### **Abstract**

In the following technical report, we describe the development and scaling of the easyCBM CCSS middle school mathematics measures, designed for use within a response to intervention framework. All items were developed in collaboration with experienced middle school mathematics teachers and were written to align with the Common Core State Standards. Items were calibrated to a common, vertical scale spanning grades 6-8. The results of the scaling analysis were then used to assemble items into 13 comparable alternate test forms in each grade, with 10 designated for progress monitoring and 3 designated for seasonal benchmarking. Evidence of alternate form equivalence is provided through both test characteristic curves (TCCs) and test information functions (TIFs). Individual item functioning is reported in appendices by both the total pool of items piloted and by test form.

## **The Development and Scaling of the easyCBM CCSS Middle School Mathematics**

### **Measures**

Response to intervention (RTI) is a systematic process of monitoring students' progress through comparable alternate test forms, intervening with those performing below expectations, and evaluating the effectiveness of interventions. RTI is an increasingly popular model for school-wide improvement (Shores & Chester, 2009) and a means of identifying students for special education placement (VanDerHeyden, Witt, & Gilbertson, 2007). Early adoptions of RTI focused primarily on students' early reading skills (for example, see Burns, Appleton, & Stehouwer, 2005). Recently, however, there has been an increased interest in applying the logic of RTI to other subject areas, most notably mathematics, and to higher-order skills such as those necessary in the middle-school grades (Fuchs, Fuchs, & Compton, 2010; Fuchs et al., 2011). For this extended application to be possible, the development of measures used to monitor students' progress in math must be re-conceptualized.

Progress-monitoring measures in math have been created for developmental skills such as early numeracy and basic addition and subtraction by counting, for instance, the number of correct digits in a one minute-timed probe (Fuchs et al., 2007). However, with higher-order skills, such as those appropriate in the middle school grades (6-8), these fluency-based tests no longer measure the skills of interest. Rather, a test must be developed that taps into the subtle nuances of higher-order skills so that growth can still be measured, despite the growth trajectory being less steep. The measures must be sensitive enough to the underlying skills such that students' scores change to reflect the learning gains students have made. At the same time, the measures must adequately differentiate between students who *are* and *are not* competent in the knowledge and skill areas under examination. In this technical report, we describe the

development and scaling process used to develop progress monitoring and benchmarking measures in math aligned to the Common Core State Standards (CCSS).

## **Methods**

### **Item Development**

Our design of middle school math measures appropriate for use in schools employing an RTI model incorporated two key components: (a) alignment to standards, and (b) accessibility to diverse student populations. In this section, we present the process used to develop items with these features. All items were written by middle school math teachers recruited specifically for the task of writing math items aligned with the Common Core State Standards (CCSS) in mathematics. The CCSS are comprised of five domains for grades 6-8. Within each domain are sets of 24 – 29 standards. A total of 2,700 items were written – 900 at each of grades 6, 7, and 8 – stratified across all CCSS in the respective grades. Occasionally there were sub-standards within standards (e.g., grade 6, Ratios and Proportional Relationships domain, standard 3). Items were commissioned so that an even number would be written to each standard, however, the number of items written to specific sub-standards varied, as all sub-standards were treated as part of the larger standard.

**Item writing process.** Five teacher-leads were recruited to help develop the items. All teacher leads had a Bachelors degree in a math- or science-related field and a Masters degree in teaching. Three of the five teacher leads had 4-5 years experience teaching mathematics to students in grades 6-8, one had 7 years teaching experience and had taught math at both the secondary and collegiate levels, and one had 30 years teaching experience. Four of the five teacher leads were practicing classroom teachers, with one serving as a district research, evaluation, assessment, and data analyst. All teachers had, in some capacity, served in a

mathematics leadership role for their district. Leadership roles included grade-level team leadership, school-wide math coach, and/or membership in a curriculum adoption or alignment committee.

On December 11, 2010 all teacher-leads attended an all-day training. The training began with an overview of the project and the teacher-lead role was explained in detail. Next, we presented techniques for effective item writing, emphasizing seven principles of Universal Design for Assessment, as outlined by Thompson, Johnstone, and Thurlow (2002):

- Considers *all* characteristics of test-takers.
- Precisely defined constructs.
- Accessible, non-biased items.
- Items amendable to accommodations.
- Simple, clear, and intuitive instructions and procedures.
- Maximum readability and comprehensibility.
- Maximum legibility of text, tables, figures, and illustrations

Items exemplifying these features were presented and critical features highlighted. The training was primarily based on the item writing recommendations outlined by Haladyna (2004) and Downing (2006a, 2006b). The PowerPoint slides used during the training are presented in Appendix A.

The training concluded with a structured practical application to ensure deep understanding of expectations. Teacher-leads worked together to write items they believed would be effective, accessible, and aligned with a targeted standard. Particular attention was given to item distractors. For all items, teachers were instructed to write one distractor that was “close” to the correct response and one distractor that was “far” from the correct response. After items were

written, the group critiqued features of the items and discussed ways they could be improved. At all points throughout the day, group discussion was encouraged and teacher-leads were given the opportunity to ask questions. At the conclusion of the meeting, each teacher-lead was assigned a batch of items to write, which served as example items for all item writers.

We worked with the teacher-leads to recruit 18 item writers, each hired to write 150 items. Part of the teacher-leads' role was to recruit these item writers and serve as the item-writers' primary contact. All item writers were recruited within one week of the December 11 training. While at the December 11 meeting, teacher-leads were provided with a binder of information relevant to the project and effective item writing practices. A similar, but slimmed down version was produced and mailed to all teacher-leads a week later for dissemination to each item-writer. Additionally, a "testing" web page was developed for each teacher-lead and each item-writer, where users could input item information and see how the item would appear in its final format (see [http://mathdev.easycbm.com/admin/items.php?get\\_miid=TestPage](http://mathdev.easycbm.com/admin/items.php?get_miid=TestPage)).

Teacher-leads trained all recruited item writers using the same materials presented to them during the December 11 training. All recruited item writers were practicing middle school mathematics teachers. Graphics were produced for all example items so that item-writers could see the items in their entirety. Finally, weekly emails were sent to all teacher-leads for the duration of the item writing process to ensure that no "roadblocks" were encountered.

**Item review.** One of the primary roles of the teacher-leads was to initially review all items written by the item writers. The teacher-leads were instructed to examine all items for mathematical correctness and for the features discussed during the training (Universal Design features, lack of bias, etc.) During the summer of 2011, all items were loaded into an online system so they would appear as they would to students taking the actual tests. Items were then

reviewed by a group of university-employed researchers, assembled into a variety of teams, which always included at least one doctoral student in the College of Education at the University of Oregon, who served as the “lead reviewer” and at least two other research assistants who were typically undergraduate or graduate student workers employed by the research institute developing the assessments, Behavioral Research and Teaching. During the internal review, all team members again checked all items for mathematical correctness while also looking closely at each item for possible issues of bias or features inconsistent with Universal Design principles. Additionally, the internal review team ensured that all items were formatted in a consistent manner. Prior to participating in the review, members of the internal review team were required to watch a video recording of the December 11, item writing training given by the project manager.

**Graphics development.** A graphic artist produced original graphics for all items using Adobe Illustrator. Consistent with Universal Design, all graphics were line drawings with no shading. Items only required a graphic if the item writer had explicitly requested a graphic for the item. Item writers had the option to either hand draw a picture of what the graphic should look like, from which the graphic artist would work to produce an electronic version, or describe the graphic in detail. There were generally very few graphics that were deemed unclear with regard to item writer intent. When intent seemed unclear, the item writer was contacted directly for clarification. All graphics were produced to be as simple and clear as possible.

### **Scaling**

Four primary steps were followed during the scaling of all the items: (a) creating a piloting plan, (b) choosing appropriate anchor items and creating pilot forms, (c) recruiting subjects and piloting the items, and (d) calibrating all items to be on the same scale.

**Piloting plan.** For each grade, a piloting plan was drafted to create pilot forms. The plan included 50 items in each pilot form with anchor items between forms within a grade (horizontal anchors) and between grades (vertical anchors). For all pilot forms, the plan called for 5 horizontal anchor items linking to the previous pilot form and 5 horizontal anchor items linking to the following pilot form (e.g., pilot form 2 would have 5 anchor items linking to pilot form 1 and five anchor items linking to pilot form 3). For sixth and eighth grade forms, there were an additional 10 vertical anchors: 5 from within the grade and 5 from seventh grade. However, for the seventh grade forms the plan called for 15 vertical anchors: 5 sixth grade items, 5 seventh grade items, and 5 eighth grade items. The vertically-anchored design was thus balanced, with students in both grades taking the same vertically-anchored items (e.g., sixth graders taking sixth- and seventh-grade items and seventh graders taking the same sixth- and seventh-grade items).

The increase in the number of vertical anchors in seventh grade meant that the number of unique items in each form was reduced. Because the pilot forms were already quite lengthy, we opted to produce more forms for seventh grade to get all the items piloted, rather than increasing the number of items per form. The full piloting plan is displayed for grade 6 and 8 in Table 1, and for grade 7 in Table 2. There were 25 forms planned for grades 6 and 8 and 29 forms planned for grade 7. Notice that this plan delineates how items were anchored horizontally, but only designates the number of items to be anchored vertically (i.e., it does not show *how* the items were anchored vertically). In each table, subscripts indicate the anchor set. It is important to note that while each form had two sets of horizontal anchor items (one linking to the previous form and one linking to the following form), the set of anchor items designated for vertical scaling repeated across five forms before a new set began. In other words, while there were 25

sets of anchor items designated for horizontal scaling, there were only 5 sets designated for vertical scaling. Decreasing the number of sets used for the vertically-anchored items meant that more students would be administered the vertically-anchored items. Large samples were deemed necessary for the vertically-anchored items given their importance to vertical scale stability (Kim, Lee, Kim, & Kelley, 2009). In grade 7, there were again only 5 sets of vertically-anchored items, but in forms 26-29 the vertically-anchored sets repeated (i.e., form 26 had vertically-anchored set 1, form 27 had set 2, etc.).

**Choosing anchors and creating pilot forms.** A team of four researchers worked together to choose all appropriate anchor items. One of the researchers had a Ph.D. in Educational Measurement and Evaluation, two were Ph.D. students in an Educational Methodology, Policy, and Leadership program, and one had a Master's degree and was a retired educator with over 20 years of experience in the field, including running an alternate assessment program for the state of Oregon. The researcher with the Ph.D. had not previously worked with any of the items, but took time to familiarize herself with them prior to any work. The two Ph.D. students were intimately familiar with all items, as they had led the majority of the review sessions. The retired educator had also assisted in the review process and was thus familiar with all items.

There are 5 CCSS domains in each of grades 6-8. Because each set of anchors included 5 items, one item from each CCSS domain was chosen for each anchor set. There was a two-stage process for selecting anchor items. For the first stage, domains within each grade were divided among the researchers, with each researcher assigned specific domains. The researchers then worked individually to review all items from within the assigned domain to identify potential candidates for anchoring. The large pool of items within each domain was decreased to

approximately 35-45 items by each individual researcher. For 6<sup>th</sup> and 8<sup>th</sup> grade, there were a total of 30 anchor items needed per domain: 5 for the vertical anchor sets and 25 for the horizontal sets. For seventh grade, there were a total of 34 anchors needed per domain: 5 for the vertical anchor sets and 29 for the horizontal sets. Thus, the number of items chosen as potential candidates was increased in grade 7.

When looking for possible candidates for anchoring, the researchers followed a number of guidelines – outlined in Table 3. Items that were to be used for vertical anchoring also had the additional requirement that they be at certain difficulty levels. It was impossible to know the difficulty of the items empirically, as the items had not previously been piloted. However, judgments were made based on the number of steps required to solve the item and other features that might increase or decrease the overall difficulty (e.g., size of the numbers used, fractions, etc.). Items in sixth grade chosen for vertical anchoring were intended to be difficult for the average sixth grader. Items in seventh grade chosen for vertical anchoring were intended to be of average difficulty for an average seventh grader. Items in eighth grade chosen for vertical anchoring were intended to be quite easy for an average eighth grader.

Stage 2 of choosing appropriate anchors included the group of researchers working together to select the most appropriate anchor items from the 35-45 items selected by the individual researcher as possible candidates. From the smaller pool of items, the group of researchers systematically chose items for anchoring while eliminating weaker items. Occasionally, the group eliminated items to the extent that there were no longer enough remaining to fulfill the anchoring requirements of the piloting plan. In these cases, the group went back to the full pool of items within the specific standard and discussed strengths and weaknesses of different items until enough items had been chosen for anchoring.

After the anchor items were chosen, pilot forms were created. The first 10 items of every form were designated for horizontally-anchored items, with items 1-5 linking to the previous form and items 6-10 linking to the following form. The vertically-scaled items came next in ascending order by grade-level. Finally, the unique items were last. All unique items were stratified across forms by standard.

**Participant recruitment and piloting.** A minimum of 200 student responses to each item were needed to obtain stable and accurate item calibrations. The form creation outlined above led to 25 pilot forms in grades 6 and 8 and 29 pilot forms in grade 7. To fulfill the minimum response count per item, we needed at least 200 students completing each form, leading to a  $25 \times 200 = 5,000$  student minimum sample size at grades 6 and 8 and  $29 \times 200 = 5,800$  student minimum sample size at grade 7. We restricted the number of forms piloted to 13 in grade 6 and 8 and 15 in grade 7 to reduce the total sample size needed, with the remaining forms banked for future piloting. The pilot was open to individual teachers across the United States, which increased the geographic diversity of the sample. No student-level information was collected (e.g., demographics).

For the actual item pilot, students logged on to the pilot website (<http://math.easycbm.com/>) and selected their grade level. They were then immediately administered one of the pilot test forms. The test form the student was administered was assigned automatically by the online assessment engine, based on the number of students who had taken that form previously. That is, students were assigned the test form that had the fewest student responses overall. Data were automatically recorded based on the students' response (a, b, or c) to each question. Given that students were assigned test forms based on the sample size taking

that form, nearly all students in a computer lab could take the test simultaneously and each have different tests administered. This approach limited the degree to which cheating was a concern.

When piloting the items, the computer automatically logged the time students began and completed the test form they were taking. From these variables, we were able to calculate the time it took each individual to take the test. Inspection of these data revealed a portion of students who completed the test unrealistically quickly (e.g., less than 1 minute for all 50 items). The proportion of correct responses for these students also suggested random guessing (~33% correct). Figure 1 displays a line plot of students' mean scores for the first hour of test administration. In the figure, the time it took students to complete the test is plotted along the x-axis with their corresponding score plotted along the y-axis. There were 125 students who took 11 minutes to complete the test, with an average score of 20.22. The average score was thus above what would be expected by random guessing. Further, we had three student workers complete one test at each grade as quickly as possible while responding to answers correctly. The average time it took each of them to complete the test was over 10 minutes. Given that the student workers took longer than 10 minutes to complete the test, and that 11 minutes was the first time increment with an average score above 40% correct (i.e., first score that was more than 5% above the random guessing range), we decided to remove from the dataset all students who had completed the test in 10 minutes or less. Removing these students enabled us to largely maintain the minimum sample size necessary for each item, while simultaneously reducing the unreliable data in the dataset based on students who had not attempted to complete the tests with accuracy.

**Item calibration.** All items were calibrated to be on the same scale with a 1-parameter logistic Rasch model in a concurrent equating design, using Winsteps version 3.6.8 (Linacre,

2008). In other words, all student and item parameters were estimated simultaneously from a single data file containing all student responses, grades 6-8. The Rasch model is defined as

$$P(X_{is} = 1|\theta_s, \beta_i) = \frac{\exp[(\theta_s - \beta_i)]}{1 + \exp[(\theta_s - \beta_i)]} \quad (1)$$

where  $P$  = probability,

$X_{is}$  = the response of student  $s$  to item  $i$ ,

$\theta_s$  = the estimated ability of student  $s$ , and

$\beta_i$  = the estimated difficulty of item  $i$ .

The equation indicates that the probability of a correct response ( $X_{is} = 1$ ) is a function of the student's ability and the difficulty of the item. In the right portion of the equation,  $\exp$  is the natural log base (2.718) raised to the power of  $\theta_s - \beta_i$ , the difference between the students' estimated ability and the difficulty of the item. The natural log base changes the scale from probability to the log odds of a student responding correctly. These log odds can then be used to create an equal interval logit scale for all parameters in the model (i.e.,  $\theta_s, \beta_i$ ). The end result is items and students being placed on the same scale, and thus being directly comparable. The concurrent equating design estimates students' ability by their response to *only* the items to which the students actually responded, while treating all remaining items as missing. Items are placed on the same scale through the anchor items (see Tables 1 & 2) and all parameters are estimated simultaneously.

**Form creation.** All test forms were created with a process aimed at maximizing the comparability of the test form difficulties, while stratifying an equal number of items from each CCSS in each form. The process began by first eliminating from the total pool of items any that did not fit the model well. We followed the recommendations by Wright and Linacre (1994) when evaluating item fit, relying primarily on the value of the mean square outfit. Wright and

Linacre recommend that any item with a mean square outfit smaller than 0.8 or larger than 1.2 be eliminated for any high-stakes multiple-choice test. After we excluded items falling outside the fit criteria, items were sorted in ascending order by CCSS based on their estimated difficulty. Within each standard, 5 sets of 13 items were needed (given that there were 13 total forms and each form called for 5 items from each standard). Ideally, the range of item difficulties within each set would be small, given that any differences between the easiest item and the most difficult item would be reflected in the forms. Thus, prior to selecting the 5 sets, we calculated the range of item difficulties for all possible sets and selected the 5 sets with the smallest range.

A process for selecting items to forms was created that distributed items according to the difficulty of the items previously assigned to the form. That is, if Form A was assigned an easy item from Set 1, then a more difficult item would need to be assigned to Form A from Set 2 to “wash out” the differences and ensure that all forms were of comparable difficulty. Our form creation process followed 5 steps:

- 1) Arbitrarily assign Set 1 (13 items from a given standard) to the first item of all 13 forms.
- 2) Compute the mean item difficulty from Set 1.
- 3) Compute the deviation of each item difficulty from the mean item difficulty from Set 1 (residual). Negative residuals thus indicate items that are easier than the average from the set, while positive residuals indicate items that are more difficult than the average from the set.
- 4) Assign the most difficult item from Set 2 to the second item on the form with the most negative deviation. Assign the second most difficult item from Set 2 to the second item on the form with the second most negative deviation, etc., until the easiest item from Set 2 is assigned to the second item on the form with the most positive deviation.

- 5) Compute mean item difficulty for Set 2 and begin the process over for Set 3.
- 6) Continue the process until all items are assigned to all forms.

Ideally, the residuals from each form would sum to 0. That is, regardless of whether a form had a single item that was particularly easy or particularly difficult, the overall distribution of items within a form would equal the average difficulty of the sets represented. Similar to individual items, negative summed residuals would indicate a form that was easier overall than the other forms, while positive summed residuals would indicate a form that was more difficult overall than the other forms. However, one could also simply examine the average item difficulties of each form.

To ensure that the forms function comparably regardless of a student's estimated ability level, we produced test information function (TIF) and test characteristic curve (TCC) plots. *Information* can be traced back to Sir R. A. Fischer, and is defined as “the reciprocal of the precision with which a parameter could be estimated” (Baker, 2001, p. 107). The test information function plots display the information obtained by the estimated ability of the student. Substantial differences between test forms at any ability level would indicate that the error in student scores, and thus the information obtained, is different between tests. The test characteristic curve, in contrast, displays the relation between students' estimated ability level on the logit scale with their true score estimate on the scale of the measure. Any discrepancies between forms are, again, problematic because students with the same ability should have the same predicted true score.

## **Results**

### **Form Creation**

The item difficulties in each created form are displayed by grade in Tables 4, 6, and 8, while the residuals are displayed in Tables 5, 7, and 9. TIFs and TCCs for each grade level are displayed in Figures 2 -7.

### **Item Statistics**

All item statistics are displayed in ascending order by name in Appendix B and by test form in Appendix C. When examining the items, it is important to understand the item naming convention. For all items, the second digit identifies the grade, followed by the CCSS domain, followed by the standard number. Finally, the last three digits indicate the item number. For example, i6G1001 indicates a sixth grade item written to the Geometry domain, standard 1, item 001. Similarly, i7EE3012 indicates a seventh grade item written to the expressions and equations domain, standard 3, item 012.

It is also important to highlight the meaning of the discrimination statistic displayed. As mentioned, all items were scaled with a one-parameter logistic Rasch model, which implies item discrimination parameters fixed at 1.0 (Linacre, 2008). However, Winsteps can estimate a discrimination index through a post-hoc analysis, which approximates the values that would be obtained through a two-parameter model with discrimination values freely estimated (Linacre, 2008). The distinction between discrimination values estimated as a parameter in the model versus through post-hoc estimation is important. While it does not change the interpretation of the values, caution is advised given that the Winsteps reported values are simply a rough *indicator of* rather than an *estimate of* the item discrimination.

**Distractor Analysis.** All response option statistics are displayed in ascending order by name in Appendix D, and by test form in Appendix E. The interpretation of these statistics is similar to the item parameters, but can be viewed for each option in each item. For all items, the

correct response was coded A, while the asterisk represents missing data. The average person measure should always be highest for the correct response (A) relative to the distractors (B or C). However, viewing the average person measure or the distractors relative to the correct response can provide insight into the functioning of the item. During the item writing process, the goal was for all items to have one near and one far distractor. Thus, items functioning ideally according to the development plan would have one distractor with an average person measure slightly below the measure for the correct response and another distractor functioning substantially below. The development plan was intended to spread out the scale, as distractors with similar average person measures would provide largely redundant information.

### **Conclusions**

In this technical report, we described the development and scaling of the easyCBM CCSS Mathematics assessments, a set of math measures designed for use within a RTI framework at the middle school level. Perhaps the greatest benefit of these new measures is the vertical scale, which enables both intra-individual as well as inter-individual evaluations of growth across multiple school years. It is also important to note that, as a whole, middle school math has been largely ignored in the CBM literature. In an extensive review by Foegen, Jiban, and Deno (2007) only 4 studies were found focusing on mathematics CBMs in middle school. Thus, the measures reported here represent a step towards filling that void. Yet, much work remains to be done. Future studies will begin to provide further validity evidence for the use of the measures within RTI, including alignment with standards, reliability of test forms, alternate form equivalence, and criterion-related validity evidence. Further, while this technical report discusses the full developmental process used, the scaling statistics are reported for only the first half of the items, those piloted and scaled during School Year 2011-2012. The remaining items will be scaled

during the 2012-2013 school year, at which point a new technical report will be available describing the process used to ensure the newly-calibrated items remain on the same scale as those reported here. Overall, it appears the developmental process worked well, as the vast majority of items displayed adequate fit to the Rasch model. All items in the operational test forms fell within Wright and Linacre's (1994) mean square outfit range of recommendation for large-scale tests.

Table 3

*Guidelines for Choosing Anchor Items*

| Guideline # | Guideline   |
|-------------|---|
| 1           | Generally requires more than one step to solve, but not too many (i.e. 4+), or only one step if operation is difficult  |
| 2           | Minimal language requirements outside those needed to solve problem.  |
| 3           | Free of cultural bias, subjects of questions balanced (e.g., sports questions are not overly represented)   |
| 4           | Targets standard (and specific substandard) directly, far below skills (i.e. simple addition) that are requisites of the targeted skill in the standard or OK |
| 5           | Consistent with universal design test features (simplicity, perceptibility, intuitiveness)  |

## Some Basic Item Writing Guidelines

### Why multiple choice items?

*"Selected-response items are the most appropriate item format for measuring cognitive achievement or ability, especially higher order cognitive achievement or cognitive abilities, such as problem solving, synthesis, and evaluation." (Downing, 2006, p. 288)*

- **Validity**
  - Less chance of construct irrelevant variance in scores
  - Allow a given skill to be assessed multiple times (multiple items)
- **Efficiency**
  - Easy to administer
  - Easy to produce
  - Easy to score objectively (as opposed to constructed response item types)

### How do you write a good item?

*Art* or SCIENCE?  
(maybe a little of both)

#### **Answer Options**

- Use only 3 options: 1 correct response and 2 distracters
- Choose logical distracters
- Avoid excess text or irrelevant features

#### **Assess Only Target Knowledge**

- Math
  - Reduce language as much as possible
  - If the item is supposed to assess fractions, make sure it doesn't assess other factors, such as conversions.

#### **Be Sensitive of Bias Issues**

- Keep in mind the population of students who will be taking the items
  - ELL, SWD, Diverse Cultures, etc.

## Universal Design

How should we design a building so the widest range of populations possible can access it?

## Universal Design for Assessment

- Considers *all* characteristics of test-takers.
- Precisely defined constructs.
- Accessible, non-biased items. Primarily BRT Responsibility
- Items amendable to accommodations.
- Simple, clear, and intuitive instructions and procedures.
- Maximum readability and comprehensibility.
- Maximum legibility of text, tables, figures, and illustrations

Thompson, Johnstone, and Thurlow (2002)

TABLE 1  
A Revised Taxonomy of Multiple-Choice (MC) Item-Writing Guidelines

Content concerns

1. Every item should reflect specific content and a single specific mental behavior, as called for in test specifications (two-way grid, test blueprint).
2. Base each item on important content to learn; avoid trivial content.
3. Use novel material to test higher level learning. Paraphrase textbook language or language used during instruction when used in a test item to avoid testing for simply recall.
4. Keep the content of each item independent from content of other items on the test.
5. Avoid over specific and over general content when writing MC items.
6. Avoid opinion-based items.
7. Avoid trick items.
8. Keep vocabulary simple for the group of students being tested.

Formatting concerns

9. Use the question, completion, and best answer versions of the conventional MC, the alternate choice, true-false (TF), multiple true-false (MTF), matching, and the context-dependent item and item set formats, but AVOID the complex MC (Type K) format.
10. Format the item vertically instead of horizontally.

Style concerns

11. Edit and proof items.
12. Use correct grammar, punctuation, capitalization, and spelling.
13. Minimize the amount of reading in each item.

Writing the stem

14. Ensure that the directions in the stem are very clear.
15. Include the central idea in the stem instead of the choices.
16. Avoid window dressing (excessive verbiage).
17. Word the stem positively, avoid negatives such as NOT or EXCEPT. If negative words are used, use the word cautiously and always ensure that the word appears capitalized and boldface.

TABLE 1  
A Revised Taxonomy of Multiple-Choice (MC) Item-Writing Guidelines

Writing the choices

18. Develop as many effective choices as you can, but research suggests three is adequate.
19. Make sure that only one of these choices is the right answer.
20. Vary the location of the right answer according to the number of choices.
21. Place choices in logical or numerical order.
22. Keep choices independent; choices should not be overlapping.
23. Keep choices homogeneous in content and grammatical structure.
24. Keep the length of choices about equal.
25. *None-of-the-above* should be used carefully.
26. Avoid *All-of-the-above*.
27. Phrase choices positively; avoid negatives such as NOT.
28. Avoid giving clues to the right answer, such as
  - a. Specific determiners including always, never, completely, and absolutely.
  - b. Clang associations, choices identical to or resembling words in the stem.
  - c. Grammatical inconsistencies that cue the test-taker to the correct choice.
  - d. Conspicuous correct choice.
  - e. Pairs or triplets of options that clue the test-taker to the correct choice.
  - f. Blatantly absurd, ridiculous options.
29. Make all distractors plausible.
30. Use typical errors of students to write your distractors.
31. Use humor if it is compatible with the teacher and the learning environment.

## Content Concerns

*"Every item should reflect specific content and a single specific cognitive process" (Haladyna, 2004, p. 98).*

### Guidelines

- Make sure to have teachers write items that align with only one standard (or one part of one standard), and that the item targets that standard clearly and directly.
  - Target only one skill in each item. If standard asks for multiple skills, use multiple items.
- Try not to be over-specific or over-general.
- Try not to "trick the students"
- Each item should be independent of all others.
- Avoid focusing items on trivial parts of standards.
- Present items in novel formats

*Note.* The following slides are largely based on Haladyna, 2004.

## Targeting Only One Skill

**Standard 6.SP:** Recognize that a measure of center for a numerical data set summarizes all of its values with a single number, while a measure of variation describes how its values vary with a single number.

### Example item 1

Which number describes the center of the dataset?

Dataset: 5, 7, 3, 3

- A) Average – 4.50
- B) Standard deviation – 1.91
- C) Range – 4.00

### Example item 2

Which number describes the center of the dataset?

Dataset: 5, 7, 3, 3

- A) 4.50
- B) 1.91
- C) 4.00

### Targeting Only One Skill

#### Example item 1

- The first item provides the student with the name of the statistic **AND** the number.
- The target skill of the item (measure of central tendency) is not confused with other math skills.

#### **HOWEVER -**

- Item still requires vocabulary and reading skills

#### Example item 2

- Second item requires student to both know the best statistic (average) **AND** to recognize which number represents that statistic.
- Item has less text, but in this case, the text may help target the skill of interest.

### Targeting Only One Skill

- Both items target only one part of the standard (central tendency), yet item 2 still targets multiple math skills.
  - Note: if we were interested in knowing students' skills with calculating the average, we could easily address it with a different item.

#### Example

The average of: 4, 3, 9, 4 = ?

- A) 5
- B) 20
- C) 4

## Over-specific/Over-general

### Over-specific item

Who wrote the *Icon of Seville*?

- A) Lorca
- B) Ibanez
- C) Rodriguez

Over-specific items often assess trivial content.

### Over-general item

Which is the most serious problem in the world?

- A) hunger
- B) lack of education
- C) disease

Over-general items are often opinion-based.

Balancing the generality of an item is part of the “art” of writing good items.

Note. Examples from Haladyna, 2004, p. 102.

## Trick Questions

- Is there a fourth of July in England?  
Yes, there is a fourth of July everywhere.
- Some months have 31 days. How many have 28?  
All of them
- How many animals of each gender did Moses bring on his ship?  
None. Moses didn't have a ship, Noah did.
- A butcher in the meat market is six feet tall. What does he weigh?  
Meat

Note. Examples from Haladyna, 2004, p. 104.

### Trick Questions

*"There are enough problems in testing without contributing more by using trick items." (Haladyna, 2004, p. 104)*

### Formatting Concerns

- Make sure stem is a complete sentence.
- Make sure item is multiple choice, and contains three options (correct response and two distracters).
- Always place correct response as answer option A
  - Because items will be computer-administered, we will randomly rotate all options. For development purposes, it's easiest to always keep the correct response in a consistent location.

**All other formatting concerns are BRT responsibility**

### Style Concerns

- Please proof read all items provided to you by the teachers
  - Encourage teachers to proof read all items before turning the items in to you to reduce your workload
- Primary things to look for:
  - Grammar
  - Can the reading load be reduced without losing clarity?

### Stem Construction

- Try to be as clear and concise as possible
- Make sure the stem is complete and contains all the information needed to solve the problem.

### Developing options

- Probably the most difficult part of an item to develop.
- Answer options must be reasonable and have only one justifiably correct answer (e.g., if you can make a reasonable argument that one of the distracters is also correct, it is not a good distracter).

### Developing options

In a perfectly functioning item...

- Stem contains all the information needed to solve the question
  - Answer option A is the correct response, and will be chosen by students who understand the content targeted by the item.
  - Answer option B is a close distracter, and will be chosen by students who have partial, but incomplete knowledge of the content targeted by the item.
  - Answer option C is a far distracter (but not TOO far), and will be chosen by students who have little to no knowledge of the content targeted by the item.

### Developing options

- Keep format of each option the same (length, grammar, etc.)
- Do not use “all of the above” or “none of the above”
- Keep distracters plausible, but avoid hinting at the correct response.
- Try to use distracters that represent typical student errors

### Developing options

- Although guidelines can help, coming up with reasonable options is difficult. Getting the options to all function the way they are intended to is even more difficult.
  - Why some refer to item writing as an art.

### Hypothetical example

- Imagine a kindergarten or first grade standard that requires students have knowledge of basic shapes.
  - i.e., squares, circles, triangles, rectangles, etc.

### Item Non-Example

Greg and Sally were both in the first grade. Greg liked the color blue and always wore a blue shirt. Sally liked the color green and always wore a green shirt. Which shirt has more triangles on it?

- |          |          |              |
|----------|----------|--------------|
| a) blue  | c) Sally | e) triangles |
| b) green | d) Greg  |              |

### Why this is a poor item

- Way too much text
- Lots of irrelevant information
- Low-cognitive-level question (basically counting)
- What if the student is color blind?
- Too many options
  - Not logical distracters
  - There is arguably more than one correct response option (either blue or Greg)
- Doesn't really address the standard
- Et cetera

### Item non-example 2

Triangles:

- a) have three sides
- b) have two long sides and two short sides
- c) have rounded edges
- d) all of the above
- e) none of the above

### Why this is a poor item

- Stem does not present the information needed solve the problem.
- Uses the “all of the above” and “none of the above” options
  - Although there is some empirical evidence supporting that the “all of the above” option increases the difficulty (Huang, Trevisan, & Storfer, 2007), the general consensus is that it creates a “cueing” effect for students. Also, students may choose these options with mis- or partial knowledge.

### Better item

Which is a triangle?

### Why this is a better item

- Clearly addresses the standard
- Low level of text
- No irrelevant information

### Language Issues

For math items, excess text threatens validity

- Particularly worrisome for English language learners

#### What to do?

- |   |   |
|---|---|
| – Use familiar words  | – Avoid conditional and relative clauses      |
| – Omit all unnecessary words                                      | – Avoid negation                              |
| – Use no text if possible, or keep sentences as brief as possible | – Use concrete versus abstract representation |

## Now.... Time to look at some real items!

Existing easyCBM items

### Existing easyCBM items

- *Note.* There's only a limited amount we can learn from these items
  - Aligned to different standards
  - Developed for a different population

#### **However**

- Formatting will be similar
- Universal design features evident
- Good item writing principles applied
- Perhaps most important – **We know they work!**

### Existing easyCBM item

**Standard:** Solve problems about similar objects (including figures) by using scale factors that relate corresponding lengths of the objects or by using the fact that relationships of lengths within an object are preserved in similar objects.

- A.  $\frac{4}{5}$  in.  
 B. 4 in.  
 C. 5 in.

**Remember:** These items were designed for very low performing students. The new items should target students at or slightly below grade-level expectations.

- Universal Design features?
- Targets a single skill?
- Over-specific/over-general?
- Clear and concise?
- Alignment?
- Other concerns?

### Existing easyCBM item

**Standard:** Use descriptive statistics, including mean, median, and range, to summarize and compare data sets.

- A. \$11.50  
 B. \$9  
 C. \$12

- Universal Design features?
- Targets a single skill?
- Over-specific/over-general?
- Clear and concise?
- Alignment?
- Other concerns?

### One more...

**Standard:** Explain why the sum of the measures of the angles in a triangle is 180 degrees, and they apply this fact about triangles to find unknown measures of angles.

- A.  $38^\circ$
- B.  $71^\circ$
- C.  $16^\circ$

- Universal Design features?
- Targets a single skill?
- Over-specific/over-general?
- Clear and concise?
- Alignment?
- Other concerns?

### How do you become a good item writer?

*"Effective item writers are trained, not born... Although item writers must be expert in their own disciplines, there is no reason to believe that their subject matter expertise generalizes to effective item writing expertise."*  
(Downing, 2006, p. 11)

### Bottom line

*"Practice does not make perfect. Only perfect practice makes perfect."*

*~Vince Lombardi*

- Practice, practice, practice.
  - Practice writing different types of items
    - Geometry, number & operation, etc.
  - Look back at other test items
    - Find examples of good and bad items

### Resources

- Multiple choice item writing Do's and Don'ts
  - <http://www.eric.ed.gov/PDFS/ED398238.pdf>
- Recommendations portion of the following IDEA paper
