Department of Health and Human Services, Administration for Community, Living National Institute on Disability, Independent Living, and Rehabilitation Research (NIDILRR), grant number 90RTGE0001. The information developed by the StatsRRTC does not necessarily represent the policies of the Department of Health and Human Services, and you should not assume endorsement by the Federal Government (Edgar, 75.620 (b)).

The StatsRRTC is part of the Institute on Disability (IOD) at the University of New Hampshire (UNH). The IOD was established in 1987 to provide a university-based focus for the improvement of knowledge, policies, and practices related to the lives of people with disabilities and their families and is New Hampshire's University Center for Excellence in Disability (UCED). Located within UNH, the IOD is a federally designated center authorized by the Developmental Disabilities Act. Through innovative and interdisciplinary research, academic, service, and dissemination initiatives, the IOD builds local, state, and national capacities to respond to the needs of individuals with disabilities and their families.

Introduction

Make the Call. Statistics are a powerful tool. The National Bureau of Economic Research tracks changes in the national gross domestic product, a key indicator of economic activity, to "make the call" as to whether the economy is in recession. On the first Friday of each month, the Bureau of Labor Statistics releases the official unemployment rate to monitor the labor market. Each year during the second week of September, the Census Bureau publishes the official poverty rate and whether an increase or decrease in the poverty rate was detected. The Centers of Diseases Control and Prevention's Health People program tracks health indicators over the course of each decade. The goal of the Annual Report on People with Disabilities in America is to track the progress of people with disabilities using key social and economic indicators and "make the call" (for each indicator) as to whether an increase or decrease was detected.

Topics. The Annual Report will include many of the key indicators identified in a comprehensive 2008 study, Keeping Track: National Disability Status and Program Performance Indicators, conducted by the National Council on Disability (NCD). This NCD report used a systematic approach of stakeholder input to select indicators based on data availability and ability to address key areas of interest to stakeholders. The resulting indicators were in the following areas of interest: employment, educational attainment, health and health care, financial status and security, leisure recreation, personal relationships, and crime/safety. At the top of each topic the population being studied is noted in parentheses. In the coming years, the Annual Report will add more of the NCD indicators in these areas, as well as indicators for which data has only recently become available.

Methods. The current set of indicators is derived from the American Community Survey (ACS). In future years, other data sources will be used to track other indicators. The ACS is an annual survey conducted by the Census Bureau and is well-suited to track indicators over time due to its large sample size, consistent questionnaire over the years, and multitude of variables to examine. The Public Use Microdata Sample (PUMS) files were used to estimate the statistics enclosed. The PUMS files allow data users to conduct custom analyses. At the top of each topic the population being studied is noted in parentheses. Sample weights and replicate sample weights were used to produce nationally representative statistics that account for sample design effects. Statistical significance is based on a one-tail test using a 95 percent level of confidence.

COVID-19 Impact on Data Collection. The ACS uses a mix of internet, mail, telephone, and in-person interviews to collect data. Due to the COVID-19 Pandemic, data collection activities were interrupted. In-person interviewing ceased on March 20, 2020, and only internet and telephone interviewing continued through the end of June 2020. In July and August 2020, limited in-person interviewing resumed in certain geographic areas, expanding throughout the year. However, the ACS resumed pre-COVID in-person interviewing coverage in February 2021. Mailings were also limited due to a decrease of federal staff and resources during this same time period. This impacted not only mail data collection but also telephone response rates due to the lack of pre-notice mailings typically sent in advance of first contact.

Due to these data collection challenges, the U.S. Census Bureau assessed the 2020 ACS for new biases (i.e., differences from previous years) due to nonresponse and coverage and examined data quality issues associated with low sample sizes high and high item non-

response rates. Due to the corresponding bias in some point estimates, combined with the lower reliability of estimates, the standard 1-year ACS estimates were not released. Instead, U.S. Census Bureau-issued experimental weights which have been applied to provide the best estimates for 2020 at the national and state level. Data users should not interpret substantial changes from 2019 as evidence of a trend or statistically significant difference. Estimates using the experimental weights are generally considered the best possible estimates of U.S. population statistics in 2020, but comparisons should not be made to prior years. As a result, a red line appears between the rows of 2019 and 2020 in the table below. No statistical tests conducted comparing estimates from 2019 and 2020. In each of the line graphs below, there is no line connecting the 2019 data point to the 2020 data point.

Due to the variance properties of the experimental estimation methodology, the standard error estimates for some PUMS estimates may be smaller than expected when compared to the equivalent variance estimates from previous years. (Census Bureau: https://www.census.gov/programs-surveys/acs/data/experimental-data/2020-1-yearpums.html)

Findings: Gaps. The Annual Report tracks the "gap" between people with and without disabilities for key indicators related to education, employment, earnings from work, poverty, health insurance, health insurance, transportation, and housing. In 2020, for each of these indicators, a "statistically significant" gap was detected, meaning that we are certain that each of these gaps is greater than zero. In other words, we are certain (with at least 95 percent confidence) that a given gap exists. It is also important to note that statistical significance is not the same as the term significance or meaningfulness. Whether the magnitude of any gap is meaningful from a social or policy perspective is a matter for further discussion.

Findings: Changes in Gaps. Unfortunately, due to the data collection issues, described above, there is no way to determine whether the gaps between people with and without disabilities increased. There is no news on whether 2021 estimates will be comparable to 2020 estimates or 2019 estimates. Stay tuned.

Additional Resources. The Annual Report complements the detailed tables of data which can be found in the Annual Disability Statistics Compendium (www.DisabilityCompendium.org). For reasons discussed previously in methods, the statistics reported in the Annual Report might differ from those reported in the Annual Disability Statistics Compendium and Supplement. Help navigating any of the resources described here can be found in the Frequently Asked Questions section at www.DisabilityCompendium.org/fag. Assistance interpreting and locating additional statistics is available via our toll-free number, 886.538.9521, or by email, Disability.Statistics@UNH.edu. For more information about our research project, please visit www.ResearchOnDisability.org.

Appendix

The six disability questions in the American Community Survey (ACS) are listed below as they appear in the 2019 English language questionnaire:

- G. Answer question 17a if this person is covered by health insurance. Otherwise, SKIP to question 18a.
 - 18. a. Is this person deaf or does he/she have serious difficulty hearing? [yes or no]
 - b. Is this person blind or does he/she have serious difficulty seeing even when wearing glasses? [yes or no]
- H. Answer questions 19a c if this person is 5 years old or over. Otherwise, SKIP to the questions for Person 2 on page 12.
 - 19. a. Because of a physical, mental, or emotional condition, does this person have serious difficulty concentrating, remembering, or making decisions? [yes or no]
 - b. Does this person have serious difficulty walking or climbing stairs? [yes or no]
 - c. Does this person have difficulty dressing or bathing? [yes or no]
- 1. Answer question 20 if this person is 15 years old or over. Otherwise, SKIP to the questions for Persons 2 on page 12.
 - 20. Because of a physical, mental, or emotional condition, does this person have difficulty doing errands alone such as visiting a doctor's office or shopping? [yes or no]

Glossary

American Community Survey (ACS) – The American Community Survey (ACS) is a large, continuous demographic survey conducted by the Census Bureau that will provide accurate and up-to-date profiles of America's communities every year. Annual and multiyear estimates of population and housing data are generated for small areas, including tracts and population subgroups. This information is collected by mailing questionnaires to a sample of addresses. See the Census Bureau website for additional details.

Bachelor's Degree or More – A person has attained a bachelor's degree or more, if the person has received a bachelor's degree (for example, BA and BS), master's degree (for example, MA, MS, MEng, MEd, MSW, MBA), an advanced professional degree (for example, MD, DDS, DVM, LLB, JD), and/or a doctorate degree (for example: PhD, EdD).

Civilian – A person is a civilian, if the person is not in the active-duty military.

Disability – In the ACS, the Census Bureau used responses to six questions to identify whether a person has a disability. These questions ask about difficulties related to vision, hearing, cognition, ambulation, self-care, and independent living. (See Appendix for the wording these six questions.) A person is coded as having a disability, if an affirmative (yes) response is recorded from one or more of these difficulties.

Earnings – Earnings include wages, salary, commissions, bonuses, or tips from all jobs, before deductions for taxes, bonds, dues, or other items. Earnings are reported on an annual basis for the past 12 months reference period. The ACS is fielded over the course of the survey year.

Employed – Individuals were asked a series of questions designed to identify their employment status. Based on the answers, individuals were classified into one of five groups: (1) people who worked at any time during the reference week; (2) people on temporary layoff who were available for work; (3) people who did not work during the reference week but who had jobs or businesses from which they were temporarily absent (excluding layoff); (4) people who did not work during the reference week, but who were looking for work during the last four weeks and were available for work during the reference week; and (5) people not in the labor force.

Gap – The difference between estimates of a given indicator (such as the percentage of people employed) for two different sub-populations, usually people with and without disabilities.

Full-Time, **Full-Year** – A person is considered to be a full-time, full-year worker, if the person worked 35 hours or more per week for 50 to 52 weeks in the past 12 months.

Health Insurance Coverage – A person is covered by health insurance, if it is indicated that the person is covered by: (a) insurance through a current or former employer or union (of this person or another family member); (b) insurance purchased directly from an insurance company (by this person or another family member); (c) Medicare, for people 65 and older, or people with certain disabilities; (d) Medicaid, Medical Assistance, or any kind of government-assistance plan for those with low incomes or a disability; (e) TRICARE or other military health care; (f) VA (including those who have ever used or enrolled for VA health care); (g) Indian Health Service; and/or (h) Any other type of health insurance or health coverage plan.

Income – The ACS asks for income amounts for the following eight categories: (1) wages, salary, commissions, bonuses, or tips from all jobs (before deductions for taxes, bonds, dues, or other items); (2) self-employment income from own nonfarm businesses or farm businesses, including proprietorships and partnerships (after business expenses); (3) interest, dividends, net rental income, royalty income, or income from estates and trusts; (4) Social Security or Railroad Retirement income;

(5) Supplemental Security Income (SSI); (6) any public assistance or welfare payments from the state or local welfare office; (7) retirement, survivor, or disability pensions (not including Social Security); and (8) any other sources of income received regularly such as Veterans' (VA) payments, unemployment compensation, child support or alimony. The sum of these incomes across all persons in a family is used to determine poverty. See the definition of poverty in this glossary.

Less than a High School Diploma - A person has attained less than a high school diploma, if the person has not received a high school diploma, General Equivalency Degree (GED), or alternative credential.

Living in the Community – A person lives in the community, if the person is not living in an institution, such as jail, prison, nursing home, and hospital. A college dormitory is not considered an institution.

No Difference Detected – No difference detected (i.e., statistical insignificance) is a statement, conveying that the likelihood of rejecting a null hypothesis, when it is true, is above a certain assumed threshold, such as 5 percent. For example, in Table 2, no difference was detected between the 2017 employment gap (41.0% pts) and the 2013 employment gap (40.9% pts). In other words, there is a less than a 95 percent chance that we have not detected a difference. Basically, given the data, we can't tell.

Noninstitutionalized Population – Individuals not living in institutions, such as jails, prisons, nursing homes, and hospitals. College dormitories are not considered institutions.

Population Size – The total number of inhabitants in a defined geographic area including all races, classes, and groups.

Poverty – The Office of Management and Budget in Statistical Policy, Directive 14 creates income thresholds (i.e., poverty lines) based on the cost of a standard bundle of goods and services that family needs. Different income thresholds are created based family size and age composition (i.e., number of persons under age 18 and number of persons 65 and older). In the ACS, information about income. household size, and household age composition is used to determine whether a person lives in a family with income below the poverty line of the person's family. See the definition of income in this glossary.

Public Use Microdata Sample (PUMS) Files – The ACS PUMS files contain household- and individual-level data, pertaining to responses to the ACS questionnaire and other variables (such as sample weights). Data are edited to protect anonymity.

Sampling Error – Sampling error occurs when a statistic is estimated using a sample rather than the entire population.

Standard Error – The standard error is a measure of the deviation of a sample estimate from the average of all possible samples. It is a measure of how imprecisely a statistic is measured with respect to sampling error. It typically decreases as sample size increases and decreases as the variation in the phenomenon being measured decreases.

Statistical Significance - Statistical significance is a statement, conveying that the likelihood of rejecting a null hypothesis, when it is true, is below a certain assumed threshold, such as 5 percent. For example, in Table 2, the employment gap in 2017 is statistically significant, because based on the data, there is less than 5 percent chance of rejecting the null hypothesis that the employment gap between people with and without disabilities is greater than zero. In other words, we are 95 percent (or more) confident that we detected a gap between the employment-to-population ratio of people with disabilities and the employment-to-population ratio of people without disabilities.

About the Center

Rehabilitation Research and Training Center on Disability Statistics and Demographics (StatsRRTC)

Policymakers, program administrators, service providers, researchers, advocates for people with disabilities, and people with disabilities and their families need accessible, valid data/statistics to support their decisions related to policy improvements, program administration, service delivery, protection of civil rights, and major life activities. The StatsRRTC supports decision making through a variety of integrated research and outreach activities by (a) improving knowledge about and access to existing data, (b) generating the knowledge needed to improve future disability data collection, and (c) strengthening connections between the data from and regarding respondents, researchers, and decision makers. In this way, the StatsRRTC supports the improvement of service systems that advance the quality of life for people with disabilities.

Led by the University of New Hampshire, the StatsRRTC is a collaborative effort involving the following partners: American Association of People with Disabilities, Center for Essential Management Services, Council of State Administrators of Vocational Rehabilitation, Kessler Foundation, Mathematica Policy Research, and Public Health Institute.

The StatsRRTC is funded by the U.S. Department of Health and Human Services, Administration for Community Living, National Institute on Disability, Independent Living and Rehabilitation Research under grant number 90RTGE00010100, from 2018–2023.
