (IRT) was used to estimate average mathematics scale scores for the nation and for various subgroups of interest within the nation. IRT models the probability of answering a question in a certain way as a mathematical function of proficiency or skill. The main purpose of IRT analysis is to provide a common scale on which performance can be compared among groups, such as those defined by characteristics, including gender and race/ethnicity, even when students receive different blocks of items. One desirable feature of IRT is that it locates items and students on this

[^54]common scale. In contrast to classical test theory, IRT does not rely solely on the total number of correct item responses, but uses the particular patterns of student responses to items in determining the student location on the scale. As a result, adding items that function at a particular point on the scale to the assessment does not change the location of the students on the scale, even though students may respond correctly to more items. It does increase the relative precision with which students are measured, particularly those students whose scale locations are close to the additional items.

The results for 1990, 1992, 1996, 2000, and 2003 are presented on the NAEP mathematics composite scale. For the NAEP mathematics assessment, a scale ranging from 0 to 500 was used to report performance in each of the five mathematics content areas at each grade: number sense, properties, and operations; measurement; geometry and spatial sense; data analysis, statistics, and probability; and algebra and functions. The scales summarize student performance across all three types of questions in the assessment (multiple-choice, short con-structed-response, and extended con-structed-response).

In producing these content-area scales, three distinct IRT models were used. Multiple-choice questions were scaled using the three-parameter logistic (3PL) model; short constructed-response questions rated as acceptable or unacceptable were scaled using the twoparameter logistic (2PL) model; and
short constructed-response questions rated according to a three-level guide, as well as extended constructed-response questions rated on a four- or five-level guide, were scaled using a generalized partial-credit (GPC) model. ${ }^{12}$ Developed by ETS and first used in 1992, the GPC model permits the scaling of questions scored according to multipoint rating schemes. The model takes full advantage of the information available from each of the student response categories used for these more complex constructed-response questions. ${ }^{13}$

The scales are composed of three types of questions: multiple-choice, short constructed-response (scored either dichotomously or allowing for partial credit), and extended constructedresponse (scored according to a partialcredit model). Unfortunately, the question of how much information different types of questions contribute to a scale has no simple answer. The information provided by a given question is determined by the IRT model used to scale the question. It is a function of the item parameters and varies by level of mathematics proficiency. ${ }^{14}$ Thus, the answer to the query "How much information do the different types of questions provide?" will differ for each level of mathematics performance. When considering the composite mathematics scale, the answer is even more complicated. The mathematics data are scaled separately by the content areas. The composite scale is a weighted combination of these subscales. IRT information functions are only strictly

[^55]comparable when they are derived from the same calibration. Because the composite scale is based on five separate calibrations, there is no direct way to compare the information provided by the questions on the composite scale.

Because the NAEP design gives each student a small proportion of the pool of assessment items, the assessment cannot provide reliable information about individual performance. Traditional test scores for individual students, even those based on IRT, would result in misleading estimates of population characteristics, such as subgroup means and percentages of students at or above a certain scalescore level. However, it is NAEP's goal to estimate these population characteristics. NAEP's objectives can be achieved with methodologies that produce estimates of the population-level parameters directly, without the intermediary computation of estimates of individuals. This is accomplished using marginal estimation scaling model techniques for latent variables. ${ }^{15}$ Under the assumptions of the scaling models, these population estimates will be consistent in the sense that the estimates approach the model-based population values as the sample size increases. This would not be the case for population estimates obtained by aggregating optimal estimates of individual performance. ${ }^{16}$

## Item-Mapping Procedures

The mathematics performance of fourthand eighth-graders can be illustrated by "item maps," which position question or "item" descriptions along the NAEP mathematics scale at each grade. Each question shown is placed at the point on
the scale where students are more likely to give successful responses to it. The descriptions used on these item maps focus on the mathematics knowledge or skill needed to respond successfully to the question. For multiple-choice questions, the description indicates the knowledge or skill demonstrated by selection of the correct option; for constructed-response questions, the description takes into account the knowledge or skill specified by the different levels of scoring criteria for that question.

To map questions to particular points on the NAEP mathematics scale, a re-sponse-probability convention was adopted to divide those who had a higher probability of success from those who had a lower probability. Choosing a responseprobability convention has an impact on the mapping of the test questions onto the mathematics scale. A lower boundary convention maps the mathematics questions at lower points along the scale, and a higher boundary convention maps the same questions at higher points on the scale. The underlying distribution of mathematics skills in the population does not change, but the choice of a responseprobability convention does have an impact on the proportion of the student population that is reported as "able to do" the questions on the mathematics scales.

There is no obvious choice of a point along the probability scale that is clearly superior to any other point. If the convention were set with a boundary at 50 percent, those above the boundary would be more likely to get a question right than get it wrong, while those below the

[^56]boundary would be more likely to get the question wrong than right. Although this convention has some intuitive appeal, it was rejected on the grounds that having a $50: 50$ chance of getting the question right shows an insufficient degree of mastery. If the convention were set with a boundary at 80 percent, students above the criterion would have a high probability of responding successfully to a question. However, many students below this criterion show some level of mathematics ability that would be ignored by such a stringent criterion. In particular, those in the range between 50 and 80 percent correct would be more likely to get the question right, yet would not be in the group described as "able to do" the question.

In a compromise between the 50 percent and the 80 percent conventions, NAEP has adopted two related responseprobability conventions for all its subjects: 65 percent for constructed-response questions (where guessing is not a factor), and 74 percent for multiplechoice questions with four response options (to adjust for the possibility of answering correctly by guessing) or 72 percent for five response options (to correct for the possibility of answering correctly by guessing, with slightly less correction applied when students were presented with five rather than four options). These response-probability conventions were established, in part, based on an intuitive judgment that they would provide the best picture of students' mathematics skills.

Some additional support for the dual conventions adopted by NAEP was provided by Huynh. ${ }^{17}$ He examined the IRT information provided by items, according to the IRT model used in scaling NAEP questions. Following Bock, Huynh decomposed the item information into that provided by a correct response $[\mathrm{P}(\Theta) \mathrm{I}(\Theta)]$ and that provided by an incorrect response $[(1-\mathrm{P}(\Theta)) \mathrm{I}(\Theta)] .{ }^{18}$ Huynh showed that the item information provided by a correct response to a constructed-response item is maximized at the point along the mathematics scale at which the probability of a correct response is 0.65 (for multiple-choice items, the information provided by a correct response is maximized at the point at which the probability of getting the item correct is 0.72 or 0.74 ). It should be noted, however, that maximizing the item information $\mathrm{I}(\Theta)$, rather than the information provided by a correct response $[\mathrm{P}(\Theta) \mathrm{I}(\Theta)]$, would imply an item-mapping criterion closer to 50 percent.

The NAEP mathematics achievement results are presented in terms of the composite mathematics scale. However, the mathematics assessment was scaled separately for the five content areas at grades 4 and 8 . The composite scale is a weighted combination of the five subscales for the five content areas. To obtain item map information, a procedure developed by Donoghue was used. ${ }^{19}$ This method models the relationship between the item response function for the subscale and the subscale structure to derive the relationship between the item

[^57]score and the composite scale (i.e., an item response function for the composite scale). This item response function is then used to derive the probability used in the mapping.

## Weighting and Variance Estimation

A complex sampling design was used to select the students who were assessed. The properties of a sample selected through such a design can be very different from those of a simple random sample in which every student in the target population has an equal chance of selection and in which the observations from different sampled students can be considered to be statistically independent of one another. Therefore, the properties of the sample for the data collection design were taken into account during the analysis of the assessment data.

One way that the properties of the sample design were addressed was by using sampling weights to account for the fact that the probabilities of selection were not identical for all students. All population and subpopulation characteristics based on the assessment data were estimated using sampling weights. These weights included adjustments for school and student nonresponse.

Prior to 2003, the national samples used weights that had been poststratified to the census or Current Population Survey (CPS) totals for the populations being assessed. Due to concerns about the availability of appropriate targets for poststratification as a result of changes in the reporting of race in the 2000 census, nonpoststratified weights have been used in the analysis of national samples since 2003. The state NAEP samples have always been analyzed using nonpoststratified weights, since there
were no targets available from CPS to use in poststratification.

Not only must appropriate estimates of population characteristics be derived, but appropriate measures of the degree of uncertainty must be obtained for those statistics. Two components of uncertainty are accounted for in the variability of statistics based on student ability: 1) the uncertainty due to sampling only a relatively small number of students, and 2) the uncertainty due to sampling only a portion of the cognitive domain of interest. The first component accounts for the variability associated with the estimated percentages of students who had certain background characteristics or who answered a certain cognitive question correctly.

Because NAEP uses complex sampling procedures, conventional formulas for estimating sampling variability that assume simple random sampling are inappropriate. NAEP uses a jackknife replication procedure to estimate standard errors. The jackknife standard error provides a reasonable measure of uncertainty for any student information that can be observed without error. However, because each student typically responds to only a few questions within any mathematics content area, the scale score for any single student would be imprecise. In this case, NAEP's marginal estimation methodology can be used to describe the performance of groups and subgroups of students. The estimate of the variance of the students' posterior scale score distributions (which reflect the imprecision due to lack of measurement accuracy) is computed. This component of variability is then included in the standard errors of NAEP scale scores. ${ }^{20}$

[^58]Typically, when the standard error is based on a small number of students or when the group of students is enrolled in a small number of schools, the amount of uncertainty associated with the estimation of standard errors may be quite large. Estimates of standard errors subject to a large degree of uncertainty are followed by the "!" symbol to indicate that the nature of the sample does not allow accurate determination of the variability of the statistic (see for example table A.25). In such cases, the standard er-rors-and any confidence intervals or significance tests involving these standard errors-should be interpreted cautiously.

The reader is reminded that, as with findings from all surveys, NAEP results are subject to other kinds of error, including the effects of imperfect adjustment for student and school nonresponse and unknowable effects associated with the particular instrumentation and data collection methods. Nonsampling errors can be attributed to a number of sources-inability to obtain complete information about all selected schools in the sample (some students or schools refused to participate, or students participated but answered only certain questions); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct background information; mistakes in recording, coding, or scoring data; and other errors in collecting, processing, sampling, and estimating missing data. The extent of nonsampling errors is difficult to estimate and, because of their nature, the impact of such errors cannot be reflected in the data-based estimates of uncertainty provided in NAEP reports.

## Drawing Inferences from the Results

The reported statistics are estimates and are therefore subject to a measure of uncertainty. There are two sources of such uncertainty. First, NAEP uses a sample of students rather than testing all students. Second, all assessments have some amount of uncertainty related to the fact that they cannot ask all questions that might be asked in a content area. The magnitude of this uncertainty is reflected in the standard error of each of the estimates. When the percentages or average scale scores of certain groups are compared, the estimated standard error should be taken into account. Therefore, the comparisons are based on statistical tests that consider the estimated standard errors of those statistics and the magnitude of the difference among the averages or percentages.

For the data in this report, all the estimates have corresponding estimated standard errors of the estimates. For example, tables A. 23 and A. 24 show the average national scale score for the NAEP 1990-2003 national assessments and the percentage of students within each achievement-level range and at or above achievement levels. In both tables, estimated standard errors appear in parentheses next to each estimated scale score or percentage. Additional examples of estimated standard errors corresponding with results included in this report are presented in tables A. 25 through A. 27. For the estimated standard errors corresponding to other data from this report, the reader can go to the Data Tool on the NCES web site (http://nces.ed.gov/ nationsreportcard/naepdata/).

Table A. 23 Average mathematics scale scores and standard errors, grades 4 and 8: 1990-2003

|  | Accommodations not permitted |  |  |  | Accommodations permitted |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Grade 8 |  |  |  |  |  |  |  |
|  | 263 (1.3) * | 268 (0.9)* | 272 (1.1)* | 275 (0.8)* | 270 (0.9) * | 273 (0.8) * | 278 (0.3) |

* Significantly different from 2003.

NOTE: Standard errors of the estimated scale scores appear in parentheses. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

* Significantly different from 2003.

NOTE: Standard errors of the estimated percentages appear in parentheses. Detail may not sum to totals because of rounding. In addition to allowing for accommodations, the accommodations-permitted results (1996-2003) differ slightly from previous years' results, and from previously reported results for 1996 and 2000, due to changes in sample weighting procedures. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
$\ddagger$ ) Reporting standards not met. Standard error estimates cannot be accurately determined.
${ }_{2}^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }_{3}^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self report racial/ethnic information.
NOTE: Standard errors of the estimated scale scores appear in parentheses. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003 , compared to previous years, resulting in smaller detectable differences than in previous assessments.

Using confidence intervals based on the standard errors provides a way to take into account the uncertainty associated with sample estimates and to make inferences about the population averages and percentages in a manner that reflects that uncertainty. An estimated sample average scale score plus or minus 1.96 standard errors approximates a 95 percent confidence interval for the corresponding population quantity. This statement means that one can conclude with an approximately 95 percent level of confidence that the average performance of the entire population of interest (e.g., all fourth-grade students in public and nonpublic schools) is within plus or minus 1.96 standard errors of the sample average.

For example, suppose that the average mathematics scale score of the students in a particular group was 256 with an estimated standard error of 1.2. An approximately 95 percent confidence interval for the population quantity would be as follows:

$$
\begin{gathered}
\text { Average } \pm 1.96 \text { standard errors } \\
256 \pm 1.96 \times 1.2 \\
256 \pm 2.4 \\
(253.6,258.4)
\end{gathered}
$$

Thus, one can conclude with a 95 percent level of confidence that the average scale score for the entire population of students in that group is between 253.6 and 258.4. It should be noted that this example and the examples in the following sections are illustrative. More precise estimates carried out to one or more decimal places are used in the actual analyses.

Similar confidence intervals can be constructed for percentages, if the percentages are not extremely large or extremely small. Extreme percentages should be interpreted with caution.

Adding or subtracting the standard errors associated with extreme percentages could cause the confidence interval to exceed 100 percent or fall below 0 percent, resulting in numbers that are not meaningful.
Analyzing Group Differences in Averages and Percentages
Statistical tests determine whether, based on the data from the groups in the sample, there is strong enough evidence to conclude that the averages or percentages are actually different for those groups in the population. If the evidence is strong (i.e., the difference is statistically significant), the report describes the group averages or percentages as being different (e.g., one group performed higher or lower than another group), regardless of whether the sample averages or percentages appear to be approximately the same. The reader is cautioned to rely on the results of the statistical tests rather than on the apparent magnitude of the difference between sample averages or percentages when determining whether the sample differences are likely to represent actual differences among the groups in the population.

To determine whether a real difference exists between the average scale scores (or percentages of a certain attribute) for two groups in the population, one needs to obtain an estimate of the degree of uncertainty associated with the difference between the averages (or percentages) of these groups for the sample. This estimate of the degree of uncertainty, called the "standard error of the difference" between the groups, is obtained by taking the square of each group's standard error, summing the squared standard errors, and taking the square root of that sum.

Standard Error of the Difference $=$

$$
\mathrm{SE}_{\mathrm{A}-\mathrm{B}}=\sqrt{\left(\mathrm{SE}_{\mathrm{A}}^{2}+\mathrm{SE}_{\mathrm{B}}^{2}\right)}
$$

The standard error of the difference can be used, just like the standard error for an individual group average or percentage, to help determine whether differences among groups in the population are real. The difference between the averages or percentages of the two groups plus or minus 1.96 standard errors of the difference represents an approximately 95 percent confidence interval. If the resulting interval includes zero, there is insufficient evidence to claim a real difference between the groups in the population. If the interval does not contain zero, the difference between the groups is statistically significant at the .05 level.

The following example of comparing groups addresses the problem of determining whether the average mathematics scale score of group A is higher than that of group B. The sample estimates of the average scale scores and estimated standard errors are as follows:

| Group | Average <br> Scale Score | Standard <br> Error |
| ---: | ---: | :---: |
| A | 218 | 0.9 |
| B | 216 | 1.1 |

The difference between the estimates of the average scale scores of groups A and B is two points (218-216). The standard error of this difference is

$$
\sqrt{\left(0.9^{2}+1.1^{2}\right)}=1.4
$$

Thus, an approximately 95 percent confidence interval for this difference is plus or minus 1.96 standard errors of the difference:

$$
\begin{gathered}
2 \pm 1.96 \times 1.4 \\
2 \pm 2.7 \\
(-0.7,4.7)
\end{gathered}
$$

The value zero is within the confidence interval; therefore, there is insufficient evidence to conclude that group A outperformed group B.

The procedure above is appropriate to use when it is reasonable to assume that the groups being compared have been independently sampled for the assessment. Such an assumption is clearly warranted when comparing results across assessment years (e.g., comparing the 2000 and 2003 results for a particular state or subgroup) or when comparing results for one state with another. This is the approach used for NAEP reports when comparisons involving independent groups are made. The assumption of independence is violated to some degree when comparing group results for the nation or a particular state (e.g., comparing national 2003 results for males and females), since these samples of students have been drawn from the same schools. When the groups being compared do not share students (as is the case, for example, comparing males and females) the impact of this violation of the independence assumption on the outcome of the statistical tests is assumed to be small, and NAEP, by convention, has, for computational convenience, routinely applied the procedures described above to those cases as well.

When making comparisons of results for groups that share a considerable proportion of students in common, it is not appropriate to ignore such dependencies. In such cases, NAEP has used procedures appropriate to comparing dependent groups. When the dependence in group results is due to the overlap in samples (e.g., when a subgroup is being compared to a total group), a simple modification of the usual standard error of the difference formula can be used. The formula for such cases is
$\mathrm{SE}_{\text {Total-Subgroup }}=\sqrt{\left(\mathrm{SE}_{\text {Total }}^{2}+\mathrm{SE}_{\text {Subgroup }}^{2}-2 p \mathrm{SE}_{\text {Subgroup }}^{2}\right)}$
where $p$ is the proportion of the total group contained in the subgroup. ${ }^{21}$ This formula was used for this report when a state or district was compared to the aggregate nation.

## Conducting Multiple Tests

The procedures used to determine whether group differences in the samples represent actual differences among the groups in the population and the certainty ascribed to intervals (e.g., a 95 percent confidence interval) are based on statistical theory that assumes that only one confidence interval or test of statistical significance is being performed. However, there are times when many different groups are being compared (i.e., multiple sets of confidence intervals are being analyzed). In sets of confidence
intervals, statistical theory indicates that the certainty associated with the entire set of intervals is less than that attributable to each individual comparison from the set. To hold the significance level for the set of comparisons at a particular level (e.g., .05), the standard methods must be adjusted by multiple comparison procedures. ${ }^{22}$ One such procedure, the Benjamini-Hochberg False Discovery Rate (FDR) procedure, was used to control the certainty level. ${ }^{23}$

Unlike other multiple comparison procedures that control the familywise error rate (i.e., the probability of making even one false rejection in the set of comparisons), the FDR procedure controls the expected proportion of falsely rejected hypotheses. Furthermore, the FDR procedure used in NAEP is considered appropriately less conservative than familywise procedures for large families of comparisons. ${ }^{24}$ Therefore, the FDR procedure is more suitable for multiple comparisons in NAEP than are other procedures.

To illustrate how the FDR procedure is used, consider the comparisons of current and previous years' average scale scores for the five groups presented in table A.28. The test statistic shown is the difference in average scale scores divided by the estimated standard error of the difference. (Rounding of the data occurs after the test is done.)

[^60]Table A. 28 Example of False Discovery Rate comparisons of average scale scores for different groups of students

|  | Previous year |  | Currentyear |  | Previous year and current year |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Average scale score | Standard error | Average scale score | Standard enor | Differences in averages | Standard error of differences | Test statistic | Percent confidence ${ }^{1}$ |
| Group 1 | 224 | 1.3 | 226 | 1.0 | 2.08 | 1.62 | 1.29 | 20 |
| Group 2 | 187 | 1.7 | 193 | 1.7 | 6.31 | 2.36 | 2.68 | 1 |
| Group 3 | 191 | 2.6 | 197 | 1.7 | 6.63 | 3.08 | 2.15 | 4 |
| Group 4 | 229 | 4.4 | 232 | 4.6 | 3.24 | 6.35 | 0.51 | 62 |
| Group 5 | 201 | 3.4 | 196 | 4.7 | -5.51 | 5.81 | -0.95 | 35 |

${ }^{1}$ The percent confidence is $2(1-F(x))$ where $\mathrm{F}(\mathrm{x})$ is the cumulative distribution of the t -distribution with the degrees of freedom adjusted to reflect the complexities of the sample design.

The difference in average scale scores and its estimated standard error can be used to find an approximately 95 percent confidence interval or they can be used to identify a confidence percentage. The confidence percentage for the test statistics is identified from statistical tables. The significance level from the statistical tables can be directly compared to $100-95=5$ percent.

If the comparison of average scale scores across two years was made for only one of the five groups, there would be a significant difference between the average scale scores for the two years at a significance level of less than 5 percent. However, because we are interested in the difference in average scale scores across the two years for all five of the groups, comparing each of the significance levels to 5 percent is not adequate. Groups of students defined by shared characteristics, such as racial/ethnic groups, are treated as sets or families when making comparisons. However, comparisons of average scale scores for each pair of years were treated separately. The steps described in this example would be replicated for the comparison of other current and previous year average scale scores.

Using the FDR procedure to take into account that all comparisons are of interest to us, the percents of confidence in the example are ordered from largest to smallest: $62,35,20,4$, and 1 . In the FDR procedure, 62 percent confidence for the group 4 comparison would be compared to 5 percent, 35 percent for the group 5 comparison would be compared to $0.05 \times(5-1) / 5=0.04=4$ percent, ${ }^{25} 20$ percent for the group 1 comparison would be compared to 0.05 $\times(5-2) / 5=0.03=3$ percent, 4 percent for the group 3 comparison would be compared to $0.05 \times(5-3) / 5=0.02$ $=2$ percent, and 1 percent for the group 2 comparison (actually slightly smaller than 1 prior to rounding) would be compared to $0.05 \times(5-4) / 5=0.01=1$ percent. The procedure stops with the first contrast found to be significant. The last of these comparisons is the only one for which the percent confidence is smaller than the FDR procedure value. The difference between the current year's and previous years' average scale scores for the group 2 students is significant; for all of the other groups, average scale scores for current and previous year are not significantly different from one another. In practice, a very small number

[^61]of counterintuitive results occur when the FDR procedures are used to examine between-year differences in subgroup results by jurisdiction. In those cases, results were not included in this report.

## Understanding NAEP Reporting Groups

NAEP results are provided for groups of students defined by shared characteris-tics-gender, race/ethnicity, parental education, region of the country, type of school, school's type of location, and eligibility for free/reduced-price school lunch. Based on participation rate criteria, results are reported for subpopulations only when sufficient numbers of students and adequate school representation are present. The minimum requirement is at least 62 students in a particular subgroup from at least five primary sampling units (PSUs). ${ }^{26}$ However, the data for all students, regardless of whether their subgroup was reported separately, were included in computing overall results. Definitions of the subpopulations are presented below.
Gender: Results are reported separately for male students and female students.
Race/Ethnicity: In all NAEP assessments, data about student race/ethnicity is collected from two sources: school records and student self-reports. Prior to 2002, NAEP used students' self-reported race as the primary race/ethnicity reporting variable. As of 2002, the race/ ethnicity variable presented in NAEP reports is based on the race reported by the school. When school-recorded information is missing, student-reported data are used to determine race/ethnicity. The mutually exclusive racial/ethnic categories are White, Black, Hispanic,

Asian/Pacific Islander, American Indian (including Alaska Native), and Other. Information based on student self-reported race/ethnicity is available on the NAEP Data Tool (http://nces.ed.gov/ nationsreportcard/naepdata/).
Parental Education: Eighth-graders were asked the following two questions, the responses to which were combined to derive the parental education variable.
How far in school did your mother go?

- She did not finish high school.
- She graduated from high school.
- She had some education after high school.
- She graduated from college.
- I don't know.

Students were also asked
How far in school did your father go?

- He did not finish high school.
- He graduated from high school.
- He had some education after high school.
- He graduated from college.
- I don't know.

The information was combined into one parental education reporting variable in the following way: if a student indicated the extent of education for only one parent, that level was included in the data. If a student indicated the extent of education for both parents, the higher of the two levels was included in the data. If a student responded "I don't know" for both parents, or responded "I don't know" for one parent and did not

26 For the NAEP national assessments prior to 2002, a PSU is a selected geographic region (a county, group of counties, or metropolitan statistical area). Since 2002, the first-stage sampling units are schools (public and nonpublic) in the selection of the combined sample. Further details about the procedure for determining minimum sample size will appear in the technical documentation section of the NAEP web site (http://nces.ed.gov/nationsreportcard).
respond for the other, the parental education level was classified as "I don't know." If the student did not respond for either parent, the student was recorded as having provided no response.
Region of the Country: Prior to 2003, NAEP results were reported for four NAEP-defined regions of the nation: Northeast, Southeast, Central, and West. As of 2003, to align NAEP with other federal data collections, NAEP analysis and reports have used the U.S. Census Bureau's definition of "region". The four regions defined by the U.S. Census Bureau are Northeast, South, Midwest and West. The Midwest region defined by the Census includes the same states as the NAEP-defined Central region. The Northeast region defined by the Census is made up of the same states in the NAEPdefined region minus Delaware, the

District of Columbia, Maryland, and the section of Virginia in the Washington, DC metropolitan area. The Census-defined West region includes the same states as the NAEP-defined West region except Oklahoma and Texas. The Censusdefined South region includes all those states previously defined by NAEP as the Southeast region plus Delaware, the District of Columbia, Maryland, Oklahoma, Texas, and the section of Virginia in the Washington, DC metropolitan area. Due to this change in the region variable, no trend data for each region were provided in this report. Figure A. 2 shows how states are subdivided into these census regions. All 50 states and the District of Columbia are listed. Other jurisdictions, including the two Department of Defense Educational Activities jurisdictions, are not assigned to any region.

Figure A. 2 States within regions of the country defined by the U.S. Census Bureau

| Northeast | South | Midwest | West |
| :--- | :--- | :--- | :--- |
| Connecticut | Alabama | Illinois | Alaska |
| Maine | Arkansas | Indiana | Arizona |
| Massachusetts | Delaware | Iowa | California |
| New Hampshire | District of Columbia | Kansas | Colorado |
| New Jersey | Florida | Michigan | Hawaii |
| NewYork | Georgia | Minnesota | Idaho |
| Pennsylvania | Kentucky | Missouri | Montana |
| Rhode Island | Louisiana | Nebraska | Nevada |
| Vermont | Maryland | North Dakota | New Mexico |
|  | Mississippi | Ohio | Oregon |
|  | North Carolina | South Dakota | Utah |
|  | Oklahoma | Wisconsin | Washington |
|  | South Carolina |  | Wyoming |
|  | Tennessee |  |  |
|  | Texas |  |  |
|  | Virginia |  |  |
|  | West Virginia |  |  |

[^62]Type of School: Results are reported by the type of school that the student attends-public or nonpublic. Nonpublic schools include Catholic and other private schools. ${ }^{27}$ Because they are funded by federal authorities (not state/ local governments), Bureau of Indian Affairs (BIA) schools and Department of Defense Domestic Dependent Elementary and Secondary Schools (DDESS) are not included in either the public or nonpublic categories; they are included in the overall national results.

Type of Location: Results from the 2003 assessment are reported for students attending schools in three mutually exclusive location types: central city, urban fringe/large town, and rural/ small town.

Central city: Following standard definitions established by the Federal Office of Management and Budget, the U.S. Census Bureau (see http://www.census.gov/) defines "central city" as the largest city of a Metropolitan Statistical Area (MSA) or a Consolidated Metropolitan Statistical Area (CMSA). Typically, an MSA contains a city with a population of at least 50,000 and includes its adjacent areas. An MSA becomes a CMSA if it meets the requirements to qualify as a Metropolitan Statistical Area, has a population of $1,000,000$ or more, its component parts are recognized as primary metropolitan statistical areas, and local opinion favors the designation. In the NCES Common Core of Data (CCD), locale codes are assigned to schools. For the definition of central city used in this report, two locale codes of the survey are combined. The definition of each school's type of location is deter-
mined by the size of the place where the school is located and whether or not it is in an MSA or CMSA. School locale codes are assigned by the U.S. Census Bureau. For the definition of central city, NAEP reporting uses data from two CCD locale codes: large city (a central city of an MSA or CMSA with the city having a population greater than or equal to 25,000 ) and midsize city (a central city of an MSA or CMSA having a population less than $25,000)$. Central city is a geographical term and is not synonymous with "inner city."
Urban fringe/large town: The urban fringe category includes any incorporated place, census designated place, or nonplace territory within a CMSA or MSA of a large or mid-sized city and defined as urban by the U.S. Census Bureau, but which does not qualify as a central city. A large town is defined as a place outside a CMSA or MSA with a population greater than or equal to 25,000 .

Rural/small town: Rural includes all places and areas with populations of less than 2,500 that are classified as rural by the U.S. Census Bureau. A small town is defined as a place outside a CMSA or MSA with a population of less than 25,000 , but greater than or equal to 2,500 . Results for each type of location are only compared across years 2000 and after. This is due to new methods used by NCES to identify the type of location assigned to each school in the Common Core of Data (CCD). The new methods were put into place by NCES in order to improve the quality of the assignments, and they take into account more information about the exact physical location of the school. The variable was revised in NAEP beginning with the 2000 assessments.

[^63]Eligibility for Free/Reduced-Price
School Lunch: As part of the Department of Agriculture's National School Lunch Program, schools can receive cash subsidies and donated commodities in turn for offering free or reduced-price lunches to eligible children. Based on available school records, students were classified as either currently eligible for free/reduced-price school lunch or not eligible. Eligibility for the program is determined by students' family income in relation to the federally established poverty level. Free lunch qualification is set at 130 percent of the poverty level, and reduced-price lunch qualification is set at between 130 and 185 percent of the poverty level. Additional information on eligibility may be found at the Department of Agriculture web site (http:// www.fns.usda.gov/cnd/lunch/). The classification applies only to the school year when the assessment was administered (i.e., the 2002-2003 school year) and is not based on eligibility in previous years. If school records were not available, the student was classified as "Information not available." If the school did not participate in the program, all students in that school were classified as "Information not available."

## Caution in Interpretations

As previously stated, the NAEP mathematics scale makes it possible to examine relationships between students' performance and various background factors measured by NAEP. However, a relationship that exists between achievement and another variable does not reveal its underlying cause, which may be influenced by a number of other variables. Similarly, the assessments do not reflect the influence of unmeasured variables. The results are most useful when they are considered in combination with other knowledge about the student population and the educational system, such as trends in instruction, changes in the school-age population, and societal demands and expectations. A caution is also warranted for some small population group estimates. At times in this report, smaller population groups show very large increases or decreases across years in average scores; however, it is necessary to interpret such score gains with extreme caution. The effects of exclusionrate changes may be more marked for small subgroups than they are for the whole population. Another reason for caution is that the standard errors are often quite large around the score estimates for small groups, which in turn means the standard error around the gain is also large.

## Appendix B

## Subgroup Percentage Appendix

Appendix B presents the percentages of students in each of the subgroups reported for the nation, states, and other jurisdictions, and other selected urban districts. There has been a shift in race/ethnicity composition of the student population and students participating in NAEP. The percentage of Hispanic students increased from 6 percent in 1990 to 18 percent in 2003 at grade 4 , and from 7 percent to 15 percent at grade 8 . The percentages of White students decreased from 75 percent in 1990 to 60 percent in 2003 at grade 4 , and from 73 percent to 63 percent at grade 8 . The percentage of Black students, which has changed less over the years, was approximately 17 percent in 2003 at grade 4 and 16 percent at grade 8 .

\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met. Special analyses raised concerns about the accuracy and precision of national grade 8 Asian/Pacific Islander results in 1996 and grade 4 Asian/Pacific Islander results in 2000. As a result, they are omitted from this report.
1 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Detail may not sum to totals because of rounding.

${ }^{2}$ Department of Defense Dependents Schools (Overseas).
3 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: State-level data were not collected in 1990. Detail may not sum to totals because of rounding.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
\# The estimate rounds to zero.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
2 Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Score gaps are calculated based on differences between unrounded average scale scores. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments. Negative numbers indicate that the average score for male students was lower than the score for female students.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Score gaps are calculated based on differences between unrounded average scale scores. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

3 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Detail may not sum to totals because of rounding. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

${ }^{2}$ Department of Defense Dependents Schools (Overseas).
3 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Detail may not sum to totals because of rounding. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }_{4}^{3}$ "Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-Englishproficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
1 National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
3 Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school records was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
3 Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficien students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools ( 2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{* *}$ Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## \#The estimate rounds to zero.

$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{2}$ Department of Defense Dependents Schools (Overseas).
NOTE: Detail may not sum to totals because of rounding. The results for students with disabilities and limited-English-proficient students are based on students who were assessed and cannot be generalized to the total population of such students. The weighted percentages of students with and without disabilities and limited English proficiency are based on the total number of students assessed while the percentages excluded are based on the number of students sampled.

${ }^{2}$ Department of Defense Dependents Schools (Overseas).
NOTE: Detail may not sum to totals because of rounding. The results for students with disabilities and limited-English-proficient students are based on students who were assessed and cannot be generalized to the total population of such students. The weighted percentages of students with and without disabilities and limited English proficiency are based on the total number of students assessed while the percentages excluded are based on the number of students sampled.

## Appendix D <br> State- and District-Level Contextual Variables

To help place results from the NAEP 2003 state and Trial Urban District assessment programs into context, this appendix presents selected state- and district-level data from sources other than NAEP. These data are taken from the Digest of Education Statistics 2002.

## cknowledgments

This report is the culmination of the effort of many individuals who contributed their considerable knowledge, experience, and creativity to the NAEP 2003 mathematics assessment. The assessment was a collaborative effort among staff from the National Center for Education Statistics (NCES), the National Assessment Governing Board (NAGB), Educational Testing Service (ETS), Westat, and Pearson Educational Measurement. Most importantly, NAEP is grateful to the students and school staff who made the assessment possible.
The NAEP 2003 mathematics assessment was funded through NCES, in the Institute of Education Sciences of the U.S. Department of Education. The NCES staff—Peggy Carr, Arnold Goldstein, Steven Gorman, Carol Johnson, Andrew Kolstad, Val Plisko, Taslima Rahman, and Marilyn Seastrom-worked closely and collegially with the authors to produce this report.
The NAEP project at ETS is directed by Stephen Lazer and John Mazzeo, with assistance from John Barone. Sampling and data collection activities were conducted by Westat under the direction of Renee Slobasky, Nancy Caldwell, Keith Rust, and Dianne Walsh. Printing, distribution, scoring, and processing activities were conducted by Pearson Educational Measurement under the direction of Brad Thayer, Connie Smith, and William Buckles.

Test development activities took place at ETS under the direction of Jeff Haberstroh with assistance from James Braswell and Mary Anne Dorofee.
The complex statistical and psychometric activities necessary to report results for the NAEP 2003 mathematics assessment were directed by Catherine McClellan and Frank Jenkins, with assistance from Brenda Tay-Lim, Amy Dresher, and Ying Jin.
The extensive data processing and computer programming activities underlying the statistical and psychometric analyses conducted at ETS are under the direction of David Freund, Edward Kulick, Bruce Kaplan, and Steven Isham. Data analyses presented in the report were managed by Edward Kulick and Scott Davis with assistance from Laura Jerry, Youn-Hee Lim, Mei-Jang Lin, Haiying Liu, Norma Norris, Alfred Rogers, Fred Schaefer, Yuxin Tang, Michael Weiss, and John Willey. The complex database work for this assessment was managed by Katharine Pashley with assistance from Gerry Kokolis.
The reporting process was directed by Jay Campbell with assistance from Wendy Grigg. The design and production of this report were overseen by Loretta Casalaina with assistance from Rick Hasney and Susan Mills. Ming Kuang coordinated the documentation and data checking procedure with assistance from Janice Goodis, Andrea Bergen, and Alice Kass. Arlene Weiner coordinated the editorial procedures with assistance from Linda Myers. The consistency review process was coordinated by Carmen Payton. The web version of this report was coordinated by Rick Hasney.
Many thanks are due to the numerous reviewers, both internal and external to NCES and ETS. The comments and critical feedback of the following reviewers are reflected in the final version of this report: Young Chun, Elvira Germino Hausken, Jeremy Kilpatrick, Naomi Senkeeto, Linda Shafer, Alan Vanneman, and Aileen Waters.

[^5]:    2 Throughout this chapter the term "jurisdiction" is used to refer to the 50 states, the District of Columbia, and the two Department of Defense school systems that participated in the NAEP mathematics assessments.

[^6]:    - Not available. The jurisdiction did not participate or did not meet minimum participation guidelines for reporting.
    * Significantly different from 2003 when only one jurisdiction or the nation is being examined.
    ** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
    ${ }^{1}$ National results for assessments prior to 2003 are based on the national sample, not on aggregated state samples.
    ${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
    ${ }^{3}$ Department of Defense Dependents Schools (Overseas).
    NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details.

    Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

    NOTE: State-level data were not collected in 1990. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools (2000 and 2003) differ slightly from previous years' results, and from previously reported results for 2000, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased in 2003, compared to previous years, resulting in smaller detectable differences than in previous assessments.

[^41]:    6 The initial base sampling weights were used in weighting the percentages of participating schools and students. An attempt was made to preselect one substitute school for each sampled public school, one for each sampled Catholic school, and one for each sampled nonpublic school (other than Catholic). To minimize bias, a substitute school resembled the original selection as much as possible in affiliation, type of location, estimated number of grade-eligible students, and minority composition.
