## What Works Clearinghouse

# Scott Foresman-Addlison Wesley Elementary Mathematics 

Program Description ${ }^{2}$
Scott Foresman-Addison Wesley Elementary Mathematics is a core curriculum for students at all ability levels in prekindergarten through grade 6. The program supports students' understanding of key math concepts and skills and covers a range of mathematical content across grades. The curriculum focuses on questioning strategies, problem-solving skills, embedded assessment, and exercises tailored to students of different ability

Research ${ }^{3}$ Two studies of Scott Foresman-Addison Wesley Elementary Mathematics that fall within the scope of the Elementary School Math review protocol meet What Works Clearinghouse (WWC) evidence standards, and one study meets WWC evidence standards with reservations. The studies included more than 2,800 elementary students from grades 1 through 5 in 49 schools. The schools were located in a mix of urban, suburban, and rural

1. This report has been updated to include reviews of seven studies that have been released since 2005. Of the additional studies, three were not within the scope of the protocol and two were within the scope of the protocol but did not meet evidence standards. A complete list and disposition of all studies reviewed are provided in the references.
2. The descriptive information for this program was obtained from a publicly available source: the program's website (http://www.pearsonschool.com; downloaded June 2010). The WWC requests developers to review the program description sections for accuracy from their perspective. Further verification of the accuracy of the descriptive information for this program is beyond the scope of this review. The literature search reflects documents publicly available by March 2009
3. The studies in this report were reviewed using WWC Evidence Standards, Version 1.0 (see the WWC Standards), as described in protocol Version 1.1.
4. The evidence presented in this report is based on available research. Findings and conclusions may change as new research becomes available.

Effectiveness Scott Foresman-Addison Wesley Elementary Mathematics was found to have mixed effects on math achievement for elementary students.

|  | Math achievement |
| :--- | :--- |
| Rating of effectiveness | Mixed effects |
| Improvement index ${ }^{5}$ | Average: -2 percentile points |
|  | Range: -10 to +6 percentile points |

## Absence of conflict of interest

The Agodini et al. (2009) study summarized in this intervention report was prepared by staff of Mathematica Policy Research. Because the principal investigator for the WWC review of elementary school mathematics also is a Mathematica staff

## Developer and contact

## Additional program

## information

Scott Foresman-Addison Wesley Elementary Mathematics was developed and is distributed by Pearson Scott Foresman, a division of Pearson Education, Inc. Address: One Lake Street, Upper Saddle River, NJ 07458. Email: communications@pearsoned. com. Web: www.pearsonschool.com. Telephone: (201) 236-7000.

## Scope of use

The editions of Scott Foresman-Addison Wesley Elementary
Mathematics reviewed in this report were published in 2004 and 2005. Information is not available on the number or demographics of students, schools, or districts using the curriculum.

## Teaching

Scott Foresman-Addison Wesley Elementary Mathematics consists of teacher-led lessons that follow a check-learn-check-practice sequence, emphasizing key math concepts and skills. Teachers
member, the study was rated by staff members from the University of Wisconsin and the Optimal Solutions Group. The intervention report was reviewed by the deputy principal investigator, a WWC Quality Assurance reviewer, and an external peer reviewer.
check students' skills prior to each lesson, introduce the lesson, and then check students' understanding during the lesson. "Practice" sections in the text permit students to further demonstrate their understanding of concepts and apply this knowledge to solving real-life problems. Lessons (typically 45-60 minutes in length) are organized into chapters that extend over two to eight weeks and use texts, workbooks, transparencies, manipulatives, and technology through group and individual activities.

## Cost

The cost of Scott Foresman-Addison Wesley Elementary Mathematics varies based on the grade and number of components included. For the 2004 and 2005 editions, current prices range from $\$ 23.47$ to $\$ 61.97$ for a single student edition textbook, up to $\$ 214.47$ for a single teacher's edition textbook, from $\$ 3.97$ to $\$ 7.47$ each for various student workbooks, and up to $\$ 409.47$ for a manipulatives kit.

Research Twelve studies reviewed by the WWC investigated the effects of Scott Foresman-Addison Wesley Elementary Mathematics on elementary students. Two studies (Agodini et al., 2009; Resendez \& Azin, 2006) are randomized controlled trials that meet WWC
evidence standards. ${ }^{6}$ One study (Resendez \& Manley, 2005) is a randomized controlled trial that meets WWC evidence standards with reservations. The remaining nine studies do not meet either WWC evidence standards or eligibility screens.
5. These numbers show the average and range of student-level improvement indices for all findings across all studies.
6. One of the three comparisons in Agodini et al. (2009) demonstrated differential attrition of more than 5 percentage points; therefore, this one comparison is rated as meeting evidence standards with reservations.

Meets evidence standards
Agodini et al. (2009) presented results for 39 schools that had been randomly assigned to one of four conditions: Scott Foresman-Addison Wesley Elementary Mathematics (11 schools), Saxon Math (9 schools), Investigations in Number, Data, and Space (10 schools), and Math Expressions (9 schools). The analysis included 1,309 first-grade students and 131 teachers who were evenly divided among the four conditions. The study compared average spring math achievement of students in each condition. The study reported student outcomes after one school year of program implementation.

Resendez and Azin (2006) randomly assigned 39 teachers of 3rd- and 5th-grade students to Scott Foresman-Addison Wesley Elementary Mathematics (20 teachers) or a comparison condition (19 teachers). The analysis included approximately 850 students in the 39 classrooms. The comparison curricula included two distinct basal curricula and a school-created math program based on a number of different math materials from various resources. The study compared average student math achievement outcomes of classrooms in the intervention condition ( 20 classrooms) with those of the comparison condition ( 19 classrooms). The classroom-level means included 837 to 862 students, depending on the outcome measure used. ${ }^{7}$ The study reported student outcomes after one year of program implementation.

## Findings

The WWC review of interventions for elementary school mathematics addresses student outcomes in the domain of overall mathematics achievement. The findings below present the

## Meets evidence standards with reservations

Resendez and Manley (2005) was a randomized controlled trial with severe differential attrition. The authors randomly assigned 35 teachers of 2nd- and 4th-grade students to Scott ForesmanAddison Wesley Elementary Mathematics (18 teachers) or a comparison condition ( 17 teachers) using five different elementary math programs. The analysis included 533 to 645 students, depending on the outcome measure used. The teachers in the intervention condition were in their first year of implementing the Scott Foresman-Addison Wesley Elementary Mathematics program. The comparison programs included chapter-based basal curricula and strand/module-based investigative curricula. The study compared math achievement outcomes of students in the intervention condition with those of the comparison condition. The study reported student outcomes after one year of program implementation.

## Extent of evidence

The WWC categorizes the extent of evidence in each domain as small or medium to large (see the WWC Procedures and Standards Handbook, Appendix G). The extent of evidence takes into account the number of studies and the total sample size across the studies that meet WWC evidence standards with or without reservations. ${ }^{8}$

The WWC considers the extent of evidence for Scott Fores-man-Addison Wesley Elementary Mathematics for elementary students to be medium to large for mathematics achievement.
authors' estimates and WWC-calculated estimates of the size and the statistical significance of the effects of Scott ForesmanAddison Wesley Elementary Mathematics on elementary students. ${ }^{9}$
7. Number of students indicates the number posttested.
8. The extent of evidence categorization was developed to tell readers how much evidence was used to determine the intervention rating, focusing on the number and size of studies. Additional factors associated with a related concept-external validity, such as the students' demographics and the types of settings in which studies took place-are not taken into account for the categorization. Information about how the extent of evidence rating was determined for Scott Foresman-Addison Wesley Elementary Mathematics is in Appendix A6.
9. The level of statistical significance was reported by the study authors or, when necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation about the clustering connection, see the WWC Tutorial on Mismatch. For the formulas the WWC used to calculate the statistical significance, see WWC Procedures and Standards Handbook, Appendix C for clustering and WWC Procedures and Standards Handbook, Appendix D for multiple comparisons. In the case of Agodini et al. (2009), no corrections for clustering or multiple comparisons were needed. In the case of Resendez and Azin (2006), corrections for multiple comparisons were needed, and in the case of Resendez and Manley (2005), a correction for multiple comparisons was needed, so the significance levels may differ from those reported in the original studies.

Agodini et al. (2009) reported, and the WWC confirmed, statistically significant negative effects of the Scott ForesmanAddison Wesley Elementary Mathematics program on the Early Childhood Longitudinal Study-Kindergarten (ECLS-K) Math Assessment, when compared to Saxon Math or Math Expressions. The study also reports no significant effects of Scott Foresman-Addison Wesley Elementary Mathematics on the ECLS-K Math Assessment when compared to Investigations in Number, Data, and Space.

Resendez and Azin (2006) reported no statistically significant effects of the Scott Foresman-Addison Wesley Elementary Mathematics program on either the TerraNova Math Total or the TerraNova Math Computation scores. The average effect across the two outcome measures in Resendez and Azin (2006) was not large enough to be considered substantively important according to WWC criteria (i.e., an effect size of at least 0.25).

Resendez and Manley (2005) reported no statistically significant effects of the Scott Foresman-Addison Wesley Elementary Mathematics program on either the TerraNova Math Total or the

The WWC found Scott Foresman-Addison Wesley Elementary Mathematics to have mixed effects for mathematics achievement for elementary students

## Improvement index

The WWC computes an improvement index for each individual finding. In addition, within each outcome domain, the WWC computes an average improvement index for each study and an average improvement index across studies (see WWC Procedures and Standards Handbook, Appendix F). The improvement index represents the difference between the percentile rank of the average student in the intervention condition and the percentile rank of the average student in the comparison condition. Unlike the rating of effectiveness, the improvement index is entirely based on the size of the effect, regardless of the statistical significance of the effect, the study design, or the analysis. The improvement index can take on values between -50 and +50 , with positive numbers denoting favorable results for the intervention group.

TerraNova Math Computation scores. The average effect across the two outcome measures in Resendez and Manley (2005) was not large enough to be considered substantively important according to WWC criteria (i.e., an effect size of at least 0.25 ).

In summary, one study showed statistically significant negative effects and two studies showed indeterminate effects.

## Rating of effectiveness

The WWC rates the effects of an intervention in a given outcome domain as positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. The rating of effectiveness takes into account four factors: the quality of the research design, the statistical significance of the findings, the size of the difference between participants in the intervention and the comparison conditions, and the consistency in findings across studies (see the WWC Procedures and Standards Handbook, Appendix E).

The average improvement index for mathematics achievement is -2 percentile points across the three studies, with a range of -10 to +6 percentile points across findings.

## Summary

The WWC reviewed 12 studies on Scott Foresman-Addison Wesley Elementary Mathematics for elementary students. Two of these studies meet WWC evidence standards; one study meets WWC evidence standards with reservations; the remaining nine studies do not meet either WWC evidence standards or eligibility screens. Based on the three studies, the WWC found mixed effects in mathematics achievement for elementary students. The conclusions presented in this report may change as new research emerges.

Meets WWC evidence standards

## Appendix

## Appendix A1.1 Study characteristics: Agodini et al., 2009

| Characteristic | Description |
| :---: | :---: |
| Study citation | Agodini, R., Harris, B., Atkins-Burnett, S., Heaviside, S., Novak, T., \& Murphy, R. (2009). Achievement effects of four early elementary school math curricula: Findings from first graders in 39 schools (NCEE 2009-4052). Washington, DC: National Center for Education Evaluation and Regional Assistance, Institute of Education Sciences, U.S. Department of Education. |
| Participants | Schools were randomly assigned to one of four different curricula, using a stratified procedure that helped allocate similar numbers and types of schools to each curriculum. All first-grade classrooms in participating schools were included in the study. When compared to the national average, participating schools had a higher percentage of minority students and students eligible for free/reduced-price meals. |
|  | The baseline sample consisted of four districts, 40 schools, 134 teachers, and 1,525 first-grade students. The analysis sample consisted of four districts, 39 schools, 131 teachers, and 1,309 first-grade students: 11 schools with 36 teachers and 359 students used Scott Foresman-Addison Wesley Elementary Mathematics (the intervention), 10 schools with 33 teachers and 332 students used Investigations in Number, Data, and Space (comparison 1), 9 schools with 31 teachers and 314 students used Math Expressions (comparison 2), and 9 schools with 31 teachers and 304 students used Saxon Math (comparison 3). |
|  | One school with 3 teachers and 32 students assigned to Math Expressions withdrew from the study and did not permit posttesting of students. Because this represents differential attrition of more than 5 percentage points for the comparison of Scott Foresman-Addison Wesley Elementary Mathematics and Math Expressions, this particular comparison is rated as meeting evidence standards with reservations. |
|  | The authors compared the baseline characteristics of the students in the analysis sample on seven characteristics, including the baseline assessment score. Statistical tests conducted on those characteristics for the analysis sample indicated no differences across the four groups. Subgroup findings based on school and classroom characteristics, including baseline fall math achievement and free/reduced-price meal eligibility, are provided in Appendix A4. |
| Setting | The study included 39 schools in four districts located in Connecticut, Minnesota, Nevada, and New York. Two districts were in urban areas, one district was in a suburban area, and the other district was in a rural area. |
| Intervention | Students used the 2005 Scott Foresman-Addison Wesley Elementary Mathematics curriculum as their core math curriculum during the 2006/07 school year. Scott Foresman-Addison Wesley Mathematics is published by Pearson Scott Foresman and is a basal curriculum that combines teacher-directed instruction with a variety of differentiated materials and instructional strategies. Teachers select the materials that seem most appropriate for their students. The curriculum is based on a consistent daily lesson structure, which includes direct instruction, hands-on exploration, the use of questioning, and practice of new skills. Some $87 \%$ of teachers reported completing at least $80 \%$ of the curriculum (not significantly different from the other three curricula, $p$-value $=0.24$ ). |

| Characteristic | Description |
| :--- | :--- |
| Comparisons | Comparison 1 students used Investigations in Number, Data, and Space as their core math curriculum. The curriculum is published by Pearson Scott Foresman. It uses a <br> student-centered approach that encourages reasoning and understanding and draws on constructivist learning theory. The lessons focus on understanding, rather than on <br> "correct answers," and build on students' knowledge and understanding. Students are engaged in thematic units of three to eight weeks in which they first investigate and <br> then discuss and reason about problems and strategies. Students frequently create their own representations. Some $80 \%$ of teachers reported completing at least $80 \%$ of the <br> curriculum (not significantly different from the other three curricula, $p$-value = 0.24 ). <br> Comparison 2 students used Math Expressions as their core math curriculum. Math Expressions is published by Houghton Mifflin Harcourt and uses a blend of student- <br> centered and teacher-directed instructional approaches. Students using the curriculum question and discuss mathematics but are explicitly taught effective procedures. There <br> is an emphasis on using multiple specified objects, drawings, and language to represent concepts, and an emphasis on learning through the use of real-world situations. <br> Students are expected to explain and justify their solutions. Some 89\% of teachers reported completing at least $80 \%$ of the curriculum (not significantly different from the <br> other three curricula, p-value = 0.24). <br> Comparison 3 students used Saxon Math as their core math curriculum. Saxon Math is published by Houghton Mifflin Harcourt and uses a teacher-directed approach that |
| offers a script for teachers to follow in each lesson. The curriculum blends teacher-directed instruction of new material with daily distributed practice of previously learned con- |  |
| cepts and procedures. The teacher introduces concepts or efficient strategies for solving problems. Students observe and then receive guided practice, followed by distributed |  |
| practice. Students hear the correct answers and are explicitly taught procedures and strategies. Frequent monitoring of student achievement is built into the program. Daily |  |
| routines are extensive and emphasize practice of number concepts and procedures and use of representations. Some $97 \%$ of teachers reported completing at least $80 \%$ of |  |
| the curriculum (not significantly different from the other three curricula, p-value = 0.24 ). |  |

## Appendix A1.2 Study characteristics: Resendez \& Azin, 2006

| Characteristic | Description |
| :---: | :---: |
| Study citation | Resendez, M., \& Azin, M. (2006). 2005 Scott Foresman-Addison Wesley Elementary Math randomized control trial: Final report. Jackson, WY: PRES Associates, Inc. |
| Participants ${ }^{1}$ | Third- and 5th-grade teachers were randomly assigned to the intervention or comparison condition. The baseline sample included 39 teachers ( 20 treatment and 19 comparison) and 915 students ( 468 treatment and 447 comparison). Twenty-three teachers taught 3rd grade ( 13 treatment and 10 comparison), and 16 taught 5 th grade ( 7 treatment and 9 control). No teachers left the study, and student attrition was low. Between 837 and 863 students were posttested on the TerraNova Math Computation and Math Total assessments, respectively. ${ }^{2}$ In general, participating schools had a higher percentage of Asian students and students with higher ability levels than the national average. Participating schools had a lower percentage of Hispanic and African-American students, special education students, and students eligible for free/reduced-price meals than the national average. |
| Setting | Four schools (two in Ohio and two in New Jersey) participated in the study. Schools were in urban and suburban settings. |
| Intervention | Students used the 2005 Scott Foresman-Addison Wesley Elementary Mathematics curriculum during the 2005/06 school year. The curriculum is a research-based program designed to make math simpler to teach, easier to learn, and more accessible to every student. The curriculum is a comprehensive, basal program that emphasizes independent learning, embedded assessment, and immediate and systematic remediation. The teachers covered $79 \%$ ( $\mathrm{SD}=18.1 \%$ ) of the curriculum. |
| Comparison | Comparison students used three different math curricula. Students in two schools used a chapter-based, comprehensive basal program; students in a third school used a basal math program; and students in a fourth school used a school-created math program based on a number of different math materials from various resources. The comparison curricula generally covered the same content as Scott Foresman-Addison Wesley Elementary Mathematics. Teachers covered $80 \%$ ( $\mathrm{SD}=9.5 \%$ ) of the curricula. |
| Primary outcomes and measurement | The authors administered the TerraNova Basic Multiple Assessment with Plus test (Level 13 in 3rd grade and Level 15 in 5 th grade). The math test provides two overall scores: the TerraNova Math Total and the TerraNova Math Computation Total. The Math Total score is based on multiple choice and constructed response items that are predominantly word problems that measure basic, applied, and higher-order thinking skills. The TerraNova Math Computation Total is based on the Plus test booklet, which contains only multiple-choice computational problems. Scale scores were used in the analysis. For a more detailed description of these outcome measures, see Appendix A2. |
| Staff/teacher training | Teachers received three hours of initial training prior to implementing Scott Foresman-Addison Wesley Elementary Mathematics in their classes. At the initial training session, the trainer described the key components of Scott Foresman-Addison Wesley Elementary Mathematics, reviewed the Teacher's Edition and available ancillary resources, offered examples of when to use certain materials, provided an overview of the math technology available, and modeled a math lesson. The training focused on the components most vital to the program and those that were required for full implementation. <br> Two follow-up sessions were offered during the school year. The first session was offered four to eight weeks into the school year and lasted two hours. The session was informal and allowed teachers to discuss and ask questions about issues encountered while implementing the program. A second follow-up session was provided to one school in March (the other three schools were offered the second follow-up session but chose not to receive it). The second follow-up addressed pacing issues and further covered the technology available with the program. |

 studies in this review, an author query was conducted to obtain results based on classroom-level means. The results in this review are based on the class means.
2. The exact number of students taking both the pretest and posttest is not available.

## Appendix A1.3 Study characteristics: Resendez \& Manley, 2005

| Characteristic | Description |
| :---: | :---: |
| Study citation | Resendez, M., \& Manley, M. A. (2005). Final report: A study on the effectiveness of the 2004 Scott Foresman-Addison Wesley Elementary Math program. Jackson, WY: PRES Associates, Inc. |
| Participants | Second- and 4th-grade teachers were randomly assigned to the intervention using Scott Foresman-Addison Wesley Elementary Mathematics. The baseline sample included 35 teachers ( 18 treatment and 17 comparison) and 742 students ( 389 treatment and 353 comparison). Of the 35 study teachers, 19 taught 2nd grade ( 10 treatment and 9 comparison) and 16 taught 4th grade ( 8 treatment and 8 comparison). The analysis sample included 35 teachers ( 18 treatment and 17 comparison) and 533 (290 treatment and 243 comparison) to 645 ( 352 treatment and 293 comparison) students in the TerraNova Math Computation and Math Total analyses, respectively. ${ }^{1}$ For both assessments, the differential attrition exceeded 5 percentage points; therefore, this study is rated as meeting evidence standards with reservations. Some $37 \%$ of participating students were minorities. At two of the six participating schools, more than $90 \%$ of students were eligible for free/reduced-price meals; the percentage of students eligible for free/ reduced-price meals at the other four schools was similar to the national average of $37 \%$. |
| Setting | This study took place in six elementary schools in urban, suburban, and rural communities in Washington (one urban school), Wyoming (one rural and one suburban school), Virginia (one urban school), and Kentucky (two suburban schools). |
| Intervention | Students used the 2004 Scott Foresman-Addison Wesley Elementary Mathematics curriculum during the 2004/05 school year. The curriculum is a comprehensive basal program that uses several research-based strategies to promote student success. The curriculum's goal is to help students both do and understand math. The study teachers were implementing the intervention curriculum for the first time and covered $70 \%$ ( $\mathrm{SD}=15.3 \%$ ) of the curriculum. |
| Comparison | Students used five different comprehensive math curricula that used basal or investigative approaches. The comparison curricula covered the same content as Scott Foresman-Addison Wesley Elementary Mathematics. Teachers covered 75\% (SD =18.2\%) of the curricula. |
| Primary outcomes and measurement | The primary outcome measure was the TerraNova CTBS, Basic Multiple Assessment with Plus test (Level 12 for 2nd grade and Level 14 for 4th grade). As noted by the authors, the TerraNova CTBS is a reliable and standardized test consisting of multiple-choice, constructed response, and computational problems. According to the authors, it offers broad coverage of mathematics content in most textbooks and reflects the National Council of Teachers of Mathematics (NCTM) standards. The assessment provides two overall scores: the TerraNova Math Total and TerraNova Math Computation Total. Normal curve equivalent (NCE) scores were used in the analysis. For a more detailed description of these outcome measures, see Appendix A2. |
| Staff/teacher training | Teachers in the intervention classrooms met with a Scott Foresman-Addison Wesley Elementary Mathematics professional trainer for approximately four hours prior to implementing the curriculum in their classes. In the initial training session, the trainer described the key components of the curriculum, reviewed the materials provided, and offered examples of when to use certain materials. <br> Two follow-up sessions, approximately two hours each, were offered. The first session occurred 4 to 8 weeks after teachers began implementation. A second session occurred 10 to 18 weeks after implementation and was provided by the Scott Foresman-Addison Wesley Elementary Mathematics trainer and one of the curriculum authors. This second session focused on the curriculum's philosophy, lesson modeling, and how teachers could use Scott Foresman-Addison Wesley Elementary Mathematics to help students understand mathematics. The second session was provided to five of the six schools. |

[^0]| Outcome measure | Description |
| :---: | :---: |
| ECLS-K Math Assessment | The ECLS-K Math Assessment was developed for the National Center for Education Statistics' Early Childhood Longitudinal Study-Kindergarten (ECLS-K) Class of 1998-99. The assessment is individually administered, nationally normed, and adaptive. The authors indicate that they selected the test because it met accepted standards of validity and reliability, because it measured achievement gains over the study's grade range, and because of the test's accuracy in measuring achievement of students from a wide range of backgrounds and ability levels. The assessment measures the following content areas: (1) Number Sense, Properties, and Operations; (2) Measurement; (3) Geometry and Spatial Sense; (4) Data Analysis, Statistics, and Probability; and (5) Patterns, Algebra, and Functions. The student tests were scored by the Educational Testing Service using a three-parameter item response theory (IRT) model. Scale scores from the IRT scoring were used in the analysis. |
| TerraNova CTBS Basic Multiple Assessment | The TerraNova CTBS Basic Multiple Assessment is a standardized test that provides an overall score for mathematics (the Math Total score). Level 12 was administered to 2nd-grade ( 34 questions), Level 13 to 3rd-grade ( 38 questions), Level 14 to 4 th-grade ( 43 questions), and Level 15 to 5 th-grade ( 43 questions) students. The test is administered during two class sessions and takes 75 to 90 minutes to complete. The majority of items are word problems measuring basic, applied, and higher-order thinking skills, and the test also contains a few computational problems, as well as multiple choice and constructed response questions. The authors state that they selected the test because of its validity, reliability, and sensitivity; because it assesses content presented in the latest textbook series available from multiple publishers; and because it reflects NCTM standards. The test is scored by CTB-McGraw Hill, which provides a normal curve equivalent (NCE) score and scale score. Scorers demonstrated inter-rater reliability on the constructed response items of 0.86 to 0.98 in Resendez and Manley (2005) and 0.81 to 0.90 in Resendez and Azin (2006). |
| TerraNova CTBS Basic Multiple Assessment with Plus | The TerraNova CTBS Basic Multiple Assessment with Plus test is a supplemental test that can be administered with the TerraNova CTBS Basic Multiple Assessment. It provides a separate overall score (the Math Computation score). The test contains 20 multiple-choice items measuring basic and advanced computational skills. The test takes 20 minutes to complete. It is scored by CTB-McGraw Hill, which provides a normal curve equivalent (NCE) score and scale score. |

 are not included in these ratings but are reported in Appendix A4.
 had more similar outcomes
3. Positive differences and effect sizes favor the intervention group; negative differences and effect sizes favor the comparison group
4. For an explanation of the effect size calculation, see WWC Procedures and Standards Handbook, Appendix B.
5. Statistical significance is the probability that the difference between groups is a result of chance rather than a real difference between the groups.
 The improvement index can take on values between -50 and +50 , with positive numbers denoting favorable results for the intervention group

 significance levels may differ from those reported in the original studies.
8. The intervention group mean is the unadjusted control mean plus the program coefficients from the hierarchical linear modeling (HLM) analysis.
9. The control group mean is the unadjusted control group mean.
 from the average effect sizes.
11. Number of students indicates the number posttested. The exact number of students taking both the pretest and posttest is not available.
 level means obtained through an author query. The reported standard deviation is the student-level unadjusted posttest standard deviation obtained from the report.
13. The effect size reported here differs from the report. The effect size was calculated by the WWC using classroom-level means and student-level standard deviations.
14. Number of students indicates the number posttested.

## Appendix A4 Summary of subgroup findings for the mathematics achievement domain ${ }^{1}$

|  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |

| Outcome measure | Study sample ${ }^{4}$ | Sample size (students) ${ }^{5}$ | Authors' findings from the study ${ }^{2}$ <br> Mean outcome (standard deviation) ${ }^{3}$ |  | WWC calculations |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| ECLS-K | Greater than 40\% FRP | 317 | $n r$ | $n \mathrm{r}$ | $n r$ | -0.20 | ns | -10 |

ns = not statistically significant
$\mathrm{nr}=$ not reported
ECLS-K = Math assessment developed for the Early Childhood Longitudinal Study-Kindergarten Class of 1998-99
FRP = Free/reduced-price meal eligibility

1. This appendix presents subgroup findings for measures that fall in the mathematics achievement domain. Total group scores were used for rating purposes and are presented in Appendix $A 3$.
2. The subgroup sample sizes, means, and standard deviations were obtained through communication with the study authors.
3. The standard deviation across all students in each group shows how dispersed the participants' outcomes are: a smaller standard deviation on a given measure would indicate that participants had more similar outcomes.
4. Subgroups were defined using school characteristics. Subgroups defined using baseline student achievement data are defined as students in schools with average math scores in the lowest, middle, and highest third of the study's school-level distribution. Subgroups based on socioeconomic status are examined for students in schools with up to $40 \%$ of students eligible for free or reduced-price meals, compared to schools with more than $40 \%$ of students eligible for free or reduced-price meals.
5. The number of teachers in each subgroup was not provided by the authors.
6. The study provided effect sizes and statistical significance for subgroup outcomes produced through HLM that were calculated in accordance with WWC standards. Adjusted means were not available and are consequently omitted in this table. The table includes the effect sizes and statistical significance reported in the study, along with improvement index values calculated by the WWC based on the study-reported effect sizes.
7. Positive differences and effect sizes favor the intervention group; negative differences and effect sizes favor the comparison group.
8. For an explanation of the effect size calculation, see WWC Procedures and Standards Handbook, Appendix B.
9. Statistical significance is the probability that the difference between groups is a result of chance rather than a real difference between the groups.
10. The improvement index represents the difference between the percentile rank of the average student in the intervention condition and that of the average student in the comparison condition. The improvement index can take on values between -50 and +50 , with positive numbers denoting results favorable to the intervention group.
11. The level of statistical significance was reported by the study authors or, when necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation about the clustering correction, see the WWC Tutorial on Mismatch. For the formulas the WWC used to calculate the statistical significance, see WWC Procedures and Standards Handbook, Appendix C for clustering and WWC Procedures and Standards Handbook, Appendix D for multiple comparisons. In the case of Agodini et al. (2009), no corrections for clustering or multiple comparisons were needed.

## Appendix A5 Scott Foresman-Addison Wesley Elementary Mathematics rating for the mathematics achievement domain

The WWC rates an intervention's effects in a given outcome domain as positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. ${ }^{1}$
For the outcome domain of mathematics achievement, the WWC rated Scott Foresman-Addison Wesley Elementary Mathematics as having mixed effects for elementary students. The remaining ratings (no discernible effects, potentially negative effects, and negative effects) were not considered, as Scott Foresman-Addison Wesley Elementary Mathematics was assigned the highest applicable rating.

## Rating received

Mixed effects: Evidence of inconsistent effects as demonstrated through either of the following criteria.

- Criterion 1: At least one study showing a statistically significant or substantively important positive effect, and at least one study showing a statistically significant or substantively important negative effect, but no more such studies than the number showing a statistically significant or substantively important positive effect.

Not met. No studies showed a statistically significant or substantively important positive effect.
OR

- Criterion 2: At least one study showing a statistically significant or substantively important effect, and more studies showing an indeterminate effect than showing a statistically significant or substantively important effect.

Met. One study showed statistically significant negative effects, and two studies showed indeterminate effects.

## Other ratings considered

Positive effects: Strong evidence of a positive effect with no overriding contrary evidence.

- Criterion 1: Two or more studies showing statistically significant positive effects, at least one of which met WWC evidence standards for a strong design.

Not met. No studies showed a statistically significant or substantively important positive effect.

## AND

- Criterion 2: No studies showing statistically significant or substantively important negative effects.

Not met. One study showed statistically significant negative effects.
Potentially positive effects: Evidence of a positive effect with no overriding contrary evidence.

- Criterion 1: At least one study showing a statistically significant or substantively important positive effect.

Not met. No studies showed a statistically significant or substantively important positive effect.

## AND

- Criterion 2: No studies showing a statistically significant or substantively important negative effect and fewer or the same number of studies showing indeterminate effects than showing statistically significant or substantively important positive effects.

Not met. One study showed statistically significant or substantively important negative effects, and two studies showed indeterminate effects.

1. For rating purposes, the WWC considers the statistical significance of individual outcomes and the domain-level effect. The WWC also considers the size of the domain-level effect for ratings of potentially positive or potentially negative effects. For a complete description, see the WWC Procedures and Standards Handbook, Appendix E.

| Outcome domain | Number of studies | Sample size |  |
| :---: | :---: | :---: | :---: |
| Mathematics achievement | 3 | Schools | Students |

1. A rating of "medium to large" requires at least two studies and two schools across studies in one domain and a total sample size across studies of at least 350 students or 14 classrooms. Otherwise, the rating is "small." For more details on the extent of evidence categorization, see the WWC Procedures and Standards Handbook, Appendix G.
2. This number is an estimate based on students with available posttest scores across the three studies. The exact number of students in the analytical sample is not available for Resendez and Azin (2006).

[^0]:    1. Number of students indicates the number posttested.
