Whatever may have come of his tremendous labors and those of his faithful assistants during these early years, working under a military supervision, it can not be reasonably doubted that any competent reader of the educational literature thrown up in this period, with the commentary of subsequent events, will be forced to acknowledge that then and there was laid a permanent foundation for the new departure of a system of common schools in the South which should take the little child by the hand and lead him as far as he was able to go along the broadening path to the summit of society. In doing this General Eaton not only incurred the implacable hostility of all evil-disposed, but gained the respect and enjoyed the appreciation of the large body of good people in the South who favored the admission of the colored race to a share in the new common-school system at a later date. The slave-holding class, with its professional and educated environment, has so far been responsible for the majority of the good things done by the Southern people for the negro that have enabled him to reach his present hopeful state. And the best of all the things done has been the opportunity of education which, however imperfect and too often abused and turned to a pretense, is responsible for more of the genuine progress in these States than all the legislation and even the new industrial development of which such account is now being made. Numbers of the best men and women who have honored the country by their great labors in this field of Southern education were either "effectually called" or reliably aided by the hearty cooperation and genuine interest of General Eaton.

Only the limit of space compels the absence from this essay of the entire publication of a remarkable letter addressed by Superintendent Eaton to Mr. Levi Coffin, a distinguished representative of the religious Society of Friends, living in Cincinnati, Ohio, and the agent of the Western Freedman's Aid Committee of that city, dated January 5, 1864. In this almost apostolic epistle the good general sets forth the magnitude of the work intrusted to his charge, the effort to avoid fatal mistakes and the lessons of experience gained by its administration. It was indirectly a letter to all the people of Great Britain, as Mr. Coffin was at that time abroad, and presents with striking freshness the insincerity of the too prevalent distrust and disparagement of the purposes and aspirations of the Union cause.

At this point [he writes] this superintendency, embracing the territory between the lines of our army from Cairo, Ill., down the Mississippi to Red River, La., together with the State of Arkansas, numbered in its care during the past year, 1863, 113,650 freedmen. These are now disposed as follows: In military service, as soldiers, laundresses, cooks, officers' servants and laborers in the various staff departments, 41,150; in cities, on plantations, and in freedmen's villages and cared for, 72,500. Of these, 62,500 are entirely self-supporting—the same as any industrial class anywhere—as planters, mechanics, teachers, preachers, draymen, etc., working on their own responsibility or as hired laborers. The remaining 10,000 receive subsistence from the Government. Three thousand of them are members of families, whose heads are carrying on plantations and have under cultivation 4,000 acres of cotton and are to pay the Government for their subsistence from the first income of the crop. The other 7,200 include the paupers (those over and under the self-supporting age, the cripples, and sick in hospitals) of the 113,650 and those engaged in their care, and instead of being improvident have now under cultivation 500 acres of corn, 790 acres of vegetables, and 1,500 acres of cotton—besides the work done by wood choppers, etc. There is reported the aggregate sum of over 10,000 acres of cotton under cultivation. Of these, about 7,000 acres are loaned and cultivated by blacks. Some of these are managers of as high as 300 or 400 acres. It is impossible to give, at the present date, any definite statement of many of the forms of industry. Fifty-nine thousand cords of wood are reported as cut within the line of 110 miles on the river banks above and below Vicksburg. The amount cut by these people is enormous. The price of cutting is from 50 cents to \$2.50 per cord. Thirteen thousand three hundred and twenty of the whole number have been under instruction in letters, about 4,000 have learned to read quite fairly, and about 2,000 to write. * * * "Each move makes history." To enter upon this duty was to forsake friends and pass under a cloud; to have the sympathies taxed with the most trying forms of suffering and the mind racked by the severest social problems. The path was dark; there was no highway. * * *

In the management of the governmental efforts the aim has been to yield to no prejudice or fancy, to hold fast to common sense and Christian principles, to keep the eye on the lessons of history, and to search for their just teaching in regard to present times and exigencies; in a word, to make all governmental action to be simply the administration of justice between them as a freed people. The gifts of funds and supplies by the nation report a sum of \$300,000. * * * In striking the balance of expense and income to the Government of this emancipation policy we have to calculate what their industry would have produced in army supplies to the rebels from their presence in all the large cities, as the 15,000 in Memphis contribute a loyal element of security and strength; the value of the colored soldier, as well officered and disciplined, rapidly increasing in efficiency and commanding the respect of friend and foe. We overlook the fact that no one of these soldiers has cost the Government a bounty of \$300 or \$400. Of the five or tens of thousands sometimes fed, only 10,000 now receive supplies. * * * The wages of labor run as high as \$45 per month. * * * Evidences of the success of free compensated labor are becoming abundant. Shrewd Southern business men are confessing the greater profitableness of free labor. It is safe to count on motives of profit and the advancement of Southern sentiment as well as the social, mental, and civil weight of the entire black population and the result of the larger military operations in the work of reconstructing society in these regions. * * * The plan of General Grant was to gather the freed slaves on the right side on the rich soil along the rivers, in a sufficient number for defense as regular troops or militia, and put all others to industry, educate them, regulate the communities by martial law, under a head reporting to the Secretary of War directly under the Executive, and thus not only vindicating the policy of emancipation before mankind by offering an asylum for the comfort and training of the liberal rebels, by so much to weaken and demoralize their armies, to increase the number of troops in the field, and by lining the river banks for miles in breadth with a loyal population, self-supporting, and contributing to the revenue, to render thus secure the water courses, and then to cooperate in making successful our military operations. * * * Assure friends and all coworkers for truth in England that while those of us thrown among the most trying scenes of the war ask the candid judgment and manly sympathy and cooperation that it deserves, and such material aid for the distressed as their charity can bestow, we are not only confident of success, but that America will not make this great sacrifice of her precious life and blood in vain, either for her own people or the rest of mankind.

THE INAUGURATION OF THE COMMON-SCHOOL SYSTEM AMONG THE COLORED PEOPLE OF LOUISIANA, BY GEN. N. P. BANKS, 1863-64.

Gen. Benjamin F. Butler, who had cooperated with Admiral Farragut in the capture of New Orleans in 1861, and performed most effective duty as the greatest chief of military police developed in the Union armies during the civil war, was released from his command in 1862 by the appointment of Gen. N. P. Banks, also of Massachusetts, to his department. In the autumn of 1862 General Banks left the harbor of New York with an army of 20,000 volunteers, under orders to open the lower valley of the Mississippi River and establish himself at a commanding position in the Red River country, for the protection of Louisiana, Arkansas, and eastern Texas. A series of military operations, with varied fortunes, in the year 1863 culminated in the capture of Port Hudson, a few days after the fall of Vicksburg, Miss., which accomplished the opening of the great river from the Gulf to Cairo and the virtual establishment in the entire region along its banks of the authority of the Union.

But previous to this, by the request of President Lincoln, encouraged by the condition of civil affairs in the department of General Banks, the loyal people of Louisiana had inaugurated a movement for the return of the State to the Union. In December, 1862, two Union Representatives to Congress were elected by a vote, perhaps representing one-tenth of the white population of the State, under the protection of General Shepley, military governor of Louisiana, and in February, 1863, the Commonwealth was once more represented in the Congress of the United States. After the important series of victories for the Union armies in 1863, President Lincoln proposed a definite plan of reconstruction to Congress. The substance of the plan was that, after eliminating certain classes in the seceding States from the suffrage, one-tenth of the voting population of 1860, of loyal tendencies, might be intrusted with the formation of a State government.

In January, 1864, a free State convention was held in New Orleans, followed by a proclamation from General Banks containing suggestions for reconstruction. In February, 1864, a governor was chosen, and inaugurated on March 4. A new State constitution was formed, which contained a prohibition of negro slavery and a provision for the establishment of a system of free schools. While the political side of the movement somewhat miscarried, owing to a conflict of opinion between Congress and the President, calling his action to account in the method of reconstruction, the destruction of slavery and the establishment of the most deadly enemy of all slaveries, the people's common school, remained intact.

Immediately after this reorganization of the State, on March 22, 1864, General Banks issued an order for the establishment of a system of common schools for the freedmen. A board of education was created by the Department of the Gulf, with power to establish common schools, employ teachers, build schoolhouses, arrange courses of study, and exercise the general authority usual in the school systems of the Northern States. The purpose of the order was stated "for the rudimental instruction of the freedmen of the department, placing within their reach the elements of knowledge which give intelligence and value to labor." With the exception of a few of the French creole families, under the old order the teaching of the negro had been strictly prohibited by law, but at once there sprung into existence as by magic a complete system of public instruction.

At least 150 schools for colored children, with 265 teachers and 14,000 pupils, were established. In the city of New Orleans 19 large schools, with 104 teachers and 5,750 pupils, were in session. More than 50,000 children of colored people were taught to read in the city and immediate vicinity. The inspector of the Freedmen's Bureau, Mr. J. W. Alvord, in 1866, reported the schools "in a remarkably encouraging condition. No Southern State has so large an organization. No State has excelled Louisiana in the detailed perfection of its school system." A number of

Southern white teachers had been employed and were favorably regarded as having a superior knowledge of the negro. Colored teachers were employed when found capable of doing the work. General Banks, more than twenty years before, as a rising young public man, had been appointed as the first general agent of the State board of education in Massachusetts, then under the administration of Dr. Barnas Sears as secretary of the board and virtual State superintendent of public instruction, and was henceforth known as a fast friend of universal education. He inaugurated the New England idea of combining the academical and industrial elements in the schooling of the colored people in Louisiana. All land owners who employed the negroes in the fields were taxed to contribute to their schooling. A superintendent of instruction, Maj. Rush Pumley, from Philadelphia, was appointed, and the inspector of the Freedmen's Bureau grows enthusiastic in his report over the great success of the experiment.

Here, for the first time, was established in the South a complete system of the American common school, supported by local taxation. In South Carolina, Virginia, and Tennessee, where schools for the freedmen were established under the protection of the military power, the native white people were not directly taxed for their support. By the early political movement in Louisiana during the war, a provision for public education had been placed in the revised constitution of the State, and the schools were virtually placed under State control. There had been several attempts for the establishment of a system of common-school education for white youth in Louisiana previous to 1860, with more or less success, but the most satisfactory result had been reached in New Orleans. About the year 1838, Dr. Shaw, of Massachusetts, had been called to New Orleans in response to the request of the city authorities to Horace Mann, then in the second or third year of his administration, and the public-school system established under his superintendency had already become a permanent feature of municipal policy at the breaking out of the war.

But the provision in the revised constitution for the complete establishment of the system was premature work. For not only the schools, but the constitution under which they were established, was held up by the military army of occupation. The overwhelming public opinion of the white people of Louisiana was opposed to the public schooling of the negroes, although it is probable that the common school public that for so many years had been baffled in its attempt to set up a common-school system for the whites was getting ready to undertake this work, but then unable to support it financially. In 1866 the collection of the tax on landowners for colored schools was suspended by military order. Great numbers of the colored parents petitioned the authorities to permit them to assume the money tax as their own, although already paying their own portion for the general system. It was this condition of suspended action of the schools that we find in the report of the inspector of the Freedmen's Bureau in 1866. Industrial schools for the colored people had meanwhile been opened in New Orleans.

The war period, from 1861 to 1867-1869, can be regarded as a sort of rehearsal for the grand experiment of offering to the 5,000,000 or 6,000,000 emancipated freedmen in the South the complete system of elementary education as then developed in the United States, to the extent to which the people of these States were competent to accept and anybody was able and willing to support it. Indeed, the great experiment from Washington to New Orleans practically included every variety of schooling then in vogue in the country. First came the movement by private charity. Following this came the churches and philanthropic associations for the schooling of the contrabands in camps and barracks; even on the field of battle during an engagement the colored soldiers clutched the spelling book in one hand while they grasped the musket in the other. On this was laid the basis of the extended system of church denominational and private schools, not only for the elementary but the secondary and higher normal and industrial

education, that has become so prominent a factor in all the Southern States, and without which the common schools, the churches, and society of the colored race in general would have been deprived for an entire generation of its most valuable leadership in all departments of its new life. With this has come up a great and beneficent movement for the reformation of the church, school, and society among the negroes, in the general improvement of their condition, and the development of the professional class of teachers, clergymen, physicians, and leaders in their new industrial life.

But far more important and vital than this, indeed, the movement to which all that has been done by the North and the nation has been tributary, was the founding, first in an indirect, and finally in a direct way, of a complete system of schools under the protection and by the support of the military arm of the Government of the United States. Through Gen. Rufus Saxton, in the Department of the South, Gen. John Eaton, jr., in the valley of the Mississippi, and by Gen. N. P. Banks, in Louisiana, this original effort was developed into a veritable public school system of the national type, before the establishment of the Freedmen's Bureau. That amid the tumults of war, and its terrible excitements, and an almost incredible experimenting with the emancipated class, and with so little money available for the support of the movement, so much could have been accomplished is one of the many wonders of our American history. Nevertheless, it was done, and so well done, that within ten years from the beginning of the free elementary schooling the experiment had evolved into the establishment of the complete American common school system, including the children of the schools of twenty years before.

Our next step will be to put on record the attempt of the United States Government during five years by the Freedmen's Bureau to extend and develop the original experiment through the stormy period of Southern State reconstruction, followed by the final consent of the Southern white people, restored to the full political control of their own States, to accept the entire system of American universal education in connection with the Peabody education fund, the establishment of the national Bureau of Education, and the large appropriation of public lands and moneys by Congress for the establishment and support of colleges of agriculture and the mechanic arts in all the States of the Union.

THE FREEDMEN'S BUREAU.

The operations of the Army and the various private and church organizations for the schooling of the freedmen already described received a new direction by the passage of the following act of Congress, approved by President Lincoln March 3, 1865, almost the last official act of the great President:

AN ACT to establish a bureau for the relief of freedmen and refugees.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there is hereby established in the War Department, to continue during the present war of rebellion and for one year thereafter, a Bureau of Refugees, Freedmen, and Abandoned Lands, to which shall be committed, as hereinafter provided, the supervision and management of all abandoned lands and the control of all subjects relating to refugees and freedmen from rebel States or from any district of country within the territory embraced in the operations of the Army, under such rules and regulations as may be prescribed by the head of the Bureau and approved by the President. The said Bureau shall be under the management and control of a commissioner, to be appointed by the President, by and with the advice and consent of the Senate, whose compensation shall be \$3,000 per annum, and such number of clerks as may be assigned to him by the Secretary of War, not exceeding 1 chief clerk, 2 of the fourth class, 2 of the third class, and 5 of the first class. And the commissioner and all persons appointed under this act shall, before entering upon their duties, take the oath of office prescribed in an act entitled "An act to prescribe an oath of office, and for other purposes," approved July 2, 1862. And the commissioner and chief clerk shall, before entering upon their duties, give bonds to the Treasurer of

the United States in the sum of \$50,000 and the latter in the sum of \$10,000, conditioned for the faithful discharge of their duties, respectively, with securities to be approved as sufficient by the Attorney-General, which bonds shall be filed in the office of the First Comptroller of the Treasury, to be by him put in suit for the benefit of any injured party upon any breach of the conditions thereof.

SEC. 2. *And be it further enacted*, That the Secretary of War may direct such issues of provisions, clothing, and fuel as he may deem needful for the immediate and temporary shelter and supply of destitute and suffering refugees and freedmen and their wives and children, under such rules and regulations as he may direct.

SEC. 3. *And be it further enacted*, That the President may, by and with the advice and consent of the Senate, appoint an assistant commissioner for each of the States declared to be in insurrection, not exceeding ten in number, who shall, under the direction of the commissioner, aid in the execution of the provisions of this act; and he shall give a bond to the Treasurer of the United States in the sum of \$20,000, in the form and manner prescribed in the first section of this act. Each of the said commissioners shall receive an annual salary of \$2,500, in full compensation for all his services. And any military officer may be detailed and assigned to duty under this act, without increase of pay or allowances. The commissioner shall, before the commencement of each regular session of Congress, make full report of his proceedings, with exhibits of the state of his accounts, to the President, who shall communicate the same to Congress, and shall also make special reports whenever required to do so by the President or either House of Congress, and the assistant commissioners shall make quarterly reports of their proceedings to the commissioner, and also such other special reports as from time to time may be required.

SEC. 4. *And be it further enacted*, That the commissioner, under the direction of the President, shall have authority to set apart for the use of the loyal refugees and freedmen, such tracts of land within the insurrectionary States as shall have been abandoned, or to which the United States shall have acquired title by confiscation or sale, or otherwise; and to every male citizen, whether refugee or freedman, as aforesaid, there shall be assigned not more than 40 acres of such land, and the person to whom it was so assigned shall be protected in the use and enjoyment of the land for the term of three years, at an annual rent not exceeding 6 per centum upon the value of such land, as it was appraised by the State authorities in the year 1860, for the purpose of taxation, and in case no such appraisal can be found, then the rental shall be based upon the estimated value of the land in said year, to be ascertained in such manner as the commissioner may by regulation prescribe. At the end of such time, or at any time during said term, the occupants of any parcels so assigned may purchase the land and receive such title thereto as the United States can convey, to pay therefrom the value of the land as ascertained and fixed for the purpose of determining the annual rent aforesaid.

SEC. 5. *And be it further enacted*, That all acts and parts of acts inconsistent with the provisions of this act are hereby repealed.

Approved March 3, 1865.

ABRAHAM LINCOLN.

This law was one of the last approved by President Lincoln. The Freedmen's Bureau was born amid a military and political cyclone. On the 2d day of April, 1865, Richmond fell, and on the 9th of the same month General Lee surrendered at Appomattox Court-house, Va. On the following 14th of April President Abraham Lincoln was assassinated, and immediately Vice-President Andrew Johnson was elevated to his place. It was not until May 15-16 that Gen. O. O. Howard, of the United States Army, appointed commissioner of the Freedmen's Bureau by Secretary of War Edwin M. Stanton, assumed the office and issued his first circular as "Commissioner of Bureau of Refugees, Freedmen, and Abandoned Lands" and established his official headquarters at the corner of I and Nineteenth streets, Washington, D. C.

In his first circular Commissioner Howard announced the policy of the bureau, as follows: "The negro should understand that he is really free, but on no account, if able to work, should he harbor the thought that the Government will support him in idleness." On May 19 he defines the duties of the assistant commissioners to be appointed for all the late insurrectionary States. They were to be "super-visors of abandoned lands, and have control of all subjects relating to refugees

and freedmen in their respective districts. All agents of the bureau were to report to them in all applications for relief to be made to them or their agents." In a rapid series of circulars the commissioner further informed the public and his subordinates that the bureau was not established to supersede the action of other associations in the field. Cooperation was invited and urged with all these. "The utmost facility will be offered to benevolent and religious organizations and State authorities in the maintenance of good schools for refugees and freedmen until a system of free schools can be established by the reorganized local governments. It is not the purpose of the bureau to antagonize existing organizations, but to stimulate and facilitate them."

The difficulties attending the management of abandoned lands appeared at the beginning of the administration. On May 22 it was announced that numbers of the late owners of these estates were claiming possession. All such were informed that there would be no consideration of the claims of the disloyal owners and that the freedmen engaged in raising crops must be paid for their labor till the harvest ended. On May 29 Col. John Eaton, jr., was promoted from his great work in the Mississippi Valley to be assistant commissioner of the Freedmen's Bureau at Washington, and it is probable that much of the success of the bureau during the five years of its troubled existence was due to the large experience gained in his administration in the Southwestern department. By June 1, 1865, nine States had been included in the appointment of assistant commissioners and agents, who were stationed in the most important centers of their respective Commonwealths. The relief stations established during the war were discontinued as far as possible, as it was the policy of the bureau to make all the people self-supporting. Loyal refugees were to be protected to the uttermost of the ability of the local officials and the freedmen assured of their rights as complete as the free white people. The teachers already at work among the negroes were urged to cooperate, and accurate reports were demanded. Colonel Brown in Virginia; General Whittelsy in North Carolina; Gen. Rufus Saxton in South Carolina, Georgia, and Florida; Colonel Osborne in Alabama; Chaplain T. W. Conway in Louisiana; Col. Samuel Thomas in Mississippi; Gen. Clinton B. Fisk in Tennessee, and General and ex-Governor Sprague, son-in-law of Gen. Benjamin F. Butler, in Missouri and Arkansas were appointed assistant commissioners. All of these men were fully competent, and several of them afterwards rose to distinction during the coming fifteen years of reconstruction. The teachers indorsed by the board were to receive rations, transportation, and the use of school buildings, although this dispensation of aid was to be strictly guarded.

By July 12 the policy of the bureau was announced through the authorization of the appointment of superintendents of education by the assistant commissioners, who should be authorized to cooperate with State authorities when such existed, and otherwise visit schools, and as far as possible aid and encourage the teachers acting under the different benevolent organizations from the North, and on certain conditions to assist in building or furnishing schoolhouses. Attempts were made to protect the freedmen from the injustice threatened by the new vagrant and labor laws enacted by several of the late insurrectionary States now being called into a responsible civil and political condition by the edict of President Johnson. The commissioner states that mischievous reports that the freedmen were to be given possession of the lands of their former masters were industriously spread abroad in order to unsettle labor. Already the chronic friction of a double authority was experienced in the complaints of some of the military commanders of the Southern districts that the assistant commissioners were exceeding their authority. The commissioner warns against this, and reminds his subordinates that all matters of military concern are to be referred to the army authorities.

In the 23 published circulars issued by Commissioner Howard during the year 1865 the policy of the administration of the freedmen's bureau was completely indi-

cated, and the great difficulties that beset its path were revealed. It was soon apparent that Congress in the framing of this comprehensive law had embarked on an enterprise involved in almost insurmountable difficulties. The radical mistake would seem to have been the involving of the educational movement with the prodigious work of administering on abandoned lands, protecting the refugees, redressing the wrongs of several millions of emancipated slaves, and generally acting as an ex-tempore civil and religious Providence through a realm as extensive as the whole of central Europe.

The whole matter was immensely complicated by the political policy of President Johnson, who at once, on his accession to the Presidency, by the advice of Secretary of State William H. Seward, assumed the responsibility of reorganizing the States lately in rebellion by sending to them provisional governors authorized to invite the white people, with the exception of certain classes of high military and civic ex-Confederate officials, to summon constitutional conventions, adapt their State constitutions to the present order of free society, assemble their legislatures, and elect members of Congress. This policy at once was carried out in all the seceding States, and the Thirty-ninth Congress of the United States, assembling on December 1, 1865, found itself confronted with a "solid South," in the political possession of the same people who, four years before, had formally seceded from the Union, waged a terrible war even to the verge of absolute exhaustion, and now demanded the recognition of their complete Statehood and the admission of their members to Congress, with all the rights of legal citizenship for their constituents. Their legislatures at once, in several States, passed laws affecting the freedmen that, in the opinion of the Northern people, practically remanded the negro to a state of slavery. His rights as a free laborer were greatly restricted and the right to bear arms denied. He was liable to be deprived of his liberty on charges of vagrancy; the colored youth to be bound out to an apprenticeship that certainly offered the opportunity for great abuse, and his further education was environed with hard conditions that amounted to a practical denial of the right to schooling. It is easy to understand into what a veritable pandemonium of hostile passions, insupportable difficulties, and impossible conditions this unfortunate bureau was plunged before the end of the first year of its existence. It was not so much that its local administration was intrusted to incompetent or unworthy men, but that the ablest and best men could do so little to advantage in such a state of affairs. The negroes, of course, returned to their former homes at the close of the war. Either they must be reinstated in their possessions and organized to go to work, or the entire laboring population of eleven great States would be reduced to beggary. The emancipated freedmen could not understand that the provision for leasing and buying abandoned lands did not mean the spoliation of their masters' estates in their behalf, and often either refused to work or were involved in endless misunderstanding and quarrels over their wages and conditions of support. The effort to educate and train them for their future duties by the agents of the bureau was met by the fact that they were already recognized as citizens of the United States and were practically under the code of laws enacted for their regulation by their former masters, enforced by local officials and a State militia. It was not remarkable that the white people should fall into a panic concerning the supposed dangers attending the setting free of 5,000,000 slaves, and honestly believed that these severe laws were necessary to preserve the peace and protect the lives of their families. A State, like a man, can lose its head, and a million men really become a mob under the influence of such a reaction as the waking up to the possible results of their situation by the people of the eleven ex-Confederate States in 1865.

Meanwhile the Congress of the United States recognized the situation brought in by President Johnson as a peril only less than that of open war. And then began the series of enactments that involved the Administration in a bitter and

exasperating conflict, only ending in the attempt to impeach the President. At once the members of Congress elected from the seceding States on appearing were refused their seats. A comprehensive law was passed to protect the freedmen against the severe provisions of the vagrant and labor laws of those States.

It is not the purpose of this essay to discuss or even to give a connected history of the political events of the five years following the close of the civil war, 1865-1870. Enough to say that the year 1869 found the late insurrectionary State governments established under the action of President Johnson abolished. The entire area of these eleven States was divided into five military districts, presided over by commanders of the national armies and their people living under martial law. New governments were originated by the return of all loyal people, including the negroes, and finally all the States were readmitted to the Union on condition of accepting the three amendments of the Constitution of the United States that made slavery and secession forever impossible save by an act of revolution, confirmed full American citizenship upon the negro, and forbade all discrimination in civil rights, including suffrage, on the ground of race, color, or previous condition. The disqualification of great multitudes of white voters in these eleven States, by reason of inability to take the oath of loyalty, placed the governments of several in the hands of a population largely composed of the freedmen, in many cases acting under irresponsible leaders from their own and the Northern States. Their legislatures were filled with extemporized statesmen, graduated from the plantations. The vacant seat in the Senate of the United States of Mr. Jefferson Davis, ex-president of the Confederacy, was occupied by a colored man, once a slave. In brief, after a frightful civil war of arms, in which 3,000,000 American men were enlisted and which not only ended in the defeat of the Southern forces, but practically left the old order of society in the sixteen slave States in ruins, came another war of politics, lasting for ten years, even more exasperating, which was only arrested by the returning good sense and patriotism of the Northern people; a conflict which if prolonged would have made republican society itself an impossibility through half the area of the Union.

It was during this period that the Freedmen's Bureau was buffeted like a frail ship amid the tumult of a tropical hurricane. Its attempted management of abandoned and confiscated lands practically came to nothing save a temporary occupation, and, to some extent, collection of taxes imposed on the seceding States by Congress. The confiscated lands could only be held by the Government during the lives of their disloyal owners, and by the end of the existence of the Freedmen's Bureau the policy of the Government was clearly indicated to abandon all attempts at wrestling with a problem so impossible as the virtual confiscation of real estate through half the Union. The system of relief for the impoverished and sick was already on the edge of collapse from the mighty development of productive industry in the white and colored discharged soldiery of both armies. The protection of the rights of the emancipated and loyal white people could only be assured by the Army, and the bureau had no other means of affording it.

It was inevitable that the permanent operations of an organization so frail, so loosely put together, and practically with no effectual power of enforcing discipline, would fall into confusion. Indeed, its first year's demand for \$11,000,000 was so preposterous and so disparaged the entire arrangement that an attempt to reenact the law, with larger powers, was defeated, and with difficulty it was put in execution by general acts of renewal for short periods. In 1868 all its functions, except the educational, were abolished. A strong opposition was encountered from the Army, which regarded it as a rival on its own field of occupation. The story of the bureau and the final examination of General Howard and his leading subordinate is familiar to all interested in the swift progress of events in that tumultuous period. The failure of the Freedmen's Bank, which resulted in the loss of large sums of money invested by the negroes, was a great calamity, from the effects of

which this people have never recovered. The reconstruction policy, which called the freedmen to a great festival of political power, made them forget the comparatively little aid that could be received from the bureau, and arrested its attempt to control the opinions and conduct of a multitude elated by their new citizenship, and too often acting under the influence of incompetent and mischievous leaders.

It was not from the lack of an earnest purpose, a sincere devotion to the welfare of the country, and a reasonable and energetic administration of the missionary work among this new "nation within a nation" that the Freedmen's Bureau was in many ways a failure. It now seems a marvel that the Congress of the United States should have attempted an undertaking so impossible as the practical "bringing up" of 5,000,000 of emancipated people, living in contact with and completely in the power of the 10,000,000 who during four years had fought to hold them in perpetual bondage, and who needed more than one generation of sorrowful experience and experiment to find themselves in permanent satisfactory relations with them. The failure of this enterprise was far more valuable as a lesson of what can not be done in an American State than its success would have been; especially if it had demonstrated the possibility of the Government of the United States holding eleven commonwealths in the condition of conquered provinces. The fact of the final emergence of all these States during the past twenty-five years from the terrible confusion in which they were left at the close of the civil war and their hopeful state of affairs to-day is a new proof of the wondrous political common sense of the American people that will forever refute the predictions of the pessimist and fortifies the faith of the patriot in the opening years of the second century of the nation's life.

But with all this ineffectiveness, the Freedmen's Bureau during the five years of its operation was one of the most praiseworthy agencies of the Government. While it was unable to achieve impossibilities, it wrought great positive good and prevented untold evils. No human organization, though administered by angels, could have entirely carried out what was proposed by the original statute. As well might Congress have legislated against a northwestern cyclone or a Mississippi River overflow as to expect that a country as large as central Europe, left in the condition of the eleven ex-Confederate States at the close of our civil war, could be kept in order by less than 1,000 officials, the majority drawn from civil life, and absolutely dependent on military support for the execution of a bewildering variety of duties. In these eleven States was concentrated five-sixths of the entire negro population of the country, in 1880—5,360,298, with 7,622,852 of the white race. In nine of these States, in 1880, there were 4,563,763 colored and only 5,286,784 white people. In three States—Mississippi, Louisiana, and South Carolina—the negro population was in considerable excess of the white. The freedmen were practically all illiterate. As late as 1884, 68 per cent of the colored voters and 77.6 per cent of the colored women could neither read nor write, while at the same date 14.3 per cent of the white voters and 19.4 per cent of the white women in these States were illiterate. And when we consider the condition of a vast population suddenly arrested in the midst of a most exasperating civil war, we may well conceive the burden cast by a legislative enactment upon this little group of poorly paid officials, many of them living in daily peril of their lives, working amid a cloud of dust raised by the whirlwind of contention that raged through the entire population of the North, not one in a thousand of whom outside the army of occupation had any personal knowledge of Southern affairs, or any intelligent notion of the right thing to be done or the possible way of doing it in the administration of local affairs through the Southern half of the Union.

The whole situation could not be better described than in the final report of Commissioner-General O. O. Howard—a document that should be read by every person who proposes to form a correct judgment on the state of Southern public affairs at the time when the Freedmen's Bureau went into operation. Less than

a month after the passage of the act the President of the United States was assassinated, and the war suddenly came to an end with a crash that resounded through the civilized world. Says General Howard: "In every State many thousands of the freedmen were found without employment, without homes, without means of support, wandering into towns and about military posts where they could find protection and be kept alive. The sudden collapse of the rebellion, making emancipation an actual fact, was like an earthquake. It shook and shattered the whole social system. It broke up the old industries and threatened a reign of anarchy. Even the well-disposed and humane landowners were at a loss what to do or where to begin the work of reorganizing society and of rebuilding their ruined fortunes. Very few had any knowledge of free labor, or any hope that their former slaves would serve them faithfully for wages. On the other hand, the freed people were in a state of great excitement and uncertainty. They could hardly believe that the liberty proclaimed was real and permanent. Many were afraid to remain on the same soil they had tilled as slaves, lest by some trick they might find themselves again in bondage. Others supposed that the Government would either take the entire supervision of their labor and support or divide among them the lands of the conquered rebels and furnish them with all that might be necessary to begin life as independent farmers."

The work of attending to the physical wants of the poor, sick, and vagrant among this vast multitude was in itself appalling. Still, by cooperation with the medical department of the Army, aided by a flowing tide of charity from the loyal people of the entire Union, a great work was done. During the first year of the operations of the bureau, 1865-66, the death rate among the freedmen was reduced from 30 to less than 4 per cent. By August, 1866, 166,000 patients had been treated in 56 free hospitals and 5 orphan asylums. During four years more than half a million sick and infirm persons, absolutely dependent on charity, were thrown upon the charge of the bureau. In 1865, 148,000 people of both races were being fed and clothed and sheltered by the military authorities, and by the greatest effort at finding occupation the number was gradually reduced at a large saving of cost to the Government. During this period much suffering was brought upon all the Southern people from the failure of the crops, and the bureau distributed an appropriation of \$500,000 made by Congress for relief; the average number of persons daily assisted in 1867 being 31,105. More than \$250,000 worth of clothing was at different times distributed, the poorer white people sharing equally with the colored, without respect to their former loyalty. The Southern people were left in such a condition of general destitution that little help could be expected from their own State governments. Indeed, the entire legislation of the year when President Johnson was trying the experiment of reconstruction by executive edict, reads to-day like the action of a people bereft of their ordinary sense under the influence of a panic, which made a wise and humane conduct of public affairs impossible. The fact that amid such an indescribable confusion the vast majority of the able-bodied negroes became at once self-supporting is itself a tribute to the immense practical value of the bureau in the advice and direction of these bewildered and distracted people, to the general industry of the majority of the colored folk, and the constant personal private charity of the white population among which their lot was cast.

President Johnson, within a month after his accession to the Presidency, offered a wholesale pardon to all save 14 excepted classes of the Southern people, and held out such an encouragement to these excepted classes that 24 stout volumes of Government records of special pardons are now found in the Department of State. He then, by executive edict, invited the original voting population of all the ex-Confederate States to assemble in conventions, revise their State constitutions by the recognition of the freedom of the slaves, and at once proceed to set up their original forms of State government and elect Representatives to Congress. C.

course, the 800,000 acres of abandoned lands thrown upon the charge of the Freedmen's Bureau, much of which had been leased to and cultivated and occupied by the negroes and yielding an annual income of \$400,000 were returned to their former owners. By 1869 there was practically no valuable real estate in possession of the bureau. This policy at once threw the 5,000,000 emancipated slaves upon the charge of the Southern people, generally upon the old proprietors of the plantations, never more than 2,000,000 of the 7,000,000 white people, for occupation and support. The severe labor and vagrant laws immediately passed by the new legislatures placed this entire colored population almost completely in the power of their old masters, and although Congress, in 1865-66, passed several laws suspending the operations of these local statutes, and a year later abolished all the new State governments, yet the relations of the President and the political party that supported him at the North with the dominant party in Congress during the earlier administration of the bureau put a premium upon disorder. Under these discouraging circumstances the Freedmen's Bureau performed a much needed work of reconciliation between the white and colored classes in the South, and so completely succeeded in a practical reorganization of labor that in these States the negroes raised a large proportion of the food that supported the white people, besides a large amount of rice, sugar, and tobacco for export and 200,000 bales of cotton each year, on which was paid into the United States Treasury in 1866-67 a tax of more than \$40,000,000. At the least it may be claimed that by the services of the bureau in this respect the United States Government was saved an amount equal to the \$13,000,000, which was the entire sum expended by the organization during the five years of its existence.

There can be no doubt also that a good work was accomplished by the Freedmen's Bureau in the administration of justice. Until the passage of the fourteenth and fifteenth amendments to the Constitution of the United States the negro, under the edict of the Supreme Court in the Dred Scott decision, was not a citizen of the United States, had no reliable standing in the courts of the South and, while in many districts exposed to constant bodily peril and impositions, in all his dealings he had little chance of gaining redress by appeal to legal process. The soldiers and sailors who with their families numbered a full half million of these people were in constant "peril among false brethren" from the infamous crew of land sharks that stood between the National Government and the claims of this class for service. While continually looking for the return to peaceful methods of redress for injuries through the ordinary agencies of justice, the excited condition of the people left whole States bordering upon anarchy. While the plantation class, who were the greatest sufferers, were by disposition and interest inclined to deal with their laborers with commendable fairness, the Southern country was thronged by gangs of ruffians who defied law and order and especially vented their rage on the unoffending freedmen. The Army could not well operate beyond the narrow limits of its local points of occupation, and much that was accomplished was the work of the agents of the bureau.

But, in the language of Commissioner Howard, "the most urgent want of the freedmen was education, and, from the first, I have directed more attention to this than to any other branch of my work." During the last two years of its active operation the work of the bureau was by law limited to the care of the schools. And it is impossible to estimate the value of what was accomplished in this direction during its entire administration. Previous to 1865 a great deal, as already shown, was accomplished by the various organizations from the North and the efforts of the Government through the military authorities. For a brief time in Louisiana, under the administration of General Banks, a system of schools for the freedmen was maintained by the taxing of the employers of their labor. The Freedmen's Bureau utilized the services of all the most experienced workers, General Saxton, General Eaton, General Armstrong, General Fisk, Superintendent Alvord, and

others—and by its appointment of a superintendent of education in each State, and subordinate agents in all districts of the country did much to bring order and a good method into the school work and restrain wasteful and misdirected activity. While compelled to work with sparse appropriations for education from Congress, the Government did, indirectly, in many ways contribute largely to this fundamental work of laying the foundations of a true American civilization on the ruins of the old-time local and aristocratic order.

During the first seventy-five years of the national life, including the Revolutionary period, the South had been a great contributor to the upbuilding of the Union. First, through the contribution of a group of remarkable statesmen and the mighty leadership of Washington, it identified itself forever with the beginnings of republican government. Second, by its statesmanlike and patriotic policy of placing the entire domain of the original Northwest in charge of the National Government and cooperating in the dedication of one thirty-sixth of it to the schooling of the children and youth of the new States, even to the neglect of the six original Southern Atlantic States in a munificent distribution of educational lands. Third, it was under the far-sighted administration of a Southern President, Thomas Jefferson, that the purchase of the immense Louisiana Territory from France, which extended the area of the Republic to the Rocky Mountains in the Northwest, was accomplished. Fourth, the series of operations, including the annexation of the Republic of Texas to the Union, the Mexican war, and the acquisition of the magnificent Pacific coast empire were largely the result of Southern statesmanship, in the face of constant protests, especially from the Northeast. The previous acquirement of Florida gave to the Union a significant outstretched finger pointing to the West Indies. And it must never be forgotten that the two most powerful States of the southwestern border, besides Maryland, Delaware, and the new State of West Virginia, never revolted from the Union, and furnished to its armies a larger body of effective fighting men than had ever been marshaled on the Western Continent, including a group of the most distinguished commanders in the National Army and Navy.

The future historian will add to this distinguished record the prodigious service rendered popular education by the hearty cooperation of the great Southern statesmen of the Revolutionary period in the dedication of the first national land grant for universal education, a proposition originating from the Virginia group of the fathers and more and more coming to be regarded one of the most valuable of the contributions of this body of great men to the general welfare of the American people. The indirect influence of the educational scheme of Thomas Jefferson has never been fully understood, even in the South. First, it originated the movement of the common school in the Southern States, which, during the eighty years from Yorktown to Appomattox, made persistent headway in the development of an influential educational public, including large numbers of the foremost men of all these States, which demonstrated its power in repeated efforts to establish the common school for the white population. In 1860 three of these States had on the ground a proper common school, and a dozen of the leading cities of the section were in accord with similar communities in the North in the support of the system. During this period, following the lead of Virginia, anticipated by North Carolina and Maryland, the majority of these States had established the State university, which is the crown of the common-school system. The University of Virginia was largely influential through its unsectarian and broad scheme of organization in giving the initiative to the State universities of the Western and Pacific States. Meanwhile, a most valuable educational literature, really the best Southern contribution to the national literature, had been developed during these years, which the younger school men of the South are now engaged in editing and introducing to its proper place in the national libraries at Washington.

The historian will not fail to do ample justice to the great service rendered by

the North and the nation to the complete realization of the American idea of universal education by the opening of the great front door of the common school-house to the admission of one-tenth the entire number of American children and youth, the descendants of the 5,000,000 negro slaves emancipated by the civil war. This work, not only under the direction of the National Government but still continued through the agency of the Northern churches and private contributions, forms one of the most interesting chapters in the history of American education. But it should be remembered that it was not the North nor the nation but the South, acting through the ordinary channels of State, municipal, and rural legislation and administration, that completed the great circle of the American system by everywhere admitting the children of the freedmen to equal opportunities in the common school as early as 1875. The story of the treatment of the negro child and youth, even later than this date, in several of the States, as far as relates to educational opportunity and encouragement, is not one on which even the most enthusiastic educator of this section is anxious to dilate. And whatever may have been the influence of Northern educational effort in these States since the war, it can not be compared with the prodigious significance of the action of all these States during the last twenty-five years in building up that side of the American common school which is the final demonstration to the world of the possibility of the education for responsible citizenship of every order and condition of the human race.

It may not be out of place here, at the close of the record of the proper national work in the preliminary stages of the elementary schooling of the negro during the fifteen years from 1860 to 1875, to place before the reader a late official statement of the present condition of common schools for the colored race in the majority of the Southern States, by Dr. J. L. M. Curry, general agent of the Peabody and Slater educational funds, in his report of the latter for 1898. Referring to what has been accomplished by the South in this respect, after ample justice done to the previous efforts of the North and the nation, the Doctor says:

At immense cost, considering their diminished resources, have these States undertaken and partially accomplished this Herculean task. To illustrate the burden and patriotism of the school system, examples may be cited. North Carolina paid last year for education of white children in public schools \$173,466 and for the negro children \$246,946. Of taxes on real and personal property for schools, the whites paid \$402,839 and the negroes \$14,748. Of the taxable values in the State, the negroes own \$880,074, which is about one twenty-ninth of the whole. In the State, the negroes of school age are 211,519; attending school, 131,404. The school law requires the terms of all public schools to be as nearly as possible of the same length without regard to race, and the average school term of the whole State is 10.86 weeks. This does not apply to schools sustained in part by local taxation. The number of negro teachers is 1,652, with an average salary per month of \$23.68. In Florida the negroes of school age (6 to 21) are 66,402, of whom 39,502 were enrolled, with an average attendance of 25,854. The expenditure for negro schools in 1896 was \$153,292, State funds being apportioned to the counties on the basis of average attendance without regard to race. Average length of session in 1897 was 98 days. Negro teachers, 642, with an average salary per month of \$29.50. Total value of negro school property, \$117,845. The State Normal School, well equipped, with over 200 colored pupils, is provided for by the State, independently of public-school funds. In South Carolina there is no school census of children (6 to 21), but the United States census shows (5 to 20) 313,249, of whom 139,156 were enrolled. The teachers numbered 2,025, with an average salary of \$18.90 per month. The schoolhouses numbered 1,766, of which 972 were owned by the State, with a value of \$116,156. The average length of session was 3.84 months. The expenditure for negro schools, \$175,374. The State has an agricultural and industrial college at Orangeburg with 500 students. The colored school population in Virginia (5 to 20), 263,703; enrolled, 123,231; average attendance, 68,203; months taught, 6.1; teachers, 2,127; schoolhouses, 1,885. The State has also a normal and industrial school for colored people.

In Tennessee the negroes of school age number 182,214; attendance, 61,744; teachers, 1,679. The length of sessions and pay of teachers vary in different localities. In Arkansas, negroes of school age, 127,736; in attendance, 82,192; average

length of session, 70 days; teachers, 1,564; pay, according to grade, from \$15.20 to \$23.35; value of negro schoolhouses, \$120,000. School funds are distributed according to the number of children of school age without distinction as to race. The negroes of scholastic age in Texas number 167,316; the average attendance at school, 139,698; school term, 4.45 months; negro teachers, 2,747; average compensation for school term is \$202.07; value of negro schoolhouses, \$607,441.50. School funds are distributed pro rata as per the scholastic census, impartial provision being made for both races, the schools being maintained the same length of time each year for the two races. In Alabama the negroes of school age (7 to 21) are 277,173; in attendance, 132,213; general average of session, 87 days; teachers, 2,466; average salary per month, \$20.93; school property estimated at about \$460,000. There are two normal and industrial schools, with 1,330 pupils. Georgia has 289,931 negroes of school age, 156,650 attending five months' sessions; 3,799 teachers with average salary per month of \$21.10; negro schoolhouses owned by county boards outside of cities, \$9,811. School funds are distributed per capita. In West Virginia the number of negroes of school age is 12,528, of whom 7,481 attend school; teachers, 233; average salary per year, \$212.49. There is no race distinction in the distribution of the State's school funds. In Mississippi, out of a total enrollment of 367,579, 196,768 are colored. The State appropriates \$923,500 for the maintenance of schools, and the distribution is pro rata according to enrollment. There are two normal and agricultural schools, with State control and support. Louisiana reports 960 schools; an enrollment of 71,609; average attendance of 49,670; 1,019 teachers; average school term, 4.62 months; average salary per month, \$23. School funds are prorated according to the number of educable youth. There are 75 private schools, with 1,757 pupils. The State superintendent says it is impossible not to see everywhere in Louisiana the great improvement in the mental and moral condition of the colored people during the last seven or eight years. In every one of these States, except Tennessee, there are normal and industrial schools sustained from the public revenues.

It is only by a knowledge of these facts in the civic and educational history of the South that the educational public at home and abroad can comprehend the great movement in behalf of universal education through all these 16 States during the past twenty-five years. In the light of these facts, it is seen that in education, as in politics, American society in these States has repeated itself. It was through the colonial experience of a century that the group of conservative Englishmen who were thrown especially upon the colony of Virginia by the collapse of the Stuart dynasty in England came forth in Washington and the majority of his great compatriots in 1776, fully abreast of the corresponding body from radical New England and the middle colonies, to fight their way out from European control and inaugurate the new departure of the ages in the Government of the United States. In like manner a similar class in every Southern State, reared under the influence and to a considerable extent by the actual contact with the educational system of Great Britain of half a century ago, appeared at the close of the civil war not only prepared to establish the common school for its own race, but also for the race that up to that date had nowhere heartily been accepted as "having any rights" in the American schoolroom "that the white man was bound to respect." It was one thing that in the majority of the States of the North even the small contingent of colored children and youth were not admitted without protest as early as 1860 to equal educational privileges with the dominant race. It was quite another venture when the 16 former slave commonwealths rose up from the awful calamities of the greatest civil war of modern times, and in their poverty assumed for a full generation almost the entire support of the schooling of the freedmen, with probably no more opposition at home than was encountered in several of the most powerful and wealthy of our Northern States in the final establishment of the free common school not later than seventy years ago. It would have been regarded as philanthropic prophecy run mad in 1860 had it been declared that within twenty years the Southern people would have established the entire American system of universal education, with its colored "annex," by placing on the ground a system of free common schools for all classes and both races and supporting them at an expense of nearly \$500,000,000, includ-

ing nearly \$100,000,000 for the children of the freedmen. But in the preliminary stages of this great work, as far as relates to the negro, the Freedmen's Bureau must be credited with a good share of the important work during the period immediately following the close of the civil war—the time of special peril for the cause of the new education in the South. By its cooperation with the church and private agencies and the rising educational public of the South as a Government bureau it did a good work in helping to secure the placing in the constitutions of every reconstructed Southern State a provision for the common school as early as 1875.

The moneys directly expended during the five years of the administration of Commissioner Howard probably did not exceed \$3,000,000, including the cost of transportation and other forms of indirect aid, an amount no greater than is now paid annually by several of our Northern cities. But it is doubtful if \$3,000,000 were ever put out at interest in a way more remunerative to the investor since this world was made. By the method adopted, in working in connection with the organizations and agencies already on the ground, the bureau "was able to give material aid to all engaged in the educational work, to harmonize the numerous independent agencies in the field, and to assist all impartially." And in doing this, as a governmental agency, it was not only a beneficent influence, assisting in the reconciliation of sectional and local jealousies among the great variety of associations and individuals concerned in the movement, but was all the time directing the attention of the freedmen and poorer white people of the South to the only final source of supply for the great need of this section—a system of public schools for all orders and conditions of its population, supported and supervised by the whole people.

With all the zeal and unsurpassed generosity of giving developed by the loyal people, backed by the consecrated service of the best men and women of the country as teachers, the Freedmen's Bureau was never able to reach directly more than one-tenth of the children of the freedmen. It is a remarkable fact that during the earliest period of schooling the children and youth of the race their parents seemed to have been more ready to contribute money than to-day, when their circumstances are so much improved. In the year 1869 it is estimated that out of their little store the freedmen paid \$200,000 for school buildings and the support of teachers. Many of the schools in the rural districts were entirely supported in this way. The wide dispersion of the service of the bureau practically covered the beginnings of education for the colored people through the entire area of the South, as the border States that remained in the Union—Maryland, Delaware, West Virginia, Kentucky, and Missouri—were included in its field of operation. It is impossible to estimate the indirect effect of such a movement on the entire body of more than 5,000,000 for the first time in the history of this race introduced to the education that comes from the contact with letters and schools.

It was greatly owing to the influence of these teachers and the contact with the more intelligent soldiers during the war that the negroes seem at once to have taken up the idea that school education was the great lever by which their people were to be lifted to prosperity, power, and competent citizenship. There was little just then to awaken or encourage this notion among the people of the South. The old prejudice against schooling any laboring class was still very powerful and for several years greatly interfered with the efforts that were made. But during the five years that preceded the final reconstruction of these States and their permanent reincorporation into the Union so much was done that the colored people in every State for several years, in some of them the more numerous voting class, insisted on a public provision for general education. This, of course, brought with it the same demand from the masses of the white people, a considerable portion of whom were virtually in a state of illiteracy. And with all the events of this period of reckless experimenting with their new-found citizenship,

there is little doubt that in this helping to "force the fight" for the common school and place on the ground a State system of public instruction, the negro conferred a benefit on the South that far exceeded the losses of the vexed period of reconstruction, of which so much is yet said with a great deal of exaggeration.

And it is morally certain that without the cooperation and material aid of the Freedmen's Bureau it would have been impossible that the generous provision for the secondary, higher, and professional training of superior colored youth, which contributes such an important element to the education of the colored race, could have been made, at least without postponement for many years. It was the aid extended by this friendly agency that first placed the Hampton Normal and Industrial Institute on its foundations and called Gen. S. C. Armstrong to its presidency. The Howard University at Washington, D. C., was another of its early beneficiaries. Nearly all of the twenty or more of the "colleges" and "universities" for colored students now in operation and still largely supported by Northern beneficence, date from the period of the Freedmen's Bureau, and but for its timely aid would probably never have been considered possible. The rise of these schools and the demonstration made in them by a generation of training in the secondary, higher, and professional departments of instruction, especially in the preparation for teaching, has largely influenced all the States of the South in extending their system of common schooling for colored youth beyond the elementary grade, even doing what the British Parliament still refuses to do for the children of British subjects, including the free high, the State normal, and the industrial departments with the beginnings of the higher education in its superior schools.

During the existence of the Freedmen's Bureau the Peabody education fund was organized by the gift of \$3,000,000 from George Peabody and the appointment of Dr. Barnas Sears, the successor of Horace Mann in the superintendency of public instruction in Massachusetts, and for many years a distinguished educator in the collegiate and theological seminaries of New England, as its general agent. Dr. Sears took up his residence in Staunton, Va., and gave the last twelve years of his life to this work, which more than the efforts of any one man or group of men or institutions supported from the North made the present condition of popular education in these States a possibility. Dr. Sears at once put himself in connection with the Freedmen's Bureau and freely utilized the organization in doing the preliminary work of his great mission. Indeed, the public schools that were supported or substantially aided by the Peabody fund were, for a time, nearly all that were in operation in the Southern States.

The entire system of school education, private, denominational, and public, existing in the eleven ex-Confederate States before the war went down in the general wreck of the Confederacy. With the exception of the schools of a few cities and some institutions of a superior grade, there was little that deserved the name of a general system of schooling in the South during the ten years between 1860 and 1870. The Peabody educational fund, under the wise and inspiring administration of Dr. Sears, touched to a new life many of the feeble beginnings of the common schools and supplemented the work of the Freedmen's Bureau for the colored folk. Its supervision of education for this race in all these States aided materially by advice and active cooperation in dispensing the limited means of the Peabody fund in the hands of Dr. Sears. And it was a great point gained that while the bureau representing the National Government was operating so largely on the line of establishing the common school for the negroes, the Peabody fund concentrated its work entirely upon the upbuilding of public education for all children, and later especially directed attention to the training of teachers for the common schools of both races.

When the complete history of this period of fifteen years, from the opening of the civil war to the final return to political power of the Southern people in 1876;

is written it will be seen that in no manner has the good Providence in the soul of calamity been so manifested to the South as by the early participation in the education, especially of the emancipated slaves, of the Government of the United States and the loyal people of the North. We already have shown, without fear of contradiction, that it was this great movement that at once decided the attitude of the Southern people of both races and all classes in regard to the common school, and even amid the tumults of war brought the schoolmaster and school-mistress to the front as the final reconciler of all classes and sects and both races, in the hostile section of the Union. By the expenditure during these years of probably \$50,000,000 and the immediate direction of a cooperation with the teachers in their work to combine instruction in letters with the training in good morals, free labor, and competent citizenship, it called the attention of the ruling Southern classes, especially the planters and superior people, to the plain facts of the situation. Under this influence and the improved method in the educational training of children, the public school party, that had been growing stronger during the entire previous generation in the South, was able to take advantage of the situation and compel the adoption of this as the only practical expedient for the general enlightenment. Of this movement for the uplifting of the younger classes during the civil war of which we have now written, the Freedmen's Bureau could say with truth: "All of which I saw and part of which I was." The influence of public schooling is perhaps even more powerful and far-reaching in awakening the desire for improvement and progress among the masses of an illiterate people than in the immediate effect of the knowledge and mental and moral discipline imparted to any one generation of children and youth.

The pessimistic cultivated critic may look with indifference or open contempt upon the apparently slight result of the schooling of the colored and humbler white people of the South during these fifteen years of the war and reconstruction, but when he declares that the result of this was, and continues to be, the educating of several millions of people "above their sphere in life," he gives away his entire argument. For it is just this, the filling of the souls of every new generation of American youth with a deep discontent of the condition into which they were born and a restless aspiration for a better and grander life than has yet been realized by the fathers, that popular institutions are maintained and American society is replenished, reenforced, and strengthened to bear the increasing burdens that must be shouldered by every new generation as the years go on. During the past one hundred years of the national life the negro population increased from 700,000 in 1790 to 7,000,000 in 1890. With no desire to undervalue the remarkable development of the colored race during its two hundred and fifty years of American slavery it can truly be said that the thirty years of schooling, with all that goes therewith, since 1865 have done more for the general awakening and informing of this people than any or all other human influences.

It may be questioned whether the social and political opportunities offered to these people have yet been realized to the complete satisfaction of those who gave the earnings of a generation and the lives of half a million that liberty might be "proclaimed throughout the land to all the inhabitants thereof." But one of the most competent observers and broad-minded educators and religious thinkers of this entire Southern region, the late Bishop Atticus Haygood, writes concerning the great experiment of educating the negro as early as 1884. After such words as the following from such an eminent source, we may believe that here has been realized a success that is the prophecy of things prepared in the providence of God for this race of people through all the centuries to come.

Says Dr. Haygood, in one of the early reports of his secretaryship of the Slater education fund, in 1884: "The colored schools are in every respect better than was reasonably expected, when the experiment began, to be seen in twice twenty years.

* * * The colored race in schools is capable of furnishing its own teachers.
 * * * No amount of money, no perfection of method, no expenditure of energy can at once or within a generation or two or three generations surmount the difficulties that inhere in the heredities and the social conditions that make the case of the negro in the Southern States what it is. * * * The right principle of action, when a great and necessary work is to be done, and it is not only difficult but of such a nature that it must take a long time to accomplish it, and it is so connected with the very roots of social order and progress that failure means disaster, is that the sooner the work is begun and the more earnestly it is pressed the better for all concerned." He freely speaks of the educational question connected with the negro as "a problem without a mystery," and continues, "in no possible sense has the great effort at educating the negro been a failure. It has, judged by any vital test, been a marvelous success. There is no mystery apparent in the education of the negro race if the work is ever done as the best of teachers of both races agree that it be done. The time must come when the Southern white people cordially can cooperate in the work. It would be as easy to develop a colony into a great State by immigration alone in a country without births as to permanently establish and successfully conduct a great educational work by supplies from abroad. The interest of the white people in making the negro a good citizen is only less than the interest of the negro in his own elevation."

But the educational work now briefly described among the freedmen, for the ten years following the election of Abraham Lincoln to the Presidency and the outbreak of the civil war, was only the first step in the great experiment of the establishment of the American system of universal education in all the States of the South, which is the theme of the present essay. The next step in the great civic and social drama enacted during the momentous thirty past years was the introduction of the freedmen to complete political citizenship by the final scheme of reconstruction, from 1869 to 1876. The last of these seceding States of 1861, with every Southern State that had hitherto neglected to make a distinct recognition of and provision for the common school, joined the remaining States of the Union by placing a decided and elaborate article in its fundamental law adopting the entire scheme of American universal education. Beginning with the new State of West Virginia, in 1863, this great act was completed only by the final acceptance of all the late ex-Confederate States of the terms of political reconstruction in 1870.

THE PEABODY EDUCATION FUND.

But all this placing of elaborate provisions for the establishment of the common school in the constitutions of the reconstructed States of the South, completed by 1870, and the immediate passage of public-school laws and the action of the State governments during the following troubled six years, might have failed to realize their intention had not the good providence that, from the outbreak of the civil war in 1861 up to the present day, has served to keep watch and ward over the 3,000,000 children and youth of these 16 States, put it into the hearts of many good men and women, the Government of the United States and the churches of the North, to retain a deep and fruitful interest in their educational welfare. It would be a great injustice to these influences and agencies from without and an inexcusable lapse in the correct history of the common schools in the South during this critical period of the last thirty years to omit at least a sketch of this remarkable series of cooperative movements, several of which are still in full activity, and all now fully recognized by the competent educators of that section as legitimate and praiseworthy in their bestowal and honorable in their reception.

The first of these, which even anticipated the establishment of the common-school systems in the ex-Confederate States during the ten years of the final period of reconstruction, was the Peabody education fund. The publication of the admirable volume narrating the complete history of the inception and development of

this, one of the most unique and successful charities recorded in modern history, by Dr. J. L. M. Curry, the distinguished general agent of this and the John F. Slater education fund for the colored race, with an elaborate memorial paper on the life of Hon. Robert Charles Winthrop, the president of the board of Peabody trustees until his death, published in the Report of the national Bureau of Education for 1893-94 by the author of this essay, relieves this historical record from the necessity of a detailed account of its great achievement through the thirty years from 1867 to 1897. Yet so intimately connected is the Peabody education fund with all that was done, especially through the critical years of the establishment of the common-school system in these 11 States, that some account of its operations is absolutely necessary to a correct understanding of Southern educational affairs.

To appreciate the necessity for the appearance of some new agency, sufficiently powerful and attractive to the more influential class of the Southern people through them to lift and hold the attention of the entire section above the tumults and contentions of public and the discouragements and exasperations of private life, until a permanent foundation had been laid for the education of the children of the South, we have only to turn to the impressive words of the author of this volume. Says Dr. Curry: "At the origin of the fund not a single Southern State within the field of its operations had a system of free public schools, and only in a few cities were any such schools to be found. No State organization existed through which this fund could reach the people. The illiteracy of the inhabitants was appalling, and by no means was confined to the freedmen, but included a large per cent of the white population. * * * The legislatures of these States, during the period of reconstruction, largely under the influence of members from Northern States, where the common schools had been for years a recognized institution, and of colored representatives who were filled with a laudable ambition for the schooling of the children of their own people, had laid out a work entirely and sometimes absurdly beyond the ability of their people to sustain. For the support of this scheme was to fall upon the native white people, who held 90 per cent of the remaining property of these Commonwealths. During the war and the five years following—1860 to 1870—the property values of these States had diminished to the extent of nearly \$2,000,000,000. There were in the ex-Confederate States 2,000,000 children and youth within the years of instruction." And it must be remembered that the outbreak of the war had practically closed the schools of the States engaged in it, even largely affecting those of the five border States which remained in the Union. Probably an entire generation of Southern children had come up during this period with the most meager opportunity for obtaining even the elements of schooling. Children of the superior class, left at home during the four years of conflict with the negroes and the women, in the condition of fearful excitement and apprehension that involved every Southern home during these terrible years of clouds and darkness, must have often been neglected. A great deal that is now recognized and deplored as the shadow side of life in some of these States is the direct result of the enforced absence of proper home, school, and church influences upon this generation, now the people of the most active age in the management of private and public Southern affairs.

Well does Dr. Curry say:

In the effort to organize and put in successful operation a new and untried system of public schools adequate to the needs of the entire population, the Southern States were under a weight of debt beyond their ability in their impoverished condition to pay. To add the expense of free education to this crushing weight was, in their financial condition, a perplexing and almost impossible task. Free schooling was a new question, introduced and to be administered by novices in this work. To organize the freedmen—the equality of citizenship of a large class, lately the slaves of the white people—was not easy, because in conflict with the traditions, prejudices, social customs, and legal rights of a few years preceding.

To impose voluntary heavy burdens on the scant property which survived the demoralization of the war so as to educate gratuitously their own children and the children of the late African slaves, was a test of patriotism, of humanity, of civic duty which no other people ever encountered. * * * These States courageously undertook the work, levied taxes on property, more than 90 per cent of which belonged to the white citizens, for the establishment of a dual system of schools, giving like and equal advantages to both races; and there was, of consequence, a muttering of discontent, a complaint of overtaxation, a controversy upon the efficiency of inchoate schemes, and efforts to overthrow the education which was unfamiliar to teachers and people.

To further complicate the situation, the agencies which had wrought for the promotion of order, industry, and intelligence, especially among the emancipated negroes during the progress of the war, had been withdrawn or were acting against an almost insurmountable resistance from a large class of the Southern people. The Army was still present in its most exasperating relation, sufficient to be a constant source of popular irritation, but not strong enough in numbers to protect anybody outside of a military post. The Freedmen's Bureau, through its educational operations, was regarded rather as an officious agency from without than an ally of the home educational public, and at best would only look to the reconstructed State governments regarded as usurpations for the aid and comfort necessary to its effective action. It is doubtful if any demonstration, however patriotic, conciliatory, and powerful for good, made from the North or the nation would have met a response in a condition, now well appreciated, but then regarded by the loyal people of the country as an unreasonable and almost treasonable prolongation of a state of practical civil war.

It was then that George Peabody, "moved by the Holy Ghost," came to the rescue "of the suffering South for the good of the whole country." George Peabody, in his large and generous personality, appeared to the Southern people as a representative of the entire civilized and Christian world rather than of the North or the nation. By the Northern people he was recognized as a genuine son of New England and a decided friend of the Union, who had never withdrawn from his American citizenship or even placed his name in a London directory, a representative of all that was noblest and most lovable in the highest realm of society in the free States.

George Peabody was born in that portion of the old town of Danvers now known as Peabody, Essex County, Mass., February 18, 1795, of poor but thoroughly respectable parents. His only education in letters was in the New England district common school of that early day. At the age of 11 he was apprenticed in an old-time New England country store. At 14, he "moved on" to Vermont according to the original form of "going West," for a New England boy at the beginning of the century. He soon returned to the village of Newburyport, Mass., where he remained till "of age." A fire that "burned him out" was the good providence that sent him to an uncle in Georgetown, D. C. As the young "traveling man" of a firm of merchants in this little city he formed a close acquaintance with the people of the neighboring States of Virginia and Maryland that gave him a permanent attraction to his new home. Promoted to the active partnership of a larger establishment in Baltimore, Md., he accumulated there the first \$5,000 that proved the corner stone of his, at that time, great fortune of \$15,000,000. As a "home guard" he shouldered arms in defense of Washington, D. C., in the war of 1812. In 1827, at the age of 32, he first saw London and ten years later, at 42, he was established there as a banker and general operator in exchange.

In his early manhood, as he tells us, he formed a resolution to devote the major part of his fortune to some act of charity and education. He lived unmarried, always with a becoming simplicity, but with a cordial hospitality to his visiting countrymen in London that gave him troops of friends on both sides of the water. By his one financial operation in behalf of his adopted State, Maryland, and an

active cooperation in the representation of the United States in the first great industrial exposition in London, he became widely known.

At the age of 52 he entered upon a public career of charity that at his death, in 1869, left him one of the most honored and beloved of any men in Christendom. A plain American countryman, he was borne to his burial with more than kingly honors, the three great powers of Europe—England, France, and Germany—uniting in the naval escort of his body across the Atlantic; as it were, Christendom rising up to hail an example of practical Christianity so complete. Well might Victor Hugo declare him that “great citizen of the world and brother of mankind.” His larger bequests began in 1852 by his gift of \$2,500,000 for the development of self-helping manhood and womanhood among the poor in London. His system of tenement houses, rented to the most deserving in straitened circumstances, has already so enlarged its own sphere of operation that it may, as he predicted, ultimately become the solution of the awful problem of poverty that for a century has baffled the vast charities and challenged the executive genius of church and state in Great Britain.

The record of the numerous timely and well-considered gifts which extended over the remaining twenty-six years of his life consumed \$10,000,000 of Mr. Peabody's fortune of \$15,000,000, without injustice to even the distant relatives of his own family. One of these gifts was a memorial church, built in commemoration of his mother, in his native town.

After long and confidential correspondence and consultation with the most reliable American advisers, George Peabody, on an October day in 1866, at the charming suburban home of Hon. Robert C. Winthrop, in Brookline, Mass., seated under the portrait of Benjamin Franklin, opened his “leathern wallet,” a veritable budget of blessings, which contained the securities and documents connected with what was then the greatest and most fruitful gift to popular education in the history of the world. It consisted of \$1,000,000 in reliable securities and \$1,500,000 in such as were esteemed by himself as certain of future recognition, the whole sum to constitute a permanent fund to be administered by a board of sixteen trustees, nominated by himself, with provision for permanent corporate existence, for the education of all classes and conditions of the children of the Southern States most in need of aid. While confined for the present, for good reasons, to the ex-Confederate States, it was the desire of the giver that at the final distribution of the fund, in thirty years, it should be so handled as to include every State of the South in its benefactions. The board of trustees was chosen with great wisdom. Indeed it would have been difficult to name a list of sixteen men then living in the United States who represented more of the general ability, wisdom, and worth of the country. It was notable, however, that it did not include the name of any distinguished professional teacher, but was selected from the men who in public and professional life best represented the entire American people. This original board of trustees contained the following names:

THE BOARD AS ORIGINALLY APPOINTED BY MR. PEABODY.

Hon. Robert C. Winthrop.....	Massachusetts.
Hon. Hamilton Fish.....	New York.
Right Rev. Charles P. McIlvaine.....	Ohio.
Gen. U. S. Grant.....	United States Army.
Admiral D. G. Farragut.....	United States Navy.
Hon. William C. Rives.....	Virginia.
Hon. John H. Clifford.....	Massachusetts.
Hon. William Aiken.....	South Carolina.
Hon. William M. Evarts.....	New York.
Hon. William A. Graham.....	North Carolina.

Charles Macalester, esq.....	Pennsylvania.
George W. Riggs, esq.....	Washington.
Samuel Wetmore, esq.....	New York.
Edward A. Bradford, esq. (resigned).....	Louisiana.
George N. Eaton, esq.....	Maryland.
George Peabody Russell, esq. (resigned).....	Massachusetts.

The vacancies created by death or resignation have been filled by the election of—

Hon. Samuel Watson.....	Tennessee.
Hon. A. H. H. Stuart (resigned).....	Virginia.
Gen. Richard Taylor.....	Louisiana.
Surg. Gen. Joseph K. Barnes, U. S. A.....	Washington.
Chief Justice Morrison R. Waite.....	Washington.
Right Rev. Henry B. Whipple.....	Minnesota.
Hon. Henry R. Jackson (resigned).....	Georgia.
Col. Theodore Lyman (resigned).....	Massachusetts.
Ex-President Rutherford B. Hayes.....	Ohio.
Hon. Thomas C. Manning.....	Louisiana.
Anthony J. Drexel, esq.....	Pennsylvania.
Hon. Samuel A. Green.....	Massachusetts.
Hon. James D. Porter.....	Tennessee.
J. Pierpont Morgan, esq.....	New York.
Ex-President Grover Cleveland.....	New Jersey.
Hon. William A. Courtenay.....	South Carolina.
Hon. Charles Devens.....	Massachusetts.
Hon. Randall L. Gibson.....	Louisiana.
Chief Justice Melville W. Fuller.....	Washington.
Hon. William Wirt Henry.....	Virginia.
Hon. Henderson M. Sommerville.....	Alabama.
Hon. William C. Endicott (resigned).....	Massachusetts.
Hon. Joseph H. Choate.....	New York.
George W. Childs, esq.....	Pennsylvania.
Hon. Charles E. Fenner.....	Louisiana.
Daniel C. Gilman, LL. D.....	Maryland.
Hon. George Peabody Wetmore.....	Rhode Island.
Hon. John Lowell.....	Massachusetts.
Hon. George F. Hoar.....	Massachusetts.
Hon. Richard Olney.....	Massachusetts.

Hon J. L. M. Curry, honorary member and general agent.

Since the publication of the above list, in 1898, Hon. William M. Evarts, the only remaining member of the original board of trustees, and its president, is deceased.

The first meeting of the board of trustees was held at Washington, D. C., in Willard's Hotel, on February 8, 1867. The venerable Bishop McIlvaine, of Ohio, invoked the divine blessing, General Grant devoutly kneeling by his side. The selection of this board of trustees was a master stroke of the executive wisdom that at once includes and rises above policy. Probably there has never been in any country a working board intrusted with great educational funds that represented so varied and in almost every person so eminent an array of high character, ability, and large experience in affairs, combined with distinguished public station. During the past thirty years it has included three Presidents of the United States, two Chief Justices of the Supreme Court of the United States and several distinguished members of the State judiciaries, famous military and naval commanders of the Union and Confederate armies, including General Grant and Admiral Farragut; lawyers like Lowell, Evarts, Choate, and Clifford; financiers like Drexel,

Childs, and Morgan; the ideal Southern gentlemen of the old time in Governor Aiken, of South Carolina; statesmen of the same period in Gibson and Rives; distinguished gentlemen of cultivated leisure in Eaton, Bradford, Russell, and Macalester; public men like Lyman, Endicott, and Olney, Mayor Courtenay, of Charleston, S. C., and Manning, Somerville, Watson, Porter, and Jackson from the South; two bishops of the Protestant Episcopal Church—McIlvaine and Whipple; the learned secretary of the Massachusetts Historical Society, Dr. Greene, Hon. William Wirt Henry, of Virginia, and among the later members President Gilman, of Johns Hopkins University, and Senator George F. Hoar, of Massachusetts. During the thirty years of its operation 47 gentlemen have served on this greatest of common-school boards, and of the 16 regular members no meeting has failed for lack of a quorum, on one occasion President Grover Cleveland having held himself in reserve amid important duties in Washington to go to New York to fill a possibly vacant chair.

At once the necessity was realized of appointing a competent agent, to whom should be intrusted the practical administration of the gift. Here the wide acquaintance with distinguished men possessed by Mr. Robert C. Winthrop, who, during the remaining twenty-seven years of his crowded and beneficent life, remained the president of the board, stood the new enterprise well in hand. As chairman of the committee on education in the legislature of Massachusetts in 1837 Mr. Winthrop had been largely influential in the educational new departure that called Horace Mann to the leadership of the great revival in the common school system of the State and the Union, and he also brought in the bill to the legislature for the establishment of the first State normal school in the United States, at Lexington, Mass. He turned at once to President Barnas Sears, of Brown University, Rhode Island, who, in 1848, had been appointed the successor of Horace Mann in the office of secretary of the board of education of Massachusetts, practically the superintendent of public instruction, for consultation and suggestion. The reply of President Sears, in a remarkable document outlining a policy for the board of trustees, confirmed the belief of all that he was the man whom Mr. Winthrop well named "a perfect pilot of a perfect scheme." After careful consideration Dr. Sears resigned the presidency of Brown University, a position in which he declares "my duties are a perfect luxury and my associates all I could desire," for a work that might well have appalled the courage and tact of any living educator. In March, 1837, he accepted the call, removed to Staunton, Va., and for the remaining twelve years wrought a work whose originality, difficulty, and success will establish his reputation as one of the great educational statesmen of modern times.

At once the question came up of the fit method of distributing this munificent gift. Mr. Peabody had already fixed a long term as the limit of its activity in the provision that after thirty years the board of trustees, by a two-thirds vote, could decide to administer the fund for the best interests of education in every Southern State. He had also expressed the wish that the money should be used in a way to benefit as many students of limited means and all classes as was possible under existing circumstances. Dr. Sears, by long service in many varieties of educational institutions, from the country district school of New England, through collegiate and professional seminaries, and as a State superintendent of public instruction, was a most competent adviser. After a careful study of the situation at "short range" for three months, by consultation with the best informed friends of education in the Southern States, he presented to the board, in session at Richmond, Va., in 1868, a programme which so commended itself that after a thorough discussion and comparison of views it was adopted and became the policy of an administration which has probably achieved a greater educational success than was ever realized before from an invested capital of \$2,000,000.

This plan, as outlined by Dr. Sears to the board, was, in brief, the most thorough

preparation for the immediate establishment of the American common school in every Southern State. It proposed to assist in the establishment of common, free public, in distinction from private denominational or corporate, schools, as the chief educational centers of the section. Each school should be located where its influence would be most extensively felt, where the community could be induced to aid in its foundation and permanent support, the best teachers could be obtained, and the most approved methods of school organization, government, and instruction could be illustrated. As far as possible, at once, the fund should be used in connection with the State governments. Where no system of public schools existed, the efforts of the agent should be in the direction of establishing this great desideratum. It required no little courage, executive energy, and tact to reject the numberless influential appeals for educational aid to existing institutions, on the lines of the old-time system of denominational and private academies and colleges adapted to the wants of the superior class. Here came in the "saving common sense" and broad statesmanship of the board, composed of men of extensive experience in public affairs and well aware of the state of public opinion among the most thoughtful people of the country. After deliberate consultation this scheme, with the urgent advocacy of General Grant, was adopted as the policy of administration, and hereafter the name of George Peabody will be associated with the foremost educators of the complete system of American universal education for every class in every State of the Union.

At the third meeting of the board of trustees, in the city of New York, May 28, 1867, the act of incorporation granted by the legislature of that State was presented, an organization under the charter was perfected, and a common seal for the corporation authorized.

The wisdom displayed in the choice of Dr. Sears as the general agent of the board at once became apparent. Few men summoned to the "high calling" of reconciliation between the people of the two sections of the country, so long becoming estranged and so fiercely contending during four years of the greatest civil war in modern times, have been so eminently fitted by temperament, education, experience, and a rare combination of intense consecration and an almost microscopic faculty for managing details, with a cosmopolitan habit of far-reaching observation and the ability to put himself in the place of every man or community with which he was called to deal, as Dr. Sears. Well does his successor, Dr. Curry, express the universal judgment of the country on this matter in his statement that "the history of education in the South would have been very different but for the wonderful skill and ability with which Dr. Sears, transferring his home and citizenship to Virginia, surmounted obstacles, changed adverse opinions and convictions of the people, made the Peabody Education Fund a most popular trust, and became himself embedded in the confidence and affection of the South."

In nothing was the foresight and the profound insight of Dr. Sears into the then present educational needs of these States more evident than in the decisive manner in which he rose above all the former associations with his own religious body and the system of denominational education which was so dear to the sect and such a title to its honorable standing before the country. He saw at a glance that the old-time habit of private and denominational control of institutions of learning was so firmly rooted in the Southern mind and heart that the church there could be safely left to deal with the rehabilitation of every valuable school of this character that deserved a new lease of life. His judgment has been vindicated by the fact that in one generation from the educational wreck of the war the entire South is to-day in a far better condition in respect to this side of the secondary, higher, and professional education than ever before. The zealous efforts of all the religious bodies of the nation to plant important schools for the superior training of the negro youth of both sexes, including the important annex of industrial education, has already given to this race a better proportional outfit of excellent seminaries

than the united people of the whole country enjoyed until far along in the second half century of the national life. Dr. Sears recognized the fact that here was the providential reinforcement of the growing common school public of the South, which for fifty years had been laboring against almost insurmountable obstacles to give even free elementary schooling to the white children and youth of the humbler classes. Only this fact that in the South was found a large and increasing body of influential people who regarded universal education of the American type as the only means to remove the radical hindrances of every description to the prosperity of this section explains the immediate welcome to Dr. Sears, appearing as the representative of the common school idea, indorsed by such a weight of influence as the board of trustees of the Peabody Education Fund. Mr. Peabody had already expressed his own convictions that his great gift would be best employed for "the free education of the children of the South, without other distinction than their needs and their opportunities of usefulness." And although there were earnest and distinguished advocates of giving immediate appropriation of funds to aid the impoverished youth of the old families and rescue schools of long-established reputation from the peril of final collapse, yet the indorsement of the broader system by Dr. Sears, backed by a large majority of the trustees, not only prevailed, but finally won the dissenters over to a cheerful agreement with the final policy. The reason that the fund has to some extent been used to subsidize the denominational "colleges" and "universities" for the negro is that only in this way has it seemed possible to supply the imperative need of competent teachers of their own race for the new public schools.

The great success of the movement of Dr. Sears in persuading the people of many different classes and rival sects to heartily cooperate in the establishment of what was called "the graded school," simply the common school of the North and similar communities, including its secondary department, the high school, was certainly not due to the small amount of money he was authorized to distribute. The board at once decided in no case to meet the entire cost of maintaining any local school. The donation was rarely more than one-fourth the expense of its establishment and maintenance, and was given only on the pledge that the remaining three-fourths should be assumed by some responsible party or the municipal government of the place. Dr. Sears wrote in 1869: "Our maximum for white schools has been \$300 for 100 pupils; \$450 for 150; \$600 for 200, and we have paid in Virginia, North Carolina, and Georgia \$4,000 in each State for a little more than 2,000 pupils. I am inclined to adopt that rule, namely, \$300 for 100 white pupils and \$200 for 100 colored. It costs less to maintain schools for the colored children than for the white."

At a later date experience suggested a variation from this policy, and—

Instead of a proportionate distribution according to populations or poverty, a limited number of the larger towns, such as would exert the widest influence upon the surrounding country, was selected, and for any locality the maximum appropriation was \$2,000 and the minimum number of pupils was 100, being the smallest number that would admit of a graded school. These models of well-organized and well-conducted schools, showing the people what a good graded school is, did more to enlighten the communities, disarm opposition, and create a sound public educational sentiment than all the verbal arguments that could have been used. The chief benefit did not arise from what the fund gave, but from what it induced others to give and to do. The unvarying rule of helping those who help themselves, of requiring a larger sum than was furnished to be raised by local tax or contribution, has marked the entire administration of the fund and has had a most salutary influence in increasing fourfold what has been given for education, and in indoctrinating taxpayers with a sound economic principle that there is no more legitimate tax on property than that which is levied for the education of the masses. In many instances the towns soon assumed all the expense, the schools became self-supporting, and thus the timely and judicious aid gave permanence to schools, which continued to flourish after the fostering external help was withdrawn. Attention was thus excited, and soon the feebler rural districts were

reclaimed. The experiment of partial succor, conditioned on larger self-help, had a widening and happy influence in bringing about an organized, competent State system, which included both urban and rural schools.

Twenty-four cities and 200 villages, at first assisted by the fund, had soon been able to get on without it, and were supporting the graded system of public instruction free to all classes and both races. During the first twelve years of the administration of Dr. Sears, until 1880, this policy was followed with eminent success, and so wisely has the "business end" of this great charity been managed that during the thirty years contemplated for its existence by the founder a sum larger than the original gift has been disbursed, while by the grand donation of Mr. Peabody \$2,000,000 are still "in the bank," after carrying the repudiation of nearly \$2,000,000 of the bonds of Mississippi and Florida to the wrong side of the ledger. For several years these two States were left out in the distribution of educational aid, but finally, at the suggestion of ex-President R. B. Hayes, it was concluded no longer to punish the children for the policy of the fathers.

The thirty "years of grace" have come and gone. But the board has wisely concluded to indefinitely postpone the final distribution, and the consequent dissolution of the corporation. An almost unanimous protest against this policy came up from the entire educational public of the South. The very existence of such an organization, so wisely conducted, will in itself be one of the most powerful agencies in the coming revival of common school education, everywhere demanded and confidently predicted in the first generation of the new century. The effect of this gift in stimulating other and larger benefactions, not only for the common schools but for the higher education, contemplated by Mr. Peabody, has been realized. Between 1867 and 1898, not less than \$12,000,000 had been contributed in large sums to the cause of education in these States. Of this, \$8,000,000 have been given by their own citizens, and the willingness of States and communities to appropriate more generously and enact more favorable laws for the support of popular education has steadily increased.

But it was only by a slow and intermittent movement that the educational interest, prostrated by the ten years of war and civic agitation, lifted its head. In 1870, after three years of aid, largely including the educational centers already described, Dr. Sears reports, in his annual address to the board, that "the condition of affairs is unfavorable to systematic, vigorous, or liberal action on the part of the States." In North Carolina there was only the income of a State school fund of \$300,000 to educate 750,000 children. In South Carolina no schools were in operation under the new law, and, with the exception of Charleston, no towns supported schools by public taxation. No school law had been passed in Georgia, and only a few towns were moving. Florida had a good law, but little income. Alabama reported a school fund of \$525,000, 4,000 schools and 160,000 children, one-half the school population in attendance. On his first visit to Texas, in 1870, Dr. Sears found both laws and sentiment discouraging, and not till 1871 was a school system launched, only to go down amid a "fierce party strife." The good doctor went about his work with the broad impartiality of the Providence that maketh the "sun to rise on the evil and the good, and sendeth rain on the just and the unjust," but always grieved at heart over the discouraging sketch of "the impoverished condition of the people, State, municipal, and individual bankruptcy, the debts that hung with crushing weight on States, and the cruelty of increasing taxation for even the best purpose."

But even greater was the personal burden of going to every place as a peace-maker among the people themselves. "To deal with all sorts of people, from cranks and imbeciles to governors, legislators, and Congressmen; in short, to convince a community torn by political dissensions that seemed ever on the eve of bursting forth into civil war, and distracted by the habit of suspicion and recrimination that is the worst result of defeat in a supreme effort for a magnificent suc-

cess; not that he and the rest of the country were unworthy of confidence, but that the first necessity at home was to come to an agreement to do something for the common good that would lay a new and abiding foundation for the future." All these local causes of distrust were now reenforced by a movement in Congress to insert in a "civil rights bill" for the protection of the freedmen a clause requiring a system of "mixed schools," in which the children were to be educated together through all the Southern States. It was only by the determined and persistent efforts of Dr. Sears, General Eaton, and others of the best informed and most trusted leaders of the colored race, that this mischievous provision was left out of the bill, which would have been vetoed by President Grant had it passed through Congress.

But death and change are the lot of man, and the board of trustees of the Peabody education fund during the past thirty years has been no exception to the immutable decree of Providence. The original board of trustees, as arranged by Mr. Peabody and Mr. Winthrop, president of the board, has been already published in this essay. The Hon. William M. Evarts, disabled by age and infirmity, for a time the only remaining member of that illustrious company, Mr. Russell having resigned, died in 1901. The second table already referred to, containing the names of the entire number of gentlemen who at different times have succeeded to membership in the Peabody board, is itself an impressive commentary on the rapid disappearing of the generation that lived and wrought in the "grand and awful time" of the marvelous effort that decided the permanency of the Union.

Dr. Sears and Dr. Eben Stearns, first chancellor of the revived University of Nashville, whose academical department became the basis of what is now the Peabody Normal College, have also departed, and their places have been admirably filled. Dr. J. L. M. Curry, of Alabama, later of Richmond, Va., and at present of Washington, D. C., is now general agent of both the George Peabody and J. F. Slater educational funds. Dr. William H. Payne, of the University of Michigan, became chancellor of the University of Nashville and president of the Peabody Normal College on the death of Chancellor Stearns in 1887, and resigned in 1900. The place is now occupied by Hon. James D. Porter, of Tennessee.

A glance at this list of 46 men, 20 of whom by death or resignation no longer remain with the management of this fund, will explain the immediate respect and great expectations awakened through the entire South on its appearance upon the field of popular education in 1867-68, and the confidence reposed in it to-day as the trusted adviser and the fast friend of the section, and the best existing representative of the nation and the North thereto. It would be a fitting tribute to the great work already done that the proposition of Dr. Curry, that the Southern States should place a statue of George Peabody in the Capitol at Washington, be complied with. The time may come when the children of the South may be moved to emulate the spirit of the children of Massachusetts, who placed the statue of Horace Mann opposite that of Daniel Webster in front of the State House in Boston. And a final tribute of all educators and friends of the common school in the Union would be the gift of an additional million of dollars to the Peabody fund as a memorial to Robert C. Winthrop, to whom only less than to George Peabody this great benefaction owes its immediate and continued success, with a provision that this portion of the entire fund at least shall be made perpetual, and that the vacancies in the board of management, as fast as they may occur, shall be filled in equal measure from the group of eminent women educators of the country.

It was one of the earliest suggestions of Dr. Sears that the most imperative need of the new Southern schools was the supply of a sufficient number of competent teachers, at least for the work in what is known as the graded schools. It was a great advantage to the South that when all these States took up the final work of adopting the American common school as a permanent institution in 1870, it was no longer the old-time country or even the city isolated district school so fully

delineated in the gallery of educational sketches and full-life pictures so forcibly drawn by Horace Mann and Henry Barnard in the North, or the "old field" Southern arrangement so picturesquely drawn by Dr. Richard Malcolm Johnston in the South, or even the regulation private home or denominational school of the South before 1860. Dr. Sears and Dr. Stearns, who became the first president of the Peabody Normal School at Nashville, Tenn., were among the most reliable and experienced educators of their time, and no public man even of New England had a more intelligent and consecrated zeal for popular education than Robert C. Winthrop, who, as chairman of the committee on education in the Massachusetts legislature of 1837, was in at the beginning of the great revival that began in that State and the establishment of the first State normal school, located on July 4, on Lexington Green, Massachusetts, facing the monument there erected to the memory of the first martyrs of the Revolution. In the thirty years from 1837 to 1867, the date of the establishment of the Peabody fund, the old-time city, village, and even largely the country district school of New England, supervised by its own local trustees under such teachers as the wisdom or the whim of the "prudential committee" or the intelligence and zeal of the "town meeting" for the financial needs of education might place in the schoolroom, had been passing through an evolution into the complete system of the common school of to-day. That system, known in the South as the graded school, now offers the opportunity of a complete education, at public expense, to every child, from the little children's primary to the State university, including the later annexes of industrial training and the people's free library. No man, however wealthy, in Boston or New York in 1830 could have purchased such opportunities for the education of his children in his own State or country as are now freely offered to the child of every creed, nationality, or "previous condition" probably in every city of 20,000 people in every Northern State. And although the zealous advocates of the old-time European educational methods of the church and of the limitation of the public schools to the elementary and industrial departments still make their chronic protests, the people of the United States have determined, with a unanimity not found in any previous action, that this shall be the accepted method of training young America for the most honorable and, in the coming century, most responsible and difficult human position, intelligent, moral, and effective American citizenship, and that whatever else "goes by the board," the people's common school in its present and improved organization shall abide.

Such expectations as were now awakened in the executive work of the nation's great common-school board, the trustees of the Peabody education fund, could not fail to appeal both to the pride and the feeling of stern necessity of the leading educators and influential people to place the new system on a solid foundation, and accept nothing but the best for the schooling of their children and youth. There was found at once the most valuable material in any country for a temporary supply of teachers in the great number of women of good culture, high character, and social standing, who, by the fate of war and losses of property, had been left to the prospect of earning their own bread. At the call of the people many of these excellent women at once appeared, not only working to gain an honorable support by labor in an untried field, but moved by a great desire to contribute to the rehabilitation of their States and communities in this, the most vital way. During these first twelve years—including the entire term of the service of Dr. Sears as agent of the Peabody fund—not only the reviving seminaries for girls, but in large degree the new public schools, were taught by women of the foremost character, culture, and social standing, whose place in the schoolroom shut the mouths of cavilers, and assured the better sort of people that here was the place of all others where it was safe to educate their children. During the first five years of the Southern ministry of education of the author of this essay, he met hundreds of these persons, many of them the widows and daughters of the most distinguished military and civic characters in the Confederate cause, who

gave to their daily task in the schoolroom the same burning zeal, tact, and self-sacrificing affection that had been so sadly disappointed in the attempt to establish a new nationality. And it should be said to the praise of these good women, and only less completely to the large number of distinguished men who came to the front during the first twenty years in the new educational movement of Southern schools, that they went to their work in no spirit that separated them from the most confidential personal relations with the superior teaching officials of the whole country. It may be truly said that there was one set of people in the United States who, in 1865, were in no special need of "reconstruction," the superior educators of the whole country, who at once found each other out and met each other as friends and fellow-soldiers on the nobler battlefields where the grand army of the nation's youth was marshaled responsive to the old-time prophecy, "A little child shall lead them."

But even for this class there was a great need, by nobody more keenly realized than by themselves, for the special training that would equip them for the best service in the new graded common schools. It was not possible or wise to bring expert teachers from the North or from abroad in any considerable numbers, although many of these were found working in beautiful accord with their Southern brethren and sisters in their noble calling. But there was at once a swarming of such as could afford the pecuniary expense to the great summer schools of the nation, and the new collegiate and normal schools for women were never so largely attended from the South, even in its days of prosperity before the war. There was the most imperative necessity that in some way at once there should be placed on the ground an arrangement by which, at the smallest expense in time and money, at least a portion of the leading teachers in every locality should be trained in the best methods of organizing and disciplining the new graded schools, that they might become the models for their subordinates and prevent the new system from being a disappointment to the people who, often at great personal sacrifice, were supporting it. Of course, at once there sprung up the usual crop of feeble imitators and educational shams of the old-time "infant-school" type, in charge of a teacher whose chief outfit was pecuniary impecuniosity and an all-sufficient self-confidence. But there were numbers of others, honest and progressive young people, who were no longer satisfied with the regulation schooling of the days of the fathers and grandfathers, but demanded the same professional training that their class was then receiving in every civilized land.

It was perhaps not remarkable that this want was first supplied to the colored pupils by the establishment and generous support of a great number of schools of the elementary, secondary, and higher type through the agency of all the religious denominations in the Northern States. This was the result, to a large extent, left by the great effort of the nation and the North, as already described, during the war and up to 1872, through the Freedmen's Bureau. The result was not only the primary schooling of many thousands of youth and adults, but the placing in the constitutions of all the reconstructed States a provision for the common schooling of all children. In several of the larger Southern cities the public schools for the colored children were instructed by white teachers. Indeed, as late as 1882, the writer of this essay visited in the city of Charleston, S. C., the seat of the opening of the civil war, a great public school of 1,500 pupils, superintended by a Southern brigadier-general and instructed by a devoted corps of women teachers from good Charleston families, justly the "show school" of the city. The same was true at that time of Richmond, New Orleans, Baltimore, and other cities.

But this, of course, could be only a temporary supply. At once, beginning at the Hampton Normal and Industrial Institute, at Hampton, Va., and following in a score of the larger schools established by Northern charity in spacious buildings, were placed excellent teachers drawn from Northern schools and colleges, often of great experience, large culture, and denominational importance, furnished

with libraries and opportunities superior to those enjoyed in many of the colleges for the whites.

For a time there was really a greater absence of supply of professional teachers among the white than among the colored youth. In his first communications to the Peabody board, Dr. Sears had enforced the immediate necessity of this matter. Dr. Curry says: "In the whole South there was not a single normal school." Many annexes and departments with the name were hastily originated, but these were in denominational and private institutions, and rivalries and jealousies soon compelled a resort to the principle of confining aid on the plan of the Peabody trustees to such schools as were under State control. The attempt to utilize the existing schools for this purpose in Virginia and Louisiana, as in several States in preceding years, soon came to naught, and before the end of the first year of Dr. Sears's administration it was seen that schools must be created by the board to meet the immediate emergency.

In 1876 it was determined by the board, by advice of Dr. Sears, to omit the gifts for general education and concentrate on the pressing need of the schools for the training of teachers who should become leaders in the campaign of the establishment of the new graded and county district schools for the whole people. The policy of establishing the new special institutes was recommended, but this encountered the double difficulty from the extreme summer heats of the Gulf States and the expense of attending by teachers so poorly paid.

But already, in 1875, an opening appeared by which a solid foundation could be laid for this great work through the establishment of a model normal school that should at once send forth a limited number of trained teachers and enable every State and city to obtain one or more of the graduates. In a previous Report of the United States Commissioner of Education a deeply interesting account will be found of the labors of Dr. Lindsley, in Nashville, Tenn., from 1824 to 1850, in behalf of a great university in the Southwest. The good doctor, like the prophets and kings of old, had "desired it long, but died without the sight" of his ideal institution. But his memory was cherished, and his many able and numerous publications set up in Nashville a light-house flashing radiance over the troubled educational waters of the State and the Southwest, and he had left the foundations for a superstructure in the Valley of the Mississippi. In 1876 Dr. Sears found at Nashville, Tenn., a "campus" of 16 acres, containing a number of substantial school buildings and a small library and museum, a medical and law school annex, and a limited amount of funds, all in the hands of a board of trustees, composed of the foremost men of the city, including Governor Porter and the son of the old president, who had laid down his life for the cause so near his heart. An address to the legislature of Tennessee by Dr. Sears secured no encouraging response; but the trustees of the University of Nashville, by which name all this was called, offered \$6,000 and the use of all the buildings of the corporation and the establishment of a normal school in place of the academical department of the institution. Dr. Eben S. Stearns, one of the most distinguished school men of New England, who, under the secretaryship of Dr. Sears, in Massachusetts, was appointed to the principalship of the first normal school in the country, then located at West Newton, Mass., where a group of young women had been educated who went forth to acquire a national reputation, afterwards principal of the Albany (N. Y.) Female Academy, whose teachers were chiefly drawn from his own normal school in Massachusetts, and later the principal of a superior school for girls in Exeter, N. H., was called to the chancellorship of the university, including the principalship of the new Peabody Normal Seminary.

Dr. Stearns entered upon this, the greatest of his life-works, on December 1, 1875, with a class of fifteen female pupils amid a great deal of private disparagement, indifference, and hostility, while the State of Tennessee withheld the aid necessary for its rapid development. But Dr. Stearns was not the man to fail. He demanded

the use of the representatives' hall in the State capitol for his inauguration exercises, and planted a memorial tree at the close of his first year's labor. In 1876 the Peabody Education Board came to the rescue by the appropriation of \$200 a year for giving student aid in the form of two years' free tuition to each of a number of students from the ex-Confederate States, the candidates to be appointed after a competent examination and limited to the number of the State delegation in Congress. This student aid was later reduced from \$200 to \$100 a year. By this arrangement 204 students were soon gathered, and the Peabody Normal School at Nashville at once took rank among the better class of seminaries of its kind in the Union. The students were pledged to teach for a limited time after graduation, and these States have received great assistance in the organization of their common-school systems from some of them. At a later period the material facilities were improved by the building of a president's house, a gymnasium and library, and a modern schoolhouse. In the twenty-two years from its establishment to 1898 \$138,584.10 had been given by the Peabody fund in this way to twelve States.

In 1879 the continued lack of interest in the college by the people and legislature of Tennessee precipitated a crisis in its affairs. The trustees authorized Dr. Sears to enter into negotiations with the State of Georgia for its removal. Only the provision of the constitution of that State, which placed every institution of learning in the Commonwealth receiving State aid, under the general title of the "University of Georgia," with the probability of a divided administration, prevented the acceptance of a very flattering offer for its establishment in that State. The citizens of Nashville came to the rescue and relieved the school of several items of expense, until the legislature could be brought to more favorable terms, beside a generous appropriation for the repair of the buildings. Encouraged by this liberality, the able and devoted Chancellor Stearns wrought with redoubled energy. In June, 1881-82, the State agreed to contribute \$10,000 annually, and the sum was afterwards raised to \$15,000, on condition of a perpetual number of scholarships for students from the State.

It is not improbable that the labors and anxieties attending the final disposal of this matter shortened the life of Dr. Sears. He died at Saratoga, N. Y., before the completion of the final organization on July 6, 1880. Not even among its own most illustrious educators has the South ever known a better friend than this great and good man; great and good in breadth of mind, ability in administration, and indomitable patience; above all, with the "charity that never faileth," so rarely united in the benefactors of States and nations. His service of twelve years in an office that would have taxed the energies of the most competent and original educational statesman and administrator can never be fully estimated. It has already become a part of the lifeblood of many Southern communities and, like all work of this nature, will be most valuable as the seed corn of a future harvest more abundant as the years go on.

Seven years later the Peabody Normal School was visited with an even more distressing affliction in the death of Chancellor Stearns, which occurred at Nashville on April 11, 1887. Dr. Curry fittingly says of him: "For eleven years and more Dr. Stearns gave untiringly his energies and ability to this enterprise, and what it became was largely due to his zeal, his paternal watchfulness, his brave helpfulness, and his administrative and scholarly capacity."

The place of Chancellor Stearns was filled by the appointment of Dr. William H. Payne, on October 5, 1887. Dr. Payne was called from the University of Michigan, where for several years he occupied the chair of pedagogics, afterwards filled so ably by Dr. Hinsdale. Under his administration the Peabody Normal College, as it is now named, made rapid strides in numbers and equipment until it ranks with the best of the superior training schools for teachers in the country. In 1897 it reported 544 students and 25 instructors, with the advantage of situation and

the general aid and appurtenances of a college of established reputation as a basis for the training of teachers capable of assuming the leadership of all superior grades of schools in the South. Chancellor Payne resigned in 1901.

The period of the administration of Dr. Sears, ending in 1880, may be regarded as the formative and most critical in the establishment of the complete common-school system in the South. For already, as early as 1863, in West Virginia and during the war, in 1864, by the partial establishment of a loyal State government in Louisiana, and in all the Southern States by the insertion of a provision for a system for the public instruction of all their people in the new revised State constitutions, the basis had been laid for the future building for the children. Yet the progress was very slow and the best-informed friends of education were not among the most hopeful concerning the final success of the great experiment. The cold figures of educational statistical tables are of little value in a correct estimate of the labor, sacrifice, and "wear and tear" of soul and body and public and private endurance involved in such an undertaking. It is easy to see that up to 1880 the new graded schools, even in the larger cities and villages and county towns of all these States, were beating uphill, laboring against a variety of hindrances and overshadowed by the mighty industrial, social, and political changes that within the thirty years had given the nation not only a new South, but also a new East, and especially a greater new West that now aspires to "set the pitch" of the later American civilization.

And in the vast open country, where nine-tenths of the Southern children live, the progress of the new education was painfully slow. One of the earliest results of the war was the drifting of a great body of the most progressive and able young men of the ex-Confederate States away from the old rural life upon the plantations and the farms not only to the more prosperous towns but largely to other States. It has been said that 1,000,000 young men have in this way left the Southwest for the Northwest and the States beyond, beside another great crowd who have gone from the Atlantic coast States to the leading cities of the Northeast. The young women left behind have often shown a remarkable energy, lofty spirit, and honorable ambition to do the best under the most discouraging circumstances for the intellectual, moral, and religious uplift of the old home. When the critical educator is tempted to regard with indifference or contempt the imperfect results of the new educational life in such localities, he may be reminded to call up the story of patient labor, weary waiting, and poorly paid toil that is a daily sacrifice "hallowed by prayer without ceasing," the most heroic courage and the tenderest sympathy in behalf of the little ones, of the faithful, often overworked mothers, devoted young wives and sisters, splendid daughters, and "glorious maiden aunts" in the churches and the schools. There are hundreds of faithful men and women toiling in these little schoolhouses, quietly laying the foundations of the better time coming. And in all these humble temples of the new civilization the names of George Peabody, Robert C. Winthrop, Barnas Sears, Eben S. Stearns, J. L. M. Curry, and William H. Payne will be held in deeper reverence as the years go on.

The position of general agent of the Peabody fund and honorary member of the board of trustees, vacated by the death of Dr. Sears in 1880, was filled in the following year by the appointment of Dr. J. L. M. Curry. Dr. Curry was a native of Georgia, although he was brought to the beautiful mountain region of Alabama, at Talladega, in early youth. A graduate of the University of Georgia, he completed his professional education at the law school of Harvard University. As a young member of the Alabama legislature, he was placed on the committee of education, and was influential in the early movement for a system of common schools in that State before the civil war, in 1854. In 1857 he was elected a Representative in the Congress of the United States from his own district, and at once attracted attention by a peculiar blending of classic elegance and impassioned eloquence in the debates of that body. He followed his adopted State into the

Confederacy, and after a brief term of military service was elected to the Confederate congress, of which he remained a member until the close of the war. Removing then to Richmond, Va., he became a professor in Richmond College, an institution of the Baptist denomination. His attention was soon earnestly directed to the final movement for the establishment of a complete system of public instruction in Virginia. His early acquaintance with Dr. Sears soon ripened into a devoted personal friendship, emphasized by the increasing interest his new friend had so much at heart. It is understood that Dr. Sears had his friend in mind as the one man in the country best qualified to succeed himself on his retirement or death. For obvious reasons in 1880 it was desirable that the second agent of the Peabody fund should be a native of and resident in the South. Dr. Curry was unanimously elected to the post of general agent and afterwards to an honorary membership of the board of Peabody trustees, in 1881, the detailed business of the office during the interim being transacted, under the supervision of President Winthrop and the Hon. A. H. H. Stewart, of Virginia, by Mrs. Fulz, the daughter of Dr. Sears.

The opening administration of Dr. Curry, as agent of the board of trustees, was signalized by a new departure in the policy of distributing the funds of the association. The progress of the common-school movement in all the Southern States brought to the board more forcibly than ever the necessity of better provision for meeting increased demand for competent teachers. It was now fifteen years since the close of the war, and many of the devoted men and women who had bravely come forth as volunteers in the teaching force in the schoolroom had passed away or were forced into retirement by age and declining health. Already a new army of graduates from the graded schools and reviving seminaries and colleges were seeking the especial preparation essential to success in the still novel profession of graded-school instructor. The Peabody Normal School at Nashville was not yet in a position to accommodate more than 250 students. The great necessity seemed to be the establishment of normal schools in every State, following the habit of all the Northern Commonwealths. Besides this, it was held that the superintendents of the city and village schools should be required to form a teachers' department from their higher class, which might often assume the work of a fitting school for college, with an opportunity for observation and practice in the management of schools in all the grades below. The teachers' institute and conventions, State and local, were to be utilized for the same purpose as in the North, especially for the benefit of the teachers in the rural schools who had been unable to profit by the other agencies. An increasing number of the more ambitious teachers, often at great sacrifice of energy and with very moderate means, were spending their vacations at the great summer schools of instruction in the East and West or in a tour abroad, and the country already was feeling its way toward the annual Chautauqua Assembly, its founder, the present Bishop Vincent, of the Methodist Episcopal Church, being a native of Alabama.

In this state of affairs it was decided that the income of the Peabody fund, now somewhat diminished by the declining rates of interest, should be largely concentrated upon the work of increasing and improving the entire teaching force in all the Southern States. The allowance of \$200 per annum for two years to the students of the Peabody Normal College was reduced to \$100. Dr. Curry went South to address the different legislatures in behalf of the immediate establishment of State normal schools, with a promise of aid from the Peabody fund for several years. Dr. Sears had already advocated this work in his conferences with Dr. Henry Ruffner and Dr. Curry in the beginning of the period of public instruction in Virginia, 1870. Dr. Curry at once came to the front as the man of men to deal with the legislatures of these States. His long political experience, glowing eloquence, educational wisdom, and admirable blending of "fiery zeal" and conservative policy lifted him at once to a position above governors and legislators and

made him the "guide, philosopher, and friend" both of educators and statesmen. It will not be known until the death of this foremost of Southern educational reformers how great has been his influence during the years since the acceptance of his present office. To this work has been added the agency of the Slater fund, of \$1,000,000, for the education of the colored race, established by Mr. John F. Slater, of Norwich, Conn. It is said that Dr. Curry has addressed a larger number of legislative bodies as a private citizen than any man now living in the Union. These addresses would form one of the most valuable additions to the educational literature of the country. His personal address and progressive and masterful handling of all matters connected with education, with his intimate knowledge of the conditions of public opinion in all the Southern States and their prominent localities, have borne abundant fruit and were never so valuable as now. Each of the Southern States, in response to the powerful appeals of Dr. Curry and other friends of education, established State normal schools of the American type. In several States more than one of these schools are now supported, sometimes by the policy of subsidizing academical seminaries for this purpose, although it seems that the normal element is more evident in these schools than in some of the Northern seminaries of this description. The summer school of instruction, the Chautauqua assembly, the teachers' associations, local, city, and State, have all risen to importance since 1880, and the teachers of the Southern schools, besides a general association of their own, find a valuable element of improvement in the annual meetings of the National Educational Association.

The labors of Dr. Curry, as agent of the Peabody fund, were interrupted in 1885 by his retirement from the office, caused by his appointment as minister of the Government of the United States to the court of Spain by President Grover Cleveland. During his three years' absence from the country the affairs of the fund were well directed by Dr. Samuel Green, of Boston, Mass., as secretary of the board of trustees, in constant cooperation with Mr. Winthrop, both residents of that city. Dr. Green is well known as one of the men of good work and good will in a city so rich in men and women of that munificent type. The administration of the Peabody fund suffered no decline under the vigilant supervision of two such devoted friends as himself and the venerable president. Dr. Green visited the Southern schools aided by the fund, and commended himself to all with whom he was brought in contact. On the return of Dr. Curry, induced by the increasing danger to the health of himself and family in Madrid, he was summoned again to what, since 1888, has been his complete work. In the agency of the John F. Slater fund, made vacant by the appointment as bishop of the Methodist Episcopal Church South of that early apostle of the education of the colored race and among the foremost leaders in the work of collegiate and popular education, Dr. Atticus G. Haygood, this position was offered to Dr. Curry, and for the past thirteen years both these great benefactions have been administered in the only way by which such a trust can be effectively used by a man of such commanding ability and executive capacity for the work behind it that every dollar expended goes to its place, charged with a vitality that reenforces the mental, civic, and religious life of a community.

In 1895 the last of all its great afflictions came to the board of Peabody trustees in the death of its great president, Hon. Robert C. Winthrop. He died in Boston, Mass., November 14, 1895, in his eighty-fifth year. His monument bears the inscription—of which his son and biographer well says, "I doubt if he could be better described in fifteen words"—"Eminent as a scholar, an orator, a statesman, and a philanthropist—above all, a Christian."

The recent biography of Mr. Winthrop, edited by his son who bears his honored name, with the testimonials of the Massachusetts Historical Society, the national Bureau of Education, the Teachers' Association of the State of Texas, the dedication of the State Normal College for white girls in South Carolina to his

memory by the adoption of his name and the establishment of an annual memorial service, the press everywhere, and the affectionate tribute of Dr. Curry, his associate and devoted friend, relieve this essay from the necessity of enlarging on the life and services of this foremost citizen of his native metropolis, the most widely known of American public men abroad, and, beyond all American statesmen, celebrated by the consecration of the last twenty-seven years of his life to the great work of educational reform, as president of the board of trustees of the Peabody education fund for the Southern States.

Robert Charles Winthrop was born in Boston in 1809, a direct descendant, in the fifth generation, from the first governor of the Massachusetts Bay Colony, John Winthrop, whose biography he wrote. Graduated from Harvard University at the age of 19, he studied law in the office of Daniel Webster, and was admitted to the bar at the age of 22. In 1834, at 25, he was in the legislature of Massachusetts, where he remained for six years, serving as speaker of the house of representatives until 1840. At the age of 31 he was sent to Washington as a representative of Boston to the House of Representatives in the National Congress, serving five terms, ten years, until 1850. While in the Massachusetts legislature, as chairman of the joint committee on education, in 1837, he reported the series of enactments which resulted in the establishment of the Massachusetts board of education and the appointment of Horace Mann as its secretary. Later Mr. Winthrop also assisted in the same way in the founding of the first State normal school in the United States at Lexington, Mass. His addresses on education were notable, even among his associates in public life, of whom Horace Mann said there was no man of great public eminence in New England during that generation who had not served as a teacher or effectual friend of the public schools. Entering Congress in 1840, he at once became the foremost representative of the Whig party in that body, and in 1847 was elected to the Speakership of the House of Representatives. In 1849 he failed of reelection to the same office by three votes. On July 30, 1850, he was appointed to membership of the Senate of the United States, to fill the unexpired term of Daniel Webster, who had recently become Secretary of State under the Administration of Millard Fillmore.

On the 24th of April, 1851, Mr. Winthrop permanently retired from political life by failure of election as Senator of the United States. The crisis in the growing contention between the free and slave States of the Union had now reached an imminent stage, prophetic of the final attempt at separation in 1860-61. His political opponent, the representative of the two political organizations which, in 1856, appeared as the Republican party of the nation, Mr. Charles Sumner, elected to the United States Senate from Massachusetts by a coalition vote, then entered public life, in which he continued until his death. Mr. Winthrop's defeat as candidate for governor of Massachusetts, to which office he would have been elected had the present method of choice by a plurality instead of a majority vote above all opposing candidates been in operation, caused his final retirement as a candidate for any public position from public life at the age of 42, although he occasionally appeared on the political platform, and was doubtless offered more than once opportunities for official preferment. While his patriotism and devotion to the Union and freedom were always understood, he was by temperament, training, and public experience a liberal conservative, and, like all men of that type, was in retirement during the turbulent years from 1850 to 1870.

But this defeat in what promised to be one of the most successful careers of political statesmanship in a generation was a providential event for the cause that lies below all public affairs, the education and training of the children and youth for sovereign American citizenship. At once, as if relieved of a temporary burden in the form of high political station, Mr. Winthrop rose to the full stature of perhaps the loftiest distinction known to our American order of society, the supreme statesmanship of a great man in private station. Above the names of all, save a

few leaders of political history, will shine forth the names of George Peabody and Robert C. Winthrop through all time in the sixteen great Southern Commonwealths of this Republic.

During the sixteen years immediately following his retirement from public life Mr. Winthrop was one of the most active men in America, at home, engaged in almost every important question of social and educational importance and the cultivation of the highest public spirit and character. His numerous addresses, now published in several stout volumes, are not only models of the noblest eloquence, but also a diary of the nation's progress in education, prosperity, and practical religion. It is highly probable that during George Peabody's life he was the adviser and chief American repository of his plans for the expenditure of nearly \$10,000,000, especially for the noblest benefaction of all, the \$3,000,000 located in the Peabody education fund. From the memorable day in 1866, when he was visited by George Peabody at his home, in Brookline, Mass., and listened to the plan of this "great citizen of the world and brother of mankind" concerning the use of this fund for the children and youth of the South, and the first meeting, February 8, 1867, when, as president of the board of trustees, he presided in an "upper chamber" at Willard's Hotel, Washington, D. C., and during the entire twenty-seven years, until his death, November 14, 1897, Mr. Winthrop lived for the one care, the presidency, whose administration he declared "the greatest honor of his life." That life fully justifies the final words of his epitaph, "Above all, a Christian."

It will probably never be known to what an extent he directed the mind of George Peabody in the choice of the board of trustees or the general policy of their administration. It is, however, well understood that both the two agents and the two presidents of the Peabody Normal College were in constant communication with Mr. Winthrop, and in no known instance in any vital movement differed from his opinion. In the several important departures of the board, like the original dedication of the fund to the upbuilding of the common school for both races and all classes, in the choice of central strategic educational points as the bases of operation in all the States, in striking first the cities and larger villages, in the subsequent determination to confine the distribution largely to the training of teachers, including the founding of the Peabody Normal College at Nashville, and the subsidizing of State normal schools for both races, and aiding the States in the support of teachers' institutes, in the hearty support of the movement in Congress for national aid to education; in all these and in other only less important matters Mr. Winthrop's judgment, experience in public affairs, large acquaintance with distinguished men at home and abroad, and especially his devotion to the work which he regarded his highest opportunity to serve his country, the work on which his exalted reputation will finally rest, his vigilant and judicial spirit was always evident. His complete biography, not yet written, will reveal to the public men of the country an ideal of patriotic service so exalted that the gift of George Peabody would have been fully justified had it only left to the people the memory of such a common-school board as the trustees of the fund and the twenty-seven years consecration to the duties of its presidency by a man who, in any other than a revolutionary period, would only have stopped short of the Presidency in a political career of the highest order and most illustrious fashion.

As companion pieces in American educational history to the Peabody education fund, we may here fitly make mention of two subsequent donations, especially for the schooling of the colored race, the John F. Slater donation of \$1,000,000 in 1833, and the later gift of \$1,000,000 by Daniel Hand to the American Missionary Association for a similar purpose. In 1833 Mr. John F. Slater, of Norwich, Conn., a private citizen largely engaged in manufactures, "in view of the apprehensions felt by all thoughtful persons" for the education of the colored citizens, placed in

the hands of a board of trustees \$1,000,000 "for the uplifting of the lately emancipated population of the Southern States and their posterity, by conferring on them the blessings of a Christian civilization." He sought to provide "not only for their own sakes, but also for the sake of our common country, means of such education as shall tend to make them good men and good citizens, by training in just notions of duty toward God and man in the light of the Holy Scriptures." He advised "on lines of operation adapted to the condition of things, the employment of such methods as are most effectively useful in promoting the training of teachers." The trust was to be administered in no partisan, sectional, or sectarian fashion, but in the interest of a generous patriotism and enlightened Christian spirit. By "Christian education," Mr. Slater takes especial care to explain, "truly leavened with a predominant salutary Christian influence, such as is found in the common-school teaching of Massachusetts or Connecticut, with no need of limiting the gifts of the fund to denominational institutions." Neither principal nor interest of the fund was to be expended for land or buildings. Ex-President Rutherford B. Hayes, of Ohio, was appointed president of a board of trustees, chosen on the same principle as the Peabody board. Indeed it is highly probable that this and other large gifts for education in the South were suggested and often determined by the great success in the administration of the benefaction of Mr. Peabody.

With great wisdom Dr. Atticus G. Haygood, of Georgia, was appointed as the first agent of the Slater fund. Dr. Haygood was a native and resident of the State of Georgia. He came of a family well known for its interest in education and religion in the Methodist Church South. His brother served as a trustee of the public schools of Atlanta, Ga. His sister, Miss Laura Haygood, for several years was beyond question the most distinguished woman connected with the public-school system of the South, as principal of the Girls' High School of Atlanta, founded by Superintendent Mallon. Miss Haygood for more than the ten years before her death was engaged in an important missionary work connected with the higher education of Chinese girls.

Dr. Haygood, at the time of his appointment, was president of Emory College, Georgia, the principal institution of the higher education for young men in the Methodist denomination in that State. He had already distinguished himself as a young man of great vigor of mind, breadth of view, and administrative capacity in his college presidency. His attention was early directed to the study of the educational status of the colored people, and in his admirable book, *Our Brother in Black*, he outlined the most effective method of dealing with the educational as well as the social and political situation. He took the field as a lecturer in defense of the educational training of the negro, and at great hazard of opposition in high social, civil, and ecclesiastical quarters, persisted, becoming widely known in all the educational centers of the North. He resigned the presidency of the large denominational college to accept the agency of the John F. Slater fund in 1884. His reports as agent are among the most valuable contributions to the literature of this very difficult subject, combining a broad, Christian catholicity and enthusiastic patriotism and an all-abounding charity in his discussion of a question beset with temptations to every form of ignorance, prejudice, and sectional contention. His advocacy proved such an eminent success that it finally brought around the entire common-school public of the South to his ideas and secured his election to a bishopric in the Methodist Church South at an earlier age than any of his predecessors. His labors and trials in these efforts seemed to have exhausted even his matchless physical vitality and he died a short time after his appointment at the end of a short term of service in California. One of his future plans was the establishment of a great college for white girls in the South, on the plan of Wellesley, Smith, and Vassar, and others well known in the North, so complete that it might meet the demands of the most ambitious student, and so

well endowed for student aid that no worthy girl should be turned away. This, with its broad plan and great expectations, was dissipated by his early death. But his name in his State has connected the years of his life with works of permanent value; and one of its most valuable lessons is a proof that the leading class of the Southern people has an open mind to genuine criticism and is not behind the corresponding class anywhere in its full appreciation of an educational career in which the most advanced ideas are blended with a single-minded consecration, a dauntless courage, and a faith in that "sober second thought" of the people which in great national emergencies is perhaps the best earthly representative of the voice of God.

On the resignation of Dr. Haygood and upon the return of Dr. Curry from his ministry to Spain and his resumption of the office of agent of the Peabody fund, the corresponding presidency of the J. F. Slater fund was offered to and accepted by him. This fund seems destined to combine the work of industrial training with the education of the mind and character as the central purpose of the common school. For the last few years the Slater fund has thus been administered, giving by annual appropriations an opportunity for the establishment both of a department of industrial training and the better education of teachers for the public schools. In this way many of the large colleges and universities, supported by the different religious bodies of the North, which formerly had not seen their way to take up the expensive department of manual training and household work for girls, have been enabled by the aid of a stated annual contribution from this fund to embark on this much-needed new departure in the secondary and higher education of colored students of both sexes. From 1884, the first distribution, to 1894, \$439,981.78—a sum nearly half the original donation of Mr. Slater—had been applied under the wise direction of Dr. Haygood and Dr. Curry; in 1891 the sum being \$50,650. The combination of this system of subsidizing two classes of schools under the oversight of a common superintendent, and such a superintendent as Dr. Curry, now by common consent the foremost educational statesman of the South, provides a more effective administration with a considerable saving of money.

The Slater fund has made an important contribution to the literature of the new education by a series of able papers, published in addition to its annual reports. The general scope of these publications, as of all the reports and the publications of this charity, is well stated in the words of Dr. Curry: "The trustees of the Slater fund believe that the experimental period in the education of the blacks is drawing to a close. Certain principles that were disputed thirty years ago appear to be generally recognized as sound. In the next thirty years better systems will undeniably prevail and the aid of separate States is likely to be more and more freely bestowed. There will also be abundant reasons for continued generosity on the part of individuals and communities. It is to encourage and assist the workers and the thinkers that these papers will be published."

THE MISSION SCHOOLS FOR THE COLORED RACE ESTABLISHED BY THE CHURCHES AND PEOPLE OF THE NORTHERN STATES.

The value of the great work in behalf of the education of the freedmen during the civil war under the protection of the American armies and the Freedmen's Bureau, continued by the Peabody and Slater education funds, and through the past thirty years by private individuals, churches, and benevolent associations, can by no means be rightly judged if confined to its primary and direct results on the 10,000,000 or more of these people. Its indirect results, never so eminent as to-day, were in many ways more important. Two of these were, first, the waking of the entire mass of the 5,000,000 colored people in the South on their emancipation to the necessity of independent labor and preparation for their new American citizenship; and, second, the inserting of a provision for popular education in the

revised constitution of every reconstructed State by the years 1870-1873, only eight years after the collapse of the war. It now remains to follow out the enlargement of this stream of tendency during the thirty-five years since the advent of peace by a brief account of a large number of institutions of learning of a type never hitherto established for the uplift of a class in any respect similar to the emancipated slaves of the United States in 1865-1900. There is no more valuable development of the American innate genius and ready tact at seizing a grand opportunity and adjusting old agencies and methods to novel occasions than the very interesting type of seminaries which, under various and sometimes exaggerated and inappropriate names, have been built up during the past thirty-five years in our 16 Southern States for the mental, moral, and industrial training of the children of the colored people.

The Report of the United States Commissioner of Education for 1896 contains the names of 178 of these institutions, which include all grades of schooling, with 40,127 students, of whom 25,092 are in the elementary, 13,563 in the secondary, and 1,455 in the collegiate, 4,672 in the manual training, 1,319 in the professional, and 12,341 in the industrial departments and grades. These schools are taught by 1,636 teachers, and contain 209,801 volumes in libraries, valued at \$166,574. Their school properties amount to \$7,524,948, and their annual income is \$1,117,569, of which \$289,845 is from State and municipal aid, \$124,481 from tuition fees, \$92,297 from permanent funds, and \$610,946 from "unclassified sources." A large majority of these schools are of the character above described, graded seminaries with departments for the secondary, higher, industrial, and sometimes normal and professional training. Three-fourths the income is probably received from contributions of Northern people; special benefactions and bequests amounting to \$323,718. These, with the exception of a limited number of public high and State normal and industrial schools, are supported from the North, under the direction of the missionary associations of the different Christian churches, or occasionally dependent on private contributions. A few of the higher are subsidized by the Southern State governments. Their teachers are largely white, drawn from all portions of the Union, and sometimes from Canada, and the body contains a fair proportion of instructors who would be regarded anywhere as experts. Besides these, there is even a greater number of smaller local schools, largely built up and supported by the zeal and contributions of private individuals, single churches, and associations from the North. The reports of this class of educational institutions are often difficult of attainment and not always correct, as was the case with all schools in the South before the civil war. A large expenditure of money and labor besides that now reported in the annual statements of educational statistics by the national Bureau of Education is always going on, of which no permanent public record is made.

The most effective feature of these schools thus far has been the training of a large number of colored youth of both sexes for the work of teaching in the common schools of the colored race. There were, in 1896, 1,429,713 colored children and youth in attendance on the common schools of the South, and, outside of a few cities, their teachers are of their own race. When we remember that in 1835 the illiteracy of the colored population of the South was almost universal, the fact that native teachers of any grade in sufficient number to preside over this multitude can be provided is surely encouraging. And although the schools in which these teachers were educated, or, at least, three-fourths of the whole number, are not public and in no way dependent on State or municipal aid for their support, yet their intimate relation to the common schools in the training of these teachers, and to the general community in their professional and industrial departments, justifies such brief notice as the limits of this essay permit of their organization, support, success, and possible future in all these States.

The first movement in the direction of the peculiar training of the children and

youth of the freedmen, including many adults, in the elementary schools for letters, discipline, and, finally, industrial and domestic life, was such as could be improvised by the imperious conditions of the situation. The work was done during the war in the wake of advancing armies, under the military protection and the outward supervision necessary to success. Before the close of the war the organization of the school life of these people was left to associations or individuals. Under the Freedmen's Bureau a general superintendent of these schools was appointed for each State, with subordinate agents for the different localities. This supervision was often of the most informal sort, principally for the purpose of protection where military aid could be afforded. But after the Freedmen's Bureau was abolished the schools that stood on no firm foundations generally closed by default, leaving such as remained in charge of special associations and individuals to whom they could look for support.

In process of time two types of school appeared, more and more decisively distinct as the years have gone by. The majority have been taken under church and sectarian protection, organized and conducted virtually in imitation of the denominational academy and college of both sections of the period at which the war broke out. Many have been named academies and institutes, and several dozen, perhaps more, colleges and universities. The teachers of this latter class have taken the name of professors and presidents, their courses of college study have been copied almost verbatim from the corresponding class of seminaries of the higher education in the Northern and Southern States, and in some cases college degrees have been conferred. And although by the necessities of the case an overwhelming majority of their pupils could only be instructed in elementary studies of a low grade, yet these institutions, generally designated as the graded schools, colleges, and universities of half a century ago, have been gradually found insufficient for the present need and actual conditions of these people. A large portion of the reliable work done in them has been of a pronounced religious, moral, and social character. In all the larger institutions the pupils and their white teachers have been housed together, living, indeed, in a relation in which the school, church, and family have been blended in the way the manners, customs, and habits of this peculiar order of household demanded.

Up to 1880, with a few exceptions, there was no serious attempt to combine industrial training of any sort with the schooling of the boys, and the girls were rather employed than instructed in such household duties as would reduce the expense of their living and improve their present crude habits of home life. The religious exercises and moral training of both sexes have been of a decidedly pronounced character, such as is not often found in Christian families. A supervision of the moral deportment of students has been maintained that would neither be desirable nor necessary in "Christian schools" of a similar grade among the white race. Indeed, the declared function of these seminaries has been of the missionary type. They have been supported largely by the churches as "Christian schools." Their teachers in most cases have not only been required to present the ordinary testimonial of good moral character, but also that of a personal professional church membership of the Protestant "Evangelical" type, and their boards of management have almost invariably included at least a commanding majority of the clergy and laity of some distinct religious body of this Christian communion.

On the other hand, beginning with the Hampton Normal and Industrial Institute, at Hampton, Va., a different type of school has grown up, and with some changes ultimated itself in the new State normal and industrial colleges now maintained by nearly every Southern Commonwealth. The Hampton school was organized and became essentially what it is through the presidency of Gen. S. C. Armstrong. This remarkable man came to the work from a long experience among a people in the Sandwich Islands closely resembling the negro. During the war and for several years after the advent of peace he commanded the colored

troops and was trained in the general service of the Freedmen's Bureau. He may truly be said to have been the chief author of an original type of schooling for this people. The basis of the organization at Hampton was industrial, elementary educational, practically Christian, with military discipline. While directly religious and severely moral in the general sense implied in "the common Christianity," it was in small degree denominational, but slightly sectarian, and dealt sparingly with the methods of the regulation church and special agencies for the character training of the pupils. The discipline was maintained under strict military jurisdiction, and the problem of school government in that way was effectually solved, to the great satisfaction of the teaching force. The studies of the ordinary college course were not admitted, and the institution was confined to the acquiring of a sound English education of the superior elementary and public high-school type. A skilled expert in normal instruction was employed from the first, and great stress was laid on the training of teachers for the schooling which was needed both in the graded and ungraded schools of the South. The basal idea of Hampton was a school that should be a model of the life of a good American man or woman destined for American citizenship. The whole organization of the Hampton Institute was pitched on the life of the common people. The school was a crowd of young colored folk learning to be farmers, mechanics of all grades, wives of laboring men, and husbands of working women, who in going out into their new world would not only be self-supporting, but leaders in the great American art of self-help and good citizenship in the communities where their lot might be cast.

This type of instruction and discipline has become more and more pronounced as the years have gone on. The Tuskegee Normal Institute, in Alabama, under the presidency of Mr. Booker T. Washington, has made a new departure in the fact that all the teachers are colored, and no white man or woman occupies any important position save the treasurer and on the board of general management, the institution being one of three public normal and industrial seminaries supported in part or largely by the State of Alabama for colored youth.

The State institutions for colored youth have also followed in this direction. They rarely attempt to deal with the classical department of the college, and are practically large graded schools, from the primary department to the secondary and normal grades, to the extent of a superior free high-school course. They are all industrial, hand work and physical labor being compulsory. Their teachers are almost universally of the colored race. They have no corporate relation with any religious denomination and are responsible in all respects to State control. Indeed they are the proper head of the common-school system for the colored race in whose establishment the South has been engaged for the past thirty-five years, at an expense of nearly \$100,000,000, employing 27,000 colored teachers at an annual cost of \$5,000,000 to \$6,000,000, 75 per cent of which is furnished by the taxation of the white people.

The large number of schools supported by private beneficence, personal effort, and the charity of single churches are generally of the same class as everywhere under similar management—indifferent, good, or better, as they may be.

THE HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.

For the details of the great educational work among the youth of the freedmen by the different classes of seminaries, the reader is referred to the elaborate reports and the mass of contemporary literature in the records of the numerous conventions, transactions, and deeply interesting narratives which, with the constant reports in the press and magazine articles, form an important department in any well-selected educational library. But the original work at the Hampton Normal and Agricultural Institute, in Hampton, Va., is in itself so suggestive, and its first principal, Gen. S. C. Armstrong, was in many ways a man so original and char-

acteristic of the entire work with the freedmen that it requires a special notice in this essay.

Samuel C. Armstrong was born in Hawaii in 1839. He was the son of the Rev. Richard Armstrong, D. D., a native of Pennsylvania, who with his wife, from Massachusetts, from 1837 to 1847 labored as a missionary in the Sandwich Islands. In 1847 Dr. Armstrong was appointed minister of public instruction, in which capacity he served until his death in 1861, having been largely instrumental in building up the system of Hawaiian free schools, 500 in number, with other institutions of superior grade.

Gen. J. F. B. Marshall, for fourteen years acting treasurer and trustee of the Hampton Institute, speaks of this young Samuel as "a restless member of my Sunday school class of 8-year-old boys in the only English church in Honolulu." General Marshall was at this time chairman of the committee on education in the Hawaiian Parliament. Returning to Massachusetts, he served during the civil war on the military staff of Governor John A. Andrew. In 1870 he was brought into connection with his old pupil, then the principal of the new enterprise at Hampton, Va., which has grown into such remarkable prominence during the past thirty-five years.

The youth of young Armstrong till the age of 21 was spent in the best school of general training for his future work. In company with his father he visited the schools in all the inhabited islands of the group and was a close and thoughtful observer of the results of the ordinary methods of missionary work among the natives, whom he describes as "in many respects like the negro race." The strongest impression left upon his mind seems to have been of a fatal lack in the development of moral stamina in this picturesque and in many ways attractive people. Quick to learn from books, devoted church members in the matters of a general support of and constant attendance on public worship, given to family devotions, charming in their hospitality, "they lived pretty much in their old ways; all in one room, without the conditions which make a high standard of morality possible. The 'old man' in them had very much his own way. They were like the people to whom the epistles of the New Testament were written—grown-up children. Despite the faithful preaching of the Christian moralities from the pulpit and the constant visits of devoted women to their homes, with the addition of a severe church discipline and with the positive advance of having been lifted above many of the crude barbarities of heathenism, they remained in a condition well described by a returned missionary: 'Our saints are about up to your respectable Boston sinners.'" There were schools of the higher grade in the islands and one important normal labor institute for boys. The latter, Armstrong relates, "had produced the more solid men."

By this experience at home young Armstrong was grounded in two convictions: First, that the old-time missionary methods had a fatal defect in dealing with the more emotional and superficial elements of a religious life, and leaving out that change in the conditions of living which, more than all other things, determines the character of the manhood and womanhood; second, that although the ordinary collegiate and academical system of education of the day formed accomplished scholars and brilliant graduates, the result was often disappointing, while the training in a solid English education, with manual labor, gave to the people their best teachers and workers. On these two foundation stones the great institution at Hampton was afterwards built.

This most valuable experience, in which no other conspicuous worker for the negro except General Marshall, his associate, seems to have shared, was supplemented by a course in Williams College, Massachusetts, under the presidency of Dr. Mark Hopkins, who, with Dr. Eliphalet Nott, of Union College, New York, made a stronger impression upon a generation of students than any of their contemporaries. To have given to the country such men as Garfield, Dickinson,

Bryant, Armstrong, and scores of others only less conspicuous was a life work exceeded in value by that of few statesmen. Such men are the makers of the statesmen who are called to the supreme post of administration in the crisis of their country's destiny.

Before his graduation from Williams College Armstrong enlisted in the Union Army, and for one year was captain and major in the One hundred and twenty-fifth New York Volunteers. But it was soon discovered that here was the man of all others to lead the newly enlisted colored troops on the Atlantic coast department of Gen. Rufus Saxton. For the two and a half subsequent years he was the lieutenant-colonel and colonel of the Ninth and Eighth regiments of the United States Colored Troops. He was greatly impressed with the general good qualities of his soldiers, especially with their "tidiness, devotion to their duty and their leaders, their dash and daring in battle, and their ambition to improve, often studying their spelling books under fire, * * * and that they deserved as good a chance as any people." One additional foundation stone, in his mind, was laid by this military experience with the negroes, "that slavery was a failure, though doubtless for the time an educational condition." It is observed that in the admirable brief account of himself found in the memorial volume, *Twenty-two Years with the Hampton Normal and Agricultural Institute*, he returns to this fact, the opportunity and influence of negro slavery as an educational institution.

Here, in connection with the conclusions gained in his experience in Honolulu, is found the secret of his success. Instead of descending upon a people like the pagan and African races from above by ignoring or looking upon their former life as the entire cause of their present defects, he realized what a stride had been taken by the American negro from the pagan savage of 1620 to the soldier of the Union and the freedman in 1865. And instead of attempting to lift up this people by educating them according to the scholastic systems of half a century ago, he showed his wisdom in his way of taking them where they were found, and, in the establishment of Hampton, was chiefly concerned to assist in the development of moral discipline, self-control, and reliable manhood and womanhood. He said to the author of this essay: "I have little fear of the abuse of coeducation at Hampton. My boys are rung up at 5 o'clock in the morning, called to military parade before breakfast, kept busy all day till 8 p. m., always under military discipline, and after that hour I will risk all the harm they will do to anybody." In his military service he was in camp at the siege of Richmond and accompanied the Twenty-fifth Army (negro) Corps to Texas for a watch of Maximilian over the border.

In 1866 he was placed by Gen. O. O. Howard, commissioner of the Freedmen's Bureau, in charge of 10 counties of eastern Virginia, with headquarters at Hampton, then a great contraband camp, with almost despotic power "to manage negro affairs and, if possible, to adjust the relation of the races." For two years he wrought at this almost impossible task of lifting the freedmen, demoralized by the charity of two years, to entire self-respect and self-support and to bring the returned white owners of lands in kindly relations, often with their former slaves. Here he was impressed at once with the conclusion "that both classes were ready to do the fair thing." He sent 1,000 of his colored wards to Massachusetts, who were placed in families as servants through an agency of Boston ladies. In the fact that "the better class of the whites were well disposed, but inactive in suppressing any misconduct of the lower class," he exposed the root of much of the race trouble that still exists. The general friendliness between the races, only broken by political excitement, he attributed to the fact that in slavery days the children of both sorts were brought up together, whereas the children of the foreign missionaries were kept separate from even their youthful converts by every means in the parents' power. There were no courts then in operation, and justice was administered by martial law. Scattered negro families were reunited. His testimony to the work of the Freedmen's Bureau is important. He writes: "Gen-

eral Howard and the Freedmen's Bureau did for the ex-slaves from 1865 to 1870 a marvelous work, for which due credit has not been given. Among other things, he gave to their education an impulse and a foundation by granting \$3,500,000 for schoolhouses, salaries, etc., promoting the education of about a million of colored children. The principal negro educational institutions of to-day, then starting, were liberally aided. At a time of vital need Hampton received over \$50,000 from General Howard for improvement."

He found at Hampton on his appearance as agent of the Freedmen's Bureau "an active, excellent educational work going on under the American Missionary Association of New York, which in 1862 had opened in the vicinity the first school for freedmen in the South, in charge of Mrs. Mary Peake." Here 1,500 children were in daily attendance in the old hospital barracks, for several years the one hospital of the Army of the James. Six thousand soldiers had here been buried in the national cemetery. Close at hand was the region connected with the most eventful first years of the history of Virginia—the residence of Pocahontas, the landing of the first slaves in the colonies, later the battle between the *Monitor* and the *Merrimac*, which revolutionized the naval warfare of the world, and the scene of the celebrated order of Gen. B. F. Butler that declared the negro slave "contraband of war." His practiced eye, now trained by thirty years' looking into the heart of the matter, took in the situation, and at his suggestion the American Missionary Association purchased a considerable estate of 125 (afterwards raised to 190) acres on the beautiful shore looking out on Hampton Roads, one of the most charming sites for a great educational establishment in America. To his own surprise he was called to the principalship of the new school, and said "Yes," as a matter of course.

He had no doubt concerning what was to be done. It was "to train selected negro youth who should go out to teach and lead their people, first, by example, by cultivating land and making homes; to give them not a dollar that they could not earn themselves; to teach respect for labor; to replace stupid drudgery with skilled work; and to these ends to build up an industrial system, for the sake not only of self-respect and efficient labor, but also for the schooling of character. And it seemed equally clear that the people of the country would support such a work for the freedmen." He had noticed at home that "ignorance alone was not half the trouble; the chief difficulty was, with that, defective character, as it is with the negro. He is what his past has made him. The true basis of work for him and all men is the simple one—the union of intelligence and manhood; all that follows is of course." His proposition found few friends; the old missionary method still held "the religious public" fast; the manual labor schools of the North had failed. His scheme "would not pay." He replied: "It will pay in a moral way. It will make men and women, as nothing else will. It is the only way to make them good Christians."

In April, 1868, with 2 teachers and 16 pupils, Armstrong, now wearing the title of "general," began work. In 1870 he made his first report, the same year the institution being incorporated under a special act of the legislature of Virginia. "It was a corporation under trustees independent of any association, religious sect, or government. It did work for the State of Virginia and the General Government, for which it received compensation, but was not connected with or supported by them." The fundamental principle of the establishment was, "Nothing is asked for the student that he can obtain by his own labor. He seeks nothing but an opportunity to work his own way."

An institution established on such immutable foundations of experience, common sense, and enlightened Christian philanthropy grew apace, as everything planted in its own soil and tended with care grows naturally and "brings forth fruit after its kind." At the time of writing the admirable essay from which we quote so freely (1893), Armstrong relates that there were 650 boarding students

at Hampton Institute in 24 shops and groups, averaging 18 years of age, 136 of them Indians, 80 officials, teachers, and assistants, of whom half were in the 18 industrial departments and shops, and 300 children in the adjoining county public—formerly the Butler, afterwards the Whittier—school, used as a practice school for the normal department of the institute. The foundation for the good feeling and cooperation of the white people had been laid in that portion of Virginia by the three years' work of General Armstrong in the ten counties adjoining Hampton as an agent of the Freedmen's Bureau, and the legislature made a wise movement in turning over to the principal of the Hampton Institute \$10,000 annually, which the State applied for the use of the colored race out of the land grant of 1862 by Congress for the support of agricultural and mechanical colleges in all the States. The Congress of the United States afterwards offered \$20,000 per annum to Hampton for the education of 120 Indians.

On January 27, 1870, the first meeting in behalf of the new Hampton school was held in Music Hall, Boston. Among its most valuable results was its capture of General Marshall, for a permanent residence of fourteen years at Hampton, as treasurer of the institute. What with the decided impression made by the presence of General Armstrong and the valuable and excellent social acquaintance of General Marshall in Boston, always the foremost of American cities to respond to a call to beneficent action that comes down from the upper story of life, a fountain of supply was then and there opened that has never run dry. General Armstrong always declared that "for continuous and reliable giving New England was distinguished above all other portions of the country." An accurate record of the contributions, often of large sums, from Boston alone, to say nothing of the remainder of New England, would, first and last, include the names of a large majority of the men and women eminent in Christian character and philanthropy for the past twenty-five years. Mrs. Mary Hemenway at once became a devoted disciple of the Armstrong propaganda, and by large and continuous gifts of land and money was a never-failing source of supply. And many less known, though equally interested, were always reliable.

The situation of the school at Hampton was ideal. Fortress Monroe and Hampton Town for many years had been favorite places of pleasure resort. Their nearness to Washington insured a constant stream of distinguished visitors. The winter population thronging the great hotels and neighboring cities was attracted to Hampton first by the novelty of the work, and seldom left the grounds without a contribution, often with a good impression that made for constant aid. Happily, among the early friends were President Mark Hopkins, of Williams College, the old schoolmaster of Armstrong, and Gen. James A. Garfield, also a trustee, a pupil of the same great educator. They insisted that the plans of the young 30-year-old principal should be tried. President Hopkins said: "He will not be satisfied till he has tried his plans; and if the plans fail, he will be the first to see it and abandon them."

In 1893 the school was maintained at a cost of \$155,000. The large sum of \$100,000 was contributed by its friends at the suggestion of the principal. Sixty thousand dollars came in the form of \$10,000 subscriptions. In 1893 the people of the country were contributing \$1,000,000 annually for the support of twenty or more normal and academical institutions, all established by the impetus given by the rapid success of Hampton and stimulated by the education of 16,000 students—2,000 in Virginia alone—for competent teachers, 5,000 of whom being at this date trained in this superior manner. By combining the academical and industrial plan of training, the graduates at Hampton were prepared for successful teachers in the short-term colored public schools, and during the remainder of the year were able to turn their hand to whatever industry they were adapted to undertake. Hampton alone in 1893 had sent out 750 full graduates and half that number of undergraduates, 1,000 in all, of whom General Armstrong says, "but

10 per cent are disappointments." A glance at a map or chart accompanying the interesting work before spoken of shows the location of these pupils more largely in Virginia than elsewhere, but scattered through all the States of the South. A valuable plan of correspondence with the graduates, by which the institution has always been kept in touch with all its children and by which the career of several hundreds of them may be referred to, has been carried on from the first.

In 1878 the plan of the school was enlarged, to try the experiment of schooling the Indians; and several of the worst specimens, then in banishment in Florida, were sent to Hampton. Under the wise and firm management of the school, the success was so evident that Congress voted an annual gift of \$20,000 for the education and maintenance of 120 at Hampton, and also established the famous school for Indian youth alone at Carlisle, Pa., under Captain Pratt, of the United States Army. Out of this came, as a logical sequence, the development of the national policy of educating the Indian children and youth, first through cooperation with different churches, but afterwards by the establishment of the common school among the different tribes and reservations. In 1889 this enterprise received an appropriation of \$2,000,000 from Congress. In future the National Government will withdraw from all cooperation with any church or private association and only subsidize the common schools for Indian children and youth.

One of the most valuable features in the plan of Hampton was its faith in the educational power of self-dependence and solid work. This fundamental idea of the way to teach the negro so commended itself to the Christian common sense of the people that it has drawn to its support one-tenth of the popular Northern contributions to twenty or more of the superior schools established in different parts of the South.

The great element in the wonderful success of this novel experiment in the education of the negro and Indian in 1870 was, of course, the personality of the principal of Hampton. Looking along the lines of this fundamental work, not more important in the long run to the South than to the nation, it is evident that if there was a providence displayed in the statesmanship of Abraham Lincoln and the military genius of Ulysses S. Grant, it was also manifest in the training of Samuel C. Armstrong for the experiment of educating "the nation within a nation," the 10,000,000 of the colored race for American citizenship. First, in his youth, spent in the far-off islands of the Pacific, among a people who had been partially reclaimed from barbarism, needing only the central element of character and industrial training for true citizenship; then, under the influence of Mark Hopkins, greatest of contemporary American schoolmasters; next, as colonel, engaged in the formation of a military colored contingent for the defense of the freedmen in their first experiment of free labor and the reenforcement of the Union Army; again, in Virginia, as agent of the Freedmen's Bureau, getting acquainted with the neighbors of his last twenty years of life at Hampton Institute, Armstrong was fully trained and informed for what came to him as the great right man of genius brought to the right place.

The entire stamina of his manhood was of the military type. He only said what was in his heart when he directed his family and friends to give him "a soldier's funeral." He was not literary save in a "short, sharp, and decisive" style of speech and writing, becoming the grave and perilous work on hand. After 1870 General Armstrong was never off duty, always accessible to anybody worth talking to in behalf of his great experiment. His public speeches read like military reports. Every sentence in his brief autobiographical sketch in the volume *Twenty-five Years' Work in Hampton* is weighted with the significance of a volume. His personal bearing was intensely vital and inspiring. It always impressed the thoughtful observer as if, while listening or speaking, with courteous attention, his eye was elevated toward a point beyond his present horizon. He used to say, "The true way to get things done in obtaining money for new buildings is

to first get enough together to lay the foundations; then bring everybody to look at it, explain it, and ask if such a work ought to be left half done." He refused for a long time to have the old plantation house in which he lived painted, until every visitor declared it "a big shame that such a man should live in a house so shabby." He always appeared like a soldier on the eve of a forlorn hope. "Forgetting those things which were behind and reaching forth unto those things which were before, he pressed toward the mark." It was this decisive and soldier-like air of command, as of a man that was not to be avoided or halted or detained on the march to a great field day, that saved him from the fate of the sentimental, pathetic, supplicating type of philanthropist, and forced every man or woman he deliberately approached to decide at once what could be done about it.

He grasped as by instinct—what really came to him as the result of an experience of twenty years—the correct point of view in the training of an emancipated race, only two hundred and fifty years out of the bonds of African barbarism, tempted as never before was a race of freedmen by the throwing open before it the highway to the loftiest earthly opportunity and the noblest earthly position—full American citizenship. Instead of beginning work from above, lifting the subject by main strength and holding him at a perilous eminence above his own natural standing place, he met him where he found him and along with him began to climb the "steep and rugged way" of his new career. He almost alone among the leading educators of the day understood what every superior man and woman of the slaveholding class of the South knew as a commonplace, that the American negro of 1865 was not the negro of Africa, or of any previous decade of his two hundred and fifty years of bondage. When he said, "The negro in a tight place is a genius," he only put in familiar language the fact that of all races of men he has the most native aptitude for recognizing and assuming the outward elements of a higher civilization. He is "a genius" in manners, in the rapid acquirement of language, in what the Southern people call "the faculty of imitation," which is simply a native capability for acquiring a superior civilization which amounts to a race characteristic. So instead of stimulating this faculty, always sufficiently active and often the most dangerous of his new temptations, Armstrong put his colored boys and girls at once down on "hardpan." He compelled every one of them to take a firm stand on the common level of an American working man and woman, and through a life of wholesome hardship get fairly planted on his own feet as a self-respecting, self-supporting, self-determined citizen of a country where no man honorably and permanently succeeds by being held up by anybody else.

He was greatly favored by the early response of the people to his appeals for financial aid, being thereby saved from the misery of having his institution smothered by an avalanche of raw student material only suitable for a children's primary school. He waited and waited, with a patience as conspicuous as his fiery zeal, until he obtained the class of pupils most favorable to the success of his great experiment. He also fully understood and displayed the ability of every great commander in the choice of his subordinates. He stood up like a granite wall against the assault of the crowd of incompetent men and sentimental women, often of wealth and high social position, that rushed to the work of teaching the negro as a new sensation, hypnotized by his powerful manhood, and accepted only the graduates of higher institutions, people of eminent capacity, and kept only those who were able to find out for themselves the way they should go. It is doubtful if any large school in the country for a generation has retained a corps of teachers more justly celebrated for general ability, good culture, and the personal qualities that go so far with the negro pupil than Hampton.

And long before any of the rival institutions that were established on the foundations of the ordinary denominational academy and college seem to have suspected that their graduates needed anything beside instruction in a course of study

and the general discipline of a good school as the special qualification for a teacher, General Armstrong, at Hampton, had organized one of the most effective normal-school departments in the country, placed at its head an expert woman, second to no person in like position, and, in addition to his own able work, after the style of President Hopkins with his senior class in the Butler, afterwards the Whittier graded county school, had organized a complete practice department for the use of his pupil teachers. All his graduates were first carried through an English academic course, modeled after the best existing arrangements for common-school instruction. The industrial department was handled as an auxiliary to, not a substitute for, a good elementary and, if possible, a secondary English education. With the increasing duties of the principal, the necessity arose for a more stringent correlation of work and supervision of the large body of instructors. At a later period, Miss Hyde, the accomplished principal of the normal school department, was promoted to the office of general supervisor of the academic work, thereby providing against the danger of the undue prominence of any special teacher or group of instructors, sure to bring in a lopsided condition of affairs in which a few people of superior executive power gradually usurp the entire control of the institution.

But it was in the influence upon the character and life of every pupil of sufficient ability to be impressed by it that the growing excellence of the Hampton Institute was more and more indicated. Its chief characteristic was a community, always under a firm and conservative head, with no lack of the "zeal according to knowledge" which shines out through the whole field of religious living. There was no breaking forth like a spring freshet in a flood that bears along its destructive course the refuse of fields and villages and leaves the barren waste of a drenched and smoking wilderness behind. But the institution itself was a proper "fitting school" in the true Christian education that culminates in the life of love to God and love to man. Those who came out, after a fair trial, seemed to have gained a positive conception of the new liberty of the race, not yet half understood. Their education at Hampton inclosed them as with a high wall of protection. Notwithstanding the inexorable military discipline of the institution, which in itself developed a fine soldier-like pride in law and order, there was always within its limit ample room for the development of a self-respecting and self-poised manhood and womanhood. The variety of exercises relieved the monotony of repetition and made life at the institute a constant source of entertainment. The kindly and home-like spirit that sought every proper opportunity for healthful amusement, the charms of an ever varying landscape, the opportunity for games, and the daily spectacle of the military dress parade, made life a new thing to the lawless and vagrant. Indeed, from the first Hampton school was a university of the new American life, where its pupils at once seemed to realize the almost miraculous change that had come to their people.

The industrial department of the institution was managed with a skill and carried on by a method that gave a new significance to that still so greatly misunderstood side of modern school life. The old-time manual-labor school did not pretend to teach even the rudiments of the different industries carried on within its walls. The school claimed a certain number of hours each day of the sort of work that the student was supposed best able or willing to perform, with the sole purpose of lessening the expense of his education. Under its monotonous discipline labor remained the "old man of the sea," perched upon the shoulders of every wearied student, and as the American negro for two hundred and fifty years had tested the value and the mortal weariness of this type of "industrial education" to the bitter end, it was not strange that the pupils of Hampton and all these great seminaries came with a prejudice against hard work that amounted to a longing for a paradise of literary laziness. It was incessantly proclaimed by many of the foolish preachers and politicians who had been drifted to the front by

the upheaval of that time that industrial education in schools was only a new device of the "despotic white man" to reduce the colored people to the rank of a perpetual peasantry. The regular old time college curriculum was welcomed as the "bow of promise" in the storm cloud that overhung the race, as the highway by which the emancipated 5,000,000 should march upward to permanent prosperity and power.

Many of the leading presidents and professors of the new "colleges" and "universities" that sprung into life, organized according to the average idea of the religious public of every sect, were young soldiers, like Armstrong, going from the field to the college, with none of his previous experience of educational life, or young scholars preparing for the Christian ministry, carrying "down South" their entire stock of lofty enthusiasms and exaggerated expectations. Of course there was among them an inevitable, sometimes an "invincible ignorance" concerning the nature, capacity, and present mental and moral condition of their students. Thus it came to pass that as late as 1880, on the first visit of the author of this essay to the most important of these schools, he found a decided reluctance in many of them to take any hearty interest in the feature of industrial training, or, if such an attempt had been made, it was often with the old-time idea of providing work by which student aid could be secured for pupils in the academic and college grade. With few exceptions, the Hampton Institute was the only great school at that time, fifteen years after the founding of many of the most important of them, where there was any very great and intelligent interest in the training of the hands save from the labor of the girls at ordinary housekeeping and table service, and that not regarded as an educational exercise.

But despite all indifference or disparagement General Armstrong went steadily on his way, every year scoring some new success, confident that his idea would finally be adopted by the common school as distinguished from the "Christian school" public of the whole country. His instinct in this respect was prophetic. As soon as the States of the South had been encouraged by the aid of the Slater fund and the demands of their most influential colored citizens to assume the training of selected teachers for the country district and village and city graded schools, Hampton appeared as the model institution from Washington to Texas. Every one of these State schools now in operation is a more or less faithful copy of the Hampton Institute, only claiming to be a common school of the higher-graded type, with ample provisions for the training of teachers and a compulsory industrial department.

Even beyond this influence in determining the best type of State education for its colored youth, these commonwealths have patterned after Hampton in perhaps the most original of all the new developments in Southern education—the organization of the normal and industrial free college for white girls. Beginning twenty years ago in Mississippi, this improved type of the Southern "female college" is now in operation in Georgia, Alabama, and the two Carolinas, with the prospect that it will finally be adopted by every Southern and possibly by some of our Northern States. It would be the best possible type of the common school to introduce into our colonial possessions, which are opening up a new world for the expansion of the American idea of universal education.

It was only necessary that this type of the blending of the academical, normal, and industrial education in one great organization should be carried to its logical finish, in being placed entirely under the instruction and discipline of a colored principal and faculty, to vindicate the genius of General Armstrong in giving to the South and the country the most effective object lesson of its success. It was at first held by its critics that, although under the direction of an exceptional head, with teachers nearly approaching experts, the majority graduates from the most celebrated schools of the country, such a peculiar educational arrangement might succeed, yet it would fail when brought to the test of a great gathering

of ordinary colored pupils under the entire control of teachers of their own race. But the same good Providence that directed General Armstrong to Hampton put it into the heart and mind of a little boy, born in a one-room cabin with mother earth for a floor, trained in a Virginia coal mine, to steer his frail ship toward the great lighthouse of Hampton Roads. It was in the Hampton school, as a student, a worker, and finally as superintendent of the Indian department, that Booker T. Washington learned the art of building a new model Hampton, down in the black belt of Alabama, with a student constituency representing perhaps the least hopeful side of the colored population, not only the teachers of the academic, but of every industrial department drawn from his own race, like Hampton subsidized and to a greater extent than Hampton controlled by the State; like Hampton growing constantly in favor with the better side of Southern society, while so attractive to the people of the North that, in less than twenty years from its establishment, there is probably no American school that receives so large an annual contribution from all classes of people.

And that here again this great success may not be dismissed as the exceptional work of a man of uncommon genius, the new Hampton at Tuskegee to-day furnishes the model on which every Southern State is now building the most valuable type of college for the training of the superior class of its 10,000,000 colored citizens. It has not been chiefly the extraordinary genius of Armstrong and the ablest of his pupils that has so commended this type of school to the national confidence that the most exclusive institutions of the ecclesiastical Northern and Southern type are more and more compelled to take on the characteristic excellencies of the Hampton plan. The crowning genius of these remarkable men was in seeing at once not only the possibilities of this type of superior seminary, but demonstrating its necessity to the colored people and in every case bringing it into line with the State system of public instruction, on which 16 Southern States have expended \$500,000,000, including \$100,000,000 for the colored children, during the past thirty years.

The experiment of combining the education of the negro and Indian at the Hampton Institute was a stroke of genius. General Armstrong saw at once that the talkative, social, and magnetic negro was the providential companion of the shy, silent, proud-spirited Indian. The result of this twenty years' training of the native red man of the West on the Atlantic shore, where he was first encountered by the coming master of the continent, has belied most of the dismal prophecies of its opponents and opened the way to another triumph of Armstrong's genius in the final establishment of the American common-school system for the children of this race in their own homes. Ever since the discovery of America by Columbus, the ecclesiastical authorities have labored at the almost hopeless work of civilizing and making good citizens of the different populations of the American continent by the method of changing the mode of their religion and combining with this effort a certain amount of the sort of academical training common to the denominational religious schools of the past four centuries. It would almost seem that the chief success of this method had been the saving of a select few to live as a sort of curiosity in the society of the dominant race, while the mass have either been long ago exterminated, as in the West Indies, or held in military submission, even in this Republic. It was given more completely than to any previous educator to Armstrong to understand that the only successful way of converting the native American savage to the religion of a civilized country was, first, to take him from his isolation and place him in contact with the common life of the common American people; teach him the industries, the habits of life, and the general way of doing common things that has everywhere lifted the white man out of a similar barbarism; give him a common-school education—in short, make his daily life an object lesson of what the Christian religion can do for a people as contrasted with the squalor, poverty, and slow destruction of the life he is now

living. To have done this, as it has been inaugurated at Hampton and Carlisle and put in operation even to the present degree among the Indians of the West, is glory enough for one man, and in itself assures to Armstrong a foremost place among the educational statesmen of his country and time.

It will be a great help to the whole class of prophets of dismay who see in our new national assumption of a great colonial life, involving the control of new millions of the lower orders of mankind, only a stupid repetition of the old policy of "imperialism," if they could realize the prodigious significance of this great experiment at Hampton in the education of all races of men in their progress from pagan barbarism to a self-relying Christian civilization. It is not so much fortunate as providential that the country has not been called to face this mighty responsibility of dealing with these new millions of the little children and wards of Christendom until, by a thirty years' experimenting at home, it had not only discovered but put in operation in every Southern State, by the agreement and cooperation of all sections, the Hampton methods of training the lower majority of this world on the lines of a Christian civilization.

The only remaining question raised by the splendid success of General Armstrong at Hampton was whether all this, like so many of the great things of this world, was not after all an annex to a great man which at his death, like the "cloud-capped towers" of the poet's vision in the heavens, would "dissolve and like the baseless fabric of a vision leave not a rack behind."

The men of genius in executive affairs are of two sorts. First is the man whose genius for organization and administration is centered on himself and is, at all points, involved in his own despotic control of his fellow-man. His work depends chiefly on himself as its "author and finisher"—a work whose secrets nobody but himself can understand and which nobody else can touch except on peril of pulling it down upon his own head. Opposed to this type of ruler of men is the man who goes through this life studying and by his own genius discovering the divine, natural, scientific, immutable laws by which human society must be organized and every human institution fashioned into the self-perpetuating factor of a progressive civilization. This man, as he does not "live to himself," so he does not "die to himself." He leads his fellow-men by living with them, and even more by his own way of living and action than by the subjugation of others to himself shows the better way by which families, communities, and States can be led "in the way they should go" and taught to fashion the institutions which shall become the great agencies of this work.

Of the latter type of men, of the organizing and executive sort, was Armstrong. Like the majority of able men nowadays called to the presidency of our rapidly developing educational foundations, he was compelled more and more to live away from home. He only taught his senior class in a course that, under the name of "mental and moral philosophy," included a practical training in American manhood and womanhood. For many years he was severely tried by the absence of the efficient supervision of his large company of teachers, some of whom resented the idea of any pretense of control within their own beat. But in his later years he was able to secure this great advantage. In 1893 he says truly: "The present efficient force of officers and teachers could manage successfully every department of the school should its head be taken away. In twenty-two years it has attained a life of its own; it would be poor organization and development that would not, in that time, have realized this point. It might once have been, but is not now moved by a one-man power. The change will come and the school will be ready for it."

Even before the faithful principal wrote these impressive words the end was approaching. It was befitting a man so burdened with a mighty labor, a labor that proposed the organization of a new type of school, which should become a national institution, destined to lift not only the negro but all similar races to a

new civilization which should be the basis of American citizenship, that he should lay down his own life on the altar raised by himself for the worship of the cause to which he had given his best years. No one could talk half an hour with General Armstrong, even in that peculiarly unconventional mood when he could become the most charming of men, without noting his mysterious mental absorption that reminded of a vast "beyond," seen by him alone, and with which he lived in perpetual communion. As the years went on it was evident to those most concerned that the great leader was more and more living in his own vast ideals which nobody but himself could realize, and he certainly not in this world. By the stringent policy necessarily adopted by his board of trustees, he was only half persuaded to restrain "a noble rage" for expansion that alarmed his prudent friends, lest his sudden death should leave the school under a crushing load of obligation. He was induced to announce that, hereafter "not an expansive but an intensive policy" would rule in the administration. But no body of directors and no consideration of a limited policy could hold in leash the principal of Hampton, who, with the ardor of a young captain of "rough riders," plunged anew into the dear old work of pleading before the people for his children. He fell, like a good soldier on the perilous edge of a charge up hill, in the midst of an address in a village church in Massachusetts, on Thanksgiving Day, and only lived on the borders of the grave long enough to gain the steadiness and peace to step up into the greater command that awaited him in the grander campaign beyond.

In his last words (left as "memoranda") to the school and the world, he concentrated the lesson of his life, a life that had already become a vital force in the Republic.

For, in the organization of the Hampton Institute, General Armstrong accomplished a work that may be compared with that of Horace Mann. While the American common school, by the great revival of 1830 to 1860, had to a large extent adjusted the system to the expanding needs of the Northern States, making it cover the entire space between the old-time district school of the rural section and the new graded school for all sorts and conditions of children in the great centers of industry up to the State university, academical and industrial, it had not really been able to solve the great problem of the South—to lift up a third of the population of a vast area, in sixteen States, in range of the dominant class. The prodigious effort made by all the religious bodies of the country to lift up these millions of illiterates, only half a generation removed from chattel slavery, to full American citizenship by the training of a superior class for leadership in a type of institution modeled on the denominational religious college and academy of half a century ago, assuming their names and giving their teachers the highest titles of the secondary and higher degrees, during the first thirty years following the civil war, did accomplish a work than which the American church has done nothing better. It is impossible to see how, without this agency, in which perhaps \$50,000,000 of Northern and national money have been invested, the public-school system for the colored folk could ever have been built up even to its present unsatisfactory condition.

It should also be noted that in doing this the American Church, North and South, has learned a great lesson—that it can not permanently maintain for its denominational seminaries an assumption of moral and religious superiority by conferring on them the title "Christian," and on the people's common school the name "secular." Indeed, these great mission schools in the South have been built up to their present efficiency far more by the interest of the people of their own religious connections in the new Southern common school for the negroes than by any permanent concern for sectarian propagandism. Their ablest managers and teachers on the ground from the first have seen that their real work was to train the greatest number of youth possible as teachers in the common schools and leaders in the new industrial, home, and social life of their great constituency.

The schools of this sort that are now most thoroughly committed to this policy of discouraging the multiplication of private and parochial schools and urging their graduates to lead the people in building up their own public-school system, and by living with them in every trade and profession hasten their preparation for good citizenship, are not only the most useful but are most certain of future support.

With no disposition to discourage the higher education, even in the limited curriculum of half a century ago, for any student competent to receive and make a high use of it, the educational public of the whole country is more thoroughly convinced every year that the central obligation and opportunity of all these institutions to-day is to increase and improve their facilities for training good teachers for their people's common schools, and make their own foundation at least a "college" or "university" of a genuine American life to its students. Sooner or later, while the majority of these local seminaries will disappear, a few score of these establishments will remain, under fit management, representatives of a superior training in every department—one of the noblest contributions of Christian missionary zeal, ability, and self-sacrifice to the suffering South, for the sake of the Union, in the history of our own or any Christian nation.

But it was evident to General Armstrong from the first, while in hearty sympathy with the Christian spirit that has prompted this great work, and, like all first-class American educators, profoundly convinced that the training of a character based on a solid religious and moral foundation is the fundamental work of every good school, that the work to be done in the South could never be accomplished by the old-time sectarian missionary methods, of which, even a generation ago, he had seen the last outcome in his own island country. He saw also that the Southern people could never be permanently educated at the expense of the nation, much less by the efforts of the rival Christian sects of the North to build up great centers of denominational propagandism for the training of the freedmen. The reconstructed South was not to be an annex to the North in any way, but a group of American States relieved from the great burden of the past by war, each reconstructing itself in genuine American style. The majority of the Northern churches were and still are, unfortunately, out of fellowship and practical cooperation with those of similar name in the South, and the large majority of the negroes are organized in churches under their own ministry. He felt that in building the final type of school for the freedmen he must escape all the pitfalls of denominationalism, while keeping his institution a broad and devout representative of the common Christianity.

He saw, again, that the final educational arrangement for the negro must be in some sort of corporate relation with the common-school system of the South; so he at once organized under the laws of Virginia and made Hampton a representative of the State by the disbursing of a portion of its industrial education fund to its colored citizens. He also understood that the negro, for a century to come, would be in no condition to be educated, even in his superior class, by attendance on the different types of schools developed at the North. This could only be done by working an extensive system of student aid from the North, which would at once demoralize a generation of colored youth and finally exhaust the patience of the most zealous givers.

What was needed was a new type of school, an educational arrangement that should receive such as were able to live under it, where every pupil should learn the whole art of living by his own effort; be compelled to conform to a severe discipline, truly Christian in its spirit, but, like the Christian life, "a strait gate and a narrow way;" be thoroughly drilled in some method of honorable self-support, with as much good schooling of the common-school type in the elementary and secondary grades as could be carried on in connection with everything else; the opportunity of learning how to teach a good common school, and, as far as possible,

through summer annexes, indirectly be qualified, under fit conditions, for a genuine Christian ministry. To combine all these departments and agencies in one school and put such a life into it that it would commend itself at once to the whole American people, North and South, and become a permanent contribution to American education; nothing less than the last achievement of Christian philanthropy to lift up the lower races of the world into line with modern Christian civilization; this was indeed a work of educational Christian statesmanship whose results only the genius of its master builder could compass.

Armstrong lived to see the scheme adopted, largely under the leadership of teachers like Booker Washington and other good men and women trained at Hampton, by every Southern State and already carried to a point, both in the training of the colored and white children of the South, that marks it one of the future permanent agencies of republican civilization. His most eminent disciple, Mr. Washington, has at once grasped the larger meaning of its application to the needs of the colonial policy on which the Republic has finally entered by suggesting the training of young men and women from the West and East Indies at Tuskegee, who would then inaugurate new Hamptons and new seminaries of the type of the Southern State normal and industrial school for colored students and white girls in all these newly acquired lands.

This attempt to set forth the real work of General Armstrong may be fitly closed by the republication of the estimates of his coworkers and friends, as set forth at a memorial service held at the Hampton Institute a few months subsequent to his death, and his last words, an educational "will and testament" worthy of this great and good man not yet half understood by the people for whom he gave his life:

REMARKS OF REV. W. E. STRIEBY, D. D.

In 1861, seven months after the fall of Fort Sumter, the American Missionary Association started a school for freedmen near where we stand; then one at the Butler School on these grounds; then Camp Hamilton, with 1,500 pupils from the contrabands' cabins all around. Then, in 1866, General Armstrong came as an officer of the Government in the Freedmen's Bureau, to take charge of the refugees and contrabands and abandoned lands. But he saw that for the 1,500 pupils who had been for five or six years under instruction a change was needed. He communicated his ideas to us and cheerfully and promptly we acceded, and this Hampton school was started. In 1867 we bought 120 acres here for it. The next year this Hampton Normal and Agricultural School was opened and General Armstrong was at its head. In 1869 he first appealed for a permanent building. The question was what to do. There was the old Chesapeake Female Seminary, now the Soldiers' Home, which could be bought cheaply. General Armstrong felt strongly opposed to it, and induced President Mark Hopkins and Gen. James A. Garfield to come down and help discuss the matter. We all met on the veranda of the general's house, with also the superintendent of schools of Connecticut (Mr. B. G. Northrop), Mr. Alexander Hyde, of Massachusetts; Mr. E. P. Smith, afterwards United States Commissioner of Indian Affairs, and myself. We talked the matter over. I said, "That is the best thing to do, to buy the seminary building." General Armstrong was inflexibly opposed to that. At last President Mark Hopkins took me aside and said we had better let General Armstrong do what he wants to, and so we did. If General Armstrong had been a common man I would have been right; but I was wrong, because General Armstrong was not a common man: he was a great man. He was great in his magnetic power over men. When this stripling of a young man would talk over with us the matter of the site of the school he could induce a Hopkins and a Garfield to come down to Hampton and be on his side. And ever since he has been drawing the Hopkinses and Garfields to him and to his board of trustees. My associates will not hear me when I say I have never known a body of more power, and never have I known a body of teachers superior to those he has gathered here, nor a body of students so magnetized—mesmerized—by one great spirit as here. General Armstrong was a great man in his broad plans and bold measures.

He tells us that the vision of Hampton, essentially as it now exists, was in his mind back in the days of the war. So when he took up the work it was all in his mind. The day we met on the porch of his house there were only two brick houses

and a few barracks and shanties on the place. But he saw it all, and the rapidity and vigor with which he pushed it into visible shape astonished us. We used to say, "Every year we come we see two or three new buildings." We would say, "General, this is large enough, we can't go any farther." "Oh, yes," he would say, "no more buildings." But the next time we would come there would be one or two more under way. Once when two corner stones were to be laid on an anniversary day (Winona Lodge and Stone Building) I was to speak at one and Dr. Potter, of New York (afterwards Bishop Potter), at the other. A little rain fell, and I said, "Dr. Potter, you had better wait; it will be over in a few minutes." "Oh, no," said Dr. Potter, "if I wait General Armstrong will have another corner stone started." But the General was not only great in making plans. Many a fool can make plans and get in debt for what he can't carry out. It is the mark of a great man to keep his plans in hand, and that is what the General did. A teacher here has told me that he knew the condition of every building from garret to cellar. So he knew all his business. He was great, too, in knowing how to select his subordinates. He said to us, "I am not indispensable to the school. I am dispensable. I can go to California and the Hawaiian Islands, because I know those I leave will do what is needed and the work will go well." To show us that he was not led away by visionary schemes, he would show us his balance sheet. And whatever perplexity or trouble there was I never knew him to whine. He never said to us, "Oh, what trouble we are in, won't you help us out?" but "I am going to do this, and that, and get us out." He made me think of Napoleon, who, after a battle had gone against him, gathered his forces under a tree, and instead of talking of the defeat, began to say, "I am going to do this and that to-morrow." One of his generals exclaimed, "Sire, thou art worthy to command us." So we felt that we had in General Armstrong a worthy commander and guide.

REMARKS OF MR. BOOKER T. WASHINGTON.

A few nights ago, while I was driving through the woods of Alabama. I discerned in the distance a large, bright fire. Driving to it, I soon found out that by the glow of this fire several busy hands were building a nice frame cottage to replace a log cabin that had been their abode for a quarter of a century.

That fire was lighted by General Armstrong, years ago. What does it matter that it was twenty-five years passing through Hampton to Tuskegee, and through Tuskegee Conference to that lonely spot in the lonely woods? It has done its work effectually all the same, and will continue to do it through the years to come. It is a serious embarrassment to me to speak of General Armstrong. It would be comparatively easy to speak of him as our teacher; but he was more than our teacher. He was the heart of our race, and held us so strongly and tenderly in his great heart that it broke at the time when most men have just begun to live. It would be comparatively easy to speak of him as our friend, but he was more than friend—that word is cold and barren. General Armstrong and the power of his personality and influence over his students, his tenderness, his love, his confidence in them, was so indescribable that I hope you will not think it irreverent if we not only reverence, but almost worship him. But General Armstrong would be the last to wish us to utter mere abstract words of praise. Every spark of energy in him was connected with some purpose, lifting up the unfortunate of the black and red and white races. Here in Virginia you know how his life penetrated, but what of his influence in the "Darker South?" I hope I shall be pardoned if I speak from experience and show by Tuskegee how his work is marching on. The rose I placed on his grave is his work at Tuskegee. To-day it is a light-house for the country about. Eleven years ago it began with 30 students and 1 teacher; to-day it has 600 students and 34 teachers. Then it had scarcely a dollar and not a foot of ground, now it owns 1,400 acres and 28 buildings—a plant representing \$180,000. Then it owned one blind horse; now it owns 260 head of live stock. Then the present school ground was an old plantation that had known only labor forced by the lash. To-day it has 14 different industries carried on by 600 as happy-hearted workmen and women as there are in America. Then it was questioned if the negro would work. Now 17 out of the 28 buildings are put up by the labor of the students. But our great chief taught us that all material advancement is as nothing except as it contributes to the elevation of manhood, of character.

REMARKS FROM SPEECH OF COL. THOMAS TABB.

When I am requested to speak of General Armstrong's relation to this community which I have known for twenty-five years, I could not fail to make my tribute to his memory and worth, however humbly. More than twenty-five years of this

nineteenth century, grandest of all the ages, with its magnificent development, its splendid progress, its grand achievements, and its grander men, have swept into the past since General Armstrong first came into this community. I knew him as a young man in the pride of his early manhood, and ever since till we laid him to rest in yonder cemetery—and who does not know how fair and famous that life has been? It was my privilege to meet him early in his official capacity as an officer of the United States Government. I refer to the past because I can not speak fittingly of the memory of General Armstrong without relating the circumstances that brought him here. Go with me to the dark days of 1866. All was not beautiful here then as it is to-day; all was ruin and desolation in the track of war. You can not realize the wondrous transformation these years have wrought. My own people were returning again, ruined in fortune, with blighted hopes, to their once happy homes. Those of them who stood on the verge of life could only think of those happy days never to return. Hither was returning the ex-Confederate to his home; here came the matron a widow and childless, who in 1861 had bidden husband and son go forth to battle, her loved ones sleeping on the heights of Gettysburg or in the shades of the Wilderness or Chancellorsville. Thousands of colored men and women, who had fled here as to a city of refuge, were occupying our lands and abiding in our homes. I say it not to their prejudice; such is not my purpose; no man appreciates their fidelity as a race more than I; they have my best wishes for their welfare, but naturally too many of them thought liberty meant license; freedom, exemption from labor. General Armstrong came here as a representative of the Freedmen's Bureau. Here laws were silent, courts closed; the bureau administered justice between man and man. Many were embittered. But he impressed this community as no man of his predecessors had done. We came to regard him as a true, brave, just, impartial man and well he met the difficulties of the hour, impartial to white and colored, a just man, and discharging his duty fearless of consequences and in the fear of his God. Some sweet memories come back to me of his goodness to my own people. The bravest are ever the tenderest. He passed from the Freedmen's Bureau to the organization of this great school. Methinks there was something in his environments here which spoke to him as the voice of destiny. It may not be that our great Creator speaks to us as to Moses and John, yet He speaks to us, and if we would give heed there would be more and grander men than there are. Yes, he heard the voice which would speak to him and, like John on the barren island, he gave heed to that voice and God pointed out to him his destiny and so this school arose. I well remember its beginning. How unpromising! I can go back twenty-five years and recall how it started with 2 dilapidated houses, old hospital frame buildings, 2 teachers, and 15 pupils. What has he accomplished here? These 600 students bear witness. These magnificent buildings tell the story of his great life. Beyond all this, the hundreds of young men and women going all though this land to elevate their people to a higher plane of manhood and womanhood—these speak more eloquently than I can speak of the work and the worth of General Armstrong. Michael Angelo liberated the angel from the block of rough and shapeless stone; General Armstrong has been a greater Angelo for two races.

SPEECH OF REV. DR. WAYLAND.

I don't know what I can add to all the fine and impressive things that have been said of General Armstrong. Great he was—he thought of what seemed impossible as something that must be done, and he did it. A soldier, he drew his sword only in behalf of justice, law, liberty, and love of God and men. A statesman, he had wisdom to see that when the war was over it was only half done. He had seen multitudes lay down their lives, the Potomac and the James run red to the sea, to achieve bodily freedom. But he saw the souls were still to be set free, and to that end he devoted his life. A Christian, he saw that God had given to him the mission of bearing, living, suffering for others, and that the divinest thing in humanity is a life devoted to man's redemption. We call him dead, but his presence was never more truly felt. From that picture, from that grave, he speaks to us, and yet more from the class room, from the church, from workshops, from cabin and cottage, and says, "I have borne this burden for men, so do you; and as I carried this load of labor, care, and love on my heart till it ceased to beat, so do you no less." These sixty buildings are a monument to him, compared with which Trajan's column is an inanimate block; these shall always speak. And he has other monuments in the hearts of men. So long as an Indian or a negro mother shall teach her child the name of Jesus and tell him of the great-souled man who here for a quarter of a century worked, watched, and died, so long his memory shall not fail from the minds of men.

General Armstrong's "Memoranda," left to be read after his death, have already been given to the press, as was but right—a legacy of inspiration to all who read. Certain clerical errors and omissions are corrected in the copy below, which is a carefully accurate transcript of his original manuscript.

MEMORANDA.

Now, when all is bright, the family together, and there is nothing to alarm and very much to be thankful for, it is well to look ahead, and, perhaps, to say the things that I should wish known should I suddenly die.

I wish to be buried in the school graveyard, among the students, where one of them would have been put had he died next.

I wish no monument or fuss whatever over my grave, only a simple headstone; no text or sentiment inscribed, only my name and the date. I wish the simplest funeral service, without sermon or attempt at oratory—a soldier's funeral.

I hope that there will be enough friends to see that the work of the school shall continue. Unless some shall make sacrifices for it, it can not go on.

A work that requires no sacrifice does not count for much in fulfilling God's plans. But what is commonly called sacrifice is the best, happiest use of one's self and one's resources—the best investment of time, strength, and means. He who makes no such sacrifice is most to be pitied. He is a heathen, because he knows nothing of God.

In the school the great thing is not to quarrel; to pull all together; to refrain from hasty, unwise words and actions; to unselfishly and wisely seek the best good of all, and to get rid of workers whose temperaments are unfortunate, whose heads are not level, no matter how much knowledge or culture they may have. Cantankerousness is worse than heterodoxy.

I wish no effort at a biography of myself made. Good friends might get up a pretty good story, but it would not be the whole truth. The truth of a life usually lies deep down. We hardly know ourselves. God, only, does. I trust His mercy. The shorter one's creed the better. "Simply to Thy cross I cling," is enough for me. I am most thankful for my parents, my Hawaiian home, for war experiences and college days at Williams, and for life and work at Hampton. Hampton has blessed me in so many ways. Along with it have come the choicest people in the country for my friends and helpers, and then such a grand chance to do something directly for those set free by the war, and, indirectly, for those who were conquered. And Indian work has been another great privilege.

Few men have had the chance that I have had. I never gave up or sacrificed anything in my life; have been, seemingly, guided in everything.

Prayer is the greatest power in the world. It keeps us near to God. My own prayer has been most weak, wavering, inconstant, yet has been the best thing I have ever done. I think this a universal truth. What comfort is there in anything but the broadest truth? I am most anxious to get a glimpse of the next world. How will it all seem? Perfectly fair and perfectly natural, no doubt. We ought not to fear death—it is friendly. The only pain that comes at the thought of it is for my true, faithful wife, and blessed, dear children. But they will be brave about it all, and, in the end, stronger. They are my greatest comfort.

Hampton must not go down. See to it, you who are true to the black and red children of the land and to just ideas of education.

The loyalty of my old soldiers and of my students has been an unspeakable comfort.

It pays to follow one's best light, to put God and country first; ourselves afterward.

Taps has just sounded.

S. C. ARMSTRONG.

HAMPTON, VA., *New Year's Eve, 1890.*

CHAPTER XII.

LETTER CONCERNING THE ESTABLISHMENT OF A NORMAL SCHOOL FOR THE WOMEN OF VIRGINIA.

ADDRESSED TO THE TRUSTEES AND FACULTY OF HOLLINS INSTITUTE, BOTETOURT SPRINGS, VA., AUGUST 20, 1864, BY EDWARD S. JOYNES, PROFESSOR IN WILLIAM AND MARY COLLEGE AND ACTING PROFESSOR IN HOLLINS INSTITUTE.

GEORGE P. TAYLOR, Esq.

President of Board of Trustees of Hollins Institute, Virginia.

SIR: The approaching meeting of the board of trustees of this institute, over which you preside, when, as I understand, the future policy of the institute, both during and after the war, will be discussed and determined, furnishes me the occasion for addressing to you, and through you to the board of trustees, some views and recommendations which I trust may be found worthy of consideration. The present condition of our country, its prospects and future wants, particularly in the interest of education, as a chief element of its independence, give a peculiar present importance to the subjects which I shall present. The position of this institute, as the oldest and largest female seminary in Virginia, renders it, moreover, proper that the trustees and faculty should more profoundly consider their duties and their opportunities with reference not only to the institute itself, but to the wants of the country under the highest views both of professional and patriotic obligation. I am encouraged to believe that any considerations touching these subjects will be favorably received by the trustees of this institute, and that whatever views may be adopted the responsibilities which they represent will not be disregarded. My sense of the vast and enduring importance of these interests to national as well as to social and individual welfare, and the acknowledged influence and reputation which this school enjoys, encourage me to address you especially on this behalf; and I feel that I may do so the more freely because, while deeply interested in its success, I am yet connected with the institute only by a temporary tie, and have my permanent position and interests elsewhere and in a different sphere.

Among all the interests and influences which comprehend the character and welfare of a people there is no one more important than that of education. This embraces the very sources of the national life, and, conceived in its moral as well as its intellectual aspects, it may almost be said to be omnipotent in its influence upon national character, as well as upon social and individual welfare and happiness. The school, the church, and the family, which are all embraced in its full signification, are the great laboratories in which the elements of a nation's life are combined and wrought into power, and in these, in their constitution and character, their influences and traditions, their teachings and discipline, will be found the key to the intellectual and moral life of the individual and the people. One of these receiving the child at its birth and attending the man in one relation or another throughout life surrounds him with influences and sanctities silent and innumerable that can not be analyzed nor described. Another comprehends his relation to his Maker and embraces the inscrutable mysteries of the heart, which none but himself and God can penetrate. For these reasons, being thus of the

nature of individual and sacred concerns, they are less the subject of discussion or of control; but the school, which, though hardly less individual in its importance, is yet public in its character and social in its constitution, is therefore the more appropriately matter of public concern, and questions of education have at all times engaged the attention and discussion of thoughtful minds.

And such questions are, indeed, not only of vital importance to each individual and family, but they possess a universal and patriotic interest at all times. The school and the schoolmaster occupy the very fulcrum of intellectual and moral influence upon the young. They contribute the materials which shall form by assimilation the substance of the future mind and character. They determine, by early discipline and example, [the quality of] reasoning and judgment, and in no small degree, also, of feeling and of conduct in after life; and beyond the sphere of mere instruction, and in a far more important sense, the associations and the habits, the standards, the examples, the traditions of the school, woven into the web of early growth and habit, constitute oftentimes the most powerful elements in the formation of the intellectual and moral character in after life. The agencies, therefore, which convey these influences can not be of slight importance. The institutions of education constitute, indeed, in all their peculiarities, a most important and characteristic part of civilization of a people. In their several departments of action and of influence, both moral and intellectual, in their constitution and conduct, their government and discipline, their methods and subjects of discussion, they are indeed of vital interest. In all nations, just in proportion to their advancement in intelligence and civilization, they have received the attention of thoughtful minds and a well-constituted system of education and educational institutions is regarded as among the highest glories of a nation.

But if this is true, if these things are important at all times and for all peoples, then are they especially so for the South and at this time. We stand, indeed, on the threshold of a new civilization. For this people "old things have passed away and all things have become new." A little while hence, and, God helping, they will stand erect, a bruised and shattered remnant, it is true, but yet a people and a nation, clothed with a blood-bought independence and endowed with the rights and responsibilities of liberty and self-government. Through the sacrifices and the victories, the agonies and the glories, the trials and the triumphs of this great war, they will have won for themselves a place and a name among the nations of the earth and laid the foundations of their own national character; and beneath the inspirations of this great struggle—under the influence of its discipline and sufferings—by the light of its profound teachings, they will begin to make their own career and to work out their own civilization and destiny in the history of the world. That this civilization will be a new one, in comparison at least with their past history, that a profound change will have come over the condition and character of the people, affecting at once all the circumstances of individual and social life and all the concerns of public interest, needs not to be said, certainly not to be argued. It is already manifest. The war itself, in a word, will be the basis upon which the distinctive civilization of this people will be founded hereafter, and its effect upon their political and physical condition, great as it may be, will be scarcely greater than upon their intellectual and moral character. Its experiences, recollections, and traditions; the impulses, the energies, the passions, and aspiration it has called into being, will be impressed with controlling force upon every mind, and will inspire the thoughts and sentiments, the literature and the ambition, of the present and future generations with ever-increasing influence. An immense impulse will have been given to the intellectual as well as the physical energies of the people. All the energies of thought and of passion, as well as of action, will have been aroused to their utmost intensity, and with the same intensity they will seek for continued exercise. And as the groundswell after a storm is more dangerous than the storm itself, which controls while it arouses the

deep, so the periods that immediately succeed great wars are often more fraught with peril to a people than war itself. At such times, so critical and so difficult for the statesman and the ruler, there is more than ever need that all the conservative moral forces which influence the character of a people and give stability to social and political institutions shall be held unimpaired and in full activity. All the influences of education, of religion, and of morals become then supremely important. As the passions and the energies of men have become intensified and the demoralizing effects of war been spread abroad through the land, all the constraining and conservative agencies of society must be strengthened in proportion. And as the former are but too surely transmitted in increased intensity to the young, so is it in the minds of the young, ever most susceptible to good or to evil, that they must be met and controlled. For of the mixed good and evil which result from every war, however the former may ultimately preponderate, it is unfortunately the evil that is most immediately felt and most speedily propagated. And if, under such circumstances, we will not educate our children to liberty, that they may be the guardians of free institutions, our institutions themselves must succumb to ignorance and license; for if society may not be protected and liberty preserved by intelligent obedience and enlightened opinion, under mild laws, liberty must give place to anarchy, and then to despotism, which is its only cure. Civil liberty can not long consist with popular ignorance under democratic institutions, least of all in periods of intense excitement or of profound reaction, such as follow after great wars. Of this truth history is full of proofs. In free governments, therefore, such as ours, and especially in times like these, apart from every obligation of duty, the necessity of self-preservation—stronger in political ethics than every other motive—requires that the people of the State, above all others, shall appreciate the importance of education and cherish all its institutions and agencies.

To these agencies of moral as well as intellectual influence, now more than ever important, we must chiefly look, both to resist at once the immediate demoralizing effects upon the young and to meet hereafter the multiplied intellectual and moral wants of the country in its new condition. These wants must be, moreover, now anticipated and provided for, while the elements of demoralization are already so rife, or it may be too late, when—the stress of war removed—they shall be let loose unrestrained upon the country. Almost an entire generation of our young men since the beginning of this war have passed from childhood to manhood, and entered the field of strife in great measure without even the ordinary advantages of intermediate education. This is already a sad condition for themselves and for their country, and it is, therefore, only the more important that this want shall be supplied for those who are to follow after them. The Confederate congress, in their enactments, and our excellent President, in many public expressions, have shown a wise appreciation of the vital importance of this subject to the country. Under circumstances of public peril, calling for the exercise of all the defensive power of the country, and in the midst of a conscription almost universal, those who are legitimately and permanently engaged in the profession of teaching have been left exempt from military duty. This can only have been done from a conviction of the vital and enduring importance to the country of their work, and that they—unfortunately only too limited a number—could best subserve the public defense and the common welfare by keeping alive the institutions and the influences of education, and by training, during this critical period, those who are soon to be charged with the destinies of the country. This consideration imposes upon teachers, on the other hand, a peculiar obligation that they shall take high and patriotic views of the trust thus confided to them, and that in their sphere, not the least important in this respect, they shall realize that they, too, are called to labor, for the establishment of our independence. * * *

Without this, without an independent national culture, there can be no com-

munity of sentiment among the people, no independent literature, no distinct national character; in a word, no true independence and no permanent institutions, for, without these, political independence or military power can rest upon no distinct and enduring basis. Of this truth this war has given us already an impressive proof. To our cost have we realized (when it was almost, yet, thank God, not yet quite too late) to what extent, under the name of equality and liberty, the Delilah of this false Union had already shorn us of our strength. Not only had it well-nigh robbed us of all the elements of political, industrial, commercial independence until it deemed us powerless in its grasp, but with a still more subtle invasion our artful "brethren" of the North had sapped the foundations of our education and our literature by the emissaries of their schools and the publications of their press, and had these influences not been happily arrested they would in the end have undermined our opinions, our politics, our institutions themselves, rendering their dominion complete and revolution for us impossible. How far had this been already done in some States we have abundant and melancholy proofs, and since at this rate revolution or slavery must have come, we have on this account reason to be thankful that revolution came so soon. To carry forward successfully this revolution in their own sphere and to establish this bulwark of independence for our people henceforth is now the peculiar duty of Southern teachers, and how this shall be effected is the great problem of Southern education at the present day. It is a problem that comprehends the profoundest interests and the most momentous and far-reaching results, affecting the welfare and character of our people, and if it is not solved practically now, under the impulses which this war has awakened and while its spirit is yet rife, it may be safely said that it will never be done at all, but that we shall drift back after peace is made into a worse than our former dependence, for it would then be a dependence upon a foreign people and a confession alike of intellectual inability to complete and of moral unworthiness to enjoy that independence which our arms had won.

With your indulgence, I desire to offer some practical views which I deem important in connection with this general subject before passing to the specific object of this communication, upon which, however, they will have a direct bearing.

It has been the misfortune of the South that thus far the profession of teaching, as such, has scarcely been known among us. Except in a few college professorships, many of which are of limited influence, but few educated men of Southern birth have devoted themselves professionally to this pursuit. This has been caused, in part, doubtless, by the character of the Southern people, who have been attracted rather by the more active pursuits of agriculture, or of professional or political ambition, than by the quiet studies of the school. * * * The result has been—apart from other influences most unfriendly to our institutions and pernicious to our youth—that the profession of teaching itself had fallen into disrepute among us. * * * Among our own people teaching has been mostly a temporary occupation, serving only as a stepping stone to some other pursuit that offered higher rewards; and too often it has been the last resort of the incompetent and worthless, who had failed at every other business. Under such circumstances, with such standards in the profession of teaching itself, it is not to be wondered at that our standard of education was low. * * * There have been, of course, exceptions in many worthy and illustrious Southern teachers—I speak of the rule. It is only of late years, and chiefly through the influence of the University of Virginia, whose noblest offspring is the body of earnest teachers which have been sent abroad throughout the South, that our people have begun to awaken with worthier standards from this pernicious error, and to perceive that it is not only important what is taught, but how, by whom, and under what influence and associations. * * * We need an independent, self-sustaining system of education, repre-

sented by our own teachers, sustained by our own institutions; * * * an education simple, earnest, truthful, worthy of the intellect and character of a free and uncorrupted people. How shall this be supplied?

I do not propose to discuss any of the details of this question, however important, but only to indicate some leading points that are pertinent to my present object.

In the first place, and as the groundwork of every other reform, the profession of teaching among us and the character of our teachers is that of mind upon mind, character upon character, in direct and daily contact, aided, on the other hand, by all the impressibility of youth. It is conveyed through innumerable channels beyond the mere agencies of instruction, and for good and evil—if the teacher be not wholly imbecile or repulsive—it will affect the moral as well as the intellectual being of the pupil throughout life. How many there are who can trace their most characteristic habits of thought and of life to the influence of some one or two favorite teachers in early years; how many more in whom such influences, still potent, have been only forgotten by themselves. To bear worthily this high office, and to train our children not only in right knowledge but in right conduct and in those refined sentiments and high principles which are better than all knowledge, we need a body of teachers who shall possess not only talents and learning, but moral qualities and accomplishments, such as shall make them worthy models of character and of manners under the highest standards of life. That we may have these the dignity of the profession of teaching must first be elevated, its influence and importance must be acknowledged, and there must be attached to it such rewards of honor and of emolument as shall offer inducements to the highest order of talents and attainments in the choice of a profession. And in this direction teachers themselves must take the first step for themselves and for the public. Their profession, like every other, will receive no higher estimate than such as they put upon it. Let them, then, begin by adopting for themselves, in the first place, the highest standards of professional attainment and conduct. Let them discard and frown upon whatever is false, superficial, or unworthy in method or presentation. Let them cultivate among themselves the highest sentiments of professional responsibility and professional pride. Let them at the same time set a right value, and a right price also, upon the work of education, remembering themselves and teaching the public to understand that of all cheap things that are bad, cheap education is the worst. They will thus, by mutual influence, elevate the standard of the profession among themselves, and by setting a right value upon their own work they will elevate both it and themselves in the eyes of the public and increase the dignity, the usefulness, and the inducements of their profession. Thus only an enlightened public opinion supporting their efforts, it may be hoped that young men of talents and ambition may be attracted to this pursuit and induced to prepare themselves for it, with elevated standards of attainment, as the profession of their lives.

In the next place—and this is the only other consideration to which I shall advert at present—that such a reform may be made practicable and effective, means must be provided and facilities furnished for the special education of teachers. Teaching is not a mere occupation. It is an art of the highest difficulty and importance, that requires special attainments, as well as the highest faculties, for its exercise. It is one thing to know; quite another thing to teach. The teacher must possess quite a peculiar education, and if it is not given to him by preparation he must give it to himself by experience. *Non repente fit.* No man is at once a competent teacher, and no man will become such, in the higher sense, who does not devote to it continuously his whole time, and strength, and study. There are habits of mind—modes of thinking, of knowing, of imparting—that belong to the teacher and that no man can acquire without special study and experience. This constitutes the great importance and value of professional teachers, men who shall make

teaching the business and study of their lives and find in it their sole emolument and ambition. None others will subject themselves to those severe methods of discipline and study which are required in teaching, none others will submit cheerfully or constantly to its constraints and sacrifices, none others can enjoy that matured and ever-progressive experience which is essential to the best teachers; for the truly good teacher is himself the chief learner, and every year will add not only to the stores of his knowledge, but to his mastery of his art. He is ever acquiring, by his own experience, new views, more striking illustrations, clearer power of expression, simpler and more progressive methods of instruction, and a profounder knowledge not only of all the relations of his subject, but of the laws of the human mind and of the means by which it is to be reached and wrought upon. Let every true teacher say if such has not been his experience. It may be safely said, with few exceptions, that none other than professional teachers are efficient teachers, and that none of those who pursue teaching as a mere pastime or as a preparation for other pursuits will ever attain the highest usefulness as teachers or contribute to advance the standards of the profession. Apart from this, it is of the highest moment to each community that the office of teacher in their midst should be permanently filled by persons of approved experience and ability, and that they shall not be subject, as in general heretofore, to the risk and loss of a perpetual change of schools and school-teachers. A body of professional teachers is indeed scarcely less important than a professional ministry, and a people who fail to provide for the one or the other imperil the highest interests of education and of religion.

And, indeed, it is only through the influence of such a body of educated and professional teachers that any true reform in our system of education can be accomplished. The laws of physical architecture are reversed in the intellectual and moral world, or, rather, the law is the same, but the point of departure is different. Here the foundation is above, and from above all building, all reform, must begin. It is only through the influence of a superior intelligence or of an outward influence higher than itself that the human mind or the human heart can be elevated to a higher nature. It is so in religion, it is so in morals, it is so in intellect, and this is consistent with the doctrines of Revelation, which teaches that all holiness and all intelligence come from God and that man alone can work out no good for himself. All civilization, all progress in the world's history, have come from the influence superior to himself, that shall control and exalt him. Left to himself, he will never become conscious of his intellect, and his moral nature, if indeed it could have any existence, will follow only the promptings of original sin, or, at best; of his merely physical appetites. So in education. If you would elevate the colleges, you must begin with the university, from which they derive their teachers and standards. If you would elevate the academies, you must first raise the colleges, and if you would elevate the schools you must first provide the teachers who shall be competent to teach them upon elevated standards. Of what use are free schools and public schools, even if you would fill them with pupils, without a supply of educated and competent teachers, and how else can we hope to secure these in permanent employment without providing the means for their education in our own institutions? This State has committed the error of attempting to institute schools without providing teachers. From such a system nothing could have been adopted and nothing can ever flow except results the most depreciatory and discouraging to the interests of education among the people. The money that has been spent in vain in Virginia in the institution of free schools, if employed in the education of teachers, would in a few years revolutionize the system of education in the State, rendering free schools first useful and then soon unnecessary; for the influence of a truly able teacher in any community is to make education first appreciated and then voluntarily sought by all around him. Not in the schools alone thus directly supplied with teachers would the influence

of such teachers be felt with reforming power, but in all the institutions above them. From the primary schools the pupils would go with proper preparation to the academies, and these would no longer need to do the offices of the school, nor the college those of the academy, nor the university those of them all, as, from want of proper preparation below, has been the case heretofore; but each grade of institutions, alike supplied with teachers suitable for its own wants, could do its own work in its own sphere, and within that sphere reach the highest degree of efficiency. Thus mutually related and each depending upon the other, the various grades of institutions would grow together into a compact system of education, not, as now, each for itself endeavoring to do the work of all and all imperfectly.

The importance of this subject is fully understood and exemplified in those countries which have accomplished the highest results in education and in the general diffusion of knowledge. The whole of the compact and wonderfully perfected system of education in Prussia is founded upon its normal schools, and similar institutions exist in other countries of Europe, being regarded everywhere as the basis of the whole system of education. These schools, which are under the peculiar care of the Government, are designed especially for the education of teachers upon standards adapted to the wants of the various grades of schools, and from them are appointed the teachers for all, according to their several requirements. Thus from these schools, by the teachers which they send forth, are derived the standards, the methods, the text-books of instruction, throughout all the schools of the country, which are thus adapted in their several grades and relations to a uniform and compact system, embracing the whole range of education from the primary school to the university. They are therefore called normal schools because they are normal to all others, determining the norms or standards by which all are conducted. Upon them is founded the whole system of education. The utmost care of the Government is devoted to them. Whatever improvement is effected in them is extended through all the schools, and their influence in advancing the interests of education is acknowledged throughout Europe as supreme. In a Government such as ours, where the State can not exert that direct control over the system and parts of education which is possible in monarchical countries, it is, as it seems to me, only the more important that it shall avail itself of those indirect means which, while not inconsistent with the voluntary principles of free government, shall tend to produce these desirable and systematic results. There is but one way practicable to reach these ends, and that is by the education of teachers adapted to the wants of our schools. This reform is fundamental to every other in the cause of education. For want of it all the endowments of the State and all the endowments of benevolence in behalf of education, however extensive, will languish and fail; for it is at last only through good teachers that good teaching can be had, and without good teaching no system of education can be effectual. The same liberty which is now manifesting itself in so encouraging a manner in the most enlarged enterprises for the extension of education to the needy and bereaved of our country should consider this object, without which all such efforts, however well conceived, must be, in a great measure, ineffectual. The results that have been accomplished in a few years in this direction by the University of Virginia, both directly and through its influence upon other institutions, and that, too, without special profession of this design, but only by its methods of elevated and exact instruction, show clearly what might be accomplished in our State and country by an institution, or a system of institutions, especially adapted to the education of teachers according to the wants of our schools. And with this example before us, and as the university passes on, let us hope, henceforth to its own special and wider calling, I can not but express the hope that the State itself will supply this fundamental want in

our system of education, and that at no distant day, and from some influential source, the attention of the legislature may be called to the subject.

These considerations have, in all their weight, a peculiar application to female education, with which we are at present most immediately concerned. Whatever arguments may be directed to the improvement of education, apply with all the more strength to the education of woman. This much-flattered and much-abused sex is in no one thing, perhaps, so much flattered and so much abused as in her education, in the common understanding of the term. If it be possible to speak comparatively of things so immeasurable, I should say that the education of this sex is of still more importance than that of the other, and that because, in the first place, they are so much more susceptible of the influence of education; and because, in the next, their individual influence is so much greater on the intellectual and moral tone of society. Certainly, however, reform and improvement are here much more needed, because so little of worthy effort has yet been made in this direction. Female education, indeed, as too often conceived and practiced (especially under the influence of Northern models) is at once a shallow pretension and a gross outrage, and for all those who value the character and influence of woman in wife, in daughter, or in any of the relations of society, it is a consummation devoutly to be wished that profounder ideas and worthier standards should be adopted on this subject. I am happy to know, however, that in Virginia, at least, we have some schools not unworthy even of Virginia daughters. And if I might, without being drawn into the subject, say one word in passing upon it, I should say that the characteristics chiefly to be desired in female education are two—which the term implies. First, that it shall be education; and, secondly, that it shall be feminine; that it shall be thorough for the training of her mind, but not masculine, for the perversion of her character. It should be based upon the idea that woman is woman, and not man nor a butterfly—man's helpmeet and companion, but neither his plaything nor his rival—whose highest destiny is to be wife and mother, and to bear throughout life wherever she moves, in the household and in society, the enchantment and the sanctities of woman's influence as mother, sister, wife, and friend. Her education in all its modes and circumstances should be founded upon this conception of her distinctive nature and calling in life, and adapted to this destiny. And, therefore, while it should cultivate with equal care the intellect and the manners by the loftiest standards, it should shun alike the false flattery of merely superficial accomplishments, which will degrade her in intellect and usefulness, and that other extreme of intellectual pride and masculine independence, which would unsex her, aiming, in one word, to educate neither belles nor bluestockings, but women for woman's sphere.

But this branch of the subject has, under our present circumstances, an importance that can hardly be expressed. During the period of this war the higher education of young men has been almost entirely suspended, and the boys that are coming after them are suffering scarcely less of intellectual loss and of the demoralization which the war has brought with it. There will then pass into the arena of life and into the control of our future destinies almost an entire generation of men without even the ordinary advantages of education. To what source, then, can we look for the moral and intellectual support of our society in future than to the influence of educated women, the sisters, the wives, and the mothers of the next generation? To what other source can we look for the refining, constraining, exalting influence of true culture upon the men than to them? For they ever set the tone of the household and of society, and in all the departments of life their influence is omnipotent. When we educate our daughters to-day we educate our sons who are in the army and their children; we educate the homes, the society, the moral and intellectual character of the generation that is now passing into manhood—we shape the sentiments, the principles, the standards of manners and of honor which shall govern them; and, under the present circumstances, this

agency is the more important because now it is almost the only means by which we can reach these objects. The responsibilities of the women of the South will be greater than heretofore and ever perhaps hereafter. They will occupy a larger space, not only in relative numbers, but in relative influence, in society, and their intellectual and moral culture will exert a profounder influence upon the character and destiny of the country. It is well that they should understand this. It is well, above all, that those who, at home or in schools, are engaged in their training should realize it. And while our male institutions of education are, for the most part, of necessity closed, our female schools should be cherished with the more care and conducted with the more vigor.

These considerations, the weight of which scarcely anyone will deny, give now a peculiar importance to the education of female teachers in our country. All that has been said in regard to the education of teachers in general applies with equal force at all times to this branch of the subject, and the present and future condition of our country in consequence of the war gives to it now an unequalled importance. Not only will the numerical relation between the sexes have been greatly disturbed by the war, but, in consequence of the impulse which it will have given to physical enterprise and military ambition, many of the ordinary functions of society formerly performed by men must hereafter, for a time at least, be filled by women, and this enlargement of the sphere of employment for women will be found to be not the least among the reflex benefits of the war. Among these functions may be reckoned, in increased degree, that of teaching, which will offer at first but few attractions to intellectual young men in comparison with more active and profitable pursuits. It therefore becomes the more important that the means for the competent education of women for this office should be provided, and on such basis as, while offering needful facilities for all who are worthy, shall encourage the most refined and gifted young ladies to enter this profession. For it must ever be remembered that it is not knowledge and intellectual competency alone that are requisite in the teacher, but refinement of manners also, and elevated moral influence; and these are the more indispensable in the female teacher, because so essential to her character and influence as a woman and because the culture of the manners and of the moral sentiments holds relatively a so much more important place in female education.

But there is besides, in the nature of things, the more need that the number of competent female teachers shall be multiplied, because they are actually in so much greater numbers, especially for the education of children of their own sex. Whatever may be the truth of the matter, whether or not there are evils inseparable from boarding schools which no prudence can remove, it is nevertheless true that there exists in the minds of many of the people of Virginia a deep-seated prejudice against boarding schools for girls; and it must be admitted that this aversion is not without foundation as regards the earlier education. It is certainly in the highest degree desirable that in the place of boarding and even neighborhood schools shall be substituted for young girls, and even for small boys, domestic education, beneath the influence of the parental eye and amid the sanctities of home; and the education of competent female teachers for our own homes can alone supply this want, and contribute, without surrendering the higher education of our daughters, to render boarding schools unnecessary.

To supply this want for our Southern homes facilities and encouragements for the education of female teachers in sufficient numbers must be furnished. Up to this time, for want of such provision, our people have been compelled for the most part either to send their daughters at a premature age to boarding or other public schools or to import female teachers from abroad. * * * These we should endeavor to supplant, and to supply this want for our families by educating our own young girls to this office—daughters of the South, reared in the midst of Southern society, with the purity, the delicacy, the good sense of Southern women, fit

to enter our homes in congenial companionship, and there to educate our daughters at once in the discipline of sound knowledge and by the example of a refined and elevated womanhood. What measure can we place to the influence of such a class of educated Southern women teaching in our homes? What a blessing it would be to our families, to our society, if such a system of domestic education could be rendered widely available for our daughters and our little boys, and what a beneficial and patriotic work would the preparation of such teachers be for our common country on the part of those who might be called to this high office. He who sends forth into life a single refined and educated woman sets a star in the firmament of society; but he who sends forth a refined and educated teacher sets indeed a sun in the heavens, whose rays of intelligence and influence shall lighten all beneath her sway. And great as is the influence of the male teacher, through both intellect and character, that of the female teacher is still greater, for she is by nature the bearer of a mightier individual influence, of attraction or of repulsion, and she employs this influence chiefly over those earlier years of life that are most susceptible and upon that sex which is at once the most sensitive recipient and the most powerful reflector of every ray.

But to effect this object in anything like an adequate degree, organized effort on an enlarged and permanent plan is necessary—difficult, and even impossible under present circumstances, as such an undertaking might appear. * * * The times, indeed, look dark around and before us; but believe me, never before has there been in this country a time so favorable for the inception of great undertakings as now. This is an age of mighty activity—of wondrous thought—of new and teeming ideas. It will soon be an age of mighty progress. Bold conceptions, that years ago would have languished and failed, now caught in the stirring whirl of the popular heart, will soon be borne upon the mighty returning waves of our progress to realization and success. And though material difficulties may intervene and complete success for a time be impossible, yet seeds sown now in the eager and earnest minds of our people will take deeper root and bear surer fruit than if postponed to a later day, when once more purely material enterprises shall absorb their attention. And this is particularly true with regard to objects like that here contemplated. All the energies of the people are now concentrated upon the one object of securing their independence, and whatever will contribute in any way to confirm and perpetuate that independence will awaken an interest and a support on the part of the people which they would never hereafter accord to any object upon its own merits alone. Now is the time for every movement in that direction, while the heart is all alive with this absorbing purpose. And, as I have before remarked, if the foundations that are to secure our intellectual and moral independence of the North be not laid now, under the impulses of this revolution, they will probably never be laid at all, and that independence never won.

But for the inauguration of the enterprise now under consideration, the present time is, from other considerations, in a peculiar degree opportune. This war has impoverished hundreds of families in the South, whose daughters will remain dependent after the war upon their own exertions for support. It has made thousands of orphans, whose fathers or brothers, fallen upon the field of battle, have bequeathed them to their country. Among these will be found many of the highest intelligence, worthy of the most liberal education and capable of the highest usefulness as teachers, if the means of training were afforded them. There are many of the daughters of the most educated families, born to wealth and reared under associations of the most refinement, now impoverished and dependent, who would gladly spend their last remains of fortune in fitting themselves for the honorable office of teachers. It is a happy omen for our future that such young ladies are already preparing themselves for this work. I speak from experience when I say that there have been such at this institute, who will compare favorably in every particular with the daughters of any gentleman in the

land; and were the opportunity more liberally afforded, their numbers would, as we know from almost daily application, be largely increased. Not only, then, would such an enterprise at this time, be sure at once of an ample field and of abundant material, but the very position and influence of pupils such as these would give to it at once, as well as through their profession hereafter, a dignity and an influence in the public estimation, which otherwise, considering our former circumstances and habits in this regard, years of effort might not attain. The time, the need, and the promise of success and usefulness alike invite our people to the consideration of such an effort at this time.

And yet no small difficulties, even under the favorable circumstances, would attend the undertaking. An institution fulfilling these objects should be conducted upon the most elevated, and, at the same time, the most extended basis, such as would not only afford the most thorough and ample instruction in the higher branches of education, but provide equally for the more elementary instruction in branches requisite for the ordinary teacher, with standards of attainment and graduation adapted to the different wants of different families and grades of schools. Thus, at once the most able and the most ample faculty would be necessary and an equipment in other respects equal to all the purposes of extended and thorough instruction. Such a school, in order really to fulfill its mission, should not be normal merely in name, but it should be conducted throughout upon the standards of the most refined and elevated society. Its instructions, its discipline, its associations, should be adapted to the education not only of the intellect, but of the character and manners; not only in peculiar degree to the training of such habits and exercises as are especially necessary to the teacher and governess, but to the culture of those graces of mind and character which adorn the truly educated woman, remembering that it is through these at last that her influence as a teacher will be chiefly felt; and that as, on the one hand, only an educated mind and refined taste can confer true accomplishment of manner, so, on the other, it is only the truly refined and elevated woman that can make an attractive and worthy teacher. While, therefore, on the one hand, these requisites would demand a large outlay of money and an ample income, on the other hand, that the practical objects of such an institution might not be defeated, its prices should be within the reach of persons of moderate fortunes; and that its fullest usefulness might be attained, it must be, to some extent at least, beneficiary. It may be safely said, therefore, that such an institution can never be successfully based upon private enterprise, nor could any private or temporary school, however successful, fulfill the desired requisites. It must be public and permanent in its nature, and it must be supported by ample donations from the public as an institution and free from the objections that are usually applied against such measures. It can not be hoped under the present circumstances that, in view of the prejudices that have governed the policy of our legislature, it would be willing to second measures already instituted. But I can not doubt that if this subject were properly presented and its importance duly realized, there would be found numbers of patriotic and intelligent men willing to unite in its support, and the public interest thus excited might perhaps induce the State to place the enterprise upon an enduring public foundation, or, better still, to establish institutions of its own for the education of both sexes. But that such a movement may be successfully inaugurated it must first be made from some responsible source, and with an earnestness and an ability that shall give to the public a guaranty of both fidelity and success.

It is to the noble office of taking the first step in this great work, so needed for our country and so appropriate to the time, that I would urge the authorities of Hollins Institute.

This institution, from its position and advantages, is peculiarly qualified, and I believe, if these considerations are just, called upon to inaugurate this movement.

Its long establishment, its success and reputation, and the known character of its trustees and faculty, would be a pledge at once of fidelity and of ability that would secure the confidence and support of the public; and while, from the condition of the country, it is debarred from its full operation in the ordinary channels, it might, with the more facility, undertake such internal changes as would be required, and happily in its case these would be slight. Having been originally adapted to this very object, it is already known for the thoroughness and completeness of its instruction and for the high attainments of its graduates, many of whom have been most successful teachers. It possesses a faculty (this I may say disinterestedly, for I am but a sojourner here) unsurpassed in ability and experience by that of any college, male or female, in this State, and more ample in numbers, I believe, than has ever been possessed by any female school in the South. Its buildings, its improvements, and its apparatus of instruction have already been brought to a high degree of development, and its methods and standards of instruction and examination are already established upon the highest basis. It is, indeed, an institution which, considering all the circumstances, is an honor to those who have founded and to those who conducted it, and which, if I rightly estimate its capacity and its destiny, is called to a high function hereafter in the education of Southern women. I propose that it shall now advance to meet this destiny by taking the first step toward an organized effort for the education of Southern female teachers upon a basis of public beneficence.

Let it be understood, however, that it is not proposed, in making this suggestion, to introduce any changes into the constitution or conduct of the school that would impair its general usefulness or change its relations in any respect. Whatever might be desirable to complete the idea of a normal school, adequate to the wants of our people, or whatever we might be able ultimately to effect, in this direction by the force of a successful example, it is not proposed in this instance to aim at any results not reasonably practicable within the scope of our institution, such as it now is. For, indeed, it is only thus, by practical success in however limited degree, that we can hope, by influence and example, to effect the good at which we aim. It is not proposed, therefore, to change the character of the instruction or of the patronage of the school in any degree, but simply to combine with its usual operations the special and beneficiary education of teachers, in practicable extent, as a recognized and permanent feature in its constitution. It is believed that the happiest results would flow from this combination upon proper principles, and that so far from suffering injury, the reputation and success of the school would be increased thereby in every direction. An institution known to be adapted to the education of teachers, according to the highest standards of instruction, would be sure to attract a large measure of the most select private patronage on the part of those who, without designing their daughters for teachers, would yet desire for them a like solid and thorough education; and the teachers themselves, thus sent forth, would constantly return to the school. I believe that such an enterprise, with all its rewards of honor and usefulness, is now practicable, with full assurance of success.

I do not propose to discuss the details of any plan for the object. This will naturally be a subject for the deliberation of the trustees and faculty, should the proposition itself meet with favor. I will merely sketch the general principles of such a system as seems to me to be practicable.

In the first place, I will remark that the experiment as here conceived, even should it be only an experiment, can cost nothing and lose nothing to the school. The very idea of such an enterprise implies that it shall be based upon a pecuniary foundation ample to support its expenses. Any attempt at beneficiary education upon any other basis would result practically in charging the other patronage of the school with the expenses of this education. And it is believed, further, that the example of public benefits conferred without corresponding sacrifice is injuri-

ous both to the recipient and to the public. It is only by appealing to public support that the public interest can be actively enlisted, and only by attaching value to the privilege can we make the privilege itself appreciated. The school itself, therefore, can not and ought not to undertake anything in this direction except upon an assured foundation of public pecuniary support. The first step, therefore, will be, after digesting such a plan as may seem practicable, to secure this foundation in advance. It is proposed, then, to go at once before the people by publication, by efficient agency, and through the public press, setting forth the plan proposed; to impress upon the people the importance of the movement; to explain its workings and its results; and to endeavor to secure contributions upon which the enterprise may be practically founded. Such publication should also set forth the actual character and condition of the school, as a pledge of its ability to redeem its promises. I do not doubt that if the idea in all its bearings were properly represented before the public, and if the people were made to appreciate the profound and far-reaching results of such a system, successfully realized, the means could be obtained, and that many who would not contribute to the ordinary objects of a school and many others beyond the more special sphere of the influence of this institute would, from patriotic considerations, contribute to an object such as this. A foundation once begun, and the public mind interested in the idea, the movement would gather progressively strength and influence in still wider circles. It is the first step only that costs, and, as in all important enterprises, the first step, once firmly taken, will secure the footing. The very example of such an effort, even if not successful, would redound to the reputation and influence of the school, and if successful it would inaugurate a new era in southern female education and accomplish results of usefulness to the country and of honor to the school that can not be estimated.

It is proposed, therefore, that we announce to the public our purpose to make arrangements in this school, conditioned upon the means being obtained for the permanent education, annually, of a certain number of young ladies of Virginia, free of rent and tuition, for the profession of teaching; and that this arrangement shall go into effect on the 1st of January next, or as soon thereafter as means can be secured to justify the undertaking, the money subscribed to be due only when the arrangement is actually begun; the outlines of the plan to be somewhat as follows: The funds obtained for this purpose shall constitute a permanent endowment for the general purposes of the school, the interest upon which shall be annually devoted to the payment of the tuition of these beneficiary pupils. The pupils shall be selected, from the number of applicants, by the trustees and faculty, or by a committee appointed for the purpose, upon such plan as may be agreed, without regard to denominational or other peculiarities, but solely according to certificate of intelligence, character and fitness for the office and influence of teachers, a reasonable degree of previous preparation, and a reasonable standard of age being required in each case. Preference shall be given for a reasonable period, say, for ten years, other things being equal, to the daughters of those who have been killed in battle, or become reduced by patriotic sacrifices, during this war of independence. It shall, however, be distinctly understood that this provision is not made for the education of the indigent, but rather of those who, by nature and qualifications, shall be deemed most capable of future usefulness as teachers, and who by their own influence, both as pupils of the school and as teachers afterwards, can best subserve the ends of the benevolence which they enjoy. For this reason the benefit proposed shall embrace only the tuition and privileges of the school—and that on conditions to be mentioned—not the board, text-books, or personal expenses in any degree. The system shall be beneficiary, not eleemosynary, and shall be limited to those who are either able to bear their own expenses, and willing to make the sacrifice, or who, from promise of usefulness, shall be able to secure to this extent the interest of others in their behalf. It is only thus that their

proper relations and associations in the school could be secured without offense to others, and only thus, too, by selecting persons of proper standing and of proper merit, capable of enjoying and appreciating the highest standards of instruction and of association, that the benefits of the system itself could be extended through the highest and the widest circle of influence. And it may be safely affirmed that while the applicants for this benefit would embrace only persons capable of appreciating the value of these requisites, they would exert the best influence in the school and the highest usefulness in life. Every such pupil should be entitled to a full course of three years' instruction, but not more, except in extraordinary cases; but the more fully to guard against the results of mistaken choice, and to sustain the highest standards of improvement, the election should, in each case, be repeated every year.

On receiving their election, the parties should be required to enter into bond, by their legal representative, with good security, to spend at least three years * * * in teaching, within the Confederate States, the condition being that in the event of the forfeiture of the bond the party should pay to the institute the full sum of the tuition received, with interest from the time it was due, which sum should then accrue to the funds devoted to this general object; and certificates of the fulfillment of this bond should be required to be returned to the superintendent of the institute. Dismissal from the institute, or the withdrawal of this privilege from incompetency or any other cause, should likewise render the party liable for the tuition, but should release from any further obligation. As part of the training of these pupils for the office of teaching, they should be required, during the last year of their studies, to take part as assistant teachers, under the supervision of the faculty, in the instructions of the institute; and their diploma should set forth this fact, and certify, besides their attainments in knowledge, their competency in teaching, as thus ascertained. This requirement, while of important advantage to themselves as future teachers, would constitute an incidental benefit to the institution of no small value, in multiplying its means of instruction according to its own systems. In conferring diplomas of graduation, or other certificates, grades should be adopted, in the case of these pupils, according to the different requirements of teachers in different grades of schools, of which I would suggest two: The classical or academical, embracing Latin and French, and the English, embracing only the studies of the English departments; the degree of attainment in music might constitute a third. These grades should represent only the difference in the subjects or extent of attainment, thoroughness of discipline and a high degree of sound knowledge being required alike in every case, as of all other graduates, in any department of the school. Beyond this, as to the methods of instruction and examination, and the rules of conduct and discipline, no distinction should be made between them and other pupils. Whatever improvements might be required for their benefit should be common to all; whatever advantages might be enjoyed by others should belong to them also. According to the standards here conceived, whatever accomplishments of intellect or of manners are appropriate to the most refined and select society are also appropriate for those who shall be the teachers of the daughters of our State, and whatever thoroughness of instruction and of discipline is required for these is surely desirable for all. In every respect, so far as possible, this system should be made a part of the general operations of the institute and these pupils identified in education, association, and sympathy with the rest of the school. The highest benefits would thus result to all. In this school, with its existing modes of discipline and conduct, no difficulty would attend this union; and its known standards of instruction already guarantee the most material requisite of success in every other respect.

The extent to which this undertaking could be realized would depend, of course, upon the means obtained. It might indeed be begun with any number, however

limited; and such a beginning would probably do more than anything else to insure the full success of the enterprise. It is proposed, however, that the announcement be made for 20 pupils, and the effort continued until the means are obtained for the education of such a number, it being understood that the number shall be limited always by the interest of the funds secured. An annual interest of \$2,000 would pay for the tuition of this number of pupils at \$100 each, in old money, and while the school need only be charged yearly with the interest, in the form of such instruction, the principal, or any portion thereof, might be legitimately devoted to the general improvement of the school, which would be indeed its best investment. The character and number of the trustees would be an ample pledge to the public that the funds would be faithfully applied. Could we attain even this number, while we might even go beyond it, there would be left an ample margin for private patronage; while the school would thus, in a few years, accomplish an amount of good in the education of the daughters of our people that is incalculable.

With these remarks, I venture to urge this subject upon the consideration of the trustees of Hollins Institute. The time is ripe, the need is great, the means is ready, as I believe, for the undertaking. I regard it as a great and patriotic enterprise, whereby, if they should succeed, they will not only elevate the character and reputation of the institute itself, but will entitle themselves, also, to the gratitude and praise of the country for inaugurating an enterprise of such wide and lasting usefulness. I believe that they will meet with undoubted success, that the idea will be seized and their example followed elsewhere for both male and female schools, and that they will find it to be no small honor to have been the founders of the first normal school in the Confederate States. I sincerely hope that this honor and this usefulness may belong to them and to the Hollins Institute and Normal School of Virginia.

I am, sir, very respectfully, your obedient servant,

EDWARD S. JOYNES,
*Professor in William and Mary College and
 Acting Professor in Hollins Institute.*

HOLLINS INSTITUTE,
Botetourt Springs, Va., August 20, 1864.

ACTION OF THE TRUSTEES.

At a meeting of the board of trustees of Hollins Institute, held on the 23d of August, 1864 (the preceding letter having been laid before the board by the president), the following resolutions were adopted, viz:

Resolved, That the trustees of Hollins Institute cordially approve the views and recommendations embraced in the letter of Prof. Edward S. Joynes to the president of the faculty, and that the trustees adopt the same as a basis of action.

Resolved, That a committee be appointed, to act in connection with a committee of the faculty, to mature a plan in furtherance of these views and objects.

Resolved, That this plan when adopted shall be communicated to the public through such means as the committee may devise, embracing also the publication of the letter of Professor Joynes, with these proceedings, and the employment of an efficient agency or agencies to advance the object.

Resolved, That as soon as a basis is obtained for the education of five pupils on the principles thus adopted, the system shall be put into operation, announcement being made at least two months in advance.

Resolved, That the pupils chosen under this plan shall be selected from the State of Virginia, without regard to denominational or other peculiarities, but with the sole reference to their capacities for usefulness as teachers.

ACTION OF JOINT COMMITTEE.

In pursuance of the above resolutions of the board of trustees, the president of the board and the superintendent of the institute having been requested to act as chairmen of the respective committees of the trustees and the faculty, the committees met on the 5th of September and agreed upon the following action:

Resolved, That deeply impressed with the importance of an independent and self-sustaining system of education as essential to the independence of our country and the perpetuity of our institutions, and believing that the education of Southern female teachers for the schools and homes of the South constitutes one of the first and most important steps toward the attainment of this end, which now deserves peculiar and immediate consideration; we, in behalf of the trustees and faculty of Hollins Institute, agree to adopt the following plan, and appeal to the patriotism and benevolence of our fellow-citizens in its support.

I. It is proposed that there shall be founded an endowment by public beneficence, the interest of which shall be devoted perpetually to the education of Southern female teachers in this institute.

II. These teachers shall be educated free of charge for tuition or rent, but paying their own board; and shall be entitled otherwise as pupils of the institute to all the advantages and privileges of the school, on the same footing with other pupils.

III. The said pupils shall be appointed annually from the State of Virginia by the faculty and trustees of the institute or by committees appointed for the purpose; but the same person may be appointed in successive years until her course of studies shall be completed, yet not exceeding three years, unless by a unanimous vote.

IV. These pupils shall be chosen at stated times after public notice in advance of at least one month in not less than three of the leading newspapers of Virginia. The applications shall be considered without any peculiarities in regard to religious belief or personal or political connection, but solely with reference to intelligence, character, and fitness for usefulness and influence in teaching. These qualifications shall be required to be satisfactorily attested, and a due degree of previous preparation, as well as a suitable age (not less than 14 years), shall also be held to be requisite for appointment.

V. These requisites being fulfilled and other things being equal, the preference shall be given in making these appointments to the daughters or orphans of soldiers of the Confederate army or to others who may have become impoverished in consequence of patriotic sacrifices during the present war of independence. But as this benefit is designed to be in its results a public and not a personal one, indigence alone will not be considered a recommendation for appointment.

VI. Every such pupil on receiving her appointment shall, by her legal representative, enter into bond, with acceptable security, to spend at least three years of the next five after leaving the institute in teaching in some one of the Confederate States, and binding herself, in case of the forfeiture of the bond, to pay to the institute the full sum of the tuition received, with interest from the time it was due, which sum shall then accrue to the funds devoted to this object, and be invested on the same principles. But if, by act of the faculty, the pupil shall be removed from the institute, or her appointment withdrawn, or in case of her death or any involuntary disability, the bond shall be considered discharged. Certificates of the fulfillment of this bond shall be returned to the superintendent of the institute and shall be filed by him.

VII. The said pupils shall be permitted and required to teach, as a part of the institute during the last year of their studies, provided that this requirement shall be held subsidiary to their own improvement, and shall not exceed one hour per day without the consent of the pupil.

VIII. This foundation shall be known as the Normal Department of Hollins Institute. It shall embrace two courses of study, adapted to the wants of the different grades of schools, namely, the English, embracing a full course of studies in the English department, including mathematics, and the classical, which shall embrace, besides, the Latin and French languages; but the pupils in this department shall also have the privilege, with the consent of the faculty, of studying other subjects in the literary departments when not inconsistent with the specific objects of this endowment. On completing either of these courses, on such standards as may be fixed by the faculty, these students shall receive appropriate diplomas declaring them to be graduates in this department, and qualified as teachers accordingly. And those who may fail to complete the whole of the said course or courses may, upon application and examination, receive from the faculty certificates of their qualifications as teachers in particular subjects. Other pupils, also,

who propose to become teachers, may enter themselves as members of this department and secure the like diplomas or certificates upon the same terms.

IX. This department shall be in all respects an integral part of the institute. Its pupils shall receive the same instructions and the same examinations as other pupils in the same classes, and upon the same standards of elevated and thorough scholarship which are adopted throughout the institute. And in conduct, discipline, and association, as well as in all the other obligations and privileges of the school, these pupils shall be on the same footing precisely as all others.

X. That the benefits of this endowment may be made perpetual, the number of such pupils must be limited by the amount of the annual interest upon the funds subscribed. As an additional pledge, however, of our desire to extend this benefit to the widest possible degree consistent with the maintenance of the institute, it is provided that the tuition of said pupils shall always be reckoned at 25 per cent less per annum than the regular charges for other pupils; or, in other words, the number of such pupils received shall be 25 per cent, being donated annually by the institute to this object. And the entire amount of the interest accruing at 6 per cent shall be regularly thus employed.

XI. In order, however, still further to limit, on a permanent principle, the charge for tuition in the case of these pupils, it is provided that the paid charge shall never at any time exceed one-half the price of board as then fixed by the trustees of the institute. The present value of each of these scholarships, which shall be known as the normal scholarships in Hollins Institute, is for the present fixed, however, at \$4,000 in the present currency of the Confederate States. Any one or two persons subscribing this amount shall have during life the right to nominate one such pupil in such manner consistent with these regulations as may be hereafter prescribed, and the scholarship in question shall be known perpetually by the name of the founder or founders.

XII. This system shall be put into operation as soon as an amount shall have been subscribed sufficient to establish one such scholarship. The funds shall not be due until notice has been given to that effect, and all moneys previously collected shall be returned if at the end of twelve months the enterprise shall not have been to this extent successful.

XIII. The superintendent is authorized and required to employ, with the concurrence of the faculty, efficient agencies to bring this subject before the public, and to solicit subscriptions on this behalf. The president of the board of trustees shall be the treasurer of the fund so collected, and the investment and expenditure thereof shall be under the control of the trustees, whose names, number, and character are offered as a guaranty of the good faith of its employment.

XIV. This enterprise is undertaken as a public benefit, under a profound sense of the importance to our country of affording enlarged opportunities for the education of female teachers in the South, and in the hope that the example, if successful, may be followed by other institutions.

XV. The position of this institute, for nearly twenty years successfully conducted with the amplest patronage and upon the most elevated basis, constitutes, it is hoped, both a vindication of the motives of the enterprise and a sufficient pledge that this trust, if confided to it, will be executed with both fidelity and ability in the selection and education of pupils under the highest standards of scholarship and discipline for all the requirements of teachers in the schools and families of the South. The instructions of the institute being already adapted to this object as an original feature in its constitution, we may the more confidently appeal to the support of the public in behalf of the present plan.

GEO. P. TAYLOR, *President*,
J. P. CORRAN,
RUFUS PITZER,

Committee on the Part of the Trustees.

CH. L. COCKE, *Superintendent*,
L. W. SEELEY,
W. H. PLEASANTS,

Committee on the Part of the Faculty.

HOLLINS INSTITUTE,
Botetourt Springs, Va., September 5, 1864.

CHAPTER XIII.

EDUCATION IN THE SOUTH.

ADDRESSES DELIVERED AT THE TENTH ANNUAL MEETING OF THE SOUTHERN EDUCATIONAL ASSOCIATION, HELD AT RICHMOND, VA., DECEMBER 27-29, 1900.

CONTENTS.—Industrial education and the New South, by George T. Winston.—Education and production, by Charles W. Dabney.—Negro education in the South, by Paul B. Barringer.—Reply, by Julius Dreher.—Discussion, by H. B. Frissell.—Reply, by Paul B. Barringer.

INDUSTRIAL EDUCATION AND THE NEW SOUTH.

By GEORGE T. WINSTON,

President of the North Carolina College of Agriculture and Mechanic Arts.

The two great forces of modern life are education and machinery. The one elevates man, the other subdues nature. Together they develop civilization and determine the destiny of nations and races. How far removed is the American Indian in bark canoe from the modern engineer in iron steamship! Stretch canoe and Indian in endless chain around the globe, each within call of the next, multiply them by 100,000, and the sum of their power will not equal that of a single trans-Atlantic steamer. * * * The little Commonwealth of Massachusetts, with its machinery for education and its education for machinery, is more potent in the life of the world than the whole continent of South America. The cotton crop produced this year by the Southern States could not have been grown, housed, picked, spun, and woven a century ago by the entire population of the globe.

The greatest industrial changes ever wrought within a lifetime have been witnessed by the generation now living in the South. For more than a hundred years we maintained an industrial system in opposition to the industrial forces of the world. The long and bitter struggle between North and South, although waged apparently in courts of justice and halls of Congress, in pulpits and drawing-rooms, on deck of ship and field of battle, was not political, nor legal, nor social, nor military, but educational and industrial. It was a struggle between the educated Yankee mechanic, astride the steam engine, and the educated Southern planter, carrying on his shoulders the negro slave. The heroism of that struggle, the courage, the fortitude, the skill, the energy, and the power with which the South maintained it in peace and in war, are emphasized, beautified, and almost glorified into martyrdom by the absolute certainty, the preordained necessity of its total failure. There was no need of Gettysburg or Appomattox. The contest had already been settled by the mills and factories, the railways and steamships, the power looms and spinning jennies, the reapers, binders, threshers, and other machinery of a people leading the world in mechanical invention, in use of machinery, in industrial progress, and in public education. Had the South possessed resources of skilled and educated labor, of shops and factories, of mills and furnaces, of ships and locomotives, of accumulated wealth such as the North possessed, had the victory been possible by endurance and fortitude, by courage and heroism alone, the boys in gray, under Lee and Jackson, would have been invincible, not only by the North but by the world.

The building up of the South since her overthrow in war, the revival of old industries and the establishment of new, the accumulation of wealth, and the multiplication of schools, colleges, and universities are the admiration and the wonder of the world. But there is nothing wonderful about it. The people who were great with slavery and unskilled labor have become greater with freedom and education. The apparent emancipation of the negro slave was the real emancipation of the Southern white. By Lincoln's proclamation the South was freed from slavery, and the road was cleared to educated labor and industrial development. We realize at last that slavery was not our riches, but our greatest poverty. We dare not picture the condition of the South to-day, with slavery dominant, controlling her industries, and repressing her development.

The South is now in touch with the world. She is educating her own children and the children of her recent slaves. Through the aid of machinery she is converting into wealth her large and varied resources. The roll call of her slaves will never be heard from Bunker Hill monument, but the whirr of her spindles and the click of her looms is already heard in Lowell and Manchester. She is shipping iron to Birmingham, coal to Newcastle, calico to Calcutta, and tobacco to Turkey. Cotton is still king, but his throne is no longer in the field. He rules in the mill and hears the music of machinery instead of the song of slaves.

But the development of the South is only begun. We are traveling in the right direction, but we have not traveled far. We must quicken our pace or we shall fall behind in the world's industrial race. As yet our products are chiefly raw material, or coarse and cheap fabrics. We are winning our way by cheap products, cheap labor, and long hours of work; but the day may come when cheaper labor and cheaper products and longer hours elsewhere will drive us from the field. Cheap labor is abundant in South America, and in Asia is practically unlimited in supply. The safety of the South is in better labor and better products.

The labor unit of the South is still the negro, emancipated, but ignorant, unambitious, and less trained than when a slave. In his present condition he renders difficult, if not impossible, the changes requisite to intensive and diversified agriculture and retards the development of all industries in which he is employed. As a race he is less skilled than during slavery. The industrial development of the South demands that the negro be either improved or gotten rid of.

The problem is not political, but purely industrial. With the South it is one of development; with the negro, of existence. It must be solved, and solved aright. The mistakes of reconstruction must be corrected. The North and the South, government and philanthropy, education and religion, all forces, domestic, social, and industrial, must combine to make the negro a better workman. The real race struggle is for existence, and the negro is ill prepared to win it. Dragged from barbarism to civilization, educated through slavery into freedom, cut off suddenly by emancipation and enfranchisement from the influences that had given him all the power he possessed, he wandered about like a child in the night of reconstruction after the false lights of political and social promise, away from the paths that led to industrial progress and economic independence. It was in his power for twenty years after emancipation to control the industries of the South. Had the energies of the race and the ambition of its leaders been directed to obtaining homes and acquiring wealth instead of political and civil power its condition to-day would be far better, not only from industrial and physical standpoints, but mentally, morally, and even politically. The present ideals and ambitions of the race belong to the distant future. For this generation and many yet to come there is need of radical change in negro education. His colleges of law, of medicine, of theology, and of literature, science, and art should be turned into schools for industrial training. Hampton Institute and Tuskegee should be duplicated in every Southern State—if possible in each Congressional district. The visionary ideals of Wendell Phillips and Frederick Douglass should give place to the practical work

of General Armstrong and Booker Washington. The wasteful expenditure of money for negro literary education in the public schools of the South should be changed into profitable and useful training in industrial schools, shops, and farms, maintained at public expense and under public direction, for negro education in each county or township of the South. The entire system of public education for the negro race, from top to bottom, should be industrial. As yet all the industries of the South are open to his employment. The door of his opportunity is not yet closed; but unless he speedily enter, armed with skill, training, and industrial power, it will close, and close forever. The skill and training which the race possessed in slavery must be regained. The new generation, now less capable than the old, must be taught to work. After handicraft will be time for headcraft. The race is not yet out of tutelage. Its industrial apprenticeship, begun in slavery, must continue in freedom. We must recognize the fact that the negro is still unable to stand alone. But the help he needs is not so much of books and "schoolmarm" as of tools and master workmen. He needs the aid, the sympathy, the daily instruction of his Southern employer. Every Southern household, farm, shop, factory, and mill might be a school for the training of the negro. It was so in slavery. But to-day the chasm between the races is deep and wide, forbidding interest and sympathy and authority on the part of the whites; docility, obedience, and zeal on the part of the blacks. Nothing will bring the races together again but the industrial skill and power of the negro. His education should look to this end. The race is entitled to live. Justice and humanity demand that it be given a chance. The duty and the problem are national. The burden is too large for the South. The National Government should aid in the industrial education of the negro until he is able to earn a decent living. Then may come independence and self-reliance, to be followed finally by culture, learning, and refinement. Give the negro a chance, a natural and reasonable chance, for progress, and either, like other races, he will aid the development and share the prosperity of great America, or, if slowly dying through race inferiority and incompetency, he lingers ages longer, a curse and a hindrance to the nation that made him slave, let it be said that the white race through every agency of training and education patiently and bravely endeavored to save the negro from extinction and equip him for free existence.

The necessity of industrial education is almost as great for Southern whites as for the negro. The industrial life of the New South must be based upon education. The education of the New South must lead to industrial life. The Southern schoolboy dream of statesmanship must yield to desire for workmanship. Our children must be taught to express their thoughts in work as well as in words.

The healthful happiness, the lasting utility, and the real nobility of genuine, downright labor, of labor wrought into things of beauty and value, must supplant the nervous excitement of mere intellectual gymnastics and the tiresome weariness of the mental treadmill.

Our present system of education is not in touch with life. The highest expression of the world's power to-day is not literary but industrial. The world's work is growing daily in character, value, and intensity, and is demanding for its performance not only labor but genius—genius of the highest order and thoroughly trained. Ours is an age of action and performance. The world's demand is not for skilled talkers but skilled workers. Mountains must be tunneled, rivers bridged, oceans led captive over continents, deserts irrigated, cities built into air and guarded from fire and filth, enemies to life detected and destroyed in plant and animal, goods exchanged between the ends of the earth, nature's forces harnessed to human service, and her crude material, infinite in variety and extent, fashioned into forms of beauty and utility to gratify the ever increasing desires and necessities of life.

This is the age of the engineer, the chemist, and the biologist.

The educational system of the South needs to be greatly changed, if not recon-

structed. For one hundred years our schools have manufactured orators, statesmen, and universal geniuses. The supply now exceeds the demand, and a change of industrial machinery is necessary. For declamation and dialectics we must substitute the microscope and the laboratory, the drawing board and the machine shop. The South needs workers, trained and skilled workers, in every department of industry. Rude labor will not suffice, even in agriculture. Our cotton crop has been trebled in thirty years. Improvements in cultivation, in machinery, in fertilizers, and in utilization of waste products have produced this wonderful result. The methods of slavery would mean bankruptcy to-day. Thirty years hence the crop will be trebled again and the methods of to-day will mean bankruptcy then. The same is true of all our industries. To remain stationary is really to fall behind. As ginning has supplanted hand picking, carding machines hand cards, and power looms hand looms, so the plaids and sheetings of to-day must yield to lawns and laces and muslins to-morrow.

The weavers of Asia are still using hand power. When they rise to steam and power looms the South must move up further or else be ruined. Industrial education is our only hope. Other people are employing it and revolutionizing their industries. Germany is dotted with industrial schools; of agriculture and forestry, of metal and woodworking, of weaving, bleaching, and dyeing. German goods are filling the markets of the world in spite of tariffs and hostile legislation. Great Britain is no less active; Japan, after her sleep of centuries, has awoken to life through industrial education. Even Russia is preparing for the struggle.

In the United States, outside of the South, the chief industrial centers have organized technical colleges and schools for manual training. In New England the public schools from top to bottom are looking to industrial training. Drawing and designing, wood and metal working, the plastic arts, the microscope and the laboratory, unused a century ago, are commoner to-day in the schools of the North than books of declamation and treatises on the human understanding. But not so in the South. We are stumbling along in the same old paths. Our public schools are not arousing public enthusiasm or inspiring public confidence. As a rule they do not deserve it. They are not following, much less leading, the industrial revolution of the South. Our system must be changed. Necessity will require it. We have reached the limit of skill and production without the help of industrial education.

Our public schools—kindergarten, primary school, grammar school, and high school—all should be strengthened with manual training. Every child should be taught to do something, to make something, and to make it well. Drawing, plaiting, weaving, coloring, designing, carving, and molding would be more useful preparation for life than learning the ancestry of Tiglathpilezer or the boundaries of the world as imagined by Ptolemy. Special industrial schools adapted to the prevailing industry of each district should be established in all industrial centers. The principles underlying each industry—chemical, mathematical, mechanical, or biological—should be thoroughly comprehended. Actual manipulation and experience in at least the leading lines of work should be required. Such schools would supply skilled workmen for every industry—wood workers, metal workers, leather workers, workers in field and forest, in mine and mill and factory, skilled workers, exchanging in the markets of the world finished goods for raw material, skill and knowledge for rude labor.

The system should be crowned in each State with well-equipped colleges of technology, offering complete instruction in the applied sciences and furnishing the State with an adequate supply of highly trained professional experts; with civil engineers for the construction of railways and bridges; with hydraulic engineers for the construction of dams and waterways and the transmission of water power; with electrical engineers for the creation, transmission, and application of elec-

tric power; with mechanical, mining, chemical, sanitary, and textile engineers; with architects, designers, inventors, industrial promoters, and managers.

The South must follow the spirit of the age. She will do so from necessity, if not from preference. Industrial competition will force her to it. Her resources are practically undeveloped and unlimited. She is amply endowed with all three requisites for the production of wealth; with natural resources, capital, and labor. Her natural wealth is the greatest on the continent. In variety and fertility of soil, in diversity and healthfulness of climate, in abundance and variety of minerals, in forests and fisheries, in water power and fuel, she is rich beyond power to calculate. She is accessible to world markets, both for raw material and for finished products. Her capital is abundant and easily increased by foreign importation; her white labor is native, of English, Scotch, and German stock, reliable, intelligent, abundant, and cheap. All conditions are favorable to the production of enormous wealth, and with it the promotion to a high degree of popular happiness and prosperity. The one thing lacking is industrial training and skill. Supply these and the South will be the paradise of the world, the realization of perfect democracy, where labor is so productive and wealth so abundant that there is leisure and opportunity for universal culture and universal progress.

EDUCATION AND PRODUCTION.

By CHARLES W. DABNEY,

President of the University of Tennessee.

Every lover of his country must rejoice in the great interest in technical education manifested recently in the South. It shows that we have at last come to recognize the deficiencies of our system of education and the one-sidedness of our present schools. The recent agitation for technical education grows directly out of the desire of the people to work up their own resources, their cotton, wood, and iron, and produce more wealth. Are we not in danger of taking too narrow a view of this subject? If increased production is our aim, we must begin by educating all of our people in the public schools, and not merely a few of them in technical schools. As patriotic men and women we want to see all of the people earn more, so that they may live better and happier. The difficulty with our system of education in the South thus far is that we do not pay enough attention to the common schools. We have given most of our thought in the past to the higher education and too little to the broader education. A complete educational system is like a pyramid; its base must be broader and stronger than any other part of it. Our present educational system, as far as we have any at all, is a column with a beautifully carved capital upon its top, which is altogether too large for the base and the shaft. The reason our institutions of higher education are not attended as largely as those of other States is because they have too few public schools to support them.

Technical education is important, but I beg my fellow-countrymen of the South not to forget that universal public education is more important. Let us begin at least by putting manual training and scientific branches in the high schools where all the children can have an opportunity for the broad training. If greater productivity is our aim we must first have better common schools. If we content ourselves with a few technical schools here and there, we will be greatly disappointed.

My first proposition, then, is that if we desire to produce more wealth in the South we must begin by building better public schools.

The chief characteristic of the nineteenth century has been the extension of the

benefits of education to the masses of the people. Its chief lesson is that education increases the wealth-producing power of a people in direct proportion to its distribution and thoroughness. In fact, the relations between education and productivity are so well understood now that you can measure the wealth-producing power of a people by the school privileges which they have enjoyed. Statistics show, for example, that the power of the people of the different States to earn money is in direct proportion to the length of the period the average citizen has attended school. To illustrate¹, the average school period in 1898-99 of each inhabitant of the United States was 4.4 years; of Massachusetts, which has the best schools, it was seven years; of Tennessee it was a little less than three years. The total annual production of the United States in the year 1800 was less than \$30 a year, or 10 cents a day, counting 303 working days in the year, for each man, woman, and child; by 1850 the production had increased to nearly \$92 a year, or 30 cents a day, and in 1899 it was about \$170 a year, or 55 cents a day.

MASS.	EDUCATION	14
	PRODUCTION	13
U. S.	EDUCATION	8.8
	PRODUCTION	8.5
TENN.	EDUCATION	6
	PRODUCT'N	5.8

The production of Massachusetts in 1899 was \$260 for each man, woman, and child, or 85 cents a day. The most favorable figures make the total annual production of the people of Tennessee in 1899 less than \$116 a year, or 38 cents a day, for each inhabitant. Another way to express it is to say that the average family of 5 in Tennessee must live on \$580 a year, counting everything produced on the farm and in the home, as well as sales and money wages, while the same family in Massachusetts has \$1,300 a year to spend, and the average family of the United States has \$850. Put these facts together and we at once see their tremendous significance. The proportion between the school period in Massachusetts, the school period in the whole United States, and the school period in Tennessee is expressed by the figures 7, 4.4, and 3; or, multiplying each by 2, by the figures 14, 8.8, and 6. The proportion between the productive capacity of each person in Massachusetts, in the whole United States, and in Tennessee is expressed by the figures 260, 170, and 116; or, dividing by 20 to bring to terms similar to the others, we have 13, 8.5, and 5.8. Think of this!

Education is as 14 in Massachusetts to 8.8 in United States to 6 in Tennessee.

Production is as 13 in Massachusetts to 8.5 in United States to 5.8 in Tennessee.

This is not a mere coincidence in the case of Massachusetts, the United States, and Tennessee. It is the law the world over. The productivity of a people is everywhere proportional to their education; that is, their intellectual, physical, and moral training. It is not the natural resources, the climate, the soils, and the minerals; it is not even the race, much as these things count in production, but it is education which above everything else determines the wealth-earning power of a people.

The Southern people have made great sacrifices for public education, and especially for the education of the negro, but they must prepare to do even more if

¹ The data used in this paper were derived from the Reports of the Commissioner of Education of the United States and of the State board of education of Massachusetts, from Butler's Education in the United States, from articles by Dr. William T. Harris, Commissioner of Education of the United States, and from the Tennessee State reports.

they are to keep up with the other States in production. The States represented in this association are still far behind the Eastern and Western States in the manner in which they support their public schools. Let me take for comparison the best school State in the Union—Massachusetts—and my own State of Tennessee, which represents, I find, the average conditions in the South.

The population of Massachusetts is 2,305,346; of Tennessee, 2,030,616. They have the same number of children to educate. The enrollment and the average daily attendance at their public schools in 1898-99 were as follows:

	Enrollment.	Average daily attendance.
Massachusetts	471,977	360,317
Tennessee.....	499,845	352,734

Massachusetts taught school 188 days in the year, and her enrolled pupils attended an average of 143.5 days. Tennessee taught school only 89 days, and her enrolled pupils attended only 62.8 days. The average Tennessee child is absent 26.2 days in the 89 days of the school session.

Massachusetts expended for all purposes of her public schools in 1898-99 \$13,889,838, which was \$38.55 per pupil in average daily attendance and \$5.07 per capita of her population. Tennessee expended for her public schools in the same year \$1,628,313, which is \$4.62 per pupil in average daily attendance and only 83 cents per capita of population. The average expenditure for all the States of the Union is \$19 per pupil in average daily attendance and \$2.67 per capita of the population of the entire country.

The power of education in production may be presented again in this concrete way: From the statistics above it is seen that Massachusetts spent in 1898-99 \$12,261,525 more upon her public schools than Tennessee; but see what a return she gets. Each one of the 2,305,346 citizens of Massachusetts—men, women, and infants—has, as we have said, a productive capacity of \$260 a year against \$170 a year for the average inhabitant of the whole United States and \$116 a year for the average inhabitant of Tennessee. The inhabitant of Massachusetts has thus an excess of \$90 a year over the average inhabitant of the United States and \$144 a year over the average inhabitant of Tennessee. This means that the people of Massachusetts earned last year \$252,487,140 more than the same number of average people of the United States and \$403,969,824 more than the same number of people in Tennessee. Twelve million dollars invested in superior education yield \$400,000,000 a year.

If the people of the South would compete in production with the people of the other States and of the world—and they must do so whether they will or not—they must educate all their children, not only their white children, but their black; and they must educate them all not poorly for a few months in the year and a few years in their lives, but thoroughly through a long series of years. If history teaches us anything it is the solidarity of all mankind, that “no man liveth unto himself,” and “no man dieth unto himself,” but that we are each our “brother’s keeper.”

Our great resources—climate, soils, and minerals—are useless in the hands of an untrained people. Moreover, if we do not educate our own people to use these resources intelligently the trained men of other States will come in and do so and make our native people “the hewers of wood and the drawers of water” in their industries.

Some persons seem to think that the marvelous energy and common sense of our people are a sufficient guarantee of their success in the battle of life; but common sense and even unmeasured energy do not win in these days without education.

We must give our people knowledge and training or they will surely fail in the hot competition of the twentieth century. Will we not realize that our best resources are our own children and that our highest duty is to educate them for the greatest usefulness in life?

Having made provision for the elementary education of the people on this broad plan, we may wisely turn our attention to the technical education. A complete system of technical schools comprehends the following:

1. A system of trade schools in which pupils are trained for the leading arts.
2. Polytechnic schools in which instruction in the applied sciences and technical or professional training are offered more advanced students.
3. Institutes of technology or departments of science in universities in which the highest professional instruction in the applied sciences is provided.

There is no difficulty in accounting for our early indifference in the South to science and technology. It was in accordance with the history of science the world over and with the laws of its development in all countries. Up to fifty years ago we had all the science, or more than we could use. We were engaged in getting out raw material, in "skinning" our soils, in cutting down our forests, and in working a few surface mines. Germany and France supplied us at first with our science and England or New England with our technical experts.

A young people always view their raw material as their chief source of wealth, and they are often too ready to barter it for a mere mess of pottage. When they become older, they discover that it is not upon natural wealth alone, but upon the culture of the scientific intellect that permanent prosperity depends. England was not a manufacturing nation until the Elizabethan age. Though coal, iron, and wood were found in abundance in the reign of the Plantagenets, they produced little prosperity. Their home-grown wool was sent to Flanders to be manufactured and turned into cloth. Spain, which had fallen heir to Arabian science, was the greatest manufacturing country of those days. When the Moors were banished and the political crimes of Spain led to its destruction as a nation, England took its position as the leading industrial nation of the world. The invasion of the low countries by Philip II drove the Flemish manufacturers, as the French persecution drove the Huguenots, to England, and they introduced the industries of cotton, wool, and silk in that country. In none of these countries was science a subject of study at this time. The acquisition of wealth must precede the cultivation of science. Technical skill is needed to utilize the raw material to the best advantage. The time comes, however, in the history of every nation when it must educate its people in science and train them in manufactures and industries or it will go down. This higher scientific education is the forerunner of higher prosperity, and the nation which fails to develop the intellectual faculty for production must degenerate, for it can not stand still.

In society, as in biology, there are three states. In the first, the state of primal equilibrium, things grow neither better nor worse; the second is the state of evolution or development, during which animals and plants adapt themselves to their environments and take on new characteristics; the third is that of degeneration, when they first stand still, then decay, and so go back to the earth from which they sprang. The same is true of nations. A nation may remain in equilibrium for a brief time in the early stage of its history, but it is impossible to hold its forces in balance when its environment is constantly changing. To stand still then, is to die. The life of a people industrially is science. We must feed its fountains and keep them pure or growth will cease, industry will fall, and the nation will die. Our southland stands at the beginning of the second state. We have lived as long as we can upon the bounties of nature, and have reached that point at which we must study science, learn the arts, use our material resources and accumulate wealth, or else fall behind and go down.

The study of science and the application of science always have gone and always

must go hand in hand. As a matter of fact, discoverers and appliers of science are often combined in the same person. The interests of pure science and of technology are largely identical; and science can not take a step forward without opening new fields for industry. New truth in science always leads to new developments in industry. Hence, we must have the inventor as well as the investigator. So, on the other hand, every advance of industry facilitates the experimental investigation upon which the growth of pure science depends. See how the glass industry has promoted the progress of chemistry, and how the electrical industry has in our own time aided physics and mechanical engineering. Pure science and technology can not be separated. Civilization began with man as a tool-making animal; it has grown with man as a machine-making being. It is not the classics or philosophy that alone makes a people strong; else India might have been the ruling nation of the world and England its province. Historically, technical progress did not follow the growth of science, but preceded it. Mining developed geology. Fisheries led to biology.

It is not generally known that General Lee was a great believer in scientific and technical education. Says Professor Joynes, his colleague: "General Lee's plans for the development of Washington College were distinct and definite. He aimed to make this college represent at once the wants and the genius of the country. Under his influence the classical and literary schools of the college were fully sustained; yet he recognized the fact that material well-being is, for a people, a condition of all high civilization, and, therefore, though utterly out of sympathy with the modern advocates of materialistic education, he sought to provide all the means for the development of science and for its practical applications." The Southern people have still to realize the ideals of Lee in education.

NEGRO EDUCATION IN THE SOUTH.

By PAUL B. BARRINGER,

University of Virginia.

Those of us of the South who have elected to abide by the South must, for that reason if no other, take a proper and natural interest in any specific class of its people which numbers nearly 40 per cent of its population. It matters not how insignificant this people may be when measured by economic standards, nor how humble they may be socially, nor how impotent politically; so long as they constitute 40 per cent of the population they are a factor which must be taken into serious account whenever we think of the South and its future. If this 40 per cent—the negro race—improve, the South to that extent will improve; if it go backward, it will either carry the South with it, or, failing in this, it will demand as the price of progress an expenditure of energy on the part of the whites which no people can endure.

All general questions of humanitarian interest aside, what is the present outlook for the negro, and therefore for the South? I say general questions of humanitarian interest aside, because he who approaches this great problem in the spirit of the doctrinaire has no place in the councils of the South, be he for the negro or for the white. This is not a matter of sentiment, but of interest—acute, present interest. The question is one land for two peoples, and these the most divergent. This one land—who can best rule and administer it with benefit to the greatest number, the white man or the black? This is the Southern problem, the race problem, the negro problem; but the education of the negro is its most important factor. We of the South are to educate him. Shall we prepare him to be a political antagonist? Shall we make of him an economic antagonist; or can we prevent him from becoming either, and yet have the South, as a whole, improve? That is the question.

I am sorry that I have to mention political antagonism, but the case can not be fairly presented without it. The political antagonism between the Southern white and black is manifested by the fact that since his enfranchisement the negro has, as a race, voted solidly against the measures, local or general, advocated by the white people of the South. This is a peculiar fact, because nine times out of ten there is a personal friendship between every black and the whites he knows. This antagonism, therefore, is not personal, but racial.

This was not always so, for there are hundreds here who remember the old slave days, the manifest affection of the negro for and his pride in the old master, the mistress, the young master, and all. * * * After the war, we all remember how short was the first racial flight of freedom; how, like birds, startled but not affrighted, they circled but to return. It was not then. No, the antagonism between the Southern whites and blacks has come since the war, and it is now reciprocal. It is now race against race. What has caused it? This question, daily asked, is hard to answer, because no one cause is responsible. There are two great causes—the one political, the other economic.

As to the political cause. For over a century preceding the war between the States slaveholders dominated this Union. They gave it its flag and thirty-four out of forty-four stars on its field. They gave this Republic every general that carried this South-made flag to victory against America's foes—Washington, Jackson, and Scott. They gave to America every creed and policy which we even now invoke as fundamental. Liberty and freedom—Jefferson; the Constitution and its father—Madison; no foreign entanglements—Washington; America for the Americans—the Monroe doctrine—Monroe; Southerners all. They gave her everything of which she can well be proud and nothing of which she need be ashamed.

But the war brought a change. With army gone, people, land, and credit exhausted, the South stood as "on her sheepskin," expectant. What did her people expect? They expected to see a new symbol added to the flag of their fathers; a steel-blue bar across stars, field, and stripes, and riveted at every joint. This would have been truly fitting. They expected, moreover, to see a new amendment added to the Constitution which would declare the dogma of State sovereignty forever dead. They saw neither. The flag still waves as before, the unchanged blazon of their fathers' deeds; and, as far as statute is concerned, the Union is still on the basis of the tenth amendment or the "secession of 1787." What they did see were the thirteenth, fourteenth, and fifteenth amendments to the Constitution.

The purposes of these were quite distinct. The first (thirteenth) gave to the negro freedom, while the last two (fourteenth and fifteenth) gave citizenship and its attributes. The first, intended by the donors as a recompense to the negro for years of servitude, has become a threatening source of racial decay through an economic revolution now just becoming evident. The second * * * has failed. Its immediate result was the production of race hatred, and is now becoming a source of peril to our public policy. The attempted degradation of a proud people was simply a sectional crime; but a brake on the wheel of national expansion is, if possible, a greater evil still, and this the fifteenth amendment has put. Two more Southern stars—Arizona and New Mexico—and then we stop.

We dare not give statehood to even the islands already under the flag, with their Spanish-American, Chinese, Malayan, and Polynesian population. A government of the people, by the people, and for the people can not exist with the franchise for such as these. We must, as a nation, now confess that only intelligence can rule, for we know the political stability of the Spanish-American and his "republics." we know China and the Philippines, and Wilcox is with us! No; the bill for the reduction of Southern representation will never pass, and negro disfranchisement is to stand. America now sees the handwriting on the wall, for she faces a golden opportunity with hands tied.

The fourteenth and fifteenth amendments have been failures. Let us look at the thirteenth, which opened the economic problem.

It has always been a mystery to the people of the North why the nonslaveholding class at the South fought so ardently during the war. No explanation seems to solve the mystery for them. Let me first note, by way of explanation, that in the mountains of North Carolina, Tennessee, and Virginia (now West Virginia), where the negro was unknown, the poor whites did not fight, or else fought on the Federal side. Let me also recall that the enormous emigration that took place from the South was chiefly a labor emigration, and even the wealthy, when threatened with poverty, fled from the South. These things were because every workingman who knew the negro looked with a holy fear upon the day of his emancipation. With the well-fed chattel, the expensive slave, he could compete; but with the starving negro of freedom he had not a ghost of a chance. In the fated language of Professor Ross, late of Stanford University, speaking of the Chinaman, the white man can "outdo" the barbarian, but the latter can "underlive" him, and there's the rub.

The laboring man, who alone knows what it means to have to underlive his fellow, will always hate the negro on contact. There are to-day thousands of negroes in the South living on a ration that costs 6.5 cents a day, or less than \$2 per month, while, if pressed, they can live on the half of it. Imagine the fate of the white man who has to compete with such labor.

Lured by higher wages, many negroes are now making pilgrimages to the North—to New York, Philadelphia, and Chicago. As a rule they are the best-trained workers of their race in the South, and hence the highest livers, but they underlive all competition so easily and cut wages with such profit to themselves that the hatred of the negro, always felt by the white workers of the South, is beginning to be felt at the North; and this is the true and only reason of the later race riots there. Wherever the negro goes disenchantment follows. The old slave owner, his natural friend, is now, as we have seen, against him as a political foe, and the poor whites of the South still hate him as an economic enemy, while the laboring men everywhere now recognize that the "deification of the darkey" was for them a mistake.

There is one other class in the South, fortunately a small one. I refer to the men of wealth or education whom the war and its consequent social chaos brought down to poverty and personal manual competition with negro labor. Thirty years of unrequited toil has broken and soured them, till any "ism," from populism to nihilism, finds fertile soil. They have not risen; they have done well even to "mark time" in the ranks; but through the public schools their children are rising, and they are the hope of the South and nation. A distinct generation is coming with an hereditary intelligence sharpened by adversity; but with their very mother's milk they have drawn in a hatred of the negro race that is a hate infernal.

I have here briefly presented the facts leading up to present conditions. Some of these will change and some will not, and the last to go will be the bitter economic antagonism of the white Southern laborer. When you leave this out, you are leaving the Southern problem. If the political question is not reopened, the antagonism of the dominant class will be at once withdrawn. This class has never been and will never be influenced by negro competition, and if the fifteenth amendment is nullified as at present, or, better still, repealed, they will have nothing more to ask. Their antagonism will die with politics; the laboring antagonism dies only with the man. We might as well be frank. These conditions exist and they seriously complicate the case as presented by the negro himself, which is about as follows:

Having received from the South, American residence, the English tongue, the opportunities of the Christian religion, a sound body, and thorough training in

agriculture and all the domestic arts, he, after two centuries, received from the North, freedom, citizenship, and the ballot. In the next generation he received from the two sections two hundred millions in education, and he still stands a beggar at the door of the South, now a criminal beggar. What are we to do with him?

As he has grown in criminality and physical depravity since receiving what he has of education, that kind of education is surely a failure. Moreover, he has used this education, given in compassion as an arm of defense, as a weapon of political offense against those who gave it. Under the circumstances there is a natural and growing sentiment in the South demanding that we give him only the pittance that he himself produces as a taxpayer, and then let him shift for himself. The object of this paper is to protest against the adoption of this policy as economically unwise and as unworthy of the South. We should as soon think of withdrawing our subscription to the church because its Sunday school class had missed its lesson. It would be better to double your subscription and get better teachers. No! We should not and we will not withdraw from the negro the one and only hope of his race—the white man's support. Noblesse oblige.

So far we have been consistent. Of all the sections the South now alone presents in her history that rare virtue. In all the years of her domination, from Roanoke Island to Appomattox, she claimed just what she claims now, namely, that American citizenship was a privilege of the highest kind, reserved for the highest type, and that degraded and barbarous races, specifically marked by nature as inferior, were unfit for its functions. She set the white man up as the guardian and the example for the savage. The North claimed that the Union was an asylum for all, and that citizenship was for all, regardless of race, color, or previous condition. Her sincerity has ever been open to doubt; shall we let ours be so likewise? It will be if, claiming that the Southern slave owner was the only sincere friend of the negro, we let him revert to savagery under our very eyes. We can not lay down the white man's burden yet.

It is now suggested that the hope of the negro is industrial education. It is hailed as a discovery, and it is shrewdly claimed that this education will check political antagonism. This is a mistake. Any education will be used by the negro politically; for politics, once successful, is now an instinctive form of warfare. The question, then, plainly put, is simply this: Shall we, having by great effort gotten rid of the negro as a political menace, deliberately proceed to equip the negro of the future as an economic menace? Shall we, knowing his primitive racial needs, arm him and pit him against the poor white of the South? Shall the educated class of the South to whom the lower classes, both white and black, look for guidance, indorse a policy which will certainly promote racial warfare?

It is all very well to ignore racial hatred in New York and Chicago, with a policeman at every corner and politics behind every policeman, but do it long enough even there and a time will come when there will not be policemen enough. Today if the hand of official "protection" were withdrawn, the negroes of these cities would have short shrift. Labor fears and hence hates the man who can underlive a church mouse, be he Chinaman, negro, or Malay. Shall we see a negro and Malay exclusion act? In the South, policemen do not patrol the fields, and race hatred must be kept down if only for the sake of the black. Read any account of a Southern race riot and see who usually furnishes the funerals. Almost always the black.

There was never before on the face of the earth a people more law abiding, patient, or long suffering in the face of great temptation than our white yeomanry of the South. Living beside an alien race which they know to have been the cause of their poverty, which they recognize as having corrupted their manners, their morals, and their speech, and which, above any other race, degrades labor, they spare him. If you have race riots on tap at the North from a beginning labor competition, what would happen were that mongrel city brood exposed to the

temptations daily long present at the South? Our people have been brought down, but they still have the Saxon virtue of the courage that dares refrain. Do not press them.

To see how best to educate our two races at the South, let us look into the recent progress of this section and see what it shows. In 1895 there were about two and a half million spindles in the South, at the close of 1899 5,000,000 spindles, to-day over 6,000,000. What part has the negro labor played in this extension and what part the white? In furnishing the raw material, the cotton, he plays the old slave-day part, but in the function of the new South, in manufacture, he has no part. It may be asked has he had the chance? Yes, in Charlotte, N. C., and in Charleston, S. C., he has been tried in the clothing factory and in the cotton mill, and he has failed in each case. The reason of his failure was the absolute lack of moral responsibility. While perhaps capable enough, an excursion, a circus, or a revival always had claims upon him in excess of his obligations as an employee. You may make him a perfect physical imitation of the workman, but morally he is the negro still.

We have just seen the first great labor strike in the South. For months 4,000 white mill hands stood out against their employers. These mills could have been filled at any time with cheaper negro labor, but it was not done. When the cold, practical logic of economy turns down an opportunity like this there is a reason. The reason was the absolute mercantile distrust of the moral stamina of the present black.

While the negro came out of slavery illiterate, he was not ignorant of the trades and the mechanic arts. He was the smith, the carpenter, the shoemaker, the tanner of the plantations of the South. Trained to labor as few white men were, and with labor ever in demand, he is still the laborer and the common mechanic; rarely the skilled artisan. He has not kept pace with his opportunities. All this is suggestive, and leads to the conviction that it would be folly for any State to enter upon the industrial training of its deficient race while the laboring class of its higher race is equal to any training and any effort. We can not equip both, and to equip the negro to the neglect of the poor white would be a grave political error and an economic absurdity.

The average negro is so light-hearted, so gay, and so free from care that he gives a pleasant impression, but in all his actions he shows the mimic. He provokes an involuntary smile, and we ignore the lack of the genuine article. These characteristics are generic, and in varying degrees they make up our idea of the negro to the extent that we habitually discount his faults, vices, and defects. In fact, we set for this race a different standard from our own. The result is that any old suit makes the negro a "dude," reasonably fluent speech makes him seem the "orator," while a fair address and intelligence so dumfound us that such a negro "shines as a one-eyed man amongst the totally blind." He is never what he seems. What we may call a "good" manservant may be, and sometimes is, an absolute liar, something of a thief, and quite a rascal. A "good" nurse or cook may be anything, provided she can nurse and cook. We pay no more attention, as a rule, to the moral atmosphere of the kitchen than to the stars of heaven, and the kitchen and our children suffer. We pour out our blood and treasure on the literary heathen of China, and shut our eyes to the greater need of missionaries at home. What the negro needs as a race is moral training, some "thou shalt not," something to form character. When we have given him a morality which will save him from degeneracy and the hand training which will make him an even respectable servant or laborer, then, and not till then, may we think of the technique of the higher industries.

The public-school training of this people should be primarily a Sunday-school training; a moral training, given by those to whom morals mean more than words. This training the whites must give financially and, in large measure,

personally; for there are not enough properly qualified teachers of the negro race to do this work. In the midst of peace and opportunity we now see daily from this race spontaneous evidences of reversion to savagery which make us utterly distrust the influence and the capacity of those thus far responsible for their training. It seems as if every paper adds something new to the catalogue of negro crime.

Their moral training should be supplemented by the three R's and such simple training in agriculture and the domestic arts as all will need. The negro race is essentially a race of peasant farmers and laborers, and their education should first be directed to improving them as such.

It is claimed that since education has raised up for this people its own leaders, the problem is solved. Far from it. An education that makes leaders at the expense of the led is a failure. Every negro doctor, negro lawyer, negro teacher, or other "leader" in excess of the immediate needs of his own people is an anti-social product, a social menace. Neither in the North, the South, the East, nor the West can such a professional man make a living at his calling through white patronage; and to give him the ambition and the capacity, and then to blast his opportunity through caste prejudice and racial instinct, is to commit a crime against nature. Nature made the white man and the black; it made the natural and unalterable prejudice between the two races; and hence the crime lies at the door of him who knowingly attempts the impossible. In equal measure what is true of the professional man is true of every trade and calling in which the negro's natural qualifications are not first considered. As a source of cheap labor for a warm climate he is beyond competition; everywhere else he is a foreordained failure; and as he knows this, he despises his own color. When a race is in such a condition that every paper issued by its educated class carries advertisements of nostrums openly claiming to produce such changes in hair and skin as will make the black man less a black, what are we to think? When its reading, and hence its higher, class give such patronage as to maintain these advertisements in their papers year after year, what would you give for the influence on them of any "leader" whose skin and hair bore, in however slight a degree, the same racial stain? The very solution of the negro problem is a part of the white man's burden.

But it is asked, How are we to continue to educate the negro at all and avoid future political trouble? In answer I say: Base his franchise upon a property qualification, and give him for once a legitimate stimulus to work. He has never been offered an attainable ideal before. To-day the partly educated black, jail-bird or preacher, looks with contempt upon the negro whose only forte is honest work and accumulation. Let us change this and make the taxpayer and not the politician the racial ideal. The temptation to spend is inherent in the human race; to learn to save is to cultivate man's highest power, the power of inhibition. When a man can hear and obey any "thou shalt not," monetary or moral, he is improved as a citizen. The Jew has had this mandate longer than any other race, and he is the greatest of all accumulators and the least criminal of races. The negro is the most criminal, and he needs the mandate.

One truth about the trouble with our negro ballot in the past is instructive.

The poor white, in competition with negro labor, has had to work his children to live. The negro, easily underliving him, was able to use this same white man's taxes in the public school, and hence has given his children the rudimentary knowledge now necessary to vote. This is fast making a reading, voting, pauper class of blacks and an illiterate, working, taxpaying class of whites. Which of these classes has most interest in the State and most right to be heard? This political paradox must be changed, so changed that it will still allow us to work for the salvation of the negro. With an educational suffrage, the first step toward improvement—education—is the first act in a political feud. Let us be done with it and be free to help him and make him help us.

As for ourselves, let us go back to the old rule of the South and be done forever with the frauds of an educational suffrage. Let us break up the game that produces political professionalism. Let us return to the political status we had when we furnished the men of America. In national politics also let us strive for truth and consistency. We can not be high and mighty in the Philippines and high and holy in Cuba and maintain the respect of the world. It is now more than a generation since the war, and our fanatical altruists have posed long enough. Let us see that the hypocrisy that now ties our hands in Cuba is the last act of the comedy. We of the South are by heredity the expansionists of America; and as we must expand, let us strive to be honest expansionists. Let us boldly say dollars in lieu of duty and land in lieu of liberty.

NEGRO EDUCATION IN THE SOUTH—A REPLY TO DR. BARRINGER'S PAPER.

By JULIUS D. DREHER,

President of Roanoke College.

The education of the negro in the South, taken in its broadest sense, is the most difficult problem before the American people to-day. It is not a simple, but a complex problem. If it were simply to provide good schools for the colored people, the task would tax the wisdom and resources of the South, but we have to deal with the more difficult question of so educating the negroes that their relations to the white people may be finally so adjusted that both races may live together peaceably on a just economic and political basis. In any serious discussion of this problem we may as well take it for granted—

(1) That the negroes will remain in the South;

(2) That the fifteenth amendment will remain a part of the Constitution; and, consequently,

(3) That the negro will remain a voter.

We are confronted, therefore, with a great humanitarian problem, which is also economic and political, and which, while being national, is also in a peculiar sense a Southern problem. How shall we so educate the negro as best to develop his manhood, make him a valuable economic factor, and fit him for intelligent citizenship?

After more than thirty years of effort in trying to solve our problem we all agree that it was a grave mistake to suppose that with a ballot in his hand and a book under his arm the negro could make substantial progress simply by acquiring a certain amount of knowledge in ordinary schools. We believe that it was also a mistake to establish at first so many institutions of higher education, a large proportion of these being called universities. But the negro has had thirty-five years of freedom, during which he has made considerable progress in acquiring education and property, so that it would be a greater mistake to assert to-day that he does not need higher education at all. If we think for a moment how many ignorant teachers and preachers are trying to instruct the negroes, we shall be quick to recognize their need of many more educated men and women than are now to be found among them. In order to advance in civilization every race needs educated leaders—concrete examples of what the best of the race may aspire to be; but what the negro certainly does not need is a class of educated idlers who wish to live simply by their wits.

It seems to me that for many years to come the education of the negro should be of a very practical character, such as is given, for instance, at Hampton and Tuskegee. The prevalence and increase of crime throughout our country may well

cause us to suspect that our system of education for the white people might also be improved by introducing more of the practical and industrial into our public schools. As almost every line of industry and business is open, at least in the South, to the competent of both races, there seems to be no need for a radical difference in the education of the masses of the two races. It might be well to give more attention to moral and religious (not sectarian) instruction in all our schools. As to the "Sunday-school training" advocated by Dr. Barringer, that should be left mainly to the negro churches; but I believe it would be a distinct advantage to the negroes at present if they had more white teachers in their Sunday schools and also in their other schools.

As the white people own nearly all the property, and as the negroes are mainly laborers on farms, the education of the latter should be to as large an extent as possible industrial and practical, in order that they may the more readily make a living and improve their mode of living. Little can be done to elevate any people until they begin to acquire property and independence, until they become self-supporting and self-respecting, as we have learned from our costly experience with our Indian tribes. We must teach the negro the value of steady habits, so that he may become a reliable workman; the necessity of economy, so that he may gradually acquire property; the importance of raising the standard of his social and domestic life, so that his character may be improved, and the need of education, in order that he may be fitted for intelligent and patriotic citizenship. The low standard of living among the negroes tends to depress the price of labor, and thus injuriously affects the white workman. Wherever there is a low standard of living and of morals among the colored people the white people suffer from it; and if in any part of our country there is marked improvement in the general condition of the weaker race, the stronger race will be favorably affected by such progress.

If in any line of industry the negroes bring sharp competition to bear on white workmen, it is not a matter to be wholly deplored on account of the latter, for this very competition will cause them to become more efficient in their trades, and efficient labor, as we all know, is a crying need of the South. If there is danger that the white mechanic may be displaced by the better-trained negro mechanic, let us not for that reason give the latter less industrial training, as suggested by Dr. Barringer, but rather let us provide the same sort of education for the white man, and then let there be an open field for fair competition on the basis of merit. It is to be hoped that our Southern people will not discredit their own profession of interest in the negro by shutting against him doors of opportunity for making a living as has been done at the North, where his position and inferior advantages and opportunities to better his condition are so discouraging as to account largely for race deterioration and crime. If odds are to be given in the race of life, industrial and political, surely the Anglo-Saxon with his centuries of education, achievement, and accumulated advantages will not be so lacking in chivalry, generosity, and Christian spirit as to ask odds at the expense of a weaker race, which is only now fairly setting out, with uncertain step but steady purpose, on the ample highway of a larger freedom and higher civilization.

In the solution of our problem the fortunes of both races in the South are involved. We must help to lift the negroes up or they will drag us down. As the Republic could not exist half free and half slave, so no Commonwealth can long prosper with one half of its citizens educated and the other half illiterate. We must convince our people that no investment pays better dividends than that in brains. In Massachusetts, for instance, where the best educational facilities are freely provided for all classes alike, the average price of a day's labor is more than double the average price in the Southern States; and, although that Commonwealth is the most densely peopled in the Union, the census just taken shows that its population increased more than 25 per cent in the last decade, while that of Virginia increased less than 12 per cent. In the South every effort should be made to

lengthen the school term for the children of both races, and we ought to hear nothing more of that unwise and unpatriotic suggestion to divide the school fund between the races in the proportion of taxes paid by each, a proposition against which I am happy to know that Dr. Barringer protests.

The more education and property the colored people acquire the better for the State, for they will thus become more valuable citizens. If the negroes of Virginia had as much property per caput, and as high an average in intelligence and education as the white people, does anyone doubt that the State would be immensely benefited? And if we could to-day lift up the entire colored population in the South 100 per cent in property, education, character, and general civilization, would we not be far on the way toward the solution of our problem? That problem, as well as all the other problems of humanity, must be solved, if solved at all, by the power of religion and the right sort of education.

After a somewhat careful study, I have come to the conclusion that the negroes are generally more eager to educate their children and improve their condition in life than are the middle and the poorer classes of white people. The self-denials and sacrifices of colored parents to educate their children would make a story at once pathetic and inspiring. The present able State superintendent of schools in Georgia told me nearly two years ago that he had frequently used with good effect the example of the negroes when he was urging white people to take more interest in the education of their own children.

We who have spent our lives in the South, and especially those of us whose experience and observation antedate the civil war, know well how much the contact of the white people did to civilize the negroes during slavery. Wherever this contact brought the races into relations of closest sympathy and interest, the best results were produced. As educators we know that unless a teacher has the confidence of his pupils, he can do little more than instruct them from the text-books, while the more important work of molding character is scarcely touched. So in adjusting the relations of the races in the South, mutual sympathy and confidence are as much needed as education from books and in trades. The negro is naturally influenced more by the acts and example of the white man than by his words. In working out our problem it is of the highest importance that the negro should trust the white man as a friend and well-wisher, and that the latter should set an example of absolute fairness and justice in all his dealings, as well as in making and executing laws. The blighting results of reconstruction left a wide political gulf between the races. To bridge that gulf should be the aim of the statesman, teacher, minister, editor—of every true patriot of both races in public or in private station.

It must be counted as unfortunate, therefore, that recent legislation in several States has seemed to justify the negro's belief that the white people are unwilling to do him justice; and it is also to be deplored that in so many cases of all sorts of crimes mobs of white men in all parts of our country have trampled law under foot by undertaking to do what should be left to the calm deliberation and decision of courts and juries, after the evidence on both sides has been duly presented and considered. Such examples of injustice in making laws and of lack of respect for laws on the statute book hinder the good work of establishing and maintaining harmonious relations between the races, and thus far render the solution of our problem still more difficult. Example is more powerful than precept. Lawlessness breeds lawlessness, hatred begets hatred, revenge incites to revenge. If we sow the seeds of wrong and injustice, of hatred and revenge, of cruelty and brutality, we can not expect to reap the fair fruits of Christian civilization.

If it be true, as Dr. Barringer asserts, that "a distinct generation is coming with an hereditary intelligence sharpened by adversity, but with their very mother's milk they have drawn in a hatred of the negro race that is a hate infernal," then

it is high time to do missionary work to save the civilization of the white people of the South. Such hatred is no part of our religion, and has no place in our civilization. And if white people are growing up with such diabolical hatred of the negro, what answer do you expect this "man with the hoe" to make to such a challenge in the next generation? But I do not believe that Southern mothers are teaching such bitter hatred to their children, and it is difficult for me to understand why Dr. Barringer makes such a bold assertion. It seems to me to have little, if any, foundation to support it; and if I did not know that his creed is that of the stern orthodoxy of the Presbyterian Church in the South, I would suspect that he had been reading Universalist books and had thus been persuaded to adopt a much milder idea of things infernal; or else we must charitably suppose that when Dr. Barringer speaks of "a hatred of the negro race that is a hate infernal," he is simply indulging in superfluous rhetoric.

As one deeply interested in all the facts bearing on our problem, I wish Dr. Barringer would produce some proof to substantiate also the statement that "we now see daily from this race spontaneous evidences of reversion to savagery." White men occasionally act like barbarians in America, as they have been recently acting also in China and elsewhere, but we do not believe for that reason that the race is reverting to savagery. Neither do I believe it about the negroes.

At the present time, when the negro is being eliminated as a political factor, it may seem inopportune to speak of educating him as a voter; but I am discussing this question in the firm belief that it can not be settled by temporary makeshifts of doubtful morals and still more doubtful expediency. Whether it takes one century, or two, or five, to solve this problem, we may be sure of one thing, and that is that it will never be settled by injustice. The truth may be so obscured now as to be only dimly apprehended by people in the South, but it remains true that it is the chief glory of our country that it is great enough to give equal rights before the law to all classes of its citizens of whatever race or condition. If it be taken for granted that the suffrage has been made too free throughout our country, it must, nevertheless, be admitted that at the present stage of the negro's advancement whatever restrictions are placed on the elective franchise, whether of education, or property, or both, should apply with equal justice and fairness to the voters of both races alike. And it should be borne in mind that it is a far wiser policy to fit men for intelligent citizenship than to disfranchise any considerable number on account of illiteracy or poverty. For as James Russell Lowell so pertinently says in his address on democracy: "It may be conjectured that it is cheaper in the long run to lift men up than to hold them down, and that the ballot in their hands is less dangerous to society than a sense of wrong in their heads."

Our Southern people, with their love of fair play, will not long tolerate laws which put a premium on the intelligence of the negro and on the ignorance of the white man—laws which incite the former to make the utmost efforts to qualify himself for the intelligent exercise of the elective franchise, and which encourage the latter to remain in a state of chronic apathy with regard to education. A law which in the letter discriminates against the negro and which has an "understanding clause" by which it is intended that he shall be further discriminated against at the ballot box according to the whims of the officers in charge is a discredit to any civilized State that pretends to legislate on a basis of equal justice to all its citizens. Such laws operate to the injury of both races. The negro is profoundly discouraged in his efforts to educate and improve himself; he resents the injustice done to him and still further distrusts the white man, while the latter loses respect for laws which permit such injustice. Already from Mississippi and Louisiana we are hearing reports of alarming apathy among the white voters, indicating that there is little political life in those States. As a matter of fact, the election returns of last fall show that there is one Congressional district in West Virginia

and others in various Northern and Western States in each of which more votes were cast than in all the Congressional districts together in either Mississippi or Louisiana.

We have happily passed the period when negro domination was possible anywhere in our country. Any State in the South could now pass laws of absolute fairness to restrict the suffrage without the least risk that the evils of the reconstruction period would ever be repeated. Hence it is our plain duty, as well as good political policy, to treat the negro with sympathy, justice, and absolute fairness, and to condemn in individuals or States anything like duplicity, chicanery, and injustice in dealing with them.

Let us not forget that the negroes are not to be blamed for their present situation. They did not come to America of their own accord; they were patient and submissive through generations of slavery; and they had little to do in gaining their freedom. Instead of taking part in the struggle which involved their freedom, the slaves, as guardians and protectors of the families on the plantations, exhibited a faithfulness to their trust which should entitle them to the lasting gratitude, kind consideration, and patient forbearance of the white people of the South. The suffrage was thrust upon the freed negro when he was wholly unprepared to appreciate and discharge such grave responsibilities; and, in spite of his mistakes and blunders, it should be said in justice to him that in his political life he has been rather sinned against than sinning. But he is learning. His political illusions, with others, have been dispelled by the stern logic of events. He now realizes that the road to manhood and character and independence is a long one, and the journey painfully tedious; that there are no short cuts, and that he must at last work out his own civilization as the Anglo-Saxon gained his, through centuries of effort and struggle and conflict. We can not, however, turn a deaf ear to this last child of the centuries in his appeal for all the help and encouragement we can give him.

The negro is now our trust, our charge, and our burden. We dare not be faithless to that trust. We should not forget that the white man's burden will become even heavier in the coming years if he withholds his sympathy and help from the black man in his efforts to lift up himself and his race. We dare not do him injustice by any policy of industrial or political repression or suppression, and we can not afford to degrade our Anglo-Saxon manhood by hating or wronging our weaker brother in black. By as much as we are superior to him in civilization, by just so much are we under the greater obligation to help the less-favored race in every worthy endeavor for moral, social, and material progress. Whatever may be the fate of the negro in the future, we should not shrink from the responsibility of doing our duty manfully in the present; and if we do the right as God gives us to see the right, we may with unfaltering faith leave the consequences to that gracious Providence which has blessed our nation through all the eventful years of its history.

For right is right, since God is God;
 And right the day must win;
 To doubt would be disloyalty,
 To falter would be sin.

DISCUSSION.

By H. B. FRISSELL,

Principal of Hampton Institute.

I approach the discussion of the subject before us with a certain reluctance, for I realize that there are men in this audience and on this platform who know much more about this problem than I do. For though I have lived in Virginia for many years, I am not to the manner born. I realize that this is a Southern man's prob-

lem; that if it is to be worked out at all he is to do it, and that we of the North can only help. If I have any fitness for the task it is because I have had such good teachers. For years I have sat at the feet of Dr. Curry, whose grand work in the cause of common-school education is known to you. I am glad of a chance to express publicly to-night my sense of obligation to him for the sympathy and help that he has rendered Hampton. I take no such dark view of the relation of the races as Dr. Barringer does. I have lived in Virginia for twenty years. During all that time I have worked alongside of Southern white men, most of them mechanics, and I do not believe that the average Southern white man hates the black or that there is any danger of a race war. Most of our shops at the Hampton school are in charge of Southern white men, and I have never found a more loyal, devoted body of men, or men more interested in the improvement and uplift of the negro youth. I should be glad if I had time to tell you stories showing the pride that these white men take in the progress of their black protégés.

I live in a community where the blacks largely outnumber the whites, and where both whites and blacks receive the highest wages that are paid in any part of this State. There is the least possible friction between the two races. It may be that I am not an unprejudiced witness in this matter of the relation of whites and blacks, for I have been connected with a negro school that has received continually the strongest evidences of sympathy and interest from the governor and superintendent of instruction down to the plainest citizen of the State. Year after year the Senators and Representatives of this State have pleaded in the Halls of Congress for an appropriation for Indians. Through Dr. Curry, that eloquent apostle of education for every man, white or black, the school has received generous appropriations from the Slater and Peabody funds, and from every part of the country have come assurances of kind feeling. It is not easy under such circumstances for me to believe in race hatred or race wars.

Some years ago there was a suggestion that the school's industries, which are quite extensive, were interfering with the industries of the town. It was proposed by the citizens, and cordially seconded by the school authorities, that a committee of the senate and house of delegates be sent down to investigate the matter. A hearing of three days was given in the county court-house. Witnesses were summoned from every walk of life—merchants, mechanics, and farmers—white and black. There was not a single case of a man who wished the school withdrawn. Not only was it shown that the school was bringing thousands and tens of thousands of dollars into the town, not only did merchants show that their trade was largely helped by this negro school, but one white contractor after another testified that he had gotten his first start in his business in helping to erect some one of the school's sixty buildings. The farmers testified as to the better stock and machines and the improved methods of farming which the school had brought into the community. From every class there came the most cordial witness to the fact that the school was not only not a hindrance but a great help, not only to the blacks but to the whites. They showed what I firmly believe to be always the case, that just as one finger can not be fattened without the others, so you can not lift up one portion of a community without lifting up all of it.

The report of the joint committee of the senate and house of delegates is one of the strongest campaign documents that the school has ever received. In it Judge Cardwell and his associates say: "The institute has been a great benefit to this county and to Hampton, giving employment to a large number of citizens, white and colored, bringing annually tens of thousands of dollars to the community. It has been one of the means of building up this part of the State; population has increased, every branch of business has been made more prosperous, and, indeed, it is a self-evident fact that the Hampton Normal and Agricultural Institute has spent a vast amount of money in the community, bringing great benefit to all classes of citizens."

This testimony as to the value to all classes of the proper education of the blacks, and the kindly relations resulting from it, comes from some of the wisest lawyers and business men of this State. But similar testimony to that given in regard to Hampton has been given in the case of the schools started by its graduates all over the South. Booker Washington was a graduate from Hampton, and started a school on the same plan in Tuskegee, Ala. We have sent 50 of our graduates to help him carry it on. In his autobiography, which is just appearing in the Outlook, he bears witness to the uniform kindness shown him and the school by every class in that community. He was called to make the chief address at the opening of the Atlanta Exposition and was cheered to the echo. I much doubt if there is any white man in the South more cordially loved and honored by the whole South and the whole country than this black son of Hampton and the Old Dominion.

What Mr. Washington has done at Tuskegee in a large way, hundreds of Hampton graduates have done all through the South in a small way. I went not long

since to the town of Lawrenceville, in Brunswick County, in this State, where a Hampton graduate has started an industrial school. I met the leading white physician of the place. He told me that he was the school physician, and commended the work. I found that the leading lawyer of the place was the school's treasurer. Every white man in the town whom I met had only pleasant words to say of this colored teacher who had started in the black belt of Virginia a smaller Hampton.

I could take you to certain counties in this State where not many years ago the blacks bore no part of the burden of taxation, but to-day are paying one-fifth of the property tax. I could take you to counties where crime is reduced to a minimum and the relations between the races are of the pleasantest. There has been an increase of the land holdings of the blacks in the country districts of Virginia of nearly one-third in the last six years. Hampton has sent out between five and six thousand young people since its founding. So far as we can find out there has been only one of them behind the bars, and there has been absolutely no complaint of unkind treatment by the whites.

What has been true of Hampton graduates has been true of the blacks that other schools have sent out. The leading citizens of Winston-Salem, N. C., have helped a young colored man to start a school, a model black colony, and a farm. They have themselves subscribed generously, and have done all in their power to improve the blacks. When I was last in their beautiful city they told me that in that black community of hundreds of souls there had never been an arrest made or a legal paper served. That shows what can be done when Southern white men really take this negro problem in hand. Prof. Jerome Dowd, a professor in Trinity College, North Carolina, in an excellent article in the December Century, on "Paths of Hope for the Negro," says: "The field is broad enough for both races to attain all that is possible for them. In spite of the periodic political conflicts and occasional local riots and acts of individual violence, the relation between the races in respect to nine-tenths of the population are very friendly."

I have watched with great interest for the last ten years the labor problem being worked out near my home, in one of the largest shipyards in the world, where whites and blacks labor side by side. There have been fewer strikes and less labor trouble in that great yard, with its thousands of workmen, than in almost any yard of its size in the world. Instead of the blacks pulling down the wages of the whites, the wages paid to both are the highest in the market. In an undeveloped country like the South, which needs all the labor that it can possibly obtain, with vast tracts of land waiting to be cultivated, with untold resources of iron and coal to be developed, the last thing to be feared, it seems to me, is a race labor war. I have traveled largely in the South; I have talked with all classes of men. The one thing that faces planters and manufacturers is scarcity of labor. The planters tell me that their men are drawn off to the mines and the railroads. The wage of the laboring man, both white and black, is rising, and that means prosperity for both races, but especially for the white man.

The Hon. John Temple Graves pleads eloquently for the removal of the blacks. But whenever there is a hint of the removal of any of them there comes the loudest protest from every class in the community. Not long since a movement was made in one of the agricultural counties of Georgia to take away the blacks. The planters begged that the exodus be stopped, declaring that if it went on they would be ruined. A friend of mine tried to move a colony of blacks from Alabama and Mississippi to Mexico. He declared to me that the greatest difficulty he had to encounter was the opposition of the Southern white man. The truth is, people all over the world are turning their eyes continually toward the Southern negro laborer, realizing what many a Southern man has told me, that the blacks, when properly treated, are the best laborers in the world. Shrewd, long-headed Germany has asked Booker Washington to send some of his men to raise cotton in South Africa. In the December number of the International Monthly, Mr. Washington says that within the last two months he has received letters from the Sandwich Islands, Cuba, and South America asking that the American negro be induced to go to these places as laborers. In each case, as he says, there would seem to be an abundance of labor already in the places named. It is there, but it seems not to be of the quality and value of that of the negro in the United States.

In the testimony given recently before the United States Industrial Commission, again and again Southern white men have stated in the most emphatic language that the negro is the best laborer that the South has ever had, and is the best the South is likely to get in the future.

We have been hearing much of late to the effect that the negro is dying out, that he is thoroughly criminal, that education ruins him, and that he is altogether valueless as a laborer. The census seems to show that he has increased from four to nearly ten millions since the war, that he has accumulated nearly a billion

dollars' worth of property of his own, and that as a free laborer he raised four times as much cotton in 1899 as he did as a slave in 1850.

Is it quite just to say of this people that it "stands at the door of the South a criminal beggar?" It is not strange that in the demoralization following emancipation crime should have increased, that the negro should have often confused freedom with license and thought that it meant freedom from labor, that the negro father and mother should have had little idea of family life or of the proper way to train their children, but the suggestion that education is the cause of crime, or that an increase of intelligence in any part of the community is harmful is certainly not to be entertained in this home of Thomas Jefferson.

Mr. Washington has received from 300 prominent Southern white men answers to these questions:

1. Has education made the negro a more useful citizen?
2. Has it made him more economical and more inclined to acquire wealth?
3. Has it made him a more valuable workman, especially where thought and skill are required?

Nine-tenths answered all three questions emphatically in the affirmative. A few expressed doubt; only one answered no.

REPLY

By PAUL B. BARRINGER.

[By previous arrangement Dr. Dreher and Dr. Frissell replied to Dr. Barringer's paper, and in reply to Dr. Frissell's criticism of the words "criminal beggar," Dr. Barringer presented the following statements.]

A few years ago a balance sheet for the blacks and whites of Virginia stood as follows:

For negro criminal expenses	\$304,018
For negro education	324,364
For negro lunatics.....	80,000
Total negro expenses	608,382
Total negro taxes.....	103,565
Annual loss to Virginia on account of negro	504,817

The above report was made by the State auditor, and was quoted in Hofiman's *Race Traits and Tendencies*, page 301. It will be seen from it that the annual net loss on the negro population of this State (Virginia) is over a half a million of dollars, and that the total negro taxes paid is even less by \$100,000 than the sum annually expended by the whites to repress negro crime.

Secondly, Dr. Barringer called attention to the report of the Virginia Penitentiary for 1899, where there were among the State convicts only 404 whites as against 1,694 blacks, giving on the basis of population negro criminality as 7.4 times greater than the white. The latest reports of the State penitentiaries from Maryland to Texas show about the same results, rising to 9.4 and 8 in Georgia, where progressive municipal administration draws the negro to town, and falling as low as 5.4 in Mississippi, where the negroes live in the country, and where white domination and negro disfranchisement are most complete.

These facts, Dr. Barringer stated, warranted him in making this clear statement of the situation.

CHAPTER XIV.

GERMAN INSTRUCTION IN AMERICAN SCHOOLS.

By L. VIERECK,

Of New York, late Member of the German Reichstag.

CONTENTS.

V. Effect on relations between Germany and America.....	703

PREFACE.

The author of the following chapter published a number of articles on the subject in German and German-American journals during the years 1899 and 1900, which led to the present compilation. No one appreciates better than himself the imperfection of his work and its numerous deficiencies. Independently of the short time allowed him, he may offer in excuse the reason that no previous attempt had been made to present the subject as it is herein treated, so that comparatively few works are available for reference. No history has yet been undertaken which portrays the manifold influences during the past two hundred years of German thought on American civilization in general and on the formation of the whole educational system in particular. For Maryland and Pennsylvania these influences have been studied to some extent, but for all the other States but very little, if any, scattered material for reference exists, especially as

prominent American writers on the history of education in the several States have not as yet paid sufficient attention to the educational relations between the two great nations.

The best material is contained in a number of detached articles and addresses on the subject, mostly short, in more comprehensive works. The references in the text furnish the necessary information as to the sources made use of, though it may be stated in advance that much valuable information was obtained especially from the works of Hon. William T. Harris, United States Commissioner of Education; Hon. Andrew D. White, United States ambassador in Germany; the late Professors Seidensticker and Hinsdale, and School Superintendent Knortz. The following gentlemen, at present connected with the higher educational institutions of the country, sent excellent material, partly in manuscript, to the author: Professor Learned, University of Pennsylvania; Professors Carpenter and Thomas, of Columbia University; Professor Schoenfeld, Columbian University; Professors Kuno Francke and Hugo Münsterberg, Harvard University; Professor Gruener, Yale University; Professor Goebel, Stanford University; Professor Senger, University of California; Professor Keller, New York Normal College, and Director Dapprich, of the Normal Seminary in Milwaukee. The author extends his sincere thanks to these gentlemen for their kind assistance.

No historical sketch of the development of German instruction could have been attempted without a short reference to the relations between Germany and the United States, and the position of German-Americans toward Anglo-Americans. These relations influenced the organization of German instruction to a great extent, and also explain the favorable or retarding course of public opinion. At present the position of German in higher education and the recognition of German methods on the part of the scientists of America is so assured that, in future, patriotic benefactors need only occasionally promote the extension of German elementary instruction in the city district schools.

The efforts of the author will be amply rewarded if the subject treated receives, in the course of time, the attention heretofore unquestionably deserved but denied, and if a general knowledge of the educational relations between two of the most important and progressive nations of the whole world contributes toward bringing about permanently a better understanding between Americans and Germans.

LIST OF WORKS CONSULTED.

The following list does not include catalogues, presidents' reports, and similar easily accessible documents. An exhaustive bibliography, which would comprise a number of other publications on the subject, has of course not been intended.

Americana Germanica; a quarterly devoted to the comparative study of the literary, linguistic, and other cultural relations of Germany and America. Editor: Marion Dexter Learned, University of Pennsylvania.

American Colleges, On the growth of, since 1891, an address given at the opening of Sibley Hall, in Cornell University, June 21, 1871, by D. C. Gilman.

American Colleges, their students and their work, by Charles F. Thwing.

American Education in 1869-1879, an address given at Saratoga, Sept. 10, 1879, before the American Social Science Association, by D. C. Gilman.

American German Review; a monthly magazine. New York, 1899.

American Institute of Instruction, *Annals of*, 1830-1900.

Amerikanische Litteratur- u. Kulturgeschichte, Beiträge zur. Von E. P. Evans, Stuttgart, 1898.

Amerikanische Pädagogen, Was, über deutsche Volksschulen denken, von K. Knortz.

Amherst College, History of, by W. S. Tyler.

- Aus den Erinnerungen eines Achtundvierzigers*, von Jacob Müller, Cleveland, Ohio.
- Aus grosser Zeit*. Beiträge zur Geschichte der Achtundvierziger in Amerika. Chicago, 1900.
- Baltimore, seine Vergangenheit und Gegenwart*. Herausgeg. vom deutschen literarischen Bureau, Baltimore, 1887.
- Belleville Public Library*. 17th Annual Report of the Board of Directors (1900).
- Bureau of Education*. Circulars of Information and Annual Reports.
- Child Life in Colonial Days*, by Alice Morse Earle, 1900.
- College Book, The*, by Charles F. Richardson and Henry A. Clark, Boston, 1878.
- College, The, and the Church*, by L. S. Metcalf, New York, 1887.
- Connecticut, The History of Education in*, by B. C. Steiner. Circular of Information, Bureau of Education, Washington, 1893.
- Conried Plays, The, and the German Publication Fund of America*. Philadelphia, 1900.
- Contributions to the Educational History of the United States*, edited by H. B. Adams. Circulars of Information, Bureau of Education.
- Comenius, The place of, in the history of education*, by Nicholas Murray Butler, Syracuse, 1892.
- Cousin, Victor*. Rapport de l'instruction publique dans quelques pays de l'Allemagne et particulièrement en Prusse. Deux tomes.
- Deutsch-amerikanisches Konversations-Lexikon*. Herausgeg. von Alex. J. Schem. 11 Bände. New York.
- Deutsch-amerikanische Geschichtsblätter*. Vierteljahrsschrift. Herausgeg. von der Deutsch-amerik. historischen Gesellschaft von Illinois, Chicago, seit Jan. 1901.

PART I.—HISTORICAL DEVELOPMENT.

The historical development of the study of German is easily divided into the three following epochs, distinguished by characteristic differences:

- I. From the beginning of the eighteenth century to the year 1825.
- II. From the year 1825 to the year 1876.
- III. From the year 1876 to the close of the century.

The first epoch is characterized by the parochial schools of the German colonists in the eighteenth century of the colonial period, by the "first travels of discovery" to Germany undertaken by wide-awake Americans either for the purpose of study or to learn the conditions of higher education in that country, and finally by the first modest efforts made in different colleges to introduce German, all of which, however, had but a transient effect.

The second epoch begins with the appointment of a German professor to the chair of modern languages in the newly founded University of Virginia and the important step of permitting Prof. Charles Follen to teach his mother tongue at Harvard. In the course of fifty years nearly 3,000,000 immigrants, among them thousands of men with an academic education, came into the country, using German as their language in social intercourse. Numerous German private schools were established in the different parts of the country, and German was introduced into the public schools of cities with a large German population at this time. The best higher educational institutions of the country began to include German as an optional study, after educated Americans had become acquainted with German educational methods, German literature, and German science, in part, indirectly from France through England. Such a condition of affairs was, in a great measure brought about by the circumstance that German high schools were attended longer and oftener by American students, who enthusiastically advocated educational reform based upon the German model.

The third epoch was inaugurated by the founding of the Johns Hopkins University, which, from the very beginning, has based its work upon German methods and given expression to the fact that the high educational value of the German language and literature is at present generally recognized. Not only have all universities since founded followed the example given in Baltimore, but older colleges are beginning their process of change in the same direction. For admission to the better colleges a certain knowledge of German has already begun to be required, and no academic degree is now conferred unless candidates are at least so well acquainted with German as to be able to understand, in the original, the German books and periodicals which they must study. This latest period of development is by no means concluded; it seems rather to be leading to

the general issue of raising German and German literature to an obligatory element of "college education," at the same time effecting the introduction of German into all preparatory schools without exception, since within recent years no one is admitted to a first-class college unless he possesses an elementary knowledge of German.

I. FROM THE BEGINNING OF THE EIGHTEENTH CENTURY TO 1835.

The German parochial schools in Pennsylvania, as well as those in North Carolina, Virginia, and other British colonies in which German colonists settled in large numbers in the eighteenth century, are about as old as the settlements themselves. Whether the immigrants called themselves Pietists, Mennonites, Dunkards, Moravians, German Quakers, members of the Reformed Church, Lutherans, or simply dissenters, and however great their differences of opinion in the interpretation of the Bible may have been, on one point at least they were united. They all believed with Martin Luther:

Burgomasters princes, and nobles we can dispense with: schools can not be dispensed with, for they must govern the world.

The colonists not only thought so, but acted accordingly. As soon as a town was formed an immediate effort, as a rule, was made to establish a school. In fact, it is stated in regard to a Moravian settlement in North Carolina, that the founders of the colony considered it their duty to begin a building for church and school purposes before the homes of the colonists were finished. School attendance was always considered as serious a matter as the teaching of religion, which was combined with elementary instruction, so that German colonies thus paved the way for compulsory education.

American authors are prone to underrate these German pioneers, whom they unjustly regard as thoroughly rough and ignorant "German boors." However, what has been said should suffice to establish a better opinion of them. For the most part of course these colonists themselves had no higher education than what was to be acquired in the German village schools of that time. Therefore, as a rule, they brought over with them a man who, as minister and teacher, represented the movement of education. This union of personality of minister and teacher was due to the fact that formerly in Germany theologians were always required to pass the teachers' examination, because until the close of the eighteenth century, teachers, almost without exception, were ministers. When, in the beginning of the eighteenth century, the renowned German pedagogue, August Hermann Francke, established his first normal school in Halle, poor theological students, in return for board and lodging, at first taught secular studies under the direction and superintendence of school inspectors.¹

As the clerical teachers who emigrated to America were in the course of time followed by men who had enjoyed the benefit of higher education in Halle or at other German universities, the first parochial schools sometimes attained the level of passably good public schools, such as at that time were hardly to be found outside of New England, if anywhere. These schools were particularly important for the progress of culture in Pennsylvania, in which State the English Quakers did not possess the same deep appreciation for the necessity of public schools as did the Pilgrim Fathers, who established Harvard University at a time when the whole of Massachusetts contained not much over 5,000 inhabitants (1638).

According to the conscientious researches of Oswald Seidensticker, the first school established by German colonists in America was that of Germantown, which was regularly attended after the year 1703 by the children of the author of the text-book *Pastorius's Primer*. Germantown, the German city which now forms a part of Philadelphia—namely, the twenty-second ward—was founded in 1683 by

¹ Compare Paulsen's *History of Scientific Instruction*.

Francis Daniel Pastorius, the friend of William Penn. This man, who was a universal genius for his time, deserves the greater praise for the labor of teaching the children in his colony himself, as he was, undoubtedly, one of the busiest men of the period. He was at the same time teacher in the English Quaker school in Philadelphia, and burgomaster, judge, and teacher in Germantown. Besides, from 1683 till his death, which occurred on the 27th of December, 1719, he found time to write 43 different works. Among them are *Alvearium*, or *Bee-hive*, a kind of encyclopedia, containing over 5,000 articles on history, geography, literature, and church matters, which was designed to teach his pupils all the German learning that he himself had imbibed.

A most interesting illustration of the conception which the noble Pastorius himself had of his earthly mission to be the actual founder of German Americanism is found in the *Foundation and Daybook of Germantown*, kept by him while in office. It contains the following pathetic preface, written in Latin.

Hail! posterity, posterity in Germanopolis! Learn first of all from the contents of the following pages that your parents and forefathers left Germany, the fair land in which they were born and reared (oh, ye native hearths!), for voluntary exile, in order to pass the remainder of their lives in the wilds of Pennsylvania, in less anxious lonely isolation and in true German fashion; that is to say, like brothers. Learn, too, how painful it was to establish the German name in North America after crossing the Atlantic Ocean. And you, beloved generation of grandchildren, who were to me the paragons of right, imitate our example; but forgive us for swerving from the difficult path, which we willingly acknowledge to have done, and may the dangers that threatened others make you careful. Farewell, posterity! farewell, German nation of brothers! forever farewell!

When he wrote those words, the old student of Strassburg, Basle, and Jena must have borne the celebrated verse from the *Æneid* in mind:

Tantæ molis erat Romanam condere gentem.

It should never be forgotten that he established the "German-American" name a whole century before the thought was conceived of giving birth to a new American nation. To the German immigrants with an academic education he gave the example, so often followed since with more or less success, how to transmit the treasures of older German civilization to the younger shoots of the German nation, and how to convert them into active elements of the new American civilization. Pastorius rejected all pointless scholastic knowledge, and desired above all else to have such learning disseminated as would be profitable to the growing generation in their later pursuits in life.

I myself would give 100 rix-dollars at once [he said on one occasion] if I had devoted the valuable time spent in learning Sperling's physics, metaphysics, and other unnecessary sophistical argumentationibus and arguitionibus to engineering and printing, which would serve me better now and would be of more use and pleasure to me and my fellow-Christians than such physics, metaphysics, and all Aristotelian elenchi and syllogismi, by which no savage or heathen is led to God and much less a piece of bread is earned.

Pastorius attached great importance to the practice of teaching children English, the "country language," as well as German, the language of their former home. This policy has been pursued by all intelligent German-American teachers of later times. The Schwenkfeldians, for instance, who were among the best teachers of their times, published a school order in the year 1764 which contained the following article:

Concerning the useful sciences which, besides true knowledge and the fear of God, shall be taught to children in school, they must begin with reading and writing; as in Pennsylvania two languages, particularly, are spoken, children shall be thoroughly taught and informed in the said two languages, in speaking both as well as in reading and writing, as much and as far as is practicable.¹

¹ Accordingly, arithmetic, geography and, if possible, Latin were to be taught. Compare the account of Learned in *Americana Germanica*, II, No. 2, p. 74.

As early as the year 1706, the Mennonites founded the school at which Christopher Dock, the worthy successor of Pastorius, taught. He composed the celebrated school order which was published under the following title: "A simple and thoroughly prepared school order in which it is clearly defined in what way children are not only best trained in the studies usually taught in schools, but how they may be well instructed in righteousness; written out of love for humanity by Christopher Dock, an experienced teacher of long practice, and published by several friends of the common weal." Boone rates Dock's services so high as to consider him in a certain measure the German-American Pestalozzi.¹ Lutherans, as well as members of the Reformed Church, undoubtedly established schools before the year 1720, though definite facts can be traced only from 1720. Learned mentions, besides, the following German teachers during the period from 1720 to 1740:² John Phillip Brehm, of Whitpain, Montgomery County; George Michael Weiss, a graduate of Heidelberg University; George Stiefel, of Tulpehocken, Berks County; John Jacob Hock and Kaspar Leutbecker, of Tulpehocken. Men like Mühlberg and Schlatter, who had been students at Francke's Paedagogium in Halle, came later, and improved the schools. The development of German literature produced in America, and including thousands of different prints, went hand in hand with this progress. The first Bible published in the New World appeared at that time in the German language, forty years before an English Bible was printed in America.³ The first printer who undertook to print German works in this country was, strange to say, no German but an American; none other than Benjamin Franklin. In 1730 he printed (in Roman characters) the oldest German-American book extant, or at least the oldest discovered until now.⁴ It was printed by order of the monastery of Ephrata, which established its own printing office in 1745, and bore the following bombastic title:

"Divine hymns of love and praise that together penetrated the hearts of the children of wisdom and again flowed out from them. Written out of heartfelt love for the praise of God and by those followers of divine wisdom for their regeneration and encouragement in their cross and sorrow. For to be filled with love gives God the highest praise and us the most beautiful inspirations of song. Printed in Philadelphia by Benjamin Franklin, Market street, 1730."

It is a duodecimo volume of 96 pages.⁵ Franklin afterwards printed a large number of German hymn books, prayer books, and text-books, records, and also a German catechism, until in 1738 Christopher Sauer, the father, and later on his son of the same name, instituted a competition in this line of business in Germantown. This was more keenly felt as, to advertise his undertaking, Sauer controlled a powerful agency, having founded the first German newspaper, called the "Hochdeutscher pennsylvanischer Geschichtsschreiber" (German Historical Record of Pennsylvania), which was afterwards changed to "Germantowner Zeitung" (the Germantown Paper). Nevertheless, Franklin printed a number of German books, among others, jointly with Böhm, in the year 1751, a splendid edition of "Arndt's True Christianity."

Seidensticker, in fact, asserts that Franklin himself was the editor of the first German-American newspaper. In his "German American Events, principally of Pennsylvania, up to 1870," we find the following apposite data:

1732. Benjamin Franklin proposes to issue, and probably issues, the Philadelphia Zeitung—first German paper in America.

¹ Boone, Education in the United States. Dock's life and services to pedagogics are given with more detail in Pennypacker's Historical Sketches.

² Americana Germanica, II, No. 2, p. 73.

³ Zimmermann, German in America, page xxiv.

⁴ Compare Seidensticker, German Day, 1892, page 12, and Zimmermann, German in America, page xx.

⁵ The only copy extant of this remarkable book is in possession of Mr. Abraham H. Cassel, Harleysville, Montgomery County, Pa.

1755. Under the auspices of the Charity School Society, Benjamin Franklin and Anton Armbrüster publish a German newspaper in Philadelphia.

Be it as it may, whether Franklin was not only a German-American printer, but also the first German-American journalist, it serves our present purpose only to prove the fact that one hundred and fifty years ago a man like Franklin paid the greatest attention to German and German literature; many other exceptionally convincing facts exist.

Charles Lee Smith estimates the number of German immigrants during the first half of the eighteenth century to have been only 30,000, of whom 18,000 settled in North Carolina.¹ There remained, then, only 12,000 persons for the other colonies, including New York (the foundation of Newburg on the Hudson) and Maine (the German settlement at Broad Bay), as objective points of a large number of immigrants since the years 1709 and 1740, respectively. That is manifestly much too low an estimate. In the year 1749 alone a German traveler by the name of Kalm saw 25 emigrant vessels, with 7,049 German emigrants aboard, arrive at Philadelphia. The authority accepted as most reliable on such questions, the celebrated German geographer, Christopher Daniel Ebeling, gives the population of Pennsylvania in the year 1755 as 200,000 souls, of whom the half came from Germany.² The governor of the colony, Thomas, was of the opinion that the German element formed even a larger proportion of the population, for in 1748 he wrote to the bishop of Exeter:

The Germans of that province are, I believe, three-fifths of the whole people, and by their industry and frugality have been the principal instruments of raising it to its present flourishing condition.

We understand from these opinions of Governor Thomas that he did not allow himself to be duped by the Nativists, but favored German immigration. His predecessor, Patrick Gordon, had in 1729 procured the passage of a law in the assembly of Pennsylvania providing that an entrance duty of 20 shillings should be paid for every Irish servant, as well as for all "redemptioners," 40 shillings for all other foreigners, and £5 for every negro. In 1730, however, these restrictions were revoked and such persons only excluded as were incompetent to work or might become a burden to the community for other reasons. Franklin, and all intelligent citizens with him, maintained the point of view that every further restriction upon immigration would be prejudicial. However, he advocated that all newcomers should be Americanized in an appropriate manner. The best means for this end, as most of the immigrants were Germans, was the introduction of German into American schools, and this measure was promptly adopted. Learned refers concisely to the matter in the following terms:³ "While the introduction of the charity or free school and the 'neighborhood school' naturally favored the study of English as the official speech of the province, yet German was retained in the course of study. And when the school extended its scope in the direction of the academy, the forerunner of the later college and university, German still found a place among the languages to be taught. Indeed it is not too much to say that German instruction has been kept up in Pennsylvania persistently from the days of Penn and Pastorius to the present time."

But if that could be proved as the course of educational development in this State for two hundred years, no one deserves a higher acknowledgment than Benjamin Franklin. Soon after settling in Philadelphia he founded the "Junto Club," which was incorporated in 1732, and enlarged to the "Philosophical Society of Philadelphia" in 1743. Again, in 1749, this society agitated the foundation of the "Public Academy of the city of Philadelphia," the same institution that, later on, developed into the present University of Pennsylvania.

³ Compare Americana Germanica, II, No. 2, pp. 74 and 75.

This is the first American school into which German was introduced. Franklin designed its course of study and recommended instruction in French and German, besides the language of the country. This proposition was accepted. When, in 1753, the academy became a college, the trustees decided to appoint Mr. William Creamer as German professor. Mr. Creamer filled the position until 1775, and never had cause to complain of the want of pupils.

About this time an event occurred which, strange enough, seems to have escaped the notice of Franklin's biographers, but which is an eloquent testimony of the keen interest which this far-sighted man took in the educational system of Germany. Franklin's visit to Göttingen took place in August, 1766, and justly created a sensation in Germany. As far as we know, Benjamin Franklin was the first American who ever visited a German university.¹ He was permitted to attend a session of the Academy of Sciences and enjoyed the distinction in Göttingen due to his prominent position.

Hinsdale, who found out the fact himself and made it known to the American public, accompanies it with the following comment:

It is rather surprising to find that the man who is the best embodiment of the practical spirit of American philosophy should have been the first American to show an interest in the higher education of the land of abstract thought and science. It is surprising, also, to find that nearly all the facts which we possess relating to the visit are found in German authorities. In truth, I have never been able to find the slightest allusion to the visit either in Franklin's correspondence or in the leading biographies of him that have been published, although I have reason to think that some slight allusions are to be found in these sources.

After what has been said of Franklin as a German printer and publisher and his recommendation of the introduction of German into American schools, the reader will not be so surprised to hear of his interest in a German university, and especially the one which in consequence of the union of Hanover and England in the Guelph dynasty was, like Pennsylvania, under English rule. The opinion seems likewise justifiable that the transformation of the college in Philadelphia to the University of Pennsylvania, begun soon after Franklin's return from Germany, was in no small measure due to the account of the impressions which Franklin received in his "travel of discovery" to Göttingen.

But even if this opinion be untenable, the event is of great importance for American civilization, as such American travels of discovery were until then mostly a cause of wonder, somewhat like the expeditions for the exploration of the interior of Africa, or the discovery of the North Pole. The latter expeditions, however, were directed to savage or little civilized districts, whilst the former established the line of communication with a center of the highest civilization, and this connection was calculated to exert a most beneficial influence on the American mind, especially during the first half of the nineteenth century. Without Franklin, whose visit, we shall soon see, encouraged the first Pennsylvania students to attend Göttingen,² totally unknown in America at that time, there would have been no American "Göttingen men," who were so prominent in bringing on the final issue, and of whom the American ambassador in Berlin, Andrew D. White, spoke so admirably in his last Thanksgiving Day speech.³ Among other things, he said:

Although Great Britain is generally honored as the mother of the United States, Germany has, from an intellectual standpoint, become more and more the second mother of the United States. More than any other country, Germany has made the universities and colleges of America what they are to-day—a powerful force in the development of American civilization.

¹ Compare Hinsdale, *Foreign Influence upon Education*, in the Report of the Commissioner of Education for the year 1897-98, Vol. 1. The text of the detailed account of the visit can, of course, not be repeated here, but is to be recommended for close study.

² Compare Hinsdale, page 607.

³ According to the reports of both German and American newspapers.

A long time, it is true, was to intervene before German influence was felt, as Mr. White declared it has been. In the beginning it seemed almost as though it would take America by storm. According to the new charter of 1779 of the institute of Pennsylvania, the six chief churches in Philadelphia, namely, the Episcopal, the Presbyterian, the Baptist, the Lutheran, the German Calvinist, and the Roman Catholic, selected their own chapter among the three of which the board of trustees was composed. They appointed two of the most prominent German ministers of the city, John Christopher Kunze and Kaspar Weiberg, as trustees. Owing to the influence of these two men, the following remarkable resolution was passed on January 10, 1780: "A German professor of philosophy shall be appointed, whose duty it shall be to teach Latin and Greek by means of the German language in the academy as well as in the present university." One of the proposers of this measure, Kunze, considered the most eminent teacher of his time in America, was elected to fill the position and contemplated making the new university, to a certain extent, the "Göttingen" of America, which was to be the intermediary between German and American education.

Kunze, whose literary merit Learned has minutely discussed,¹ had made an attempt as early as 1773 to establish a kind of German "normal seminary." The following statement, written in a letter to a friend, is still in existence:

Since my stay in Klosterburg I have always felt a special desire to be connected with a school in which languages and the sciences would be taught. All my other affairs have done so little to repress this within me that, on the contrary, I have always rather entertained the thought sometime * * * to establish a like institute among the Germans here. * * * In the beginning of the new year 1773 a student of Halle came to us, who had given up law, become a soldier, and finally taught a long time in St. Thomas. He is looking for a position, and presented certificates from the University of Halle. * * * It seemed strange to me that the day before my candidate, Mr. Leps, was announced the thought came to me:² If I should ever come in possession of £20, I would buy the first German student who would land on these shores in debt for his passage, put him in my uppermost room, begin a small Latin school, teach myself during the morning hours, and then let my servant teach for me and charge a small tuition fee. * * *

Meanwhile Mr. Leps was not in debt, and, besides, had a small sum of money, sufficient to support him for a few months. I advised him to open a Latin school, promised to help him in the undertaking, and wrote out the following for him on a sheet of paper:

"A few promoters of the true welfare of the German nation in America contemplate forming a society to be entitled: 'The Society for the Promotion of Christianity and all Useful Knowledge among Germans in America.'"

The required 24 subscribers were found, each contributing £10 (\$50). These founders enjoyed free instruction; the others were obliged to pay. Three classes were formed, and the work was begun with energy. "This school," says Learned, "seems to represent the first attempt to introduce strictly academic instruction among the Germans in America, and transferred the influence of Francke's pedagogical institute in Halle to American soil."

The worth of this small private school, which proudly bore the title of "German seminary," has perhaps been overestimated, as Mr. Leps, the teacher, had received no seminary education himself; still the success of his first pedagogical effort encouraged Professor Kunze to further action in this direction. He was an influential member of the "German society," founded in 1764, for the protection of German immigrants, which applied to the assembly in 1780 or 1781 for a charter. In their petition the members, prompted by Kunze, declared:

That they contemplate extending their original institution, and applying a portion of the money in their hands and what would be received in the future to other charitable purposes, as, for instance, the instructing of poor children in German as well as in English, and in reading and writing, and obtaining for them the

¹ In his speech of March 21, 1896, at the dedication of the Bechstein library in Philadelphia.

² The following explains what was at that time understood by redemptioners; i. e., poor immigrants whose services were sold for a stipulated period to pay the expense of their passage.

instruction and education for which they may be best adapted, placing those who excel in the position to complete their studies at the university established in the city of Philadelphia; moreover, that they intend to found a library and, besides, do more than they can undertake with a charitable purpose, without prejudice to other residents of the State, for the help and welfare of their compatriots.

The charter granted more than these petitioners asked; it imposed the obligation on the society to attain these purposes by their action.¹

But excepting a few successful efforts nothing was achieved, on account of the same adversity of circumstances which, in the course of a few years, led to the decline of the "German Institute," the official name given to the "German division" established at the university under the auspices of Kunze. The "German Society" furnished the means for many students to study German and other scientific branches at the university. In the year 1784 Kunze accepted an invitation to the "Columbia University," in New York, where he was called to the chair of oriental languages, as at that time a German professor, John Daniel Gross, S. T. D., had already been appointed for the years 1784-1795.²

Reverend Justus Henry Christian Helmuth succeeded Kunze in Philadelphia, and was so decided upon promoting the study of German that he made a most earnest appeal to the "German Society" to give an annual prize, a gold medal, for the best composition on a given theme, allowing every lover of the German language in America and Europe to compete. The first theme was to be: "How can the preservation and extension of German in Pennsylvania be best effected?"

The petition received as little consideration as an article in the Philadelphia Correspondenz of 1787, which recommended the founding of public schools in which German should be taught. Helmuth enjoyed the satisfaction of seeing the "institute" decidedly prosperous under his direction. In his annual report for 1785 he could proudly assert the fact that the attendance of the "institute" had risen to 60. At the "actus oratorius" the young men acquitted themselves brilliantly in a number of German recitations, and in the representation of a scene in which several children from the country go to school and there, for the first time, learn something of the world in studying German. At the same time, the students were so well posted in current German literature that they were already acquainted with Lessing's "Nathan," for instance, which had appeared only in 1779. Perhaps the very circumstance that the "institute" was so prosperous exerted a prejudicial influence for the cause of German. In the year 1786 a number of German citizens of the State manifested opposition to the "institute" by founding "Franklin College." On the occasion of the one hundredth anniversary, in 1891, of the institution now known as Franklin Marshall College, Provost Pepper made the following most noteworthy statements concerning the participation of the aged Franklin in this undertaking:

For a long time he had taken great interest in the welfare of the Germans, who formed the bulk of the population in some parts of Pennsylvania. He aided in the establishment of schools for them, and served as a trustee of a society for the benefit of the poor among them, and in 1787, although in his eighty-first year, he was active in the promotion of the long-cherished scheme of founding a college for the education of young Germans. On March 10 of that year—1787—an act was passed by the assembly incorporating and endowing the German College and Charity School in the borough and county of Lancaster, in which act it is recited that "the college is established for the instruction of youth in the German, English, Latin, Greek, and other learned languages, in theology, and in the useful arts, sciences, and literature." The same act of incorporation states that, "from a profound respect for the talents, virtues, and services to mankind in general, but more especially to this country, of his excellency Benjamin Franklin, esq., president of

¹ Act of incorporation, page 8 in Seidensticker's History of the German Society in Pennsylvania, page 180.

² Columbia University Bulletin, March, 1897.

supreme executive council, the said college shall be, and hereby is, denominated Franklin College." Franklin was the largest contributor to its funds, giving of his moderate fortune the sum of \$1,000, which may be considered large for those days; and still more when, in the spring of 1787 the corner stone was to be laid in Lancaster, he underwent the pain and fatigue of a journey thither in order to perform that ceremony.

The long list of deeds by which Benjamin Franklin proved himself an excellent patriot and likewise a warm friend of the Germans closes in a brilliant climax by this undoubtedly authentic representation of his participation in the foundation of the first German college. Unfortunately, neither the zeal of Germans such as Helmuth, nor the commendable example of so eminent an American as Franklin, could delay the downfall of German in Pennsylvania for many years. As early as 1787 the German "institute," whose attendance had diminished to 6, was abolished; Professor Helmuth, however, was permitted to retain his position as professor of German.

The misfortune [Learned remarks on these events] did not lie in the founding of "Franklin College" by the Germans, but in the division of the forces in the State on the one hand, by the suppression of the prosperous German institute in Philadelphia on the other; by the premature formation of a German college in the central part of the State at a time when not sufficient interest was manifested for the support of German education in the country. If the German institute of the University of Pennsylvania had been continued a quarter of a century longer, and if "Franklin College" had been founded on ground thus prepared in consequence of a strong current of German culture setting toward Philadelphia, the history of both institutes, the "University of Pennsylvania," as well as "Franklin College," would have left decidedly more noticeable traces in the annals of the young Republic.

But, as matters took their course, neither "Franklin College" nor the "University" fulfilled their educational purposes. The so-promising cooperation of German and English civilization at the University of Pennsylvania during the time when Kunze and Helmuth taught there was suspended for nearly a century. The scion of German learning took root again in the cool soil of New England, and then only in the second half of the nineteenth century.

This first phase of the development of German instruction in America led to the attendance of the first American student at a German university—Benjamin Smith Barton. At the age of 21 he was a student at the university in Philadelphia, when the event occurred of Franklin's visit to his home—Lancaster—to lay the corner stone of Franklin College. Such an event was calculated to make a deep impression upon a highly gifted, intellectual, and industrious young man, and so he decided to spend a number of years in Europe to apply himself to the studies of medicine and the sciences. He studied in Edinburgh, London, and Göttingen. At the last-mentioned university he received the degree of doctor of medicine, in 1799. Returning to America, Dr. Barton occupied a prominent position in Philadelphia. Previous to his death, which occurred in the year 1815, he wrote a number of scientific works that have given him a place in the annals of American civilization.¹

One of the chief reasons why the influence of German civilization in America suddenly suffered so decided an interruption during the last quarter of the eighteenth century was the struggle for independence that continued for so many years, and, in fact, ceased only at the close of the war with England, in 1812. *Inter arma silent leges!* Even schools can seldom continue their peaceful work of civilization undisturbed. Many colleges, as the Columbia, in New York, from 1776 to 1784, were obliged to close their halls for a longer or shorter period, whilst others were altogether abolished. Kunze's German Seminary, of Philadelphia, was among the schools swept away by the storms of revolution, whereas the Ger-

¹ A sketch of Barton's life is contained in Vol. I of Appleton's *Cyclopedia of American Biography*. Hinsdale accords him the honor (*ibid.*, p. 607,) of being the first American to receive an academic degree at a German institution.

man College, of Lancaster, gradually sacrificed its character as a German educational institution par excellence.

Why German influence was so much less predominant in general after the peace of 1783 than the French, which then predominated for a long time, is easily explained by historical events. Lafayette and the French had taken just as active a part in the foundation of the republic as the 29,166 Hessian, Brunswick, and other German soldiers in opposition to it. The fact was not generally known that these tools of England were only the victims of degenerate petty despots who were forced to turn their arms against the Americans and even occasionally went over to their side. Readers are used in the schools of the present day which record only the fact that at that time German princes sold their soldiers in America in order to crush rising liberty there. Not one word, on the other hand, is mentioned concerning Frederick the Great's friendly attitude toward the young republic or the part which German-Americans have a right to claim in the patriotic events. For the sake of historical truth the fact should not be passed over in silence that American generals included men like the inspector-general of the Army, Baron von Steuben, General De Kalb, and General Nicholas Herkimer, the victor of Oriskany; moreover, Germans like Rev. Peter G. Mühlenberg, who formed an entirely German regiment, were found on the American side. George Bancroft and all other great American historians render full justice to the Germans, but the public at large are as ignorant of the conditions of the case as, presumably, even the educated are of Benjamin Franklin's attitude to the German nationality, as explained above.

Another reason why German influence declined during the last quarter of the 18th and during the first quarter of the 19th century was the decrease of the number of immigrants from German countries. According to the calculations of J. Blodget and the statements given in Seibert's statistical annals, the whole immigration during this time did not exceed 4,000 to 6,000 persons a year whenever the blockades of the harbors during the wars admitted of any maritime intercourse. Immigration to any great extent was resumed only in the year 1817. In that year there were 22,240 immigrants, among whom few Germans were to be found. At all events, in the year mentioned only 3,102 Germans and Swiss came to Pennsylvania, where, in the meantime, the exceedingly friendly attitude which Franklin had maintained had been laid aside, and, instead, measures had been taken that tended to a less considerate Americanization of German colonists. Thus, for instance, the attempt was made to oblige Germans to anglicize their family names, a proceeding that explains the fact that in the State which originally showed the largest percentage of German residents, German names are comparatively weakly represented, and that sometimes families which have good reason to be numbered among German Americans bear a name which gives no sign of a German origin, for instance, the Pennypacker family. The determination to require German immigrants against their will to relinquish at once their nationality, instead of assimilating them gradually in an appropriate way, has, fortunately, been now completely set aside. No one has opposed it more decidedly and instead emphatically recommended the introduction of German instruction in public schools than Dr. W. T. Harris, United States Commissioner of Education, in his lecture on "German Instruction in American schools and the national idiosyncracies of the Anglo-Saxons and the Germans," delivered in Cleveland, July 16, 1890. As the most noteworthy remarks of Dr. Harris have by no means become as well known as the interests of educational progress demand, a short extract from them will not be out of place here.

The speaker based the appropriateness of the introduction of German instruction in public schools on the fact that a large number of citizens who have come from Germany desire to have their children know their native language and

should find the best means of satisfying this just desire in the public schools of the country.

It will contribute to raise the number of German immigrants, and at the same time "Americanize" them, if they are taught in public schools to be imbued with the spirit of American institutions and to sympathize with them.

It is of the greatest importance that immigrants should be educated in the best institutions of the country and be "Americanized" in the spirit of our free intelligence; otherwise they will, most assuredly, be "Americanized" by the worst forms of our political corruption. That is the alternative before which we stand which leaves us no free choice. For if we do not "Americanize" our immigrants by giving them a part in the best accomplishments of our civilization and maintain an active intellectual intercourse with them, they will rather contribute to the degeneration of our community and, in this way, de-Americanize"—or even directly undermine—our national life.

The author then referred to his own experiences while superintendent of schools in St. Louis, where he introduced German to the greatest extent, and closed the first part of his lecture with the following noteworthy remarks:

For a long time after immigration the immigrants keep a relation with their kindred in the mother country. Our population in the Northwestern States keeps up correspondence and recognizes the family ties that exist with the people in Great Britain and Ireland, Germany and the Atlantic States. No difficulty is experienced by the Anglo-American settler among us in this matter. But the German-American is obliged to learn two languages. For if his children learn English only, there must be a too sudden and abrupt breaking off the continuity of race and a consequent great evil wrought upon his character. The consciousness of the history of one's ancestry and the influences derived from communication with the oldest members of one's family are very potent in giving tone to the individuality of youth and ripening age. This continuity of history is a kind of solid, substantial ground for the individual, and from its soil spring up his self-respect and aspiration.

A class of immigrants who had no desire to preserve a relation with their family stock would bring calamity upon the community into which they come.

The best Germans in America have always manifested the highest degree of patriotism toward their adopted country. The Utopian idea of founding their own "state within the state" had comparatively few adherents, and these were soon converted to a sensible view by the logic of facts.¹ This is best shown by the distinguished German author, Julius Fröbel, who states in direct terms² that Anglo-American thought does and must ever exercise a governing influence on the development of the United States.

Now, by fusing itself with this ruling thought and exerting its own influence upon it, the German element can participate and continue to participate in the great advantages of the extraordinary results of American civilization. The German spirit in America can receive its just due only by fusion with the American. For it is inherent in the nature of idealism that it can only be effective in the world through realism.

Those who landed in America with the chimerical notion of founding a distinct German community built, for instance, the cities of Hermann, in Missouri (1837), New Braunfels, in Texas (1839), and New Ulm, in Minnesota (1855), all of which have become flourishing centers of American civilization. The citizens of this country who have emigrated from Germany have fully understood that they have become Americans, and must allow that fact preeminence in deciding their attitude toward any question affecting the public good of America. They have an excellent example for their course of action in the French Huguenots who emigrated to Germany centuries ago, and have clung as tenaciously to their mother tongue as to their religion. As many bloody conflicts have since been fought between the two neighboring nations, these "refugees" have never allowed them-

¹ The political Utopias of German missionaries are briefly sketched in a comprehensive work in *Americana Germanica*, Vol. I, part 2, by Dr. T. S. Baker.

² Julius Fröbel, *German Emigration*, page 123.

selves to be surpassed in patriotism even by those Germans whose forefathers may have fought against the Romans in the Teutoburgerwald.

The patriotism of German-Americans was proved beyond a doubt during the critical times of the Revolution. Michael Hillegas¹ (of German parentage) was the first treasurer of the United Colonies in 1775, and subsequently of the United States until 1787. F. A. Mühlenberg was in 1787 president of the Pennsylvania convention that ratified the Constitution, and in 1789 was Speaker of the First Congress. Thus, the Germans played a conspicuous part in the development of public law in the Republic. In all probability no blame attaches to them for the failure of the ingenious plan of George Washington to organize education for the sake of the Union and for this purpose to found a national university in the Federal city, "embracing all the advantages of European tuition."² As we have seen, they attached the greatest importance to the education of the people, and were willing to erect the proud structure of liberty upon this rock.

After the favorable opportunity of making the education of the people a national affair had thus been missed, the separate States were compelled to give their attention to retrieve at once what the colonial governments for the most part had neglected. The proceedings in Virginia in this regard are of particular interest. William and Mary College, the second oldest in the country, had been in existence since 1693. Influenced, probably, by the circumstance that relations with Europe were becoming constantly more active, it had introduced instruction in French at an early period. Thomas Jefferson, who, as we know, spent some time in Paris, supported the plan of Chevalier Quesnay de Beaurepaire to establish a "French academy of the arts and sciences" in Richmond, with branches in New York, Philadelphia, and Baltimore. When this undertaking failed for want of capital, he for a time cherished the odd idea "of removing bodily to Virginia the entire faculty of the Swiss College of Geneva, which was thoroughly French in its form of culture." This proposition, however, met with little response from the practical Americans. European institutions can not be directly transplanted to America. They only belong there if, and in so far as, they can be adapted to the totally dissimilar American conditions. Had the idea been realized, it would surely have helped to broaden the gulf that later on separated the North and the South. One of the most prominent of Jefferson's biographers pertinently remarks concerning this incident: "Nothing is so enduring when once established as forms of culture. If French ideas had really penetrated Virginian society they would have become as dominant in the South as German ideas are now becoming in the State universities and school systems of the Northwest." The penetration of the great statesman was manifested in that he clearly discerned one of the main deficiencies of American education, that the habit of speaking the modern languages can not be well acquired in America.³ We shall see later on that by the foundation of the State University of Virginia he found the right way to supply the deficiency, at least for Virginia. To estimate his other extraordinary services to American education would be out of place here. To follow the development of education in the separate States would also lead us beyond our intended scope.

There is not the slightest doubt but that the proceedings in Massachusetts, particularly at Harvard College, were of the very greatest importance for the subsequent definite introduction of German into the curriculum of American schools. At a time when German parochial schools were just beginning to be called into existence in Pennsylvania, Cotton Mather had already placed himself in direct communication with Professor Francke, in Halle, and conducted a regular cor-

¹ German-American Events, page 19.

³ Compare Hinsdale's article on "Education in the United States," in the *New American Supplement* of the latest edition of the *Encyclopædia Britannica*, Vol. II, page 1118.

respondence with him during the years 1709 to 1724.¹ A result of this intercourse was that Mather published a comprehensive account of Francke's works, and that New England theologians consequently showed themselves favorably inclined toward German ideas. It would require a whole volume, Hinsdale asserts, to give an exhaustive account of the influence of German studies upon American theology.² For the purpose of this review it is sufficient to state that these men were obliged to acquire the knowledge of German. Naturally, this reacted upon all those who were influenced by these pioneers of the study of German. Thus, Prof. Moses Stuart brought over German theology and philology to Andover. James Marsh, born in Vermont in 1794, and president of the University of Vermont, was one of his pupils. It was he who became acquainted with Kant's Critique of Pure Reason, and brought the first knowledge of it into America. Through his influence the "Coleridgians" became acquainted with each other.³ By this term the disciples of Coleridge are meant. Since 1780 it had been the custom for the most prominent English authors to make a trip to Germany, visit Goethe, and then try to make the treasures of German classic literature accessible to their compatriots. Among them were William Taylor, of Norwich, Wordsworth, Coleridge, Walter Scott, and Carlyle. However, their influence was probably greater over the inquisitive American mind than over their own compatriots, since from that time a steadily increasing interest in German literature and science was manifest. Owing to this interest, Edward Everett and George Ticknor became the first two New England students of Göttingen, which they attended from 1815 to 1817. The latter himself states that his motives for going were suggested by the reading of Mme. de Staël's celebrated book on Germany, a pamphlet on Göttingen, and the verbal accounts of an Englishman.⁴

In consequence of increased intercourse, the channels through which German influence made itself felt were manifold. Ticknor's account of the difficulties which he was required to overcome to gain the necessary rudimentary knowledge are highly interesting. He relates the following:

The first intimation I ever had on the subject was from Mme. de Staël's work on Germany, then just published. My next came from a pamphlet, published by Villers, to defend the University of Göttingen from the ill intentions of Jerome Bonaparte, the King of Westphalia, in which he gave a sketch of the university and its courses of study. My astonishment at these revelations was increased by an account of its library, given by an Englishman who had been at Göttingen, to my friend, the Rev. Samuel C. Thacher. I was sure that I should like to study at such a university, but it was in vain that I endeavored to get further knowledge upon the subject. I would gladly have prepared for it by learning the language I should have to use there, but there was no one in Boston who could teach me.

At Jamaica Plain there was a Dr. Brosius, a native of Strasburg, who gave instruction in mathematics. He was willing to do what he could for me in German, but he warned me that his pronunciation was very bad, as was that of all Alsace, which had become a part of France. Nor was it possible to get books. I borrowed a Meidinger's Grammar, French and German, from my friend Mr. Everett, and sent to New Hampshire, where I knew there was a German dictionary, and procured it. I also obtained a copy of Goethe's Werther in German (through Mr. William S. Shaw's connivance) from among Mr. J. Q. Adams's books, deposited by him on going to Europe in the Athenæum, under Mr. Shaw's care, but without giving him permission to lend them. I got so far as to write a translation of Werther, but no further.

The result of Everett's and Ticknor's stay at Göttingen was that the former prevailed upon President Kirkland to grant George Bancroft a scholarship for Göttingen. He studied there from 1818 to 1820, and was about the most successful of all who ever attended the university. On his return he wanted to teach history at

his first alma mater as a "lecturer," but could not carry out his intention. He therefore united himself with his fellow-student at Göttingen, Dr. Joseph Green Cogswell, to establish an educational institution after the model of the German gymnasium, in Northampton, Mass. In the "Round Hill School" attention was not given to the memorizing of facts, but to the development of the critical powers of pupils. From 1823 to 1831 the school was attended by 293 pupils, who came from 19 separate States and 4 foreign countries. All received instruction in German. The institution prospered, but not for any great length of time, having been discontinued in 1839. The Gymnasium, conducted by the brothers Henry E. and Sereno Dwight in New Haven from 1828 to 1831, met a similar fate. Nevertheless, the book written by the former and entitled "Travels in the north of Germany in the years 1825-1826," which contained a complete description of German life, and especially of education, had a wide circulation, and advocated the introduction of German methods of instruction.

In the meantime New York had likewise begun to be interested in the German educational reform. An eminent teacher, John Griscom, had spent the years 1818 and 1819 in Europe, become acquainted with Pestalozzi, and was enthusiastic over the institution conducted by Fellenberg according to Pestalozzi's ideas in Hofwyl, near Bern. This was the same place that gave Friedrich Fröbel his suggestions for his "kindergartens." Griscom remarks on this institution, "I can not but cherish the hope that this scheme of education, of combining agricultural and mechanical with literary and scientific instruction, will be speedily and extensively adopted in the United States." His own subsequent attempt to establish a similar institution failed, but nevertheless his work was not vain. Such was the opinion of Dr. Barnard, the celebrated American educator, who states, in reference to Griscom's report, which appeared in two volumes under the title "A year in Europe," that "no other book of the first half of the nineteenth century exerted so powerful an influence on the development of our educational system." Ex-President Thomas Jefferson confirmed this opinion, with the further comment that in organizing the University of Virginia he had, so far as it was practicable, followed the suggestions given therein.

In 1819 the plan of Jefferson was approved by the legislature of Virginia.

In one point [he wrote on this subject to Ticknor, in Cambridge¹] we shall depart from the usual custom that has been adopted by almost every college and academy in the United States. Restricting students to certain branches, the obligation of following exclusively those studies that will qualify them for special pursuits selected by them will not be carried through. On the contrary, we shall allow students the full liberty of attending all lectures which they may desire to hear, and shall require nothing more than the necessary preparatory education and the necessary age.

Ticknor himself was to be the soul of the new institution, and was invited to accept the chair of modern languages, with the guaranteed salary of \$2,500—a large amount for those times. He declined, however, though he considered Jefferson's plans very good. His views coincided with those expressed by his colleague, Professor, afterwards President, Everett, of Harvard, in his critique of Jefferson's new institution:² "We highly approve the professorship of the modern languages, and would wish to see this example followed by such of our universities as have not already made provision for them."

By this declaration, which may be considered the programme of the second epoch of the development of German instruction, Everett proves conclusively that, as an educator, he was abreast of his times, or rather, as Eliot says, in advance of them. Everett had, besides, brought a large number of German books from Göttingen, which formed the foundation of a German library for Harvard. In 1818

² North American Review for January, 1820.

this collection was considerably increased by the acquisition of Professor Ebeling's library in Hamburg, which this eminent geographer had been collecting for fifty years and which was purchased by a resident of Boston by the name of Thorndike. Ebeling had undoubtedly written the best work on American history and geography, and had received the thanks of the members of Congress officially.¹

It created a great sensation, both in the Old and the New World, that a Yankee should have carried off Ebeling's library before the King of Prussia. This incident must have had some influence on the great master, Goethe, who was very much pleased that all American students at Göttingen hurried to Weimar to pay him their respects personally. These circumstances, perhaps, afford the key to the extremely interesting fact that he should have felt called upon to present a set of his works in 30 volumes to the Harvard library. These books bear the inscription: "Gifts of the author, J. W. von Goethe, of Germany," to which is added the following translation of the original letter accompanying them:

The above poetical and scientific works are presented to the library of the university at Cambridge, in New England, as a mark of deep interest in its high literary character and in the successful zeal it has displayed through so long a course of years for the promotion of solid and elegant education.

With the high respects of the author.

J. W. VON GOETHE.

WEIMAR, August 11, 1819.

II. FROM 1825 TO 1876.

Alexander von Humboldt ranks first among the illustrious visitors who came to America in the beginning of the nineteenth century. In 1804, he finished his work in Central America, for which he was commissioned by the Spanish Government, and went to Washington as the guest of Thomas Jefferson. As subsequently an uninterrupted correspondence and exchange of books took place between these two prominent men, we may suppose that this intercourse furnished one of the reasons that determined Jefferson to establish, instead of a French academy, a "State university," at which German was taught from the very beginning. In his report to the legislature of the year 1818, the introduction of German into the curriculum of the institute is recommended in the following terms:²

The German now stands in a line with that of the most learned nations in richness of condition and advance in the sciences. It is, too, of common descent with the language of our own country, a branch of the same original Gothic stock, and furnishes valuable illustrations for us.

At the opening of the institution in the year 1825, a division for modern languages was at once established; 64 of the total number of students (116) with which the university began its work took German from the beginning. In 1854-55 the division numbered an attendance of 200. In 1859 the knowledge of German and French was made obligatory for the degree of Master of Arts created in 1831, and the same rule has obtained since then.

The first "professor of modern languages," who filled the position from 1825 to 1840, was Dr. Blättermann, a German. It seems, however, that in the same way and for the same reasons his life was made as hard as that of Francis Lieber, at South Carolina College.³

¹ Christopher Daniel Ebeling, born 1741, died June 30, 1817, published his above-mentioned celebrated History and Geography of North America, in seven volumes, during the years 1796 to 1816. He collected about 4,000 books on America, besides many smaller publications and a large number of charts. Though we look for his name in vain in Brockhaus or Meyer, and even in the German-American Conversations-Lexicon, we find him mentioned in the American Cyclopaedia, Vol. VI, p. 383. In the earlier numbers of the North American Review frequent reference is made to Ebeling, and the acquisition of his library, of which Thorndike gained possession, though his competitor was King Frederick William III of Prussia, is discussed at length.

³ Compare American Contributions, p. 114.

As much as it may always redound to the fame of the University of Virginia to have been the first to give German instruction a permanent introduction, this fact was, nevertheless, much less important for the progress of the study than the corresponding step taken at Harvard, likewise in the year 1825. Since the conclusion of peace, owing to the increased intercourse between the Old and the New World, the necessity of studying modern languages was felt more than ever in the north-eastern part of the Union. As James Russell Lowell remarked upon one occasion, "The modern languages were not deemed worthy to be taught, except as a social accomplishment or as a commercial subsidiary." In most instances French humbugs à la Riccaut de la Marlinière were alone accessible, who attempted to teach without being at all prepared for the profession, and became dancing masters if they did not succeed in teaching French. Bad experiences, such as, for instance, that of Amherst College in the years 1827 and 1828, with such an ignorant professor, were a very great drawback to the introduction of modern languages.

As we have learned, Everett and Ticknor long since desired to have German instruction and German methods introduced into Harvard. Jefferson's bold action in Virginia strengthened their opinions and led them also to act at the earliest opportunity. Just at the right time two men arrived in the country whose action was to bear far-reaching consequences. These were Dr. Charles Follen, who also adopted his Latin family name, Follenius, and Dr. Charles Beck. Both were German political refugees, and possessed excellent credentials from Lafayette, when they landed in New York on Christmas Day in 1824. Called to Round Hill school by Bancroft and Cogswell, they were soon connected with Cambridge. In the autumn of 1825 Follen was called to Harvard as professor of church history and ethics¹, and the arrangement was made allowing him, by way of experiment, to form a German class. In his *Harvard Reminiscences* Dr. A. T. Peabody speaks of this memorable event in the following words, that have not lost their interest:

German had never been taught in college before, and it was with no little difficulty that a volunteer class of eight was formed. I was one of that class. We were looked upon with very much the amazement with which a class in some obscure tribal dialect of the remotest Orient would be now regarded. We knew of but two or three persons in New England who could read German, though there were probably many more of whom we did not know. There were no German books in the bookstores. A friend gave me a copy of Schiller's "Wallenstein," which I read as soon as I was able to do so, and then passed it from hand to hand among those who could obtain nothing else to read. There was no attainable class book that could be used as a "reader." A few copies of Nöhdén's Grammar were imported, and a few copies of I forget whose "pocket dictionary," fortunately too copious for an Anglo-Saxon pocket, and suggesting the generous amplitude of the Low Dutch costume, as described in Irving's mythical "History of New York." The German Reader for Beginners, compiled by our teacher, was furnished to the class in single sheets as it was needed, and was printed in Roman type, there being no German type within easy reach. There could not have been a happier introduction to German literature than this little volume. It contained choice extracts in prose, all from writers that still hold an unchallenged place in the hierarchy of genius, and poems from Schiller, Goethe, Herder, and several other poets of kindred, if inferior, fame. But in the entire volume Dr. Follen rejoiced especially in several battle poems from Körner, the soldier and martyr of liberty. I never have heard recitations which impressed me so strongly as the reading of those pieces by Dr. Follen, who would put into them all of the heart and soul that had made him too much a lover of his country to be suffered to dwell in it. He appended to the other poems in the first edition of the reader, anonymously, a death song in memory of Körner, which we all knew to be his own, and which we read so often and so feelingly that it sank indelibly into permanent memory, and I find that, after an interval of sixty years, it is as fresh in my recollection as the hymns that I learned in my childhood.

In this account, unusual in its grasp of the subject, one thought strikes us, namely, the reported deficiency of German books, of which the university library

¹ I have not been able to find any other reference to this professorship than the mention made of it by Metzner in the *Yearbook of German-American Athletics*, Vol. I, No. 1, p. 10.

must have possessed thousands at that time. Of course we do not, on that account, lose interest in Peabody's report, which testifies that there have been enthusiastic American students at all times.

Follen continued to work with the same zeal that he manifested in his first course. The consequence was that he gained recognition for German instruction in America, whilst he himself was called to a chair of German language and literature in September, 1831. He entered upon this position with a speech on "The importance of the study of German and German literature," in which he said:

The treasures that are contained in German books no longer escape the attention of the public; the same intelligent interest is manifested toward them as toward all else that tends to enrich knowledge and strengthen the intellect. At this university, where formerly German literature was included under the rubric "non leguntur" (i. e., "is not read"), the library has been recently increased by a considerable number of valuable German works. The university itself prints books in German characters, and the number of those who are studying German averages 50 for each session. Moreover, there are now German teachers and German books in all important cities of this country, whereas, I have been assured, fifty years since, not a single German grammar or dictionary could be found in Boston. Many present residents can not only speak German, but read German works with a full understanding of their meaning. Many German classics have found their way into private libraries.

This great progress occurred in the short space of time between the years 1825 and 1831, during which the influence of Follen, and (after 1827) of Francis Lieber on the mind of the American Athens was felt. These men did not confine themselves to the intellect, but also gave their attention to the physical development of youth. They were the first to introduce instruction in gymnastics and swimming. Lieber's Boston swimming school made such a sensation that even the President of the United States went to see it.

Follen acted officially as "German professor" only five years. In 1833 he published an appeal to the American nation against slavery, for which he was greatly censured. The press reproached him with "being a fugitive enjoying American hospitality," for whom, to say the least, it was out of place to throw a firebrand into the social life of his new home. In being an abolitionist, however, Follen acted in perfect accord with all German-American traditions. As far back as April 18, 1688, the German Quakers of Germantown had issued a protest against traffic in human flesh.¹ But his aggressive attitude seemed to make continuance in office impossible.²

Fortunately, however, the stone once set in motion could not be kept from rolling. As early as 1838, Longfellow began his celebrated lectures on Goethe's Faust, in consequence of which educated Americans of to-day are thoroughly conversant with "Faust," and some even take an active part in researches relating to that work. Even before Longfellow, Alexander Hill Everett, in his "Europe," published in 1822, had referred to German literature and had written, particularly upon Schiller, a fiery criticism in the *North American Review*.

An intimate knowledge of German classic literature, until then known only in English translation, was speedily recognized by practical Americans to be the main purpose of the study of German. As Professor Learned states in a recent lecture,³ the study of German literature animated the great active period of American literature represented by the names of Longfellow, Emerson, Margaret Fuller, and the so-called transcendentalists. He says:

They all drew either indirectly through Carlyle or directly from the German source, and created in prose or metrical form a truly beautiful American national

¹ Compare Seidensticker's *The First German Immigrants in America*, page 80.

² Compare Metzner, *ibid.*, page 14.

³ The lecture referred to was delivered in German before the *Deutschen Verein* of Columbia, and was published in the *Pedagogical Monthly*.

literature, such as no subsequent period has ever again attained. Longfellow, as mediator of German poetry, in beautiful, pure, poetical form, still occupies the highest rank among our poets, and just where Americans recognize the great poet in the "Golden Legend" he is a worthy imitator and interpreter of the master Goethe. His entire conception of the Christ trilogy is Goethe's, and purely German, although he took the matter partly from American life. What would Emerson have been without Kant, the transcendentalists, Margaret Fuller, the other Concord poets, and the visionaries of Brook Farm without this German impulse? It was cultural history that gave the great philosopher-essayist Emerson a German disciple like Hermann Grimm. From William E. Channing to James Russell Lowell, German influence on our literature is unmistakable, and whether consciously or unconsciously, our greatest poets have thought and written under this influence. Whenever a return to purely English models has taken place, the want of creative power, poetical depth, and culture-historical understanding is manifest.

In this period of German force in New England we find the beginnings of Germanic ties, from which have proceeded, directly or indirectly, our historical writings, our later academic education, our gymnastics, our music, in part our desire of investigation in natural science, our liberal tendency in theology and religion, and particularly the so-called "new criticism" in our philosophy, and, to a great extent, our fine literature and rising literary criticism. From this time Germany was a new Athens for educated Americans, and the stream of American students to Germany increased from year to year.

Strange to say, the July revolution in France, through the following remarkable concatenation of circumstances, is one of the factors that strengthened German influence on American civilization. In May, 1831, the French Government sent the celebrated student and philosopher Victor Cousin to Germany to study the educational system of that country. The result of his observations is given in the masterly conceived work in two volumes entitled: *Rapport de l'Instruction Publique dans quelques Pays de l'Allemagne et Particulièrement en Prusse* (Report on Public Instruction in Some of the Countries of Germany, especially Prussia). Cousin began his travels in Frankfort-on-the-Main and subsequently visited Schulpforta, Saxe-Weimar, and the Kingdom of Saxony. Two-thirds of the whole work, however, are devoted to Prussia. Cousin was particularly impressed by the general observance of compulsory education wherever he went, even in the smallest villages.

He pertinently observes that in all questions of civilization national antipathies are prejudicial, and that the true greatness of a nation does not consist in proudly ignoring the achievements of others, but rather in turning to the best account what progress has been made in others, without being afraid of undermining thereby individual patriotism.

This report made a great sensation, first in England, where attention was drawn to it by the Edinburgh Review, and where a translation of the part relative to Prussia was published in London in 1834 through the efforts of Mrs. Sarah Austin. In America the demand for this translation was so great that the firm Wiley & Long, in New York, published an edition. This literary event was of paramount importance for the organization of the entire educational system of the West.

Just at the time when Cousin's report was agitating the minds of educated men, matters had progressed so far in Michigan that the organization of the educational system was contemplated. For this purpose a highly-gifted, eccentric, elderly man, Judge Woodward, had years before planned a system, original throughout, even to its nomenclature, according to which the State was to organize instruction.¹ A division was to be arranged into special faculties according to the Epis-

¹ Unfortunately, we have not the space to give any of the interesting details of the celebrated "Catholepistemiad." They can be obtained from the different publications of the University of Michigan, as Woodward desired the institution to be called. See also History of Higher Education in Michigan, Circular of Information No. 4, 1891, of the U. S. Bureau of Education.

temic system. Thus the German thought of a state university had already taken root, and Rev. John D. Pierce, whose duty it was as State school superintendent to plan the institution, expressed his purpose to adapt the Prussian system, as portrayed by Cousin, to the West.

A competent judge thus expresses himself:¹

A university in the German sense—an institution crowning the educational system of a state, treating its students as free adults engaged in a bona fide pursuit of knowledge, offering its advantages at the lowest possible prices, sending down its roots into the life of the people to take thence the sap of its own vitality and paying back the debt by raising the intelligence and adding to the value and the dignity of life throughout the entire commonwealth—a university upon this theory was as yet an experiment to be tried. That the experiment came to be tried in Michigan, under reasonably favorable conditions, is largely due to Mr. Pierce, whose office was modeled after that of the Prussian minister of public instruction, and who is said to have been the first American to hold such a position under a State government.

Unfortunately, the task was not by any means completed with the establishment of a "board of instruction" and a "university." On the contrary, the extremely painful work of creating a solid foundation, such as German universities possessed in the gymnasia, and Eastern colleges partly in academies, had to be undertaken. In this direction a system of high schools was established for Michigan, whose pupils, after completing the school studies, were to be qualified to enter the State University without examination after the year 1870. This latter arrangement has not been the least instrumental in acquiring for the State a reputation for possessing such an excellent school system as few other States in the whole Union can show. As a matter of course, the study of modern languages, and particularly German, receives its full due. In the middle of the century President Henry T. Tappan was able to introduce, besides the classic degree of bachelor of arts, the equally meritorious academic degree of bachelor of science, for which two modern languages were equivalent to Latin and Greek. No special "scientific schools" were erected for these "modern" students, as in the great Eastern colleges; but all students were brought together in the closest possible relations, in order to develop among them the proper "esprit du corps."

Tappan aimed to make the institution, as soon as he had taken charge of it, as much like a German university as possible. For this reason he abolished the regulation of distributing the positions equally among the different denominations, and made the effort to get the very best teachers. Persons, and not buildings, he considered the chief matter of value for universities. He called Andrew D. White to the chair of history and English literature; the astronomer Brunnow, one of Encke's best pupils from Berlin, to the direction of the observatory, and Henry T. Frieze to the professorship of the dead languages. His successors, Dr. E. O. Haven (1863-69) and J. B. Angell (since 1871), have followed in his footsteps, and thus brought the institution to its present honored position.

Professor Hinsdale, who occupied the chair of pedagogics at this university, sums up its significance for the whole educational system of America in the following words:

The University of Michigan has been the type to which all the really vigorous and subsequent State universities have conformed more or less closely. Reference has once been made to the State universities as introducing a secular factor into the higher education. This fact, together with the possession of comparatively large resources, has given these institutions an influence in many of the Western States that has been very powerful, if not controlling.

The guiding influence of the University of Ann Arbor can hardly be better characterized than by saying that it opened German ideas in general and the study of German in particular to the whole West. The increase in ocean travel and the

¹ Calvin Thomas, *The University of Michigan and Its Recent Jubilee*.

growth of German immigration to giant proportions at the close of the German revolution of 1848 contributed to this result to an extraordinary degree. During the half century in question, between two and one-half and three millions of German immigrants must have landed. The majority of these traveled to the middle part of the West, where, in Ohio, Indiana, Missouri, Kentucky, Illinois, Minnesota, Wisconsin, and Michigan numerous German colonists settled. As this new national element was, for the most part, resolved to adhere to its mother tongue, and, if possible, to found strictly German colonies, many German society or private schools were founded which, in contrast to the still existing and newly established German parochial schools, bore no religious character. How well defined the movement was among the immigrants to found German schools twelve years before the tide of the "immigrants of 48" (*Achtundvierziger*), is best manifested by the fact that in October, 1837, a German convention¹ was held in Harrisburg, composed of delegates from six different States. It was agreed to demand the recognition of German as a second State language next to English, and to found a German normal school for the strengthening of existing German schools, as well as of those to be founded. Collections of money were taken up that amounted to enough to establish the normal school in 1838 in Philipsburg. Subsequently, interest flagged to such an extent that it was forced to close in 1840.

In the meantime the abnormal condition had developed in Ohio that in the larger cities there was a greater attendance at German private schools than at the different public schools. In the year 1831 in Cincinnati only 400 children received instruction in the city schools, whereas the attendance at German schools numbered 1,500. This condition lasted a number of years, and was the worse, as the public schools were decidedly inferior to the private. Thus in 1835 an excellent German educator, Dr. Frederick Rölker, resigned from his position in the city schools to accept that of superintendent in the newly founded Catholic elementary school, for the sole reason that the latter "promised to be decidedly better than the city schools, and he was not so handicapped in developing it into a perfect elementary school, according to the German, i. e., Prussian, system, by the depressing mechanism and manner of instruction that obtained in the city schools."²

In 1836 the German Protestants of Cincinnati founded a "German Immigrant School," later on incorporated by the State, in which the chief positions were filled by three excellent teachers educated in Germany—Edward Solomon, from Erfurt, Julius Weyse, and Julius Schwarz, the son of a professor at Heidelberg. This school was under the patronage of the "Lane Seminary" in Cincinnati, at which a prominent American teacher, Calvin E. Stowe, who afterwards married the authoress of "Uncle Tom's Cabin," was appointed professor.³ What he saw proved to him beyond a doubt that radical measures were necessary to remedy the deplorable condition of public schools in Ohio.

In January, 1836, Stowe took part in a convention of "professional teachers and school advocates" of the West, held in Columbus, Ohio, and before which he delivered a lecture on the subject, "The Prussian system of public instruction and its applicability to the United States."

Like a newly announced gospel, this lecture attracted so great attention in the whole country that the then governor of the State of Ohio sent it with a message, February 4, 1836, to the legislature then in session, which resolved to print it. Governor Lucas was subsequently commissioned by the legislature to send Professor Stowe to Europe, as a representative of the State of Ohio, to study the

¹ Compare Schem's *German-American Conversations-Lexicon*, XI, p. 284.

² Compare *The German Pioneer*, Vol. XIV, p. 3.

³ The account of conditions in Ohio is taken from the excellent writings of H. A. Rattermann, especially from the article on German influence on the organization and development of American schools. If more of such works of reference had been available, this account could have been made more complete.

school systems of the different countries and to report on them. Professor Stowe left for Europe in March, 1836, made a careful study of the educational systems of England, Scotland, France, The Netherlands, Germany (especially Prussia and Bavaria), Austria, Russia, and Denmark, and made a comprehensive report to the legislature, which was published by the State of Ohio in 1837. In reference to Prussia he states:

Indeed, I think the system in its great outlines as nearly complete as human ingenuity and skill can make it, though, undoubtedly, some of its arrangements and details admit of improvements, and some changes will, of course, be necessary in adapting it to the circumstances of different countries.

Professor Stowe refers to the fact that the German (i. e., Prussian) system had already been introduced into this country by private enterprise in the German-English elementary schools with two languages. As this expression of a prominent American is of special interest, I may be permitted to give the following quotation:

There is one class of our population for whom some special provision seems necessary. The children of foreign immigrants are now very numerous among us, and it is essential that they receive a good English education. But they are not prepared to avail themselves of the advantages of our common English schools, their imperfect acquaintance with the language being an insuperable bar to their entering on the course of study. It is necessary, therefore, that there be some preparatory schools, in which instruction shall be communicated both in English and their native tongue. The English is and must be the language of this country, and the highest interests of our State demand it of the legislature to require that the English language be thoroughly taught in every school which they patronize. Still, the exigencies of the case make it necessary that there should be some schools expressly fitted to the conditions of our foreign immigrants, to introduce them to a knowledge of our language and institutions. A school of this kind has been established in Cincinnati by benevolent individuals. It has been in operation about a year, and already nearly 300 children have received its advantages. Mr. Solomon, the head teacher, was educated for his profession in one of the best institutions of Prussia, and in this school he has demonstrated the excellencies of the system. The instructions are all given both in German and in English, and the use of the two languages does not interrupt the progress of the children in their respective studies. I can not but recommend the philanthropic institution to the notice and patronage of the legislature.

In neighborhoods where there is a mixed population it is desirable, if possible, to employ teachers who understand both languages, and that the exercises of the school be conducted in both, with the rule, however, that all the reviews and examinations be in English only.

As a supplement to his comprehensive report, Professor Stowe added a translation of the Prussian school laws, which were taken into consideration in framing the school law of Ohio in 1839. Thus Ohio, like Michigan, attained in a different way a State school system based upon German ideas, that has surely done much toward helping these progressive States to their present flourishing condition.

In New England at this time a lively movement was begun toward educational reform. The events at Harvard, the founding of the schools in Northampton and New Haven, the ever-increasing number of publications, and the lively personal agitation of many prominent men, necessarily weakened gradually old traditions. The legislature of Massachusetts sent for the report of Professor Stowe and made it generally known. Two men in particular—Horace Mann and Henry Barnard—fought with as much success as energy against the old system of district schools with their mechanical methods.

As early as 1837 Horace Mann brought about the appointment of a "State board of education" in Massachusetts, of which he was made secretary. In his annual reports he advocated educational reform with ardent zeal, but lived to experience the positive opposition of teachers themselves. In the year 1830 the teachers of New England, with whom educators from other parts of the country subsequently associated themselves, had formed the "American Institute of Instruction," in

which pedagogical questions were discussed at the annual meetings held in different places. This association had listened to lectures by several Germans (Follen in 1834 and Hermann Boekum in 1835), had been instructed as to the advantages of the people's schools of Germany, and had even conducted a correspondence with Victor Cousin, in which expressions of esteem are not wanting. But when in the year 1839 Mann demanded the introduction of the study of modern languages, he met with violent opposition, which was strengthened when, in 1843, he published his seventh annual report, since so renowned, in which he gives a detailed statement of the events of his travels, undertaken at private expense, to Scotland, Saxony, and Prussia. In this report he severely censures the faults of every system applied in American instruction, and places that of Prussia foremost as a model of a thoroughly and consistently executed system, without referring to its deficiencies. Proceeding on the principle that "in a republic ignorance is a crime," he demanded radical reforms according to the proposed model.

The reply, entitled "Remarks on the Seventh Annual Report," addressed to Mann by 31 Boston teachers, is not without interest. They protested against Mann's "Utopian" and "revolutionary" ideas, which did not even allow corporal punishment, sanctified by age; and complained in bitter terms that Mann should have spoken of American schools as "dormitories" in comparison with those of Prussia; they even reproached him with partial ignorance of American conditions.

Fortunately, however, the 31 protesters could not stop the march of events. Mann succeeded at least in paving the way for his reforms. In 1839 he established the first American normal school in Massachusetts, which was thus founded one year after the German institution in Philippsburg that proved a failure. What Mann's "normal school" signified, which was followed in the same year by a "teachers' institute" in Connecticut, established by Henry Barnard, we learn from the following statement of a specially gifted educator:¹

Normal school.

When the agitation for better education had fairly set in (in the decade 1835-45), it was clearly seen that the provision of better teachers was necessary to the accomplishment of the end. About the same time the attention of American educators was first drawn to the school systems of the German states, in which the teacher's seminary, or the normal school, as we have chosen to call it, borrowing the name from the French, is such an important feature. In these facts originated the movement to give elementary teachers professional training as well as academical training. The first American normal school was founded in 1839, and the number of such schools has continued to increase until the present day. But the effort to provide professional training for teachers has not been confined to normal schools. Training classes are found in high schools, while pedagogical departments and chairs, which look rather to the preparation of teachers for the secondary schools, have been established in many colleges and universities. A small number of teachers' colleges have also been established. Public normal schools are divisible into two classes—schools supported by the States and schools supported by the localities or cities. Many cities have adopted the policy of providing, in whole or part, teachers for their own schools.

A teachers' institute may be defined as a normal school that is held for a short term with a short course of study, and conducted according to methods peculiar to itself. It is known only in the United States, save as it may have been introduced in Canada. In 1839 Dr. Henry Barnard, then secretary of the Connecticut board of education, "in order to show the practicability of making some provision for the better qualification of common school teachers, by giving them an opportunity to review and extend their knowledge of the studies usually pursued in district schools, and of the best methods of school arrangements, instruction, and government under the recitations and lectures of experienced and well-known teachers and educators," called together at Hartford for a month's session, such teachers of Hartford County as were disposed to attend, organized them into a school, and, with several instructors whom he had called to his assistance, pro-

¹ Compare the article of Hinsdale in the Encyclopædia Britannica, American Supplement, XXIX, page 2657.

ceeded to instruct them along the lines proposed. This was the first institute of which we have any knowledge; the name, however, was given at a later day. The next year Dr. Barnard held a second one for ladies. Other educators were quick to imitate his example, and soon the institute spread over the States that were participating in the forward educational movement then in progress.

Besides Mann and Barnard, Francis Wayland, of New York, deserves mention as being a prominent pedagogical reformer of these times. From 1826 to 1855 he was president of Brown University in Rhode Island, where he instituted, even if, unfortunately, only for a time, liberty of instruction and study. He also introduced instruction in modern languages, and provided a great number of German books for the university library. It was specially through his works, however, that he gained a widespread reputation. Among these his *Thoughts on the Present Collegiate System in the United States* (1842), and his *Report to the Corporation of Brown University on Changes in the System of College Education* (1850) deserve special mention.

The second third of the nineteenth century is strikingly characterized by the efforts of distinguished men, who, following Victor Cousin's advice, recommended their compatriots to make use of the accomplishments of Germany in culture generally, and for the organization of the system of education in particular. From the long list of names we add to those already mentioned the following, to whom frequent allusion is made:

Alexander Dallas Bache, president of the celebrated orphan asylum founded by Stephen Girard in Philadelphia, was sent to Europe in 1837 and 1838 for the purpose of studying educational systems, in order to draw up appropriate regulations for the institution. On his return he composed his celebrated *Report to the Trustees of Girard College on Education in Europe*, which was published in Philadelphia in 1839. Six of the sixteen chapters of the report are devoted exclusively to German relations, and they are frequently referred to in other places. He maintains the fundamental idea that the general principles of education must be based upon human nature, but that they must be modified according to national differences. In this sense he recommends the Prussian model for the purposes of the institution.

Frederick Henry Hedge was one of the first, if not the first, American to complete his education at a German gymnasium, where he acquired a thorough knowledge of the German language. He was therefore able to make a life work of spreading the knowledge of German poetry and philosophy in America.

Theodore Parker was a minister thoroughly acquainted with German literature, even that of no theological tendency. Knortz comments on his other work:¹

His article on German literature, appended to C. C. Felton's English translation of Menzel's history of literature, is very interesting; in this, he makes a vigorous attack on the nativism of his compatriots. At that time American women in New England were accused of so far forgetting themselves as to admire nothing but German classics. A German epidemic was said to have broken out, to which professors and theologians had fallen victims. Parker, who upon occasion could be sarcastic, expresses his astonishment that German literature was not thrown back into the salt ocean when it landed on American soil; but, whilst the guardians of morality had fallen asleep, the enemy came, and American youths and virgins paid homage to the German lotus. He makes a bold stroke for German literature and philosophy, which he considers as important as religion, and proves by numerous examples that Germans are not, as the Know-nothings so often sounded forth, nothing but unbelievers, tobacco smokers, visionaries, and compilers of dictionaries. He triumphantly proclaims German literature to be the richest, freshest, most beautiful, original, and religious of modern times. England [he states] boasts much of its classical learning; but the men who prepare faultless editions of Roman and Greek authors and write keen explanations for them are Germans. He thus proves the superiority of German science in all departments.

¹ Knortz, *History of North American Literature*, I, page 263.

The Emerson brothers may be numbered among the Coleridgeans to whose great influence reference has already been made. William was at first a theologian, and sought Goethe in Weimar, to lay before him his religious scruples. As Goethe's diplomatic advice gave him little comfort, he changed his profession and became a lawyer, whilst his brother, Ralph Waldo, so prominent in philosophy and polite literature, became a minister. His essays belong to the pearls of the literature of the world. He says of Goethe that, since Shakespeare, the world has produced no mind equal to his.

Goethe exerted the very strongest influence over the group of American authors in question. Longfellow has already been mentioned in this regard. George Henry Calvert, the author of "Goethe, His Life and Works," and Bayard Taylor should not be omitted. The latter paid his first visit to Germany in 1844 to take his tramp through that country, which he has so charmingly described in his *Views Afoot, or Europe with Knapsack and Staff*. He was attracted back to Germany again and again, where he met his companion in life, and acquired so thorough a knowledge of the language that he was able to produce his celebrated translation of *Faust*.

At the memorable banquet of former students of Göttingen, held at the Metropolitan Club in New York, November 12, 1898, an object lesson was, in a manner, given on the importance to America of the element of culture that is gained by the development of American intelligence at German high schools. Among those who pursued their studies at the Georgia Augusta before 1850, or soon afterwards, were Edward Everett, George Ticknor, George Bancroft, G. H. Calvert, Emerson, Longfellow, John Lothrop Motley, Basil L. Gildersleeve, Francis T. Child, and George Martin Lane. At that time this category numbered 225 students, of whom not fewer than 137 became professors at American universities and colleges.

One of these, Prof. E. T. Harris, of Amherst College, thus expresses himself on the advantages which the students enjoy there:

Has the American student anything especially to gain in seeking a German university? My observation and experience answer in the affirmative. The important sentiment first referred to can only ripen into profit and pleasure by viewing the scenes I have recounted. We must compare the foreign with the home scenes, that we may appreciate our own. And in the purpose of a scholar it is of the first importance that the opening and developing mind should take in the different methods and points of view we meet with in foreign institutions, where we can come in contact with the very sources of science and all modern thought. It acts as a quickening impulse, and not a few have, for the first time, felt that glow of a burning enthusiasm as they contrasted the German thought and method with those of their native realm. It is like feeding flocks in new fields. There is an added sentiment which has so often been the keynote to so many Americans that have there had a new birth, and afterwards developed oftentimes to honorable standard, frequently to distinction, and sometimes to fame.

Harris, it is true, belongs to a former generation, but the fact that, at present, the American colony in Göttingen averages 30 to 50 students each session proves that the same force acts now as before, despite the great reforms carried out in the system of higher education in this country. The only novelty consisted in the women students, of whom Miss Margaret E. Maltby, the second American woman who ever received an academic degree in Germany, was graduated, a few years since, as doctor of philosophy.¹

It were not easy to exhaust the plenitude of intellectual relations between Germany and America represented by the students of Göttingen alone. But Göttingen is only one among several dozen of German universities.

¹It is probably deserving of mention that the hall was ornamented with the busts of the following six men: Edward Everett, George Bancroft, Motley, Longfellow, Benjamin Franklin, and Prince Bismarck. The latter was so intimate a friend of Motley from their school days that the relation continued till the latter's death.

Before 1850 Berlin and Halle were regarded with special favor, and, subsequently, Leipzig, Munich, Heidelberg, Freiburg, Würzburg, and many others came into notice. President Thwing estimates the number of students abroad at 700 a session. How great, then, must be the number of Americans who have studied in Germany or the neighboring German-speaking countries! There must be thousands, if not tens of thousands, among the living, and the influence of this élite element must, as a matter of course, promote the relations of civilization between the two countries.

In contrast to this American exodus to the East, the constant movement westward annually brought fresh streams of German immigrants into this country. After the movement of 1848 and 1849, that notable class of German-Americans came over that are distinguished from other European malcontents as "the emigrants of 1848" (Achtundvierziger). The greater number of these were physicians, lawyers, ministers, authors, and professors of all kinds, who had adopted the cause of the rights and liberties of the people at the sacrifice of position and honors, as well as fortune. They were forced to emigrate in order to escape the persecutions which they would be called upon to suffer on account of their participation in the revolution. In this country they were taunted by the name of world reformers, because they criticised existing conditions here just as much as those that they had left behind.¹ They discovered, at the same time, however, that as much as reform might be needed, there was possibility of improvement, as American intelligence was positively resolved to smooth the way for all rational progress.

The burning questions of the times were abolition and educational reform, both of which presented to the educated representatives of German idealism a specially suitable field of action, in which they could cooperate, body and soul, with the best native citizens. The cause of German instruction in public schools, particularly, received a decided impulse because of the circumstance that so many educated teachers were at one time at command. We have already mentioned some Germans, as Charles Follen, Francis Lieber, Dr. Beck, Dr. Blättermann, and Oscar Seidensticker, who occupied chairs at universities. There was now no longer a lack of teachers to prevent the introduction of optional German instruction in the public schools of cities with a large German population. In the beginning of the fifties its introduction was effected, as in New York, where, besides French, it became an optional study in the highest class (1854). In the middle of the century the flourishing period of German private and association schools first began, and only upon their decadence could the introduction of this study into public schools meet with success. It was in the natural order of events, therefore, that fresh efforts were made to found a German normal school. Dr. Ad. Douai gave his whole energy to the work in New York, and at the same time was one of the strongest advocates of Fröbel kindergartens, the first of which was opened in 1855 by the wife of Karl Schurz at her residence in Watertown, Wis.

The following words of a competent Anglo-American judge in recognition of the work of the emigrants of 1848 may be appropriately quoted:

These Germans founded a vigorous German-American press for both defensive and offensive warfare. Some of them even dreamed of a great German Freistaat in America. But the most of them were men of cool heads, and looked with a steady gaze to the future of the great Republic. They took up the antislavery cause and made noble sacrifice for the American Union. They transplanted the new turner organizations and revived the gymnastic spirit of Beck, Follen, and Lieber, advocating the doctrine that has become one of the cardinal principles of American education to-day: that manhood is the backbone of the nation's strength. They introduced the scientific method and spirit of the Fatherland, many of them becoming strong factors in American education. They introduced German art, especially the art of music, winning American admiration for the

¹ Compare Mueller's Reminiscences of an Emigrant of '48, page 7.

rich melodies of German song, and eclipsing the masters of Italian opera. They have been, in a word, the inaugurators of a new era of German influence in American life, and we, as a nation, are now at the zenith of this great German revival.¹

The agitation of mind that preceded the civil war was by no means favorable to the positive work of educational reform, which came in a degree to a standstill during the war. The new citizens of the Republic, on that very account, had a better opportunity to prove their patriotism and show their gratitude for the hospitable reception which they had received in the New World. As a matter of fact, they were a valuable aid to the North in its struggle. The following quotation is taken from Vocke's *The German Soldier in the American Civil War*:

We have no complete statistics to inform us with any exactness how great the participation of the different nations represented in our country was in the civil war. According to the statements of Dr. A. B. Gould, who was commissioned by the United States Sanitary Commission to make out his report, "Investigations in the Statistics of American Soldiers," an American work which, as far as I know, is considered the most reliable by the bureaus in Washington, the Germans gave 187,858 men to the Union army, while, in proportion to the German population, as given by the census of 1860, they need only have sent 128,102. According to these figures, therefore, we may assert that the proportion of German troops, in relation to the population, was greater than that of the troops of other nationalities. The Germans likewise gave a number of brilliant leaders and many officers of higher and lower rank whose names are imperishable in the history of the war.

It would lead us too far from our subject to go beyond this short allusion to the circumstances of the case. We understand from it why American patriots never seriously doubted on which side the body of German-Americans would be found if vital interests of the nation were ever at stake. That is true of the whole history of the nation from the beginning to the present day.²

The great events of 1866 and 1870-71 were needed, it is true, to open the eyes of the public at large to the nucleus of substantial and respectable citizens contained within the German communities and particular States. This insight reacted encouragingly on the promotion of German instruction, as the increased attendance on German courses in different places proves.

No event from the end of the civil war till the close of this epoch furnishes a better indication of general progress than the founding of Cornell University, opened October 7, 1868, at Ithaca, N. Y. This institution is named after a prominent resident of that city, Hon. Ezra Cornell, who contributed a half million dollars toward its foundation, upon the advice of Andrew D. White as to how that sum of money could best be devoted to the common good. The programme of Cornell is as short as it is pertinent: "I would found an institution in which anyone may study anything." Could a better man have been found for the execution of this design than the present member of the Berlin Academy of Sciences? He has kindly given to the writer the following information concerning the plans which he cherished when he accepted the presidency:

I may observe that instruction in German has been begun and taken large proportions since I was a student at high school, college, and university. In my young manhood very little instruction, if any, was given in the German language and literature at the leading universities of the United States. What was given was entirely outside any regular course of study and was very little thought of. At Yale University, at the time of my graduation, 1853, no instruction whatever in German was offered to students, though that institution was the second in importance in the United States.

Since that time a very striking development has taken place. In presenting a plan of organization for Cornell University, which was established in 1865, I, as its first president, laid especial stress on the importance of instruction in the German language and literature, and from the opening of that university to instruc-

¹ Thos. J. Learned, "German as a culture element in American Education," p. 19.

² Compare *The German-American during the War between the United States and Spain, 1898*. An address delivered July 4, 1899, by Charles G. F. Wahle.

tion in 1833 the German literature has held quite a large part. In order to create an interest in the literature I called the late Bayard Taylor, who was a devoted lover of German literature, to give lectures on the subject, and also called some resident professors and instructors to take charge of the regular instruction in German. Other large institutions have done the same thing, until now such instruction forms a very important part in the curricula of almost all the leading institutions of learning.

The direction of Cornell University in this way contributed much to inaugurate the most recent epoch in the development of the entire educational system. The author of the classic study on the New Germany deserves the praise of having encouraged, by his action, the advocates of reform to further progress, which has since been happily realized and found tangible expression in the organization of the Johns Hopkins University, the University of Chicago, and the Leland Stanford Junior University.

It would be unjust to pass over in silence the fact that many leading educators in the country had the same end in view as White. Several of these will be mentioned later. We shall now refer to but one, Dr. W. T. Harris.

* * * * *

III. FROM 1876 TILL THE CLOSE OF THE CENTURY.

In 1876 the Johns Hopkins University was founded and the scientific study of the modern languages first introduced. It would be hard to overestimate the influence of this university in giving full academic recognition to the modern languages, in stimulating original research by basing it on purely scientific methods, and in bringing about a more enlightened attitude toward these languages in other centers of learning.

With these words, allusion was made to the founding of the Johns Hopkins University at a large convention of prominent educators.¹ As the new university at first established only one faculty the work could be the more thoroughly carried out, and German derived the greatest advantage. From the very beginning, therefore, German-Americans manifested the greatest interest in this institution. This is proved by the memorial published in 1837 by the former German Literary Bureau, of Baltimore, which took an active interest in the university.

The following instructive extract is taken from the long article of Prof. E. D. Schönrich:

The Johns Hopkins University, founded by a legacy of \$3,500,000 left by the generous Baltimore merchant whose name it bears, was opened October 3, 1876. The administration of the new university was confided to a board of trustees composed of 12 prominent citizens selected by the founder during his lifetime, and this board invited Dr. Daniel C. Gilman, then president of the University of California, to accept the presidency. In May, 1875, he entered upon his duties, and at the opening of the university he had already given convincing evidence of his exceptional ability as an organizer and administrator. In the organization of the German university, besides the French and the English, was kept in view as a model, with such changes and additions as were deemed wise for American conditions. Thus, within the university a preparatory school "college" was established. This college corresponds, in the main, to the three highest classes of a German gymnasium; only the students are allowed a conditional selection of studies (elective system), and certain principles of the German high school (Realschule) have been introduced. The course of studies in the college is arranged for three years. The studies themselves are divided into seven groups, namely:

- I. Classical group.
- II. Mathematical-physical group.
- III. Chemical-biological group.
- IV. Physical-chemical group.
- V. Latin-mathematical group.
- VI. Historical-political group.
- VII. Group for foreign languages.

The whole system aims to adhere to the spirit and organization of the German gymnasium training, with wise consideration of the demands of modern times.

¹ Convention for the founding of the Modern Language Association in Columbia College, 1833.

A diploma of this "college" admits to the university proper. A noteworthy arrangement in the "college" is "the board of collegiate advisers," composed of representative lecturers in the different departments. Upon entering, every college student is referred to one of the members of this board as adviser, who assists him in the selection and pursuit of his studies, to whom the young student may confidentially apply in private affairs, and who, in a certain way, is sponsor to him until his admission into the university. In the university, from the very beginning the most conscientious effort is made to direct students to independent action. All tends to this end. In this respect students are not left to themselves, as in Germany.

Instruction is given according to the German principle of the seminary. All lectures are interpreted in the work of the seminary. The professor proposes themes, which are developed by the students and must be submitted for discussion. What is known in German universities as "privatissima"—regular meetings in the home of the lecturer—is now and then zealously put into practice. Instruction is thus more and more individualized, every individual is stimulated to independent action, and, by intimate intercourse between teachers and pupils, exchange of thought and knowledge is assumed in its highest potentiality.

The university has but one complete faculty—that of philosophy. The medical faculty is about to be established.¹

The university faculty numbers 53 professors and lecturers. With but few exceptions, all have spent more or less time at German universities, 13 of them having received abroad the degree of doctor. These are B. L. Gildersleeve, Ph. D., Göttingen, 1853; Ira Remsen, Ph. D., Göttingen, 1870; H. N. Morse, Ph. D., Göttingen, 1875; W. E. Story, Ph. D., Leipzig, 1875; H. B. Adams, Ph. D., Heidelberg, 1876; Paul Haupt, Ph. D., Leipzig, 1878; Henry Wood, Ph. D., Leipzig, 1879; M. Warren, Ph. D., Strassburg, 1879; R. T. Ely, Heidelberg, 1879; E. Renouf, Ph. D., Freiburg, 1880; Julius Göbel, Ph. D., Tübingen, 1881; G. H. Williams, Ph. D., Heidelberg, 1882; Herbert W. Smyth, Ph. D., Göttingen, 1884.

Two of the above, Professor Haupt and Dr. Göbel, are native Germans. The former was for three years professor of Assyriology at the University of Göttingen. One of the lecturers, Dr. Edward H. Spieker, is a German-American.

No wonder that German is called the "court language of the university." That the German department under such circumstances is most flourishing is evident. Those in charge are Prof. Dr. Henry Wood, Dr. Marion D. Learned, and Dr. Julius Göbel.

Johns Hopkins has been recognized in German university circles as an important scientific center. The rector of Heidelberg University, Professor Kühne, wrote a letter to President Gilman January 2, 1887, in which he says:

On its foundation, and when we became acquainted with its excellent organization, we greeted the Johns Hopkins University with special pleasure as a scientific sister of the New World, and again after the new institution gained the highest recognition everywhere by its magnificent work. In the beginning of its sixth century, old Heidelberg has won a new and young friend, and who knows but that in the future it will not be outstripped by its young, vigorous companion? However the case may be, we can always learn from each other, and I can not suppress the desire that the students of our universities may frequently have the opportunity of studying with you as your compatriots with us.

This letter is a fine testimony that German academicians acknowledge their American colleagues to be equal factors in the great international republic of letters, although the latter have begun to win their laurels in a relatively short time. The Americans, however, have had the advantage of being able to make use of the accomplishments of all older civilized nations for their own advancement, and they have profited well by their opportunity. The possibility that American universities may, in the course of time, outstrip the German, as Professor Kühne says, is therefore not inconceivably far off.

In the meantime, the best teachers and directors of American universities fully agree that they can still learn a great deal from Germany, while the German language is one of the most important mediums to transmit the German

¹It was opened in 1883. In 1860 Professor Gildersleeve founded the American Journal of Philology, which proclaims the progress of that science in America throughout the world.

intellectual treasures which are to be again turned to account. This is verified in a most notable passage of an address of President Gilman to his students.¹ "As Latin was the language of the scholars during the Middle Ages, so the knowledge of German is now indispensable for anyone who claims the name of a student and scholar." The opinion that President Gilman alone holds this view is best disproved by the definition which Charles W. Eliot, president of Harvard, has given of a "liberal education." In a speech delivered at Johns Hopkins, he says:²

The next subjects for which I claim a position of academic equality with Greek, Latin, and mathematics are French and German. This claim rests not on the usefulness of these languages to couriers, tourists, or commercial travelers, and not on their merit as languages, but on the magnitude and worth of the literatures, and on the unquestionable fact that facility in reading these languages is absolutely indispensable to a scholar, whatever may be his department of study. Until within one hundred or one hundred and fifty years scholarship had a common language, the Latin; so that scholars of all the European nationalities had a perfect means of communication, whether in speaking, writing, or printing. But the cultivation of the spirit of nationality and the development of national literatures have brought about the abandonment of Latin as the common language of learning, and imposed on every student who would go beyond the elements of his subject the necessity of acquiring at least a reading knowledge of French and German, besides Latin. Indeed, the advanced student of our day can dispense with Latin better than with French, German, or English; for, although the antiquated publications in any science may be printed in Latin, the recent (which will probably contain all that is best in the old) will be found printed in one of these modern languages. I can not state too strongly the indispensableness of both French and German to the American or English student. Without these languages he will be much worse off in respect to communication with his contemporaries than was the student of the seventeenth century who could read and speak Latin; for through Latin the student of the year 1684 could put himself into direct communication with all contemporary learning. So far as I know, there is no difference of opinion among American scholars as to the need of mastering these two languages in youth. The philologists, archaeologists, metaphysicians, physicians, physicists, naturalists, chemists, economists, engineers, architects, artists, and musicians all agree that a knowledge of these languages is indispensable to the intelligent pursuit of any one of their respective subjects beyond its elements. Every college professor who gives a thorough course of instruction—no matter in what department—finds himself obliged to refer his pupils to French and German authorities. In the reference library of any modern laboratory, whether of chemistry, physics, physiology, pathology, botany, or zoology, a large proportion of the books will be found to be in French or German. The working library of the philologist, archaeologist, or historian teaches the same lesson. Without a knowledge of these two languages it is impossible to get at the experience of the world upon any modern, industrial, social, or financial question, or to master any profession which depends upon applications of modern science. I urge no utilitarian argument, but rest the claims of French and German for admission to complete academic equality on the copiousness and merit of the literatures and the indispensableness of the languages to all scholars.

And at another place in his paper he remarked:

The opportunities and facilities for studying Greek and Latin in our schools are none too great, but surely the opportunities and facilities for studying French and German are far too small. The modern languages should be put on an equality with the ancient.

The effort to place modern languages on a par with the classical in the curriculum of higher institutions is the mark of the last epoch in the history of American education, and this aim naturally contributed to an extraordinary degree to the promotion of German in various directions. Ample proofs of this exist.

At the annual meeting of the National Educational Association held in Baltimore in the year 1876, Prof. Edw. S. Joynes, of South Carolina College, read a paper on the subject, "Position of the modern languages in the higher education," in which he advocates "that the modern languages be elevated from the merely tuto-

¹ Baltimore, Its Past and Present, p. 206.

² What is a Liberal Education? A paper read on the 23d of February, 1884.

rial position which they have so often occupied to a rank and dignity in our higher institutions of learning commensurate with their disciplinary value, with their literary importance, and with their intimate relations to our own language, history, and nation." The convention agreed upon this, as their resolutions proved. This purely academic recognition of the justice of their efforts was naturally not enough for the reformers. Six months after Prof. Charles Francis Adams's sensational speech at Harvard against the "fetich" of Greek, to which modern languages were to be sacrificed, a number of interested men, at the instigation of the teachers of Johns Hopkins, met in New York to form a league for the promotion of modern languages.

At the convention held in the Columbia College halls, December 27 and 28, 1883, for the purpose of founding the Modern Language Association of America, the large colleges and universities of the East, the State University of Michigan, and 12 other colleges were represented by 32 gentlemen, who discussed the following subjects:

- I. The present condition of English, German, and French in our colleges.
- II. The methods of teaching the modern languages.
- III. The best expedients.

Respecting the transactions of the first annual meeting, likewise held at Columbia, December 29 and 30, we need only mention that the following question was discussed:

"Would it be desirable to allow the substitution of one modern in place of one ancient language for admission to college?"

The result of this debate was the appointment of a committee composed of Professors W. T. Hewett, chairman; Dr. H. C. G. Brandt, J. H. Worman, W. L. Montague, and H. A. Todd, who were commissioned to make exact inquiries and submit the results, together with their own opinion, at the next annual meeting. The committee fulfilled their duty in the best possible manner.

The exceptionally thorough and instructive report drawn up by Professor Hewett reads as follows:

THE PRESENT CONDITION OF INSTRUCTION IN THE MODERN LANGUAGES IN AMERICAN COLLEGES.

At the last meeting of the Modern Language Association of America a committee was appointed to examine and report upon the present state of instruction in the modern languages in our American colleges.

The first duty of the committee was to examine the courses of study in French and German offered in the different colleges, to determine, as far as was possible, the time devoted to these studies, both required and elective, the order in which they were pursued, whether they were required for admission, and their relative place in a college curriculum. In pursuance of this duty the committee sent out blanks to nearly a hundred colleges, and received in reply statements of the courses of study and the amount of time devoted to each language.

From catalogues and written reports of instructors the committee has prepared a tabular view of the instruction given in these colleges. The inquiry for information was sent to leading colleges in the East, South, and West, and the returns represent with approximate accuracy the usage of different sections.

We purpose to present briefly the results obtained by this investigation:

First. What is shown to be the prevailing usage in requiring one or more of the modern languages for admission?

Until within a few years the classics and mathematics, with a brief English examination, have been the main requirements for admission to college. The introduction of French or German is comparatively of recent date. Harvard imposed a slight prerequisite for admission in 1874; Cornell University added one year of French, German, or advanced mathematics to the courses in science, literature, and philosophy in 1877; but the traditional requirements in most colleges remained unchanged. A doubt existed of the capacity of training schools to meet this new requirement.

If we examine the table to determine how general the requisition of French or German for admission to the course in arts is, we find that half a dozen colleges

require only one of these languages, and the requisition is extremely meager, not embracing scientific grammar or any definite knowledge of the literature, but an elementary knowledge of forms and the translation of easy phrases. Harvard, Yale, and the University of Pennsylvania require about a half year of one of these languages. Brown University requires one year of French. Boston University and Amherst College one term of French. Swarthmore College requires one year or more of French and German. We thus see how limited even yet is this requirement for admission. A significant event in the past year has been the revision of the courses of study at Yale, with a view of giving a larger place to the modern languages, and the harmonization of other prescribed studies. Through this action at least one-half year of French and German is required for admission, and the study of one or both languages is required during the first two years. A certain liberty of election is permitted during the junior and senior years.

The considerations which in our judgment demand that the elements of French and German shall be required of all students before entering college are: That language is acquired with greatest facility when the student is young, and modern languages have a special claim, since their practical use is essential to so many students. If instruction in French and German is postponed until late in the course, a mastery of the language as well as a comprehensive study of the literature is impossible.

The objection to the study of French and German in our secondary schools has been due to the fear that satisfactory instruction in these languages could not be obtained. In a paper read before the association at its last session I attempted to show that if elementary instruction in Latin and Greek could be successfully given in the preparatory schools by our college graduates there is no reason why the same graduates, if skillful instruction is imparted in college, should not be equally competent to teach French, German, and historical English. I showed, further, from the statistics of the examinations at Harvard for ten years, that while the percentage of students conditioned in these languages upon entrance was at first high it has gradually fallen until in recent years as many have been conditioned in algebra and geometry as in French or German. The number conditioned in English is nearly as great as that conditioned in German. The test of experience has shown that the colleges give direction to all elementary instruction, define its nature, and prescribe its amounts. The standard of instruction in our colleges should not be dependent upon the low average of the majority of our high schools and academies, but should be determined solely by the requirements of higher culture. The law of educational history is that the higher institutions and the higher demands everywhere condition and prescribe the character of the lower.

The objections that may be urged to requiring French or German as requisite for admission to college may be either that the preliminary course of study is already crowded and that no time remains to be devoted to the modern languages, or that in natural order they should be studied later, or that the schools can not give the requisite training. The direct requirements in the classics and mathematics for admission to college may be met in a course of study of three years. The average age of students entering upon the classical course in our colleges is about 18½. If we omit a mass of subjects which are irrelevant or superficially pursued, or which can better be studied later, there is ample time for a thorough elementary training in the modern languages, and there is no reason why the classics should monopolize the earliest and most useful years of the student. There is no purpose in this view of the case to displace the classics, but only to claim an equal right beside them for the modern languages and to insist that language is acquired with greater ease, as regards idioms and pronunciation, early in life than later, and that only when thus studied does it become a permanent possession.

The second question presented by an examination of this table of courses and studies is, What place is assigned to the modern languages?

Out of 50 conferring the degree of bachelor of arts, 18 or 36 per cent could offer instruction in French or German in the freshman year, while 22 or 44 per cent begin the study in the sophomore year; 8 or 16 per cent in the junior year, and 2 or 4 per cent in the senior year. In 23 colleges, or nearly one-half of the whole number, the study of one language is not begun until the junior year. The Canadian colleges which are included in this table, University College of Toronto University, McGill College of McGill University, and Dalhousie College of Dalhousie University, exhibit a progressiveness of spirit and a thoroughness of instruction in the modern languages which may well be imitated by many of our American institutions. In all these instruction in French and German is begun in the freshman year.

An interesting fact, revealed incidentally in the study of this table, bears upon a mooted point at the present time in considering the meaning which attaches to cer-

tain degrees—What value shall the degree of Bachelor of Arts represent? The discussion of this point is foreign to this report, but the following colleges confer the degree of Bachelor of Arts without a knowledge of Greek: Dalhousie College, the Johns Hopkins University, the University of Oregon, Randolph-Macon College, South Carolina College, and Swarthmore College; Harvard and the University of Toronto require an entrance examination in Greek. As a substitute for the entrance examination in Greek, the Johns Hopkins University requires an examination in both French and German; Dalhousie College, in French or German; South Carolina College gives the degree of B. A. for all courses of study. Tulane University confers the degree of B. A. for courses in classics, modern languages, mathematics, natural science, commerce, and mechanics.

The third question to which an answer is given in this table is, What position do French and German occupy in modern college education?

Out of 50 colleges 29, or 58 per cent, require one foreign language; 18 or 36 per cent require no foreign language for graduation in arts; 18 or 36 per cent require both French and German.

There is a marked difference in the different colleges in the amount of instruction afforded in the modern languages. Assuming 15 hours per term as a normal average of the studies of each student and 190 hours as the aggregate of the four years' course, the smallest number of hours of instruction offered in French and German in any college conferring the degree of B. A. is 15 hours, or 8 per cent of all the studies of the curriculum, or, in other words, only one-twelfth of all the time of the student is devoted to the study of the literature of France and Germany. This minimum is counterbalanced by the extended courses in French and German offered in Harvard, Cornell, Michigan, and Toronto universities and Columbia College, where the percentage of elective hours possible in modern languages reaches 53 per cent of the entire curriculum for the degree of B. A.

Of 50 colleges conferring the degree of B. A. from which full reports have been received, Harvard, Michigan, and Cornell universities offer more than 100 hours in French and German out of a possible 190; Toronto, California, and Columbia offer between 75 and 100 hours; the Johns Hopkins University in its collegiate course, Yale, Indiana, Iowa, and McGill universities and Swarthmore and Amherst colleges offer between 50 and 75 hours.

Another question which is answered by the table is, What is the order of precedence of these two languages in the judgment of the majority of educators? The former prominence given to French and the comparatively late introduction of German as an essential part of a college course give French still the precedence in the arrangement of studies. French is studied in three-fourths of our colleges in the first two years. German is begun in a little more than half the colleges during the same period, while in the remainder it belongs to the last half of the course. French is begun in the freshman year in 16, German in 13 colleges; French is begun in the sophomore year in 20, German in 15 colleges; French is begun in the junior year in 11, German in 20 colleges; French is begun in the senior year in 2, German in 2 colleges. One college does not report French in its curriculum, and no mention of it appears in its catalogue. The College of the Holy Cross, in Worcester, Mass., reports little demand for German and a larger demand for French, owing, possibly, to the large number of French-Canadians in the manufacturing cities of New England. Conversely, the College of St. Louis reports almost no demand for French on the part of its pupils, but a large and uniform demand for German.

Few colleges have a modern-language requirement for admission to the course in arts. Of the 50 reported, 3 require French, 2 offer an election between French and German, and 2 require both French and German.

The position assumed at the opening of this paper, that the modern languages should be studied before entering college, receives support from the position of these studies in the German gymnasia. The practical use of at least two foreign languages, French and English, is attained before entering the university. German students possess not only a knowledge of the grammar of these languages, but familiarity with much that is best in the literatures. The admirable results attained in Germany in the *bürgerschulen* and gymnasia in the same periods in which pupils are attending our grammar and high schools show the waste of time, the dissipation of interest, the defective methods of our schools. The limitation of preliminary studies to language, viz. the classics, French and German, historical English, the essentials of arithmetic, which do not involve advanced processes, algebra and geometry, would afford the basis for an admirable collegiate training. The multiplicity of subjects, the loss of time by devoting attention to minor branches, naturally and better acquired later, are among the evils of our present school system. The pupil's powers are exhausted and no true mastery of the essentials of a single branch of knowledge attained.

The attention of school boards should be directed to correcting these abuses,

which are due to a false conception of what is required in elementary education as well as to defective methods.

We find established in the numerous colleges a course sometimes called the Latin-scientific course, but which in a majority of cases is designated as the course in philosophy. In one or two cases we find the term "course in letters," with the degree Bachelor of Letters applied to it, as in the University of Virginia. Sometimes it is called the modern-language course, with the degree of Bachelor of Arts, as in Adelbert College, or the modern classical course, as in the University of Wisconsin, where the degree of B. L. is given. This course does not require Greek, either for admission or after entering. The place of Greek is supplied usually by an entrance requirement in modern languages. In this course more opportunity is presented for the study of modern languages than in the course in arts which we have just considered. The requirements for admission are considerable, and large opportunity for the study of French and German is afforded. Nearly one-half of the colleges reported contain this course in philosophy, or one in letters of the same general character.

One course of our educational system is the variety of degrees conferred which have no specific or recognized meaning. An effort on the part of all our colleges to unify degrees and give them a fixed value would contribute to rescue our degree system from merited contempt. Degrees are even invented to accommodate them to some supposed fitness on the part of the recipient, whose qualifications would not justify a degree of general signification. The prevalence of the degree of Ph. B. suggests that its adoption in its present accepted meaning would be one step in the direction indicated.

A noticeable and commendable tendency in scientific and technical schools and in colleges offering scientific courses is shown by the prominence given to the study of the modern languages. The vast treasures of scientific discovery which are contained in these languages make the most advanced attainments impossible without them. The tendency of all professional and technical pursuits is to exclusive devotion to a single end. A narrow and strictly technical course limits the view of the relation of the different departments of science. Literary training makes thought and expression clear, and any course of study that ignores this element in education is in that degree defective and its results unsatisfying.

The leading scientific schools, such as the Sheffield Scientific School and the Massachusetts Institute of Technology, make ample provision for the study of French and German, both as instruments of culture as well as for their practical use in scientific pursuits.

The critical study of English has made a rapid advance since the foundation of this association. This is especially noticeable in our Southern colleges. Excellent advanced courses in Anglo-Saxon and Early English are now offered in many colleges in the South. For a decade, it is safe to say, this study in the North was confined to but a few leading institutions, among which Harvard, Lafayette, and Cornell deserve especial mention. An examination of the courses of study in the hundred colleges which have been reviewed reveals graver deficiencies in the study of historical English than in that of French or German. The instruction in our own language, with its matchless inheritance of the treasures of literature, is less adequate than that of the modern languages. Here the secondary schools are lamentably deficient. Years of time are spent in the study of grammar and in reading some elementary history of literature, and the student "graduates" at some famous high school with no knowledge of Anglo-Saxon, no linguistic training which will fit him to read Chaucer or even Shakespeare intelligently. The murder of the innocents is repeated in our public schools every year and in the training of nearly every scholar.

Two or three questions remain: Does the character of the French or German language or the relation of either to English or to the classics suggest a natural order in their study? It is undoubtedly true that our large German population, scattered throughout all our cities and larger villages, makes it possible to secure instruction in German from capable native teachers more generally than in French. The compulsory instruction in German in the public schools of many Western cities gives prominence to this language and promotes its study. If we assume that the historic study of English should become a part of all instruction in our lower schools, replacing the so-called English grammar, the transition to German is not difficult. Its kindred words and inflexions will present enough of divergence of form to stimulate comparison and attract interest without the introduction of the difficulties of an entirely dissimilar language. For students unfamiliar with the classics, the discipline of a language possessing such a regularity of forms and fullness of inflexions as the German affords a linguistic discipline akin to the classical.

Similarly, the entrance upon the study of French through the Latin is easy. A knowledge of French is, however, of high, if not indispensable, value in the study of semi-Saxon, and of later English. These considerations reenforce our position at the opening of this paper, that both in themselves and from their relation to later study, instruction in these two important languages should be begun at an early date. A knowledge of French will, conversely, throw light upon Latin forms and facilitate its acquisition.

The question what is a proper equivalent for Greek in the requirements for admission to college can not be settled by any a priori or doctrinaire considerations. Admitting the equal value of both languages in modern culture, and the force of the argument in favor of their early, precollegiate study, the question of their relative order or precedence will be determined by practical considerations in the schools; only the grammar will be taught on scientific and historical principles, and a substantial acquaintance with the languages themselves will be properly required.

The above report is a commendable evidence of the earnestness and conscientiousness with which the association accepted its important mission. It was supplemented by two other reports submitted to the association, one of which referred to the progress of the study of modern languages in the South, while the other gave a general statistical review of its growth throughout the country.

The text of the first is as follows:

Report by Prof. Edward S. Joynes, of South Carolina College, on the progress of modern language study in the colleges and universities of the late Confederate States since the war (1860-1884).

The study of the modern languages was so little known in the colleges of the South before the war, as the following statement will show, that it may be said with truth that the progress exhibited in this paper covers a little more than a decade—the years (since 1837-1876) of the restored autonomy of the Southern States and of the reviving work of their educational institutions under the new condition of public affairs. Indeed the results would have been only the more striking if 1870 instead of 1860 had been assumed as our starting point of comparison, but they would not have been so significant.

Early in November I issued to 45 colleges and universities of the late Confederate States, including all institutions of any prominence, a circular letter asking for information on the points hereafter noted. I regret to say that I have received only 15 replies. The institutions from which returns are presented are the following: The University of Virginia; Washington and Lee University, Virginia; Roanoke College, Virginia; Virginia Military Institute; Virginia Agricultural College; West Virginia University; Vanderbilt University, Tennessee; University of Arkansas; South Carolina College; Wofford College, South Carolina; South Carolina Military Academy; University of Louisiana; University of Texas; Southwestern University, Texas; Austin College, Texas. Many of the institutions from which the most important returns might have been expected are, I regret to say, not reported, notably the University of North Carolina, the University of Tennessee, the University of Georgia, the University of Alabama, the University of Mississippi, etc. But I have good reason to know that their returns would only have confirmed the results reported. It should be stated that some of the institutions here included have been founded since 1860. But this does not affect the value of the returns given. This fact is only a further testimony to the general awakening of education in the South since the war.

Summary of instruction in modern languages in fifteen colleges and universities in the late Confederate States.

	1860.	1884.	Gain.	Gain per cent.
Number of professors of modern languages.....	3	15	12	400
Number of other teachers of modern languages.....	4	15	11	275
Number of students of modern languages.....	255	1,210	955	370
Total hours weekly in modern languages.....	30	238	208	730
Number of courses of study for degrees, including modern languages.....	5	47	42	840
Total years in any modern language required for degrees.....	6	36	30	500

* All in one institution, the University of Virginia.

These figures are remarkable. In fact they almost render comparison impossible, by showing that the study of modern languages has found a recognized place in the higher education of the South only since the war, or, as has been already explained, within the last ten or fifteen years. When we consider the poverty and depression of the people of the South during this period we must confess that the facts here exhibited are not only remarkable, but extraordinary and most encouraging.

In many if not all of these institutions the work done in modern languages would doubtless fall far below the highest standard. But this is due not so much to shortcomings in the colleges themselves as to the want of good preparatory schools in the South, and applies to modern languages only in common with all other departments in Southern colleges. The professors and teachers of modern languages in these colleges are, so far as I know them, men of high qualifications and of earnest purpose. The foundation at least is securely laid, and there is no reason to doubt that the work in this department will be advanced as rapidly as the condition of our Southern people may require or permit.

Much of the progress here exhibited is due to the general awakening of educational interest in the Southern States; much of it also to new and larger views of education in general—to enlarged and multiplied courses of study and the relaxation of the old curriculum. But not a little is due directly to new views of the educational value and importance of the modern languages themselves, as shown, first, by the faculties, and then in the progressive action of the governing boards of Southern institutions. Of course such movements in official quarters are only responsive to a progressive change in the general public demand, but this demand is also greatly stimulated and extended thereby. On this point I may add some interesting facts within the limits of a single personal experience—interesting not from their personal bearing, but because they illustrate the growth of opinion in influential quarters. The first chair of modern languages established in the South, so far as I know, after the war was (1866) in Washington and Lee University—then Washington College—Lexington, Va., under the presidency of Gen. Robert E. Lee, whose large and prophetic mind foresaw the future as it recognized the present demands of Southern education. Yet even under this great influence these languages were admitted, as it were, only by sufferance. A special fee of \$20, outside of the usual tuition, was charged for each modern language, thus, at first, practically excluding them from the course of study. In a few years the growing demand overcame this restriction and the modern languages were admitted into the regular courses on equality with other branches.

In 1875 the Vanderbilt University was organized on a scale designed to represent the foremost progress of Southern education. Yet in its first programme only an adjunct professorship, with greatly reduced salary, was assigned to modern languages. But before the organization was effected this was raised to the rank and pay of a full professorship, and from the first this department was one of the most prominent in the university, as now—still further subdivided—it is one of the most advanced in the South. From 1877 to 1880 a like advancement and extension of the course of study in modern languages was made in the University of Tennessee. In 1882, in the reorganization of South Carolina College, only a tutorship on half pay was assigned to modern languages, but when the faculty was constituted this department occupied a full chair, and the modern languages were made requisite in all the courses of study appointed for degrees. These are only records of my own experience, given here as signs of a public progress; others of equal interest could doubtless be found in the recent history of other Southern institutions, as the University of Mississippi, for example.

Thus, in the South all signs point to the gratifying progress of the study of modern languages in the higher education. Fifteen years ago these languages were hardly recognized in our colleges. Now there is not a Southern college of any prominence or pretensions that does not make provision, more or less extensive, for their study; and gradually, yet rapidly, they are taking their place alongside of the most favored requirements in our courses of study. This progress is supported by an intelligent and growing appreciation on the part of students and of the public. Wherever the elective system prevails these studies hold their own and show, indeed, one of the largest of the rates of increase. The day of prejudice and depreciation which I have witnessed is now past. The right of the modern languages to a place in every scheme of liberal education, on an equality with the most important studies, is now recognized in every Southern college which aspires to a leading rank.

The above-mentioned statistical review included the District of Columbia and 36 States, from which authentic reports or catalogues were obtained. Within these localities in the year 1884 there were 273 institutions with instruction in

modern languages that engaged 616 professors and instructors besides 92 other teachers.

From this list we make the following extract, which contains the 205 institutions that reported German as a special study. It is likewise of interest to add the names of the professors of German and the number of their assistants, as they are contained in the original report.

List of colleges and their professors of German.

State and institution.	Professor of German.	Number of assistants.
California:		
State University of California	Albin Putzker	
Santa Clara College	W. Melchers	
University of Southern California, Los Angeles	Rev. G. H. Bolinger	
St. Ignatius College, San Francisco	Rev. P. Mans	
Colorado:		
Colorado College, Colorado Springs	Mrs. Mary T. Hatch	
University of Colorado, Boulder	Miss Mary Rippon	
University of Denver, Denver	Dr. Wm. P. Headen	
Connecticut:		
Yale	Tutor, Alfred B. Nichols	2
Sheffield Scientific School	Instructor, Albert S. Wheeler	
District of Columbia:		
Columbian University	A. H. Janus	
Washington High School	Dr. W. Bernhardt	
Illinois:		
Augustana College, Rock Island	A. O. Bersell	
Blackburn University, Carlinville	Instructor, Th. Blanke	
Ewing College, Ewing	Instructor, Val. Minier	
Illinois College, Jacksonville	Henry E. Storrs	
Illinois State University, Champaign	Edward Snyder	
Illinois Wesleyan University, Bloomington	Wm. H. Waite	
Knox College, Galesburg	Thomas R. Willard	
Lake Forest University, Chicago	Miles Whittlesey	
Lincoln University, Lincoln	Teacher, Miss Clara Cook	
McKendree College, Lebanon	Rev. Wm. F. Swahlen	
Northwestern College, Naperville	Rev. Wm. Heidner	
Northwestern University, Evanston	Instructor, Rev. Geo. H. Horswell	
Shurtleff College, Upper Alton	Instructor, Rev. T. C. C. Clarke	
St. Ignatius College, Chicago	Rev. T. F. Pohls	
St. Viateur's College, Bourbonnais Grove	Rev. Angels Dosling	
University of Chicago, Chicago	Oscar Howes	
Wheaton College, Wheaton	W. H. Fischer	
Indiana:		
Butler University, Irvington	Hugh C. Garvin	
Earlham College, Richmond	Dr. Hans v. Yagemann	
Indiana University, Bloomington (department of modern languages)	Dr. S. Garner	1
Moore's Hill College, Moore's Hill	Monroe Vayhinger	
Iowa:		
Agricultural College, Ames	Preceptress, Martha Sinclair	
Iowa College, Grinnell	Instructor, Wm. T. Seelye	
Iowa Wesleyan University, Mount Pleasant	Instructor, Geo. Addiks	
Cornell College, Mount Vernon	Mrs. Harriette J. Cooke	
St. Joseph's College, Dubuque	P. Hoffmann	1
Kansas:		
Baker University, Baldwin	Miss Ida A. Ahlborn	
Bethany College, Topeka	Miss C. Adell Coleman	
Campbell Normal College, Holton	Carl F. Menninger	
Highland University, Highland	Dr. Daniel Kloss	
Kansas Normal College, Fort Scott	H. T. Bauer	
Ottawa University, Ottawa	Dr. Gge. Sutherland	
St. Benedict's College, Atchison	Chas. Stoeckle	
State University, Lawrence	Arthur G. Canfield	1
Washburn College, Topeka	Miss Nathalie Thomas	
Kansas Normal School, Paola	Miss Ella M. Kingsley	
State Normal School, Emporia	Miss Emilie Kuhlmann	
Kentucky:		
Bethel College, Russellville	John Phelps Fruit	
Central College, Richmond	J. T. Akers	
Center College, Danville	John W. Redd	
Georgetown College, Georgetown	R. H. Garnett	
Kentucky University, Lexington	Charles Schultze	
Kentucky Wesleyan College, Millersburg	B. T. Spencer	
South Kentucky College, Hopkinsville	Frans S. Braun	
Cecilian College, Cecilian Post-Office	Ferd. Kretz	
St. Joseph's College, Bardstown	Alb. Schädler	
Louisiana:		
Centenary College of Louisiana, Jackson	C. E. Greene	
Louisiana State University, Baton Rouge	L. W. Sewell	
Tulane University, New Orleans	J. Hanno Deiler	
Jefferson College, St. Mary's, St. James	Rev. A. Braxmeyer	

List of colleges and their professors of German—Continued.

State and institution.	Professor of German.	Number of assistants.
Maryland:		
Baltimore City College, Baltimore	Chas. F. Raddatz	
Johns Hopkins, Baltimore	Teachers, Geo. Hempf and Henry Wood	
New Windsor College, New Windsor	Instructor, Emil Benkert	
Mount St. Mary's College, Emmitsburg	C. A. Lelcup	
St. John's College, Annapolis	Wm. H. Hopkins	
Western Maryland College, Westminster	Instructor, Rev. T. H. Lewis	
Massachusetts:		
Amherst College, Amherst	Henry B. Richardson	
Boston University, Boston	Augustus H. Buck	1
Harvard, Cambridge	G. A. Bartlett	3
Smith College, Northampton	Fran. Marie F. Rapp	
Tufts College, College Hill	C. E. Fay	
Wellesley College, Wellesley	Elizabeth H. Denio	3
Williams College, Williamstown	Rich. Austin Rice	1
Massachusetts Institute of Technology, Boston.	Charles P. Otis	
Michigan:		
Adrian College, Adrian	Barnard H. Rupp	
Hillsdale College, Hillsdale	Rev. John S. Cogg	
Kalamazoo College, Kalamazoo	Instructor, Rev. Ign. Müller	
University of Michigan, Ann Arbor	Instructor, Alfred Hennequin; Professor of modern languages, Dr. Edw. L. Walter.	
State Normal School, Ypsilanti	August Lodemann	
Minnesota:		
Hamline University, Minneapolis	E. F. Mearkle	
University of Minnesota, Minneapolis	John J. Moore	
Mississippi:		
Mississippi College, Clinton	John G. Deupree	
Tocopola College, Pontotoc	Wynn David Heldeston	
University of Mississippi, Oxford	Charles Woodward Hutson	
Whitworth Female College, Brookhaven	Teacher, Miss Annie Marion Brown	
Central Female Institution, Clinton	Emil Meuger	
Dudley Institute, Dudley	President, W. S. Dudley	
Elisha Calaway Institute, Macon	Teacher, Miss Caloway	
Grenada Institute, Grenada	Teacher, Miss Edwina Bramley	
Maury Institute, Holly Springs	Teacher, Miss Gray	
Mississippi Military Institute, Pass Christian	Professor Patrick	
Macon Public School, Macon	A. H. Foster	
Missouri:		
Central Wesleyan College, Warrenton	J. M. Rinkell	
Drury College, Springfield	Geo. B. Adams	
Fayette College, Fayette	Miss Mary E. Barnes	
Lewis College, Glasgow	Charles J. Peterson	
St. Louis University, St. Louis	Edward Hanhauser	2
St. Vincent's College, Cape Girardeau	Rev. H. Augustus Asmuth	1
University of Missouri, Columbia	James Black	1
Washington University, St. Louis	J. K. Hosmer	
Westminster College, Fulton	C. C. Hersman	
William Jewell College, Liberty	R. B. Semple	
Washington University (Manual Training School).	Dr. J. Jinks	
Nebraska:		
University of Nebraska, Lincoln	Modern languages: Tutor, Lawrence Fossler; Professor, Frederick W. Grubé.	
New Hampshire:		
Dartmouth College, Hanover	Instructor, John Henry Wright	
New Jersey:		
College of New Jersey, Princeton	Dr. H. Huss	
Seaton Hall College, South Orange	Fridolin Meyer	
Stevens Institute, Hoboken	Charles F. Kroeh	
New York:		
Alfred University, Alfred	Mrs. I. F. Kenyon	
Cornell University, Ithaca	W. T. Hewett	*2
Hamilton College, Clinton	H. K. G. Brandt	
Hobart College, Geneva	Charles J. Rose	
Union College, Schenectady	Wm. Wells	
University of Rochester, Rochester	A. H. Mixer	
Vassar College, Poughkeepsie	Miss Minna Hinkel	
Wells College, Aurora	Miss Elise Piutti	
Columbia College, New York	H. H. Boyesen	b 1
Manhattan College, New York	No name given	
St. John's College, Fordham	Adolph Peterson	
St. Lawrence University, Canton	H. H. Liotard	
University of the City of New York	Dr. Chas. Carroll	
University of the State of New York	Dr. Adolph Werner	
Adephi Academy, Brooklyn	Instructor, H. J. Schmidt	

* H. S. White and T. T. W. Krueger.

b Dr. Wm. H. Carpenter.

The process of transformation begun during the last quarter of the century by the most advanced colleges in order to develop into universities in the German sense of the term, is not within the scope of this article and is therefore passed over; moreover, data relative to the separate institutions are given in the next part of this article. The action of Harvard, immediately followed by that of Columbia and Yale, opened the way. The process is not by any means completed, as the facts stated at the close of this section prove.

It may not be out of place to mention here that, in the meantime, in the year 1878, the German normal school planned for more than a half century, claiming an uninterrupted period of activity for more than twenty-two years, was eventually established with success. The history of the founding of this seminary and its subsequent results is contained in that section of this article which treats of normal schools. We need only mention here that Milwaukee possesses a similar school, the German-English Academy, with which a normal school for athletics is connected.

The merit not only of having founded, but of having organized this institute for active work is due to the National German-American Teachers' Association, in existence since the year 1870. The author has learned the following condensed facts respecting the purpose and success of the work of this association, which has striven for the following ends:

I. The introduction of kindergartens, according to the principles of Pestalozzi and Fröbel, which since 1870 have found greater and greater recognition on the part of Anglo-American educators. One of the first kindergartens was established by the association in Detroit. In Milwaukee a kindergarten and normal kindergarten are connected with the seminary.

II. The introduction of athletic instruction into the curriculum of public schools. In the cities where it is found its establishment is due to the efforts of the association, which received the warmest support from German athletic associations.

III. The introduction of instruction in manual training and hand work into public schools. It is generally known that instruction in athletics, manual training and hand work has long since been introduced into the schools of Germany. All advanced teachers agree to generalize this reform in America, in which country its favorable results have likewise been sufficiently proved.

IV. The association has always exerted the strongest efforts to replace the method of mechanical memorization formerly dominant in America by the German, which aims systematically to disclose the meaning of the subject of instruction and to develop the pupil's power of reasoning.

V. The association has always endeavored to do away with the preponderance

of women teachers, the crowding of classes, and the restriction of instruction to the traditional three R's.

VI. The association has finally endeavored to make clear to the public and professional mind the necessity of a normal education for teachers, the superintendence of schools by competent educators, and the value of instruction in more than one language, particularly the English and the German.

No more need be said of the former work of the association. The present president, Prof. M. D. Learned, published the following important article in the *Pedagogical Monthly*, of December, 1899:

THE "LEHRERBUND" AND THE TEACHERS OF GERMAN.

It is characteristic of the American people as an English speaking nation to ignore forms of modern culture which are not expressed in the English language. Accordingly, we find even college and university professors of German ignorant, not only of the character, but in many cases, even of the existence of the extensive literature which has been written in America in the German language, and of German organizations, and of German effort in general in this country.

The organization of German-American teachers known as "Nationaler Deutsch-amerikanischer Lehrerbund" has not received hitherto the cooperation of academic teachers of German which it deserves and invites. Now that the Association of Colleges and Secondary Schools has brought about more harmonious relations between academic and secondary teachers, and the attention of academic men has been drawn more and more toward the work of the National Educational Association, the time seems ripe for a closer affiliation between the "Lehrerbund" and the professors of German in American colleges and universities. Such an affiliation would be a further stage in the evolution of American education during the last three decades. The American Philological Association¹ first effected a union of the professors of languages, and reared, so to speak, the generation of modern language professors, who in the year 1883² formed a new organization for the furtherance of their more specific interests. Thus the Modern Language Association of America came into existence. In the course of a decade a need was felt for similar organizations within more limited territory, to facilitate the holding of meetings and to subserve the interests of the State or group of States in question. Thus originated the Modern Language Association of Ohio³ and the Central Modern Language Conference.⁴ Within the last five years a further differentiation has manifested itself in the formation of societies devoted more specifically to the interests of a single language—in this case, of German—thus giving rise to State organizations of teachers of German. So were formed the Association of Teachers of German in California,⁵ and the Association of Teachers of German in Pennsylvania,⁶ including teachers of German of all grades, and thus realizing in another direction one of the aims of the Association of Colleges and Secondary Schools.

In like manner there has been an evolution in the German organizations toward the same result. The first organization of German teachers in America, the "Lehrerbund," now in the thirtieth year⁷ of its existence, directed its attention for years to the exclusive interests of the lower and secondary schools, which formed in themselves, so to speak, a system of German instruction culminating in the foster-center of German teachers in America, the "Lehrerseminar" in Milwaukee. Within the last few years the Germans have awakened to the fact that they have made a great contribution to American culture, but that, while Americans have been appropriating German culture, going by hundreds to study at German universities, the German youths in this country have been discarding and even

¹ Organized November 13, 1868, at the University of New York, and including within its scope both ancient and modern languages and pedagogy. It is worthy of note that one of its prototypes was the German society, "Sammlung der deutschen Philologen und Schulmänner." (Compare proceedings of the "American Philological Association," I, p. 5 ff. 1860.)

⁷ The thirtieth annual meeting (Lehrertag) takes place in Philadelphia, Pa., at the close of the school year 1899-1900.

despising the "Muttersprache," thus imperiling the future of the German language and life in America. Accordingly, these Germans have organized the American-German League,¹ one of whose avowed objects is the cultivation of the German language in America. Every possible effort is being made by them to improve the teaching of German in both German and English schools, not to the exclusion of English, but simultaneously with it. All these forces—the "Lehrerbund," the associations of teachers of German in the various States, and the American-German League—have mobilized and lined up with the associations of academic professors in the cause of modern language instruction, in this case, in the cause of German in the schools. It is at this juncture that the old organization of German teachers in America, the "Lehrerbund," takes another step forward by inviting the cooperation of the entire body of German teachers and teachers of German from the kindergarten to the university to join in one united effort to win for German in the schools that recognition which its importance in American culture demands.

In the cultural development of America, German influence has played a most important part, and bids fair to continue for a long time the foremost foreign influence in American life. Americans have long been divided, in their estimate of the value of this influence, into two parties. The German-born American, as well as many born here of German parentage, insist upon the preservation of German speech and German customs, both in public and private life. Accordingly, they maintain German churches, German schools, German clubs, and other German forms of social life. The extremist of this party goes still farther and advocates that German be taught in the public schools and be employed as a medium of all instruction in those schools whose pupils come from German families. This has resulted, in some cities, in the organization of German public schools for German children. Others, who are less extreme, are content to see German taught in the primary schools during certain periods, with German as the medium of instruction during these periods. To this latter class of the pro-German party belong many English teachers of German.

The other party is the native Anglo-American population, who insist upon "American (English) for Americans." They oppose everything foreign in the schools, particularly everything German; they oppose the German language and the German school; they disapprove of the German church, ignore the influence of German culture, and look with disfavor upon the inroads of German industry and trade. Happily, the extreme representatives of this jingo spirit are not the most influential in directing the deeper cultural processes of America. The more moderate class of this party represent the educators of the land who recognize the importance of German culture in our life, and of the German language as a discipline in American education. Through the efforts of this class German has been introduced as an essential language in the college and university, and is now fast finding its way into the curriculum of the secondary schools, particularly high schools. While this class of educators recognize the cultural value of German, they insist upon English as the medium of instruction. They do not approve of public schools conducted exclusively in a foreign language, and deprecate the segregation of foreign-born citizens in certain districts of country or city for the preservation of foreign forms of life. To this moderate class of the pro-American party belong some of foreign extraction, and a few even of foreign birth.

It is clear to the unpartisan observer that the permanent interests of both extreme wings lie along the line of a compromise between the moderate classes of each party—in a word, in the cultural elevation of our American youth through the best educational means which Germany and America can provide.

The best corroboration of this view is the fact that the highest and best preserved forms of German life in America are to be found in those German communities which represent the highest culture and most liberal ideas. It is in German communities representing the uneducated classes that we find the German element so objectionable, not only to the English population, but to the better German classes as well. It is in them, too, that we find that immovable German conversation which has made them impervious to modern culture.

The educated German classes and the academic men in America understand and appreciate the significance of these facts. The professors in our universities and colleges and of the better secondary schools understand the problems which confront the Germans among us better than any other class of Americans. In fact, this educating class have actually built up in America, for the most part unconsciously, a "Gelehrtenrepublik," which furnishes a prototype of what the German

¹ October 3, 1898 at the "Halle der deutschen Gesellschaft" in Philadelphia, Pa. The first aim of the league is "die Einführung des deutschen Sprachunterrichts als einen Zweig des Lehrplanes in den öffentlichen Schulen."

in America might well aspire to become. This republic of teachers, composed of Germans of both native and foreign birth who have assimilated the best of American culture, and of Americans who have appropriated the best German culture, is the best conservator of true, lasting, German influence in America, as in it the two cultures are harmoniously combined.

Academic teachers have hitherto directed their efforts mainly toward the more technical pedagogical side of German teaching in our schools, giving only incidental attention to the larger problem of what German influence is to do in shaping American life and institutions or of what must be the ultimate effect of the German and American culture persisting side by side in America with little or no affiliation between them. A glance at such a state of things must show that a continuation of such conditions would prove detrimental both to Germans and Americans. Two hundred years of German history in America have demonstrated that the best results of German effort have followed the higher activity in the domain of education, art, statesmanship, and international trade—in a word, in those departments of life in which the German has come into close touch with the native American. In like manner, three centuries of English history in America have taught that the greatest epochs of cultural development have been those in which there was a strong infusion of foreign influence in American life, as was in the case of French the present century.

The educators of this country should no longer remain mechanical pedagogues, looking only to the tasks of the day. They must look forward into the future to the probable results of the coalescing of German and American forms of culture in our national life. It is not sufficient that the college or university professor content himself with teaching the principles of the language and the outline history of the literature. He must mediate between the two great cultures and infuse the stimulus of German thought into the American mind in such intelligent wise that a new and higher intellectual life shall follow. The academic professor should, moreover, try to unfold to the American student and to the American people, through the medium of German thought, a new kinship of the Teutonic races, and thus broaden the horizon of his countrymen, enrich their cultural resources, and thus lay the foundation of a new epoch in American literature.

In the cooperation of the German and American in our national education lies the possibility of an even higher form of linguistic and literary scholarship, and a higher cultural ideal. No teacher of German should permit his students to rest satisfied with a bare reading knowledge of German. Much less should any teacher venture, or any school board allow, a teacher to teach German without the ability to speak and write that language with reasonable facility. It is a well-known fact that while the universities of the land are requiring a sight-reading knowledge of German and French, even of candidates for the degree of doctor of philosophy in any science, many of our high schools, and even colleges (be it said to their shame), are employing teachers who can not so much as pronounce correctly the foreign language which they are supposed to teach. It is high time that this state of things had become an impossibility in all departments of modern languages.

The one point upon which academic and secondary teachers in America should now concentrate their energies is the elevation of the secondary teaching into a profession, requiring the same vigorous preparation as the strictly academic career. In order to accomplish this a number of preliminary steps are necessary:

1. *A uniform system of education.*—Regulating the curricula and methods of all schools, public and private, which will guarantee the continuity of educational effort throughout all grades of instruction.

2. *The emancipation of education from politics.*—Some of our Western States seem to be rising to that dignity of statehood which protects the schools from the toils of political intrigue. This is unfortunately not the case with a number of the original thirteen.

3. *The State recognition of the importance of experience and skill in the lower and secondary schools.*—The disgrace of our public schools has been that they have been made recruiting stations for other professions. The student of law, medicine, or theology teaches school till he can save money enough to quit this business for his chosen profession. The young woman waiting, not like Micawber, for something to turn up, but for some one to turn up, teaches school as a temporary makeshift.

These conditions once fulfilled, the elevation of school-teaching to a profession follows of necessity.

This, then, is the work which clamors for the cooperation of all academic and secondary teachers of German—that the language, wherever it is taught, should be taught correctly and intelligently by trained teachers who are willing to make it their life work.

Toward the accomplishment of this result the "Lehrerbund" offers:

1. The advantages of a thoroughly organized association, with the experience of thirty years, during which time it has accumulated a vast amount of valuable material, which has been published in the official organ, recorded in the "Protokoll," or transmuted into improved methods. It has a creditable standing in America and is in close touch with European education.

2. An opportunity, especially at the annual meeting (Lehrertag), to promote mutual acquaintance between German teachers and teachers of German of all grades and to discuss questions of vital interest.

3. A definite plan for the improvement of the teaching of German in the schools by advocating (a) a thorough speaking knowledge of German on the part of all teachers of the language; (b) the introduction of a full course of four years of German in the high schools; (c) the teaching of German in the lower grades as far as it is advisable; (d) the use of German as the medium of instruction where the conditions will permit; (e) the emphasizing of a careful use of German in the German home, in order to preserve the purity of the idiom in America, and to secure to the youth of German extraction the bilingual advantages to which the accident of birth entitles them.¹

4. A well equipped "Lehrerseminar," which devotes itself to the training of primary and secondary German teachers, eliciting the attention of academic men by the thoroughness of its work. There are in this institution greater possibilities, which might result in the development of a National German-American Normal School in the higher and ideal sense of the term (such as none of our normal schools has yet been or bids fair to become), a "Pädagogium," supplementing the work of the colleges and universities, and forming a recruiting station for teachers who already hold the degree of A. M. or Ph. D., and aspire to permanent careers in the high schools and secondary schools of the land.

5. A medium of publication, through its official organ,² open to all teachers of German for the interchange of views touching methods, books, administration, and other vital subjects. Here the elementary, secondary, and academic teacher will find an opportunity to discuss text-books and other literature relating to the schools and to make original contributions to American education. The official publication of the "Lehrerbund" welcomes such contributions from teachers of every grade. The closest touch with European schoolmen will be aimed at, and can not fail to prove a source of stimulus.

6. The greatest thing the "Lehrerbund" offers is the opportunity of cooperation between the hitherto rather exclusive German teachers and their altogether too indifferent English-speaking colleagues, thus opening the way to a harmonious union of educational forces which must lead to a better understanding and to a well-organized system of national education. It is, after all, the teachers of America who are the medium of cultural intercourse and of friendly feeling between Germany and America; and the closer the relation between the German and English teachers of America, the more generous will be the sympathies between them. Both will be more intelligently loyal Americans, and both will contribute to a more intelligent friendship between the German Empire and the American Republic. This is a task not for the ephemeral jingoistic press, but for the slower and surer processes of national education.

This publication, not widely enough known, by an Anglo-American professor, is manifestly a bridge between the efforts of Germans who esteem their native language in America and do not wish to disclaim their national individuality, and those of the most intelligent Americans who recognize in the German language, German literature, and German science factors of culture that are, in the course of time, to become more effectual means still in the progress of American civilization than they have been in the last two centuries. It is to be hoped that, in this way, a new era in the history of German-Americanism will be introduced, characterized by an intense interest in German at all the better educational institutions of the country.

The establishment of special "German departments" at American universities and colleges of high rank is evidently an important step in this direction. Again Harvard University is among those which led the way, especially as the reform

¹The general attitude of the "Modern Language Association" on some of these points is set forth in the Report of the Committee of Twelve, just issued by the Bureau of Education at Washington.

²The old organ, "Erziehungsblätter," was discontinued in the spring of 1899, and the first number of the new organ, "Pädagogische Monatshefte," continues the work on a different plan.

was undertaken in the consciousness of thus "contributing to the appreciation of German ideals in America." In a short article on this subject, prepared for the Chicago Exposition, we read:¹

During the whole time from Follen's withdrawal (1835) till the appointment of Professor Hedge (1872) the department was in a stagnating condition, and even while the latter was in office it suffered from an insufficient corps of teachers and limited aims. Gradually, however, a change was effected by the appointment of a number of teachers who, although they represented a great diversity of interests in the history of literature and philology, still felt united in the effort of making German ideals appreciated in America. The German department at Harvard thereby attained a degree of development and excellence in that line which entitles it to the right of special esteem on the part of the German-American population and all those interested in the promotion of German study.

The "German department" of Harvard is the largest and most capable of all. It has a staff of five professors, seven instructors, and several lecturers, who teach as many as 1,200 students. The details of the most recent plan of study and all other interesting facts are contained in the following section, in which special references to the German departments of other important institutions are given. An examination of them will show what astonishing progress has been made in the short space of sixteen years since the above-quoted inquiries of the Modern Language Association on the position of German instruction in the country were made.

The introduction of German instruction into the highest educational institutions reacts in a decided manner upon secondary schools, which for the most part prepare future students of colleges. We have seen this exemplified in the development of the educational system in Michigan. President Eliot adduces the proof that every advancement in the conditions of admission to his university "has been followed by a corresponding advance in the instruction of all the high schools of Massachusetts."² Numerically the greater significance which German instruction has attained is shown by the following proportion of pupils who study German in public and private high schools, which will be given with more detail further on: In 1889-90 there were 34,208, or 11.48 per cent of the total, studying German; in 1897-98 there were 78,994, or 14.24 per cent; in 1900-1901 there were about 100,000, or about 20 per cent.

What has been said shows how very important for our subject the efforts of late years have been to establish uniform conditions of admission for colleges, and to assure thereby a firm position for German in the curriculum of all higher educational institutions as in that of secondary schools. Efforts have been made from the middle of the eighties to have uniform rules framed relative to elementary and higher German, to be observed by college applicants. At the instigation of the Massachusetts High and Classical School Teachers' Association the faculties of fifteen different colleges in New England appointed a committee in the year 1886 to prepare theses on this subject.³ They read as follows:

¹ The department for German literature and philology at Harvard University, Cambridge, Mass. Harvard University edition, 1893, pp. 4, 5.

² Compare Transactions of the Modern Language Association, Vol. I, p. 26.

³ At the seventh annual meeting of the Modern Language Association (1889) these theses were minutely discussed, and on the whole received favorable judgment. On this occasion, Professor White stated that a "modern-language diploma" would be introduced at Cornell. In addition, he made the following statement: "In New York State a large 'literary fund' is distributed to the academies and high schools in proportion to the number of regents' examinations which the students of such institutions may pass during the year, so that each academy and high school will have a certain financial interest, too, in promoting the study of French and German. This movement is regarded in New York as of great moment, and it seems fortunate that the same effort should be now under way in New England." At Harvard, admission examinations in French and German have been held since 1857, and modern languages have been on a par with all other subjects of examination.

A PROPOSED SCHEME OF UNIFORM ELEMENTARY AND ADVANCED REQUIREMENTS IN GERMAN AND FRENCH FOR ADMISSION TO COLLEGE, DRAFTED BY A COMMITTEE ON ADMISSION EXAMINATION APPOINTED BY THE COMMISSION OF COLLEGES IN NEW ENGLAND.

ELEMENTARY GERMAN.

1. Proficiency in the following topics of elementary grammar: declension of such nouns as are readily classified, of adjectives, and pronouns; conjugation of weak and of the more usual strong verbs; simple cases of word-order.
2. The candidate must have read not less than 200 duodecimo pages of easy German—chiefly narrative prose, with a few lyric poems.
3. Ability to pronounce German and to recognize German words and simple phrases when uttered.

ADVANCED GERMAN.

1. Proficiency in more advanced grammar. In addition to a thorough knowledge of accidence (including the elements of word-formation) and of the principal values of prepositions and conjunctions, the candidate must be familiar with so much of syntax as is necessary to an understanding of the use of modal auxiliaries, of the subjunctive and infinitive modes, and of word-order in connected discourse.
2. Ability to translate ordinary German, to be acquired by the reading in addition to the elementary requisites of the following works: *Deutsche Liebe* (Müller); *Höher als die Kirche* (Hillern); *Die Journalisten* (Freitag); *Peter Schlemihl* (Chamisso); *Die Harzreise* (Heine); *Minna von Barnhelm* (Lessing); *Die Jungfrau von Orleans* (Schiller); *Egmont* (Goethe), and 30 pages of lyrics, including Schiller's *Lied von der Glocke*.
3. Composition and conversation, presupposing familiarity with the subject-matter and vocabulary of *Höher als die Kirche*, *Die Journalisten*, and *Die Jungfrau von Orleans*.

It is proposed that the works assigned be changed from time to time by a committee to be appointed by the professors of modern languages in the colleges represented in the commission.

The author does not know what tangible practical results followed upon this beginning. At all events, it paved the way for action. The decisive step was taken February 1, 1896, when representatives of the six large eastern colleges: Harvard, Yale, Columbia, Cornell, Princeton, and the University of Pennsylvania, together with those of secondary schools, came together in the halls of Columbia for a "German conference." The result of this conference is contained in the following concise and important report:

MARCH 4, 1896.

DEAR SIR: The members of the German conference held at Columbia University for unifying the present entrance requirements at the six colleges represented, adopted, by a unanimous vote, each paragraph of the subjoined elementary and advanced requirements, and have since unanimously adopted the requirements as a whole.

In elementary German—(a) The rudiments of grammar, and especially these topics: The declension of articles, adjectives, pronouns, and such nouns as are readily classified; the conjugation of weak and of the more usual strong verbs; the commoner prepositions; the simpler uses of the modal auxiliaries; the elementary rules of syntax and word-order. The proficiency of the applicants may be tested by questions on the above topics and by the translation into German of simple English sentences. (b) Translation at sight of a passage of easy prose containing no rare words. It is believed that the requisite facility can be acquired by reading not less than 200 duodecimo pages of simple German.

Practice in pronunciation, in writing German from dictation, and in the use of simple German phrases in the class room is recommended.

Preparation for the elementary requirement need not call for more than one year's instruction of five periods per week.

In advanced German—(a) More advanced grammar. In addition to a thorough knowledge of accidence, of the elements of word formation, and of the principal uses of prepositions and conjunctions, the candidate must be familiar with the essentials of German syntax and particularly with the use of modal auxiliaries and the subjunctive and infinitive moods. The proficiency of the applicant may be tested by questions on these topics and by the translation into German of easy connected English prose. (b) Translation at sight of ordinary German. It is believed that the requisite facility can be acquired by reading, in addition to the

amount mentioned under elementary German, at least 500 pages of classical and contemporary prose and poetry. It is recommended that not less than one-half of this reading be selected from the works of Lessing, Schiller, and Goethe.

It is recommended that the candidate acquire the ability to follow a recitation conducted in German, and to answer in that language questions asked by the instructor.

Preparation for the advanced requirement need not call for more than two additional years of instruction.

All of which is respectfully submitted.

HORATIO S. WHITE, *Chairman.*
WM. H. CARPENTER, *Secretary.*

President SETH LOW, LL. D.,
Columbia University.

The subject was afterwards further advanced by the National Educational Association and the Modern Language Association. The former has aimed for some time to bring about a better regulation of secondary instruction in the subjects usually required for admission to American colleges. In matters pertaining to instruction in modern languages it appealed to the latter body to prepare practical propositions. At the annual meeting in 1896 the Modern Language Association appointed Prof. Calvin Thomas and commissioned him to form a committee of twelve to comply with this request thoroughly.

The committee of twelve of the Modern Language Association of America met in the beginning of the year 1897. It consisted of the following gentlemen: Calvin Thomas, Columbia University, chairman; E. H. Babbitt, Columbia University (at present University of the South); H. C. G. Brandt, Hamilton College; B. L. Bowen, Ohio State University; W. H. Carruth, Kansas University; S. W. Cutting, University of Chicago; A. M. Elliott, Johns Hopkins University; C. H. Grandgent, Harvard University; G. A. Hench, University of Michigan (since deceased); Hugo A. Rennert, University of Pennsylvania; William B. Snow, Boston High School; B. W. Wells, University of the South.

The committee prepared a circular that was sent to about 2,500 teachers. The object of the circular was to obtain information with regard to the present status of secondary instruction in French and German in the country at large and also to elicit opinions with respect to a number of more or less debatable questions which, as was thought, would be likely to arise in the course of the committee's deliberations. The answers received, which numbered several hundred, were a perfect chaos of opinion respecting the value of German instruction, the number of courses and their extent, the number and length of hours of instruction, and the requirements of admission examinations.

The committee realized the necessity of conservative measures the more, as colleges could never be forced to accept the propositions submitted. No attempt was to be made either to decide which of the various competing courses was the best course or to antagonize any particular study. Finally the fact was perfectly understood that it is not the main purpose of secondary schools to prepare their pupils for college, but that "the great majority of those studying the modern languages in school do not go to college at all." Our secondary education must be recognized as having its own function, its own aim and ideals.¹

¹In an address delivered by Dr. Frank A. Hill, Litt. D., secretary of the Massachusetts Board of Education, July 11, 1894, at the sixty-fourth annual meeting of the American Institute of Instruction, we find the following pertinent statements: "The high school is the people's college. It has a threefold duty: It should give its pupils a good training for their own sakes; it should furnish good material for the normal schools as for the colleges, and it should inspire and lift up the schools below; therefore it should be held up itself."

The same speaker asserted that of the 247 high schools considered in the celebrated "Report of the committee of ten on the course of study of secondary schools," only 146 had college preparatory courses. Accordingly, it would be an altogether impossible demand of secondary schools to arrange their course of study exclusively for preparation for college.

The propositions of the committee relative to German were published in full in the Report of the Commissioner of Education for the year 1897-98, pages 1409-1421. The following summary will therefore suffice:

Three preparatory courses, namely, elementary, intermediate, and advanced German, are recommended for secondary schools. The elementary course, designed for a term of two years, should enable a pupil to pass the admission examination in elementary German wherever German is required as a third language, in addition to Latin and Greek.

In the first year the pupil should be drilled in pronunciation, etymology, and the chief rules of syntax, besides the phrases of daily occurrence, and 75 to 100 pages of easy text should be read. In the second year the knowledge of grammar should be extended, easy prose translated into German, and 150 to 200 pages of selected passages from German literature (narrations and comedies) read.

The intermediate course in German, with a term of three years, should enable a pupil to read at sight German prose of ordinary difficulty, whether recent or classical; to put into German a connected passage of simple English, paraphrased from a given text in German; to answer any grammatical questions relating to usual forms and essential principles of the language, including syntax and word formation; and to translate and explain a passage of classical literature taken from some text previously studied. About 400 pages of moderately difficult prose and poetry should serve for reading. This course is designed for those who do not intend to study Greek, and are therefore required to accomplish much more in German than the conditions of admission.

Finally, the advanced course in German, with a term of four years, should enable a pupil to read, after brief inspection, any German literature of the last one hundred and fifty years that is free from unusual textual difficulties; to put into German a passage of simple English prose; to answer in German questions relating to the lives and works of the great writers studied, and write in German a short, independent theme upon an assigned topic. About 500 pages should be read from such works as the following: Scheffel's *Ekkehard*, Freitag's *Soll und Haben*, Goethe's *Egmont* or *Götz von Berlichingen*, the *Sesenheim* episode from *Dichtung und Wahrheit*, Wallenstein's *Lager*, Wallenstein's *Tod*, the third book of Schiller's *Thirty Years' War*, Emilia Galotti, and Kleist's *Der Prinz von Homburg*. Appropriate works of Grillparzer, Körner, Heine, Tieck, Sudermann, and Wildenbruch may likewise be made use of.

On principle the committee did not consider any answer to the question as to whether German should be introduced into primary schools or retained in the many cities in which it is already taught. "The question in its politico-social bearings is a very large one, but it is a question which every community must and will decide for itself in view of local conditions." In general the following principles were proposed:

I. Instruction in foreign languages should never be made compulsory, but should only be given upon expressed desire.

II. The study of a foreign language should be taken by only those primary school pupils who intend to continue it in a secondary school. The reason for this is that it is impossible to acquire a sufficient practical knowledge of a foreign language in a primary school. It is very true that children learn the beginning of "conversation" in a foreign language quickly and easily, but they forget what they learn just as readily. It may be of some advantage to children whose parents speak German regularly at home to receive elementary instruction in German, "but if they leave school at the age of 12 or 14 they inevitably drop back into the speech habits of those with whom they associate, and their school training becomes, so far as the German language is concerned, a reminiscence of time wasted. The children of parents who speak English at home get a smattering of German at

school, but if they leave school at the age of 12 or 14 they soon forget all they have learned."

III. German instruction should be given in the primary grades only by teachers who have a thorough command of the language, and they should teach a small class regularly every day. "Infrequent lessons in large classes amount to nothing. It is important that the teacher know his pupils intimately and be able to adapt his instruction to their individual needs. The general aim should be to familiarize the learner with the vocabulary and phraseology of the spoken language and to teach him to express himself readily and correctly in easy sentences."

This report, which deserves to be called a worthy supplement to the above-mentioned similar report of the committee of ten on the course of study of secondary schools, was presented at the annual meeting of the Modern Language Association held in Charlottesville, Va., December, 1898, and at the annual meeting of the National Educational Association held in Los Angeles, Cal., the following summer. On both occasions it was received with extraordinary approval. The consequence was that on December 22, 1899, President Seth Low presided at a most important convention of representatives of colleges and secondary schools who met in the halls of Columbia University to establish a "college entrance examination board." This was definitely constituted November 17, 1900, as follows: Barnard College, Acting Dean Robinson; Bryn Mawr, President Thomas; Columbia University, President Seth Low; Cornell, Prof. Horatio S. White; Johns Hopkins, Professor Griffin; New York, Chancellor MacCracken; University of Pennsylvania, Professor Lamberton; Rutgers College, President Scott; Swarthmore College, President Birdsall; Union College, President Raymond; Vassar College, President Taylor; Woman's College, Baltimore, Professor Von Meter.

The following representatives of secondary schools were members of the board: Dr. Julius Sachs, New York; Dr. Edw. I. Goodwin, New York; Dr. Walter B. Gunnison, Brooklyn, N. Y.; Dr. Wilson Ferrand, Newark, N. J.; Charles I. Crossman, Haverford, Pa.

The officers of the board were: President Seth Low, chairman; President Thomas, vice-chairman; Prof. Nicholas Murray Butler, secretary and executive officer.

The executive committee was composed of President Seth Low, President Thomas, President Taylor, Professor Lamberton, Dr. Sachs.

On May 12, 1900, it had been decided with respect to German instruction that the requirements in German follow the recommendations of the committee of 12 of the Modern Language Association. These demands, therefore, need not be repeated. On the other hand, however, the resolution is deserving of mention that the uniform examinations should go into effect June 17, 1901. What effect this important step will have on the other institutions of the country is apparent from a statement in the *Educational Review*¹ to the effect that at their last meeting the New England Association of Colleges and Preparatory Schools authorized the appointment of a strong committee to take into consideration a similar plan for the colleges of that territory.

In a union of American universities, founded in Chicago, April, 1900, the first step was taken toward a permanent organization of all first-class educational institutions in the country. The first measures were taken by the University of California, whose president, Mr. B. I. Wheeler, presided at the conference in question, whilst all arrangements were in charge of President Harper of the University of Chicago.

The following universities were represented: University of California, Berkeley, Cal.; Catholic University of America, Washington, D. C.; University of Chicago; Clark University, South Atlanta, Ga.; Columbia University, New York City;

¹ December, 1900, page 536.

Cornell University, Ithaca, N. Y.; Harvard University, Cambridge, Mass.; Johns Hopkins University, Baltimore, Md.; State University of Michigan, Ann Arbor, Mich.; University of Princeton, Princeton, N. J.; University of Pennsylvania, Philadelphia; Leland Stanford Junior University, California; State University of Wisconsin, Madison, Wis.; Yale University, New Haven, Conn.

These 14 institutions, as charter members, founded the Association of American Universities, for the purpose of a common consideration of all matters pertaining to university studies and the adopting of a common attitude on all pertinent questions. As soon as practicable, this association is to embrace all higher institutions claiming the title of university, and all universities proposed at the annual meetings by the executive committee are to be admitted as members upon a favorable vote of three-fourths majority. Each university has but one vote, without regard to the number of its delegates. The association takes no active part in the politics of the separate higher institutions, as all "control" on its part is prohibited.

The president of Harvard University, Charles W. Eliot, was elected president; vice-president, Benjamin I. Wheeler (California); secretary, William Rainey Harper (Chicago). Besides these Messrs. Seth Low (Columbia) and Daniel C. Gilman (Johns Hopkins) belong to the executive committee. It remains to be seen to what extent the new association, which will probably hold its second annual meeting in Chicago, intends to promote the most immediate aim of educational reform—i. e., uniformity of entrance conditions for the freshman class. That this question is ripe for consideration is a tangible fact. On April 18 and 19, 1900, the representatives of Catholic colleges in the country held a meeting in Chicago, at which Monsignor Conaty, president of the Catholic University of America, presided, for the purpose of bringing about united action. To effect a uniformity of entrance examinations, a committee was appointed which is to present its report during Easter time, 1901.¹

Three years ago, President Charles K. Adams, of the University of Wisconsin, delivered a noteworthy lecture on "State Aid to Higher Education,"² in which he foretold that the present chaos would be soon followed by a new order of affairs. He says:

It follows that the colleges and the universities are coming more and more to regard themselves as the natural continuation of the high schools in much the same sense as the German university is the natural continuation of the *realschule* and the gymnasium. Under the impulse of this belief the chaos that has hitherto prevailed in our educational systems is gradually giving place to systematic organization, and we are coming to have some approach to what may fairly be called an organic educational system.

One thing is beyond all doubt, that in this organic educational system which is just forming German instruction will assert a position that can never be taken from it. As in the course of time all higher educational institutions, without exception, will be forced to conform to the uniform entrance conditions of the leading institutions, so those colleges in which German at present receives little or no attention will be compelled to give it the place due to it in their course of study.

A final step would be to make an elementary knowledge of German obligatory upon all applicants, in order to free colleges and universities of the burden of giving a part of their students the first training in this direction. That this step is by no means a dream whose realization is not to be thought of is proved by the following circular of the Association of Teachers of German in California, addressed to the superintendents of the California high schools;

SAN FRANCISCO, CAL., *May 10, 1897.*

DEAR SIR: The Association of Teachers of German in California, which is composed of the professors of German in both universities and of teachers of German in

¹ For this report see Chapter XVIII, Third Annual Conference of the Association of Catholic Colleges of the United States.

² February 22, 1898, at the Twenty-second anniversary of the Johns Hopkins University.

various high schools and private institutions of this State, recently made an investigation of the condition of the instruction in German in our secondary schools, resulting in the discovery that only in 35 of the 86 high schools is the German language taught at the present time. It became evident, further, that of 7,163 pupils who are taught in these 35 high schools only 918, or less than 12 per cent, were taking German, while all of the 7,163 pupils receive instruction in Latin, although but one-third of this number would probably afterwards enter a university.

In view of these facts, the Association of Teachers of German in California, being convinced of the great educational value of the study of German, begs to call your attention to the following considerations:

There are, in the first place, numerous practical reasons which speak for a speedy introduction of German in the high school curriculum. Owing to the large percentage of the German population of this country, and owing to the constantly increasing commercial relations between America and Germany, a knowledge of the German language is invaluable for business purposes. In all the large business centers of our country young men and women who command the German language are usually preferred when seeking positions to those who do not understand German.

It is, moreover, a well-known fact that professional men, like lawyers and physicians, profit likewise from a practical knowledge of German; and there is no reason why our high-school graduates, after they have been instructed in German by a competent teacher for a period of three years, should not gain a speaking knowledge of this language, and thus be enabled to avail themselves of the great practical advantages resulting from such a knowledge.

But the purely educational value of the study of German must be considered as equally great, especially for those high-school graduates who enter the university. There is at the present no branch of science in which Germany does not indisputably take the foremost place among the European nations, and a reading knowledge of German is therefore indispensable for the student in every department of university study. As a consequence, in all of the leading universities of this country German can be substituted for entrance in place of one of the ancient languages, President Gilman, of Johns Hopkins University, explaining this policy best by saying, "As Latin was during the middle ages the language of scholars, so the knowledge of German is now indispensable for anyone claiming the name of a student and scholar."

Comparing the secondary education of California with the progressive movements in the Eastern States, the Association of Teachers of German believes that hitherto undue preference has been given to the study of Latin in our high schools. While the knowledge of Latin will always remain invaluable for those entering special professions, it is comparatively of little benefit to the great mass of high-school pupils, who later on follow the practical pursuits of life. The mental drill claimed for the study of Latin may be derived in the same measure from a thorough study of the German language, which at the same time opens to the student a literature that in wealth of the most advanced thought and in beauty of expression can only be compared with the literature of the Greeks. Our English tongue is, moreover, in its formations and structure, essentially a Germanic language, and it is of far greater educational value for the majority of high-school pupils to study the historical growth of their own language in comparison with the closely related German than to learn the rudiments of Latin, which in most cases are only forgotten, because a proficiency in reading Latin can never be attained by the high school.

At the recent meeting of the California Teachers' Association a resolution was passed recommending that the study of German be placed on an equal footing with Latin in the high schools of California. The Association of Teachers of German in California believes that it is advocating the cause of higher education in the State by submitting this resolution herewith to your kind consideration, asking you at the same time to introduce the study of German in the high school of your district and to make German elective with Latin. The great importance of the study of German is being recognized more and more by the various departments of the University of California, and it is the opinion of the Association of Teachers of German in California that it is presumably only a question of time when the University will officially make German one of its entrance requirements.

Respectfully

JULIUS GORFEL,
President, Stanford University, California.
 H. E. F. UNGERTH,
Secretary, Alameda, Cal.,
Association of Teachers of German in California.

This circular was followed by a second, dated April, 1900, in which a committee composed of Prof. Julius Goebel, Prof. Henry Senger, and W. Zimmermann, appointed by the Teachers's Association, submitted to high-school superintendents a detailed plan of study for a proposed three years' course in German. As we learn from a letter of Professor Senger, quoted below, the number of high schools that have introduced German in pursuance of the above recommendation is rapidly increasing.

The efforts that tend to the obligatory German examination for entrance to college have received no little support from the recent international pedagogical movement toward substituting modern for classical languages as general subjects of instruction, a movement which has received its scientific indorsement from Prof. Dr. Fr. Paulsen, of the University of Berlin, Germany, in his highly important work, *The History of Scientific Instruction*. Such a radical change in the higher educational institutions is undoubtedly far off, but in all probability the compromise will gradually become familiar which sacrifices the Greek "fetich" on the altar of the common good and brings German into the foreground, a measure which Professor Goebel warmly advocates.

In the June number of the *Atlantic Monthly* of 1900 William Cranston Lawton treats this subject in an article entitled *A Substitute for Greek*.

Before Lawton proceeds to his subject proper he presents the following three theses, according to which the value of every study in primary and high schools is to be estimated:

I. Every study should aim to form good citizens, for only such can do their part in the intellectual development of mankind.

II. No study should be so managed as to overburden the mind by mechanical memorizing. It should serve to strengthen it.

III. Of whatever kind the study may be it must prepare for life and for no other purpose.

Proceeding from these views, Lawton decidedly advocates replacing Greek by German in our high schools and universities. He is of opinion that German should be considered the most important foreign language in the course of study and that Latin should be second in order. A child should begin the study of German not later than in his tenth year. Lawton considers the beauties and artistic worth which pupils can find in German poetry much more important than the knowledge which Greek text-books afford, and he thinks that every child 14 or 15 years old ought to know hundreds of gems, as, for instance, the ballads of Uhland, by heart. Lawton asserts that a living language is much more easily mastered than the "fragments of a dialect that has been dead for a long time." The German language should be placed first in order also because the most prominent learned men make use of it. He attacks those teachers in cutting terms who do not recognize any education as classical unless the study of Greek forms a part. "A man," says Lawton, "who knows nothing of Blass or Brueggemann, Mommsen or Boeckh, Furtwaengler and Doerpfeld, Roscher and Ivan von Mueller, is not justified in boasting of classical education. If he does not know his deficiency in education, he is so much the worse off. He on whose desk no German books are to be found can not be numbered among the learned." The history of civilization, Latin, and German should, in Lawton's estimation, be the three chief branches in every course of study of our high schools. He believes that the perception of the relationship of all civilized nations should form the foundation of our own school system, and that the German language and German science, together with the "history of Anglo-Saxon races," should be the most important element in the course of study of American schools.

Lawton favors pointing out the beauties contained in the works of poets to children, and he believes that learning poems by heart is of more value to the development of mind and character than the mechanical memorization of whole pages out of text-books. To him the knowledge of modern writers and the understand-

ing of their beauties is far more important than a drilling on the five variations of the verb "to be" in Homer, and it seems enough to him if pupils are instructed in the beauties of Greek mythology and poetry by their teacher of history.

Lawton hopes that the time may not be far distant when Greek will be excluded from the course of study of high schools. If for reasons of principle there should be any hesitation in taking such a step, practical reasons will effect the desired change, as it is no longer a rare occurrence to find only two or three pupils in the Greek classes of the large high schools.

The study of Greek may be safely confided to the old colleges; in the "people's college" of the twentieth century, however, German will take the place of Greek, and all who desire to attend a university in the future must have at least an elementary knowledge of this important language.

PART II.—THE POSITION OF GERMAN INSTRUCTION AT THE BEGINNING OF THE TWENTIETH CENTURY.

In the following account special stress is laid upon colleges and universities for the following reasons:

I. Colleges and universities are, undoubtedly, leading educational institutions, at which, as a rule, the best teachers are engaged. As Eliot says: "Schools follow universities and will be what universities make them."¹

II. They give instruction of every kind, from elementary for beginners to education of teachers and training for the highest branches of philological studies.

III. The most reliable and detailed information can be had concerning these first-class institutions, whereas that concerning secondary schools, for instance, is more or less incomplete.

IV. There is no question but that secondary schools, as a rule, will adapt themselves to the conditions laid down in reference to instruction in modern languages in the examinations for matriculation at colleges.

For these reasons, the most explicit statements were required from the most important higher educational institutions, whereas fewer facts sufficed concerning the condition of affairs in all other kinds of schools.

I. COLLEGES AND UNIVERSITIES.

Among the nearly half thousand institutions that go by the name of "college" or "university," there are but a small number which are universities in the German acceptance of the term, or are at least on the road of becoming such. Again, there are others that do so little that in many respects they stand below the level of a German gymnasium. The average college, as it has developed as a specifically American institution, ranks between these two extremes as an institution, the graduates of which, who leave at an average age of 22 years, acquire a highly creditable general education, which is a suitable foundation for the special studies of any learned profession.

The existing highest class institutions have, in connection with their "college," one or more "faculties," which have great similarity to the bodies in connection with German higher institutions of the same name. By their general plan on a large scale; their seminaries, laboratories, museums, and experiment halls; their scientifically educated teachers and the scientific methods followed by them; the preparatory education which they require for their entrance examinations and the knowledge which they demand for the conferring of an academic degree; the number of their students; the means at their command, and the reputation which they enjoy among the highly educated at home and abroad, these "universities" par excellence are so far above the second or third-grade institutions that bear the same title that only those who are thoroughly unacquainted with the conditions are

¹ Charles W. Eliot, *Educational Reform*, page 131.

misled by the term. The so frequent misuse of the term "university" is an evil which should be remedied in the future, and will probably disappear of itself when once the chaotic condition which must prevail from the founding of most of the higher educational institutions by private enterprise or societies of a religious character has been displaced by a uniform regulation of the entire educational system.

It would be out of place here to define the position of all the institutions included in the category of colleges and universities, especially as this attempt would rack the brain of the most experienced educators in the country. Still, one may remark that a glance at the statistics of education will give tangible data to determine the importance of an institution. If, for instance, one finds the statement: The "University of New Mexico," with 10 teachers, 100 students, 5,000 volumes, and an annual income of \$14,000, and Harvard University, with 496 teachers, 4,288 students, 576,900 volumes, and an annual income of \$1,376,672, he need make no further research. Of course there are indisputably first-class institutions suffering from lack of funds, like the Johns Hopkins, which nevertheless have excelled in brilliant accomplishments. Such an exception, however, does not set aside the general rule.

As a matter of course, institutions whose yearly reports show great obligations on the part of teachers and small salaries, whose libraries and other appurtenances are most deficient, whose geographical position leaves no favorable genius loci to be expected, can do nothing of note with regard to German instruction. For the present purpose it will suffice to give an account of how German instruction is organized at a true university, subsequently in the "German sections" of fourteen of the best known and most important universities, and then at a small number of other selected prominent institutions.

For the first end in view the "Columbia" has been chosen, because the author has known this excellent university for a number of years from personal observation and enjoyed the advantage of its regulations, and besides is in possession of a recently given and most instructive lecture on this subject by Mr. William H. Carpenter, professor of Germanic philology and senior professor.¹ German instruction at present is conducted as follows: The introduction of modern languages into the curriculum of the college is the result of a victorious struggle. The old college course did not recognize the modern languages as equal to the classical as a foundation for a liberal education. Latin and Greek were the only languages that were systematically taught. If the opportunity to study a modern language was offered at all, it was only possible as a side branch, perhaps two or three hours a week during a single year. Whoever wanted to learn more was obliged to seek instruction outside of the university, a condition of affairs that has existed in Germany in like manner in order to admit the equal qualification of modern languages.

Unfortunately America possesses no carefully arranged and uniform educational system, such as there is in Germany; in which each part is suited to the other, so as to form a pliable but unbroken chain that binds the whole German realm, east and west, south and north, leading the nation to similar ideas, common thought, and common ideals, as no purely political union can. In America, on the other hand, as is not in the least unnatural in so unequally developed a country, the different parts of the country have very different notions of the nature of the problem, not only of higher but of secondary education. The colleges here have been founded under entirely different conditions, and have always developed on their own lines altogether independent of those of other institutions. The state, as a rule, paid no attention whatever to the matter, so that it is rather astonishing that

¹ German Instruction at American Universities; a lecture delivered before the Gesellig "Wissenschaftlicher Verein" of New York, January 13, 1878. With the author's permission, we reproduce the following remarks, partly verbatim, partly condensed.

the whole educational system should have become organized as uniform as is relatively the case. The time will come, however, when the highest educational institutions at least will be so far in accord that liberty of attendance will exist between the different universities, and as characteristic a system of exchange will be adopted as obtains in Germany, where students prefer to attend several universities. In this respect the meeting of the six large universities in the East, February 1, 1896, was an important event, the consequences of which will be known in the course of years in a revolutionizing of the old system of attendance.

The present position of German instruction is as follows: Some smaller colleges adhere to the old régime, according to which the modern languages formed no essential part of the course of study and were learned or not learned by the students, as it pleased them. They also had the privilege of choosing between them and some other study in any one year of the college course. In other colleges there is liberty of choice between German and French in one year or within two years, during which either German or French is a prominent study. In some institutions the opportunity is afforded of learning both languages at the same time or consecutively. Others, again, require that both must be studied in one grade or other of the course. All colleges of this category agree throughout in not requiring any knowledge of modern languages for admission. All that is learned must be acquired in the short space of four years. The actual value of the knowledge of the language thus gained is so problematical that it would be much better to set aside the modern languages altogether and make use of the time given to them in some other way.

Fortunately, what has been said applies only to a minority of small and poorly endowed colleges. In all the large institutions of the country modern languages play an altogether different part and occupy a very prominent position in their curriculums. As a rule, an elementary knowledge of the modern languages is required for admission into the college. Most colleges prescribe that the freshman admitted must pass an examination in German or French. In some instances that will be mentioned farther on candidates must pass examinations in both languages.

After a student has been formally admitted he is sometimes left free to choose whether he will study a modern language, and which one. Sometimes he is obliged to study one or more. In this respect different rules obtain at different colleges; but whether a matter of choice or of obligation, so much has been attained that at the present day ample opportunity is afforded at every American educational institution of the better class to learn French or German thoroughly in nearly every place of development and application; and this is true both of the language itself and its literature. German has acquired not only an honorable but an indispensable position among the branches of study. The time when German was looked upon as unnecessary is long since passed. On the contrary, a certain knowledge of it in the higher grades of education is considered indispensable. No one who is not able at least to read German can receive the highest academic degree of doctor of philosophy at Columbia University, for instance.

Every new student at Columbia is required to know a certain amount of at least one of the two principal modern languages besides English, and both, if he has no knowledge of Greek. Since the conference of February 1, 1896, referred to, these conditions for admission have been in force for the other large colleges in the East. The entrance examination aims to determine whether the candidate possesses sufficient knowledge of German, grammar, and an adequate vocabulary for an academic education, and can translate easy prose.¹ The conditions of admission are thoroughly appropriate. They were defined by a committee composed of an

¹The regulations on the subject were sent to Prof. Seth Low, in full, with the report of the German conference. See pp. 582-3 of this article.

equal number of college professors and members of the teachers' association considered particularly competent for this purpose. Representatives of secondary schools, therefore, had an equal voice with those of colleges. Nevertheless, from all parts teachers are constantly sending forth the cry that too great a burden has been laid upon them and one which they are not able to bear.

In reality every intelligent American schoolboy who knows no German but what he has learned in school during a period of instruction of three hours a week for two years ought to be able to pass this examination. The same result could be attained, in fact, by a thoroughly competent teacher with one hour for a year. The instruction presupposes as an absolute necessity, however, a sufficient practice in grammar, not empiric, but in connection with ample reading matter, by means of which a vocabulary is acquired and the grammatical forms and principles which come under observation in the text are studied, together with daily drill in translation at sight and practice in conversation at least during a part of the hour. To acquire a sufficient vocabulary not fewer than 200 pages of easy prose should be read and studied.

Another question that suggests itself is, whether schools of the present day really prepare pupils so that they are able to pass such an examination? On the whole, they, unfortunately, do not. In 1896 there were at Columbia 41 candidates, of whom only 27 passed; in 1897 there were 71, of whom only 39 passed; in 1898 there were 109, of whom only 64 passed.¹

Consequently something must be wrong, and as it is impossible for a mistake to be in the standard, the organization of secondary schools in general must be held responsible for the evil. These include some institutions whose pupils never fail in the examinations or among whom failure is the exception, whilst pupils of others do so much the worse. The point is a most important one. The accomplishments of colleges are, in a very great measure, dependent upon the material which they receive from secondary schools, and the evil is that many of these have not yet taken up German instruction seriously enough. The chief reason of this is that this language is a recent addition to the curriculum and is more in the nature of an exterior accretion than of an organic element developed under influences acting from within. A further evil is the choice of unfit teachers, who are, moreover, frequently overburdened and poorly paid. School boards, in many cases, think they have done enough by choosing a German by birth for the position in question. That has its incalculable advantages it is true, but it does not supply the deficiency of a professional education.

The fact that a large proportion of students enter from secondary schools with an insufficient knowledge of German has contributed much to lower the dignity of modern languages as elements of the course of study. At Columbia the custom obtains of allowing freshmen to make up the German examination during the first year, but in that case they are required to do a considerable amount of extra work, and are only admitted to the second year course if they have made good their deficiency so as to be able to pass the examination.

In case a student upon entering the college prefers to take the examination in French instead of German, in connection with Greek, he is obliged to study elementary German during the first year. He then receives daily instruction for one hour as has been previously described, and, at the end of the first year must possess as much knowledge of German as those who passed the examination in elementary German upon entering.

¹Since the recent action of the city high schools has gone into effect the conditions seem to have improved to some extent, for in 1899 there were 96 candidates, of whom 73 passed. However, as a matter of course, the result of a single year is dependent upon accidents, and permits no reliable conclusions, which must be deduced from more full data. In his Educational Reform, Professor Eliot deprecates the fact that only 9 of the 230 high schools in Massachusetts regularly prepare competent students for Harvard.

With the admission examination, if German was chosen as the modern language, or with the elementary one year course in German, if candidates preferred to be examined in French, the obligation of students to study German is fulfilled; but an ample number of opportunities are presented to build on this foundation, and it is their own fault if they do not make use of them. For the degree of bachelor of arts, however, no more than an elementary knowledge of German and French is required.

For those students who pass the examination for the higher grade on entering, the opportunity is afforded to follow a higher course at once. To pass the examination for the intermediate course, either an extra year must be devoted to preparatory instruction or the student in question must have a comprehensive knowledge of German before admission. This is much more seldom the case in America than we are led to expect from the large population of German extraction. In New York there are only a few, but still at least some, institutions that are able to prepare for this higher examination.

After the elementary course, two courses with three hours a week for a year are arranged to advance students to the level corresponding to the intermediate course. The one aims to give students, while they are continuing their study of the language, some knowledge of the classical period of German literature. Accordingly, selected passages from Goethe, Schiller, and Lessing are translated. Students are required besides privately to read historical and biographical works on these authors and their times. Compositions written altogether or partly in German, intended to show the results of this study, are required from time to time. A part of every hour is given to sight reading. During the second semester one or more works are read in the original. The language spoken during instruction is as far as possible German.

The other course aims to enable those students who intend to make a special study of history, literature, philosophy, political economy, or other disciplinary study of the kind, to read German books on these subjects with profit. In this case, the work consists chiefly in sight-reading with explanation of the difficult passages. The readers used are, for instance: Freytag's *Bilder aus der deutschen Vergangenheit*, Scherer's *Deutsche Literaturgeschichte*, and Hansen's *Die drei Bevölkerungsstufen*. A special course in this grade is designed for more advanced students of the natural sciences; readers are used containing an appropriate scientific vocabulary, and the selections are from good technical works on these subjects.

After a student has advanced so far he must decide whether he intends to follow the linguistic or the literary course, or both. The first literary course open to him gives him a bird's-eye view of the general development of German literature, by which he is made acquainted with the most important authors and their works, and receives a general idea of the different epochs and the relation of the history of literature to politics, religion, and the development of society.

The course of two hours a week on Goethe's *Faust* (Parts I and II), which claims a whole year, follows upon completion of the general course of the history of literature. In this course the student is made familiar with this work, learns its importance, as well as its poetical and ethical value, and becomes thoroughly acquainted with the history of its origin. Another two hours' course is confined especially to the coryphæi of German literature, and is open to such students as can read German fluently, and desire to study the masterpieces. In this sense such works are read and explained, and students are required from time to time to write compositions on the works studied.

The linguistic course has two divisions in this grade. The one (two hours a week for one year) gives practice in speaking and writing. All is conducted in German discussions and compositions; an excellent opportunity for practical use of the language is thus afforded to those who are sufficiently advanced. The other

course (likewise two hours a week for one year), consists of lectures on the history of the German language, combined with text interpretation of all periods of literature. The purpose is to follow the history of the Modern High German written language gradually; from Old High German to the present time, and to explain the changes of the relations of vowels and the origin of grammatical forms. Suitable readers furnish Old and Middle High German text for the time of Luther, and copies of German literary works for Modern High German.

The *Germanic Seminary*, which likewise works two hours a week, accepts only graduates who are thoroughly familiar with what has been studied in the preceding courses. The critical study of the separate productions of Old and Middle High German poetry is pursued.

The other courses of the curriculum justify the name of the department of the Germanic languages. They include the Scandinavian languages, the Icelandic, and the Gothic. Further lectures are given on philology. All these higher courses naturally are not meant for college students, but for graduates only. This curriculum does not claim to be perfect, and admits of various additions; nevertheless, it has been drawn up with a thoroughness and regularity of plan that are deserving of recognition. If it is carried out systematically from beginning to end, it is possible for even a college student who, on entering, did not understand a single word of German, to become so familiar with the language within the quadrennium that he will be able intelligently to read any printed or written text that presents no unusual difficulties, express himself in correspondence with exactness, and read with a good pronunciation. Furthermore, the opportunity is presented to acquire a comprehensive general knowledge of German literature in all its periods of development, and a special knowledge of the classic writers, modern and ancient. Besides, the German language can be learned in its historic development, together with German and Germanic etymology. In this way the best graduates of every year have acquired an apprehension of the German language very nearly equal to that for their native English.

In case the mental equipment of a student on entering includes a sufficient knowledge of German for him to omit the elementary course, he can attain the aim proposed the more surely, since he is in the position to take all the courses, which are only given alternately in the higher classes, and because, with his greater advancement, he can derive more advantage from instruction and can do more justice to the separate studies.

Columbia could be taken as a type of the better colleges, because its work ranks about equal with that of the University of Chicago, or of the universities of Michigan and Wisconsin. Some universities, like Harvard, have a greater number of courses; others, like Yale, have fewer. On the whole, however, all universities have the same end in view, and the wholesome competition among the greatest institutions of the country fully supplies the want of State supervision exercised in Germany. At all events, German instruction in colleges has been set on a sure foundation, both as regards the forms of instruction and its subjects. The science of pedagogics will not stand still in reference to instruction in the languages, but will make further demands. The issues belong to the future, and will in the course of time be decided in the natural order of normal development.

The following accounts of the "German departments" of 14 leading institutions demonstrate how far each deviates from the type which has been under consideration. As with some the catalogue of 1899-1900, with others that of 1900-1901, was used as main reference, uniformity may in the meantime have become a shade closer. The effort to bring about a general regulation of entrance conditions and of the amount of work to be done for the receiving of academic degrees, is apparent throughout; and the harmonious cooperation of the Modern Language Association has not failed to exert an influence on the uniform organization of German instruction.

HARVARD.

Much has already been said concerning the history of the German department of the leading university of the country; we need, therefore, now only to refer to the state of affairs in that department at the beginning of the year 1901.

The personnel of teachers consists of the following gentlemen: George Alonzo Bartlett, A. M., associate professor of German; Kuno Francke, Ph. D., professor of German literature and chairman of the department of Germanic languages and literatures; Hans Carl Gürthler von Jagemann, Ph. D., professor of Germanic philology and chairman of the division of modern languages; Hugo Karl Schilling, Ph. D., assistant professor of German; Alfred Bull Nichols, A. B., D. B., instructor in German and secretary of the department of Germanic languages and literatures; Heinrich Conrad Bierwirth, Ph. D., instructor in German; William Guild Howard, A. M., instructor in German; John Firman Coar, A. M., instructor in German; Macy Millmore Skinner, Ph. D., instructor in German; Guido Carl Leo Riemer, A. M., instructor in German; William Witherle Lawrence, A. B., instructor in German.

Besides this regular corps of teachers, the following gentlemen conduct separate courses of lectures in this department: George Lyman Kittridge, A. B., professor of English; William Henry Schofield, Ph. D., instructor in English; Dr. Neilson; Dr. F. N. Robinson; Professor Sheldon; Professor Grandgent; Associate Professor Gates.

The courses classed under the head of Germanic languages and literatures are divided into four groups.

I. *German*.—This group comprises those courses which aim to impart a practical knowledge of the German language, and to introduce the student to the principal works of the great German writers.

II. *German literature*.—This group is devoted to the history of German literature and to a critical study of special phases of German culture.

III. *Scandinavian literature*.—This group consists of courses which aim to impart a practical knowledge of the Dano-Norwegian language; to introduce the student to the best works of modern Danish and Norwegian writers, and to aid him in a critical study of the great monuments of the old Norse literature.

IV. *Germanic philology*.—This group is devoted to a comparative study of Germanic languages and institutions and to instruction in the methods of linguistic and literary research.

SEPARATE COURSES.

I. PRIMARILY FOR UNDERGRADUATES.

1. Elementary course—Grammar—Translation from German into English, and elementary exercises in translating into German. Three times a week.

The principal aim of course 1 is to give the student a knowledge of German sufficient to enable him to read easy German at sight and translate simple English sentences into German. Special attention is paid to systematic training in pronunciation. Five teachers (for freshmen in Harvard College).

2. Elementary course—Grammar—Translations from German into English, and elementary exercises in translating into German. Three times a week. Three teachers (for students of the Lawrence Scientific School who did not present German at the examination for admission).

3. Elementary course—Grammar—Composition—Translation and reading at sight—Selections in prose and poetry. Five times a week, counting as two courses.

Course 3 is intended for those students who, beginning German in their freshman year, wish to give more time to this language than is prescribed in course 1. It will be found especially adapted to those students who intend, in subsequent years, to give much attention to college studies in which a good knowledge of German is of advantage. Such studies are ancient and modern languages, philosophy, history, fine arts, etc.

4. German prose and poetry—Reading at sight—Grammar and composition. Three times a week.

The course is conducted in a manner to meet the needs of students who can read easy German at sight, but who have not had as much systematic training in grammar and composition as is given in course 1. Practice is given in reading at

sight, in pronunciation, in translation from German into English and from English into German, and in writing German from dictation.

5. German prose and poetry—Reading at sight—Grammar and composition. Three times a week.

This is the course best adapted to the needs of the students who intend in a subsequent year to take any of the higher courses in German. Constant practice is given in reading at sight, in pronunciation, and in translation from German into English and from English into German. No attempt is made to teach the student to speak German, but practice in writing German from dictation and similar exercises aid to give him some facility in understanding German when it is spoken or read by others. This is a necessary part of the preparation for courses 12, 13, and 14, which are conducted in German.

6. German prose—Subjects in history and biography—Reading at sight. Three times a week.

This course is especially designed for those students who wish to acquire a sufficient knowledge of the language to enable them to read German books on history, philosophy, etc. It may, however, if taken in connection with course 8, serve as an introduction to courses 11, 12, 13, and 14. A large amount is read, and much time is given to reading at sight. The matter to be read is selected from such works as Riehl's *Kulturgeschichtliche Novellen*, Von Sybel's *Kleine historische Schriften*, Freytag's *Bilder aus der deutschen Vergangenheit*, etc. The examinations test the student's knowledge of the subject as well as of the language of the texts.

7. German prose—Subjects in natural science—Reading at sight. Three times a week.

This course is intended to furnish drill in the reading of modern scientific German, and is recommended to students who are taking, or who plan to take, special courses in natural science or in medicine. An elementary knowledge of at least two of the natural sciences is requisite for success in this course. Dippold's *Scientific German Reader* is used as an introduction, and is followed by monographs on various subjects, in order to give the student as large a vocabulary as possible. The reading matter is taken from such books as Hirzel's *Chemie*, Brewer's *Naturlehre*, Müller's *Die elektrischen Maschinen*, Helmholtz's *Ueber Goethe's naturwissenschaftliche Arbeiten*.

8-10. German grammar and practice in writing German. Twice a week.

In courses 8-10 instruction is given in the principles of German grammar and weekly themes in German are required. They are graded courses, and no two of them may be taken in the same year.

11. Introduction to German literature of the eighteenth century—Selections from the works of Lessing, Goethe, and Schiller—German ballads and lyrics—Translation—Reading at sight—Composition. Three times a week.

The object of this course is to give an introduction to the study of German literature. The texts used include selections from the prose writings of Goethe and Schiller and selected dramas of Lessing, Goethe, and Schiller. Kluge's *Auswahl deutscher Gedichte* is used as a text-book in the study of German ballads and lyrics. Much attention is given to translation at sight, and there are frequent exercises in composition and in writing German from dictation.

12. The German drama of the classic period—Lessing: *Minna von Barnhelm*; Emilia Galotti; Nathan der Weise—Schiller: *Maria Stuart*; *Die Jungfrau von Orleans*; *Wallenstein's Tod*—Goethe: *Egmont*; *Faust*—Lectures in German. Three times a week.

The object of this course is to make the student acquainted with the principal dramas of Lessing, Goethe, and Schiller. The history of German literature of the classic period forms the subject of weekly lectures, special attention being paid to the drama.

13. Schiller and his contemporaries—Schiller, *Kabale und Liebe*; *Wallenstein*; *Maria Stuart*; *Die Jungfrau von Orleans*; *Die Braut von Messina*—Goethe, *Egmont*; *Faust*—Lessing, *Emilia Galotti*—Ballads and lyrics. Lectures in German. Three times a week.

This course aims to give the student a general idea of the classic period of German literature, and a more detailed acquaintance with the life and the principal works of Schiller. The development of German literature from Lessing's first appearance to Goethe's death is treated in weekly lectures. Much time is devoted to practice in reading at sight and to the oral discussion and criticism of the texts.

14. Goethe and his time—Lessing, *Emilia Galotti*—Schiller, *Wallenstein*—Goethe, *Götz von Berlichingen*; *Egmont*; *Iphigenie*; *Tasso*; *Dichtung und Wahrheit*; *Gedichte*; *Faust*—Lectures in German. Three times a week.

In this course the principal works of Goethe and selected works of Lessing and

Schiller are read and discussed. Goethe's life and his position in the literary movements of his time form the subject of weekly lectures.

II. GERMAN LITERATURE.

Courses 16, 19, 20, 21, 22, 23, 24 are conducted in German.

15. Introduction to the history of German literature—Lectures and collateral reading of representative works in English translations. Once a week.

This course does not require a knowledge of German. It is intended chiefly for students who, without making a specialty of the study of German literature, wish to obtain a general knowledge of its great men and its leading ideas. Francke's *Social Forces in German Literature* is used as text-book, the lectures in the course being intended as a running commentary and supplement to it. The collateral reading consists of the standard works of German literature from the Nibelungenlied to Goethe's *Faust*, in English translations.

16. History of German literature to the nineteenth century, with special study of the classic periods of the twelfth and eighteenth centuries—Lectures, reading, and English theses. Three times a week.

This course is intended to give a more detailed knowledge of the development of German literature and a better understanding of its great men than can be obtained in Course 25. Among other works, the following are read and discussed: *The Nibelungenlied* (translated into modern German by Roman Woerner); *Gottfried von Strassburg's Tristan* (translated into modern German by Wilhelm Hertz); *Walther von der Vogelweide's Gedichte* (translated into modern German by Bruno Obermann); *Lessing's Laocoon and Nathan*; *Schiller's Wallenstein and Braut von Messina*; *Goethe's Wilhelm Meister and Faust* (both parts). The student is also expected to consult the standard works on the history of German literature, such as *Scherer's Geschichte der deutschen Litteratur*, *Hettner's Geschichte der deutschen Litteratur im 18. Jahrhundert*, etc., and critical commentaries by such men as *Kuno Fischer*, *Herman Grimm*, *Erich Schmidt*, *Ludwig Bellermann*, and others.

17. German literature in the first half of the nineteenth century—*Kleist—Uhland—Heine*—Lectures with collateral reading. Three times a week.

In this course the reading and discussion of selected works is accompanied by a weekly lecture, and by assigned outside reading. The lectures deal with the romantic school; *Heinrich von Kleist*; romantic fiction; *Uhland* and the *Swabian school*; romantic lyric; the poetry of pessimism; *Young Germany*; *Heinrich Heine*. The course is conducted in English.

18. German literature in the second half of the nineteenth century—The development of the novel and the drama—Lectures with collateral reading. Three times a week.

This course is conducted on the same lines as the preceding one. The lectures deal more particularly with the development of the German novel, and with the drama since 1840, but other aspects of the period are not neglected. The class-room reading is in the drama (*Hebbel*, *Otto Ludwig*, *Wildenbruch*, *Sudermann*, *Gerhart Hauptmann*) and the lyric (*Geibel*); the outside reading is taken wholly from modern prose fiction. The course is conducted in English.

19. German literature in the twelfth and thirteenth centuries—*Nibelungenlied—Kudrun—Hartmann, Der arme Heinrich—Wolfram, Parzival—Walther von der Vogelweide*—Translation into modern German—Lectures and collateral reading. Three times a week.

This course is intended to give the student a reading knowledge of Middle High German, and to acquaint him with some of the representative works of mediæval German literature. Incidentally, exercises in translating from the original into the modern idiom afford practice in speaking German; but members of the class who prefer to translate into English are at liberty to do so. The reading of the texts is supplemented by weekly lectures, in German, on the development of German literature in the twelfth and thirteenth centuries.

20. German literature and art in the thirteenth and fourteenth centuries—The mystic movement—*Meister Eckhart*; *Suso*; *Tauler*—First climax of religious sculpture—*The Marienlegenden*. Twice a week.

The lectures in this course deal with the growth of individual thought and feeling in religious speculation, art, and poetry, which marks the thirteenth and fourteenth centuries as the transition period from mediæval to modern culture. The collateral reading consists of selected portions of the mystic literature and of the legendary and didactic poetry of the fourteenth century.

21. German literature and art in the fifteenth century—The religious drama

and its relation to religious painting and sculpture from the Van Eycks to Dürer and Vischer. Twice a week.

The lectures in this course deal with the principal cycles of the Christian legend and their treatment in the religious drama, painting, and sculpture of the fifteenth century. The collateral reading consists of selected Christmas, Easter, and passion plays.

22. German literature from the Reformation to the classic period of the eighteenth century—Lectures, reading, and theses. Once a week.

The principal topics of the lectures are: Influence of the Reformation upon German literature; the beginning of a reactionary movement; the Thirty Years' War; preponderating influence of foreign culture; sporadic attempts to preserve the national character of the language and literature—The Sprachgesellschaften. First Silesian, Königsberg, and second Silesian schools—Development of the novel—Eighteenth century—Slow growth of national consciousness; opponents of the Silesian schools; gradual emancipation of literature from foreign influence—Haller and Hagedorn; Gottsched, Bodmer, and Breitinger; Klopstock, Lessing, and Wieland.

The most important works of this period are read and discussed.

23. The early romantic movement in Germany; with special reference to its social and political aspects—Novalis—The brothers Schlegel—Tieck. Twice a week.

The lectures in this course trace the history of romanticism and its relation to German public life from the last decade of the eighteenth century to the national breakdown in the Napoleonic wars. Every member of the course is expected to make a special study of some one author of the period.

24. The later romantic movement in Germany, with special reference to its social and political aspects—Arnim—Brentano—Fichte. The literature of the wars of Liberation and of the Restoration. Twice a week.

The lectures in this course trace the history of romanticism and its relation to German public life from the national regeneration following the catastrophe of Jena, through the wars of liberation, and the restoration epoch, to the beginning of young Germany. Every member of the course is expected to make a special study of some one author of the period.

III. SCANDINAVIAN LITERATURE.

FOR UNDERGRADUATES AND GRADUATES.

25. Modern Danish and Norwegian literature—Holberg—Oehlenschläger—Ibsen—Bjørnson and others—Practice in the spoken language—Lectures on the history of Scandinavian literature. Three times a week.

This course is devoted chiefly to the reading and discussion of important works of leading Danish and Norwegian authors of modern times. No previous knowledge of Scandinavian is necessary. Groth's *Dano-Norwegian grammar* will be used. Johann Storm's *Dialogues français (Norwegian-French)* is recommended.

PRIMARILY FOR GRADUATES.

26. Icelandic (Old Norse)—Selections from the Sagas and the Elder Edda. Three times a week.

The object of this course in the first half year is to give a reading knowledge of ordinary saga prose; in the second half year a considerable portion of the Poetic Edda is read. Noreen's *Altisländische und altnorwegische Grammatik*; Holthausen's *Lehrbuch der altisländischen Sprache*, Vol. I (*Elementarbuch*), and Vol. II (*Lesebuch*); Mogk's *Gunnlaugssaga Ormstungu*; Wilken's *Prosaische Edda*; and Hildebrand's *Ältere Edda*, are used as text-books.

IV. GERMANIC PHILOLOGY.

PRIMARILY FOR GRADUATES.

The following courses are intended for students who wish to devote themselves to the philological study of the Germanic languages and literatures: Courses 27 (Gothic), 29 (Old Saxon), 33 (Germanic mythology), and 34 (Germanic antiquities), are of a more general character and will be found equally valuable to students of English and of German. Course 30 (Old High German), 31 (Middle Low

German), 35 and 36 (the seminary courses), and 32 (history of the German language) are especially designed for students of German.

27. Gothic—Introduction to the study of Germanic philology—General introduction and phonology. Three times a week.

This course should be taken first by all students of Germanic philology, since the records of the Gothic language that have been preserved are older than those of the other Germanic dialects and represent in many respects the most archaic forms of Germanic speech accessible to us. Braune's *Gotische Grammatik* and Heyne's *Ulfilas* are used as text-books.

28. Introduction to the study of Germanic philology, continued—Morphology—Etymology. Three times a week.

29. Old Saxon—Introduction to Germanic metrics. Three times a week.

This course is devoted to the study of Old Low German, or Old Saxon, and its relations to Old High German on the one hand and Anglo-Saxon on the other. Gallée's *Altsächsische Grammatik*, Sievers's *Heliland*, Heyne's *Kleinere altniederdeutsche Denkmäler*, and Zangemeister-Braune's *Bruchstücke der altsächsischen Bibeldichtung* are used as text-books.

30. Old High German. Half course (first half year). Three times a week.

In 1899-1900; to be given in 1900-1901.

Braune's *Althochdeutsche Grammatik* and the same author's *Althochdeutsches Lesebuch* are used as text-books.

31. Middle Low German. Half course (second half year). Three times a week.

This course is devoted to the study of Middle Low German and Middle Netherlandish. Lectures are given on the literature of those dialects, and especially on the *Tiersage*, Lübbers's *Mittelniederdeutsche Grammatik nebst Chrestomathie* and Martin's *Reinaert* are used as text-books.

32. History of the German language. Three times a week.

The object of this course is to give a systematic presentation of the development of the German language from the time of the earliest records to the present, with special reference to the historical explanation of living forms. Acquaintance with Gothic, Old Saxon, Old High German, and Middle High German is presumed.

33. Germanic mythology. Half course (first half year). Three times a week.

34. Germanic antiquities. Half course (second half year). Three times a week.

In this course Germanic life is treated in its various aspects from the origins down to the later Middle Ages. The course is chiefly designed to furnish a commentary on the most important allusions to public and private life in the principal works of the Anglo-Saxon, Old Saxon, Old and Middle High German, and Icelandic literatures.

SEMINARY COURSES.

The seminary courses have two purposes in view: First, to make a thorough study of selected works with special reference to text criticism and (in courses 35 and 36) to etymology and the history of grammatical forms; second, to acquaint the student with the methods of linguistic and literary research through original investigations carried on by him under the direction and supervision of the instructor. The exercises take place once a week and generally last an hour and a half. Occasionally the results of the work done by the students are presented by them before the Modern Language Conference.

35. The works of Hartmann von Aue.

36. Selected topics in the German romantic movement.

TEACHERS' COURSE.

PRIMARILY FOR GRADUATES.

37. The methods and equipment of a teacher of German in secondary schools. Lectures, discussions, required reading, and illustrations of class work. Three times a week.

Among the subjects treated in the lectures and discussions are the following: The adaptation of methods to the age and previous training of students; the arrangements of courses in different schools; the choice of text-books; the annotation of texts; the teachers' sources of information; the disciplinary and practical value of the study of German and its relation to the study of English. Students

taking the course are required to prepare reports on grammars, readers, or editions of texts, and present to the class some of the more difficult topics in grammar, syntax, and composition.

ADDITIONAL COURSES.

The attention of students of Germanic languages and literatures is also called to the following courses:

ENGLISH.

Anglo-Saxon—Bright, Anglo-Saxon reader. Half course (first half year). Three times a week.

Anglo-Saxon—Béowulf. Half course (second half year). Three times a week.
Historical English grammar. Half course (second half year). Three times a week.

Anglo-Saxon—Cædmon—Cynewulf. Half course (second half year).

English literature in its relation to German literature, from 1790 to 1830.

ROMANCE PHILOLOGY.

General introduction to linguistic science—Phonetics—Lectures on the principles of change in language. The pronunciation of English, French, German, and Latin. Twice a week.

Old French—Phonology and inflections—The oldest texts—La Chanson de Roland—Chrétien de Troyes—Aucassin et Nicolette. Three times a week.

Provençal—Language and literature, with selections from the poetry of the Troubadours. Three hours a week.

COMPARATIVE LITERATURE.

The origin and development of historical epic poetry in mediæval Europe. Half course (first half year). Three hours a week.

The origin and literary history of the Arthurian legends and romances—Lectures, special investigations, and theses. Three hours a week.

English literature in its relation to German literature, from 1790 to 1830.

REQUIREMENTS FOR THE DEGREE OF DOCTOR OF PHILOSOPHY.

For the degree of doctor of philosophy not less than two years, at least one of which must be spent in residence at this university, devoted to advanced studies, are required of students already qualified for candidacy for the degree. The faculty will, in estimating the amount of a candidate's study for the degree, give weight to advanced work done in the graduate department of another university.

The period of residence and study named above must be regarded merely as a minimum requirement. The requirement of time is wholly secondary.

The degree is given, not for the mere reason of faithful study for a prescribed time, or in fulfillment of a determinate programme, and never for miscellaneous studies, but on the ground of long study and high attainment in a special branch of learning, manifested not only by examinations, but by a thesis, which must be presented and accepted before the candidate is admitted to examination, and must show an original treatment of a fitting subject, or give evidence of independent research.

The special requirements for the degree of doctor of philosophy in Germanic philology will necessarily vary according to the special line of work chosen by the candidate. In a general way, however, it may be said that, apart from the thesis, which may treat either a linguistic or a literary subject, the following attainments will be expected from a candidate whose main subject is German:

1. A knowledge of the history of German literature and its relation to the political, philosophical, and artistic movements of German national life.

2. A knowledge of the history of the German language and its general relations to the early Germanic dialects, including a reading knowledge of Gothic, Old High German, Middle High German, and two of the following: Old Saxon, Anglo-Saxon, or Old Norse.

3. A detailed knowledge of some special field within the range of subjects indicated under 1 and 2.

4. A practical command of modern German.

In the case of a candidate who offers as his main subject some other Germanic language, e. g., Dano-Norwegian or Dutch, these requirements will be modified accordingly.

DEPARTMENTAL LIBRARY.

In addition to a large collection of German books in the college library, the department has a reading room in the Warren Building with a special library of about 500 volumes and a number of German periodicals. The same building contains the French and Romance libraries and the Child Memorial Library, a collection of books on English literature and philology, which are also accessible to students of German.

DEUTSCHER VEREIN.

The Deutscher Verein, a student organization composed of graduates and undergraduates, holds meetings of a social character, at which topics relating to German life and literature are discussed.

MODERN LANGUAGE CONFERENCE.

The Modern Language Conference is composed of instructors and advanced students of modern languages and literatures. Its object is the promotion of independent research and of closer intercourse between instructors and students. The conference meets at regular intervals (usually every other week) throughout the college year for the presentation and discussion of papers of general interest.

The number of students that participate in the different courses of the German department amounts to 1,200, so that the best opportunities for instructing in German are afforded. The university library, the "Schier endowment," and the efforts to combine a "German museum" with the university are referred to in the third part of this work. At the beginning of the year 1901 the funds collected for the "museum" amounted to about \$5,000. After the board of trustees advises the application of \$15,000 for the museum out of the recent legacy of \$50,000 from Henry Willard to the university the idea can be realized, as \$20,000 will suffice for the commencement.

COLUMBIA.

A competent German judge, who published his impressions of American universities in 1896, says of Columbia University of New York, into which King's College, founded in 1754, developed after the Revolution, that "if it continues to progress in the same proportion as during recent years, it will outrival Yale and Harvard."¹

An impartial observer can not fail to recognize the progress that has been made since those words were written. It is manifested exteriorly in the magnificent buildings in the metropolis where the university has been established for three years, as in the largely increased number of teachers and students. Last year, according to the Columbia University Quarterly, the former numbered 389, the latter 3,888; consequently Harvard, with 448 teachers and 5,340 students, is the only one in advance. However, as in the meantime Columbia University has united with the "Teachers' College," the entire number of college students, graduate students, auditors, students of Barnard College for women, and the Teachers' College, does not fall far below the large figures of Harvard.

¹ Zimmermann, Universities in the United States of America, p. 83.

The following statement¹ gives an interesting view of the hopeful development of this institution since 1896:

Officers and students of Columbia University.

¹ From the Columbia University Quarterly, December, 1900.

² Barnard figures are those for the end of the academic year, except for 1899 and 1900.

³ From October, 1900, women graduates register under the university faculties.

⁴ From some points of view this total should include 79 other graduate students in the schools of applied science and in Teachers' College.

⁵ Includes 54 graduates primarily registered under the university faculties.

⁶ Extension students are held to full requirements of regular courses in Teachers' College.

⁷ Of students registered also in other departments summer session has 74; Teachers' College, 104.

⁸ Including 608 pupils in Horace Mann school and 63 in experimental school.

The history of the German department furnishes the explanation of the immense stride which Columbia University took under the presidency of Hon. Seth Low. This history actually dates back to the time when the new university appeared as the successor of the suspended King's College. In the autumn of 1784 John Daniel Gross first instructed in German, and continued till the year 1795. Again in 1830 and 1831 an effort was made to introduce German instruction. Professors Frederick Shaeffer and William Ernenputsch made the attempt, but each resigned at the end of the term. At last a German, Frederick Gebhard, hit upon the fundamental procedure for procuring justice for his native language. He put his hand in his own well-filled purse, drew out \$20,000, and commissioned the trustees of the university to make use of the interest on that capital to pay a professor of the German language and literature, and under no circumstances to apply the money to any other purpose. The "Gebhard professorship" was filled April 3, 1843, and the German faculty at Columbia dates from that day.

Until the year 1847 German was an obligatory study; since then it has been optional.¹

The chair of German was at that time filled by John Louis Tellkampff; his successor, Henry I. Schmidt, continued in office till 1880. Charles Sprague Smith was next called; in 1881 an assistant was given to him, Hjalmar Hjörth Boyesen. After the Gebhard professorship was given to the last mentioned in 1883 the appointment of more teachers became absolutely necessary. The department in 1900 consisted of the following personnel: William H. Carpenter, Ph. D. (Freiburg), professor of Germanic philology; Calvin Thomas, A. M. (Michigan), Gebhard professor of the German language; William A. Hervey, A. M. (Columbia), instructor in the German language and literature; Rudolf Tombo, jr., Ph. D. (Columbia), tutor in the German language and literature; Arthur F. J. Remy, A. M. (Columbia), tutor in the German language and literature; Emil A. C. Keppler, A. M. (Columbia), assistant in the German language and literature.

The following gentlemen are delegated for Barnard College: Rudolf Tombo, sr., Ph. D. (Rostock), tutor in the German language and literature; William Alfred Braun, A. B. (Columbia), assistant in the German language and literature.

The personnel of teachers has doubled in the last three years, while the number of pupils has increased during the same time from 150 to 400 for the scholastic year of 1900-1901.

The German department forms a section of the faculty of philosophy, which Pres. Seth Low arranged according to the German model and the action taken by the Johns Hopkins University in 1890. This new faculty embraces the classic, oriental, and modern languages, as well as comparative philology. Included among the strictly philosophic studies there is also a chair of pedagogics, which has been most ably filled by Prof. Nicholas Murray Butler.

President Low's ideas may be understood from his speech delivered in Baltimore² the 22d of February, 1895, on the nineteenth anniversary of the Johns Hopkins University. He pertinently remarks that a university in the American sense is something different from what is thereby understood in Europe, and that in this country it signifies a relatively new institution. However, the highest educational institutions of America should have the same aim as the German universities (Hochschulen), which are "so powerful an instrument for the service of humanity." He adds, in the following words:

The aim which the German university has set before itself, and which it has very largely realized under the conditions natural to German life, is the aim, in my judgment, which the American university has set before itself and which it has very largely realized under the conditions natural to American life, because,

¹ Carpenter, "The Germanic languages and literatures at Columbia University." The Columbia University Bulletin, March, 1897, pp. 82, 83.

² Johns Hopkins Studies in Historical and Political Science, Baltimore, 1898, p. 5029.

after all has been said, the world is ruled by its thinkers, and civilization is carried forward by the patient investigators of natural laws; the lives of men are largely shaped by the teachings of experience as revealed by historical study, and the literature of men is enriched by every addition to our knowledge of literature and language of the past. Nature's craftsmen in all these directions will produce results according to their gifts outside of a university, if they get no opportunity within it. But the history of Germany clearly shows that the opportunity to serve mankind along such lines is much enlarged, if to train such men is the chosen aim of the university; in part, because in that case the university affords the material apparatus by the aid of which the natural thinker or investigator can best do his work, and most of all, because in a university so constituted the atmosphere of the place and the spirit of the men who work there are friendly to such labors.

The observations of the author confirm particularly the truth of the closing remarks with regard to the influence of the German department, which has so favorably developed in late years, although the number of German-American students is very small. It is rather the Anglo-American element which, with comparatively modest assistance on the part of the German, is doing the noteworthy work of culture accomplished, and is thus opening so hopeful a future to American civilization.

As the plan of study has already received explicit mention, we need only add the list of courses held at Columbia University during the year 1900-1901.

GERMAN.

- Course A. Elementary course in three sections. Three times a week.
 Course 1. Longer elementary course. Six hours.
 Course 2. Grammar, reading, and composition. Three sections, each three times a week.
 Course 3. Selected works of Goethe, Schiller, and Lessing. Texts, chiefly dramatics and essays. Three times a week.
 Course 4. Historical prose. Three times a week.
 Course 5. Scientific German. Three times a week.
 Course 6. History of German literature from the earliest times to the nineteenth century. Twice a week.
 Course 7. Goethe's Faust, first and second part. Lectures and recitations. Two hours a week.
 Course 8. Practice in speaking and writing German. Talks, conferences, and themes, all in German, upon linguistic and literary topics. Two hours a week.
 Course 9. History of the German language. Two hours a week.
 Course 10. Great German writers (Schiller and Heine). Two hours a week.
 Course 11. Old High German. Lectures and texts. Two hours a week.
 Course 19. Teacher's course. Lectures upon methods of teaching and cognate topics. Two hours a week.
 Course 20. Geschichte der deutschen Litteratur im 19. Jahrhundert. Vorlesungen in deutscher Sprache. Two hours a week.

SCANDINAVIAN.

- Course 12. Swedish: Elementary course in the language, with miscellaneous reading and a general survey in lectures of the history of Swedish literature. Two hours a week.
 Course 13. Danish: Elementary course in the language, with miscellaneous reading and a general survey in lectures of the history of Danish literature. Two hours a week.
 Course 14. Icelandic: Elementary course. Two hours a week.
 Course 15. Icelandic: Advanced course. The Völsunga Saga, lectures and texts. Two hours a week.

DUTCH.

- Course 16. Dutch: Elementary course in the language with miscellaneous reading, and a general survey in lectures of the history of Dutch literature. Twice a week.

GOthic.

- Course 17. Gothic. Two hours a week.

GERMANIC PHILOLOGY.

Course 18. General introduction to Germanic philology. Lectures and exercises. Twice a week.

GERMANIC SEMINAR.

Course 21. Germanic seminar. Critical study of the Middle Low German, Reinke de Vos (first half year), and Young Germany (second half year).

A comparison between these courses and those of Harvard shows that German literature receives less attention, and that the Swedish, Danish, and Dutch languages are taught, whereas they are not taught at Harvard. An equalization is partly brought about by the public German lectures, which, according to the action taken by the Johns Hopkins, have been held for five years, and treat of the history of German literature and other subjects of general interest.

In 1896 and 1897 Prof. Louis von Eltz spoke on Streets in the Middle Ages and Germany after the Thirty Years' war; Professor Seibert on Johanna Ambrosius; Professor Thomas on Schiller; J. Winter on Heinrich Heine, and the author of this article on Fridtjof Nansen and his polar expeditions. In the year 1898 these lectures, heretofore separate and distinct, were extended in the form of a series, and were held in the large Schermerhorn Hall. In March, 1898, Dr. Joseph Senner spoke on The immigration question in America; Rev. Dr. Gustav Gottheil on Schiller's Lay of the Bell; Prof. Is. Keller on The modern German drama; Director Heinrich Conried on The stage; Louis von Eltz on Two Austrian poets, Franz Grillparzer and Anastasius Grün.

The lecturers and their subjects in 1899 were as follows: Rev. Dr. Gustav Gottheil, Goethe's Epilogue to Schiller's Bell; Dr. Julius F. von Vesteneck, Life in the Alps; Dr. Rudolf Tombo, German etymology; Rev. Dr. August Ulmann, The development of religious thought and life in Germany; Mr. Henry E. Krehbiel, The National song in America; Mr. Louis Viereck, A trip to Alaska; Mr. Heinrich Conried (manager of the Irving Place Theater), The art of speaking; Dr. Rudolf Tombo, Walther von der Vogelweide.

The lecturers and their subjects in 1900 were as follows: Rev. Dr. Gustav Gottheil, At the commencement of the century; Mr. Charles A. Bratter (foreign editor of the Staats-Zeitung), Sins of speech of German-Americans; Prof. Franz Boas, Myths of peoples living in a state of nature; Dr. Julius Sachs, The intellectual life of German universities in the sixties; Mr. George von Skal (managing editor of the Staats-Zeitung), Rights, difficulties, and accomplishments of the German-American press; Rev. Dr. August Ulmann, The passion play at Oberammergau, illustrated; Mr. Rudolf Cronau, Two and one-half centuries of German life in America; Mr. Louis Viereck (late member of the German Reichstag), Recollections of the German Reichstag; Mr. Sadakichi Hartmann, The Japanese theater; Emil A. C. Keppler, A. M., Bürger, a German forerunner of William Wordsworth.

The lectures held from January 24 till March 28, 1901, were as follows: Rev. Gustav Gottheil, Ph. D., rabbi of Temple Emanu-El, Poetry in the prose of life; Hans M. von Kadich, Ph. D., The zoological question of North America; Mr. Udo Brachvogel, Joseph Victor von Scheffel's Lady Aventure; Mr. Charles A. Bratter, foreign editor of the Staats-Zeitung, The editor the author's stepbrother; Ernst Richard, Ph. D., German student life; Mr. Heinrich Conried, director of the Irving Place Theater, The modern German drama; Max F. Blau, Ph. D., Adelphi College, Heinrich von Kleist; Rev. August Ulmann, S. T. D., rector of Trinity School, Lessing and his times; Louis Viereck, late member of the German Reichstag, Recollections of Germany's great time, 1870-71, illustrated; Mr. George von Skal, editor of the Staats-Zeitung, Education and intelligence.

The Deutscher Verein, the university library, the endowments for German purposes, and German stage representations of the classics for students are spoken of in the third part of the book.

YALE.

Yale University, founded in 1701, enjoys the reputation of being par excellence the school of scholars, in contrast to Harvard, whose students play so important a part in the national and political life of the country. While Harvard University is no further from the center of Boston than the Columbia from the City Hall in New York, Yale is situated in a relatively small city of Connecticut—New Haven—which, at the beginning of the nineteenth century, possessed only 5,000 inhabitants, though it has increased to over 100,000 during the last one hundred years. Conditions, therefore, seem in many respects to have been at Yale more favorable to closer application to abstract studies, while the proximity of the large city of Boston favored broader points of view at Harvard.

Under President Theodore D. Woolsey (1846-71), who was educated in Germany, Yale received its art school and its Sheffield Scientific School. Under President Timothy Dwight, who likewise studied in Germany and placed a high value on German universities, the elective system was adopted in 1886. The fact that the present president, A. T. Hadley, was formerly professor of German at the university promises well for the German department, the development of which is similar to that of Harvard. After the Franco-German war German ceased to be treated as a stepchild; for three sessions it was an obligatory study. The same is the case at the Sheffield Scientific School, where a candidate for a bachelor's degree must pass an examination in German or French.

The personnel of teachers is large and consists of the following gentlemen, besides the head professor, Arthur H. Palmer: Prof. Gustav Gruener; the professors extraordinary, R. N. Corwin and Hans Oertel; and the instructors, Dr. Adams, Farr, Eldridge, Dr. Carrington, and Luquiens. These instruct at both institutions in language and literature.

In 1900 the number of students who pursued the course in German were about 450 from Yale, 400 from the Sheffield school, and 7 graduates for the purpose of promotion; in all about 850 students out of a total of 2,540, consequently a very fair proportion.

Upon his induction into office during the winter session of 1899-1900, President Hadley remarked, in his inaugural address, that athletic exercises should not force scientific study into the background. This opinion harmonizes with the German idea. It is to be hoped that he will enlarge the German library, which contains only 8,000 to 10,000 volumes, not including the 500 volumes of the seminary library. The Scandinavian library of Count Riant is supposed to be the best in America.

The scope of this essay unfortunately does not permit a complete history of the German department or a detailed account of the course of study, based upon the "Notes on the development of instruction in the modern languages at Yale," including information on the subject respecting Princeton, kindly furnished to us by Professor Gruener.¹

It were wrong to fail to mention a most prominent student that Yale has given to the world, Andrew D. White, and his magnificent address delivered June 26, 1883, to his classmates on the thirtieth anniversary of his graduation, especially as his words seem to have been somewhat forgotten in the lapse of seven years. The following is from this memorable speech, which he entitled "The message of the nineteenth century to the twentieth:"

The great thing to be done is neither more nor less than to develop above all things other great elements of civilization now held in check, which shall take

¹The point of view that Yale can not possibly be behind Harvard in what it offers its students seems to be conspicuous throughout the development of the department in this university. But the feature of conservatism, which George Trumbull Ladd has assigned to Yale in his *Essays on the Higher Education*, is easily recognized.

their rightful place in the United States; which shall modify the mercantile spirit; which shall hold it in check while stimulating it; which shall make the history of our country something greater and broader than anything we have reached or ever can reach under the sway of mercantilism alone. What shall be these counter elements of civilization? Monarchy, aristocracy, militarism we could not have if we would, we would not have if we could; what shall we have?

I answer simply that we must do all that we can to rear greater fabrics of philosophic thought, literary thought—scientific, artistic, political thought; to summon young men more and more into these fields, not as a matter of taste or social opportunity, but as a patriotic duty; to hold before them not the incentive of mere gain or of mere pleasure or of mere reputation, but the ideal of a new and better civilization. The greatest work which the coming century has to do in this country is to build up an aristocracy of thought and feeling which shall hold its own against the aristocracy of mercantilism. I would have, more and more, the appeal made to every young man who feels within him the ability for good or great things in any of these higher fields, to devote his powers to them as a sacred duty, no matter how strongly the mercantile spirit may draw him.

I would have this idea preached early and late, that the man who has powers fitted for this higher service, for the discovery or proclamation of religious truth or scientific truth, for literature, for science, for art, is false to himself and false to his country, if he deliberately put his talents at the service of the mercantile spirit.

This address will ever be a fine tribute to the ideal spirit which is nurtured in Yale. Of course, the aristocracy of thought and feeling expected of the new century is not limited to the thought that emanates from Yale, but will be strengthened by all universities in which study is pursued in the spirit of German idealism. It can not be denied that the German departments in this sense are to be considered the nurseries of an incomparable progress in culture. Whoever undertakes to write a history of American culture must be especially mindful of them, because they are the most important means of uniting German idealism with American energy.

Facts concerning the course of study as it was conducted until 1900 are given in the following extract from one of the more recent catalogues:

GERMAN—The student who has passed the admission examination in German, may continue the study of German during each of the four years of his college course, if he so elect; the student who has not passed the admission examination in German may, if he desire, begin the study of German in either freshman or sophomore year, and pursue it for four or for three years; no elementary instruction in the language is given to the juniors or seniors.

The courses of work for the successive years may be outlined as follows: During the first year the work consists of German grammar; translation of easy English phrases, sentences, and connected prose into German; and of easy German prose into English. Constant sight translation is used as a means for developing and strengthening the student's vocabulary and for freeing him from dependence upon the lexicon and from the word-by-word methods which its use encourages. Especial care also is devoted to pronunciation. The work of the second year continues and extends that of the first year, taking up the translation of more difficult German prose, both with previous preparation and at sight, the study of word-formation, and the translation of more difficult English prose into German. Throughout the two years the aim in reading German is to cover as much ground as possible—from 500 pages upward—in the belief that thereby the student will acquire more command of the language than when a smaller amount is read with rigid attention to grammatical details. It is expected that at the end of the second year the student will have adequate preparation for the use of the language in his work in other branches of study. Those, therefore, who are studying German solely for this end in view may perhaps discontinue class study at this point; but no student should begin the language unless he expects to devote at least two years to its study.

For the remaining years the courses vary from year to year; but opportunity is given for the critical study of works of leading authors, and for the study of periods in the history of German literature. Advanced courses are offered also in earlier German literature and in the historical development of the language.

German readings are given by the instructors, outside of the regular college work, and a course in advanced composition is given, in which German alone is spoken. German is constantly read aloud in the class-room, and efforts are made

to improve the student's pronunciation and to help him to acquire some facility in expressing his ideas in German. But it is not a leading aim in the instruction in German to enable the student to converse in that language. Training in the ordinary conversational idiom may be had more profitably elsewhere and can not form any considerable part of the class-room work. The student may acquire the language as a tool for use in other departments of study, and may come in contact with the best works of German literature, studying their form and contents, and the lives and environment of their authors; fluency in conversation must be acquired where the conditions are more fitted to the object which they are to effect.

In 1900 the number of courses were 9 for beginners, and 8 for graduates, besides a weekly course of two hours in Swedish.

CORNELL.

The latest register, which reveals plainly the transition to the elective system inaugurated one or two years ago, says, concerning the aims and course of German instruction, as follows:

The aim of the first two courses in German, besides preparing the student for progressive and independent work, is to afford those who have not a full classical training, some grammatical and linguistic discipline, an insight into the relations between German and English, and a certain degree of literary culture.

In course 1 Joynes-Meissner's Grammar and Brandt's Reader are used, accompanied by exercises in writing German and translation at sight. Later in the year easy novels or plays are translated.

In course 2 standard German classics are translated, and special attention is paid to the study of etymology and syntax, and to reading at sight.

The later work, in the form of lectures and recitations, includes the study of German history, literature, and mythology; and courses are given, varying from year to year, embracing the works of the leading authors. Classes are also formed in composition and conversation, and recent dramatic literature and the writings of living novelists are read. Instruction is further provided in Old and Middle High German and other Germanic dialects.

The seminary system of study for advanced students has been employed in the department for several years with satisfactory results. To different members of the seminary classes different portions of the same general subject are assigned, with references to the proper authorities or sources; or individual members pursue individual courses of reading under the supervision of the professor in charge. Lectures for those intending to be teachers are also given on class-room methods and theories of instruction in the modern languages; and generous provision has been made by the university for the use of lantern slides for illustrative purposes. The seminary room in the general library building is already equipped with a good working library, which is steadily increasing in extent. The gift to the University of the Zarncke library has materially enlarged the resources of the seminary and leaves little to be desired.

Course 1, which can not be taken to make up an entrance deficiency, is for beginners in German.

Course 2, which can not be taken to make up an entrance deficiency, is otherwise open to those who have had the equivalent of course 1.

Courses 3-19 are open, under the restrictions hereafter noted, to those only who have had at least the equivalent of courses 1 and 2.

Course 1, and, under certain restrictions, courses 2, 3, 4, and 5 are open to freshmen.

COURSES IN GERMAN.

1. German Grammar and Reader. Three weeks.
2. Schiller's Wilhelm Tell, Freytag's Journalisten, Goethe's Hermann und Dorothea. Three weeks.
- 3a. Elementary German composition and conversation; translation; translation into German of selected passages adapted from German originals, and conversation on the texts thus prepared. One week. Open to those who have had course 1 or an equivalent.
- 3b. Intermediate course in German composition and conversation. Translation of easy English extracts into German. During the early part of the course con-

siderable attention will be given to conversation. One week. Open, by application, to those who have had course 3a, or an equivalent.

3c. Advanced German composition. Those intending to teach German are specially advised to elect this course. One week. Open, by application, to those who have had courses 3a and 3b, or an equivalent.

4. Heine's Life and Works. Selections from Heine's prose and poetry, with an examination of his views on literature, art, politics, and religion; and some study of the metrical and linguistic characteristics of his verse. Three weeks.

5. Goethe's Dramas. Three weeks.

6. Goethe's Faust. Parts I and II. Three weeks.

7. German Lyrical Poetry from Luther to the present day. Two weeks.

8. Deutsche Volkslieder. Selections from songs of sentiment and of religion, of various callings, including soldier and student songs, children's rhymes, and legendary and narrative ballads. One week.

9. Schiller's Life and Works, especially his dramatic writings and correspondence with Goethe. Three weeks.

10. The Modern Novel and Drama, illustrated chiefly by the works of Freytag, Sudermann, and Hauptmann. Three weeks. First half year.

11. German Seminary. The history of German literature. Two weeks.

12. Life and Writings of Richard Wagner. Selections from the texts of Richard Wagner's musical dramas including *Der Fliegende Holländer*, *Tannhäuser*, *Lohengrin*, *Parsifal*, *Tristan und Isolde*, and the *Nibelungenring*, with a study of the legendary background, and with illustrations and elucidations from Wagner's other writings. Three hours weekly.

13. The Novel of the Nineteenth Century. Mainly historical. Scheffel, Freytag, Hauff. Second half year. Open to students who have had two years of German.

14. Middle High German. Beginning course. Selections from Middle High German prose and poetry. Two hours weekly.

15. Readings from Herder's *Cid* and Klopstock's *Messias*. First half year. Two weeks.

16. German Seminary. Middle High German epic and lyric poetry. First half year. One week.

17. Lessing's Life and Writings. Early dramas and *Nathan der Weise*; first half year. Prose works, art and criticism; second half year. Two weeks.

18. German Seminary. History of the German language. Methods of modern language study and teaching, including questions of pronunciation, syntax, etymology, prose composition, German chirography, and school equipment. Open, by application, to those intending to teach. One week.

19. Courses (of Middle High German) are given like the courses 8, 12, 17, and 18, not during the current year, but in 1901-2.

Active professors are the following:

Horatio Stevens White, A. B., professor of the German language and literature, and dean of the university faculty.

Waterman Thomas Hewett, A. B., Ph. D., professor of the German language and literature.

George Burrige Viles, A. M., and George Maxwell Howe, A. M., instructors in German.

For the summer courses Prof. Dr. Herm. Schoenfeld, of the Columbian University in Washington, D. C., is added.

The course of the summer courses in 1901, is as follows:

COURSE FOR TEACHERS.

A. Methods of instruction in the modern languages; recent theories; report of the "Committee of Twelve." The teacher's equipment: A discussion of representative works for linguistic study, histories of literature, and biographies; text-books, dictionaries, grammars, and commentaries.

Introductory phonetics and historical grammar, moot points in pronunciation. Syntax and modern German verse. Two hours a week.

TRANSLATION COURSE.

B. Reading and interpretation of classical works of Goethe, Schiller, and Lessing, comprising those more often read in advanced classes. The choice will be

made from Goetz von Berlichingen, Iphigenie, Tasso, Die Braut von Messina, Die Jungfrau von Orleans, Wallenstein, and Nathan der Weise. Three hours a week.

C. The rapid reading, with comment, of the advanced requirements for admission in German, Schiller's Wilhelm Tell, Goethe's Hermann und Dorothea, and Lessing's Minna von Barnhelm. Sight translation will be practiced on certain days in the week, and there will be tests of reading done outside the class. The textbook in this will be Freytag's Verlorene Handschrift. Daily except Saturday.

D. Lectures in German upon the history of German civilization and literature from 1750 to the present time. Daily except Saturday.

E. Practical exercises in German conversation and composition. The course will be conducted entirely in German, in order to familiarize the student with a working vocabulary. Three hours a week.

In what spirit this university is conducted, which, as has been stated before, was organized by Andrew D. White, may be seen from the following quotation taken from an oration of the then president of the institution, Charles Kendall Adams. The oration is entitled "Washington and the higher education."¹

There is something in the persistency and the nobility of Washington's thought on the subject of a national university that reminds us of what occurred only ten years later at the capital of one of the nations of Europe. Prussia had fallen under the contemptuous displeasure of Napoleon; had been humiliated and well nigh destroyed. Despoiled of her fortresses, robbed of half her territory, her army, even for purposes of defense, reduced to a handful of men, to her more than to any other of Napoleon's foes it had been permitted—

"To read the book of fate,
And see the revolution of the times
Make mountains level, and the continent,
Weary of solid firmness, melt itself
Into the sea."

But through the welter of that sad ruin there rang out the clear voice of a philosopher, proclaiming that the only gospel of salvation for Prussia was the gospel of education. At the very moment when French bayonets were in possession of Berlin, Fichte lifted up his voice in the "Reden an die deutsche Nation," in which throughout the elaborate argument of 14 lectures, there was this ever-recurring refrain: "Education is the only means by which we can be rescued from our present helpless condition." The keynote of that appeal, the pathetic eloquence of which resounded throughout Germany, was in the sentence: "I hope to convince Germans that nothing but education can rescue us from the miseries that overwhelm us." And the foundation of his argument was laid in a doctrine which he has condensed into a single sentence. "Education," said he, "education, as hitherto conducted by the church, has aimed only at securing for men happiness in another life; but this is not enough, for men need to be taught how to bear themselves in the present life, so as to do their duty to the State, to others, and to themselves." The lectures, which were little else than an eloquent and impassioned elaboration of this theme, made so profound an impression upon the country, and especially upon the Government, that a commission of five of the most eminent scholars of Prussia was appointed to elaborate and recommend a system that would embody these ideas. All grades of education were remodeled and reduced to substantial uniformity of system. To us, in this discussion, it is of chief interest to note that one of the first fruits of the movement was the founding of the university at Berlin, a university which, now that three-quarters of a century have passed, brings annually together for the most advanced learning the world can give more than 5,000 of the most intelligent and the most aspiring young men of Germany. It would be easy to point out how the works of such men as Niebuhr and Ranke and Mommsen and Savigny and Boeckl and Virchow and Helmholz and others of kindred renown, each of whom, in his sphere, has stood at the very pinnacle of human knowledge, have inspired the thoughts and illuminated the paths of scholars in all parts of the world. But, fascinating as this theme would be, it would be more to our purpose to-day to contemplate the effect of this system of education upon the German people and the German nation. It must, however, suffice simply to say that it has taken the shattered and impoverished and disheartened Germany of 1810 and made it the united and prosperous and confident Germany of the present day.

The present president is Jacob Gould Schurman. During his presidency the New York State College of Forestry was connected with the university. This col-

¹ An address delivered before Cornell University, February 23, 1888, p. 35.

lege, under the leadership of Professor Dr. Fernow, is destined to introduce German science of forestry. The number of students in the university registered in 1900 was 2,270, of whom nearly one-fourth participated in the courses in German (1900-1901: 511). The summer courses were attended by 445 students. Of this number only 42 took part in the only two German courses. During the current year five courses in German will be offered, and Professor Schoenfeld is added as a valuable addition to the faculty. A large increase in the number of students of German is expected.

Concerning the library the third part of this article gives information. A little pamphlet, entitled "What profession shall I choose? How to fit for it?" explains the objects of the university. This was published in Ithaca in 1884, and serves as a valuable guide to students.

PRINCETON.

Although the third oldest seat of higher learning in the country, this institution is one of the youngest universities, having received the title on its one hundred and fiftieth anniversary, October 21, 1896. Notwithstanding that the number of its students has considerably increased (428 in 1880, according to Thwing; at present, 1,196), this institution is twentieth in the order of American universities according to attendance. The large participation in German instruction is therefore the more encouraging. The German department has two divisions: the academic, in which Professors Humphreys and Hoskins and Instructor Beam teach, and the school of sciences (technical school), conducted by Professor Huss and Instructor Priest.

In the technical school German is obligatory for the freshmen, who numbered 117 in the year 1900, and for the sophomores, of whom there were 92 in the year 1900. From then on German is optional, and about one-fourth of all the students take the course.

In the academic department in 1899-1900 eight courses were held for elementary and advanced instruction in the German language, six in the history of German literature, and eight in Middle High German, Old High German, Old Icelandic, and historical German grammar. Moreover the opportunity was offered to students of German to take part in the courses in Anglo-Saxon (Beowulf) and Gothic held in the English seminary. With the exception of the absence of the Scandinavian language and literature the course of study resembles that of Yale and does not reach the present position of Columbia. In the school of science ten courses are held for beginners and advanced students in grammar, composition, conversation, scientific monographs, and history of literature.

UNIVERSITY OF PENNSYLVANIA.

We have a comprehensive report on German at the University of Pennsylvania by Professor Learned,¹ who quotes a number of details relative to the eighteenth century. This most competent authority makes the following statements concerning the development of German study in the nineteenth century:

The revival of German studies at the University of Pennsylvania begins with the researches of Samuel Stedman Haldeman, professor of natural history, 1850-1853, and professor of comparative philology, 1869-1880. Professor Haldeman contributed 10 studies on conchology, 36 on entomology, 7 on geology and chemistry, 7 on archaeology, 32 on philology, and 28 on other subjects. Of the 32 contributions to philology, one is of particular importance as inaugurating the study of German dialects in America. This was a paper entitled "On the German vernacular of Pennsylvania," published in the Transactions of the American Philological

¹Opening of the Bechstein Germanic Library. Addresses, pp.33-53. The extract is noteworthy as being, so far as we know, the only detailed authentic account of the development of the German department in one of the most important universities of the country.

Association for 1869-1870, read also before the Philological Society of London, 1870, and published separately with prefatory notice by A. J. Ellis, under the title, *Pennsylvania Dutch, A Dialect of South German with an Infusion of English*, Philadelphia, 1872. It was the instinct and experience of a naturalist that led Professor Haldeman to the study of language and gave his researches their peculiar value. The relation of linguistics to etymology attracted him in particular and stimulated his studies *On the Phonology of the Wyandots* (1846), *On Some Points in Linguistic Ethnology, Relations between the Chinese and Indo-European Languages* (1856) and similar subjects, in which the influence of Wilhelm von Humboldt seems clearly traceable. At the time when Haldeman was writing his study on Pennsylvania Dutch, dialect study in Germany was still in the formative stage. Haldeman's Pennsylvania Dutch may be regarded as a pioneer study, first in American dialectology, and secondly in comparative study of modern German dialects.

The point of view, and at the same time the importance of Professor Haldeman's study, is admirably set forth by Mr. Alexander J. Ellis in his prefatory notice to his *Early English Pronunciation* (published in 1867), as follows:

"Sufficient importance does not seem to have been hitherto attached to watching the growth and change of living languages. We have devoted our philological energies to the study of dead tongues which we could not pronounce, and have therefore been compelled to compare by letters rather than by sounds, and which we know only in the form impressed upon them by scholars of various times. The form in which they were originally written is forever concealed. The form in which they appear in the earliest manuscripts has practically never been published, but has to be painfully collected from a mass of various readings. The form we know is a critical, conjectural form, patched up by men distinguished for scholarship, but for the most part entirely ignorant of the laws which govern the change of speech. The very orthography is mediæval. We are thus enabled to see as little of the real genesis of language in form, in sound, in grammatical and logical instruction—in short, in the real truth of philological investigation, the relation of thought to speech sound—as the study of a full-grown salmon would enable us to judge of the marvelous development of that beautiful fish. Such studies as the present will, I hope, serve among others to stimulate exertion in the new direction. We can not learn life by the study of fossils alone."

Simultaneously with the researches of Professor Haldeman in the Pennsylvania Dutch his colleague, Oswald Seidensticker, professor of German in the university, was breaking ground in another field of German-American culture—the history and literature of the German pioneer in America.

As early as 1864 Professor Seidensticker published a paper entitled "*Schiller im Englischen*." This study seems to have served only as the door to a more attractive department, for his studies for the next twenty years lay chiefly in the earlier period of German-American history and literature, and it was only toward the end of his career that he once more published a paper more closely related to the one of 1864 under the title, "*The relation of English and German literature in the eighteenth century*."

The most important work of his he published during the last year of his life (1893). It is entitled *The First Century of German Printing in America, 1728-1830* (Philadelphia).

The value of this work for the study of American culture has not been duly appreciated beyond a limited circle, partly because most Anglo-American historians have been inexcusably slow in recognizing the importance of the German element in the growth of the great American Republic. Then, too, it must stand as an menacing refection upon the German-American's interest in his own history that *Der deutsche Pionier*, which for years contributed to the study of German history and culture in America, was finally allowed to be discontinued for want of even a modest number of subscribers.

The German in America has played his part most nobly. He tills to-day our richest farms and turns the skillful hand in our most important trades; he helps to fight our battles and teaches us the arts of war; he develops American industry and controls great avenues of American commerce; he teaches us the value of literature and supplies us with a new education and a new science. The presence of 10,000,000 Americans in our population in whose veins German blood flows justifies the study of the traditions of this sturdy race. It is in emphasizing the significance of such facts that the importance of the work of Professor Seidensticker and those laboring in the same field has rendered its greatest service.

This brief survey has made it apparent that the traditions of German studies at the University of Pennsylvania have been at each revival epoch in close touch with the literature and science of the fatherland, and have fostered truly national

American ideals by investigating the cultural problems of the German settler in his adopted fatherland.

With this heritage of German traditions it remains for us to develop our resources in accordance with the most enlightened methods of the new science of linguistics, which has inaugurated a new epoch in the study of language and literature. Here is the place for a distinctly American school of Germanics. The conditions and the resources are here for such an enterprise. Even a precedent is not wanting, for the "Institut" of Kunze and Helmuth may be regarded as a faint prototype of what might be developed in the more distant future.

What conditions! Here is the cradle of German culture in America, whence thousands of sturdy pioneers have gone forth, breaking new paths to the shore of the Pacific.

The speaker closed his remarkably interesting lecture with the following exposition of his scientific working plan:

The programme justified by these traditions and resources is ample and distinctly national and American:

The scientific study of the Germanic dialects of America—High German (Swiss, Suabian, Bavarian), Midland German (Frankish, Saxon), Low German (Platt and Netherlandish), Norse (Swedish, Danish, Norwegian, Icelandic). All of these dialects are represented as living speech in America.

The study of German literature in America (German literature written here and the influence of the literature of Germany on our own).

The German folk-lore and culture of America (manners, customs, and other forms of German culture in American life).

These subjects lead naturally and necessarily to the comparative study of Germanic dialects and literatures of Europe through all the periods of their history. Thus we may justify each step by the claims of our national cultural genealogy.

It is to the achievement of the fullest success of this school of Germanics, in the estimation not only of contemporaneous American and European scholars, but in the more calm and severe judgment of the future, that we invite the Germans of the city of Philadelphia and of the country at large to lend their interest and cooperation by contributing serial publications, books, pamphlets, and other material relating to the Germans in America.

This is a work in which every German-American as well as Anglo-American may take part without fear of encountering social, political, or race prejudice and with the consciousness that he is aiding in strengthening the bonds which unite the two great cultures of modern civilization. Having once formed such an alliance among ourselves, the hearts of the fatherland will respond to the great work of preserving the history, language, literature, and culture of the German in America.

This programme has meanwhile become to a good degree an actuality. The catalogue for the current year enumerates no less than 11 courses for graduate students in the philosophical faculty.

The graduate courses in Germanic philology are grouped in cycles of three years, so as to enable the student to pursue his studies in all the representative periods of Germanic languages and literatures—Gothic, Old High German, Middle High German, New High German (including the sixteenth, seventeenth, eighteenth, and nineteenth centuries). During the cycle of three years at least one seminary course will be offered in each one of the more important periods. The Germanic seminary devotes three hours a week to German ballads. Other courses include Old Norse poetry, Gothic, Middle High German, as well as seventeenth century German; also introduction to Germanic philology and Goethe and Schiller (1794–1805). An especially interesting lecture is that of Professor Learned on German literature in America, in which the literary relations of Germany and America in the nineteenth century, with special reference to the influence of German literature on Anglo-American literature, are treated.

Another important institution is the Germanic Association. The work of this association, of which the instructors and advanced graduate students are members, is an essential part of the work in German. An original paper is presented at each meeting. This may be followed by minor communications.

Lastly, there is a class in German conversation. Students who elect German as

a major are required to join the class, unless they already have a satisfactory command of colloquial German.

All graduate courses are given by Professor Learned and by the instructor, Dr. Daniel B. Shumway; the elementary instruction in the college is entirely separated from the department sketched in the foregoing.

As a consequence of Learned's extraordinary efforts in developing his department, the fact may be recorded that the attendance upon the German courses here is now about 325, a gain of something over 100 in the last two years. This indicates a gratifying increase in the interest of German in the old cradle of German culture in America. The elementary instruction in German is conducted by Edward Charles Wesselhoeft, A. M., instructor, and Ellwood Conly Parry, assistant instructor.

Concerning the very extensive German book treasures in Philadelphia, the next chief part of this article will give the required information.

Frequently German lectures (in the vernacular) are held in the university. Thus, in 1897 Mr. L. Viereck, of New York, spoke on "Political parties in Germany," in 1900 on "Franz Lieber," and in 1901 on "Remembrances of Germany's great historical times." Mr. Couried, stage director, read a lecture in 1900 in German on the "German stage" and on Schiller's *Das Lied der Glocke*.

The total attendance of this university in 1901 was 2,573.

JOHNS HOPKINS.

As regards scientific publications, no American university deserves to be mentioned with greater honor than the Johns Hopkins, of Baltimore. Its publications stand out alone in the United States and have exerted a favorable influence on other universities.

This judgment of a competent authority¹ dates from the year 1895 and has lost none of its weight in the meantime. What the institution has done is the more meritorious, as its financial condition has been precarious since its foundation, and the legislature of Maryland has failed to follow the example given by other States in their liberal support of the universities within their limits.²

Although this university is not a generation old and is limited to two faculties—a philosophical and a medical faculty—it can boast of its graduates being particularly successful academic teachers, as may be learned from the biographical section of this article. Finally, its German department is by no means one of the largest—the comparatively small total attendance would make this an impossibility—though it is one of the best in the country. It was arranged by Prof. Herman Carl George Brandt, who taught until the year 1883, when he accepted a call to Hamilton College. Since then it has been under the direction of Prof. Henry Wood, assisted by the following gentlemen:

Dr. B. J. Vos, associate professor of German.

Dr. T. S. Baker, instructor in German.

Mr. Julius Hofmann.

The work done by the German department is mentioned in the following extract taken from the twenty-third annual report of the president:

The German Seminary, under the direction of Professor Wood, met three times weekly through the year. The subject for the first half year was Goethe's Lyrical Poems. They were studied chronologically in a selection designed to illustrate the change and growth in Goethe's language and style. Particular attention was devoted to the *Leipziger Liederbuch*, the lyrics of the first Weimar period, and the productions of the *Balladenjahr* (1797). The poems were then considered, singly and in groups, as establishing or completing modern lyrical types in literature. During the second half year the *Nibelungenlied* was studied. The first

² Compare James B. Angell, "The State universities of the West" in the *Studies in Historical and Political Science*. Baltimore: 1898.

sixteen *Aventiuren* (except the fourth, eighth, and eleventh) were read, together with parts of *Aventiuren* 21, 25, 27, 28, 30, 33, 37, 38, 39. The text of Lachmann was used as a basis, with the editions of Bartsch and Zarncke for the *Plusstrophes* of MSS. B and C. The selections were made with reference to the special subjects assigned to the members of the seminary. The chief of these were: Lachmann's criteria of genuineness, the *Kürenberger-trophe* and the *Nibelungen* poetry of Austria, Origins of the *Nibelungen* meter, Laistner's *Archetypus der Nibelungen*, Heltzmann and the MS. C, *Plusstrophes* and modern criticism, the *Siegfried* myth, *Dietrich of Bern* in *Nibelungenlied* und *Klage*.

The Germanic Society, which is composed of the director of the seminary and the instructors and graduate students in German, held sixteen meetings during the year, in an evening session. Besides reviews and reports, the following papers were read, some of them presenting completed investigations and others giving preliminary results of studies still in progress: Early German Versions of the Bible; the first person plural imperative in German; the close of Goethe's *Tasso* as a literary problem; Poe's *House of Usher* and its German source; early editions of German works appearing in America: the Gothic *u*-declension.

Professor Wood gave a course in Gothic and the elements of comparative German grammar, twice weekly, through the year. Braune's *Gotische Grammatik* was studied, after which parts of *Ulfilas* and the *Skeirman* were interpreted, with Bernhardt's larger text as a basis. Streitberg's *Urgermanische Grammatik* was read entire, and was accompanied by practical exercises designed to illustrate the principles of sound-change and word-formation for the several Teutonic languages.

A class in Old Saxon, conducted by Professor Wood, met twice weekly, during the first half-year. The *Heliand* was read, with the editions of Sievers and Piper as a basis. Particular attention was given to recent aspects of the *Praefatio*, as tending to solve questions of source, scope, and authorship of the poem. Correspondence between Old Saxon and English syntax were studied, with special reference to their application to text criticism. The *Genesis* fragments were also read.

A course in Schiller's dramas, weekly through the year, was given by Professor Wood. All the plays were read, including the fragments "*Demetrius*" and "*Die Malteser*." Schiller's earlier pieces were compared with the classicizing and Senecan variety of the Elizabethan drama, and the similarities noted were also pointed out in the case of Lessing's "*Emilia Galotti*." Schiller's later tragedies were then studied, as uniting elements of classicism and romanticism in the establishment of new tendencies for the modern drama. Particular attention was devoted to *Wallenstein* and *Demetrius* as the two most characteristic examples of the new type.

The other work of Professor Wood was devoted to instruction in language and literature in the undergraduate major and minor course.

Professor Vos taught two hours—modern Dutch, Middle High German, and history of German literature in the eleventh century. Besides, he gave a number of lectures to undergraduates.

Dr. Baker gave a graduate course on the German novel in the eighteenth century. The period studied was from the *Robinsonaden* to Jean Paul. Much attention was given to foreign influence, and particularly to Rousseau and the English contemporary novelists. In addition to the foregoing Dr. Baker gave undergraduate and special courses.

Mr. Hofmann met a class of graduates for scientific reading twice a week. He also conducted a class in conversational German weekly through the year.

To complete this account the following extract from the Register for 1898-99 may serve:

In the German Seminary, in which the graduate instruction centers, nearly equal attention is devoted to German literature and German philology. To enter upon the work of the seminary in literature the student should possess a knowledge of German equivalent to that imparted in the undergraduate courses hereinafter mentioned, supplemented by private readings. For the seminary work in philology it is desirable in addition that preliminary courses in Gothic and Middle High German should be first completed, and these may be taken with advantage by the student immediately upon entering. All graduate students of German are required to share in both the philological and literary work, and to direct their efforts to the attainment of broad results which may serve as the foundation of scientific work and of successful teaching; but the seminary and the allied graduate courses are believed to offer also sufficient opportunity and encouragement for the prosecution of chosen lines of work, whether on the linguistic or literary side, in accordance with individual capacity and bent. In this way opportunity for independent research is afforded within the framework of organized effort

directed toward the attainment of results which concern the seminary as a whole and toward which each member is expected to contribute his share.

The subjects selected for the seminary during recent years have been as follows: 1894-95, *Minnesangsfrühling*, German literature in the eighteenth century; 1895-96, Goethe and Schiller (1786-1805), Walther von der Vogelweide; 1896-97, Goethe's *Faust*, *Parzival*; 1897-98, Goethe's *Lyrical Poems*, *Nibelungenlied*; 1898-99, *Storm and stress* and early romanticism, Walther von der Vogelweide.

The Germanic Society, which meets fortnightly, supplements the work of the German Seminary; before it are presented not only reports on articles in current journals, but also successive results of studies by the members. The chief object of the society is to foster and guide the aptitude for more sustained individual investigation than the seminary proper offers scope for. Lists of the papers presented and discussed are given in the yearly reports.

In addition to the work of the seminary (three meetings a week) other advanced courses are given. For example, in 1898-99 Professor Wood gave courses in Gothic and Old Norse (Sagas). Dr. Vos conducted classes in Middle High German, Vondel, and Middle Dutch, and lectured on the history of rhyme. A course on contemporary German drama was given by Dr. Baker.

The undergraduate courses in German are conducted chiefly by Associate Professor Vos, aided by Dr. T. S. Baker, with such other assistance as may from time to time be required. A course in elementary German is given for candidates for matriculation who have entered with Greek. This is followed by the regular work in German during the first college year, a course required of all undergraduates. Nearly equal portions of the German drama and of German literary prose are read. Private readings and weekly exercises in prose composition supplement the class readings.

Undergraduates in Group VII who elect German, or undergraduates in any of the seven groups who substitute German at this point in their course, pursue the study during a second year. The readings from the classical period are continued in texts of greater difficulty, and instruction is given in the history of German literature and in the writing of German prose.

An elective course (rapid reading of contemporary literature) is offered to undergraduates who have completed the work in German of the first college year. A second elective in scientific readings is open to undergraduates who are preparing to enter the medical school.

Classes are also provided in conversational German and in historical and scientific readings for graduates who lack the ability to read the language at sight.

It seems that the interest in the study of German does not make such constant progress here as in other universities. This is plainly seen from the following statistics, taken from the president's annual report:

	1893-94.	1894-95.	1895-96.	1896-97.	1897-98.
Total number of enrolled students	522	589	596	520	641
Number participating in German courses	109	152	167	139	170

According to a circular of April, 1900, there were only 105 students taking German, namely, in the German Seminary, 11; Germanic Society, 14; Gothic, 5; Old Norse, 6; beginnings of German classicism, 10; modern German grammar, 9; history of rhyme in Middle High German, 7; English influence on German literature in the eighteenth century, 6; history of German literature, 14; minor course A, 39; minor course B (Goethe), 14; elementary German, 6; scientific readings, 8; reading in contemporary German literature, 5; historical readings, 4; oral exercises, 6.

Since of the total number enrolled, to wit, 649 students in the last scholastic year, 252 attended the medical faculty, there were still more than one-fourth of the remaining students enrolled in German. The romance languages had only an attendance of 78, equaling one-fifth of the total number.

UNIVERSITY OF MICHIGAN.

An account has already been given of the foundation and history of this university. President Dr. James B. Angell holds a position similar to that of Presi-

dents Eliot and Gilman. He was supported in his labors by B. A. Hinsdale, professor of pedagogics, lately deceased, who made a special study of German influences on the organization of the American educational system. Consequently, despite the painful loss of Professor Hensch, the growth of the German department has been extraordinary. With a total of 3,813 students the German attendance is second largest; about 700 literary students each semester and 100 engineer students, according to a report from the ordinary, February 13, 1901.

The teachers for the year 1900 were as follows: Max Winkler, Ph. D., acting professor of German; George Hempl, Ph. D., professor of English philology and general linguistics; Ernst H. Meusel, Ph. D., assistant professor of German; Tobias Diekhoff, Ph. D., Warren W. Florer, Ph. D., Edwin C. Roedder,¹ Ph. D., Ewald Boucke, Ph. D., Jonathan A. C. Hildner, Ph. D., instructors in German.

It will be observed that the corps of teachers of this faculty is composed exclusively of graduates with the degree of doctor of philosophy.

The courses are more numerous than at most universities, and are as follows:

First and second. Elementary courses. Pronunciation, grammar, and easy reading, with practice in speaking and writing German.

Third. Modern prose, narrative and dramatic, with practice in speaking and writing German.

Fourth. A drama of Lessing, Goethe, or Schiller, with collateral prose reading, and practice in speaking and writing German.

Fifth and sixth. (Each during one session.) Third year electives: (a) Goethe's *Goetz von Berlichingen*, and *Die Leiden des jungen Werthers*; Schiller's *Die Räuber*; (b) Schiller's *Wallenstein*, with extracts from the history of the Thirty Years' War; (c) Schiller's philosophic writings; (d) Goethe's *Iphigenie*, *Tasso*, and *Hermann und Dorothea*; (e) Lessing's *Nathan*, *Anti-Goeze*, and *The Education of the Human Race*; (f) *Laokoon*; (g) German composition; (h) German themes; (i) scientific prose; (k) historical prose; (l) Klee's German mythology, with supplementary reading.

Seventh and eighth. Goethe's *Faust*, Parts I and II.

Ninth. Introduction to Middle High German.

Tenth. Methods of teaching modern foreign languages.

Eleventh. Modern German sounds.

Twelfth. German syntax.

Thirteenth and fourteenth. History of German literature.

Fifteenth and sixteenth. German romanticism.

Seventeenth and eighteenth. German civilization. Lectures and readings from Freytag's *Bilder aus der deutschen Vergangenheit*.

Nineteenth. Old High German.

Twentieth. The Middle High German Folk-epic.

Twenty-first. Proseminary in modern German literature. The storm and stress movement.

Twenty-second. The literature of the sixteenth century.

Twenty-third. Proseminary in Old High German.

Besides, there are courses in Gothic (phonology and morphology, the epistles, *Ulfilas*), Scandinavian (the ancient *Edda* and Old Icelandic), and Anglo-Saxon.

The five courses for engineers are of an elementary character and are all conducted by John Dieterle, A. B., instructor in German.

Professor Winkler writes concerning the work of the year 1901: "The graduate work of the department is promising. This year we have about fifteen students working for the master's or doctor's degree."

The German library is very small. Of a total of more than 100,000 volumes, from 6,000 to 7,000 are German, and 952 of these belong to the Goethe collection.

¹ Since called to the University of Wisconsin.

Some very interesting facts concerning the latter are given further on under the head of "Silent universities." The total number of students in 1900 was 3,700.

UNIVERSITY OF CHICAGO.

This university, founded¹ July 1, 1891, was formally opened October 1, 1892, by exercises in the Cobb Lecture Hall, in the presence of an audience of 600. Although the youngest among the 14 leading universities of the country, it has quickly acquired an influential position among higher institutions, owing to its excellent management and the large financial resources at command. The best choice was made in the selection for professorships and some of the chairs are filled by Germans.

A most prominent scholar gained for the university was Dr. Hermann Eduard von Holst. Born June 19, 1841, in Livonia, he emigrated as a young man to America, "where he engaged in literary and editorial work in New York." In 1872 he was called to the newly founded University of Strasburg as professor of history, and two years later to the chair of modern history at the University of Freiburg. From there, in 1892, he assumed his present duties, which, unfortunately, he has been compelled to give up on account of his health. We shall mention only his chief work, translated under the title: *The Constitutional and Political History of the United States (Die Verfassung und Demokratie der Vereinigten Staaten von America)*.

A contributor to the "Westen," and a journalist whose articles always contain reliable information, has recently published the following graphic account of the work and arrangement of the German department at the University of Chicago.²

The fourteenth, the department of Germanic languages and literatures, is equipped with an excellent corps of teachers. The ever more widely spreading conviction that no profound study in any branch of science is possible without reading the chief German works on the subject in the original has made students understand the necessity of knowing German.

The few current phrases that, learned parrot-like, formerly satisfied an American conversant with English alone are insufficient for present times; the teacher of conversation who, without any philologic or literary preparation, undertakes private instruction can only in exceptional instances meet the want of pleasure-seeking tourists. Let us throw the mantle of charity over the average work of private schools. The so called high schools, which are far from carrying out their varied programme, and make the strangest concessions to their half-grown and mentally immature pupils respecting the selection of their favorite studies, were recently characterized in strong and appropriate terms in the Illinois Staats Zeitung as follows:

"Very little is taught and learned, but it is always better than nothing. German instruction in our schools is a weak branch of public education, and this branch bears but a few green twigs. The Germans of Chicago request our school boards to lead more sap to this branch, that it may grow and blossom."

Under such conditions, which, however, give no occasion for despair, and which educated Germans should and could more zealously endeavor to ameliorate, the work of a university is altogether different from what it is elsewhere. * * *

Poor results would be obtained by beginning at the "top," burdening freshmen (Füchsen) with philological investigations or lectures on the history of literature. The way must be cleared: reading must be taught; etymology, grossly neglected—I speak from long experience—can not be cursorily reviewed, but must be studied again from the very beginning; in the course of about two full college years good results may be attained by all who persevere—more talented students may succeed in less time. Whoever thinks that the main work is to be done by pupils makes a great mistake. It falls to the lot of the teacher, who, not bound or handicapped

¹The original University of Chicago was chartered in 1857, and continued in existence until 1886, when a series of financial difficulties caused its discontinuance. About two years later John D. Rockefeller and Prof. Wm. R. Harper, of Yale, united their efforts to reestablish the institution. The present charter dates from September 10, 1890, Professor Harper's entrance into office from July 1, 1891. The total endowments of John D. Rockefeller alone amount to more than \$10,000,000.

²The "Westen" of February 4, 1900.

by any school-board regulation, must, in accord with prominent examples, invent by his own ingenuity a thoroughly scientific and, at the same time, successful and agreeable method of instruction.

After a freshman has been thoroughly drilled in the principles of grammar, acquired facility in translation, retranslation, and composition, and has had his ear and pronunciation cultivated by German dialogue, the more difficult senior courses are accessible to him. Upon completion of these, the student in the "graduate courses" can devote the greater part of the remaining three years to some special Germanic study.

If the candidate is preparing for a final examination, he must, of course, pursue some studies in associated departments, as in English, the Romance languages, comparative philology, history, history of culture, etc.

The aim set before Germanic students at the University of Chicago is not low. "Kaffeekränzchen," with obligato declamations from little books bound in red, teas at which writers on fashion are discussed, are lacking; neither are opportunities for small talk afforded to those with social inclinations. A wholesome, earnest effort is manifested thoroughly to learn, so as to be able to teach, the German language, its history, development, and relation to other languages, and German literature from the beginning to the present day.

How is this result obtained? By a faculty of six teachers, each of whom has studied in Germany and at the leading American universities. The German department of the university can boast that every member has passed his doctor's examination with honor and does not owe his position or promotion to favor.

Prof. Starr Willard Cutting is at the head of the department. He is assisted by Messrs. Hans M. Schmidt-Wartenberg, Camillo von Klenze, Paul Oskar Kern, Philip S. Allen, Hermann Benjamin Almstedt, and, during the summer quarter, by Richard Hochdörfer, professor in Wittenberg College and director of the German department there.

A department library of about 4,000 volumes is accessible to the students. It is an advantage which can not be too highly estimated that students have free access to the bookshelves and to all the works, and can thus do more than become familiar with their names in the catalogues, or with the contents of a few, after wasting time waiting at a librarian's desk.

The library is receiving constant additions. Even if not complete, all that is most important, and even more than this, has been acquired during the seven years that the university has been in existence. * * *

To refute any deduction from what has been said that the Department may be thought to be insufficiently equipped with works of reference and journals, I shall mention the periodicals and other serial collections which seem to be the more important. They are:

Zeitschrift für deutsche Philologie; Zeitschrift für deutsches Alterthum; Literaturblatt für germanische und romanische Philologie; Herrig's Archiv für das Studium der neueren Sprachen; Schnorr's Archiv für Literaturgeschichte; Beiträge zur Geschichte der deutschen Sprache und Literatur; Quellen und Forschungen; Germania; Jahresberichte für neuere deutsche Literaturgeschichte; Jahresbericht der germanischen Philologie; Archiv für nordisk Filologi; Nordisk Tidskrift för Filologi; Americana Germanica; Journal of Germanic Philology; Deutsche Literaturzeitung; Literarisches Centralblatt; Horæ Belgicæ (von Fallersleben); Vierteljahrsschrift für deutsche Literatur; Euphorion; Zeitschrift für vergleichende Literaturgeschichte und Renaissance-Literatur; Neues Jahrbuch für deutsche Sprache (von der Hagen); Weimarisches Jahrbuch für deutsche Sprache (Hofmann und Schade); Aretin's Beiträge; Deutsches Sprachwort (Max Moltke); Anzeiger für deutsche Vorzeit; Alemannia; Die deutschen Mundarten (Frommann); Jahrbuch für niederdeutsche Sprachforschung; Correspondenzblatt des Vereins für niederdeutsche Sprachforschung; Deutsche Rundschau; Zeitschrift des Allgemeinen deutschen Sprachvereins; Zeitschrift für deutsche Sprache (Sanders); Zeitschrift für den deutschen Unterricht; Neues philologisches Centralblatt; Deutsche Revue; Westermann's Monatshefte; Beilage zur Allgemeinen Zeitung; Magazin für Literatur; Allgemeine deutsche Biographie; Bibliothek der gesammten Nationalliteratur (Quedlinburg und Leipzig); Bibliothek des literarischen Vereins in Stuttgart; Deutsche Nationalliteratur (Kürschner); Bibliothek der ältesten deutschen Literaturdenkmäler (Paderborn und Münster); Denkmale des Mittelalters (Hattmer); Denkmäler deutscher Poesie (Müllenhoff und Scherer); Deutsche Dichtungen des Mittelalters (Bartsch); Deutsche Classiker des Mittelalters (Pfeiffer); Neudrucke deutscher Literaturwerke; Deutsche Literaturdenkmäler des achtzehnten Jahrhunderts (Seuffert); Bibliothek älterer Schriftwerke der deutschen Schweiz (Bächtold und Vetter); Elsässische Literaturdenkmäler (Martin und Schmidt).

Besides these there are considerably over a hundred similar journals in other departments.

From teachers and helps accessible to students we pass to the courses.

The school year is divided into quarters; elementary courses are reviewed in each quarter: the higher courses are given on an average once or twice a year; seminary courses sometimes include several quarters, and are likewise repeated periodically during the three years' graduate course.

1. JUNIOR COLLEGE COURSES.

German grammar, exercises in translation and speaking (110 lessons in the course).

Continuation of this course—syntax, memorizing of an extensive vocabulary, written notes (55 lessons in the quarter).

Moderately difficult exercises in style and German composition (55 lessons in the quarter).

Studies in German prose—extracts from works on history, philosophy, and natural science.

Modern comedies combined with exercises in conversation (55 lessons in the quarter).

2. SENIOR COLLEGE COURSES.

Modern German lyrics and ballads; Schiller's *Wilhelm Tell*; *Deutsche Aufsätze und Stilübungen*—a course intended primarily for teachers, or students who purpose to become teachers. It consists of oral and written criticism of brief daily themes upon subjects suggested by the instructor. Discussions of German synonyms and of the peculiarities of everyday verb usage find practical application in the translations and composition work of the class.

Heine's prose and poetry; recent German drama. A discussion of recent tendencies in German literature, as manifested in representative dramas of Sudermann and Hauptmann.

Grillparzer; Lessing as dramatist; Goethe's period of classical sympathies; Goethe's life and works.

3. GRADUATE COURSES.

Lessing as critic. Seminar: Lenau. German life, literature, and plastic art from 1300 to 1550 A. D.; outline study of German literature; Gothic: Old High German; Old High German literature; Middle High German; the *Nibelungenlied*; Old Norse; Old Saxon. Seminar: Phonetical investigation. Introduction to Germanic philology.

After a brief survey of the aims of scientific language study and the history of German philology the main problems of general Teutonic phonology and morphology will be briefly discussed. Open to students that have had courses in Gothic and Old High German.

Seminary: Researches in the history of language and phonetics, making use of texts from the literature of the Reformation.

These were the courses for the school year 1899-1900. As before remarked, the higher courses are changed every year in a cycle of three years. Lectures which were not held this year are announced for the two following years. It would be taking owls to Athens if we should do more than mention that the completion of definite courses admits to higher courses. If a lower course falls in autumn and the higher in spring, the latter must be arranged for the following year.

We may add to this account that students of the German department are particularly advised to study old, early middle, and later middle English (in the fifteenth course) and Sanskrit (general introduction to the study of Indo-European comparative philology).

This university was among the first to promote popular education by the introduction of summer courses and university extension. A full account of the visit of the German ambassador, Dr. von Holleben, is given farther on. Among the graduates who have received the degree of doctor of philosophy as many as 6, up to the year 1899, selected a Germanistic theme for their thesis. An interest in the study of German has therefore been greatly encouraged. The total number of students in 1900 was 3,774.

NORTHWESTERN UNIVERSITY.

This university, founded by the Methodists in 1851, at Evanston, Ill., a small city 12 miles north of Chicago, on Lake Michigan, enjoys a large attendance (in 1900, 2,200 students of both sexes). According to the catalogue for 1899-1900, the German department has eleven courses for each of the two sessions. The teachers were: James T. Hatfield, professor of German language and literature; George O. Curme, professor of Germanic philology; Henry Cohn, associate professor of German.

The following courses were held during the first session: Elementary German, courses 1-4. (1) Lessing's *Minna von Barnhelm* and Emilia Galotti; Schiller's *Kabale und Liebe*; Goethe's *Hermann und Dorothea*; German composition. (2) Goethe's *Life and Works, 1749-1790*. (3) Goethe's *Life and Works, 1790-1832*. (4) Hymns and national songs. (5) Advanced group, subject to change. (6) Rapid reading of standard prose works. (7) Colloquial German. (8) Advanced German composition. (9) Modern German drama. (10) Gothic. (11) Old High German.

During the second session: (1) and (2) Similar to those of the first session. (3) Schiller's *Life and Works*. (4) The romantic movement and the Swabian school. (5) to (9) Similar to those of the first session. (10) Comparative grammar and Old Saxon. (11) Middle High German.

Courses (2), (7), and (8) should be included by all who intend to become teachers in secondary schools.

The German courses were attended by about 100 pupils of the preparatory school and 300 students.

The associations founded by Professor Cohn, the *Deutsche Gesellschaft* and the *Literatur Verein*, deserve a special mention. Whereas so important a university as Harvard has not yet introduced public German lectures to promote interest in German, they have been held in the *Literatur Verein* regularly since 1893. As they number over 40, we can not mention all, but quote only the following: Prof. Karl Knortz (Evansville): "National songs and popular traditions." Professor Hatfield: "The debt of young Americans to Francis Lieber." Wilhelm Vocke (Chicago): "The Boers;" "The German soldier in the American civil war;" "The relations between Germany and America." J. H. Dietz (Chicago): "Freiligrath and the poetry of the period of '48." L. Viereck (New York): "Fridtjof Nansen and the investigation of the north pole." Dr. A. Fischkin (Chicago): "The poetry of misery." William Jensen: "The Mennonites." Miss Margaret J. Mayr: "Johanna Ambrosius." Dr. G. A. Zimmermann: "Goethe and Napoleon." Sigmund Zeisler: "Hauptmann's *Versunkene Glocke*."

In addition, memorial celebrations for Lessing, Schiller, Goethe, Platen, and Hans Sachs have been held.

Besides these lectures, German theatricals and recitations play an important part. At the commencements of the German department a short German play is given, and German poems are recited interspersed with music. As all the educated Germans of Chicago support these agencies, there has never been a lack of assistants or an audience.

On March 21, 1900, Professor Cohn died suddenly. On February 13, 1901, Professor Hatfield wrote to the author concerning the changes occasioned thereby in the department:

Professor Cohn's death has been a heavy, almost irreparable, loss for us; nevertheless, the work is going on as usual, unchanged, two young men, Dr. Martin Schütze and Mr. Georg Edward, having taken his place as instructors. Dr. Schütze studied in Freiburg and Rostock, taught in Pennsylvania, and received his doctor's degree at the University of Pennsylvania. A noteworthy article by him on Hauptmann's *Die versunkene Glocke* was published in Volume III of *Americana Germanica*. Mr. Edward studied in Giessen, devoted himself to liter-

ary work, and has published a number of articles in German newspapers and periodicals. The attendance of our department has remained unchanged. We look back upon a healthy development and note, especially in recent years, the presence of maturer students. At the same time we are receiving increasing recognition in foreign countries, particularly Germany. The most important works that have been recently produced by our department are: Wesley's Translations of German Hymns and various Goethe Studies. A larger work on "The influence of the American Revolution upon German literature," by Miss Elfrieda Hochbaum, will appear in the next number of the *Americana Germanica*.

UNIVERSITY OF WISCONSIN.

Since the year 1893 Dr. Charles Kendall Adams, former professor of history at the University of Michigan, and from 1885 to 1893 the successor of Andrew D. White as president of Cornell, has been at the head of this university, founded in 1848. His labors have already been referred to. It may be inferred that under a man like him the German department has made ample progress. In how encouraging a manner this development has taken place may be understood by a glance at the plan of study for the second session of 1901, which comprises as many as thirty German courses. These are partly required courses (9) and partly elective (21).

Required courses are:

1. Grammar and prose readings.
2. Lessing's *Minna von Barnhelm*, German composition and prose readings.
3. Practice in speaking and writing German.
4. Schiller's *Wilhelm Tell*. Prose composition.
5. Schiller's *Maria Stuart*. Prose composition.
- 6 and 8. Dippold's *German Science Reader*.
7. Scientific Monographs.
9. Ratzel's *Deutschland*. Light reading and composition.

Elective courses are:

A. GERMAN LITERATURE.

10. Goethe's *Iphigenie* and *Tasso*.
11. Goethe's *Egmont*.
12. Dramatic reading. Ludwig Anzengruber and other modern dramatists.
13. Hauptmann's *Die versunkene Glocke*. } For students who have had three
14. German lyrics and ballads. } years of German.
15. Readings illustrating the history of German civilization.
16. German novels.
17. Goethe's *Dichtung und Wahrheit*.
18. Syntactical exercises. Compositions and themes.
19. Goethe's *Faust*. Second part.
20. Teachers' course. A critical study of the report of the committee on modern languages with lectures and reports on methods of teaching modern foreign languages.
21. General survey of the development of German language and literature.
22. The German romantic movement.
23. Studies in modern German literature. Heibel, Ludwig, Keller, Fontane, Liliencron, Sudermann, Hauptmann, Richard Dehmel, and *Juengstes Deutschland*. Lectures, exercises in literary criticism, and reports on Adolf Bartels, *Die deutsche Dichtung der Gegenwart*.

B. GERMAN PHILOLOGY.

24. Introduction to Middle High German. Lectures and recitations. *Nibelungenlied*.
25. Advanced Middle High German. Hartmann von Aue's *Der arme Heinrich*, with lectures on the Court Epic.
26. Studies in etymology.
27. Germanic mythology. Klee's *Deutsche Mythologie*. Lectures and collateral reading.
28. Studies in the language and literature of the sixteenth century.
29. Philological seminary.
 - a. Middle High German division. Wolfram's *Parzival*.
 30. b. Old Saxon division. Heiland, ed. Behaghel.

To these may be added lectures held by Julius E. Olson, professor of the Scandinavian languages and literatures, in his own department, 6 courses in Modern and Old Norse, so that there are 36 courses in all, a number not exceeded in any other university, and justifying the large corps of 11 teachers.

The department of Scandinavian languages is mentioned in the catalogue as follows:

This department offers instruction in all of the Scandinavian languages (Norwegian, Danish, Swedish, and Old Norse). From one year's instruction in Modern Norse the student is expected to be able to read both Norwegian and Danish authors, as Norway and Denmark have practically the same literary language. Courses 1 and 2 are devoted principally to Norwegian authors, but additional instruction in Danish and Swedish literature is offered to students desiring to pursue these branches beyond the limits of the prescribed courses.

Since the death of Professor Rosenstengel, November 12, 1900, Dr. Ernst Karl Johann Heinrich Voss, assistant professor of German philology, has been at the head of the department. He has furnished the following information on its present status:

From the list of German lectures for the second session, 1901, you will see that two new teachers have been added, Dr. Roedder, former instructor at the State University of Michigan, and Mr. Lessing. The department is at present in charge of the following teachers. (Next year there will be a professor of German literature besides. The department was already divided during the lifetime of Professor Rosenstengel, who taught history of German literature while I conducted the lessons in philology.)

Prof. Dr. E. Voss, acting professor of German; Prof. Miss Susan Adelaide Sterling, M. L.; Mr. Frederick William Meisnest, B. L.; Mrs. Abbie Fiske Eaton, M. L.; Dr. Edwin C. Roedder, A. M.; Mr. Lessing, instructors; Miss Sabena Mildred Herfurth, M. L., assistant instructor; Miss Veerhusen, assistant instructor; Mr. Handschin, fellow; Mr. Eckelmann, graduate scholar in German philology.

For the last three years the citizens of Madison have offered a graduate scholarship of \$250 annually, and last year the Germans of Sheboygan founded a second graduate scholarship for three years that gives the holder \$300 a year. On January 1, 1899, the university received about \$3,500 from the German-Americans of Milwaukee for a Germanic seminary library, that has been collected with the greatest care and will soon be dedicated.

For the last three years the Pabst Theatrical Society, in Milwaukee, has presented a classic drama in Fuller's Opera House, under the auspices of the Germanistic Society of the university. This year Minna von Barnhelm was given on March 14.

During recent years valuable books have been presented to the German department by Dr. Balz, of Milwaukee; Julius Zehnter, Theodor Herfurth, and H. Schmedmann, of Madison; the late Professor Rosenstengel, and the correspondent. The well-known firm of Brockhaus, in Leipzig, which furnished the books for the German philological seminary library, made the generous offer of presenting the library with all of their numerous editions that could be made use of. The works given by this firm represent a money value of at least \$500.

We cherish the hope of making the German department here one of the leading in the States, and count upon the active support of the unusually strong German population.

When we consider that this university has only of late years developed from a college or high school to its present importance, this report must necessarily be regarded as most encouraging. Unfortunately there is no later report of the attendance at German courses than that furnished in 1898 to the German Teachers' Association, when the number of German students amounted to 560. With a total of 2,400 students, at least 600 to 700 should take German.

THE UNIVERSITY OF MINNESOTA.

At the Chicago Exposition the tastefully arranged educational work exhibited by the State of Minnesota excited deserved attention. The university, founded in 1863 in Minneapolis, numbered 3,225 students in 1900.

The teachers of German and Scandinavian are: John G. Moore, B. A., professor of German; Olaus J. Breda, professor of the Scandinavian languages and literatures; Matilda J. Wilkin, assistant professor of German; Charles M. Andrist, M. L., instructor in French and German; Carl Schlenker, B. A., instructor in German.

Courses are divided into—(a) German for undergraduates, 6 courses; (b) German for graduates, 4 courses; (c) Scandinavian languages for undergraduates, 3 courses; (d) Scandinavian languages for graduates, 1 course.

The German courses for undergraduates include "advanced subjects in literature and criticism," like Lessing's *Laocoon*. The four graduate courses last year were: (1) *Life and works of Luther*; (2) *Old High German*; (3) *seminary (Goethe's Faust, II)*; and (4) *teachers' seminary (historical German grammar; methods of modern language instruction)*. The course in *Old High German* was given by Dr. Frederick Klaeber, assistant professor of English.

For the scientific and literary course as much knowledge of German and French as can be acquired in two years is required. Candidates for the degree of doctor of philosophy must have a reading knowledge of German and French. The total attendance of the German courses was from 400 to 500.

UNIVERSITY OF CALIFORNIA.

The personnel of teachers at the State University of California in 1900 consisted of the following gentlemen: Albin Putzker, M. A., professor of the German language and literature; J. Henry Senger, Ph. D., associate professor of German; Frederick L. Wharff, Ph. B., instructor in German; Martin A. M. Centner, assistant in German; Henry E. G. Ongerth, graduate of the University of Vienna, reader.

The courses were divided into—(1) preliminary courses for freshmen and sophomores; (2) intermediate courses, primarily for sophomores and juniors; (3) advanced courses, primarily for juniors and seniors; (4) courses for seniors and graduates; (5) graduate courses.

The courses for beginners include an introduction to scientific German. In the intermediate courses the latter forms a chief subject of instruction, for which the works of Dubois-Reymond are made use of. Special reading is assigned to students in connection with the course, principally from Virchow and Holtzendorf's collection. In the advanced courses Goethe's and Lessing's works are explained, and *Middle High German*, *Old High German*, *Old Saxon*, and *Gothic* studied. In a special course of difficult prose, books like *Bluntschli's Doctrine of the Modern State* and *Von Sybel's Rise of Europe against Napoleon I* are discussed, with oral interpretation in German. In the courses for seniors and graduates separate sections of the history of German literature receive special attention.

Last year the following courses were announced as graduate courses: (a) *Historical German grammar*, a study of the development of *Modern High German*; (b) *Goethe's Faust*; (c) *special study*.

The catalogue says of course (c): "The instructors in German hold themselves ready to assist and advise competent graduates who may propose plans of special study which meet the approval of the department."

Professor Senger writes, concerning the attendance: "During the last session 509 students took part in these lectures and exercises; this number has been increased during the present session."

The proposed introduction of obligatory German admission examinations is likely to increase the attendance of German courses to a great extent. The principle already obtains: Credit toward a degree is not given for less than two years' work in German. The total attendance of the university is given at 3,216.

THE LELAND STANFORD JUNIOR UNIVERSITY.

Although this university—formally opened to students October 1, 1891—can not look back upon an existence of ten years, it has gained a high reputation under the excellent management of President David Starr Jordan, and according to latest reports numbers an attendance of about 1,400. In view of the fact that this institution has been obliged to compete with the large State University, twenty years older and numbering an attendance of 3,000, this success is the more brilliant. In no small measure is it due to the excellent work of the German department, directed for nearly nine years by Prof. Julius Goebel, who has four assistants.

The courses are divided into the preparatory studies of the elementary and second years, third-year German, and the graduate courses. The annual register of last year contains the following remarks on the thirteen courses for undergraduates:

The aim of the elementary classes in this department is to give the student a thorough knowledge of German grammar and to enable him to acquire facility in reading German. The more advanced classes take up the study of the poets and writers of the classical period, and it is intended to offer by the reading and interpretation of these authors an equivalent for the study of the ancient languages to those not taking Latin or Greek in their university course.

A course of German syntax affords opportunity for composition and exercises in style to those who take the course of advanced German composition.

Last year the nine graduate courses were as follows:

Middle High German; Nibelungenlied; Old High German and Old Saxon; Heliland; Old Norse; Edda; Gothic; comparative German grammar; German seminary ("young Germany" and its influence on German literature, life, and politics of the nineteenth century).

The register says of the aim of the graduate courses:

The graduate courses in German, for which a thorough linguistic preparation is required, are intended especially for students who will make the teaching of German their later profession. Careful attention is given to the linguistic as well as to the literary training of the student, aiming at a comprehensive insight into the historical growth of the Germanic languages and literatures. The scientific methods of original and critical research are taught and practiced in the seminary. Such students as have given satisfactory proof of their ability as independent investigators will be admitted to the degree of Ph. D., after having presented a thesis containing a contribution to science and having fulfilled the other requirements prescribed by the university.

Professor Goebel wrote to the author of this article concerning the condition of affairs in the spring of 1900:

The German department of our university is one of the largest. Of about 1,200 students more than one-half study the German language and literature, most of them, of course, to make use of the language as a scientific instrument to aid in prosecuting their other studies, although a large number are educating themselves to be German teachers. Of these I require a thorough philologic education—Gothic, Norse, Old and Middle High German—as well as a thorough knowledge of German literature.

To give you an idea of the number of students that are making a serious study of German philology and literature, I may mention that during this session I explained Goethe's poems to 70 students, Gudrun to 20, Heliland to 10, and Ulfilas to 18. Twenty advanced students, namely, those designing to take the register or doctors' examination, followed the exercises of the Germanistic seminary. I have four assistants.¹

The reason that I am able to conduct so profound German studies is that, six years ago, I succeeded in obtaining an excellent private library for the university, the only one in America, of Rudolf Hillebrand, my teacher and friend.

¹In the eighth register (1898-99) only the following are mentioned: James Owen Griffin, professor of German; Karl G. Rendtorff, Ph. D., assistant professor of German; Alfred Francis William Schmidt, instructor in German. The name of the fourth assistant could not be ascertained.

At the close of a speech delivered at the end of December, 1897, before the California Teachers' Association, President Jordan remarked: "German stands at all the gates of culture and exacts its toll from all who would enter." The development of Stanford University confirms his words. The youngest institutions are modern in their organization and therefore cultivate German with extraordinary zeal.

THE COLUMBIAN UNIVERSITY.

The capital possesses three schools which deserve the name of universities in their graduate departments. These three universities appeal, however, to different constituencies and to different circles of students.

The Columbian University is, according to its charter and foundation, a Protestant institution in the widest sense of the word. Georgetown University was founded as a college in 1788, under the auspices of the Society of Jesus, through the efforts of the first archbishop of Baltimore, John Carroll. In 1815 it was chartered by Congress as a university, and in 1833 authorized by the Holy See to confer the highest theological and philosophical degrees. The Catholic University, founded but twelve years ago, is the papal university of America par excellence, and was intended as a graduate school only. It stands under the chancellorship of Cardinal Gibbons of Baltimore.

As the two great Catholic universities scarcely afford any space to Germanic scholarship, they do not call for further consideration in this connection. The Columbian University, on the other hand, has in the course of the last ten years allotted to the study of the Germanic language and literature a place and value equal to those of any other branch of scholarship. While German is still elective in the college, it is obligatory in the Corcoran Scientific School, and no degree can be obtained there or in the graduate school without a satisfactory knowledge of that language.

Among the professors of the Columbian University there are the most distinguished scholars and scientists of the country, who, while standing at the head of the scientific Government bureaus, and of the Supreme Court, Smithsonian Institution, etc., also devote their energies to the various departments of the university.

The headship of the department of Germanic language and literature rests with Prof. Hermann Schoenfeld, Ph. D., assisted by the instructors Reed Paige Clark, A. M., and C. S. Hyde, A. M. The courses in the college and the Corcoran Scientific School are adapted to the various needs of academic and technical or scientific students, and are as follows:

THE COLUMBIAN COLLEGE.

GERMANIC LANGUAGE AND LITERATURE.

Instruction in this department has as its primary object a thorough knowledge of the grammar and familiarity with the literature and history, with such practice in conversation as shall serve as a stimulus in the furtherance of this object.

German grammar is studied during the first three years of the course, with its principles illustrated from the class readings and written exercises.

1. The deeper aspects of grammar; accurate training in phonetics and translation into German; conversation; readings from the best German proseists and poets; Whitney's German Grammar; selected texts. Three hours.

2. Advanced course in German syntax; extensive translation into German; selected advanced prose; classical reading and literature; elements of German history. Three hours.

3. Study of the principal difficulties of the language; idioms, synonyms; German essays; literature of the second German *Blüteperiode*; German history and science; extensive reading from the classics. Three hours.

4. Elements of philology; survey of German literature and its relation to the other Germanic peoples; history of the old and the new German Empire; further

classical reading in Goethe's *Faust*; introduction into the *Nibelungen Lied* and the *Gudrun Saga*; introduction to Gothic. Three hours.

CORCORAN SCIENTIFIC SCHOOL.

GERMAN.

1. Accurate training in elementary grammar; pronunciation and translation from English into German; exercise in conversation; readings from the easier German prosaists and poets. Two hours.

2. More extended course in German syntax and principal difficulties of the language, idioms, etc.; extensive translations into German; selected stories; Gore's *Science Reader*, fourth edition, alternating with Brandt and Day's *Science Reading*; one or two classics. Two hours.

3. Study of idioms, synonyms, and Sander's *Hauptschwierigkeiten der deutschen Sprache*; special preparation for scientific professional work; Helmholtz on Goethe's work in natural history (edition of Seidensticker); Humboldt's *Kosmos*; critical studies of German classics; lectures on German literature. Two hours.

4. A special course in German training for advanced students in the historic and economic departments; Schoenfeld's *German Historical Prose*, Ranke (edited by H. Shoenfeld), and the standard works of German historians and economists will be read. Two hours.

5. An elective course in German conversation will be instituted from the start and conducted with systematic gradation for students of all grades.

The work in the two undergraduate departments being done by the professor in charge only in the most advanced classes, ample time is left him for a careful preparation of graduate students in German, who are trained especially in literature and history.

GRADUATE SCHOOL.

GERMAN LITERATURE.

1. The Literature of the Sixteenth Century. Braune's *Neudrucke Deutscher Literaturwerke*. Humanism and Reformation, with special reference to Italian and French influences. Historical basis after Voigt, Janssen, Ranke, Burckhart, L. Geiger.

2. Literary awakening in Germany in the time of Frederick the Great; critical study of the literary centers—Leipzig, Zurich, Berlin. The Storm and Stress Period and the youthful works of Schiller and Goethe; critical investigation of Klopstock's Odes; the first three cantos of *Messias*.

3. History of the Second Classical Period. Lessing's *Laokoon*, *Dramaturgie*, *Literaturbriefe*: A study of German Critique. Detailed investigation into Schiller's and Goethe's works. *Literary Germany at the death of Goethe (1832)*.

These alternate with courses concerning the older phases of the language.

GERMAN HISTORY.

1. The emerging of the Germanic, Romanic, and Slavic races in European history. The migration of peoples. The evolution of European States to the rise of the Hapsburg House. (Selections from the historical sources will be read and interpreted.)

2. The Holy Roman Empire from Rudolph of Hapsburg to the death of Maximilian I (1519), with special reference to *Kulturgeschichte*, and the first attempts at church reform.

3. History of the Renaissance and Reformation.

Special courses may be arranged, after consultation, with graduate students.

However, no more than three of the courses designated are given in any one semester. The need of an instructor in Germanic philology is urgently felt, and such an appointment will be made as soon as the means of the department will permit.

The incalculable prestige which German thought, culture, and civilization enjoy in this university becomes manifest when it is considered that in the department of philosophy, conducted by the excellent Hegel scholars, Dr. Sterrett and Dr.

Harris, six courses out of ten deal directly with German philosophy pure and proper, besides two, philosophy of history and history of philosophy, which ipso facto include the wide range of German thought.

Mr. Schoenfeld's lectures and writings¹ on the traces and influences of foreign, especially Slavonic, elements upon German history and literature have cultivated a field heretofore untouched in American universities.

UNIVERSITY OF INDIANA.

"The Indiana Seminary," founded in 1820, was raised to a "college" in 1828, and by resolution passed by the State legislature to a "university" in 1838. It is situated in Bloomington. The institution has been lifted to a high level during the last ten years. A certain knowledge of the German language and literature (Lessing, Schiller, and Goethe) is required for admission. The number of pupils increased from 144 in the year 1884, and 321 in 1890, to 1,050 in 1899; 220 profited by the thirteen courses of the German department, conducted by the following teachers: Prof. Gustaf E. Karsten, director; Dr. Carl Osthaus, professor extraordinary; Dr. Eugene Leser, Roy H. Perring, and Philipp Seiberth. A course in introduction to German dialects, often lacking elsewhere, is held for advanced students. The active interest manifested by the educated Germans of Indiana toward the work of the German department is remarkable. At the close of the year 1896, upon invitation of Professor Karsten, nine German citizens of Indianapolis contributed so generously to the foundation fund of the Journal of Germanic Philology that the able editor could begin serious work. By their support of the journal these contributors deserve the greatest credit, worthy of sincere appreciation, for the advancement of the German language.

WESTERN RESERVE UNIVERSITY.

Located at Cleveland, Ohio, this university was founded in 1826 as Western Reserve College. The undergraduate department is now known as Adelbert College. The graduate school was established in 1892. The degrees of master of arts and doctor of philosophy are conferred. All courses open to graduate students are considered graduate courses. The College for Women is a department of the university, and women are admitted to the graduate school on the same terms as men.

Under President Charles F. Thwing the number of students of German has greatly increased. Prof. R. W. Deering, who graduated at Leipzig in 1839, is at the head of the German department. Prof. Charles Harris, who in 1833 likewise graduated at Leipzig as doctor of philosophy, is one of the teachers, besides Instructor Edward Meyer, who graduated as doctor of philosophy at Heidelberg, 1896.

The following graduate courses were announced for 1899:

Deering: Gothic, Old German Literature, Old German Life, Old High German, Lessing and the classic German drama, Faust.

Harris: The Romantic School, History of German Literature, Middle High German, Modern German Grammar.

Meyer: Oldest German Poetry, German Religious Epics, The National Epic, Modern German Social Drama, The Court Epic.

The attendance at the German courses was rather large in 1898 (120 out of 700) and has since increased.

¹ One of these, Higher Education in Russian, Austrian, and Prussian Poland, appeared in the Report of the Commissioner of Education, Washington, 1896.

VANDERBILT UNIVERSITY.

In 1872 representatives of the Methodist Episcopal Church South, from Tennessee, Alabama, Louisiana, Mississippi, and Arkansas, undertook to establish a university, and it was in response to this movement that Cornelius Vanderbilt, of New York, gave \$500,000 to found such an institution. This happened in 1873, and before his death he had raised his donation to \$1,000,000, which was increased about \$500,000 by his son William and grandson Cornelius. The income of the university amounts to over \$100,000. The courses are open to women as well as men, and there is an average attendance of 700, under a faculty of 80 instructors.

The German department is under the direction of Dr. A. R. Hohlfeld, Professor of German Languages and Literatures, who graduated at Leipzig in 1888 and has since been teaching modern languages at the university.

In the sixth annual edition (1898-99) of the "Graduate Courses"¹ the following graduate courses are given:

Storm and Stress.

The Romantic School and Young Germany.

Gothic.

Old Saxon.

Historical German Grammar and Literature.

Essays in German.

WESLEYAN UNIVERSITY.

The Wesleyan University, located at Middletown, Conn., is the oldest of the Methodist Episcopal Church colleges. It was located in 1829, in consequence of an offer made by the city of Middletown to a joint committee of the New York and New England conferences. The offer consisted of two large stone buildings, together with a subscription of \$18,000 toward an endowment fund of \$40,000. With this insufficient endowment it is not astonishing that this institution, although opened in the year 1831, has seldom had a larger attendance than that of last year, 267 male and 60 female students, instructed by 28 teachers. There are only two teachers in the German department, Prof. A. B. Faust, of whom a biographical sketch follows, and Mr. Ford, who teaches the elementary branches. There were only eight courses in all, two of which were for advanced students, and treated German literature in general and the history of the German novel in particular. If, in spite of the unfavorable general conditions, as many as 175 students pursue the German courses, the result, that could be attained but by few other institutions, must be considered extraordinary. At all events, Professor Faust may regard this result with great pride.

BROWN UNIVERSITY.

In consequence of insufficient endowment, the old Brown University, founded in Providence, R. I., 1764, has been in rather an unfavorable position in contrast with the numerous finely equipped colleges. Conditions, however, may have changed, as John D. Rockefeller presented \$250,000 to the institution last year, under the condition that it should be added to a contribution short of a million from another quarter. This condition was fulfilled, and so Mr. Rockefeller has endowed the institution with the said amount. A favorable result is expected. The German seminary library contains many publications, including periodicals and philological works, also special collections in Middle High German and New High German literature.

Alonzo Williams, professor of German languages and literatures, directs the German department. The lectures for graduates treat: Faust, Parts I and II,

¹ Chicago. The University of Chicago Press, 1898, p. 38.

History of German Literature, Middle High German in three different courses (Court Epics, Minnesingers), Gothic, Old High German, German Mythology, German Philology, and Old Norse.

According to the latest reports, the university numbers 75 teachers and 886 students. How many attended the German courses could not be definitely ascertained.

NEW YORK UNIVERSITY.

New York University was founded in the year 1831, and is progressing to an encouraging degree, despite the competition of Columbia University. While the latter controls a sum of about \$17,000,000, and an annual income of \$920,000, the former possesses about \$3,600,000 and a corresponding income. Thanks to the munificence of different citizens of New York, the finances are constantly improving, and so the institution is able to do progressively more and better work. Until his death, Mr. Oswald Ottendorfer made great sacrifices to equip the German library properly, which contains about 9,000 volumes and has a good assortment of collected works and periodicals. Mr. Herman Ridder offers an annual prize to the student of the German department who renders the best work on a subject selected from German literature. Last year the theme was: "On the influence of German literature on the *Hainbund* of Göttingen."

German instruction includes elementary instruction for beginners as well as graduate courses in language, literature, and purely philological branches. Besides Professor McLouth, who is at the head of the department, Prof. Abram S. Isaacs and Instructor Ernst Mannhardt teach German. About 10 per cent of the 1,600 students in all attend the German courses. Last year several lectures on interesting subjects from the history of German literature treated specially of Grillparzer, Lenau, the German novel, the German ballad, and the origin and development of the German national song. A favorable horoscope may be defined for the further development of the German department of this university.

The summer school for Germanic languages is a new arrangement which has received special mention elsewhere. The freshman entrance examination prizes deserve a mention. A prize of \$100 is given to the freshman passing the best supplementary examination in Section A; also given to the freshman passing the best supplementary examination in Sections B or C. Further details are given in the university catalogue.

HAMILTON COLLEGE.

Hamilton College, at Clinton, N. Y., is one of the oldest educational institutions in the State of New York, having been opened in 1812; the only older ones are Columbia University, opened in 1754 as King's College, and Union College in Schenectady, opened in 1795.

In the last fifty years this college has had an almost uniform attendance of 155 to 160 students, at present instructed by 18 teachers. Proper attention is given to German and a special prize (the Munson prize) is offered to the students; the winner receives a considerable sum of money. German is a required study for three terms beginning with the third term of the freshman year for classical students, continuing as an elective to the end of the college course, and culminating in the Munson prize examination. The prospectus defines the aim of German instruction to be "familiarity with German literature, German life, and German thought," and, at the same time, "a philological and practical knowledge of the German language." That this is not a mere question of words, is substantiated by the fact that one of the most excellent educators in the country, Dr. Herman Carl Georg Brandt, has been in charge of the German studies for the past eighteen years. Dr. Brandt likewise conducts seminary courses for the students. In the year 1900, Lessing was studied. The third term of the senior year included

Middle High and Sixteenth Century German. For admission, a two years' course in French and no German, or a year's course in French and German, or, finally, a two years' course in German, is required. The attendance at the German courses is 50 to 60 for each school year.

WASHINGTON UNIVERSITY.

In the year 1900, Dr. Otto Heller wrote to the author of this work the following letter of information on the conditions of this university, founded in St. Louis in 1853, and now attended by 1,939 students:

Seven years ago I was called to the chair of German languages and literatures, founded by the munificence of Mr. Adolphus Busch. My first duty was to raise my study to the same rank as the other disciplinary branches, and I succeeded in a short time. The elective system obtains at this university. Despite the fact that only a small number of students, namely, the freshmen who did not study German in the preparatory school and studied French in the first year of college, are required to take German, so many of their own will attend the German courses that more than half of the total attendance are on my list. This active interest is due, in the first place, to the favorable location of the university. Our students, for the most part, are of German-American extraction. In my opinion St. Louis is, for this reason alone, most suitable for a school of German. * * * Every year I hold a series of public lectures on German literature, partly in the German and partly in the English language. During the last few years, the attendance has been so encouraging that the university hall has proved too small. The receipts are added in total to the library fund.

For the present I am giving instruction in the college and the school of engineering alone, but I hope to receive an assistant in the near future. At the intermediary schools connected with the university (Smith Academy, Manual Training School, Mary Institute) there are five teachers, men and women.

Of the five courses which I am conducting this year, three are intended for Anglo-Americans. In one (sketch of the history of German literature from the earliest times to the present) I unite advanced Anglo-Americans, mostly in the two highest years, and German-Americans who are just beginning the study of Middle High German. The majority of these are in the first year. The language of instruction is German. Finally, in this year, I read, exclusively to German-Americans, Goethe's metrical works. A full term of three lessons a week is given to Faust. When my time and students' preparation permit a philological course is read, and Gothic, Old High German, Middle High German, and history of language are studied.

THE UNIVERSITY OF NEBRASKA.

According to the census of 1890, the State of Nebraska numbered a few over 1,000,000 inhabitants, of whom 72,618 were born in Germany and 46,321 in Scandinavia. The Germanic element, therefore, can hardly be called strong. Nevertheless, the German department of the State University, located at Lincoln, has attained a rather large attendance in the school year 1899-1900.

The beginners' class numbered	250
The second year	175
The lectures on the classics	74
The normal course	14
The other higher courses, as Old High German, Scandinavian, etc.	41
<hr/>	
Total	554

Forty-two per cent of the total attendance—1,411 men and women—therefore, took German courses.

In the last school year twenty German courses were given. In the lower classes language lessons were held and a few easy books, among them Frau Sorge, by Sudermann, were read. The study of literature is begun after students have acquired sufficient knowledge to understand the ethical and æsthetic character of the classics. As a rule, polite literature is taken up in the third and fourth years. A two hours' lecture on "The German language, its development and construc-

tion," was designed especially for Germans who desired to make a study of their mother tongue. The lectures on the classic writers—Lessing, Schiller, and Goethe—were particularly well attended. Great interest was likewise manifested in the literature of the nineteenth century. Besides, Sudermann, Hauptmann, Max Kretzer, Bertha von Suttner, Fontane, Wildenbruch, Scheffel, etc., were eagerly studied. Some devoted themselves to purely philological branches.

The personnel of teachers consisted of the following: Laurence Fessler, A. M., professor of the Germanic languages; Hans Christian Peterson, Ph. D., instructor in the Germanic languages; Amanda Henrietta Heppner, A. B., instructor in German.

WITTENBERG COLLEGE.

Wittenberg College, which was opened at Springfield, Ohio, in 1845, has ten male and two female teachers for 160 male and 94 female students. An elementary knowledge of German grammar and the ability to construe simple German sentences and read easy prose at sight are required for admission. German instruction in the "college" is conducted by Prof. R. Hochdörfer and Instructor Wilson, the latter of whom has entire charge of the German in the "academy." Heine's *Harzreise*, for instance, is one of the masterpieces of German literature read regularly. The well-known work by Prof. Kuno Francke, *Social Forces in German Literature*, serves for private study. A two hours' lecture on German civilization was introduced last winter by Professor Hochdörfer for senior and graduate students.

The fifty-third annual catalogue says of the purpose of the eleven German courses:

The chief aim of the freshman and sophomore courses—for which a thorough and ready knowledge of the formal elements of grammar is an essential prerequisite—is to develop idiomatic expression and vocabulary by making the students acquainted with model products of German style and literature, and by oral and written composition work. The latter furnishes the primary test for a student's fitness to enter upon the advanced junior and senior electives, which aim at a study of literary masterpieces as embodiments of national ideas, and as contributions to ruling tendencies of thought. In judging the student's ultimate standing considerable stress is laid upon idiomatic utterance and stylistic ability.

Some of the advanced courses are held in the German language.

UNIVERSITY OF MISSOURI.

The State University of Missouri, located at Columbia, Boone County, began its lectures April 4, 1841. It is coeducational and at present numbers 1,200 students, male and female. The German department is quite important, and is in charge of Prof. B. F. Hoffmann. The attendance is about 200. Professor Hoffmann holds the following graduate courses: Middle and Old High German, German literature of the eighteenth and nineteenth centuries, life and works of Schiller, Goethe, and Lessing.

INSTITUTIONS FOR WOMEN.

Among the institutions designed for women exclusively, Radcliffe College, connected with Harvard, whose teachers are likewise employed there, and Barnard College, which holds a similar position with relation to Columbia University, rank preeminent, since they profit by all the advantages of these prominent universities. Others deserving of mention are Vassar College, Bryn Mawr College, the Woman's College of Baltimore, and Wellesley College.

VASSAR COLLEGE, POUGHKEEPSIE, N. Y.

German instruction was introduced here at the opening of the college in the year 1836. The first German professorship was held by Miss Caecilie Kapp, the sister of

Frederick Kapp. The progress of the German department is manifested by the fact that, whereas in the year 1889-1890, only 75 students took German, this number has since, under the excellent management of Professor (Miss) Herholz, risen until during the current year it amounts to 250, out of a total attendance of 600. In consequence, two assistants, Misses Reinecke and Bartelmann, have been appointed. Both were born in Germany. The library contains 30,000 volumes, of which about 5,000 are German. Every year \$200 to \$300 are set aside for the purchase of German books. German enjoys such favor that it is the language for conversation during recreation. The German Society, founded in 1900, presents German flags. In February, 1901, Minna von Barnhelm was studied, and is to be given at commencement. On November 10, 1900, Schiller's birthday was celebrated with memorial addresses, recitations, and songs.

The German elementary courses are required for those who enter without any knowledge of German. Besides these there are fifteen elective courses, including language, literature, and the history of literature. The following is the programme for the two courses devoted to scientific German:

Course I.—Scientific German, Gore; Science Reader or Brand and Day's Scientific German; Cohn on Bacteria; Müller, Electrical Machines. First semester (2).

Course J.—A. Lang, Characteristics of the Methods of Research of Lamarck and Darwin; Von Baer, Which is the Right Understanding of Animate Nature; Kölliker, The Present Position of Morphological Studies. Second semester (2).

Great attention is given by the seniors to Faust studies and the "novel course," which is devoted to the more prominent authors of the nineteenth century. In February of the current year Director Conried delivered an interesting lecture in German on the German stage.

BRYN MAWR COLLEGE.

Last year this college, which was opened at Bryn Mawr, Pa., in 1885, had 24 male and 17 female teachers for its 322 students. Besides its director, Prof. Hermann Collitz, Dr. Albert Haas, professor extraordinary, and Miss Rose Chamberlin teach in the German department. A certain knowledge of German grammar and the ability to translate at sight from German into English are conditions for admission. Those students who pass an admission examination in Greek are exempted from this in the beginning, but they are required to pass the German examination if they desire to receive the degree of bachelor of arts. To afford the necessary advantage, elementary courses in German have been introduced; upon completion of these, students are admitted to the course in German conversation, which is as popular here as among the students of Vassar College. Those who pass the admission examination take a two years' course devoted to an introduction into the history of German literature (in the first year, ancient literature to Klopstock; in the second year, classic and modern literature), and a thorough study of several masterpieces of German literature, and to perfecting their practical knowledge of German. Those who have been successful in this course and pass the baccalaureate examination are admitted to the graduate courses; these require three years and claim to attain the same end as the philosophic course at German universities. Accordingly, those who have studied in this division three years, and whose theses have been accepted as having scientific value, receive the degree of doctor of philosophy, if they pass the final written and oral examination. A condition is that graduates must spend at least two years at Bryn Mawr. A fellowship in Germanic and Teutonic philology, amounting to \$525, and several scholarships have been offered.

The German department was organized by Professor Collitz in 1886 and has since been successfully continued. The earnestness with which philological studies are pursued is best shown by the fact that several students of Bryn Mawr have

distinguished themselves by publications of a technical nature. The following works have proceeded from the seminary for Germanic philology in Bryn Mawr: Caroline T. Stewart: *The Nominative Singular of Weak Substantives in Old High German*, 1887 (published in *Bezenberger's Contributions to the Knowledge of Indo-Germanic languages*, vol. 23). Dorothy W. Lyon: *The hymn "Christe, qui lux es et dies," and its German, Dutch, and English Translations*, 1898 (published in the nineteenth volume of the *American Journal of Philology*).

A characteristic of Bryn Mawr College is the so called "senior orals," namely, examinations "to test the students' ability to read French and German at sight," which are held during the course of the last year before the conferring of degrees, consequently, a kind of graduate examination in modern languages in addition to the admission examination. Not only those who make a special study of modern languages, but all students who desire to receive the A. B. degree, must pass this examination.

THE WOMAN'S COLLEGE OF BALTIMORE.

This college was founded by the Methodist Episcopal Church in the year 1885, and was opened in September, 1888.

The department of German language and literature is directed by Dr. Hans Froelicher, who is assisted by his wife, Dr. Frances Froelicher. It seeks to bring the student into close touch with the character and genius of the German nation by means of exact study of its language and historical and critical study of its literature. The work is planned with a view to having courses of an elementary and introductory character precede courses calling for individual and independent intellectual effort on the part of the student. The historical succession of epochs and of writers in all the courses (except the beginners' course) forms the natural outline of the work. Social conditions and events in political history are considered wherever they bear on the subject of study. The influence of foreign literature is traced, and incidentally affords glimpses into the comparative study of literatures. Throughout the course, however, the study of historical matters is subordinated to that of literature as literature. Courses of lectures are given for the purpose of supplementing the critical study of authors and literary units, the literary and philosophic import of which forms the main object of the work. A certain elementary knowledge of German and the understanding of 500 pages of German literature are required for the A. B. degree.

Besides the beginners' course, the following five courses for advanced students were held last year:

I. The course in postclassical literature of the nineteenth century, in which Sealsfield was likewise discussed.

II. The course in Middle and Old High German, connected with the history of German literature from the earliest times to the Middle Ages.

III. The course in the German drama in general and the critical study of the classical drama.

IV. The course in epic and lyric poetry.

V. A special course in Schiller and Goethe, giving special attention to Faust.

An excellent opportunity is thus afforded to learn and appreciate German literature. No one can complete the above courses without understanding to a certain degree the thought and feeling of the most prominent German authors.

WELLESLEY COLLEGE.

Wellesley College, located at Wellesley, Mass., was opened in 1875 for the purpose of furnishing to young women advantages and facilities for a liberal education. The college confers the degrees of master of arts and bachelor of arts. The work of graduate students is under the direction of a committee appointed from the faculty of the college.

The following courses were announced for 1899:

I. Carla Wenkebach, professor of German language and literature. German mythology and Wölsungensaga; theory of the drama; history of German literature; Lessing as dramatist and critic; Goethe's Faust, I and II; German seminary.

II. Margarethe Müller, associate professor of German. Goethe's life and works; German prose; historical and other novels; Middle High German; Schiller as philosopher and writer on æsthetics.

III. Louise C. M. Habermeyer, instructor in German. Translation from German into English (advanced); nineteenth century authors.

IV. Elsbeth Müller, instructor in German. Grammar and composition (advanced).

There are at present 69 teachers for the 700 students. The attendance of the German courses was a fair percentage of the total.

II. PUBLIC SECONDARY SCHOOLS.

Our proper business is improvement.—*Daniel Webster*

It is beyond all dispute that the condition of American intermediate education is chaotic and unsatisfactory. As yet no results have been realized from the report of the committee of ten. Whereas the existing educational system is beyond compare and progresses uninterruptedly from year to year in the higher institutions of learning, the schools designed partly to prepare their students for college, and partly as "people's colleges," to give a general education to all classes, suffer for the want of a uniform system to which they might properly conform.

Independent of parochial institutions and certain other private schools, which will receive special mention, the following kinds of schools prepare for college:

I. True preparatory institutes, including the well-known "academies" of the Northeast, that have corps of excellent teachers.

II. Preparatory schools of colleges, instituted to supply the want of good preparatory institutes. They are under the direction of the teachers of the respective colleges and drill their pupils so as to become excellent freshmen.

III. City high schools similar to the formerly popular Latin schools of Germany, and designed for those who have completed the grammar-school course.

High schools are of comparatively recent date, and increased in number to any great extent only during the second half of the nineteenth century. Until now they have prospered best where, as in Michigan, they are under State supervision and stand in a positive relation with the State university. As before stated, since 1870 a high-school diploma admits to the university without further examination. A similar arrangement has been introduced in Minnesota, and other States seem to be following the same lines. Since German has become an integral part of instruction and competes successfully with Greek, the administration of a system of intermediate schools must hinge on a promotion of German studies.

The complaint that America lacks gymnasia, in which students in Germany and Austria are prepared for the university, is the dominant vein of thought in all addresses and articles by American educators who have had the opportunity of studying these schools where they exist. Hon. J. D. Philbrick, of Boston, declared in the department of superintendence of the National Educational Association, January 30, 1874:

There is no public high school in America, with the possible exception of the New York College, where the course of education is equal, either in extent or thoroughness, to that of a gymnasium or a Realschule in Vienna. The teaching staff in these institutions is composed of professors who are more nearly on a par, in respect to learning and culture, with the professors in American colleges than with the teachers of our high schools. In respect to knowledge of the science and art of education they are quite superior to the American college professors. They have not only received a university education, but they are also required to pass through a course of pedagogical training in the university seminaries established for the purpose.

The courses of study in the gymnasium and the Realschule alike extend over the period of eight years, the pupils entering at 10 or 11 years of age and graduating at 18 or 19.

In respect to equipment, including apparatus and libraries, they are vastly superior to the American high schools. In one of the youngest of these institutions, which is not yet provided with a building for its use, the apparatus, none of which is for ostentation, but all for use, has cost 26,000 gulden, a sum equivalent to more than the same number of dollars spent here. Several of the buildings which have been recently erected for the schools are quite superior to any high-school edifice which has as yet been erected in this country. The tuition is not gratuitous, but it is very cheap, not exceeding \$15 a year for such people as have the means to pay, while meritorious pupils who are not able to pay this sum are provided for by charity funds and in other ways. But, after all, you may ask, are not these schools, with such comprehensive courses of study and such accomplished professors, small establishments? Far from it. Some of the largest have nearly 30 professors each and six or seven hundred pupils, the aggregate number of their professors being about 375 and the total number of their pupils being no less than 5,500. This number of boys and young men is at least equal to the whole number of boys receiving secondary education in the public high schools of the 15 largest cities in America. Besides these public secondary schools there are others which are denominational or private. The Protestants have a very large and excellent school for both sexes, although of a somewhat lower grade.

Such is the superiority of Vienna over American cities in one of the principal departments of public instruction.¹

The attempts made in America to imitate German gymnasia have all failed, as they were destined to do, since the country needs American institutions and can not make use of the European. One would suppose that the many colleges, all of which can hardly develop into universities, would, where sufficient intermediate schools do not exist, provide preparatory classes which would supply the lack of secondary schools in a comparatively easy way.

In an interesting lecture on "Overwork in public schools,"² delivered some time since before an audience of teachers, President William De Witt Hyde, of Bowdoin College, explained one of the chief reasons why high schools can not attain the same results as the German gymnasia and Realschulen. He said:

Investigations in the high schools of Boston, Providence, and Fitchburg show that the average time spent in study and recitation during the five days of the forty weeks of a school year, is seven hours and a quarter, of which two hours and a quarter are spent outside the school. This is much less than the eight and five-tenths hours for scholars from 14 to 16, and the nine and three-tenths hours for scholars from 17 to 19, which is the limit in the German gymnasium.

A very simple arithmetical computation shows that pupils in American high schools work $7\frac{1}{4} \times 200 = 1,450$ hours, while those of German gymnasia work $9 \times 240 = 2,160$ hours on the average, consequently nearly 50 per cent more during a school year. It is not surprising, therefore, that preparation for college is here so often insufficient, and that modern language instruction is treated in a step-motherly fashion for the mere want of time.

Another weighty reason why German instruction in particular prospers no better in public high schools was explained by Professor Ferren, of Allegheny High School, in a very interesting address delivered at the first meeting of the Association of the Teachers of German in Pennsylvania.³

The study of the German language, he said, resembles a long bridge, which must be "crossed, not merely entered upon," if the end is to be reached. And he proceeds:

But why is it that so many able pupils derive so little benefit from the study of German in our high schools. We teachers must take part of the blame upon our-

¹Address by Hon. J. D. Philbrick, of Boston, on "Systems of public instruction in European and American cities compared," page 63.

²Paper read July 8, 1886, at the fifty-seventh annual meeting of the American Institute of Instruction.

³The meeting was held April 9, 1898. The full text of the address was published in Volume II, No. 2, of the *Americana Germanica*.

selves, and may hold our superiors in office and the public school system accountable for the rest. Too many of us are so utterly devoid of an "intellectual conscience" that we consent to teach most anything under the sun, whether we are qualified or not. Some of us make ourselves believe that we know German because we have a number of stock phrases at our command and have read a few hundred pages of text. The truth of the matter is that many of us are totally unfit to lead others across the bridge, because we have never crossed it ourselves. Hence, one of the first duties devolving upon this association is to set a higher standard for high-school teachers of German. Let us, like good Germans, live up to this principle, even though it should mean annihilation to us. *Patere legem quam ipse tulisti*. We must insist that no one shall be permitted to teach German in a high school who does not know his subject thoroughly. But this is not all—scholarship alone will not suffice—pedagogical ability is equally indispensable, and it is a fatal mistake for scholars to regard it as a minor matter or as something that will take care of itself. Pedagogical problems are so numerous and intricate in a high school that it will require the lion's share of a teacher's time to solve them. Whoever shirks this part of his work—be it to enjoy more leisure or to prepare for some other vocation—is a traitor to his cause. Such persons in particular are guilty of that most heinous pedagogical crime of hurrying over the elements at a breakneck speed. The great curse of language study in this country is the deplorable ignorance of the elements.

Too many of our language courses are topheavy; we need more good teachers at the base; otherwise the entire structure will collapse someday. I never could understand why so many trained men who might become useful and prominent in high-school work—and have a clear conscience besides—prefer to eke out a miserable existence in some college or university. We need a dictator to tell some people that are overplaced where they belong. The high school is not taken seriously enough. To obtain the best results in the high school we must have teachers trained in their special departments; teachers loyal to their task, and willing to devote their lives to the building up of our public school system. * * *

But there are still further reasons why the high school does not accomplish more in German. Although these do not reflect so directly upon us teachers, yet an organized effort on our part will do much to remove them. Among others there is the mistaken notion that a high-school course in German should attempt no more than to satisfy the entrance requirements of an average college. No one who is at heart a public school man can uphold such a view in the face of all statistics on the subject. If the German courses in our public schools shall not be a farce, then time enough must be given to them so that definite and lasting results can be obtained by the end of the high-school course. This I think can be accomplished, provided German runs through the high-school course as an elective for four years with 5 recitations per week, making a total of 800 periods. I do not maintain that even at the end of this time the pupils will have reached the desired goal, but they will certainly be so near to it that all who wish to reach it independently of a teacher can do so without too great a sacrifice of time and energy. If, on the other hand, we confine ourselves to short courses of two years or less, expecting the colleges to supplement these, then most of the public money spent on German instruction will be wasted, since only a small minority will derive any benefit at all from it. By attempting to do more in German than our colleges require for entrance we are not opposing these institutions, but are merely doing our duty by that large majority that will never go to college. In proof of this I quote the following from Commissioner Harris's latest report on secondary schools in the United States:

Public high schools of Pennsylvania.

	Males.	Females.
Total enrollment.....per cent.....	37.5	62.5
Percentage of total male and female enrollment preparing for college.....per cent.....	13	5.2
Pupils taking German.....	1,488	2,559

* * * Several months ago I sent out about 600 letters of inquiry concerning the study of German in our public high schools. Thus I learned that fully 100 reputable high schools distributed over 74 cities had four years of German. In Pennsylvania there are but 5 of these, Philadelphia being conspicuous for its

absence. I give a list of the cities, but omit the names of the individual high schools:

Akron, Ohio.	Council Bluffs, Iowa.	Houston, Tex.	Saginaw, W. S., Mich.
Albany, N. Y.	Covington, Ky.	Indianapolis, Ind.	Sacramento, Cal.
Allegheny, Pa.	Crownpoint, Ind.	Jacksonville, Ill.	South Bend, Ind.
Altoona, Pa.	Davenport, Iowa.	Kansas City, Mo.	South Salem, Ohio.
Appleton, Wis.	Dayton, Ohio.	La Crosse, Wis.	Springfield, Ill.
Austin, Tex.	Denver, Colo.	Lafayette, Ind.	Springfield, Ohio.
Baltimore, Md.	Detroit, Mich.	Lima, Ohio.	St. Cloud, Minn.
Belleville, Ill.	Duluth, Minn.	Milwaukee, Wis.	St. Joseph, Mo.
Binghamton, N. Y.	Elgin, Ill.	Montclair, N. J.	St. Louis, Mo.
Boston, Mass.	Elwood, Ind.	Newark, N. J.	St. Paul, Minn.
Brooklyn, N. Y.	Erie, Pa.	New York, N. Y.	Titusville, Pa.
Canton, Ohio.	Evansville, Ind.	Omaha, Nebr.	Toledo, Ohio.
Chicago, Ill.	Fort Wayne, Ind.	Oshkosh, Wis.	Trenton, N. J.
Chillicothe, Ohio.	Gloucester, Mass.	Oswego, N. Y.	Washington, D. C.
Cincinnati, Ohio.	Grand Island, Nebr.	Peoria, Ill.	Wausau, Wis.
Cleveland, Ohio.	Grand Rapids, Mich.	Pueblo, Colo.	Worcester, Mass.
Colorado Springs, Colo.	Helena, Mont. (3 ^d).	Quincy, Ill.	Youngstown, Ohio.
Columbus, Ohio.	Hamilton, Ohio.	Richmond, Ind.	
Corry, Pa.	Hammond, Ind.	Saginaw, E. S., Mich.	

The lecturer advocated at the close of his paper:

1. To introduce German into as many high schools as possible.
2. To insist on four years of German in the high schools wherever circumstances will permit.
3. To increase the efficiency of the work in our own and other departments by limiting the number of subjects assigned to each teacher.
4. To set a higher standard for high-school teachers of German by requiring them to pursue special post-graduate courses.
5. To give German its proper place as an elective in the high-school curriculum.
6. To encourage the Latin-German group, since this will raise the standard of our department, and will enable more pupils to enter college.
7. To found a national association for teachers of German.

As far as the secondary schools of New York, in particular, are concerned, the College of the City of New York has for the past few years been undergoing a process of change into a high-grade college. It may therefore be a mistake to class this institution among the intermediate schools. Encouraging attention is given to German instruction, directed by Professor Werner.

In the school year 1901, two sessions, the attendance at German instruction was:

- I. Classical course (German elective only in the last year), 12 seniors.
- II. Scientific course and mechanical course: Subfreshmen, 100; freshmen, 190; sophomores, 165; juniors, 123; hence, a total of about 600 pupils.

Dr. Montser writes concerning the conditions in the high schools of New York City, in existence about five years:

I fear that I can reply but imperfectly to your inquiry on the present status of the development of German instruction in the high schools of New York. I have exact information only on the conditions of the De Witt Clinton High School, where I am engaged. The conditions at the Cooper High School are about the same in general. Very little German, however, is taught at the high school for girls (Wadleigh). * * * The full German course with us continues four years, with four periods a week. Besides, we have a three years' course which begins in the second year and has five periods a week, and another three years' course with four periods the first and two periods each the second and third years. The last mentioned is intended for those pupils who study both classic languages, and is, therefore, that division of the high school which corresponds to the German gymnasium, while the first-mentioned courses correspond to the realschule and realgymnasium. The first year of all courses is devoted chiefly to giving an excellent foundation in grammar; later, reading, translation, composition, and, to some extent, conversation form the subject matter of instruction. In the third and fourth years pupils read works like Minna von Barnhelm, Tell, and Hermann und Dorothea.

What is to be gathered from this interesting letter, to wit, the lack of persons fully informed on the present state of affairs, is explained by the well-known maxim of Goethe, particularly applicable to secondary schools:

Nothing is constant but change.

May the Proteus of American intermediate schools soon assume the definite shape specially desirable for the interests of providing well-prepared freshmen for universities and the elevation of German instruction.

III. PUBLIC PRIMARY SCHOOLS.

Ohio's former metropolis, Cincinnati, in the year 1840, in pursuance of the school law of 1839 for the State of Ohio, introduced elementary schools with two languages, and was the first city to take this step. Ohio was followed by Indiana and Wisconsin. In most other States the choice was left open to city communities to what extent a foreign language should be introduced or discontinued in their public schools. The consequence is that in St. Louis, for instance, where German instruction flourished to such an extraordinary degree during the brilliant period of Dr. Harris's superintendence, it has been altogether suspended, whereas in New York and Chicago the attempts to discontinue it have been made futile only by the combined opposition of American intelligence and the national spirit of German-Americans.

Director Dapprich¹ has thus reported on the present state of affairs:

Whereas the two languages have an equal rank in the schools of Cincinnati, in other cities English is placed far above German. In Baltimore the English-German schools enroll more than 8,000 pupils under city control, and sufficient attention is given to German; there is no attendant expense, as the class teachers conduct German instruction and no extra outlay is necessary. Conditions are the same in Belleville, Ill., where more than half of the public-school teachers are prepared to teach German. The same may be said of many other cities. This arrangement is the only right one for the rational study of German and its continuance as a branch in public schools. The effort should be made to extend this system to all city schools. We on this side of the ocean find it incomprehensible that teachers in Germany are not required to learn at least one foreign modern language, for the time is not far distant when no one will be considered educated unless he can speak and write two languages fluently.

The tendency toward the realization of this ideal is very strong among American teachers. An epoch in this direction was marked by the report of the committee of ten to the National Educational Association in 1894. Prof. Charles H. Grandgent, of Boston, Mass., chairman of the section for modern languages, reported:

Wherever thoroughly competent teachers can be secured we are of the opinion that there should be introduced into the grammar schools an elective course in German or French, open to all pupils who have arrived at the fourth year from the end. It is supposed that the average boy or girl will reach this stage at the age of 10. We make the above recommendation not with a view to separating at such an early period the scholars who are likely to enter a high school or college from those who are to receive only elementary instruction, but in the firm belief that the educational efforts of modern-language study will be of immense benefit to all who are able to pursue it under proper guidance. It will train their memory and develop their sense of accuracy; it will quicken and strengthen their reasoning powers by offering them at every step problems that must be immediately solved by the correct applications of the results of their own observation; it will help them to understand the structure of the English sentence and the real meaning of English words; it will broaden their minds by revealing to them modes of thought and expression different from those to which they have been accustomed. The study of Latin appears, it is true, to present the same advantages, but living languages seem to us better adapted to grammar-school work, both on account of the greater ease with which they can be taught and learned and because of their closer relation to the interests and ideas of to-day.

The following statement of the extent of German instruction in American cities, furnished by the committee of the German Teachers' Association, may be appended to this general investigation.²

¹ Dr. Müller, *German Schools and German Instruction in Foreign Countries*, pp. 346 and 347.

² The tables, which are taken from pages 43 to 45 of the pamphlet *The Present Position of German Instruction in the Schools of the United States*, contain several errors that have been corrected here as far as possible. It is astonishing that the percentage of pupils studying German in cities where German is not taught in the public elementary schools is not much below that of cities where public German instruction receives "no special encouragement." In such cases parents must prefer private schools which afford ample opportunity for learning German.

NEW YORK CITY.

The following instructive facts on the introduction of German instruction in the city of New York were given at a German mass meeting held March 18, 1875, in Cooper Institute:¹

Recognizing the merits of the study of modern languages and their advantage for practical life, the school commissioner of the city of New York, in 1854, introduced an optional one-year course in the highest grade of the grammar schools. In the year 1870, chiefly because of the increasing importance of the German element in civil society and commercial interests, German was introduced as a regular branch of public instruction in all the eight grades of grammar schools wherever, in the judgment of the school trustees of the respective wards, there was sufficient demand for it. In consequence, till the close of the year 1873, German was taught as a regular branch to 19,395 pupils in 464 classes, in contrast with the limited optional course in French in the two highest grades, which was pursued by 1,609 pupils in 50 classes. The result was that in the fall of 1874 1,180 of the 1,200 students at the Female Normal College studied German, while only 20 took the French course.

On December 16, 1874, Commissioner Brown presented a report from the committee on course of study and schoolbooks to the board of education of the city of New York, as follows:

* * * Pupils attending German private schools have in large numbers left those schools to connect themselves with the public schools, and in this way not only has our system of public instruction been made more popular, but it has become more effective as a means of Americanizing the citizens of foreign birth and their children, who constitute so large a part of our population, by bringing them in immediate and daily contact with the children of Anglo-American birth, and under such educational and moral influence which tends to make them a thoroughly homogeneous part of our nation. The more effective this department of instruction is made the more successful will our system be in this respect and the more nearly shall we approach to that desirable consummation of bringing under the influence of our common schools the children of all classes of our people as well as of every nationality and creed. The importance of this consideration will be obvious in view of the fact that at least 11,000 German pupils are in daily attendance at the Catholic parochial, Lutheran, and German private schools.

The report proceeds to state the result of investigations in 12 of the larger and a few of the smaller cities. Among other things, it says:

In St. Louis the number of pupils of the public grammar schools studying German was, in 1871-72, 10,246 out of a total number of 29,138, or 35.2 per cent; in 1872-73 the number rose to 12,055 out of a total number of 31,009, or 38.9 per cent. The increase was chiefly in the number of Anglo-American pupils, who in 1871-72 numbered 1,354 and in the following year 3,150. Hence the board of education gradually introduced German into a large number of schools, and, for children of German parentage, into all the grades of the schools, from the lowest grade of the primary department up to the highest. Owing to the increased demands of Anglo-American parents, it was in 1871 introduced into the lower classes for all pupils.

The report then refers to conditions in Ohio, already mentioned, and of which a fuller account will be given, and concludes with Kentucky:

In Louisville the total number of pupils of public schools was, in 1872-73, 9,367; the number in German classes, 6,547, against 6,216 in 1871-72 and 5,713 in 1870-71. It is taught in the schools of all grades. The study is very popular, and, as in St. Louis, Cleveland, and Cincinnati, there is no opposition to it.

¹ Compare:

I. The German Language in the Public Schools. Addresses delivered at the mass meeting in Cooper Institute, New York, March 18, 1875.

II. The German Language as a Regular Branch of Public Instruction.

The reports of the superintendents and boards of education of the cities in which instruction in German has been for some time a part of the regular course of studies unanimously recognize the importance of this study. The president of the board of education of Louisville, in his last annual report, remarks: "As to the utility of the study of German in a community like our own, or in any community, there can be but one opinion."

From Commissioner Brown's report we can understand that his successor, Herring, who, in unison with Commissioner Baker, desired to abolish the "ornamental branches," of which German was one, encountered violent opposition. The protest meeting of March 18, 1875, was called to order by Mr. M. Ellinger. The chief speakers were Clark Bell, who spoke in English; Ex-Governor Ed. Salomon; Prof. Felix Adler, and Carl Gaepf. Letters of approval were sent by Bayard Taylor and Andrew D. White. The communication of the former is given in his biographical sketch. The latter wrote:

I need hardly state that I fully agree with you in keeping German as a regular study in our public schools. Years ago I expressed myself in favor of the motion, and time has only strengthened my view. I could give reasons for my opinion, but I shall refrain from doing so and mention but one fact. If every year hundreds of our best young men find it to their interests, at great expense of money, trouble, and time, to travel in Germany in order to learn the German language, it would be a ruthless waste of what we possess if we should allow this language to die out among the thousands who have its first elements and could acquire, for the interests of commerce and national education, a thorough knowledge of it by some continued exercise in our schools.

The resolutions adopted unanimously at the meeting were:

Since, according to the opinion of pedagogical authorities, instruction in a foreign language given simultaneously with that in the native tongue is the most valuable means to develop the mind of the young and the native language can be best learned by comparison with another;

Since the German language possesses all the qualities necessary for this purpose, a fact recognized in the report of the superintendents of the public schools of this city, as well as by the school authorities in other cities where German has been introduced into the public schools;

Since German is the language spoken by a large percentage of the population of the United States and of this city, on account of which direct practical advantages accrue from its introduction as a regular branch of study in public schools;

Since, as experience proves, German instruction in public schools draws a large number of children of German-American parents that would otherwise receive their education in private or parochial schools, whereby the difficulty of identifying the future generation of German extraction with our relations and institutions and educating a people of harmonious national sentiments and American patriotism is sensibly increased;

Since a former school board, with a proper appreciation of these facts, amended the by-laws so that German shall be recognized as a regular branch wherever public opinion so demands:

Be it resolved, That the citizens of this city, assembled without regard to party or other distinctions, learn with astonishment and regret that certain members of the present school board are endeavoring to change the course of study in our public schools by excluding instruction in the German language;

Be it resolved, That we, as citizens and taxpayers, most emphatically protest against these measures designed to exclude and curtail German instruction in public schools;

Be it resolved, That we fully indorse the report of last year's committee on studies, submitted to the school board, and are convinced that the adoption of the regulations therein recommended will prove an amelioration of the educational method tested by practical experience;

Be it resolved, That we consider every effort, under pretext of economy, to insure the development of our public schools, in that not only language instruction but other branches that exert a refining influence on youthful minds are excluded, as ill advised and unworthy of the genius of our times and the country and city in which we live;

Be it resolved, That as the institutions of our country are based upon a thorough and liberal education of all citizens, our public schools, to fulfill their purpose,

must afford instruction that will insure a thorough and equal education to children of the poor and the rich, of the native born and immigrants alike;

Be it resolved, That a copy of these resolutions, as expressive of the opinion of this assembly, be presented to the president of the school board by a committee appointed by the president.

We regret not to be able to give the excellent addresses delivered on this occasion. The effect of the speeches and resolutions was that the attempts to abolish German instruction were futile. On the contrary, upon motion of Commissioner Klamroth, it was decided to appoint an assistant superintendent whose special duty was to be the supervision of modern language instruction. Prof. Alexander J. Schem was appointed to this position, and has filled it most successfully.

Since then German instruction in the public schools of New York has attained a position which it is hardly likely ever to relinquish. The above-mentioned proportion—25 per cent—of pupils studying German seems to be far too small, especially when we take into consideration that, at present, only 491,203 of the total number of 733,416 children of school age are registered in public schools, and about 40,000 between 6 and 8 years of age grow up without any schooling whatever.

In the "first annual report of the city superintendent of schools to the board of education for the year ending July 31, 1899," Superintendent William H. Maxwell remarks (p. 119) on German instruction:

The German language is taught for all who care to study it. The result is that children are subjected to an amount of pressure in the Manhattan schools that is practically unknown in the other boroughs. The remedy is not to take shop work and German out of the schools, but to extend the schedule time to eight years, and at the same time to make provision by which bright children who can accomplish the work in less time may be permitted to do so.

The extension of German instruction is particularly necessary in Brooklyn, where only 5 per cent of the pupils study German, though at least one-quarter of the population is of German extraction.

CLEVELAND.

Though written twenty-five years ago, the able article on the development of German instruction in Cleveland, published by Max Horwitz in the *Deutsche Rundschau* (Vol. IV, pp. 249-252), has lost none of its worth. A glance at the tables given shows that Cleveland is one of the cities in which German instruction receives special attention.

The author writes:

It would be going too deep into the subject to give the exact data as to how German instruction was introduced in each city that has introduced it. Cleveland, which deservedly boasts of being the first city in the United States in this respect, may serve as an example.

German instruction is, to a certain extent, obligatory in Cleveland. A new school law passed by the legislature of Ohio May 1, 1873, reads:

"It shall be the duty of school commissioners to see that the German language is taught in all the public schools of the State where it is requested bona fide by seventy-five citizens, residents of the district in question, who represent not fewer than forty pupils, and the pupils want to learn German and English at the same time; provided that nothing herein contained shall be so understood as to prevent said commissioners from having German or other languages taught in the said schools, and provided that all branches of study which are taught in the public schools shall be taught in the English language."

Divested of its technical form of expression this law contains, besides a restriction in favor of English as the language of instruction, the regulation that commissioners may introduce German instruction whenever they see fit to do so, but must introduce it whenever the relatives of forty children in one district so request.

In pursuance of this law the school commissioner of Cleveland resolved that all the pupils in elementary classes must study German if at least eighty request it. The class is separated into two divisions, and is conducted by an English and a German teacher, who instruct alternately on the same day. Of the twenty-two

periods a week, eleven are given to English and eleven to German. The following table is taken from the order of study:

Subject.	English.		German.	
	Hrs.	Mins.	Hrs.	Mins.
Arithmetic.....	3	00		
Object lessons.....	2	00	2	30
Reading.....	2	30	2	30
Orthography.....	2	39	2	30
Writing.....	1	00	1	00
Singing.....			2	30
	11	00	11	00

While arithmetic is taught only in the English language, which is most proper for obvious practical reasons, and is expressly required by the State law in all classes, even the highest to which the above order of time applies, singing is taught only in German. As much as Americans may disagree with them on other subjects they consider music the special invincible right of Germans. It may be mentioned here as a curious occurrence that on the occasion of the last great German-American Sängerfest held in Cleveland in June, 1874, 1,500 children, representing, besides German, the Irish, Scandinavian, Italian, French, and negro elements, sang *Die Wacht am Rhein* with a very distinct pronunciation from beginning to end in German.

Of a total public-school attendance of 10,332 during the year 1873 3,572 pupils studied German. Of these 2,435 were children of German, 1,137 children of English parentage. The success thus attained is encouraging to Germans. The superintendent of German instruction, L. R. Klemm, appointed by the city, says:¹

"Of the 244 pupils of the A grammar classes that were examined to enter the high school 135 had studied German one, two, or three years; 123 of these 135—a little over 91 per cent—passed. Of the other 109 who had not studied German only 85—not quite 78 per cent—passed. Although the success of this entire examination depended upon the results of the examinations in arithmetic and English grammar, the pupils who took German carried off the prize from those whose ambition did not rise above a 'common English education,' even though they had more time to give to the studies specified."

And that is not all. Germans are not satisfied with demanding the opportunity for their children to learn German. They show Americans why their children likewise should have a share in German instruction. In the words of a zealous champion in Cleveland, that carry a greater weight since he speaks in an official capacity, many a prejudice is thereby removed that under other circumstances would have disturbed the friendly relations between the two nations. It is not enough that Germans should learn English. They do it without reluctance, although they clearly realize that it is not absolutely necessary for them to do so in large cities, as they can live in peace and harmony without it. Newspapers printed in their native tongue inform them of all that they need to know in politics and social life. They find enough German shopkeepers from whom they can make their purchases, and in social intercourse they need not mix against their will with persons that speak a language foreign to them; and still they learn English simply because they easily adapt themselves to the customs of others and are not so foolish as to dream of forming a state within a state. It is perfectly natural that they not only assimilate, but endeavor to impart. They think that this Republic is a crucible in which all the nationalities of the earth are represented, and since they are one of the three predominant components of the mixture they desire not only to increase the quantity, but, what is of more account, to exert an influence on the quality. They think that they possess attributes capable in fusing the mass of giving the new mixture a greater value; to that end it must give them pleasure that their English-speaking fellow-citizens are learning German.

CHICAGO.²

Upon motion of Lorence Brentano, a member of the school board at the time, German instruction was introduced in Chicago in 1865, by way of experiment, in

¹ Thirty-seventh Annual Report of the Commissioner of Education; Cleveland, 1874.

² According to the article of Dr. G. A. Zimmermann, superintendent of modern languages, in the *Pedagogical Monthly*, Volume I, No. 1, pp. 46 and 47.

the Washington school. Madame Pauline M. Reed, a highly educated woman, was the first German teacher. Upon her transfer to the high schools, in 1866, she was succeeded by Miss Caroline McFee. At that time 115 pupils studied German. The experiment did not fall through, and the school board declared it to be "a perfect success." In view of this circumstance, it was resolved that in future, in all districts where the parents of at least 150 pupils desired that their children should learn German, German instruction should be introduced. Consequently it was at once introduced into four schools—the Moseley, the Franklin, the Newberry, and the Wells. In the following years seven other schools were added to the list. At the close of the school year 1870-71 4,297 pupils, 1,411 in secondary and 2,886 in primary grades, studied German.

The great fire that transformed the flourishing city of Chicago into a mass of smoking ruins naturally affected German instruction unfavorably. After Chicago had recovered from the blow the school board resolved, in the year 1873, to appoint a superintendent of German instruction. Miss Regina Shauer was selected. At the same time the system of dividing German classes into definite grades was inaugurated; previously the teachers had acted according to their individual judgment.

When, in July, 1877, upon motion of the well-known attorney, Mr. W. Vocke, Dr. G. A. Zimmermann was placed at the head of German instruction, 1,912 pupils in 18 schools were studying German under 16 teachers. Interest in German was at that time dormant among the people at large. After great effort on his part, Dr. Zimmermann succeeded in rousing it. He made various changes in method, discarded a grammar of 400 pages and replaced it with a practical primer. The consequence was a decided change for the better. In the year 1880 German was taught in 12 additional schools and three high schools. The number of teachers had risen to 28 and the number of pupils to 3,981. Four years later 10,696 pupils, in 43 schools, were being instructed in German by 73 teachers. When, in the year 1885, German instruction was again introduced into the third and fourth grades, the number of pupils rose to 29,440, that of teachers to 143.

Through the annexation of different suburbs in the year 1890, German was introduced into 26 additional schools; 207 teachers were required to instruct the 34,801 pupils, and Dr. Zimmermann received an able assistant in Miss M. I. Purer. German instruction gained the height of its vogue in the year 1892-93; 44,270 pupils and 242 teachers worked under the direction of Dr. Zimmermann. Then came a sudden change. In consequence of financial embarrassment, the school board was forced to curtail expenses, and German instruction was restricted to the higher grades with a resulting diminution of 100 teachers and 20,000 pupils. However, all the teachers received positions as English teachers.

Since then the number of teachers and pupils has again steadily increased. According to last year's report 40,003 pupils were registered for German instruction. Of these 15,020 were of German and 12,195 of Anglo-American parentage; the parents of 12,788 were of other nationalities. Instruction was given by 210 teachers. In the high schools 2,481 pupils studied German, 1,310 French, and 12 Spanish.

For some time it seemed as though the encouragement given by this report was not to be sustained. A motion was made to abolish German instruction on account of lack of funds, and this proposition was supported by even the Times-Herald. But in pursuance of the decided attitude of the German press and the different German associations the retrogressive measure was not carried out. At present there are 42,000 pupils under 215 teachers in elementary schools, and in high schools 3,000 pupils under 27 teachers. These figures were never reached before, and including pupils of private schools are almost equal to the number of pupils studying German in the borough of Manhattan.

The following report is interesting from the very fact that its representation of the condition of affairs is no different from that of the others given. The author, Karl Knortz, superintendent of German, published the report in his recent pamphlet on German Nationality in the United States (Hamburg, 1898). In it he says:

In many of the numerous cities and villages of the East and West settled by Germans German is a branch of study in the public schools; as children are left free to choose for themselves, it depends chiefly upon the popularity of the teacher and his methods whether they take up the study or not. In some States of the Union, as in Ohio, Wisconsin, and Indiana, German instruction, under certain conditions, is regulated by law. It is deeply to be regretted that comparatively so few German-American children profit by this advantage, and that their parents attach so little importance to the preservation of their native language. I shall cite but one example: My place of residence, Evansville, has about 60,000 inhabitants, of whom 30,000 are said to be of German extraction. The public schools are attended by 7,000 pupils; as German-Americans usually have more children than Anglo-Americans, it would be supposed that at least 4,000 children would study German in the public schools; as a matter of fact, however, the number is only 2,500, and 900 of these are of English parentage. Nor is the proportion more encouraging in other cities. In view of the circumstance that of all German born pupils of public schools only 11 per cent speak German to their parents at home, the sad fact long since recognized that the German nationality of America can only be preserved by constant immigration from the fatherland is confirmed anew. Only where thoroughly educated, energetic, and discreet teachers, appreciative of the cultural value of the German language, are in charge of German instruction in public schools its condition is prosperous and its result encouraging. Where this is not the case the number of pupils studying German rapidly decreases.

IV. NORMAL SCHOOLS.

The teacher who does not feel himself or herself an apostle with an important human mission, but looks upon the teaching profession as a mere means of making a living, had better seek some other occupation—*Thomas Davidson*.

The various agencies for training teachers in the United States are enumerated by Hinsdale as follows:¹ Normal schools and colleges, teachers' training classes, teachers' institutes, summer schools, university extension lectures, teachers' reading circles, chairs of education in colleges and universities, and teachers' colleges.

Despite these manifold opportunities for a normal education it is unfortunately still the case that (on the authority of Boone) out of every four teachers only one on an average is systematically trained for his profession. Max Horwitz² presents this side of the teacher question, and especially the deficiency in number of German teachers, in the following graphic statement:

The most important question of the hour is the teacher question. Where are we to get teachers? There is an extraordinary deficiency of proper teachers. First of all, male teachers are displaced and even excluded by women. However much Germans in America are opposed to the instruction of girls' and boys' classes exclusively by women, and however much the German members of the school boards are of the same opinion, nothing remains for them to do but to adapt themselves to circumstances. Although they make the effort of gaining concessions in their behalf, they can not venture to attack a fundamental principle of the American educational system, which consists in giving teachers' positions, with the exception of the position of principal, to women. America is the country of championship for the rights of women. To their efforts and to the actual fear which Americans feel for women, and try in vain to conceal under the cover of esteem, is to be ascribed the fact that no effort has been made to give teachers' positions to men. Such an attempt would provoke an immediate siege of the ses-

¹ Monographs on Education in the United States, No. 8, page 1.

² In the article quoted above from the *deutsche Rundschau*, Volume IV, pages 255 and 256.

sion hall by hundreds of women, who would not depart until their "holy rights" had been guaranteed.

Independent of that fact, not enough male teachers could be found in America to replace the women. It does not occur to an American to study until his twentieth year in order to obtain a position that pays \$600 a year, with the prospect of slow increase. He decides to "run his chances," and tries his luck elsewhere. Germans, therefore, are required to adapt themselves to these conditions. If they desire to have German introduced in public schools, they must accept the compromise of female teachers. The city of Milwaukee is the only exception in all America. Whereas all positions in all schools are held by female teachers, who receive from \$500 to \$700, according to seniority, in Milwaukee German is taught exclusively by men, whose salary the first year amounts to \$1,000. German female teachers, or, more correctly speaking, female teachers of German in public schools, however, are not few. It must not be forgotten that other than German children are to be taught, and consequently a thorough knowledge of the English language is indispensable; otherwise bad English would counteract the good to be effected by German instruction among German children. Hence, women who have immigrated from Germany are for the most part unsuitable, and young women of German parentage who have attended American public schools and studied German privately are almost exclusively depended upon. For reasons difficult to determine, the number of young women among Germans who devote themselves to teaching is insignificant, so insignificant that now and then more vacancies occur in schools than there are teachers to fill them. In most cases, even if they pass a good examination, candidates have had no experience whatever in teaching. This must be acquired in practice, as there is no seminary for German.

In most cities where the school superintendent is not a German, the examination of German teachers is held by the German members of the school board. Candidates are examined in English and German; they are required to write a translation from one language into the other, analyze what they have translated, and are finally required to answer some questions orally. A few years since the author attended an examination in a Western city; there were six candidates, and it continued two hours. The women were allowed to converse, assist one another, and correct one another's mistakes. The committee on examinations consisted of three gentlemen, who were all exemplary citizens, but could not write a German letter of twenty lines without a mistake. No reproach is intended, but it is important to gain a clear view of the situation.

Since the above article was written conditions have very much improved; but the main evil spoken of has not been remedied. It is encouraging to note that educators are making a zealous effort to have positions filled by only competent teachers, and to root out the evil of having dilettantes following the profession for want of a better means of livelihood and giving it up when something better is offered to them. During recent decades the teaching profession has begun to develop a worthy membership, which recognizes its honorable vocation; and it would be an injustice to deny that women have done their full part toward the elevation of the profession.

At a recent meeting of New England educators¹ A. E. Winship gave utterance to the views of American teachers who prosecute their labors in the spirit of the motto of Thomas Davidson, and closed his address with the following golden text: "As the teacher is, the school is; as the school is, the child is; as the child is, the world is."

These words indicate the same ideals to which German educators aspire, and the motives which prompt them in their work—motives whose weight in forming a cultured people has been recognized since the Austro-German war of 1866, which gave rise to the pregnant words: "German teachers won the battle of Sadowa."

Whether wisely or not, the results of the effort to ascertain to what extent German instruction has been introduced in normal schools must be omitted. But it is a positive fact that German is taught in many institutions, and that the students take a great interest in it. The average number of students in the Normal College

¹ The American Institute of Instruction. See the annual reports of proceedings.

of New York City registered in 1899 was 2,560; the number of students studying German in June, 1899, was 303.¹

According to Hinsdale's article on "The training of teachers," page 13, German has been taught at the oldest normal schools in existence for upward of sixty years. Students of normal institutions connected with universities (as the Teachers' College of New York City, with Columbia University since 1898) have every opportunity of attending all the courses of the German department. The programmes of study of the different colleges and universities have specified the numerous German courses that have the value of German seminaries and are designed for normal training.

A few items relative to the attendance on German instruction in normal schools were given by Professor Ferren at the meeting of the German teachers of Pennsylvania, April 9, 1898:

A few words about German in our normal schools will not be out of place here. In New York, Massachusetts, Ohio, and several other States the normal schools accept a thorough training in German as a substitute for Latin. In answer to circular letters sent to 130 of these schools, I find that 25 per cent of the principals insist on Latin, while the remaining 75 per cent are willing to accept German as an equivalent. I have reason to believe that most of the normal school principals in this State are in favor of permitting a choice between the two and would vote to have the present State law modified to that effect. The demands made upon normal students are such that there is hardly time to study both languages thoroughly. Hence it is thought best to learn one of them well rather than obtain a smattering of both. But the standard of our normal schools is anything but uniform. For instance, in Massachusetts the normal preparatory course coincides with the high-school course, which makes a Latin-German group possible. Let us hope that Pennsylvania also may soon require a high-school diploma representing four years of work for admission to the normal schools. At any rate, the attitude of these schools toward German is too important to be overlooked. Normal graduates with a thorough training in German could make good use of it, even if they were never asked to teach it, and could do much to further our cause in communities—and there are such—where the old Know Nothing spirit still prevails.

Let us see what united effort will do for this State. Each one of us should endeavor to have something placed to his credit before the next meeting. We must try to make a better showing in the next official Report of the United States Commissioner of Education and of our State superintendent.

The speaker added that in Pennsylvania only 18.4 per cent of the candidates for teaching study German; in New Jersey the proportion is 27.2 per cent, and in Maryland fully 31 per cent.

From what has been said we may confidently affirm that the momentary need of German teachers is relatively no greater than that of thoroughly trained teachers in general. From the increased attendance in recent years in the German departments of universities, it is to be hoped that in the course of time a qualitatively and quantitatively sufficient supply will satisfy the growing demand for German teachers. This expectation is the more justifiable, as the effect of the resolutions of the "entrance-examination board" in regard to the position of German in secondary schools shows that the percentage of pupils studying German has risen more rapidly than was formerly the case.²

The German-American normal schools play no unimportant part in the training of German teachers. Director Daprich, of the National German-American Normal Seminary, mentions five:³

- I. The National German-American Normal Seminary (Milwaukee).
- II. The Catholic Normal School of St. Francis, Wis.
- III. The Lutheran Normal School in Addison, Ill.

¹ Twenty-ninth Annual Report of the Normal College, for the year ending December 31, 1899 New York, 1900, p. 20.

² Compare the data given in Part I and in the closing section of this part.

IV. The Lutheran Normal School in Seward, Nebr.

V. The Lutheran Normal School in Elmhurst, Ill.

The first-mentioned institution deserves special consideration, not only because of the announcement made, but because of its great influence despite its modest size. Its history illustrates, at the same time, the action of the German Teachers' Association, which purposes to advance "mere teachers of language to become representatives of German methods and agents of German culture in America."

In the year 1874, at the fifth annual meeting, it was unanimously resolved to establish the seminary on the foundation of the present high status of the art and science of education. A special "Seminarverein" was constituted to promote the agitation and collect a "German national subscription fund" of \$50,000 to \$100,000. The first general meeting was held in Milwaukee in 1877, and, though it possessed not much more than one-fifth of the prospective large "national fund," the opening of the institution was set for September 1, 1878. The "German-English Academy" in Milwaukee offered a suitable building for the beginning of the normal courses. According to the prospectus, this institution aims to educate thorough and zealous teachers, able to teach in German as well as in English, familiar with the most recent progress in pedagogics, and trained to present their own knowledge to pupils in an appropriate manner. For this purpose the school is provided with the best trained teachers, excellent appliances for instruction and accommodations, and a model school in the flourishing German-English Academy. By its connection with the athletic training school of the Nordamerikanischer Turnerbund, students enjoy the advantage of perfecting themselves in all branches of physical culture. There is likewise a normal course for kindergartners.

In the years 1878 to 1880 there were 500 applications, of which only 119 could be considered. The majority of the applicants could not support themselves during the three years required for their training. The rejection of applicants on account of lack of means was the more painful to the directors of the institute, as there were seldom more than twelve students during the time specified; the results obtained with these, however, were very satisfactory. Professor Rosenstengel, of the State University of Wisconsin, asserted that "nearly all the students are practically educated teachers, familiar with school and educational methods, thoroughly acquainted with the knowledge needed in their profession, and fully imbued with the necessary enthusiasm. All are enthusiastic advocates of the preservation of the German language and the dissemination of German pedagogics, and most of them are filled with a spirit of the purest devotion to the great tasks of modern education."

Such circumstances necessitated the foundation of a scholarship, and an appeal to Germans received a rather favorable response. After the Woman's Association of Cleveland and the members of the Seminarverein set the good example, New York contributed large amounts. This city formed the central association of the normal school foundation of New York and vicinity, which contributed \$2,000 in individual amounts to the fund; the Hermann Uhl memorial fund, founded by Madame Anna Ottendorfer in New York, contributed \$10,000.

In the year 1886 the German-English Academy turned over all its property free of cost to the institution, which assumed the mortgage debts; thus it came into possession of a building of its own. The efforts of Director J. Keller to remove the school to New York, where it could enjoy a larger attendance, were consequently in vain. Mr. Keller resigned and Mr. Emil Dapprich at once succeeded him, in 1888. The annual attendance of the seminary since its establishment has averaged 36 to 39.

The financial condition of the institution is very satisfactory, its property amounting to \$140,000 in 1900. Every year a benefit play is given in the Pabst Theater of Milwaukee for the scholarship fund. The students collected a fine herbarium

of 5,000 plants in 23 books for the department of education at the last Paris Exposition.

The programme of action followed by Mr. Dapprich is short and expressive: "The preservation and care of the German language, the promotion of national education, and the dissemination of sensible pedagogical ideas."

On his visits to the seminary in the years 1897 and 1900 the author received the impression that this excellent programme was being successfully carried into effect.

V. PAROCHIAL SCHOOLS.

According to the statistics of the German Teachers' Association, nearly half of all pupils studying German belong to Catholic, Lutheran, or Evangelical parochial schools. Although it is impossible to give these the attention which they deserve, they can not pass altogether unnoticed.

In the first place, it must not be forgotten that parochial schools two hundred years ago first introduced German instruction and laid the foundation of the present proud structure. This honor can never be taken from them, and their traditions will not be lost in never so long a course of development.

Superintendent Knortz has given a not very alluring account of the present condition of parochial schools in his article on German Nationality in the United States. His views are of great interest, even if, as a former speaker of a free religious society, he may not have regarded affairs impartially. He writes:

German parochial schools are found in all parts of America where orthodox German communities exist. Religion forms the main branch of study and is taught in German, consequently pupils join the German parish of their parents. More German is taught in parochial than in public schools and less time is given to English. Very little is done for the spread of German literature and science, and as the teachers have for the most part been educated in synod seminaries, and are prejudiced against the classical writers of Germany, the greatest attention is given to the study of the catechism and Bible history. Parochial schools, therefore, are of minor importance from the point of view of general culture. The ministers educated here have no sympathy for German literature, and since they are more American at heart than German, it costs them little effort to conduct religious services in English instead of German. Their excuse is that the English language is better understood by the rising generation, and is consequently preferable.

The Missouri Synod, a fifty-year-old organization of strict Lutheran congregations in the States of Indiana, Ohio, New York, Illinois, Missouri, etc., claims the merit of unremitted and decided action for the preservation of German nationality.

There is an unusually large number of well-organized higher educational institutions of the Lutheran church in America for the education of ministers and teachers. Among them are a theological seminary in St. Louis, a theological seminary in Springfield, Ill., a complete gymnasium in Fort Wayne, Ind., another in Milwaukee, an under gymnasium in St. Paul, Minn., in Concordia, Kans., and in Neperan, N. Y., a normal school in Addison, Ill., the lower division of a normal school in Seward, Nebr., and the Walther College, of St. Louis, named after the renowned scientific and religious champion of this German church organization, Prof. Charles Ferdinand William Walther (born in Saxony in 1811, emigrated in 1839, and died in St. Louis in 1887). Sixty highly educated professors are engaged at these schools.

Within the districts of the Missouri Synod there are, besides, 19 charitable institutions, orphan asylums, homes for the aged, hospitals, etc. Its own publishing house, with an immense printing establishment, in St. Louis provides devotional and instructive works and has become noted in the whole Lutheran world by its beautiful edition of the complete works of Luther.

Among the conditions which govern admission to the synod and control a continuance of association, the constitution mentions: "The sole use of the German language in regulations." In the spirit of its constitution, the Missouri Synod states in one of its recent announcements: "We exhort all German Lutheran parents to afford their children every possible opportunity to acquire a sufficient knowledge of our beloved mother tongue by sending them to German schools and by speaking the German language at home."

In this spirit, likewise, the higher and other schools are conducted. With just pride the Lutheran Rundschau states in one of its recent numbers:

"Much is said of the duty of German nationality in behalf of the culture of the American people. Among those who have labored most zealous'y for fifty years to fulfill this duty, the German church of America ranks first and the Missouri Synod stands forth preeminent. What it has done, and continues to do, for the advancement of German manner and nature in the best and noblest sense of the terms deserves general esteem and recognition. Its congregations, teachers, and ministers are German—even those of the second and third generations living in this country—and by German religious services, as well as by German instruction in schools, German consciousness, German thought is preserved, harbored, and nurtured among them. The synod provides in a truly German way for the spread of German education, without degenerating into bigotry and with a full consideration of the demands which the peculiar relations of this country make upon it. Most of the numerous journals edited by it or published within the limits of its jurisdiction appear in the German language and contribute, in every respect, toward the preservation of German method and thought."

All this sounds very encouraging, but we must not forget that already evening worship in several communities is conducted in English and that the Missouri Synod is a fully armed opponent of all intellectual progress which is not in harmony with the inexorably strict doctrine of its church. The German nationality of that organization is therefore nothing more than extreme Lutheranism.

The General Synod, a union of less strict Lutherans, on the other hand, believes that the exclusive use of the German language jeopardizes their influence; and, consequently, so that its ministers shall lose no hearers, it commands them to use the English language in churches and Sunday schools wherever children have lost the knowledge of German.

In the official organ of the synod, the Lutheran Church Friend, published in Chicago, a minister in a small city of Nebraska writes under the date March 19, 1896:

"As far as the language is concerned, it is a general fact that children want to speak English, and when they attend English day schools they do not even learn to understand German properly. Even when German is spoken in the family children have only the barest knowledge of the language, of literature, and of religion, and if they understand it lose all interest, because they can not express themselves fluently. The consequence is that children attend other schools and gatherings and are lost to their own church.

"I am sincerely sorry to be obliged to make such comments. I know families in which disagreements have risen between parents and children on this very account.

"The parents desired to remain German and be faithful to their own church, but the children felt a greater attraction toward other churches simply because of the language. In other cases German children become careless in regard to religion, as though Christianity were meant only for old persons. As excellent as it is, and as correct as its doctrine may always have been, German church work is not practical for the rising generation in America. We shall be a factor as long as the older generation survives. After it has departed German churches will be a thing of the past.

"If our communities would occasionally hold services in English, so as not to leave the impression that Lutheranism and German nationality are identical, the young would be much more closely united with them and be a surer element of the church. Versatility of language is one of our very advantages. The Lutheran Church is represented in 75 languages or dialects. Then why should we adhere so religiously to German? Where it is understood and properly used the German language is magnificent—I may say incomparable in its magnificence, but where such is not the case disputes and command avail nothing. Thou shalt speak German! The truth is that children born and raised in America do not love German. Then why should we torment ourselves? Our churches are not dealing with German nationality, but with Christianity."

The German Catholics of America have frequently referred to the advantages which they have gained by preserving German nationality in their parochial schools, founded and sustained at a great sacrifice of money. The Catholic Church in America is chiefly under the influence of Irish bishops, who have no predilection for the German language. It often happens that a parish established by Germans is placed in charge of an English-speaking Irish priest without the Germans making any objection. Any opposition would be unavailing, as each bishop is the lawful owner of the churches and schools within his diocese and can close them at any time.

In May, 1897, the Pope issued the following ordinances:

"I. American-born children whose parents speak a language other than English are not bound, after they are grown, to be members of the same parish to which their parents belong. They have the right to attach themselves to a parish in which the language of the country, English, is spoken.

"II. Catholics not born in America, but conversant with the English language, have the right to attach themselves to a parish in which the English language is made use of, and can not be compelled to subject themselves to the jurisdiction of a pastor whose church has been built for those who make use of a foreign language."

From this it is to be understood that the intention of Rome is to make English the sole language of the Catholic Church in America as soon as possible.

Parishes making use of a foreign language are only supported temporarily, and will be suppressed as soon as the conditions which made their foundation necessary will have changed.

These ordinances provoked great resentment among the German Catholics of several cities, and they protested strongly against them in meetings. At a meeting of German Catholics held in June, 1897, in Detroit, Mich., the following resolutions were adopted:

"The German Catholics of Michigan are faithful, law-abiding citizens of the United States, ready to sacrifice life and property for this Republic. As loyal citizens of these free States we protest against all measures which are prejudicial to the German language, German customs, German faithfulness and honor.

"At the same time we raise a loud protest against the presumptuous attempts of certain Catholic nativists to lower Germans to Catholics of second grade, divide their parishes, and gradually absorb them.

"A systematic suppression of the German language and German thought is a constant menace to the Catholic Church in America, which has developed to a high degree of prosperity through European immigration. We consider the introduction of a false, unjustifiable nativism into religion a fatal error, that portends the worst consequences for the continuance and development of the church."

The personal impressions of the author have been that those who superintend the schools are more concerned about the preservation of the German language than would be supposed from the report of Knortz. During one of my Western trips¹ I went to the town of Waverly, which has about 4,000 inhabitants and is the county seat of Bremer County, in the northeastern part of the State of Iowa. The prairies between the Mississippi and Missouri are, in general, not more attractive than the heath of Lüneburg. The valley of the Red Cedar River, however, affords a pleasant break to the endless monotony, and so the friendly town of Waverly leaves the impression on the traveler who has reached the hills that border the river's course as being an oasis in the desert. A very broad avenue cuts through the town. Following this to the northwestern end of the city, we come to a group of buildings surrounded by beautiful grounds, the foremost structure bearing the inscription "Wartburg College," in large letters. I visited the school, and Director F. Lutz kindly conducted me through it. The institution is partly an "academy" for general study and partly a "seminary" for such members of the Evangelical Lutheran Church as desire to become teachers. If they are to continue in the service of the synod at least five years they enjoy a reduction of expenses to the astonishingly low terms of \$3 a week for board and \$40 a year for lodging, instruction, heat, and light. As regards German instruction, the prospectus states:

The German language may justly be considered the key to all possible classical treasures of science and literature. Besides, a knowledge of German is just as practical for the purposes of a business man as for those of a man of letters. A young man who is able to speak German, together with the language of the country, enjoys great advantages over his competitors, whatever his occupation may be. The institution offers special advantages to those who intend to make a thorough study of German. German is taught as a living language; that is to say, pupils learn not only to read and write it correctly, but to speak it. Besides grammar, orthography, composition, and translations from English, great stress is laid upon reading the best German authors.

¹The account which follows is taken from an article by the author in a New York paper of November 25, 1900.

This programme can certainly be approved, and the reputation which the "Wartburg" enjoys beyond the limits of the State is well deserved. I also visited Prof. August Engelbrecht, the head teacher next to the director, and a member of the board of administration, Pastor Br. Lobeck, in Knittel. With both of these gentlemen I found true German thought, and, what is to be doubly appreciated in this temperance State, true German hospitality. Such Lutheran communities adhere strongly to German nationality. In the city of Clinton, Iowa, there is another "Wartburg College," conducted on the same lines.

From Deindörfer's History of the Evangelical Lutheran Synod of Iowa (Chicago, 1897) we learn that there are different kinds of Lutheran parochial schools. Very few are open the whole year. Most of them are open only during the winter session, and the instruction given is little more than a preparation for confirmation. The author states (page 271): "The schools are accordingly mostly attended for two or three winters by the older children that are going to be confirmed. Instruction is limited to the most necessary branches, and much time is given to religion." As a matter of course such schools can do little, but German institutions like the "Wartburg" are of the same significance to them as were the castles of the Middle Ages to feudal life.

According to the investigations of the German Teachers' Association, Catholic schools have almost twice as many pupils (193,627) as have the Lutheran (85,984) and the Evangelical (19,880). As Zimmermann states,¹ Catholic colleges have given a proper degree of attention to modern languages from early times. He says of the St. Louis University, in St. Louis, Mo.: "The college was recognized as a State university in February, 1833,² and received all the usual privileges. The Jesuits responded so unreservedly to modern demands that they admitted students unacquainted with the classical languages to the academic grades. Most Catholic colleges," Zimmermann continues, "have a scientific course of four years. The first three years correspond to the first three years of the classic course, although modern languages, natural sciences, and bookkeeping take the place of the classical languages."

German instruction accordingly possesses a firm support in Catholic parochial schools. German Catholics in this country have repeatedly announced their firm purpose not to give up their mother tongue. As a companion to the resolutions adopted by the Catholics of Michigan in 1897, the resolutions passed by the Union of the Catholic Associations of Illinois deserve to be mentioned:

Our love for our adopted country is not lessened by our clinging to German methods implanted in us by God himself. It rather enables us to give our service more unselfishly to our glorious Republic in all things affecting its prosperity. As peaceable citizens we desire peace and despise from the depth of our hearts the instigations of a mercenary press that is endeavoring to separate friendly nations.

As the representatives of 30,000 Catholic German men of this State we hereby declare that the honor of the German name, the preservation and care of the German language and the justifiable interests of the German element in the United States are and ever will be dear to our hearts. It is always the German Catholic who is first assailed by the machinations of nativists, and stands in the front line of battle when there is question of the equal rights granted to all citizens by the Constitution.

In this struggle we are one with the German Catholic State organizations of all other States of the Union, and we are glad when other German-American associations unite with us.

German Catholics in this country are, therefore, sure to be the last to give up German instruction. When it is no longer continued in public schools they will provide for it in their own parochial schools.

¹ Chapter on Catholic Schools in his treatise on Universities in the United States of America.

² St. Louis University was incorporated by the legislature of the State of Missouri by an act of December 23, 1832. This evidently is what the author means.—Ed.

VI. ASSOCIATION SCHOOLS AND PRIVATE SCHOOLS FOUNDED BY INDIVIDUALS.

In proportion as German was introduced into public schools, elementary and intermediate, German schools founded by German associations and individuals steadily decreased. Their number has rapidly lessened in the last ten years. At present there are hardly more than a few hundred throughout the States. Knortz, Dapprich, and many others are of the opinion that the illiberality of wealthy German-Americans has more to do with the decadence of German private schools than the change in the public-school curriculum. To quote again from the article by Dapprich: "Intelligent persons of means, who foolishly spend large sums of money on luxury, send their children to overcrowded public schools to save the moderate tuition fee of a private school."

These censurable motives may be true in single instances; on the whole, however, it is to be hoped that intelligent parents send their children to public schools from principle, and therefore strive more earnestly to have German instruction introduced and the "Quincy methods" adopted. The reasons why sons of foreign-born citizens should attend American schools have already been given. Specifically German schools in this country are only justifiable where public schools do not give what parents have a right to expect, and do not pay sufficient attention to German.

According to the investigations of the teachers' association, only 35 private schools had 100 pupils and more; of these but 8 had an attendance of 200 or more. The 871 schools reported in the statistics had an average attendance of only 21 or 22. Consequently, German schools of this order in America have no further prospects; the possibilities of the development of German instruction in American schools, on the other hand, are practically unlimited.

From a consideration of European influences on the formation of American educational conditions, it is evident that Americans regard everything foreign with a certain mistrust; in single instances this is more or less justifiable. However, they willingly accept all progress which proceeds from the Old World after it has been adjusted to American conditions by suitable intermediaries. The self-consciousness of a great nation is not hurt by the circumstance that what has been done by other nations in the way of culture is in this way assimilated, but it resents being taught by others. The fact is thus understood that German schools in America are losing ground, though the demand for German instruction is steadily increasing. The schools of the German immigrants had a great cultural mission to perform, but in the main this work has been done; and so teachers of German schools will help the cause of German instruction decidedly more if they give their energies to American schools.

Besides, the American and the German comprehension of the main purpose of schools is sometimes essentially different. Public schools are intended to educate their pupils for practical life, and not to spread higher education. Therefore it is important to follow the American maxim, "practical above all," more than the estimable German motto, "always thorough."

The following are particularly flourishing German schools: Hoboken Academy, Hoboken, N. J., in existence forty years, present director Dr. Kaiser; the Beacon Theological German-English School, the German-English Presbyterian School, the German-English School, and the First Ward German-English School, in Newark, N. J.; the Adelphi Academy, in Brooklyn, N. Y.; the School of Free Congregations, and the Concordia Seminary, in St. Louis, Mo.; the General German School, in Lawrence, Mass.; the Normal Seminary, in Addison, Ill.; the Proseminary, in Springfield, Ill., and Concordia College and German-English Academy, in Milwaukee. The last-mentioned institution celebrates its fiftieth anniversary this year and has a long life before it. All these institutions have a full force of excellent teachers,

and their many graduates are interested in their continuance and provide for attendance.

Among smaller German schools the author became well acquainted with Hertzog's German-American School, in Philadelphia, from occasional visits. The object of this school is to furnish a thorough and practical German and English education. The school comprises three departments, the primary, intermediate, and senior. The term of study in each of these departments is two years. The course of instruction embraces object lessons, German and English (reading, orthography, comparative grammar, composition, elocution, literature), French, arithmetic, history, geography, natural history, algebra, geometry, penmanship, drawing, and singing.

As this school has been prospering for twenty-five years it must supply a deeply felt want. Of all the important cities in America Philadelphia pays the least attention to German, excepting, of course, the university. If there were a large opening for German private schools anywhere, one would suppose it to be in that city; but such is not the case. There is but one large female school (Miss Stevens's School, in Germantown), and that numbers 200 pupils.

VII. SUMMER AND NIGHT SCHOOLS, KINDERGARTENS, AND INSTRUCTION IN ATHLETICS, SINGING, AND MANUAL TRAINING.

According to Professor von Holst, Chautauqua is the greatest wonder in America, except Niagara Falls.

Chautauqua is a place on Lake Chautauqua, in southwestern New York. It is a popular educational resort during the months of July and August for several thousand people, who go there from all parts of the country to hear lectures and music, to attend class courses of instruction, to enjoy college life and open air. Chautauqua is a well-nigh deserted village during nine months in the year, but in the summer season it has a cottage and hotel population ranging from 3,000 to 19,000 people. It is a kind of educational Bayreuth for the people.

Herbert B. Adams, in the monographs on education in the United States, thus describes this wonderful summer school, which has been formed, in connection with a former Methodist camp meeting, on one of the most beautiful spots on earth. We must refer to it because German is taught in its college of liberal arts. The central school, 25 years old, and the 300 branches established in nearly all the States of the Union, have a "School of modern languages," as has likewise the Catholic Summer School of America, at Plattsburg, N. Y., on Lake Champlain. The peculiarly American "Chautauqua idea," promoted by a monthly magazine, *The Chautauquan*, includes the study of modern languages, and has probably made a large number of persons acquainted with German language and literature. President Harper, of the University of Chicago, was for some years principal of the Chautauqua central school.

Many universities, as Harvard, Cornell, Columbia, and New York, have instituted summer schools. The courses of study of these university summer schools also include German. It seems that ample opportunity is thereby afforded to Americans to become familiar with German literature, which is the main purpose of the study of German; pupils are required to have an elementary knowledge of the language before entering.

The course of study of the summer school of New York University in the department of Germanic languages may serve as an example:

In this department work is arranged to meet the wants of two classes of students—those who desire to get or to broaden a somewhat elementary knowledge of German, and those who, already possessing a good knowledge of the modern language and literature, desire to increase this by a study of some of the older Germanic dialects, or by a careful investigation of some important literary period. This last class of work is especially for teachers of German. All courses five hours weekly.

For the first the following courses are arranged:

Beginners' course in German.—The work in this course will comprise a rapid survey of the important parts of the grammar, the reading of some easy and interesting stories, and as much practice in conversation as the time allows.

Advanced course in German.—The work in this course will comprise a careful study by the students of some piece of classical literature, and lectures by the professor upon the literary period immediately concerned. This year selection may be made by the class from the following: Goethe's Tasso, Götz von Berlichingen; Lessing's Minna von Barnhelm, Emilia Galotti; Schiller's Jungfrau von Orleans and Maria Stuart.

As much time as possible will be given to conversation. The leading methods of teaching modern languages will be discussed and illustrated.

For the second the following courses are arranged:

Elementary course in Gothic.—Daily recitations from Braune's Gotische Grammatik and reading of selections from the Gospels.

Elementary course in Old High German.—Daily recitations from Braune's Althochdeutsche Grammatik and readings from Braune's Althochdeutsches Lesebuch.

Elementary course in Middle High German.—Daily recitations from Paul's Mitelhochdeutsche Grammatik and reading of Der Arme Heinrich.

Advanced course in modern German prose.—Two of the important novels that have appeared during the last ten years will be read and discussed.

What summer schools afford to the middle classes, night schools give to the working classes free of cost. They are supported partly by cities and partly by associations. The German-American School Association of New York, for instance, aims to preserve the German language in the city of New York by promoting German instruction and supporting German classes for children of impecunious German-Americans. Among the associations which thus promote German instruction among the people, German athletic associations rank first in order. Besides devoting themselves to physical development, they pay great attention to "mental culture," and support classes therefor that are held in their own halls; at night for adults and on Saturdays and Sundays for children. The large Philadelphia Athletic Association supports a Saturday school of several classes in Philadelphia, and the turners of Southwark have introduced a similar institution for Sundays. In New York similar schools founded by athletic associations exist.

German labor unions support the same kind of German schools in different places; one of their Sunday schools is located in Philadelphia. A competent judge states that "laborers of all kinds and every degree of education instruct, well or badly, as the case may be, young American-born Germans in the most necessary branches of study."

Nearly all of these schools possess small German libraries, by means of which their pupils can, in the course of time, acquire some knowledge of German literature. The desire for learning is generally much stronger among the laboring than among the middle and higher classes, which strive after the "mighty dollar" alone and make all things else subservient to that interest.

As far as kindergartens are concerned, Froebel's celebrated prophecy, in his standard work on education (page 333), that his system would be thoroughly understood and properly appreciated only in America, is being verified to a greater extent every year. Americans are much more enthusiastic over "kindergarten-ing" than the Germans themselves, among whom the "nemo propheta in patria" is again confirmed. Boone states, in his remarkable essay, *The Renewal of Life*, that Mrs. Carl Schurz opened the first kindergarten in America, in Watertown, Wis., in 1855. Through her Miss Elizabeth Peabody became acquainted with the idea, and followed her example in Boston in 1860. However, it was only after she had learned, in Germany, to know the methods applied there and had seen the results thereby attained that the editress of the *Kindergartner Guide* became the pioneer of this system of pedagogics in America, as was Madam von Marenholtz-Bülow its champion in Germany. Kindergartens have existed in Hoboken since 1861, and in New York since 1864. Dr. Harris exerted his efforts to introduce

them in St. Louis, and published an interesting account in his reports for 1876 and 1877 on the results of the kindergarten in St. Louis. At present kindergartens are firmly established in all parts of the country and are enjoying steadily increasing favor.

Special praise is due to American pedagogical literature for its untiring and energetic promotion of Froebel's ideas. This is done in the full consciousness that German methods of instruction are, in this way, brought into American schools. The following statements from the preface with which Dr. Harris introduces Hailmann's translation of Friedrich Froebel's Education of Man serve as a proof:¹

This work of Froebel admits us into his philosophy and shows us the fundamental principles upon which he based the kindergarten system. His great word is *inner connection*. There must be an inner connection between the pupil's mind and the objects which he studies, and this shall determine what to study. There must be an inner connection * * * within the soul that unites the faculties of feeling, perception, phantasy, thought, and volition, and determines the law of their unfolding. Inner connection is in fact the law of development, the principle of evolution, and Froebel is the educational reformer who has done more than all the rest to make valid in education what the Germans call the "developing method."

It was logical to expect that the educational system which was so ready to accept kindergartens would make room for German manual training instruction in public schools. Wherever it has been introduced, it has succeeded so well that it may be justly considered a permanent feature of the American educational system. In the years 1867 and 1868 Andrew D. White made a study of German industrial schools with a view to their introduction in America, a step which has, in the meantime, been successfully taken. It may be opportune to mention that Steuben himself recommended the founding of the military school at West Point, though he did not live long enough to see it carried out.

Athletics, which have attained a stage of perfection in the college gymnasiums in decided contrast to the modest German beginnings, and for which Americans are to be envied, are an essential outcome of German influence on American education. The fame of these improvements, which deserve to be imitated by Europe, can not be taken from America; still the impulse of their action undoubtedly proceeded from Germany.

Thomas Wentworth Higginson expresses himself² on this point as follows:

The history of modern gymnastic exercises is easily written. It is proper to say modern, for, so far as apparatus goes, the ancient gymnasiums seem to have had scarcely anything in common with our own. The first institution on the modern plan was founded at Schnepfenthal, near Gotha, in 1785, by Salzmann, a clergyman and the principal of a boys' school. After eight years of experience his assistant, Gutsmuths, wrote a book upon the subject, which was translated into English and published at London in 1799 and at Philadelphia in 1800, under the name of Salzmann's Gymnastics. No similar institution seems to have existed in either country, however, till those established by Voelckers in London in 1824, and by Dr. Follen at Cambridge, Mass., in 1826. * * * It is the Germans and the military portions of the French nation chiefly who have developed gymnastic exercises to their present elaboration, while the working out of their curative applications was chiefly due to Lingg, a Swede. In the German manuals—such, for instance, as Eiselen's Turnübungen—are to be found nearly all the stock exercises of our institutions.

A practical educator, Superintendent Philbrick, of Boston, expressed himself concerning the introduction of gymnastic training in the following manner:

For more than sixty years gymnastic training has constituted a prominent element in Prussian school education. Jahn, the great early promoter of physical training in Prussia, is now justly reckoned among the benefactors of his country, and, in recognition of the benefits of his labors, a noble statue has been erected to

¹ Friedrich Froebel, The Education of Man, translated by W. N. Hailmann, superintendent of public schools at Laporte, Ind. The International Education Series, No. 11.

² In his Outdoor Topics, p. 142-143.

his honor in Berlin. In Berlin gymnastics have been longer and more generally cultivated, perhaps, than in any other city. In that city there has existed for a long time a large and well-appointed government establishment for the training and preparation of teachers of gymnastics for the public schools. Although Vienna has been comparatively tardy in adopting this educational improvement, she now probably surpasses all other cities in respect to liberality of provision for gymnastics. In every recently erected school edifice, whether for elementary or secondary schools, the spacious and lofty gymnastic hall, with adjacent wardrobes and other accommodations, is provided. There are at present 110 special teachers of gymnastics constantly employed by the city in public schools. The educational authorities of Vienna are fully justified in their large expenditures for the physical training in view of the acknowledged advantages which have been derived from it in northern Germany.

In speaking of physical training in the German schools, Matthew Arnold says: "The teachers (of gymnastics) profess to have adapted their exercises with precision to every age and to all stages of a boy's growth and muscular development. If boys have long work hours or if they work hard, gymnastics probably do more for their physical health in the comparatively short time allotted to recreation than anything else could. In England the majority of public-school boys work far less than the foreign schoolboy, and for this majority the English games are delightful; but for the few hard students with us there is in general nothing but the 'constitutional,' and this is not so good as the foreign gymnastics."

In the German and Austrian schools gymnastic training is not provided for boys alone. Girls also receive the benefit of regular physical exercises especially adapted to the different stages of their muscular growth. I have long been impressed with the lamentable defect of our city systems of schools in respect to physical education. After seeing what has been done for this essential branch of education in Vienna and Berlin, our own deficiency in this respect seems tenfold more glaring. A radical reform is needed. Fourteen years ago I began my efforts to introduce into all grades of the Boston schools "a thorough system of physical training as a part of school culture." Some progress has been made in this direction. For some years the programme has required daily physical exercises in the schools, but as yet our provisions for physical education are very inadequate. So far as I know, there is not a single special, thoroughly qualified teacher of gymnastics employed by any city in America. To my mind, nothing is more certain than that the highest success in intellectual education can be reached only by the aid of the most thorough system of physical training.¹

Twenty-seven years have passed since Philbrick delivered this speech, and in that time athletic instruction in schools has made great progress. In many States German societies, in union with the German press, are striving for its introduction, and in Pennsylvania, Ohio, and California their efforts recently have been successful. Much work remains to be done before the physical development of the young throughout the country will approach the ideal of "mens sana in corpore sano," as in most colleges. Even many New York schools² lack advantages for athletics or conduct the exercises in localities without proper hygienic arrangements.

Finally we come to singing, that may boast of unquestionable German origin. Knortz states:³

The introduction of athletics and music in public schools is due exclusively to German-Americans. Before the immigration of 1848 Americans considered the study of music an unpardonable waste of time. At the present day, however, all cities have their singing societies that frequently excel the German, because Germans usually join such societies for social amusement, whilst Americans, without exception, become members only to study music.

Many of the teachers of athletics and singing have been educated in the German-American Normal Seminary of Milwaukee, which has an excellently conducted normal course in athletics. Instruction for the most part is, therefore, in charge of

¹ From an address by Hon. J. D. Philbrick, of Boston, on "Systems of public instruction in European and American cities compared," given at the meeting of the department of superintendence of the National Educational Association at Washington, January 30, 1874.

² For instance, the College of the City of New York, which will not have a gymnasium until it occupies its prospective new building.

³ Das Deutschtum in den Ver. Staaten, pages 77 and 78.

German teachers. Consequently it is not to be wondered at if American school children sing German songs. It has often occurred that at large reunions of singing societies and similar occasions all the school children have sung *Die Wacht am Rhein* in public with great applause. By singing songs in German, English-speaking children acquire a small German vocabulary. At a German teachers' meeting a teacher told the author that he always taught his English-speaking pupils how to sing a number of easy German songs, and with the few words thus remembered he was able to advance them.

Independently of the schools mentioned, many opportunities are afforded for learning German, as, for instance, in the Berlitz schools of modern languages. To what extent the Chautauqua Literary and Scientific Circle, which was incorporated in 1883 as the Chautauqua University, the Correspondence University, Ithaca, 1883, and numerous similar educational agencies, devote themselves to the German language and literature, could, unfortunately, not be ascertained.

VIII. STATISTICS OF GERMAN INSTRUCTION.

The "committee for the care of German," appointed by the German-American Teachers' Association, has recently published the following:¹

Number of pupils studying German in the schools of the United States.

	Universities.		Public high schools.		Public elementary schools.		Catholic schools.	
	Number.	Pupils.	Number.	Pupils.	Number.	Pupils.	Number.	Pupils.
New York and New Jersey	13	2,750	150	8,448	5	68,506	56	15,703

¹ The Present Position of German Instruction in the Schools of the United States (no date).

These statistics suffer from the same fundamental defect that vitiates all efforts in this direction, to wit, incomplete data. Furthermore, although the investigations were made only about two or three years ago, such progress has since been made that the figures given are far too small to show present conditions. We shall endeavor to add an estimate to these statistics that corresponds better with the position of the subject at the close of the century.

The term "universities" in the above table includes colleges also. The committee refers to 93 "universities," of which only the following 83 are mentioned by name in the pamphlet (pages 46 and 47):

Number of students of German in higher institutions of learning.

Location of institution.	Name of institution.	Professor.	Students of German.
Cambridge, Mass	Harvard	Kuno Francke	1, 100
New Haven, Conn	Yale	A. H. Palmer	750
Madison, Wis	State University	W. H. Rosenstengel	590
Hanover, N. H	Dartmouth College	W. G. Stoughton	510
Berkeley, Cal	State University	Albin Putzker	500
Stanford University, Cal	Leland Stanford Junior University	Julius Goebel	494
Syracuse, N. Y	Syracuse University	F. J. Holzwarth	450
Lincoln, Nebr	State University	Laurence Fossler	430
Princeton, N. J	Princeton University	Willard Humphreys	407
Minneapolis, Minn	State University	John G. Moore	400
Ithaca, N. Y	Cornell	H. S. White	400
Boston, Mass	Boston University	Marshall L. Perrin	360
Iowa City, Iowa	State University	Chas. Bundy Wilson	350
Wellesley, Mass	Wellesley College	Carla Wenckebach	318
New York, N. Y	College of the City	Adolph Werner	300
Lafayette, Ind	Purdue University	G. L. Swiggert	300
Chicago, Ill	University of Chicago	Starr W. Cutting	300
Delaware, Ohio	Wesleyan University	W. W. Davies	260
St. Louis, Mo	Washington University	Otto Heller	250
Evanston, Ill	Northwestern University	J. T. Hatfield	250
Bloomington, Ind	Indiana University	Gust. E. Karsten	240
Philadelphia, Pa	University of Pennsylvania	M. D. Learned	210
Greencastle, Ind	De Pauw University	Henry B. Longden	210
Lawrence, Kans	University of Kansas	W. H. Carruth	200
Columbus, Ohio	Ohio State University	Ernst Eggers	190
Columbia, Mo	University of the State of Missouri	Ben. F. Hoffman	187
Champaign, Ill	University of Illinois	L. A. Rhoades	175
Williamstown, Mass	Williams College	Geo. M. Wahl	175
Middletown, Conn	Wesleyan University	Albert B. Faust	175
Poughkeepsie, N. Y	Vassar College	Ottile Herholz	175
Mount Vernon, Iowa	Cornell College	Francis A. Wood	150
New York, N. Y	Columbia College	Wm. H. Carpenter	150
Tufts College, Mass	Tufts College	Chas. E. Fay	150

Des Moines, Iowa	Drake University	Gerh. J. Zepfer	68

Number of students of German in higher institutions of learning—Continued.

Location of institution.	Name of institution.	Professor.	Students of German.
Chapelhill, N. C.	University of North Carolina.	Walter D. Toy.	60
Appleton, Wis.	Lawrence University.	Mabel Eddy.	60
Athens, Ohio.	Ohio University.	Kate Cranz.	56
Holton, Kans.	Campbell University.	G. A. Hoffmann.	50
Knoxville, Tenn.	University of Tennessee.	J. B. Henneman.	50
University, Ala.	University of Alabama.	Wm. A. Parker.	50
Athens, Ga.	University of Georgia.	John Morris.	50
Granville, Ohio.	Denison University.	W. A. Chamberlin.	40
Georgetown, Tex.	Southwestern University.	R. F. Young.	36
Salt Lake City, Utah.	University of Utah.	Geo. R. Mathews.	36
Columbia, S. C.	South Carolina College.	Edw. S. Joynes.	30
Laramie, Wyo.	University of Wyoming.	Irene M. Morse.	23
Lexington, Va.	Washington and Lee University.	W. S. Currell.	25
Tiffin, Ohio.	Heidelberg.	Alf. K. Zembrod.	25
Salem, Oreg.	Willamette University.	Minnie Frickey.	24
Lincoln, Ill.	Lincoln.	C. Everett Conan.	15
Williamsburg, Va.	College of William and Mary.	Chas. E. Bishop.	20
Lebanon, Tenn.	Cumberland University.	J. D. Hinds.	20
Nashville, Tenn.	Fisk University.	C. W. Dunn.	20
Urbana, Ohio.	Urbana University.	S. Alice Worcester.	18
Lewisburg, Pa.	Bucknell University.	F. Loomis.	12
Lexington, Va.	Military Institute.	T. M. Semmes.	12
Blacksburg, Va.	Virginia Agricultural and Mechanical College.	T. P. Campbell.	10
Richmond, Va.	Richmond College.	F. W. Boatwright.	16
Lecompton, Kans.	Lane University.	R. W. Bahner.	10

The ten institutions may have been omitted on account of the small number of their students, those mentioned numbering 14,365 of the total, 14,698. However, this inference is only a hint for determining the important point as to how many were not mentioned because they have no German department, or were omitted only because no answer was received.

As regards the 83 given, the attendance of the following, as ascertained by the author from more recent reports, differs from that stated above:

	Report figures.	Later figures.	Difference.
Harvard	1,100	1,200	+100
Yale	750	750	-----
Wisconsin University	560	560	-----
California University	500	550	+ 50
Leland Stanford Junior University	494	600	+106
Nebraska University	430	554	+124
Princeton University	407	407	-----
Minnesota University	400	450	+ 50
Cornell University	400	511	+111
University of Chicago	300	400	+100
Washington University	250	400	+150
Northwestern University	250	400	+150
University of Pennsylvania	210	325	+115
Vassar College	175	250	+ 75
Columbia College	150	400	+250
Johns Hopkins University	125	105	- 20
New York University	80	160	+ 80

This statement includes, with the exception of Michigan, the 13 most important and 4 other first-grade institutions. In them the former number amounted to 6,581; the revised number amounts to 8,122, consequently an increase of 1,541, or almost 24 per cent.

In the report the University of Michigan, with 800 students studying German; Columbian University, with 108; and Hamilton College, with 45, are not mentioned.

The total, 933, together with the above difference of 1,541, added to the report number of 14,698, makes a present total of 17,192 students of German for 96 colleges and universities.

As these 96 institutions are undoubtedly the largest in the country, not too high a number should be estimated for the others; but as there are four times that number of institutions, a total of 7,800 additional students of German is hardly too optimistic an estimate. The consequent result would be 25,000 students of German for the first-grade institutions of the country, a supposition that can not be very far from the truth.

There are official statistics for secondary schools. During the last seven years, from 1891-92 to 1897-98, the number of pupils taking German increased almost continuously, and justifies the greatest hopes for the future.

According to official statements of the total number of all secondary students, the per cent taking German has been as follows:

	1891-92.	1892-93.	1893-94.	1894-95.	1895-96.	1896-97.	1897-98.
In public high schools	10.43	11.92	11.77	11.40	12	12.42	13.25
In private high schools and academies	14.45	15.63	15.25	16.07	17.46	18.84	18.45

This increase is considerable, and doubly remarkable because of its undeniable tendency. The absolute number of German pupils in public and private secondary schools amounted, in 1897-98, to 78,994, and must now be at least 100,000. German has attracted more pupils than French, which numbered only 58,165 pupils for the year 1897-98. Excepting the South, where, especially in Louisiana, French traditions obtain, German is preferred decidedly above French, although in some institutions the case is reversed.

The author is not able to revise further the statistics of the German-American Teachers' Association given above; independent of the data obtained for elementary schools, all material is wanting. The fact that the statistics of the Teachers' Association give for Chicago, for instance, 31,385 pupils of public schools studying German, whereas we learn from competent authority that the number is close to 45,000, proves that the association's figures referring to elementary schools should be in reality very much larger.

The statistics of the Teachers' Association cost very much money, and still more trouble, without producing corresponding results. "The figures," as Director Dapprich, who was chairman of the committee, writes, "can make no claim to being complete, as a large number of school authorities did not send the information requested. If we had received the full number of reports, the total number of pupils studying German would have far exceeded a million."

Although over 1,000,000 out of a total attendance of more than 15,000,000 is not much, it is always a number that can not be considered a "quantité négligeable." The fact is most important that the tendency is toward increase, and that the number of students studying German, especially at higher institutions, is rapidly growing. We can, therefore, say that even now the attendance at German instruction is not unfavorable.

It is remarkable that the progress of German instruction in Canada is parallel with that in the United States. According to the report of the Ontario Educational Association, the number of pupils studying different languages in the secondary schools of Ontario has been as follows:

	Pupils.	Pupils studying—		
		French.	Greek.	German.
1860	4,516	1,246	558
1870	7,451	2,850	769	a 232
1880	12,910	5,464	1,100	859
1893	23,301	13,866	1,456	6,288

The progress made by German instruction in Ontario is relatively greater than in the United States, but this branch of learning has a promising future in both countries.

PART III.—THE FUTURE OF GERMAN INSTRUCTION.

This part of the work treats of those agencies, institutions, and persons upon which and whom the future of German instruction in a great measure depends. Libraries, associations, periodicals and other means for the promotion of German instruction come under consideration, as well as the leading teachers and professors, of whom biographical sketches are given. Finally, the effects of close application to Germanic studies and extensive converse with all branches of German science on shaping the international relations between Germans and Americans seemed deserving of the greatest possible attention. It is most fortunate that the present diplomatic representative of the United States in Germany is a man whom the Academy of Sciences, in Berlin, deemed worthy to admit as a member, while the representative of Germany, in Washington, is a man who has considered it his duty personally to study the excellent work done by American universities.

I. "SILENT" UNIVERSITIES.

The best university is the best collection of books.—*Thomas Carlyle.*

Libraries form so important an element of the American educational system that no treatise on any educational subject can ignore them. If America had none other, it would deserve the claim of being a land of culture of the first rank on account of its public libraries, which afford every inhabitant, without distinction of age, rank, or sex, at all times, free of cost, the opportunity to supply the deficiencies of his school education and acquire new treasures of knowledge. Libraries form the most important supplement to the existing school system, and happily minister in equal degree to the wants of all who are not totally ignorant, and have the will to rise to a higher intellectual plane.

The question as to how American libraries affect German instruction is readily answered. A library that is not designed exclusively for the purpose of entertainment is simply inconceivable without German books; it must contain a larger or smaller percentage of them under all circumstances.

Proofs can readily be adduced. More than thirty years since, the renowned English scholar, Professor Huxley, made the following remark.¹

Ask a man who wants to study a subject deeply and thoroughly, be it historical, philosophical, philological, physical, literary, or theological, whether if he desires to master any abstract study—excepting, perhaps, political economy and geology, which are specifically Anglican sciences—he is not obliged to read six times as many German as English books?

It may be that in the meantime conditions have somewhat changed to the disadvantage of German scientific literature, but by no means have they altered the fact that German books are simply indispensable for any kind of scientific work. This is verified by the fact that every year approximately as many German as English and French books together are put on the market.

In the year 1892 there appeared in the United States 4,862 books; in England, 6,254; in France, 13,132, and in Germany, 20,000. The German Empire therefore almost equals in this respect the two English speaking countries and France. Besides, its literary productiveness is decidedly on the increase (in 1898 there appeared 23,739 new books), and, moreover, numerous German books are produced from year to year in Austria, Switzerland, and other countries.

¹ Quoted by Charles Phelps Taft, in his noteworthy lecture "The German university and the American college."

To speak of libraries, therefore, means to speak of institutions in which certain collections of German books are to be found. For this reason a few words must be devoted to the phenomenal development of American libraries.

According to the well-known work published by the Bureau of Education in 1876, *Public Libraries in the United States of America, Their History, Condition, and Management*, there were in this country, in 1793, 35 libraries with 75,000 volumes; in 1859,¹ 1,297 libraries with 4,280,836 volumes; in 1875, 3,682 libraries with 12,276,694 volumes. This number has greatly increased in the meantime. In the year 1891 official statistics² state the number of libraries with more than 1,000 volumes to be 3,803, with 31,167,354 volumes; while in 1900 the Report of the Commissioner of Education shows that the number of libraries of 1,000 volumes and over had increased to 5,383, and the total number of volumes to 44,591,851.

It is a well-known fact that one man alone—Andrew Carnegie—has within a short space of time given \$13,454,865 for the foundation of public libraries in America and Scotland. He says:

The result of my own study of the question, "What is the best gift which can be given to a community," is that a free library occupies the first place, provided the community will accept and maintain it as a public institution, as much a part of the city property as its public schools, and, indeed an adjunct to these. It is, no doubt, possible that my own personal experience may have led me to value a free library beyond all other forms of beneficence. When I was a working boy in Pittsburg, Colonel Anderson, of Allegheny—a name I can never speak without feelings of devotional gratitude—opened his little library of 400 books to boys. Every Saturday afternoon he was in attendance at his house to change books. No one but he who has felt it can ever know the intense longing with which the arrival of Saturday was awaited, that a new book might be had. My brother and Mr. Phipps, who have been my principal business partners through life, shared with me Colonel Anderson's precious generosity, and it was when reveling in the treasures which he opened to us, that I resolved, that if ever wealth came to me, that it should be used to establish free libraries for other poor boys might receive opportunities similar to those for which we were indebted to that noble man.³

In view of the facts that men like Carnegie are continually providing for the increase of libraries, that in recent times States and communities are attaching great importance to their foundation and improvement (in the year 1891 the State of New York, for instance, increased the number of books in its public libraries to 335,000, and in 1898⁴ to 1,755,000), and finally, that through the efforts of Melvil Dewey, traveling libraries have been introduced, it may be admitted that about 40,000,000 books in public libraries are at the disposal of the American people.

How many out of this large number are either printed in German or translated from German originals? A close investigation of this most interesting subject would make too great a digression.⁵ An approximate estimate can not even be made, as most libraries keep no statistics of the language in which the books that they contain are printed. However, from data that others have verified, personal investigations of the author, and information given by librarians and other competent persons, a few points may be given in answer to the question.

Benjamin Franklin is the founder of public libraries in America. The Philadelphia Library Company originated in the year 1732 and became operative through the members of the Junto Club, each of whom, as well as nonmembers that desired to make use of the library, paid a certain fee (subscription library). The original collection consisted of only English books; in proportion as German literature was

¹ Compare William T. Rhees, *Manual of Public Libraries, Institutions, and Societies in the United States and British Provinces of North America*. Philadelphia, 1859.

³ *The Gospel of Wealth, and Other Timely Essays*, by Andrew Carnegie, p. 27.

⁴ Compare Schultze, *Free Public Libraries*, pp. 54 and 67.

⁵ Schultze (p. 69) quotes the value of books brought annually from Europe to the United States at 12,860,000 marks. The most, of course, come from Germany.

introduced into Pennsylvania, German books may have been added. On account of the scanty knowledge of German among Anglo-Americans, translations of good German works were frequently introduced toward the close of the colonial period.

To a noteworthy article on "Early influence of German literature in America"¹ Frederick H. Wilkens adds "A list of the translations of German literature that were printed in the United States before 1836," which, without any claim to completeness, contained the titles of 187 works. Besides Goethe and Schiller, we find the names of Campe, Gessner, Klopstock, Kotzebue, L. L. Sturm, J. G. Zimmermann, J. H. Zschokke, Lessing, Schlegel, Wieland, La Motte Fouqué, Chamisso, and Pestalozzi. Kotzebue outrivaled all other authors with 32 works.

In the same proportion that it became customary to study German literature and science in the original German, books were more largely imported. The before-mentioned beginnings of a collection of German books in the Harvard College library no doubt formed the first German book collection of any importance in the whole country. This is at present estimated at about 150,000 volumes.² The German department has besides a specially select seminary library at command. Moreover, Ferdinand Freiligrath's library, a private one, and the German collection of the Boston Public Library, the greatest in the world of its kind, with 700,000 volumes, afford unusually abundant material.

The city of New York can likewise boast of possessing most valuable treasures of German books, that probably may exceed those of Boston and Cambridge in number. Large collections are contained in the Astor, Lenox, Columbia University, and Ottendorfer libraries, and New York University possesses a considerable number of German works. One-half million volumes, of which 200,000 are German, being nearly as many as English, are contained in the Astor Library alone, according to information given the author by the librarian.

The library of the Columbia University contains one of the most important collections of German books, as over 65,000 of the 270,000 volumes are German. Like all American libraries, it is divided into a reference department for general use and the main collection of books. The first, which is located in the large cupola hall, contains about 10,000 volumes, of which probably 500 to 1,000 are German, including the latest edition of Meyer's *Konversations-Lexikon*; the *Deutsche Rundschau*, complete in about 100 volumes; a collection of German classics and prominent works, as, for instance, *Simplicius Simplicissimus*; a number of histories of literature (Brandes, *Principal Tendencies in the Literature of the Nineteenth Century*), grammars, dictionaries, and similar works of reference. Each of the divisions contains the principal works of social and political literature, as *The Capital*, by Marx; historical works on music, mathematics, mineralogy, paleontology, and the different special sciences. Several valuable atlases complete this store.

The library proper contains the best bibliographical works, to determine the old and the new titles. The large lexicons of Heinsius and Kayser, with all supplements; the complete catalogue of editions of German publishers, the Hinrichs catalogue, the Leipzig general German bibliography, and periodicals, as the *Centralblatt für Bibliothekswesen*, the *Petzold Zeitschrift*, the *Serapeum*, and the *Auzeiger für Bibliotheken Journal*, hardly omit any work of importance. Should it be the case, however, the numerous journals on German literature, as the *Literarische Centralblatt*, the *Göttingen Notices*, the *Journal for Comparative History of Literature*, *Euphorion*, the *Journal for the German Language*, *Herzig's Records for the Study of Modern Languages*, the yearbooks for literature, and many others, afford the opportunity of learning of the existence of any work in question.

For general information on German thought and action all the well-known

² From a communication from Thomas J. Kiernan, superintendent of circulation.

Konversations-lexikons are at hand, besides such encyclopedias as those of Zedler and Ersch und Gruber, and the large economic technical encyclopedia of Krünitz, in 250 volumes. This division likewise contains the reports of the Berlin and the Vienna academies of sciences, the scientific associations of Saxony, Bavaria, Göttingen, and Prague, and numerous other learned societies in Frankfort-on-the-Main, Halle, Hamburg, Würzburg, etc. The Preussischen Jahrbücher, the Königsberg Alt-Preussische Monatsschrift, the Prussian Provincial Journal, and many popular journals, like Ueber Land und Meer and the Gartenlaube, deserve to be mentioned. The next division contains a most comprehensive literature on mathematics and the natural sciences. No important German journal devoted to mathematics, physics, astronomy, chemistry, agricultural chemistry, mineralogy, geology, zoology, anthropology, or meteorology is missing. We shall mention only as examples Poggenдорff's Annals and the Crelle Journal, consisting at present of about 120 volumes. In the following division we find an astonishingly complete collection of transactions of the different parliamentary bodies in Germany, from the Bundestag to the German Reichstag (the official stenographic report), as well as the separate landtags of Prussia, Bavaria, Saxony, Württemberg, etc. Here we pass on to the large politico-juristic division, which is composed about one-third of German books.

The section of statistics and political economy contains all the important works of reference, particularly the statistics of the German Empire, the journal of the Prussian bureau of statistics, the corresponding publications of Bavaria, Saxony, Austria, and Switzerland, the well-known yearbooks of national economy and statistics by Hildebrand and Konrad, Holtzendorff's Yearbooks of Legislation and Statistics, Faucher's Quarterly on Political Economy, the Tübinger Zeitschrift, the publications of the Association for Social Politics, the reports of factory inspectors, Schanz's Finanz-Archiv, Böhmert's Arbeiter-freund, and others, besides the social economic writings of Roscher, Ad. Wagner, Schäffle, Eugen Dühring, Marx, Lassalle, Kapp, etc. Books and pamphlets on the social question, care of the poor, socialism, and kindred subjects are numerous.

In the division for law and government we find the complete works of Holtzendorff, the writings of Ihering, Gneist, Laband, Zöpfl, and Thudichum; Waitz, Deutsche Verfassungsgeschichte; Moser's Deutsches Staatsrecht in 50 volumes; Grünhut's Journal of Private and Public Law, Aegidi's Staats-Archiv, the Journal of Comparative Jurisprudence since 1877, the Criminal Journal, the Judgment Hall, and a large collection of literature on the law of punishment and criminal process. The most prominent names among authorities on Roman law are all represented, as Savigny, Puchta, Glück, Vangerow, and Windscheid. We likewise find the authorities on canon law, Hinschius and Phillips, besides the transactions of the German jurist sessions, the laws of the German Empire and those of Prussia since 1810, the decisions of the superior and present imperial courts, Hirth's Annals, the Journal of the History of Law, and the New Pitaval. To these are added numerous works on commercial law and science, railroads, and state and communal government.

In the next division we find a special collection of works on the woman question and a selection of tales, folk-lore, and legends, literature on geography and geology, anthropology, ethnology, and history. The latter collection is especially large. It contains over 5,000 volumes, including the works of Ranke, Droysen, Von Sybel, Schlosser, and all other noted historians, the well-known universal histories, and a Bismarck collection of about 150 volumes. The Münchener historisch-politische Blätter, in 119 volumes, occupy considerable space, as do also the works of A. von Humboldt, Bastian, Baumgarten, Bülow, the Globus, the Aus-land, and the Stimmen aus Maria Laach. There are also many biographies, memoirs, atlases, and much church history matter, as, for instance, Martin Luther's works and the reports of many councils.

The last division is that of the philological seminary, containing about 10,000

German books. Most of the prominent German authors are represented, the most important by several editions of their works; and many works on the history of literature, philology, philosophy, psychology, psychiatry, and pedagogics are at hand. There are, besides, large special collections of Schiller (about 250 volumes), Kant (about 700 volumes), and Goethe (about 1,300 volumes). The Goethe collection is the largest outside of Germany.

The Germanic collection of the New York University numbers about 10,000 volumes, including dictionaries—especially the German Dictionary of the Grimm brothers, grammars, and works on the history of literature. The history division contains the Yearbook of the Historical Collection of the Imperial House of Austria, in 25 volumes, deserving of special mention, as only three copies are extant. The northern division contains the Old Northern Runic Monuments of Scandinavia and England, by George Stephens, a book of interest as representing the life work of a most conscientious investigator. In an article on this collection, recently published by Dr. A. Kluge, he says: "The remarkable collection of journals owned by the university, which numbers about 125 volumes and is considered the best in America, represents considerable capital. Deserving of special mention is the very important Dutch journal, *De Gids* (The Guide), published in Amsterdam since 1837 and enjoying the largest circulation. It is a monthly, devoted principally to belles-lettres, and, under the management of Potgieter and Bakhuizen, in the beginning exercised great influence on the development of modern Dutch literature; even in face of strong competition it continues to hold a commanding position. The work, including the numbers from 1837 to 1897, is bound in 120 volumes. Besides these and many other collections, as the library of the Literarischen Verein, in 218 volumes; the Literarische Anzeiger, in 11 volumes, etc., the university possesses a gem in a separate chromotype copy of the Genaer Liederhandschrift (manuscript of Jena songs), the original of which is in the university library in Jena. There are only 140 copies of this work extant, 30 of which are printed only on one side. According to the list of subscribers, only two copies are in America."

The library of the Cornell University consisted originally of but 14,000 volumes of the former private library of Prof. Charles Anthon, but became an important German collection through the purchase, in 1868, of the celebrated collection of Franz Bopp, the Berlin philologist. The Bopp collection contains many German works on Sanskrit and comparative philology that are not to be found in any other American library. Out of his own means President Andrew D. White formed a collection of German literature, and purchased scientific works on each European visit out of the library fund. In 1871 various German journals and works on mathematics were acquired through an endowment to the library from one of the trustees, William Kelley. Through the acquisition of the celebrated collection of Prof. Friedrich Zarncke, the number of German books was increased at one time by about 13,000 to 14,000 volumes. The largest addition, however, was the gift of President White, who generously presented to the university his library of over 30,000 volumes, about 10,000 pamphlets, and numerous manuscripts. A very interesting account of the most noteworthy editions contained in this collection, selected with unusual intelligence and representing the industry of a generation, is to be found in the *Beiträgen zur amerikanischen Literatur- und Kultur-geschichte*, by E. P. Evans, page 216.

"It is surprising what unique works on German history of culture have found their way to the somewhat isolated city of Ithaca, which possesses among other literature a surprisingly large number of works on magic and witchcraft. One specimen discussed a few years since by the librarian, Prof. George Lincoln Burr, is a facsimile of the original copy of the book, *De Vera et Falsa Magia*, composed by Cornelis Loos at the end of the sixteenth century and for which the author was imprisoned and prosecuted under criminal law. The printing of this

treatise was begun in Cologne in 1592, when the manuscript, fortunately only a duplicate, was confiscated and destroyed. By a happy accident the original of the official reports of the sessions of the inquisition against Dr. Frederick Flache, the companion in suffering of Cornelis Loos, was added to this facsimile. This manuscript, supposed to be lost, was preserved to posterity by Mr. White, he having discovered it in a second-hand bookstore in Berlin, the owner having no suspicion of its value. Since Mr. Burr has been in office he has made the greatest effort continually to increase the German library. As three or four thousand books are added every year, he estimates (January, 1901) the number of volumes at seventy-five to one hundred thousand."

In Philadelphia, the library of the German Association of Pennsylvania, deserves the first mention. It dates back to the year 1817, and though containing only thirty to forty thousand volumes, is a most important mine of German-American literature. Since March 21, 1896, the University of Pennsylvania has possessed a very fine German library. Prof. Dr. H. Schoenfeld thus speaks of it:¹

The library of the late Reinhold Bechstein of Rostock was acquired in bulk through the efforts of Professor Learned, and, with its archival, well-arranged material, represents the nucleus of the so-called Bechstein collection, which has been largely increased and supplemented by the purchase of other valuable works. At present it contains about 15,000 volumes and 3,000 pamphlets, representing the best periodicals, works of reference, and seriate collections, comprising works on philology and literature, dialectology, antiquities, culture, and folk-lore; Gothic, Northern, Old, and Middle High German; rare old prints, like Henssler's folio edition of Hans Sachs, and contemporaneous editions of Luther's works, with the reformer's autograph; a complete series of periodicals devoted to Germanic subjects, and about fifty complete series of publications of learned associations—as, for instance, the library of the literary society in Stuttgart. To these are added the treasures that have been collected in America itself on the subject of American Germanism.

Although German scientific work in Pennsylvania has, in reality, never ceased since the times of Pastorius, the German pioneer, a more decided tone has been given to the study of German since Prof. Samuel Stedman Haldeman, professor of comparative philology at the university from 1869 to 1880, published, among his 32 contributions to philology, his article on the German vernacular of Pennsylvania, in the transactions of the American Philological Association (1869-70). With this publication begins the study of German dialectology in America. In the words of Learned, "It is a pioneer study in American dialectology and the comparative philology of German dialects." At the same time another excellent German scholar, Oswald Seidensticker, laid the foundation of the history of German-American culture—the history and literature of German pioneers in America. A list of his numerous writings on this subject, that deserve to be studied by every educated German, are contained in a small book published on the occasion of the opening of the Bechstein Germanic Library.²

Besides this library, the following collections are accessible to any inquirer from the vicinity: The library of the Historical Society of Pennsylvania, with a fine collection of individual Germano-Americana; the library of the Philadelphia Turngemeinde, the works of which refer principally to the history of athletics in America; the collection of the Mount Airy Lutheran Seminary, which contains many documents on the development of Lutheran communities and schools in America; the collection of Judge Samuel J. Pennypacker, containing many German editions published in Pennsylvania in the eighteenth century; the collections of the Lutheran seminary in Gettysburg and the Moravians in Bethlehem and Nazareth; finally, the collection already mentioned of Mr. Abraham A. Cassell in Harleysville, Montgomery County.

Whoever, therefore, desires to devote his attention to German-American studies

¹"The importance of the University of Pennsylvania for German culture and history." In the *Pedagogical Record*, vol. 38, 1896, No. 10.

² Opening of the Bechstein Germanic Library, University of Pennsylvania, 1896.

must seek his material in Philadelphia. In New York and Boston a far greater number of English translations and books imported from Germany are to be found.

In Baltimore there were in the beginning of the eighties several libraries, including the magnificent Peabody Library, numbering over 200,000 volumes, and the Johns Hopkins University library, with 30,000. At that time, Prof. Herbert B. Adams, whose labors in so many directions have contributed to the prosperity of the university, initiated the effort to acquire the library of his deceased teacher at Heidelberg, Prof. John Caspar Bluntschli, for the university. As the well-to-do Germans of Baltimore considered the advancement of the Johns Hopkins a duty of honor and shared the desire to raise the library to a good standing, they succeeded, owing to the efforts of Professor Raddatz, professor of German at the Baltimore City College, in raising the necessary fund by subscription. On December 20, 1882, an impressive celebration was held in the large hall of the university, after which Col. F. Raina, in the name of the donors, presented the Bluntschli library to President Gilman. In his reply the latter remarked that America was indebted to Germany for three things: I. The many works contributed in the different branches of science. II. The impulse given to the promotion of education. III. The many excellent men that have come to America, so many of whom have taught in American schools. President Gilman closed his effective speech with the words, "Ad illuminandas gentes, Germania."

To speak of the other addresses would lead us beyond our scope. One fact, however, is incontestable—though the Bluntschli library is small (3,000 volumes), it is very valuable. Moreover, it has in the meantime been considerably enlarged. In 1834 the widow of Dr. Francis Lieber presented her husband's works, together with many valuable unprinted manuscripts, to the library. In 1887 the Swiss Government made a larger gift. In recent years the German library has received an annual sum of \$1,000, presented by a German-American of high standing on condition that his name be withheld.

The University of Michigan furnishes a classic illustration that many of the much-vaunted State universities suffer from the same difficulties which the Johns Hopkins encountered, viz, insufficient means for forming a German library. In December, 1885, Professor Calvin Thomas, at that time assistant professor of German at that university, addressed the following interesting letter to Dr. Hermann Kiefer, of Detroit. Only the introduction and conclusion are omitted:

Our State university is suffering greatly from the need of a Goethe library, and the question I would ask is this, Whether, if the many wealthy and educated Germans of this State were acquainted with the conditions of the case, they might not be expected to supply this need? I need not say much of the importance of Goethe in the intellectual life of modern times. Every year increases the interest in the great German poet. An immense amount of literature relating to him has already come into existence, and this literature is constantly and rapidly increasing. To quote the words of Hermann Grimm: "From now on there is a science called Goethe." How deeply, then, is the fact to be deplored that of this Goethe literature the library of the great State university of Michigan possesses next to nothing. Moreover, unless assistance comes from without there can be no speedy improvement of this condition in the future. The common belief is that an educational institution, supported by the large and rich State of Michigan, is entirely relieved of all necessity of private support. This view is, unfortunately, unjustifiable. The total amount which the library committee has been able to expend for "German literature" during the last ten years is \$400 in round numbers. That is an average of \$40 a year. Anyone who knows anything at all of the demands of a large library realizes at a glance that nothing can be done with such means. Under such conditions it can be understood why we have not been able to procure a Goethe collection, for with the little at our command we have been obliged to provide for all German literature from the time of the Middle Ages.

The above is not to be construed as though I design to accuse the State of illiberality. Nor should there be any suspicion of mismanagement of the money

appropriated. Justly and conscientiously we do what we can, but with \$40 a year very, very little can be effected. It must be taken into consideration that the library possesses no particular income. Like the university, it is, for the most part, supported by special appropriations of the legislature; the "general fund" of the institution does not suffice to pay the daily necessary expenses. What happens when the legislature seems to act rather liberally toward us? Last winter the members in Lansing appropriated \$10,000 for the university library. This has every appearance of being a considerable amount. At all events, I do not think that much larger appropriations are to be expected in the future. Now, let us see what action was taken. The sum mentioned is not intended for one year, but for two years; consequently, \$5,000 for one year. Of this amount the medical and law departments receive \$1,500; \$1,200 are spent for binding and subscriptions to periodical literature. The remaining \$2,300 are divided among about twenty-three professors of the academic department, each of whom has an equal right to have the wants of his own branch satisfied. One of these twenty-three is the professor of "modern languages," by which are understood French, German, Italian, and Spanish; other modern languages are usually ignored. From this you see what an insignificant part of the \$10,000 appropriation is and can be applied for German literature, and still no injustice has been committed.

The possible rejoinder may be made that every other department of the library is as poorly provided for as that of German literature; why, therefore, complain? Even were such the case, there would be great reason for complaint, in my estimation. But such is not the case, because so many other departments have been supported by private gifts. In 1870, for instance, Mr. Philo Parsons, of Detroit, enriched the department of political sciences by the gift of the valuable library of the late Professor Rau, of Heidelberg (about 4,000 volumes and 5,000 pamphlets). During 1883-1885 Mr. James McMillan, of Detroit, gave \$7,000 for a Shakespeare library. Another gentleman, whose name is not to be published, presented \$3,500 to the university for the purchase of historical works. Another anonymous gift of \$300 has just been received by the department of English literature. Not long since the mathematical division received \$500 from the well-known German manufacturer, Mr. Hegeler, of LaSalle, Ill., and so on, for this chapter is by no means completed. The department of German literature alone seems to have gained no such friends. Shall this reproach continue to exist? If a practical man should ask what we really want, my answer is as follows: We want about \$6,000, \$1,000 to be spent at once for the beginning of a Goethe library, and the rest to be loaned at interest, the yearly income from this capital to be applied to the completion of this library. The fund might be called "the German-American Goethe fund." By a Goethe library I understand, of course, in the first place, the works of Goethe, i. e., the different editions of his works, his correspondence, etc.; secondly, biographical, critical, and explanatory matter; thirdly, historical, mythological, and other material that throws any light whatever on the writings of Goethe (there are, for instance, 1,500 volumes of Faust literature); fourthly, illustrations of Goethe's works in copperplate and steel engravings, etc.; fifthly, after the most necessary books of the above-mentioned classes have been procured, our library should include the works of other authors (such as Herder, Schiller, the Romanticists) who stood in intellectual relation with Goethe and may be considered precursors, cooperators, opponents, or continuators of his intellectual action. In this way the library would gradually develop into an ample collection of the most important literary treasures of Germany.

Is it possible for any part of this air castle to be built upon solid ground? I apply, first, to Germans, because in reality it is a German affair. From whom else should help come? In the execution of such a design German patriotism can erect a beautiful memorial for all time. But why should this memorial be given to Ann Arbor? With the prevailing American sectarianism and the consequent division of higher educational interests, it seems to me that the Germans of Michigan have every reason to stand by the State university. More than 1,000 German students have studied there. It is the only institution in the whole Northwest where German young men and women can receive intellectual food to some extent similar to that received in the large universities of Germany. Originally this university was as far as practicable modeled after the German standard. *

Finally, in order to show that the plan which I have outlined is not a thing unheard of, I mention the fact that not long since the German citizens of Baltimore, or rather some among them, bought the large library of the renowned Professor Bluntschli and presented it to the Johns Hopkins University.

The letter was published in the German papers of Michigan and attained its purpose. The Goethe library now numbers about 1,000 volumes. Thus Professor Thomas was enabled to begin his special study of Goethe, which he has since con-

tinued with much success. Moreover, it proves that not only, as the poet says, evil deeds must ever produce evil, but that the same can be said of what is good.

As a counterpart of the measure of Professor Thomas, we may cite the following appeal, published last year in the German press of St. Louis by Professor Otto Heller. It reads:

GERMAN STUDENT LIBRARY.

DEAR SIR: Upon my acceptance of the chair of the German language and literature at the Washington University I recognized, seven years ago, that one of my most immediate and most important duties was to acquire as complete a German student library as possible for the university. Conditions were such that for a long time I could not count upon any contributions worthy of mention from the university fund, and so was obliged to promote the undertaking partly by the efforts of the German public and partly by the receipts from public lectures which I have delivered every year since 1894 for this purpose. With a feeling of gratification I thank the Germans of St. Louis for their attendance at these lectures, which alone enabled me to lay the foundation for the large library contemplated. In one, of course, rather limited branch our German department library contains a fine selection of scientific works and reliable works of reference; but only a very modest beginning has been made.

On account of the unpropitious times, which have brought so many similar efforts to a standstill and prevented the agitation of a new project, I have withheld from making a public appeal until now.

In the meantime the academic study of German in the United States has attained not only an estimable, but a brilliant position. At Harvard, the University of Pennsylvania, the University of Chicago, the Northwestern University, and all others situated in localities with a rather large German population German libraries have been acquired at a great expenditure of money, which, in my estimation, are calculated more than all articles of German scholars in English periodicals to reconcile within the quiet rhythm of time the violently antagonistic minds of two leading nations.

Since I have finally resolved, with your kind cooperation, to plead for general support for the realization of my plan, I think that I am justified in giving a full explanation of the purpose of the large German library which I have in view. The library is intended to furnish students, especially those of German extraction, with a tangible means for the systematic study of the German language and literature from the beginning to independent research. It is, furthermore, designed to lighten and oftentimes even to make possible the scientific work of authors and scholars within this district, and thus and in other ways help preserve German culture in our midst by making an important educational instrument, German literature in all its branches, accessible to every inquiring mind.

The sum of money required is considerable. I also know that German charitable institutions, the German stage, and many other praiseworthy objects have well-founded and prior claims for support, and I have not the least thought of depriving them of public assistance. Still I hope that I do not deceive myself when I believe that in their position, which exposes German-Americans to ever-increasing attacks, a greater spirit of sacrifice among individuals will promote the execution of my project.

In this hope I hereby request all who encourage this undertaking to forward their contribution of whatever amount, from 50 cents upward, to me as soon as possible, or to send it to the office of the *Westliche Post* for me. As soon as received the money will be deposited in the university treasury and the amount will be published weekly in the columns of the *Westliche Post*.

The name of each contributor and the books purchased by his gift will be noted on specially printed tickets. The university office, in union with a committee of German-American citizens selected by the first fifty contributors, will control the fund.

Professor Heller earned by this appeal only \$350.

Chicago possesses several important libraries. On June 1, 1900, the Chicago Public Library contained 21,813 German volumes, not including several thousand bound volumes of German periodicals and works of art and an indefinite number of pamphlets. Since then about five or six thousand volumes have been added, so that the entire number of German books is at least 25,000.¹

¹ The author received written information on this point from Mr. E. F. L. Gauss, assistant librarian of the Public Library, in February, 1901.

There are, in addition, the two university libraries. That of the University of Chicago is quite large.

The Rudolf Hildebrand library of the Stanford University has already been referred to.

With the best intentions it was impossible to ascertain the size of German libraries in other cities within the limited space of time at the disposal of the author. Moreover, such an investigation is hardly practicable without the collective work of an association interested in the purpose.

Independent of the large German libraries in all important cities and higher educational institutions, there are a small number of German associations that support libraries in which German books of course predominate. Several such associations have already been mentioned, but in the discussion of associations for other than purely literary purposes. There still exist, and formerly there were many more, German reading clubs, that in their way adopted the Franklin plan of subscription libraries. Such, for instance, are the German Literary Society of Morrisania (New York), and the German Reading Club, of Pittsburg. In the beginning of the year 1897 the German library of the latter numbered about 12,000 volumes.¹

The Belleville Public Library, the origin of which may be likewise traced to a German reading club, has a very interesting history, given in its seventeenth annual report of June 1, 1900. Under the direction of Dr. Anton Schott, sixteen German immigrants met and founded the German Library Society of St. Clair County. Each paid \$3, and with the accrued amount a "library" of 346 volumes was collected the first year. As the Germans of Illinois have always been good patriots, the first book purchased was the first volume of Sparks's *Life of Washington*.

As we can not refer to the interesting details of the development of this library, we mention only the following: In the year 1883 the library was estimated to contain about 9,000 volumes, partly English and partly German. It was then taken charge of by the city, to which it was presented by the library society. Since that time the number of books has risen to 30,000, and the German works have likewise been increased in number.

Only large public institutions and corporations are in a position to support a library of any importance. Small private "reading circles" are suitable for small villages and rural districts alone. Moreover, the lack of any kind of a library is of itself proof that an institution has no claim to great scientific importance. According to the Report of the Commissioner of Education for 1897-98, of the 39 largest institutions in the South, 12 possessed a library with fewer than 5,000 volumes: 7 possessed a library containing 5,000-10,000; 10 possessed a library containing 10,000-15,000; 4 possessed a library containing 15,000-20,000; 5 possessed a library containing more than 20,000. The University of Texas, with 35,000 volumes, is included in the above.

However, the disposition is manifested in the South to remedy this cardinal defect as quickly and thoroughly as possible.²

II. ASSOCIATIONS AND PERIODICAL PUBLICATIONS FOR THE PROMOTION OF GERMAN INSTRUCTION.

The Modern Language Association, as we learned in the section on historical development, deserves to be mentioned first among the societies for the promotion of German instruction. At the annual meeting held in the University of Nebraska, in Lincoln, December, 1898, its purpose was amply defined by C. Alphonso Smith,

¹ German Reading Club. Yearbook and supplement to the club catalogue. Pittsburg, 1897.

² The Sewanee Purple. The University of the South, Sewanee, Tenn. Midwinter number, 1901, page 9.

president of the central division. Among other things, he said: "The purpose is by united efforts to establish a center of correct information for the settlement of questions relating to the modern languages and literatures. We wish to make accessible to every advanced student and to every teacher of the modern languages the best ideas attainable in or about his time."

He then referred to the example of Noah Webster, and explained that this excellent scholar could not attain a result corresponding to his thought and energy because he was not acquainted with the best investigations of his time. Webster (who died in 1843) lived at a time "when Jacob Grimm had laid securely the foundation of historical grammar, when August Wilhelm von Schlegel had laid the foundation of Sanskrit philology, when Franz Bopp had laid the foundation of comparative grammar, and when August Friedrich Pott had laid the foundation of scientific phonetics; but Noah Webster cared for none of those things."

It is accordingly evident that there is a necessity for a society with the purpose in view of acquainting its members with all the current proceedings in their different branches of knowledge. In what way the Modern Language Association has taken an active part in educational reform, and how it has thus assisted German to attain the position due to it in the curriculum of higher educational institutions, has been amply explained. The action of the society must therefore be considered exceptionally beneficial.

The total number of members is about 1,000, including a considerable proportion of Germans and German-Americans. The German minority is by no means so great, however, but that it was able to elect a president of its own choice. If the main division of the association, with about 550 members, 25 per cent German, elected a German—Prof. Hans Carl Günther von Jagemann—to assume its direction, positive reasons alone could have been their motive. Nativistic narrowness does not therefore exist in these circles. If another proof were needed it is furnished by the "Kommers" ("smoker"), which, according to early German custom, was held at the seventeenth annual congress in New York at the close of December, 1899. Of 11 songs sung on this occasion, 3 were Latin, including the *Gaudeamus igitur*; 3 English, 3 German, 2 French, and 1 was "mixed," namely, partly German and partly English.

The scientific lectures delivered at every annual meeting are not all of equal value; still many are worthy efforts. The full text of only the latter is given in the proceedings of the association, which appear annually. The Modern Language Notes, likewise published by the association, are of less general interest, though they are indispensable for the preservation of data relative to the development of German instruction.

The National German-American Teachers' Association, whose work covers a period of thirty successful years, ranks next in order to the Modern Language Association.

In April, 1870, the following appeal was published to the teachers and friends of the schools:

German teachers and German-American schools lack union and combined action, and still on them chiefly is based the hope of the preservation of the German language, custom, and thought—the hope of the protection of German culture. We, the undersigned, are convinced that the necessity for a general organization of German teachers of the Union has long since been felt by the majority, and that the difficulties in the way of effecting it have caused anxiety, as the local teachers' associations have taken no part in the matter and offered no support.

We have therefore resolved to initiate the formation of a general teachers' union by annual meetings, after the fashion of German teachers' days. These would offer points of contact, the first essential toward a permanent union.

We define the purpose of such meetings to be: The formation of general pedagogical efforts, the support of the mission of the German element in behalf of the

history of culture, especially the extension and further development of specifically German-American schools, and in connection with them the defense of the interests of their teachers.

As the beginning must be made by some one, we hereby assign the first German-American general teachers' day for the 1st to the 3d of August of this year, in Louisville, Ky., and invite German teachers throughout the Union to participate in large numbers, adding that all other friends of the cause who feel a lively interest in the preservation of our native language and are not indifferent as to whether the second generation of immigrants are estranged from German thought and feeling or not, are heartily welcome. The teachers and friends of the schools in Louisville are ready to form a local committee which will make the necessary arrangements to provide the attendants with cheap or free lodging and reduced fares on railroads and steamers.

We furthermore request our honored colleagues to prepare such lectures and theses for discussions as will promote the above-mentioned purposes; the announcement of these should be sent to the provisional business committee through E. Feldner, Detroit, Mich., not later than June 1, so that the program may be arranged and published in time by the said committee.

The Louisville local committee (address W. N. Hailmann) will publish in a short time all information concerning its arrangements.

The committee formed for the organization of the first general German-American teachers' union is composed of: J. Bengel, professor at the Normal School of Ypsilanti, Mich.; Ed. Feldner, director of the German-American Seminary, Detroit, Mich.; W. N. Hailmann, director of the German-American Academy in Louisville, Ky.; Dr. Hopp, director of the German-English School in Yonkers, N. Y.; J. Illian, teacher at the German-American Seminary in Detroit, Mich.; L. R. Klemm, teacher at the German-American Seminary in Detroit, Mich.; J. C. Knapp, director of the German-English School in New Albany, Ind.; K. Knortz, professor at the High School in Oshkosh, Wis.; E. Pollmar, teacher at the German-American Seminary in Detroit, Mich.; H. Reffelt, teacher in Hoboken, N. J.; A. Schneck, teacher at the German-American Seminary in Detroit, Mich.; F. L. Soldan, professor at the High School in St. Louis, Mo.; F. R. Schunemann-Potte, speaker of the Secular League in Philadelphia, Pa.; W. Steffen, professor at the St. John's College, Annapolis, Md.; Dr. Sonneschein, rabbi of the Reformed Israelites in St. Louis, Mo.; F. Mundemann, teacher at the German-English School in Yonkers, N. Y.

The organization meeting was held in Louisville, August 1, 1876. As might have been expected, its proceedings were all of a preparatory nature. Lectures were delivered by A. Schneck, Detroit, on the subject, *A Parallel between German and American Education*; by P. Engelmann, Milwaukee, on *School Books*; by H. Reffelt, Hoboken, on *Obstacles to German Instruction in America*; by J. C. Knapp, New Albany, Ind., on *The Agitational Task of German-American Schools*; by Karl Knortz, Oshkosh, Wis., on *German Language Instruction*; by F. L. Soldan, St. Louis, on *Necessary Modification of German Methods*. Besides these, a speech in English was delivered at the general meeting on *The Mission of the German-American School*.

The officers were Messrs. E. Feldner, Detroit, president; W. N. Hailmann, Louisville, vice-president; L. R. Klemm, Detroit, first secretary; W. H. Rosenstengel, St. Louis, second secretary; F. Thurm, Williamsburg, N. Y., third secretary, and J. C. Knapp, New Albany, Ind., treasurer. The list of members contained 116 names, 21 being those of women.

The result of the meeting is thus given by W. N. Hailmann:

The German teachers and friends of schools in America met in Louisville, Ky., from August 1st to 5th. This was the first successful attempt to assemble and unite the scattered preservers of the German language and German thought and feeling in our adopted fatherland, and no one whose pleasure it was to attend the conferences left without being convinced of the far-reaching influence and importance of this opportune undertaking. By the proceedings of the united teachers the professional self-consciousness of each was strengthened; everyone returned home with renewed zeal for the fulfillment of his duties, whose dignity and significance he saw in a clearer light; everyone left with the strengthened consciousness that he was a powerful factor in a high mission, the elevation of his fellow creatures in general and those of America in particular; everyone firmly resolved

to contribute to the suppression of all narrowness in his profession, based upon traditional or acquired claims or on the ignorance of state or church.

The first positive effect of this congress was the foundation of a pedagogical monthly, the *Amerikanische Schulzeitung*. Its publication was intrusted to a former teacher, the late publisher, H. Knöfel, of Louisville, and W. N. Hailmann, likewise a resident of that city, was chosen editor. What this periodical, the name of which was changed later to *Erziehungsblätter für Schule und Haus*, gradually accomplished under the management of Hailmann, Kleinm, and Grossmann till Dr. H. H. Fick, of Cincinnati assumed the editorship can be ascertained by examining the numbers at hand. Besides the chief editors appointed by the publishers the following gentlemen were chosen by the association as assistant editors: Messrs. Rosenstengel, Müller, Keller, Klemm, Schuricht, Lohmann, Eckoff, Fick, Rink, and Geppert.

The association, as well as its organ, acknowledged the following concise and sensible statement of purposes:

- I. The care of the German language and literature, together with English.
- II. The introduction of natural (developing) methods as striven for by German pedagogics into German-American schools.
- III. The education of truly republican citizens and the defense of the intellectual and material interests of German teachers.

In this sense the foundation of the Normal Seminary, previously mentioned, was undertaken by the union. Despite unremitting agitation and, with the exception of the year 1888, annual meetings in different places (the one held in Cleveland, 1890, was visited by the United States Commissioner of Education, Dr. Harris, who delivered an address), the association has not been able to effect a firm union among German teachers. In his lecture on the history of the association, delivered on its twenty-fifth anniversary, July 3, 1895, in Louisville,¹ Dr. Fick attributed this failure partly to its loose organization, partly to the increasing indifference of German-Americans, and partly to obstacles of a partisan nature. In so far as the last reason was justified, it could not have been better counteracted than it was on the thirtieth anniversary of the foundation of the association, when Professor Learned, a thorough Anglo-American, was elected president. This action formed an unusually suitable counterpart to the choice of a German president by the Modern Language Association. Could the idea of intellectual cooperation of Germans and Americans find a more concrete expression than in these purely spontaneous manifestations of will on the part of the associations in question?

From the year 1899 a new and to all appearances more hopeful era of the association begins. Its present finely equipped organ, the *Pedagogical Monthly*,² a journal devoted to German-American education and since December, 1899, the organ of the National German-American Teachers' Association, appeals not only to German teachers, but is calculated to attract professors of colleges and universities. The editor is Max Griebisch, teacher at the National German-American Normal Seminary, and Professor Learned has personally undertaken the direction of the "division of higher education." As this worthy journal reaches about 12,000 interested persons directly, success, it seems, must follow. The list of contributors is very large and represents not only the most important States from Maine to California and from Michigan to Texas, but Canada also. The association now numbers about 1,200 members.

Besides these two associations of national importance, others restricted to a definite field of action and, consequently, the more effective, e. g., the "German societies" of the different universities, which exist in many places, deserve to be

¹Published in Nos. 300 and 301 of the *Erziehungsblätter*.

²The Herald Company, Milwaukee, Wis., publishers.

mentioned. Harvard and Vassar each has such a society, and it seems as though they will continue to be founded in the interests of the German departments wherever such exist. It is, moreover, intended that the different German societies shall have direct intercourse with one another, in order that, similarly to the societies which have a common purpose in the German high schools, they may be informed of one another's work and action and perhaps meet periodically on special "days."

These German societies are a part of student life that has yet to find its way into America. They make use of the German language, German lectures are held, German songs are sung, and a few of them give their "Kommers" ("smokers") at the close of the scientific work, so that one might believe himself transported to Heidelberg or Jena. This explains why so many of the professors who have studied in Germany take an active part in the society life, however little their professional duties may have to do with German instruction.

One of the most flourishing societies of this kind is the Deutscher Verein of Columbia. According to its constitution, its purposes are "the study and appreciation of the German language and literature, in speech as well as in writing; the discussion of all contemporaneous events in Germany; the promotion of public German lectures at Columbia University, and the social affiliation of those who are interested in German." Only teachers and students of Columbia can be active members; the number of honorary members is unlimited. The first thought of admitting as extraordinary members any who, though not members of the university, were nevertheless interested in the purposes of the society, was not carried out. Students are only admitted on condition that they understand enough German to follow the proceedings conducted in the German language.

Mention must be made that, besides all the teachers of the department, several other professors who, like most of the teachers at Columbia, studied in Germany, became regular members. Among this élite group of German students a German idealism was aroused, which White deservedly appreciates in his "Message of the nineteenth to the twentieth century."

It would cause too great a digression to mention all the lectures and proceedings of the society since its organization in the fall of 1898. During the season of 1900-1901 Dr. F. W. Holls, of New York; Professor Learned, of Philadelphia, and L. Viereck, of New York, delivered lectures, whilst those of Professors Jagemann and Schilling, both of Cambridge, are still pending. The lecture of Professor Learned cited most important data; the lecture of L. Viereck treated of the historical development of German instruction in America. The remarks of Dr. Fred W. Holls, of New York, were particularly interesting. Having been secretary of the American delegation to the Peace Congress held at The Hague, he spoke of the significance of this event for the development of international law. Besides the lecturer, two other members of that congress belonged to Columbia, viz, President Seth Low and Captain Mahan. The students were filled with no little pride at these international relations of their alma mater.

The society possesses a large clubroom in the west hall of the university. One wall is decorated with a magnificent black, white, and red flag, which was presented to the society. The other walls are lined with cases to contain the books and periodicals of the society. These are still modest in number, but are to be considerably increased, as a benefit play given in the German theater of New York realized a large amount, which is to be devoted to the purchase of German books. It must not be forgotten that students are recommended to see German classical plays after they have read them and that they willingly follow this counsel. In April of 1901 the German ambassador, Dr. von Holleben, attended a society evening.

As far as can be ascertained the two German associations of the Northwestern University—the German Gesellschaft and the Literatur Verien—may be considered

the largest and most successful of the kind outside of the great metropolis of the Empire State. They were organized by Prof. Henry Cohn, a man prematurely cut off from a life of influential action. He understood how to imbue them with a vigorous and varied life, so that there need be no fear felt for their continuance. As before stated, the Literary Society was founded in 1893; it therefore belongs among the oldest organizations in question.

In the account given of the university mention was made of the arrangements that existed in former years in the departments of art and literature. An evening entertainment given in January, 1901, by these associations was fully described in the *Illinois Staats Zeitung* of January 31, of that year, by the well-known journalist, L. Zwanzig. We quote the following:

The evening entertainment which I have mentioned was attended by many students of both sexes, a large number of professors of other faculties, the trustees of the university, with their ladies, and a number of invited guests. The programme consisted of recitations, songs, and a representation of the highly dramatic scene between Gen. Octavio Piccolomini and his son Max, from the last part of Schiller's trilogy *Wallenstein*. * * * The language of the Americans on the stage of the music hall was satisfactory in every way, and even astonishing. We must not forget that the pronunciation of German on such occasions is difficult for Americans. I was agreeably surprised at the perfect understanding of the works on the part of the young men, who thoroughly appreciated the thought portrayed.

The teachers of German at the Northwestern University adhere to the principle maintained by the greatest of all German novelists, Gustav Freytag, that the knowledge of languages is the best help for science, in order to understand the highest that man can comprehend, the souls of nations. For this I accord them my deepest appreciation and admiration. German-Americans may be proud that German instruction is in charge of such excellent scholars, to whom liberal science is "the high, heavenly goddess," and not "a fine cow that provides them with butter."

But I desire to express the pleasure which my visit among them afforded me, not only to the teachers but to the students. The students of to-day are the teachers of to-morrow. The 400 students of German at the university in Evanston form a respectable fraction of the element called to leave its intellectual stamp on the North Americans of the twentieth century. May science be free and holy to them, and may they carry out the thought of their teachers when they themselves shall be guides, leaders, and counselors of their nation, and exert a directive and molding influence on its history.

Thus far the words of the report; finally, it must not be forgotten that, at a former time, the *Deutsche Gesellschaft* felt called upon to lend a helping hand to the needy German poet, A. Mels, on his death bed. The recitation of his well-known comic Heine's *junge Leiden* (Heine's early sufferings), given by the Berlin actor, Nelich, April 14, 1894, under the auspices of the association, realized the sum of \$120, that contributed much to making his last hours pleasanter.

German Turn- and Gesang vereine, German societies and other associations which, according to their statutes or occasionally, as opportunity offers, devote themselves to a greater or less cultivation of the German language and the promotion of German instruction, athletics, and singing, are very numerous. Mention has already been made of athletic associations in this respect. However, it is beyond the scope of this work to give a special account of these kinds of associations. The same may be said of the Philadelphia German Centralbund and the different German historical societies of Baltimore, Milwaukee, and Chicago, although their work contributes not a little toward furnishing valuable historical data for German instruction.

The two quarterlies that have been published since 1897, the *Americana Germanica* (appearing since January, 1897) and the *Journal of Germanic Philology* (appearing since April, 1897), must not, however, be overlooked. The former says:

The appearance early in the current year of two quarterlies, both devoted to Germanic studies and both published and subsidized in America, and, thus far at least, receiving their contributions from scholars in America, is a reasonable

cause of surprise, and at the same time an adequate reply to those who have been wont to complain that the Germanists in America are not keeping pace in productive activity with their colleagues in the domains of Romanic and English philology. The explanation of this apparently sudden manifestation of new life is not far to seek. For more than a decade the *Modern Language Notes*, and the *Publications of the Modern Language Association of America* have been the main avenues of publication for the three great departments of Romanic, Germanic, and English philology (the last having been severed from the Germanic group, and regarded as a separate department, because of its cultural importance). While these publications, together with occasional studies in the *American Journal of Philology* and the *Proceedings of the American Philological Association*, have done much to stimulate production in their various fields, none of them could, without a serious break with its traditions, narrow down its scope and devote itself to any one particular department. The various university series begun in recent years have contributed their part toward meeting the demand for special publishing facilities until more specific journals should arise to occupy the field. It is an open secret, that for four or five years as many different Germanists in America have conceived (as it seems, quite independently, only emulating the example of German scholars beyond the Atlantic) the idea of establishing some form of journal for the promotion of Germanic studies in this country.

Thus the two new journals are natural and timely evolutions, having in each case a clearly defined point of view and plan of operation, and having so constituted their editorial corps as to include most of those who were themselves contemplating similar enterprises, thus securing cooperation and good will, which must augur a new and better epoch in the history of Germanic studies in America.

The *Journal of Germanic Philology* is edited by Gustav E. Karsten, University of Indiana, with the cooperation of Albert S. Cook, Yale University, for the department of English; Horatio S. White, Cornell University, for the history of German literature; George A. Hench, University of Michigan, for the historical grammar of the Germanic dialects; Georg Holz, University of Leipzig, Germany, European coeditor. In the language of the editors:

The journal is devoted to Germanic philology in the broader sense of that term, including the study of literature as well as that of language, thus embracing English, which occupies an important place in the scope of the journal. Thus the *Journal of Germanic Philology* and the *Americana Germanica* enter the Germanic field from quite different directions, the former taking English and German in general as the main goal, the latter emphasizing the literary, linguistic, and other cultural relations of Germany and America; the former soliciting foreign contributions on the general field of Germanics, the latter accepting American contributions on the general field, but soliciting foreign articles on the relations of Germany and America, but in both language and literature and in all the periods. Both journals are academic in character and aim at scientific treatment of the material which they publish; both accept articles in English or German and have an international circulation.¹

The *Americana Germanica* is a most excellent journal, which promotes the cause of German instruction the more effectually as its able articles not only influence professional circles, but are read by interested parties in the educated circles of both hemispheres. The editor is Prof. Marion Dexter Learned, University of Pennsylvania. The contributing editors are: H. C. G. Brandt, Hamilton College; Hermann Collitz, Bryn Mawr College; Daniel K. Dodge, University of Illinois; A. B. Faust, Wesleyan University; Kuno Francke, Harvard University; A. Gerber, Earlham College; Julius Goebel, Leland Stanford Junior University; A. R. Hohlfeld, Vanderbilt University; H. M. Schmidt-Wartenberg, University of Chicago; Hermann Schoenfeld, Columbia University; Calvin Thomas, Columbia University; H. S. White, Cornell University; Henry Wood, Johns Hopkins University.

The prospectus of the journal states:

The purpose of the periodical is to furnish a distinct medium for the publication of results obtained from the comparative study of the literary, linguistic, and other cultural relations of Germany and America, to unite the efforts already made in this domain, to stimulate new researches on both sides of the Atlantic,

¹ From an editorial in *Americana Germanica*, I, No. 3, pages 105 and 106.

and to build up in the course of the years a series of studies setting forth the history of German culture in America.

The periodical will include in its scope the following specific subjects:

1. The literary relations of Germany and America—and England as far as it has to do with these relations—comprising (a) German literature written in America; (b) German literature reprinted in America; (c) American translations of German literature; (d) influence of American literature in Germany.

2. The linguistic relations of Germany and America, comprising the Germanic dialects of America: (a) German dialects (Dutch, Platt, Palatine, Thuringian, Saxon, Bavarian, Swiss); (b) Scandinavian (Danish, Swedish, Norwegian, Icelandic); (c) English only so far as influencing or influenced by the other Germanic dialects.

3. The cultural relations (exclusive of the literary and linguistic) of Germany and America, particularly folklore, manners, customs, industries, and arts.

4. Articles on the general field of Germanics written in America.

The journal, which at present forms four volumes, has, according to this plan, published a series of valuable articles. Some have been quoted in this work; others were omitted only for lack of space. A number have been published separately. The undertaking met so pressing a demand that its extension led to the earnest consideration of an American-German publication fund. Details of the subject will be given in the next section.

Besides the more lengthy articles, criticisms of books, advertisements of recent publications, and editorials on all subjects relative to the matter in question, form the chief contents of this interesting journal. As a matter of course, it likewise contains articles on promoting German instruction, though they are not so numerous as in the official organ of German-American education, the *Pedagogical Monthly*. The "division for higher education" is directed by Professor Learned.

III. SPECIAL INSTITUTIONS AND ENDOWMENTS FOR THE PROMOTION OF GERMAN INSTRUCTION.

It is a noteworthy fact that friends of the study of German in American schools have not been satisfied with the official action in this direction referred to in previous sections, but have competed among themselves to promote the cause of German instruction further by special agencies and endowments. As a result of this praiseworthy zeal, we give the following heterogeneous list, all of which, nevertheless, tend to the same end:

I. The Germanic Museum, at Harvard.

II. The German Publication Fund.

III. The German theatrical productions given as benefits for the above and other Germanic purposes.

IV. The endowments at different universities: (a) for fellowships or scholarships to students of German; (b) for professorships in German; (c) for German books.

In March, 1897, the following general appeal was sent out from Cambridge:

THE NEED OF A GERMANIC MUSEUM AT HARVARD.

Not so very long ago the study of German in this country was valued chiefly as a means of acquiring facility in reading or speaking a language which has come to be of great practical importance in professional, business, and scholarly pursuits. Indeed in some parts of the country this is still the prevailing view taken not only of the study of German, but of all modern languages. Greek and Latin are still surrounded with the halo of a time when all higher culture was considered to be bound up with a knowledge of Greek and Roman life; while French and German are not infrequently looked upon as upstarts whose standing in the hierarchy of learning is not yet beyond doubt.

It is, however, clear that for some generations past a change has been gradually coming. The first impulse, as far as German is concerned, was given by the great epoch of German literature at the beginning of this century. When Bancroft and

Hedge and Motley returned from their studies at German universities they brought with them not only a fuller equipment of scholarship, but also a strong enthusiasm for the noble intellectual movement which was then shaping the destiny of modern Germany. Following this, there came the influence of 1848. The March revolution struck a chord to which the American heart vibrated; and when the martyrs of this revolution sought a refuge in this country, they found here a ready welcome and intelligent sympathy with German aspirations. In the friendship between Longfellow and Freiligrath this twofold affinity between the two countries as to both literary and political ideals may be said to have received its most notable symbolic expression. Next there followed the general adoption of German methods of scientific research brought here by the steadily growing number of American teachers, physicians, and theologians who had received the decisive stimulus for their life's work at the universities of Berlin, Göttingen, or Heidelberg. And finally, the dominant position acquired by Germany since the war of 1870 gave the American people a new sense of the dignity of the German nation, and kindled interest in the history of the Teutonic race.

There exists, then, to-day an ever-increasing disposition on the part of Americans to approach the study of German as a study leading to an insight into a great national civilization. Of the rapidity with which this tendency is developing, the history of the German department of Harvard University during the last twenty-five years is an index. In 1871-72 there were given two elective courses in German, both of a miscellaneous character. The number of students enrolled in them was 100. Of departmental organization, hardly a beginning had been made. To-day the department consists of ten permanent teachers, namely: One associate professor of German, one professor of German literature, one assistant professor of Germanic philology, one assistant professor of German, and six instructors. The number of courses offered, apart from the prescribed course in elementary German, is 29, and this list includes such courses as the following: History of German literature, German literature in the twelfth and thirteenth centuries, German literature and art from the fourteenth to the sixteenth century, German literature from the Reformation to the classic period, the social and political tendencies in German literature of the nineteenth century, Gothic, Old Saxon, Old High German, Middle Low German, Germanic mythology, Germanic antiquities, and a seminary of German literature and Germanic philology. The number of students enrolled in these elective courses is about 750.

Gratifying as this development is, it brings into clear relief the need of further important improvements. To one of these, namely, the need of a Germanic museum, we wish to call the attention of the community at large.

It is a principle now generally accepted that a nation's history can not be studied adequately without a consideration of its achievements in the monumental and domestic arts. Nowhere does the spirit of a people manifest itself more clearly and impressively than in the buildings devoted to public worship or public deliberations, in the images embodying the popular conception of sacred legend or national tradition, in the appliances for private comfort and security. To the student of Greek and Roman culture nearly all the higher institutions of learning offer at least some possibility of making himself acquainted with the principal monuments of Greek and Roman art. The student of Semitic civilization has an excellent opportunity of examining Assyrian and Babylonian monuments in our own Semitic Museum. The Boston Museum of Fine Arts, in its Japanese collection, gives an admirable conspectus of national life in the Far East. Both the Boston Museum of Fine Arts and the Fogg Art Museum at Harvard contain valuable collections illustrating certain phases of mediæval and Renaissance art. But nowhere in this country is there a chance of studying consecutively even the most important monuments of Germanic civilization. Nowhere in this country can the student obtain a vivid impression of the life and customs of our forefathers, from early Teutonic times to the later Middle Ages, such as is afforded by the Germanisches Museum at Nuremberg and other European collections. Nowhere can be given an accurate conception of the wonderful Romanesque cathedrals of the twelfth century, of the extraordinary power of German sculpture in the thirteenth, of the exquisite works of German wood carving in the fourteenth and fifteenth centuries, or even of the work of such great men as Peter Vischer and Albrecht Dürer.

In suggesting the establishment at Harvard of a museum devoted to this hitherto neglected subject, we do not wish to enter into a discussion of the æsthetic value of German art. We admit that for the cultivation of the sense of formal beauty the study of Italian art is decidedly more important than the study of German art; although we should not be willing to grant this preference to the art of any other modern nation. What we maintain is the paramount importance of such a collection as this for the study of civilization.

Four or five rooms containing views and reproductions of characteristic works of Germanic industry and art from the earliest times to the sixteenth century might form a satisfactory beginning of such a museum. First in the collection, chronologically, would be photographs and casts of such objects from the Neolithic age as may serve to throw light upon the questions of the existence of an anthropologically distinct Teutonic race, of its previous history, and of its geographical distribution in Europe. Next there would follow specimens of the characteristic products of the Hallstatt and La Tène periods; models of the earliest habitations in Germanic territory, so far as their construction can be ascertained from actual remains, from imitations in the form of house urns, and from the descriptions of ancient writers; pictures showing the mode of burial in various epochs, and casts of tombstones with Runic inscriptions. The progress made during the period of the Migrations and the centuries immediately following in the arts of working metals, of carving, and weaving would be shown by reproductions of objects in the museums of Nuremberg, Mainz, and Christiania, and in the British Museum; the development of navigation by models of boats, from the dugout of the lake-dweller to the seagoing boat of Nydam and the Viking ship of Gokstad; the advance in architecture by models of the German, the Anglo-Saxon, and the Norse halls as described in the literatures of the respective countries. German culture during the period from Charlemagne to the Hohenstaufen would be illustrated by photographs of exteriors and interiors of the great Romanesque cathedrals of Aachen, Worms, Speier, Mainz, etc., the Kaiserpfalz at Goslar, the Wartburg and other castles, and by casts of such works of sculpture as the Bernward column of Hildesheim, the brass portals of Hildesheim and Augsburg, the lion of Braunschweig, etc. The thirteenth century would be characterized by photographs of the great Gothic cathedrals, and by photographs or casts of the sculptures at Freiberg, Wechselburg, Naumburg, Bamberg, Freiburg, Strassburg. For the fourteenth century a selection of sepulchral monuments from the Germanisches Museum at Nuremberg would be sufficient; while the fifteenth century should be fully brought to view by representative types of the earlier wood carving, by specimens of the various schools of painting between the Van Eycks and Dürer, and, finally, by as complete a collection as possible of the works of Dürer, Holbein, Peter Vischer, Adam Krafft, Veit Stoss, Michael Pacher, and Hans Brügemann.

A collection like this could hardly be begun with less than \$10,000. But, if carried out successfully, it would undoubtedly be one of the most useful departments of the university. It would be the first attempt to bring before the eyes of American students a picture of early European and mediæval civilization. It would, at the same time, be a worthy monument to the genius of a people which has had a large part in shaping the ideals of modern life and which has given to this country millions of devoted citizens.

Very few, perhaps, will be surprised to learn that until the close of the century, consequently almost four years after the publication of the appeal, not more than \$4,000 was forwarded to the committee. Meanwhile, the thought to be realized is so striking that, perhaps, it need only be made known to the public at large in order to be speedily carried into execution in the new century. Its success would certainly be an important event in the history of culture. That the men in charge of its execution are eminently qualified to carry out such a work is just as undeniable as the fact that the oldest American educational institution in the country, by its location in the neighborhood of the American Athens, is the most appropriate place for such a Germanic museum.

It is a gratifying fact that the German ambassador, Dr. von Holleben, took a personal interest in the founding of the Germanic museum. By invitation of Professor Münsterberg, of Cambridge, he was present at a luncheon given at his house March 14, 1899, for the purpose of urging the need of a Germanic museum at Harvard. On this occasion he delivered the following address¹ before a gathering of about 200 prominent Germans of New England:

GENTLEMEN: To be greeted by this high-minded gathering—amidst eminent representatives of German science and art, transplanted to America—affords me both honor and pleasure; but it is particularly gratifying to be welcomed in the mother tongue, even though, outside of Germany, I am accustomed to hear those sounds more frequently in this than in any other country, for Germany has a home

¹ Taken from the English translation published in the German-American Review.

in America. Millions and millions have, in decades past, come from abroad and found what they sought for in vain in their old home—in many cases, perhaps, not without fault on their part—free elbowroom for their talent and efficiency. Things no doubt went hard with many, but most of them have for generations risen to respected positions, and at former times, when America did not stand upon its present summit of civilization, German intellect and laboring power, sprinkled all over America, have helped to form in many places what might be likened to an oasis.

At the head of all those contributors to evolutions stand the representatives and supporters of the intellectual wealth of the German people. German science bound the two countries together by ties stronger even than trade and industry. Those ties can not be torn asunder, for science itself can not be extinguished. German science forms the heaven of European civilization, and the Americans are more permeated by this German science than most of them imagine. Here in Boston, under the spell of Harvard University, it is hardly necessary to lay stress upon the overwhelming importance of this wealth of science. Here you all are under the more or less immediate influence of that nursery of science, almost three hundred years old; and it is the more gratifying that the leading higher school of learning in this country stands foremost in the cultivation of German science. Here German methods of research have triumphed. The study of German itself—of German language, art, history, and literature—has taken a firm hold, and has in a few decades found rapid development, and along with it German ideals became more deeply rooted; those ideals, which at times are apt to be endangered in their own country when passions of partisanship and industrial struggle run high, although no government in any country in the world is so anxious to nourish and develop the intellectual wealth of the nation as is that of Germany.

Yes! resting upon the public spirit and on the prosperity of the American people, German ideals are well harbored. But, gentlemen, is it for us to fold our hands in idleness? Is not standing still equivalent to sliding backward? With great pleasure have I learned that a movement is on foot in Harvard circles having for its purpose the erection of a Germanic museum. Whoever has passed through the halls of the Germanic museum at Nürnberg knows what it should look like, and, in view of American willingness to give, I am sure will look like some day in the near future.

The creation of such an institution must needs be, to far wider circles, the source of abundance of suggestions and intellectual impulses in the interest of the German language and German ideals. Let my last words, therefore, express the ardent desire that every one of us may do his duty in furthering the noble object of creating, within the bounds of the leading university of the country, a home-stead for the treasures of German art, language, and history.

The Harvard professors, Dr. Münsterberg, Dr. Francke, and Hugo K. Schilling, and the chairman of the visiting committee, Attorney Henry W. Putnam, likewise spoke. Unfortunately, Professor Münsterberg possesses neither a copy nor a draft of his speech. The following are the reports of the other addresses:¹

Prof. Kuno Francke said:

My colleagues and myself are deeply indebted to you for the impressive and sincere words with which, so to speak, you have pronounced the baptismal blessing of the German realm on the life of our child still unborn. We can not conceal that in many respects our undertaking has special difficulties before it. * * * We Germans in the North must look upon ourselves as champions of German stamp in America; we must consider it our foremost duty to open the eyes of our American fellow-citizens to all that German thought has aspired to and produced in the course of centuries in industry, art, philosophy, literature, and music, and what has led to the commanding position which the German Empire, thanks be to God, occupies at the present day. The very isolation of our position simply makes an undertaking like the museum in question a patriotic duty.

That is one side of the case. On the other hand, we in Harvard are by no means isolated. We know that if not the attention of the world, at least the eyes of one thousand and one American colleges and universities are bent upon us. All that is done in Harvard is echoed and imitated by all the institutions in the country. This may be said of all other branches as of the study of the German language and literature. Nowhere else are there so many and excellently trained teachers; nowhere else is the history of literature, of art, and of thought studied as extensively and scientifically. Yet the outward equipment of the department presents a decided contrast to this favorable status of teachers. Whereas Cornell

¹ Bostoner Anzeiger, No. 552, March 25, 1899.

possesses its Zarncke library; the University of Pennsylvania its Bechstein library, and even so small an institution as the University of Rochester its Ranke library¹, we have nothing worthy of mention in the way of books or other special collections.

If we succeed in forming an institution that will bear the proper relation to teachers, there is no doubt but that in a few years Harvard will be the chief seat and central point of Germanic studies in America. That is what we have in mind. As Dr. von Holleben has so beautifully expressed, we desire to prepare a home for German thought. We desire to raise a structure in which all the phases of national history shall be represented in a modest degree, but in typical views, from the oldest pile dwellings and viking vessels, the magnificent architecture, sculpture, and painting of the Middle Ages down to the glorious period of Weimar, and, finally, to the days of the Niederwald memorial and the German Reichstag; in truth, an undertaking that will be a milestone, not only in the history of Harvard University, but in the development of scientific life in America.

An address by Prof. Hugo K. Schilling followed. He said, in effect:

I hardly know what I can add to what has already been said. Permit me, then, to give a somewhat more accurate description of the proposed museum as we hope it to be. Only the barest outline could be given in the appeal made by the German department some time since in the Harvard Graduates' Magazine. Dr. von Holleben has referred to the Germanic museum in Nürnberg, which presents itself to us as the highest ideal of such a collection, and the masterly arrangement of which we shall, as far as possible, take for our model. For us, of course, this ideal is in many respects unattainable. Nor can it be our aim, like the national and provincial museums of Europe, to collect and preserve the original productions of past epochs of national culture in greatest variety. The proposed museum has a purely educational purpose in view. As Mr. Putnam says, it is to enable us to apply the method of object teaching to the academic study of antiquity and of the history of art and literature, and thus to bring before the mind in a realistic way the material and intellectual culture of our ancestors; it is to be a practical means for helping students to penetrate more deeply into the thought and feeling, the laws and morals, the faith and customs of the German nation. It must not be forgotten that the public at large takes a lively interest in such collections, and that it is susceptible in a high degree to their educational influence. Our museum, therefore, will lead to a proper appreciation of the results of German culture by broader circles of this country.

To attain this purpose in most cases, plaster casts or galvano-plastic reproductions of objects, together with models, photographs, plans, and drawings suffice; no great collections of things similar in kind are required, but only a few typical representatives of each class. In this way, as far as possible, the whole development of Germanic or German culture may be represented from the period of the separation of the Indo-Germanic tribes to the close of the Middle Ages, and, if means permit, to the present day.

Pertinent material exists in great measure; all relative to the most ancient times is confined almost exclusively to what has been found in graves, namely, weapons, tools, and ornaments. As regards the transition period from the stone to the copper and bronze ages, discoveries in the oldest pile dwellings of Germany and Switzerland give an insight into an advanced state of culture that corresponds to a remarkable extent with that of the Indo-Germanic tribes at the beginning of their separate existence, as made known by comparative philology; much information is thereby obtained concerning the architecture of their dwellings, their domestic life, food, arms, clothing, utensils, ceramics, weaving, hunting, fishing, cattle-raising, and agriculture. From that time on, discoveries become more and more numerous. The extensive grave field of Halstatt, in Upper Austria, and the more recent pile-work remains of La Tene, in Lake Neuenburg, represent different stages of culture during the iron age, which, if not brought about by the ancient Germans was shared by them. From the time of Cæsar and Tacitus the Germans appear in the light of history, and it is easier to define more sharply their characteristics.

Later on we find a new and more abundant source in the literature of the Middle Ages, which must be first interpreted and made more forcible by the knowledge of antiquity. The proposed collection will be a direct help to the study of

¹ This statement is erroneous. Upon the author's inquiry, Registrar Herbert S. West replied that the University of Rochester possesses no "Ranke library," but that the university library contains not fewer than 85,000 volumes, of which many are German. Whether there be a Ranke library in the Theological Seminary or in the Mechanics' Institute, of Rochester, could not be ascertained.

literature by furnishing a tangible representation of the objects of which we must have a clear idea in order to understand many passages in ancient poetry, independently of the fact that for the comprehension of the intellectual energy of a nation a knowledge of its material culture is necessary.

The museum will be of the same practical use for the study of the history of art; in proportion as the plastic arts, in the higher sense, develop and acquire a national individuality, their productions in a museum of cultural history must gradually be brought into the foreground. As in every other instance, the historic development of art and skill, customs and manners must be typically illustrated; thus arms from the stone ax to the armorer's masterpieces of the fifteenth and sixteenth centuries; architecture from the pile hut, and the simple structures depicted on the hut urns, to the Germanic hall of the Anglo-Saxon, Middle High German, and old Northern literatures, to the imperial palace of Goslar, and the typical lord's castle, and the Romanesque and Gothic cathedrals; the development of shipbuilding from the single mast of the inhabitants of pile villages to the large rowboat of Nydam and the viking ship of Gokstad; that of sculpture, brass work, wood carving, and painting, from their beginnings to the masterpieces of Adam Krafft, Peter Vischer, Veit Stoss, and Albrecht Dürer.

From what has been said you will understand that the museum, as regards the latter part of the Middle Ages, will be more specifically German, and with reference to art, historical. As regards the earliest times and the first part of the Middle Ages, it will be more archaeological and generally Germanic. Consequently it will promote the study, not only of German and Old Northern, but likewise of Anglo-Saxon culture and literature, and that encourages me to hope that our project will be approved by Anglo-Americans and receive substantial support.

Henry W. Putnam said:

The members of the visiting committee of the German department of Harvard University have a double interest in the founding of a Germanic museum. In the first place, we share the national feeling expressed by the gentlemen who have spoken before me. Three of us, Messrs. Schlesinger, Peary, and Godfrey Morse¹ are of German extraction, and the others, as do all Anglo-Saxons, belong to the large Germanic race. As the historian, Freeman, has so often said: Germany is our first home, England the second, and America the third.

But what I desire to emphasize is that the museum will be not only a monument of German nationality, but a scientific institution affording students of philology and history what the natural history museum offers to zoologists and botanists and the laboratory to physicists and chemists. It will contribute to the application of modern pedagogical principles and materially advance instruction by observation, the concrete comprehension of reality. At the present day we learn more and more through the eye, by actual observation in contradistinction to mere theory. In this way time is saved, the imagination is quickened, memory is strengthened, and study is made much more interesting.

I well remember the mental torture which I suffered during my college life from reading the description of the Rhine bridge in Cæsar's Gallic war. At that time the greatest stress was laid upon grammatical construction and style. What a different impression this description would have made upon me if it had been illustrated by a model of the bridge and I had thus had a clear perception of one of the greatest military technical works of all times.

The reading of the Nibelungen Lied is dry and unprofitable if teachers treat the poem from a mere standpoint of language without giving true pictures wherever a good museum is at hand of the acting persons, their dress, aims, manner of life, and domestic surroundings.

The great progress which this method means is clear to all and we desire that our children should profit by it. As Baron von Holleben has remarked, we owe this method chiefly to German science, and Americans are more influenced by German science than we think. I acknowledge, with a feeling of pleasure, that we owe a debt of gratitude. We beg of you to-day to continue helping us on the way that you have pointed out to us. Although our country is politically more free than Germany, in matters of education we are to some degree more conservative and even reactionary. Through our race relationship the committee hopes to interest Americans in this project, and I hope that the German-Americans of Boston will take a special interest in demonstrating the art and practical methods of the Fatherland to the American students of the most prominent universities.

¹In the meantime Director Heinrich Conried, of New York, and Dr. F. W. Holls were made members of the visiting committee.

THE GERMAN PUBLICATION FUND OF AMERICA.

The German publication fund of America originated in the idea that the "cradle of German-Americanism" is the proper place for the publication of larger Germanistic works. The very interesting plan framed by Professor Learned reads as follows:

The German contribution to American history and culture has been by far the most important from the continent of Europe, and the ethnographical history of America, which is likely to be the history of the near future, must draw largely upon the study of the influence of the German people in the development of American life and institutions. The increasing interest in this German influence is fast extending to the Anglo-Americans, and many serious and well-trained investigators are turning their attention to this new field of research. A large amount of matter in the form of original documents and special studies is already awaiting publication, thus making it desirable and necessary to establish a permanent fund for the publication of matter relating to the history of the Germans in America.

The plan of this publication includes all matter of a scientific and documentary character touching the "literary, linguistic, and other cultural relations of Germany and America," with such specific divisions as the following:

1. The literary relations of Germany and America: (a) German literature written in America; (b) German literature reprinted in America; (c) American translations of German literature; (d) The influence of American literature in Germany.
2. The linguistic relations of Germany and America, comprising the German dialects of America and the influence of the German language.
3. The German drama and stage in America: (a) The German drama performed on the German stage in America; (b) The German drama on the English stage in America; (c) The literary influence of the German drama in America.
4. German music in America: (a) The history of the German music societies in America; (b) The influence of German music on American culture.
5. German Turner and other societies in America.
6. German art in America.
7. German science, philosophy, theology, and educational methods in America.
8. Commercial relations of Germany and America; German industries, trades, and mechanical arts in America.
9. The German press in America: (a) The native German press; (b) The relations of the German to the American press.
10. The diplomatic relations of Germany and America.
11. The Germans in American wars.
12. German-American biography.

The organization of a national committee of the German Publication Fund of America was set on foot at the University of Pennsylvania in May, 1899, and a local executive has been constituted, as follows: President, Dr. C. J. Hexamer, president of the German Society; treasurer, C. C. Harrison, jr., 123 South Fourth street, Philadelphia; secretary, M. D. Learned, professor of German at the University of Pennsylvania.

The national committee, consisting of representative Germans and Americans, is being constituted of persons who are willing to guarantee contributions ranging from \$100 to \$5,000 to the fund. Smaller amounts will be gladly received. The sum asked for is \$100,000, which will be so invested as to secure a permanent income for the publications and to make all matter available as soon as ready for publication.

To all members of the national committee copies of the works published out of the fund will be sent gratis.

The names of the contributors will be published with each separate volume or monograph.

All matter submitted for publication will be expected to reach a high academic standard in order to be accepted.

Subscriptions of money and contributions of original studies (written in English or German) or other material, manuscripts or prints, will be welcomed from any part of the world.

The publications will be circulated through the regular channels of the book trade, and the proceeds from sales will be applied to the fund.

The publications thus put on a permanent basis will constitute a splendid and lasting monument to the Germans in America.

Subscriptions may be sent by check direct to the treasurer, C. C. Harrison, jr.,

123 South Fourth street, Philadelphia, Pa. Subscribers, who so prefer, may pay their subscription in five or ten monthly installments.

CHARLES J. HEXAMER.
SAMUEL W. PENNYPACKER.
JOSEPH G. ROSENGARTEN.
CHARLES C. HARRISON, JR.
MARION D. LEARNED.

As far as we know, no large amount has been received from subscriptions; in fact, very little has been contributed to the fund besides the sums realized from two benefit plays which were presented by Director Conried in New York, and will be spoken of later.

As Professor Learned states in an article in the *University of Pennsylvania Bulletin*, April, 1900,¹ the idea of establishing the Publication Fund was suggested by the fact that the editor of the *Americana Germanica* received entirely too many and too comprehensive articles for publication in his work. The idea will probably be realized after one leader has been found whose example will inspire other rich men.

The good cause seems to have found such a man in Director Heinrich Conried, of the German theater in New York. So far he has given benefits for five universities in the East, and has furthermore promised to present annually the amounts realized from one performance each for the German Museum in Harvard and the Publication Fund in Philadelphia. Moreover, he is connected with several other institutions, to which he gives the same generous offerings for Germanistic purposes.

So far Director Conried has given the following benefits: (a) Harvard: Goethe's *Iphigenie* (1900), Lessing's *Minna von Barnhelm* (1901); (b) Columbia: The same plays; (c) University of Pennsylvania: Lessing's *Minna von Barnhelm* (1899), *Fulda's Friend of Youth* (1900), Schiller's *Robbers* (1901); (d) Cornell: Lessing's *Minna von Barnhelm* (1901); (e) Yale: The same play.

In the course of time benefits are to be held for Johns Hopkins University and Vassar College. To make these offerings the whole company of the New York theater travel to the place in question and take all the necessary equipment along. The attendant expenses are, of course, very large; nevertheless, in each case the total receipts were presented to the beneficiary. Harvard received about \$2,500.

The importance of this generous support does not consist so much in the amount of money as in the sustained interest in the German theater, and, consequently, in the whole of German literature among American students and their teachers. The survival of only two, namely, those in New York and Milwaukee, of all the German theaters once in existence is, in no small measure, dependent upon the support given to them by educated Anglo-Americans. If interest in the preservation of good German art institutions is kept alive among this element, we may be sure that German art will always keep a few places of refuge in America. It is evident how intimately this question is associated with that of German instruction. Whoever has been inspired by German classical plays on the stage will learn to love the German language and not remain ignorant of its literature. By his excellent classical productions for American students Director Conried has won indisputable merit for promoting culture.

Under its two well-known managers, Messrs. Webb and Wachsner, the Pabst Theater Company, in Milwaukee, which presents plays in Chicago regularly once a week, has likewise given a number of benefits for the University of Wisconsin, the Northwestern University at Evanston, and the German-American Normal Seminary of Milwaukee, and has thus greatly furthered the cause in question. Although the old board of directors was dissolved last year the present management

¹The Conried and the German-American Publication Funds of America. Reprinted 1900.

seems inclined to follow their example in this respect. Naturally the more moderate means and smaller company of this theater do not allow the same munificence that is extended in the East. Some of the plays given at the Pabst Theater have already been mentioned; a full list could not be obtained.

Besides the gifts presented to the German departments by the German theater, the author learned of the following endowments for German purposes:

I. *Harvard*.—The Sohler fund, which gives an annual prize of \$250 for the best work on a subject from modern literatures.

II. *Columbia*.—The Gebhard professorship of the German language and literature has been established a long time. The Carl Schurz endowment is of recent date. The interest on the latter fund is to be devoted to a scholarship for the continuance of Germanic studies, and an annual sum is to be set aside for the purchase of German books.

III. *Johns Hopkins*.—The Bluntschli library was presented to this university. An annual sum of money is given by a German resident of Baltimore for the purchase of German books.

IV. *University of Pennsylvania*.—The Bechstein library has already been mentioned.

V. *Cornell*.—A large number of books have been presented, many by Andrew D. White.

VI. *New York*.—This university possesses (a) the freshman entrance examination prizes of \$100, (b) the Ridder endowment for the best Germanistic work, (c) the Germanic library presented by Ottendorfer. It will receive besides (d) the Ottendorfer scholarship, from which the sum of \$800 is to be paid annually to one student to continue his studies at a German university. A recent appeal was made to the Germans of New York in memory of the late Mr. Oswald Ottendorfer.

VII. *University of Michigan*.—The founding of the Goethe library has been already mentioned.

VIII. *University of Wisconsin*.—A collection of small endowments, including a sum of \$3,500 for a German seminary library, have been referred to.

IX. *The Washington University* in St. Louis, Mo., has received considerable amounts from Adolphus Busch, the noted brewer. One of his endowments is devoted to a German professorship.

X. *Stanford University*.—The founding of the Hildebrand Library has been referred to.

The renowned German publishing house of F. A. Brockhaus, in Leipsic, has presented several collections to different universities. The German Society of Pennsylvania received over 500 volumes from them.

The above list could not be made more complete. At all events, it is a proof that the cause of German instruction in this country does not lack zealous and sacrificing friends.

IV. BIOGRAPHICAL NOTES.

EDWARD EVERETT.

Though Edward Everett was not so well known in Europe as his elder brother, Alexander Hill Everett, his efforts for the advancement of German in America were by far more important. Born November 11, 1794, in Dorchester, near Boston, he graduated at Harvard with the A. B. diploma at the early age of 17. In 1812 he entered the university as tutor, but gave up his position in 1814 in order to devote himself to thorough scientific studies in German. How highly his abilities were valued at Harvard is proved by the fact that he was designated for the professorship of Greek prior to his going to Germany. He accepted the position later and fulfilled its obligations exceptionally well. He was not a worshipper of the "fetish," but endeavored to clear the way for modern studies and educational

reform. His contributions to the *North American Review* were no small force in bringing this magazine, published in Boston, into prominence. For three years, from February 5, 1846, to February 1, 1849, he was president of Harvard; his failing health, however, obliged him to resign. In 1834 he entered upon political life as member of Congress; the cooperation of so excellent a citizen could not be ignored in molding the fate of the nation. Until his death, January 15, 1865, he was not allowed to retire into private life. His accomplishments as a statesman have been so preeminent that his scientific worth, which we were not justified in ignoring, is apt to be overlooked.

GEORGE TICKNOR.

George Ticknor is best known to the public at large by his interesting *Life, Letters and Journals*, which were published in 1876, and in which he graphically portrays German conditions. Edward Everett and Ticknor were the first Americans to study at Göttingen and lay the foundation of the traditional "students of Göttingen," whose influence upon culture has been referred to. Born at Boston, 1791, he studied at Dartmouth College to adopt the profession of the law. Admitted to the bar in 1813, his desire for knowledge impelled him to go to Europe in 1815. From England he went to Göttingen, where he studied for two years with Everett. In 1819 he accepted the Smith professorship of French and Spanish literature and the college professorship of belles lettres at Harvard. In the year 1820 he was offered a professorship in the University of Virginia at a salary of \$2,500, which was not accepted. Prof. John B. Minor had said of this new institute: "The scheme adopted bears a close resemblance to that of a German university." Ticknor desired to carry out this resemblance at Harvard, and succeeded in enabling Follen to begin his German lectures there. An enthusiastic admirer of German literature, he praised its merits to Americans in the highest terms, and endeavored to remove all prejudices against Germany. With this end in view he discussed Griscom's book on Europe in the *North American Review*. His well-known *History of Spanish Literature* can not be treated of in this connection. He died January 26, 1871, after he had done his part toward founding the Boston Public Library.

GEORGE HENRY CALVERT.

George Henry Calvert, a native of Maryland, was probably the first resident south of Mason and Dixon's line who went to Göttingen, where he studied the German language and literature in 1823. He was a pupil of Beneke, profited by the works of Coleridge, and visited Goethe. As a worshiper of the prince among poets, he went to Weimar, and returned an enthusiast of the first order. His works—*Goethe, His Life and Works* (Boston, 1872), and *Charlotte von Stein* (Boston, 1877)—are a convincing evidence. His *First Years in Europe*, containing an interesting account of student life at Göttingen, had been published in 1866.

HENRY WADSWORTH LONGFELLOW.

The life of Longfellow is too well known to be considered here. To his lectures on Goethe's *Faust*, begun at Harvard in 1838, is due the fact that since then such have been introduced at all American universities. His *Hyperion*, published in 1839, is in part autobiographical, and, together with *Outre Mer*, aroused an interest in German life. Until 1854 he filled the Smith professorship of French and Spanish as Ticknor's successor. He was in turn succeeded by James Russell Lowell. He contributed much toward advancing Harvard, which was beginning to take its position as a leading school for the study of German. Longfellow's attitude toward German literature was fully defined in an interesting lecture delivered by Professor Learned in New York February 28, 1901.

MARGARET FULLER.

In his spirited essay on Margaret Fuller,¹ E. P. Evans states concerning the transcendental movement:

We can hardly form an idea of the ludicrous fear which German books excited in many educated persons of old and New England sixty years ago. At that time German writings were as suspected and forbidden in America as is American hog's meat in Germany at the present day. Many an anxious minister and pious father raised a warning cry against the moral trichinae with which these foreign conceptions of the brain teemed and threatened the life of the soul. It was bad enough if such productions were learned through abridged and revised extracts or had been thoroughly purified in the crucible of a purged translation, but the effect was much more pernicious if anyone dared to enjoy them in the original. The greatest foreign poets and thinkers were hailed with the flattering terms of "poisonous" and "pestiferous." As Goethe received the highest honor from students of German literature and was mentioned oftenest by them, he served as a scarecrow to those who knew him only by name. To overthrow the idol, Professor Felton translated Menzel's renowned work, which Margaret Fuller censured in the fourth number of the *Dial*. Even Longfellow, as charitable as he was, condemned *Elective Affinities* as a "horrible book." The great teacher of morals, Kant, who was obliged to serve as a support to crumbling orthodoxy, is decried by Lady Farrar in her *Recollections of Seventy Years* as the chief promoter of materialism and atheism and the instigator of all kinds of moral evil.

If such was the intellectual atmosphere of the period when the "Coleridgians" and transcendentalists first stepped into action they evidently had a great work to do before German ideas could find an appropriate home. The *Dial*, a weekly which appeared in 1840, was the exponent of these reformers, whose work can not be too highly estimated. Margaret Fuller had acquired her knowledge of German by self-study and quickly extended it by instructing men like Dr. Channing. She kept up a constant intercourse with the Emersons and the idealists of Brook Farm. The appreciation of Goethe as the "master par excellence," in which light he is regarded by many Americans of the present day, can be traced to the action of the *Dial*.

HORACE MANN.

The epoch-making activity of the great educational reformer is the more commendable as his chronic ill health and very limited means were serious obstacles in his way throughout his whole life. Born in Massachusetts, 1796, he studied at Brown College, where he taught for some time. In 1823 he became a lawyer. The irresistible desire to reform the educational system of his country influenced him to accept the position of secretary of the Massachusetts State board of education. According to Professor Emerson, Rev. James C. Carter, and not Mann, is the "father of the normal schools," as the former had already published his *Essays on Popular Education* in 1824 and his plan for normal education in 1826, that was discussed in the *North American Review* of May, 1827. Boone adds that the "Indiana Teacher's Seminary" had been founded in 1834 and the "Teachers' Association of Bowdoin College," in Maine, 1837, for the same purpose. Since, however, all these reforms were based upon the much older ideas of Francke, the dispute as to who has a right to claim the "fatherhood" means nothing. Posterity must decide upon the most successful execution of the thought. The palm must then be given to Mann, who overcame the greatest opposition. The endowment of \$10,000 given by Edward Dwight alone enabled him in 1839 to found the normal school, exclusively for women, in Lexington, Mass., afterwards removed to Farmington. His own means of support were partly derived from the *Common School Journal*, founded by him. His writings on education are among the best that the literature of pedagogics in America has produced. In 1852 he accepted

¹An American Idealist, in his "Contributions," Stuttgart, 1898, page 5 et seq.

the presidency of Antioch College, in Ohio; though the struggles that he endured to carry out his ideas of reform caused his early death in 1859.

HENRY BARNARD.

Barnard, born January 24, 1811, in Hartford, was not only fifteen years younger than Horace Mann but possessed a stronger constitution. He, therefore, saw the aims for which both strove with the same degree of fervor in a great measure realized. After he graduated from Yale and continued his studies in Europe he became a lawyer and was elected to the legislature of his native State, Connecticut, in 1837. Owing to his efforts public schools were placed under State supervision. He was made secretary of the State board of education, and as such proceeded to found a teacher's institute in 1839. The State Normal School of New Britain, planned by him, alone educated 2,258 teachers from 1850 to 1867. From 1855 to 1883 he most successfully edited the American Journal of Education, which is justly regarded as a pedagogical work of lasting merit. In 1857 he was made chancellor of the University of Wisconsin; in 1866, president of St. John's College, in Annapolis, and in 1867, first United States Commissioner of Education. Barnard filled this newly created office until the year 1870, and died at an advanced age in his birthplace July 5, 1900.

FRANCIS WAYLAND.

Wayland was born in New York in 1796, and in 1813 graduated from Brown University, Providence, R. I., to which his chief labors are confined. The result of his being president of this small institution was that the attendance, numbering only 150 students in the year 1849-50, rose to 252 in the year 1854-55. Nevertheless the "innovator" was not popular, and the majority of the trustees voted against the principles contained in his celebrated "Report to the corporation of Brown University on changes in the system of college education," in which he recommended the adoption of German methods of instruction. Because of the consequent friction he resigned in the year 1855, and died ten years later. Interesting details of his life, his labors as a writer on pedagogics and philosophy, and a sketch of his character are given in the work, *A Memoir of the Life and Letters of Francis Wayland*, by F. and H. L. Wayland, New York, 1867.

BARNAS SEARS.

The life of Dr. Barnas Sears, who lived from 1802 to 1880, shows to what an extent ideas of reform prevailed about the middle of the past century. He was the successor of Horace Mann as secretary of the State board of education of Massachusetts and of Wayland as president of Brown University (1855-1867). From 1845 to 1848 he studied in Halle, Berlin, and Leipzig, and associated with the most celebrated professors who taught there. He thus acquired a thorough understanding of German methods and applied them in practice. One of his pupils gives the following account of his way of teaching:¹

Sears laid comparatively little stress upon accidental mistakes and brilliant answers, but rather took the work of the whole year into question. The feverish anxiety with which we went to recitation ceased; the more talented and those less gifted could give their whole attention to the subject explained. Study was made agreeable and easy. Sears endeavored mostly to teach us to think, and guarded himself against impressing his pupils with his own views.

CHARLES FOLLEN.

Follen's name will always be inseparable from the history of American education, as he was the first to deliver German lectures at Harvard and introduce

¹ Tolman, *History of the Higher Education in Rhode Island*, page 138.

German athletics into the New World. Born September 3, 1795, as a student he took part in the wars for freedom and the founding of the Burschenschaft. In 1818 he had established himself as a private teacher, but since the deeply sensitive poet had yielded too strongly to his republican feeling in the well-known song, "Brause, du Freiheitsdrang, brause wie Wogendrang," he was obliged to flee to Switzerland, where a professorship in Bâle was bestowed on him. But as the Prussian Government demanded his extradition he emigrated to America with his friend and companion in suffering, Dr. Beck. How he became connected with Round Hill School, and his subsequent work at Harvard, have already been mentioned. After he lost his position at Harvard he became the minister of a Unitarian Church in New York, and afterwards accepted a call to East Lexington. Nevertheless he devoted a large part of his time to literary work and lecturing. Invited to lecture by the New York Mercantile Library, the steamer *Lexington*, on which he sailed February 13, 1840, took fire during the trip and Follen lost his life. His death was deeply lamented. In 1834 his younger brother Paul likewise came to America with Frederick Münch ("Far West") and the Giessener Emigration Society, and lived in Missouri till his death in 1844.

CHARLES BECK.

Charles Beck was born August 19, 1798, in Heidelberg, and through the influence of his stepfather, De Wette, professor of theology, went to Berlin, where he completed his studies. His stepfather being suspected of favoring plots against the Government, as the burschenschaft movement was considered, he lost his position and was compelled to emigrate to Switzerland. Here Beck became intimately associated with Follen, and went with his friend when he fled to America. Soon after his arrival in New York he announced his intention of becoming an American citizen, and the Republic has never had one more faithful. In 1830 he temporarily conducted a school in Philipstown on the Hudson, yet, as far as we know, he fulfilled the duties of professor of Latin at Harvard without interruption. After bidding farewell to the university he devoted himself with untiring zeal to his duties as a citizen and to private study. Twice he was elected to the State legislature, and at the same time he was a member of several learned societies and financial corporations. He visited Germany three times, partly for recreation and partly for literary purposes. At the outbreak of the civil war, although 60 years of age, he enlisted as a private in a company from Cambridge, and willingly assumed the heavy duties of a soldier's life. On account of his age, however, he was not accepted when the Army was mustered in. He made amends, nevertheless, by sending hundreds, fully-equipped, into the field of action. His generosity knew no bounds. While riding with his daughter he died suddenly from an apoplectic attack, March 19, 1866. The eulogies pronounced over him prove what an honor he was to the German name in America.

FRANCIS LIEBER.

Francis Lieber was born March 18, 1800, in Berlin. As a half-grown schoolboy he marched against Napoleon in 1815, and was wounded in battle. After graduating at Jena, his Philhellenism impelled him to take part in the Greek war for liberty; however, the undertaking was a great disappointment to him. His participation in the burschenschaft movement led to a long trial and forced him to emigrate. Unable to establish himself in London, he came to America in 1837, upon invitation of his friend Follen. Here he soon entered into personal and literary relations with the most prominent men in the "Athens of America." He was speedily associated with Josiah Quincy, president of Harvard; the renowned jurist, Judge Story; the historians Prescott, Bancroft, and Motley; the poet Longfellow; Senator Charles Sumner, and others. He was thus in surroundings

that enabled him to engage in his first American work as editor of the *Encyclopedia Americana*, based on the Brockhaus's *Konversations-Lexikon*, published by H. C. Carey, Philadelphia.

The work for the encyclopedia, which claimed five years of his time, gave him access to the circle of educated Americans. He engaged a full force of well-educated writers, though he himself wrote nearly all the articles on the subjects of history, political economy, and jurisprudence, and in this way foreshadowed the course of his future life in this country. It is hard to tell to what extent the dissemination of German ideas and the appreciation of German language and education are owing to the fact that Lieber produced the first American encyclopedia, and made use of the collective work of the best German writers.

After expressing his views on education in *Letters to a Gentleman in Germany* (1834), he was called to the professorship of history and political economy in South Carolina College, Columbia, S. C., in 1835. His leisure was employed in writing the following works: *Manual of Political Ethics* (2 volumes), *Legal and Political Hermeneutics* (1 volume), *Civil Liberty and Self-Government* (2 volumes).

These works excited the greatest attention and occasioned his call to the chair of history and political economy at Columbia University (1857). Political conditions rendering his further stay in the South unpleasant, he had resigned his professorship. His inaugural address in his new position, delivered February 17, 1858, treated of the necessity of the studies of history and political economy in free States and received great applause.

When the civil war broke out, he rendered valuable service to the Government. He was often called to Washington by telegraph to discuss important questions of the war and international law with President Lincoln. From the point of constitutional law he discussed secession in numerous pamphlets published by the Loyal Publication Society, of which he was the founder and president. His formation of a code of war, undertaken at the request of the President, was published as General Order No. 100, and distributed among all the staff officers of the Army. This work marks an epoch. Criticism has pronounced it a masterpiece of the first order, and *Bluntschli* published it as a supplement to his *Modern Law of Nations*.

Lieber's work at Columbia continued till his death, October 2, 1872, and was so successful because he applied German methods of teaching and never failed to try to make his pupils acquire a thorough understanding of the subject in question. At the end of every lesson he announced the passages from different authors that were to be read for the next one. All definitions, proper names, and dates were written by him on the blackboard, so as not to be misunderstood. Every student was required to have a well-bound notebook, in which blank pages were left for important comments. He understood how to sustain his pupils' interest, and his personal manner toward them was such that they loved and esteemed him.

JOHN LOTHROP MOTLEY.

Motley was born in Massachusetts, April 15, 1814, learned German upon the advice of Bancroft, and as a young student delivered a eulogy on Goethe. In 1832 and 1833 he studied with Bismarck at Göttingen. The prince wrote to his biographer, Dr. Holmes, in regard to his student life: "Motley was generally more studious than most of his companions. He did not speak German especially well, but nevertheless excelled by his intellectual conversation. In the autumn of 1833 we went to Berlin to continue our studies and lived together in a house on Friedrichsstrasse. Motley wanted to translate Goethe's *Faust* at the time, and attempted to write original German verse."

BAYARD TAYLOR.

Bayard Taylor had German blood in his veins, his grandmother having been a German. He was born in Pennsylvania, January 11, 1835, and taught when 17

years old, before his great European journey on foot, during which he visited Freiligrath and other great men. He learned German from books, having gained a great love for it through Howitt's *Rural Life in Germany*. During his second or third visit to Germany, in 1856, he became acquainted with Miss Marie Hansen, in the home of his friend, Bufe, to whom she was related, and married her October 27, 1857. His *Northern Travels* appeared simultaneously in German and English. In 1870-71, his celebrated translation of *Faust* was published and excited the greatest attention; his *School History of Germany*, published by Appleton in 1872, did not awaken much interest. His *Studies in German Literature*, on the other hand, published in 1879, were very well received after his death, which occurred in Berlin, December 19, 1878.

We can understand that President Andrew D. White could not have made a better choice than Taylor to open the German lectures at Cornell. What value the latter placed upon German instruction we learn from the following:

31 WEST SIXTY-FIRST STREET, NEW YORK, *March 15, 1875.*

Messrs. O. OTTENDORFER, E. F. EBERSTADT and
OTHER MEMBERS of the COMMITTEE.

GENTLEMEN: I sincerely regret that my professional duties require me to be in Vermont this week and that I am thus prevented from being here to-morrow night. Otherwise, I should gladly accept your invitation to be present at the meeting in Cooper Institute, as the fulfillment of a pleasant duty. I consider one modern foreign language a most important branch of study; in my opinion, none other arises and develops the mental powers of children in the same way. From my observations and chiefly from the experiences gathered in a recent visit to the Western States, I am convinced that the study of German, where it has been introduced for three or four years, has fully justified its claim. Pupils that excel in German are not only far from being behind in the English branches, but are, almost without exception, first in them.

In Germany, the *Bürgerschulen* have attained the most brilliant results from the introduction of English instruction, and the graded schools of our larger cities hold about the same rank. Even if our system were inferior to the German in the treatment of studies and firm organization, we must not forget the high purpose at which it aims and which it must fulfill.

As I am about to leave, I have not the time to give further reasons for my hearty participation in your movement; moreover, I trust that the speakers of the evening will make this superfluous. In haste.

Respectfully, yours,

BAYARD TAYLOR.

OSWALD SEIDENSTICKER.

Oswald Seidensticker, the son of a lawyer, was born in Göttingen in 1825. On account of "acts of high treason" the father was compelled to spend fifteen years in prison and emigrate to America in 1845. Oswald accompanied him and devoted himself with great zeal to the study of philosophy and philology. After he had taught in Boston he was called to the University of Pennsylvania in 1867 to fill the German professorship. He performed the duties of this position with great success until his death, January 10, 1894.

Next to Frederick Kapp, Seidensticker is the most prominent German-American historian. His contributions to the *Deutschen Pionier* of Cincinnati, *Rattermann's Deutsch-Amerikanisches Magazin*, and the *Pennsylvania Magazine of History* are of great value, as are the following works: *Geschichte der deutschen Gesellschaft von Pennsylvania, 1764-1876*: Philadelphia, 1876. *Ephrata; a Story of American Convent Life*: Cincinnati, 1883. *Die erste deutsche Einwanderung in Amerika*: Philadelphia, 1883. *Bilder aus der deutsch-pennsylvanischen Geschichte*: New York, 1886. *German-American Events, principally of Pennsylvania, down to 1870*: Philadelphia, 1892. *The First Century of German Printing in America, 1728-1830*: Philadelphia, 1893.

ANDREW D. WHITE.

Few Americans have labored with the admirable zeal and the same degree of success to promote German instruction, make use of the fruits of German intel-

lect for the benefit of the American people, and last, but not least, to strengthen the friendly relations between both nations, as the illustrious representative of the United States in Germany, Andrew D. White. In 1855-56 he studied in Berlin, and afterwards, 1860 and 1866, enjoyed repeated opportunities of spending some time in Germany on diplomatic missions. The country and its inhabitants became very dear to him, and he exerted himself to learn all that could be utilized for the advancement of American civilization.

The industrial schools that have done so much to promote German industry were his special study. "In the years 1867 and 1868," he himself relates, "the opportunity was given to me to study this system with a view to its introduction into America, and I learned to realize, as I had never done before, what hearty patriotism, what earnest and intelligent effort, and what patient and hard work is devoted to the establishment and development of those schools."

In an address¹ delivered June 1, 1881, he stated:

It is said that the United States will have 100,000,000 inhabitants in the near future. The national characteristics of these will be German thoroughness, stability, and faithfulness, Anglo-Saxon energy and firmness, and Italian imaginative-ness. Does it mean nothing that a German element enters into such association? In America we are accustomed to speak of England as the mother country, but in the future a large number, if not the majority, of the population will claim Germany as the mother country, and one from which neither recollections of war nor wrongs on land or water will separate them.

It would take more space than we have at command to do justice to White as teacher, statesman, and author. His most important work is *A History of the Warfare of Science with Theology in Christendom* (2 volumes, 1896). In a speech delivered by Mr. White May 22, 1897, at the farewell banquet of the *Deutscher Liederkranz*, held in his honor, in New York, before he left for Berlin to enter upon his present duties,² he closed with the following remarks:

I go back to Germany as one of the same family, bound by the closest ties. I am going to visit a mother again—Mother Germania, who fears God and no one else on earth; a mother of art, science, and literature, who has spoken to us through Kant and Lessing, Goethe, Schiller, and Fichte; has done wonders of political wisdom through Stein, Scharnhorst, Bismarck, * * * and to-day furnishes an example of penetrating wisdom, resolute courage, and thorough care for all that goes by the name of civilization.

DANIEL C. GILMAN.

Daniel C. Gilman was born in Norwich, Conn., June 6, 1831, and in 1852 graduated at Yale College, where he received the A. M. degree in 1855. The title of LL. D. was conferred on him later by Harvard, St. John's College, Columbia University, Yale University, University of North Carolina, and Princeton University. From 1856 to 1865 he was librarian and from 1863 to 1872 professor of physical and political geography at his alma mater, and resigned this position to become president of the newly formed State University of California. In his inaugural address he said: "In these days, when so much that is new and important first appears in German and French, no system of education can be called liberal which does not include these tongues." Accordingly an important position was given to the modern languages. In 1875 he accepted the presidency of the Johns Hopkins University, which he has successfully managed for a quarter of a century. In an address delivered at Harvard in 1866 on *The Characteristics of a University* he drew attention to the American emigration to German universities, adding, "and the line which began with Everett, Ticknor, Bancroft, and Woolsey has been unbroken to this day. Through those returning wanderers and through the importation from Germany, England, and Switzerland of foreigners distinguished as profes-

¹ Quoted by Seidensticker in *Die erste deutsche Einwanderung in Amerika*, page 9.

² A very good extract from this speech is given by Evans, *Amerikanische Literatur- und Kulturgeschichte*, page 223.

sors—Lieber and Beck, Sylvester and Long, Agassiz and Guyot, and their compeers—the notion of a philosophical department of a university superior to a college, independent of and to some extent introductory to professional schools, has become familiar.”

The following, from the same speech, is particularly striking: “We need but few universities, but we need them strong.”

Later speeches referred to “university libraries” (Ithaca, October 7, 1891) and “Higher Education in the United States” (Chicago, 1893).

The above speeches form the contents of his interesting book, *University Problems in the United States*: New York, 1898. Among his larger works are the *Life of James Monroe* and an *Introduction to De Tocqueville’s Democracy in America*.

Gilman is corresponding member of the British Association and officer of public instruction in France. From 1893 to 1899 he was president of the American Oriental Society.

CHARLES WILLIAM ELIOT.

Eliot was born in Boston March 3, 1834, and graduated at Harvard in 1853. The years 1863 to 1865 he spent in Europe, in order to continue his special studies of mathematics and chemistry and to learn foreign methods of instruction from personal observation. The consequence is that since he has been president of Harvard (1869) he has labored to promote modern-language instruction, to introduce liberty of study, and to elevate his university to a scientific center that will occupy no subordinate position to German universities. With the exception of Professor Bartlett, who studied in Berlin and Bonn, all the professors of the German department were born in Germany. Most of the instructors, likewise, are native Germans or completed their studies in Germany. In Prof. Hugo Münsterberg the university has gained a very competent scholar for the professorship of psychology. The number of students that take the German course is far above one thousand.

In his address delivered in Cambridge at the close of the year 1889, upon occasion of the seventh annual meeting of the Modern Language Association, President Eliot made the following interesting remarks concerning his participation in the successful work of this society:

In 1875 we established, for the first time with us, the examination for admission in French or German, which I am sure you consider a considerable step toward the proper recognition of French and German in the secondary schools. But it was only in 1887 that we took here a step which I trust may yet be taken by many American institutions, namely, the putting of advanced examinations in French and German upon a par with advanced examinations in Latin, Greek, mathematics, and all other subjects at the admission examinations.

Since then this anticipation has been realized.

Among other works, Eliot has written the following: *Manual of Qualitative Chemical Analysis*, *Manual of Inorganic Chemistry*, *Five American Contributions to Civilization and other Essays*, and *Educational Reform*. The latter work has been much used for this report.

MARION DEXTER LEARNED.

Marion Dexter Learned was born near Dover, Del., July 10, 1857. He graduated at the Wilmington Conference Academy at Dover in 1876. After one year’s teaching in a public school in Dorchester County, Md., he entered the sophomore class at Dickinson College in the autumn of 1877. In 1878–79 he was principal of the public academy at Preston, Md. In the spring of 1878 he returned to Dickinson College, where he received the degree of A. B. in June, 1880, and that of A. M. in 1883. From 1880 to 1884 he was professor of languages at Williamsport Dickinson Seminary, Williamsport, Pa. In the autumn of 1884 he entered Johns Hop-

kins University as graduate student of German. In 1885 he matriculated at the University of Leipsic, returning to Johns Hopkins in the autumn of that year, where he was Fellow in Modern Languages in 1885-86, spending a part of the latter year also in Germany. He was instructor of German from 1886 to 1889, having received the degree of Ph. D. in 1887; associate, 1889 to 1893; associate professor, 1893 to 1895. In 1895, he was called to the professorship of the Germanic languages and literatures in the University of Pennsylvania. Among his writings are the following: *The Pennsylvania German Dialect*, Baltimore, 1889; *The Saga of Walther of Aquitaine*, Baltimore, 1892; *Beginnings of German Culture in America*, Baltimore, 1894; *The German American Turner Lyric*, Baltimore, 1895; *German at the University of Pennsylvania*, inaugural address, Philadelphia, 1896. He was founder and editor of the *Americana Germanica* (quarterly); among his contributions to this journal are: *Ferdinand Freiligrath in America*, Francis Pastorius' *Bee Hive*, and *Schwenkfelder Documents*.

Occasional addresses separately printed: *Bismarck's Service to German Culture*, memorial address, New York, October 18, 1898; *German as a Culture Element of Education*, Cincinnati, 1898; *National Education and World Culture*, president's address before the Teachers' Union, Philadelphia, 1900; *Germanistics and Polite Literature in America*, read before the *Deutscher Verein* of Columbia University, December 19, 1900.

Learned is president of the National German-American Teachers' Association, 1899-1901.

HENRY WOOD.

Henry Wood was born July 7, 1849, in New Bedford, Mass.; graduated at Haverford College in 1869; studied in Berlin and Leipsic, and graduated from the latter, in 1879, as doctor of philosophy. After teaching two years at the Friends' School in Providence, R. I., he was called to the Johns Hopkins University in 1881, where he has been engaged for the past twenty years. From 1885 to 1892 he was associate professor, and since the latter date he has been professor of the Germanic languages. Besides his critical edition of Goethe's *Faust*, he has published several articles on German literature in the *American Journal of Philology*, and the *Quarterly of the History of Literature*.

KUNO FRANCKE.

Kuno Francke, principal of the department of Germanic languages and literatures at Harvard University, was born in Schleswig-Holstein; studied in Germany under Giesebrecht, and graduated in Munich in 1878. After working for two years under Waitz at the *Monumenta Germaniæ Historica*, he was called to Cambridge ten years ago, since which time he has considered it his chief duty to reconcile German and American culture. The following works have been published by him: *Social Forces in German Literature*, New York, 1896, third edition, 1899. *Glimpses of Modern German Culture*, New York, 1898.

At the Goethe memorial celebration in New York and Cleveland he recently delivered a most interesting address on Goethe's *Vermächtniss an America*, in which he illustrates the many relations that have existed, and still exist, between Goethe and the intellectual life of America in a masterful way.

HANS CARL GÜNTHER VON JAGEMANN.

Hans Carl Günther von Jagemann, professor of Germanic philology at Harvard University, is German born; began his studies in Leipsic and completed them at the Johns Hopkins University. As president of the Modern Language Association and coeditor of the *Modern Language Notes* he exerts a wide influence. From 1886 to 1889 he was professor of the German language and literature at Indiana University, whence he was called to his present position.

WILLIAM HENRY CARPENTER.

William Henry Carpenter, born in Utica, N. Y., in 1853, is at the head of the German department of Columbia University in New York. Like his predecessor, Boyesen, he taught at Cornell University, and continued his studies at the German universities of Leipsic and Freiburg. His study of Icelandic took him to Copenhagen and Iceland, and for his doctor's thesis he published the epic *Nicolasdrapa Halls prests*, which had not been printed before. Since 1883 he has been at Columbia, where the regular professorship was given to him in 1895.

CALVIN THOMAS.

Calvin Thomas, born in 1854, studied in his native State, Michigan, at the University of Michigan, where he graduated in 1874. After some practice in teaching he went to Germany to study philology for several years at Leipsic. From 1879 to 1896 he taught at the University of Michigan, after which he devoted a summer session to the study of Goethe in Weimar and was then called to Columbia, where he has since held the so-called Gebhard professorship. The list of his writings is too long to be given here; his commentaries on Faust, parts first and second, as well as his other contributions to Goethe literature (*Goethe and the Conduct of Life*, 1886), however, may not be omitted.

ARTHUR H. PALMER.

Arthur H. Palmer, head of the German department of Yale University in New Haven, studied at the Western Reserve University in Cleveland, where he graduated in 1879. He continued his studies for several years in Germany and Scandinavia, and since 1891 has had entire charge of German literature and philology as well as the Scandinavian languages at Yale University.

GUSTAV GRUENER.

Gustav Gruener, professor of German at Yale, was born in New Haven in 1863, graduated at Yale in 1884, and continued his studies there until 1887. For two years he studied in Berlin and Munich, and in 1889 entered the German department of his home university. In 1892 he was made assistant professor, and full professor in 1897.

HORATIO S. WHITE.

Horatio S. White, dean of the faculty and professor of the German language and literature at Cornell University, Ithaca, N. Y., has been at the head of the German department since 1891. Born in Syracuse, N. Y., in 1852, he studied at Harvard University, where he graduated in 1873, and afterwards continued his studies in Europe for several years. In 1878 he was admitted to the bar in New York, but gave his attention to philological studies and was made professor extraordinary of German at Cornell University in 1883. As a member of the Weimar Goethe Society he is in direct relation with Germany. He is coeditor of the *Americana Germanica* and the author of many works, of which his *Deutsche Volkslieder* was published in 1892.

JAMES T. HATFIELD.

James T. Hatfield, professor of the German language and literature at the Northwestern University at Evanston, Ill., graduated in 1890 at the Johns Hopkins University, and immediately afterwards assumed the duties of his present position. The prosperity of the German department at that university is the best evidence of his efficient worth. He is the author of many writings.

HENRY COHN.

Henry Cohn was Hatfield's faithful assistant until his death, which occurred suddenly March 21, 1900. Born in Breslau in 1847, he emigrated to America as a boy. In 1867 he graduated at Columbia College and later studied history, philosophy, and Germanistics in Berlin for three years. After teaching at different higher schools, he was made professor at Amherst College in Massachusetts in 1876, and afterwards resumed the direction of the German department of the Summer University of Chautauqua; he discharged the duties of this position with marked success until his death. He was also director of a school for languages in Chicago, and in 1893 assumed the duties of his late position as assistant professor of German at the Northwestern. His first work there was the foundation of the Deutscher Verein and the Deutscher Litteratur Verein, which have both flourished to such a degree that a special German clubhouse is under discussion; the plans have been drawn and well-to-do German-Americans have promised the funds. The work of these associations claimed a great deal of his time. As he directed the Sunday school of the Sinai Congregation in Chicago, and instead of resting during vacation was obliged to do the extensive and difficult work in Chautauqua, we can understand that he undertook too much. His mind was so centered in his profession, however, that he would not allow himself any rest. All his personal friends, among them President Rogers, and the tributes paid to him by the press, unite in commending his high idealism. His willing denial of the rewards of this world to give himself up completely to the ideal may be compared with the character of the celebrated philosopher Baruch Spinoza, who dwelt altogether in the higher world of his thoughts. An excellent life-size portrait of him is a lasting ornament to the German seminary of the Northwestern.

WILLIAM HENRY ROSENSTENGEL.

Born September 10, 1842, in Barmen, William Henry Rosenstengel followed the profession of teaching and accepted a call to America as teacher and director of a private school in St. Louis in the year 1865. Afterwards he was appointed teacher of German at the Central High School of the same city, and was called to the State University of Wisconsin in 1879. Here he enjoyed the satisfaction of seeing the same increased interest in German that was manifested in most other universities, and that inspired him anew to devote all his energies to the German cause. He was particularly active in publishing popular scientific lectures and contributions to the press, and also wrote a series of articles on educational subjects. He found a special field of labor in the German-American Teachers' Association, of which he was president for a long time, and in the Normal School of Milwaukee founded by it.

In its eulogy on Professor Rosenstengel the Milwaukee Sentinel states "that he was the only German teacher when called to the university, and that he lived to see the number of his assistants increase to eight. During this period of prosperity and growth, he was the head of the department. For some years Dr. E. K. J. H. Voss had been assistant professor and relieved him of a part of his work. In the history of the university, however, the name of Rosenstengel will always be associated with the epoch of its greatest development. Let us reflect for a moment: When he came, the institution did not number 400 students, that were accommodated in 3 buildings. When he died there were 2,400 students instructed in 12 buildings."

H. HUSS.

H. Huss, professor of German in the John C. Green School of Science of Princeton University, was born in Thüringen in 1847, studied at Jena, where he graduated in 1870. To study the Romanic languages thoroughly, he spent some time in

Geneva, Florence, and Naples, and taught German six years in Rome. From there he was called to Princeton, where he has had leisure to write many works.

A. B. FAUST.

A. B. Faust, professor of German at the Wesleyan University in Middletown, Conn., was born of German parents and studied at Johns Hopkins University, where he graduated in 1892 as doctor of philosophy. Since 1896 he has directed the German department at the Wesleyan University. Among his writings the biography of the so-called "poet of both hemispheres," Charles Sealsfield, is most interesting to the general reader.

CHARLES FREDERICK RICHARD HOCHDÖRFER.

Charles Frederick Richard Hochdörfer, since 1891 professor of modern languages at Wittenberg College, in Springfield, Ohio, was born in Magdeburg in 1854, studied in Berlin and Halle, and, after teaching for several years, accepted a call to America in 1884. Having written an interesting work entitled *Observations on the Language of the Court of Love*, he graduated at Harvard University in 1888. During the summer vacation he likewise lectures at the University of Chicago.

LAWRENCE A. MCLOUTH.

Lawrence A. McLouth is the head of the German department of the University of New York. Like Calvin Thomas, he was born in Michigan, and graduated at Ann Arbor in the year 1887. For some time afterwards he directed a high school. After pursuing philological studies in Heidelberg and Leipzig, he returned to America as a teacher at New York University, where he has occupied his present position since 1895.

EUGENE H. BABBITT.

Eugene Howard Babbitt was born in Connecticut in 1859 and studied at Harvard, where he graduated in 1886 with distinction. Twice he interrupted his teaching at this institution and the Massachusetts Institute of Technology to devote himself to study in Berlin, Paris, and Copenhagen. From 1891 to 1900 he was instructor at Columbia, and then accepted the professorship of modern languages at the University of the South in Tennessee. Among other writings, he has published the following interesting treatises: *Modern Languages as a Means of Intellectual Training*, *The Preparation of Modern Teachers of Language for American Schools*, and *The Pronunciation of English in New York and Neighborhood*. He possesses an excellent knowledge of the German language.

STARR WILLARD CUTTING.

Starr Willard Cutting, the director of the German department of the University of Chicago, graduated in 1881, continued his studies in Germany, and taught modern languages at the University of South Dakota and Earlham College in Richmond, Ind. In 1893 he graduated in Baltimore, and was then called to Chicago.

HERMANN COLLITZ.

Prof. Hermann Collitz has directed the German department of the excellent woman's college in Bryn Mawr, Pa., since 1886. Born in Hanover in 1855, he studied in Göttingen and Halle, and established himself as a private teacher in Halle in 1885. Professor Collitz has made a reputation for himself by several important scientific works.

LAURENCE FOSSLER.

Professor Fossler, who has had charge of the German department of the State University of Nebraska since 1889, was born in Germany in 1857 and came to America in 1871. He went to school in Lincoln, but pursued his scientific course at German high schools. On his return to America he was engaged at the high school of Lincoln, and was called from there to the university.

GEORGE ALLISON HENCH.

George Allison Hench was born in Pennsylvania October 4, 1836, graduated at Lafayette College, Easton, in 1855, and then studied at the Johns Hopkins. In 1857-58, he continued his studies in Berlin and Vienna; in 1858-59 he was a fellow at Johns Hopkins, and graduated there as doctor of philosophy. The year 1859-60 he spent in Europe, and was called from there to the State University of Michigan, where he remained, first as teacher, and subsequently as director of the German department, till his untimely death, the result of an accident, in 1899. His doctor's thesis referred to the *Fragmenta Theotisca*, and determined the course of his scientific study. His first work was entitled *Monsee fragments; newly collected texts with introduction, notes, grammatical treatise, and exhaustive glossary and a photolithographic facsimile*; Strassburg, Trübner, 1891. The second was entitled *Alt-Hochdeutsche Isidor, Facsimile Ausgabe des Pariser Codex nebst, kritischem Text der Pariser und Monseer Bruchstücke*, Strassburg, Trübner, 1893. Besides these works he published valuable contributions to the history of the German language and literature in the *Journal of Germanic Philology*, and in the *Modern Language Notes*. In a eulogy on him by Professor Learned, in the *American Germanica*, he says: "As a teacher he was highly successful, and the testimony of those who were influenced by him is expressed in such words as 'his ideals were so high, his vision was so broad.' He brought to his teaching that peculiar stimulus which comes from early distinction. At the age of 30 he had won international recognition and esteem." The loss of a man like Hench is very hard to replace.

HERMANN SCHOENFELD.

Hermann Schoenfeld, professor of German and of European history at Columbian University, in Washington, was born in Oppeln in 1861 and studied in Berlin, Breslau, and Leipsic. Called to Providence, R. I., in the department of modern languages, in 1888, he contributed many articles to the most important German magazines here and abroad. Many have been made use of for this work and have been given among the works of reference. From 1891 to 1893 he was instructor at Johns Hopkins University and published articles on Brandt and Erasmus, Erasmus and Rabelais, and Slavonic literature and history. He was then sent to Russia on a commission of the American Government and spent two years there. As a result of his travels he published his work on Higher Education in Russian, Austrian, and Prussian Poland, and *The Purposes of the Great Siberian Railway*. Since 1895 he has been professor in Washington and has edited *German Historical Prose*, *Mary Stuart*, and *Ranke's Charles V.* Numerous articles in *Johnson's Universal Cyclopedia* and *Brockhaus's Konversations-Lexikon* are by him. Since the beginning of the year 1901 he has been professor at the summer school at Cornell University.

GUSTAF E. KARSTEN.

Gustaf E. Karsten, professor of German at the Indiana University, Bloomington, Ind., was born in West Prussia in 1859 and studied in Leipsic, Königsberg, Heidelberg, and Tübingen, where he graduated as doctor of philosophy in 1883. Until he was called to his present position he was lecturer of Germanic and

Romance philology at the University of Geneva. Since January 1, 1897, he has edited, at a great personal sacrifice, the *Journal of Germanic Philology*, which is of the greatest value to all who aspire to a thorough knowledge of the researches that have been made in English and German.

OTTO HELLER.

Otto Heller, professor and, for the time being, only teacher of German at Washington University, St. Louis, has been laboring unremittingly for the good cause since 1893. Heller is German by birth and education and completed his studies abroad.

JULIUS GOEBEL.

Julius Goebel was born in Frankfort on the Main in 1857; studied philosophy and Sanscrit in Leipsic and Tübingen; accompanied his father, the well-known German-American teacher, Louis Goebel, to America, and was called to the Johns Hopkins University shortly after his arrival in this country. Here he found the opportunity of becoming one of the most active members of the newly founded Modern Language Association. His lecture, delivered at the second annual meeting, in 1885, on German classics as means of education, was one of the most important given at the meetings of this association. The suggestion to study Goethe as "an independent ideal of modern culture, which is not based upon Greek and Latin authors," has become again a subject of earnest thought to later American teachers. His public lectures on the history of literature, delivered in 1886-87 at Johns Hopkins, were very successful. From 1888 to 1892 he edited the *Belletristische Journal* in New York, and has since been engaged at the newly founded Leland Stanford Junior University, in California. In 1894 he succeeded in acquiring the celebrated Rudolf Hildebrand library for this university. Among his numerous writings the following are, perhaps, the most interesting to the general reader: *The Ueber die Zukunft unseres Volks in Amerika*; *Faust Studien*; *Zur Geschichte der Siegfriedsage*.

HENRY RAAB.

Henry Raab, a prominent teacher in Belleville, Ill., wrote to the author concerning his life work, in January, 1901:

What I have done for the introduction and extension of German instruction in public schools is confined to my work as teacher and superintendent of schools in this city. In the year 1857-58 I was a teacher in the elementary schools, and instructed only in English; the second year, 1858-59, I was allowed to teach German one hour a day, but the following year this permission was revoked.

In 1859-60, at my suggestion, German was introduced into the course of study from the fifth grade up to the high school, inclusive, and I was appointed as German teacher. Under great difficulties I taught four hours a week in each grade. Receiving no support from the class teachers, I became dissatisfied and requested a grade for regular instruction. From that time German was taught in the classes whose teachers understood the language. In this way German gradually received less and less attention until I agitated the subject by publishing articles in the local press during the years 1865 and 1866. I succeeded in having German taught in all classes by special teachers. After the death of the most deserving, Mr. George Bunsen, I was appointed superintendent of schools in Belleville. As many objected to German on the plea of the extra expense of special teachers, I arranged that a German teacher should have charge of every other class and teach German in both classes. Besides, I distributed the teachers so that children learn German a half hour every day during their first year at school. In all other grades German is taught one hour a day, and this arrangement obtains at present. * * *

My opinion is that teachers do not influence by their thinking, speaking, and composition, but by the way in which they conduct themselves with their pupils and colleagues and appear in public. Whenever it has been possible I have spoken German with teachers and pupils, have read the classics and German works on

pedagogics in German to English-speaking colleagues, and have always shown myself a German. I believe that I have done more in this way than by writing.

OTTLIE HERHOLZ.

Miss Ottilie Herholz, born in Thorn, Prussia, comes from a family that has followed the profession of teaching for two hundred years. She attended the high school for women, the normal school, and the University of Berlin. From 1872 to 1890 she taught in the public schools of Cincinnati. With the title of professor extraordinary she has since 1890 been at the head of the German department of Vassar College, Poughkeepsie, N. Y., an institution intended exclusively for the higher education of women.

HANS FROELICHER.

Professor Froelicher was born in Switzerland and studied in Munich and Zurich. In 1886 he graduated as doctor of philosophy at the latter university, and in 1888 was called to the Woman's College in Baltimore, where he first taught French. Since 1891 he has had charge of the German department, and has an able assistant in his wife, Dr. Frances Froelicher.

EMIL DAPPRICH.

Emil Dapprich was born in Germany and educated at the normal seminary in Usingen. In 1865 he came to Baltimore, where he taught at Scheib's school until 1875. From 1875 to 1882 he taught in the public schools of Belleville, Ill., and was subsequently made superintendent of public schools in Belleville and St. Clair County at the same time. When he was called to his present position of director of the German Normal School of Milwaukee, which he has held since 1888, the school board of Belleville had reason to regret the loss of the services of a faithful, energetic, and self-sacrificing teacher, and an educator of rare training of mind and heart.

KARL KNORTZ.

Karl Knortz, superintendent of German in Evansville, Ind., was born in Wetzlar, studied in Germany, and then went to London. In 1864 he came to America. While he was teaching at the school of the Seminar-Verein of Detroit he made a study of the Indian language in that district. From Detroit he was called to the high school in Oshkosh, Wis., in 1868, as professor of the German language and literature. In 1871 he went to Cincinnati, where he took charge of the German department of the city normal school, and in 1874 edited the fifth volume of the *Deutscher Pionier*. From there he went to Indianapolis, where he edited the German paper. Later he settled in Johnstown, Pa., where he officiated as speaker of the Free Congregation. In 1882 he went to New York, where he established himself as private teacher and devoted himself to literary work until he accepted his present position in Evansville.

Knortz is undoubtedly the most prolific German-American author, as the following list of his works shows:

Tales and Legends of North American Indians. Jena, 1871.

From the Wigwam, Old and New. Tales and Legends of North American Indians. Leipsic, 1880.

American Sketches. Halle, 1876.

From Trans-Atlantic Society; Pictures of North American Civilization. Leipsic, 1882.

Mythology and Civilization of North American Indians. Leipsic, 1882.

Capital and Labor in America. Zürich, 1881.

State and Church in America. Zürich, 1882.

Pictures of American Life; Sketches and Diary Notes. Zürich, 1884.

- The North Pole Travels of a German Sailor; William Nindemann's Recollections of the North Pole Expedition of the *Polaris* and *Jeannette*. Zürich, 1885.
 Longfellow; A Literary Study. Hamburg, 1879.
 An American Shakespeare Bibliography. Boston, 1876; second edition, 1877.
 Shakespeare in America; A Literary Study. Berlin, 1882.
 American Poems of Modern Times. Free translations. Leipsic, 1883.
 Modern American Lyrics. Leipsic, 1889.
 Two American Idyls: Elizabeth, H. W. Longfellow; Snow Bound, by J. G. Whittier. Translated. Berlin, 1879.
 Longfellow's Hiawatha. Translated and explained, with introduction. Jena, 1872.
 New Poems. Glarus, 1884.
 Humorous Poems. Baltimore, 1877; Glarus, 1889.
 Songs and Romances of Old England. Köthen, 1872.
 Scottish Ballads. Halle, 1875.
 Epigrams. Lyck, 1877.
 New Epigrams. Zürich, 1884.
 Representative German Poems; Ballad and Lyrical. German text with English translations. New York, 1885; second revised edition, 1889.
 Goethe and the Werther Period, with the Supplement, Goethe in America. Zürich, 1885.
 Irish Tales. Zürich, 1886.
 Brook Farm and Margaret Fuller. Lecture. New York, 1886.
 Walt Whitman. Lecture. New York, 1886.
 Gustav Seyffarth; Biographical Sketch. New York, 1886.
 The Life and Works of Gustav Seyffarth. New York, 1886.
 Nokomis Fables and Tales of North American Indians. Zürich, 1887.
 Songs from a Foreign Land. Free translations. Glarus, 1887.
 History of North American Literature. Two volumes. Berlin, 1891.
 Hamlet and Faust. Zürich, 1888.
 German National Songs and Tales, with the Supplement, National Songs of Yorkshire. Zürich, 1889.
 Whitman's Leaves of Grass. Selected translations. 1889.
 How He Fell in Love with His Wife. An American story, by E. P. Roe. Leipsic, 1889.
 American Tales of Crime. Vienna, 1890.
 Rome in America. Zürich, 1891.
 The American Sunday. Zürich, 1891.
 A World Outlook in Quotations. Leipsic, 1892.
 The Christian-Communitistic Colony of Rappists in Pennsylvania. Leipsic, 1892.

V. EFFECT ON THE RELATIONS BETWEEN GERMANY AND AMERICA.

The visit which the German ambassador, Dr. von Holleben, paid to the German department of Harvard in the middle of March, 1899, did not fail to excite the attention of all the universities in the country. It was considered most desirable that Germany should receive more than occasional information of the extraordinary efforts made in so many places in the United States to cause the German language, literature, and science to become the common possession of all the educated, and of what positive results these efforts can show. The consequence was that several of the leading universities in succession invited the ambassador from Germany to visit them and become acquainted with their arrangements.

The first institution to approach the representative of Germany in this matter was the University of Chicago.

It is most becoming [the invitation dated June 3, 1899, reads] that American universities should strive for the honor and privilege of expressing the esteem

which the American people in general feel for the German Government and the German nation. Universities are specially called upon to acknowledge the influence of Germany on the educational system of the United States, and it must be furthermore acknowledged that Germany has, either directly or indirectly, promoted all undertakings of universities in this country. Americans honor Germans for their pioneer work in the advance of industry, art, science, civic virtue, and religion. We approve German military excellence, and we approve still more highly the successful efforts of Germany to maintain peace.

American universities cultivate a patriotism that is founded on the conviction that American institutions are best for Americans. Still, without being untrue to their duty, they are disposed to help all Americans to know and honor other nations. It is of special importance just at present that the fact should be generally known that the efforts toward civilization made by Germany and America are essentially the same.

American universities are more especially called upon to promote a sincere understanding between Germans and Americans on account of their close race relationship. This relation has been firmly established by a long, unbroken friendship and by the large number of loyal American citizens who claim Germany as their home, as well as by the interest manifested on the part of Americans for the union of Germany and its brilliant success in being recognized as one of the great powers of the world.

In his reply, dated June 29, 1899, the German ambassador said:

Surely no place can afford a better opportunity for becoming acquainted with the national spirit of a people than a university, the school of moral and scientific education, the birthplace of new ideas, and the center and battlefield of intellectual intercourse.

The meeting held January 24, 1900, was in accord with this promising prelude. All the representatives of the university vied with one another in their expressions of gratitude for what they owed to Germany during their school course and subsequent literary pursuits. As the speeches delivered on this occasion have more than a temporary significance, the most important are quoted. The proceedings took place at 3 o'clock in the afternoon in Kent Theater, and the attendance was so large that no seat could be obtained after 2 o'clock. The stage, on which seats were arranged for the faculty and their guest of honor, was decorated with the German colors and the Stars and Stripes.

President Harper delivered a short address, in which he referred to the custom of the university occasionally to invite prominent men at home and abroad to visit the institution, and that the present meeting was held to greet one of the most distinguished foreigners in the United States as a guest of honor of the university. Prof. J. Laurence Laughlin delivered the address of welcome to the representative of Germany, as follows:

PROFESSOR LAUGHLIN'S ADDRESS.

We are pleased to offer your excellency a sincere welcome to our university, not only because we gladly honor those who are honored by their own nation, but because you represent the majesty and the influence of the great German Empire in its relations to our beloved country, and because in you is placed the trust to separate the chaff from the wheat in the varying expression of national sentiment on the part of the inhabitants of the United States.

This will be a happy occasion if we are permitted to give the reasons why our permanent conditions of life necessarily seem to assure fraternal relations with Germans. The fundamental characteristics common to Americans and Germans should ever tend to peaceful relations and a sincere understanding.

We do not forget that English and American institutions are of Teutonic origin, and we can not forget the blood relationship. The institutions established in central Europe by the ancient Germans are still preserved in America under different forms. Our "commons" follow a custom that originated in the German "mark." The "mote" of the free Germans was a precursor of our "town meetings," in which our political life was originally rooted. In our whole legal procedure, our apprehension of law, and our strong manifestation of self-help we find the evidence of the survival of our Teutonic ancestors' sense of law. Americans and Germans grasp hands to-day and greet one another as successors of the same forefathers, not

as strangers, but as friends; not as different races, but as members of the same large family.

When a son leaves his parents' house to settle in foreign parts, he in the course of time adopts the expressions of his new surroundings; he develops new capabilities and has new desires, but in his inmost soul the elementary forces of his extraction continue to operate. If we take the old steel sword that hangs over an ancestor's portrait and convert it into a plowshare it will remain good steel and cut the field of the farmer as well as it cut wounds when held in the hand of the warrior.

Our present condition and our successes on the new continent are an evidence of the excellent political and administrative characteristics of the Teutons. We Americans have attained a power that must be heeded by other nations, because the only successful colonies of modern times are those founded by the Teutonic race. Strong in hope and self-government, a body of Teutons wander to find a new country, and by virtue of their innate regard for self-government they choose a leader and at once set zealously to work to conquer forest and field. The moral responsibility of citizens toward the state, their apprehension of law, their highly developed capabilities for administration make this race particularly qualified for the colonization of new countries. It is therefore only a consequence of natural talent in the English, Germans, and Americans that they are directing the different successful colonies of the present day; in the fulfillment of this task they are unequaled by any other race.

We must not forget that when our forefathers sought this country to found a new state in which freedom could prosper and religious freedom find a place of refuge, they were assisted by the Germans. The influence and strength of the German colonies can not be overestimated. The State of Pennsylvania, with its predominant German population, still preserves the elements which characterized its power during the Revolutionary war so forcibly. A great and important part of our Union was so colonized that German ideas of public and private duties penetrated the very heart of our institutions. The carefulness, prosperity, conservative mode of thought, and deep penetration of our German brethren have contributed much toward our growth. Where the Huguenots, Puritans, Dutch, and English are celebrated in the early history of our country, the teacher of history who knows something of Mühlenberg and other participators in the vital drama of the colonies will place the importance of German influence close by that of English. We began our existence together with German brethren, worked side by side with them in forming our nation, and we are glad to acknowledge our obligation to them. In no other great crisis of our more recent history have we gone to battle or council without standing side by side with German brethren.

He who has made but a superficial study of history may endeavor to arouse seemingly just prejudices between Germans and Americans by calling to mind the Hessians that were employed by Great Britain in her effort to oppress the colonies. The story has been repeated to Americans too often, and they were not told how the misery prevailing in the weak German States, at that time, made it possible for the rulers to sell peaceful shepherds for the purposes of war. The strong and intelligent part of Germany was not at all implicated; on the contrary, we received great assistance from the strongest State. Frederick the Great was secure on his throne and could judge aright. He was above the influences to which weaker rulers yielded, and consequently the young nation found in one of the former rulers of the central state of the present German Empire the best of friends. As we gratefully remember, it was Frederick the Great who concluded the first treaty with us after the Revolutionary war. When he was requested to allow the Hessian mercenaries to march through a strip of his territory, it was quite natural for him to give the dry, humorous reply: "Yes, but I should receive the cattle tax for them at least."

Nor can we forget De Kalb and Steuben, who endured want and the dangers of war out of devotion to our just cause. It is being more and more clearly proved that Washington prized Steuben especially as an experienced officer and drill-master, who transformed our militia into an excellent army. He was a welcome assistant in the forming of our young nation.

In later history we find ourselves under obligations to a number of Germans misjudged in their native country. About 1849 there came over to us Germans of excellent education and ability, men adapted for leadership, who possessed a thorough knowledge of their moral responsibility to their adopted country, and exerted a far-reaching influence on our national life. * * *

It is not a small matter to formulate the relationship between Americans and the 5,000,000 Germans who have made this country their home; some evil together

with much good has come over with them. We naturally speak of our English extraction and our limited connection with the mother country. It is limited, and we hope that the future will not make it more so, but we must not forget that we never have had any direct, strong influx of English blood. Since colonial times we have not had any important immigration from England, whilst no nation can ignore the weighty influence of a strong immigration such as our country constantly receives from Germany. The infusion of German blood into American life is an important political and social factor. For this reason Americans are better acquainted with the habits and customs of the Germans than those of the English. The result of these influences on our domestic and foreign relations can not easily be foretold nor can a low value be set on them.

Our material and political relations to Germans are important, it is true, but we are in much closer intellectual and spiritual union with them. Spiritual affairs are much stronger than agreements and political combinations. There is no American university that has not been inspired by German intellectual activity. We have visited the halls of German universities in numbers and kindled our lamps of knowledge at their altars. Love for truth and the holy incentive to knowledge and poetry Americans have found in Heidelberg, Göttingen, Tübingen, Bonn, etc. When we look down upon the red roofs and towers of Göttingen as upon the red flower of wisdom, encircled as it is by ancient lindens, we not only see the student quarters of Bismarck, but also the places where Bancroft and Longfellow buried themselves among their books. Of course, German universities were not the model of ours, but we adapted the spirit of their knowledge to our conditions.

As a university we therefore offer a sincere welcome to you, because you represent a nation that has given us scholars, poets, and musicians, and in the name of the brotherhood of knowledge we extend a greeting to it through you. Our indebtedness to German science is great: we can not pay it back. In the surrounding buildings appropriated to biological research the great German physiologists, Louis Helmholtz and John Müller, are honored as the fathers of their science. The brilliant successes of Liebig, Robert Bunsen, and other scholars have excited the greatest admiration from all who have directed the work in the building in which we are assembled. Germany is prominent in nearly all branches of scientific work; I need only recall Wundt, Fechner, Herz, and Röntgen. Her poets and authors are known in every American household; and we are particularly indebted to Germany for music, as Germans have done most to arouse an interest in music in the United States.

Stronger than written contracts and deeper than the desires of ambitious men are these elements of intellectual and spiritual life, in which the highest types of mankind in both countries are united and which bind us by ties that fire and sword can not separate. Child, parents, and grandparents—America, England, and Germany—united in loyalty to science, literature, and art; united in the desire to perpetuate works of peace and justice; united in the effort to keep the world free from war; united not by words, but by the closest family ties, may we live and prosper in such union.

The passages in which the speaker referred to the friendly relations between the United States and Germany were enthusiastically applauded.

The introduction of the German ambassador by Dr. Harper was the signal for a storm of cheers from the students. The band played the "Die Wacht am Rhein," after which Dr. Von Holleben spoke.

DR. VON HOLLEBEN'S ADDRESS.

To-day is not the first time that I have the pleasure of addressing an audience in Chicago. That beautiful June day, six years ago, when the wonders of the World's Exposition were a delight to all, is distinctly before me now. It was German Day, and the platform on which I stood was built on the shore of your glistening lake. Many thousands crowded into the German building, and the friendly voice of the late Carter H. Harrison still rings in my ears as he told me that he was mayor of the largest German city in the world, next to Berlin and Vienna. It was my pleasant duty on that day to express Germany's greeting to you. At the time I spoke of the great sympathy and true admiration with which the German nation is following the grand development of this country. I thanked you for the cordial reception extended to German exhibitors and German immigrants. My heart was filled with gratitude and pride because of the part taken by my native country in the Exposition. After the splendor had faded I wandered through the deserted streets of the White City and asked myself

the question: What is the greatest and noblest exhibit of my country? Magnetism drew me to that suite of quiet rooms in the palace of industry, visited by comparatively few, those twelve rooms that contained the exhibit of German universities. The collection represented the energy, knowledge, and life work of the greatest German scholars, and I felt that it represented German national life and German ideas most completely and gloriously.

Years have passed since, and the White City has become a dream of the past. My official duties called me far away from the United States; but since I have returned I feel called upon to direct my steps to the great educational institutions which are the embodiment of the noblest and highest efforts of nonpolitical national life. Thus I have come to you, and I do not regret it. Nor do I regret that my desire to know all of your great universities will compel me to undertake long journeys. Like you, we Germans do not think much of concentration of scientific research. It is often unjustly asserted abroad that the University of Berlin ranks first among German universities. That is not the case. We have no scientific Mecca, as the French possess in Paris, and we desire none. All German universities have the same facilities and follow the same purposes. I must confess that foreigners are attracted by the difference between your universities and ours. That difference is partly referable to the result of historic causes and partly to the principle, defended with so much spirit by Americans, of meeting the demands of modern science in as comprehensive a measure as possible, independent of local conditions.

What makes it difficult for foreigners to form a clear comparative judgment of your universities is the circumstance that they work with much greater helps in the form of colleges which about correspond in rank to the German gymnasiums. What fills us with admiration, however, is your practice of opening the doors of your universities to both sexes alike. We admire your generosity which enables teachers to spend their vacations at other educational institutions, so that their pupils may profit by the fruits of their study. We admire the number of popular lectures. We admire the method of controlling students' knowledge by frequent examinations, and thus inciting them to new effort, and the carrying into effect of the principle that teachers should be in direct personal contact with pupils.

I frequently hear abroad that German universities do not care to modify their character according to modern needs. This is not so. "University extension" has been introduced at different German universities; and at the present day, when one of the largest Eastern universities is hesitating to confer the degree of doctor on a woman, almost every German university has at least one woman doctor.

It may be true that students profit by restrictions during their academic course, but we Germans can not forget what influence this period of free academic life has had on the subsequent career of our greatest intellectual heroes. At all events, we Germans are following the development of your universities with attention, and a common intellectual tie binds German and American universities. Both are devoted to the investigation of the sciences in their highest form of expression, and the best scientific work is being done in the universities here as in Germany. It is not so in England and France, where scholars who are not teachers of the highest educational institutions of the country are doing the most scientific work. In Germany and America the principle obtains that the productive scholar is the best teacher. Here, as at German universities, the main stress is laid upon individual scientific research, and here, as in Germany, universities impress their characteristic mark on the life of the nation. In the universities of America the same spirit is cultivated and harbored as in those of Germany, and two nations united by the bond of generations of educated men can not do otherwise than harbor and cultivate the most friendly and cordial mutual relations. So long as this bond exists neither I nor any of my successors in Washington will ever be placed in a position to deliver other than messages of peace and sincere friendship from one country to the other.

One of the toasts upon the occasion, "University life as a common bond," was pronounced by Prof. C. von Klenze with great energy. After stating that no country on earth had contributed more to the progress of human culture than Germany, he went on to say that German ideas and scientific principles in American university life had gained the ascendancy over English traditions, which naturally preponderated twenty-five years ago. "Germany was the first to develop the principles which have become the common possession of all scholars and

unite those of all countries by a common tie. These principles bear a distinctly German mark impressed upon them by the intellectual integrity which is the chief feature of German national life. If Germany has gained this merit, America may claim for herself to have been the most willing to accept the principles developed by Germany and to have applied them most thoroughly, although they must have seemed unusually strange to American universities at first. In this way a new bond has been established between the two nations that will unite all men who devote their lives to scientific research. Each nation thus tills its own field and cuts its own stone for the great palace of a new civilization. When the first happy day dawns on which mankind can dwell in this palace that will have cost so much effort to build, Germany, which laid the firm foundation of the splendid structure, will be remembered."

This concluded the serious addresses of the day which has inaugurated so important an epoch in the history of the relations between Germans and Americans. By this visit of its representative, Germany has proved that it takes the same solid interest in the existence and further development of American universities that is manifested by all civilized nations toward the maintenance of institutions of culture, and recognizes in them institutions deserving of the same general esteem as the much older German models. Ambassador von Holleben has also visited the Johns Hopkins and has accepted an invitation from the Columbia University, New York, for April of the current year (1901). His experiences have left so favorable an impression upon the illustrious visitor, that he feels it incumbent upon him to continue his visits to institutions of learning. These events have likewise contributed, most undoubtedly, to strengthen the friendly relations between the two nations and have tended to promote the study of German in America, as well as to increase the number of American students in Germany.

In conclusion, we may briefly state that in recent times the same effort has been manifested in Germany to promote the study of English as has been made in America to advance the study of German. The fact, however, is not referable in the same degree to the better judgment of educators, since men like Professor Paulsen, of Berlin, by no means recognize its educational merit, but to the personal initiative of Emperor William II, who realizes the importance of English for commercial purposes and does not wish to see it sacrificed to the Greek "fetich." German students are learning English with the same zeal as Americans are pursuing the study of German, and the inevitable result must be that the two nations will understand and esteem each other better.

CHAPTER XV.

THE FIRST COMPREHENSIVE ATTEMPTS AT CHILD STUDY.

Topical outline.—Introduction—Report of Berlin Pedagogical Society: A. Circular letter—B. The questions submitted—C. Criticism of the returns—D. Mode of procedure—E. Classification and analysis of the concepts—F. Criticism of appliances for teaching—G. Historical ideas—H. Accomplishments acquired at home—I. Propositions for further procedure—J. Supplement: Results of subsequent inquiries at Plauen and Annaberg.

INTRODUCTION.

Early during the nineteenth century individual attempts were made in studying children with a view toward finding a solid basis for the science and art of education. Rousseau and Pestalozzi had given an impetus to a study of children's mental as well as physical actions and motives of actions. A little book entitled *Record of Infant Life*, by D. Tiedemann,¹ appeared in Germany about a hundred years ago. It was a mere fragment, but served the useful purpose of pointing out the way for others to work in practical psychology. During the middle of the century child study, or rather child psychology, as the Germans term it, became a most interesting subject to students of education in Germany.

In 1864 Professor Stoy, of Jena, began to subject the pupils of the practice school connected with his seminary to an examination which was intended to reveal their intellectual status, i. e., would show for what kinds of knowledge these children had an interest and how reproduction of the matter learned proceeded. His intention was laudable, but, though the investigation was continued for some time, the results were never published.

The second attempt, eminently successful in its results, was made in Berlin.

In Berlin the teachers had for many years arranged for regular courses of lectures for their own advancement, and during the winter of 1867-68 listened to a course of lectures on educational subjects read by Prof. O. Willmann, professor of pedagogy and philosophy, one of the foremost psychologists of his time. These teachers subsequently studied and reviewed his book, in which he had collected these and similar lectures. This led to the suggestion to investigate the minds of children newly received in school at the age of 6. The suggestion fell upon fruitful soil and resulted in the first attempt at examining children "en masse" as to the contents of their minds. It was

¹Translated by F. L. Soldan, superintendent of schools in St. Louis. Bardeen: Syracuse, 1890.

the purpose to find out what these children knew before the influence of school instruction began. The results of this attempt will be found below.

Since then many like en masse attempts have been made for a variety of purposes by medical men like Axel Key, in Norway, to investigate the physical conditions of growth; by Dr. Kotelmann, of Vienna, to establish the fatigue curve; by Prof. W. Preyer, to determine the stages of intellectual growth; by Dr. Berthold Hartmann, to analyze the juvenile contents of the minds of school children in the city of Plauen, Saxony; by Dr. T. L. Ziehen, to show the association of ideas in children; by Paul Möller, to diagnose weak-mindedness, and in late years by others, especially in the United States, where the psychology of children has become a favorite study of teachers.

The teachers of the city of Berlin referred to carefully analyzed and summarized the mass of information received from various city schools and published the results in the city yearbook of 1870, where they lay almost forgotten and neglected for over thirty years. It seems very desirable to rescue this report from oblivion and render it in English for several reasons, chief of which is the thorough treatment and method of procedure of the investigators.

The following is the report of the teachers of Berlin:¹

THE CONTENTS OF CHILDREN'S MINDS ON ENTERING SCHOOL AT THE AGE OF 6 YEARS.

[Translated from "Städtisches Jahrbuch, Berlin und seine Entwicklung," volume 4, 1870.]

A. CIRCULAR LETTER.

The Pedagogical Society of Berlin issued in October, 1869, the following circular letter addressed to all the school principals of the city:

GENTLEMEN: During the August session of the Pedagogical Society, a discussion of Dr. Willmann's book, entitled "Pedagogical lectures on elevating the intellectual activity through instruction," led to the resolution to propound certain pedagogical questions, the solution of which will essentially contribute to the development of the schools, if the questions be framed with especial regard to the urban conditions characteristic of Berlin.

Since it has been admitted by educators of the most varied views that education and formative instruction are out of the question so long as the individuality of the pupil is not known, we propose, as a first task, to ascertain the individuality of the little boys and girls just entering the lowest grade of our Berlin elementary schools, so far as it rests upon the ideas they have acquired of their environments.

It is an undeniable fact that the average individuality of the child in a metropolis, hence also in Berlin, is a different one, in consequence of the influence of his surroundings, from that of a child living in a rural district or in a small town. It is also a fact that the conditions of the various parts of the city exercise different influences upon the individuality of children, in consequence of which the mental receptivity of children of different wards shows a noticeable inequality. It is not at all impossible to investigate the causes—at least partly—to which this dissimilarity in the pupils on the one hand and similarity on the other may be traced.

As is seen from the wording of the task proposed, it is at first only one aspect for which your attention is enlisted, to wit, the individuality as it appears influenced by the ideas it has acquired about its surroundings. Of course, from this information safe conclusions may be drawn as to peculiar natural endowments of the Berlin children in general.

¹ It is but just to state that the statistical work shown in the following tables was performed by Professor Bartholomäi, member of the statistical bureau of the city of Berlin, and for many years editor of the mathematical part of Lüben's Jahresbericht. (Translator.)

In order to obtain a basis necessary to ascertain the individuality of the Berlin children, we take the liberty of requesting you to send in replies to the subjoined questions. The results of our mutual work would not only serve the important purpose mentioned, but also may form the beginning of a kind of educational statistics hitherto not in existence.

The selection of the questions to be submitted to the children was not easy. To many they may seem strange, especially the questions concerning natural objects; for instance, it may sound odd to ask, "How many of you children have seen a rabbit running free in the country?" The concept rabbit, as such, has no more significance for our purpose than many other concepts. The answer to the question, however, becomes of value by ascertaining whether the child has seen the animal run free. If this be the case, it is safe to conclude that simultaneous with the idea rabbit the child has acquired a whole group of other ideas, about whose degree of clearness the replies to following questions will give the desired information.

With reference to the bearing of this attempt to ascertain the concepts of the Berlin school children and the conditions influencing their ideas, a few words may be added. The first group of questions, for instance, is intended to ascertain whether the supposition is correct that the child of a metropolis notices, more often than has been assumed, things moving in nature, while his ideas or concepts of things in repose remain indistinct or blurred, sometimes till the end of his school life; hence that his interest, in many cases, can not be easily awakened in things in repose. If this should prove true, many apprehensive phenomena in the life of the people of Berlin might be explained, and from the facts ascertained a suitable method in instruction and training in school may be devised to counteract these critical currents in the life of the people.

A similar purpose is aimed at by such questions as "How many children have an idea of a birch, oak, or pine tree standing in the woods?" Experience speaks for the supposition that the Berlin child, if indeed it has observed the woods frequently, comprehends with especial interest quite different ideas of the woods than the country child, hence that the totality of the idea of woods is an entirely different one in the city child from that in the country child.

By means of this fact may be explained the observation made by teachers in city schools, namely, that rural children having moved into the city are often, at their entrance into the city school, far behind their city-born schoolmates of similar age, but that they surpass them within a short time. Perhaps this is caused by the fact that the appliances for object lessons (charts, pictures, etc.) prescribed by the authorities, and used all over the Kingdom, are designed chiefly for rural schools and schools in small towns, and fail to consider the environments and conditions of life of the children of a large city, hence appeal preferably if not exclusively to the ideas of the rural children.

That the investigation proposed for the purpose of a statistical summary will lead to surprising results, is seen from some preliminary inquiries made to test the questions prepared. Thus, for instance, the children of an upper grade in a girls' school were asked what mountains or hills they had seen. All, without exception, mentioned the Pepperhill (Pfefferberg), a beer garden situated on the point of a little knoll in the neighborhood of the school. Some also mentioned the Kreuzberg and the Windmühlenberg as having been seen. A few questions revealed the fact that all these children thought a place of refreshment, or a beer garden, a characteristic quality of the idea hill or mountain. How this association of ideas, easily explained by local circumstances, will make it difficult for these children to comprehend song texts, selections for reading, lessons in geography, etc., in school is obvious. In another class room, in a school near the Rosenthaler Gate, 80 per cent of the pupils between 11 and 13 years had never seen the Friedrichshain (a well-known grove-like park). 50 per cent had no idea of a forest, a park, a meadow, etc., other than that which they had acquired on a visit to the zoological garden made in the company of their teachers. These children are lacking, almost up to the time they leave school, a large number of those concepts which must be presupposed in the instruction in geography, nature study, singing, and language, ideas upon which the teacher has to base his instruction.

Now, if similar results be discovered in the majority of schools in Berlin, as may be supposed with certainty, there will arise the necessity of special tasks for primary language and object lessons, and for lessons in reading and writing; also for a utilization of the walks to the zoological garden and the museums customary with our schools; for a preparation of local and foreign geography, the selection and treatment of song texts, reading matter, the study of natural objects and laws, and the proper acquisition of appliances for these branches.

Concerning the much-talked-of kindergarten,¹ no definite verdict can be an-

¹The reader is reminded of the date of this letter: 1869.

nounced before the differences in the individualities of the children having attended it and of those reared in the family exclusively have been statistically ascertained.

We are fully aware of the difficulties and obstacles which will have to be overcome in getting replies to our questions, but we are convinced that you gentlemen will gladly undertake the arduous task in view of the supreme value which such pedagogical statistics will have in future for each separate school and the whole system of city schools of Berlin.

This hope has been reenforced by the fact that all those colleagues, principals, and class teachers who have heard of our intention have given their consent gladly and will attempt to obtain replies to our questions. But the more schools which comply with our request the more complete will be the statistical summary.

A personal participation on the part of the senders of blanks filled out in the deliberation of their disposition and of their summarization is particularly desired. Our work may be made more valuable by explanations of colleagues not members of the society. A special invitation to the meetings of the society will be sent to all who have forwarded returns. All summaries will be published. Circulars filled out should be sent in no later than January 15, 1870.

THE PEDAGOGICAL SOCIETY,
R. SCHOBERT, *President*.

OCTOBER, 1869.

B. THE QUESTIONS SUBMITTED.

The questions proposed to be submitted to the children refer to the existence or nonexistence in their minds of the following concepts:

1. Rabbit running free, squirrel on a tree, grazing flock of sheep.
2. Stork on its nest, floating swan, hen and its chicks, call of a cuckoo, song of a lark in liberty.
3. Hopping frog in liberty, fish swimming in river.
4. Beehive, butterfly on a flower, snail creeping in garden or field.
5. Birch, pine, and oak tree in the woods, willow on the edge of the water.
6. Toadstool and moss in the woods, wild flowers.
7. Hazel and huckleberry bush in the woods, reeds on the banks of a pond.
8. Sand pit, turf or peat pit.
9. Thunderstorm, dew.
10. Moving clouds, hail, sleet.
11. Rainbow, evening and morning red.
12. Starry sky, phases of the moon, sunrise and sunset.
13. Dwelling place (address), the Lustgarten, Unter-den-Linden, Wilhelmsplatz, Alexanderplatz, Gensdarmenmarkt, Brandenburgerthor, the King's castle and the palace, museum, arsenal, city hall, place of refreshment, Friedrichshain, Thiergarten, zoological garden, botanical garden, Kreuzberg, Hasenhaide, Invalidenpark,¹
14. Suburbs of Berlin, such as Treptow, Stralau, Rummelsburg, and Tegel.
15. Ride in a boat, on a railroad, range of mountains, ocean.
16. Mount or hill, forest, meadow, lake, river, grain field, potato field, snow-covered landscape.
17. Village, plowing, harvesting, windmill.
18. Triangle, square, circle, cube, sphere.
19. The numbers 2, 3, 4, etc.
20. God, Christ, biblical stories, prayers, hymns, church service.
21. Name and profession or occupation of father.
22. King, coins, monuments of the Great Elector, Frederick the Great, the Victory column.
23. Fairy stories of Snow-white, Red Riding Hood, Sleeping Beauty, Cinderella.
24. How many can pronounce correctly words told them?
25. How many can recite a memorized poem?
26. How many can sing a song?
27. How many can repeat a musical tone sung?
28. How many have attended a concert?

¹ Mostly well-known Berlin localities.

That these questions solely touch upon the individuality of the children is plain from the wording of the circular letter.

This attempt at fathoming the contents of the minds of children newly entering school was heartily approved by the city school authorities, and authority was granted to submit the questions to all the schools. (Names of schools and their principals appear in the original account, but are here omitted as unessential.)

Of the 84 reports which were sent in, 13 proved to be absolutely worthless and were laid aside. New questions were suggested, such as:

1. How many of the children have brothers and sisters?
2. How many have lost their father and mother?
3. How many have house inmates, such as a servant or apprentice?
4. How many have domesticated animals, such as a dog or a cat?
5. How many have a bird?
6. How many know the colors blue and red, white or variegated?
7. How many have seen a shoemaker, joiner, mason at work?
8. How many have seen a watchmaker, printer, painter at work?
9. How many have seen soldiers, farmers, sailors?
10. How many have seen a peddler, a negro?
11. How many know how bread is made of grain, or how stockings are made?

The difficulties of the inquiry arose partly from the absence of some children, partly from the unavoidable circumstance that the last questions on the list did not come to the children before weeks and months had passed, and that it was, therefore, impossible to determine whether the knowledge the children were found to be in possession of was gained in school or whether it was in their possession when they entered school. The large number of questions also made it impossible to exactly ascertain whether the concepts expressed by words had actual lodgment in their memory.

The various teachers reporting mostly refrained from making comments. A few may be of interest to be quoted. One principal found only one child who could recognize an oak, a birch, a willow, a toadstool, moss, a hazel bush, a huckleberry bush, and reeds. And it was always the same boy, namely, the son of a clergyman, who had passed two years in succession on the farm of his uncle. None of the children knew the difference between hail and sleet. Another teacher discovered that some children who claimed to have seen a lake meant a fish tank in the market.

C. CRITICISM OF THE MATTER RECEIVED.

Considering the difficulties mentioned and the resultant differences in the degree of accuracy of the inquiry, it was to be supposed that the matter in reply to the circular letter could not be worked into reliable summaries. This opinion was candidly expressed by a lady teacher (Miss L'Hiver), who wrote:

I deny that the numbers found in footing up the returns have any value whatsoever. The reasons are these: To ask 138 questions of 26 children gives a total of 3,588 questions. (Only 14 children were to be examined at a time, but should the remaining 12 keep silent meanwhile?) Two conversation hours per week, at 50 minutes each, give in a term of 3 months, or 12 weeks, 1,200 minutes, or one-third of a minute for each question. If the children's replies are to be used as a foundation for statistical conclusions of any kind, each child would have to be asked a number of other questions to establish the conviction in the teacher that the child had not merely, parrot-like, repeated the replies of others, or that he had been mistaken. (Thus, for instance, I found that most of the children who claimed to have seen a rabbit running free had meant other animals seen in liberty.) Or, that the child had not acquired the ideas in question before, but during his school days.

For such an examination [the lady concludes] a teacher can find no time, and a superficial examination has no value whatever. I therefore do not share the hopes entertained in summarizing the returns.

Similar remarks accompanied other returns. These objections were reenforced by the character of the returns, for those which were not absolutely rejected for obvious reasons could be divided into two classes: (1) Those which revealed sus-

picious indications of the fact that older pupils, having attended school for some months, had been drawn into this examination; (2) those which were absolutely above suspicion. There had been examined:

Coming from—	New pupils.			Pupils possibly mixed with older ones.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.
The family directly	471	302	773	465	412	877
A kindergarten	83	44	127	-----	28	28
Institutions for keeping young children during work hours, so-called crèches.....	114	71	185	128	120	248
Total	668	417	1,085	593	560	1,153

We have, therefore, reliable material of only 1,085 cases, if all possible errors, the sources of which have been stated, be eliminated. The question arose whether that number could be utilized to form satisfactory averages, especially whether the number of children having attended the kindergarten or crèches (127 and 185, respectively) was not too insignificant for comparison.

Mathematics does not at once reject inaccurate observations, but often derives reliable results from them. It was therefore decided to use not only the 1,035 returns of cases which were perfectly reliable, but also the 1,153 which were slightly suspected, and the result of the calculation justifies this action.

D. MODE OF PROCEDURE.

The main question is: What value is to be placed upon these numbers? It may be presumed at the outset that the teachers have added correctly. Erroneous replies on the part of the children have their origin either in imagination, wrong perception, or in embarrassment and confusion. In cases where fancy or error was active the reply is affirmative, while embarrassment or confusion is likely to have caused a negative reply. But, on the whole, it may be assumed that the Berlin children are not troubled with embarrassment, and, furthermore, that a teacher, unless he be a bungler, will overcome the children's shyness in a very short time; hence erroneous replies arising from childish embarrassment need not be expected. This opinion is strengthened by the remarks of a teacher, who says "It was noticed that when the queries were submitted to the whole class nearly twice as many children would claim to have the idea asked for than when they were questioned in small sections of eight or ten in order to test the correctness of their answers."

The summaries show two things: (1) how many of the children have a definite idea of the objects mentioned, and (2) how many lack the idea. The former may be considered the maximum limit, the latter the minimum limit. Of course, each one includes doubtless a scale of possibility and probability, but that must be left out of the consideration. Thus, for example, the replies to the fifty-fourth question concerning the phases of the moon, show that of 471 boys and 302 girls newly entering school, at most 264 boys and 179 girls coming directly from the home, at most 66 boys and 33 girls coming from the kindergarten, and at most 63 boys and 38 girls coming from crèches, had an idea of the phases of the moon. These are classed among the numbers expressing a maximum or affirmative reply. In answering to question 65, it was found that at least 35 boys and 49 girls coming from home, etc., had either not been in the "Lustgarten," "Unter-den-Linden," or if so had forgotten it, or failed to connect their concept of these places with the names they heard from the teacher's lips. This statement belongs to the rubric of minimal numbers or negative replies.

In order to obtain larger numbers we shall add together the two groups of freshly entering children and of children mixed with some who had some schooling. The totals will retain their original significance, only the limits of maxima

and minima are displaced in the direction of their own meaning. Doing so, we find these totals:

Preparation.	Boys.	Girls.	Totals.
Coming from home.....	936	714	1,650
Coming from kindergartens.....	83	72	155
Coming from crèches.....	242	191	433
Totals.....	1,261	977	2,238

Since the number of children having come from the kindergarten is too small to furnish sufficiently reliable averages, it is much to be regretted that a comparison between the boys and the girls in this class of pupils is made impracticable, and only that between the total number of boys and girls is attempted.

E. CLASSIFICATION AND ANALYSIS OF THE CONCEPTS.

The questions proposed refer either to direct observation and resultant concepts or to things historically transmitted or to accomplishments. We may consider first those which result from observation. From the list of these concepts we shall have to eliminate (1) those which can not be definitely classified. To these belong the hen and chicks, the picking of field, meadow, or forest flowers, the snow-covered landscape, the windmill; (2) those for which general observation is not possible, such as the beehive, sandpit, peat-pit, ride on the water or railroad, range of mountains, and ocean; (3) reiterations, such as occur in the mention of suburbs, as Stralau and Rummelsburg, likewise the Schlesische Busch and Tegel. Omitting all these in summarizing, we have left 75 ideas concerning the existence or nonexistence of which the inquiry may be determined.

The 75 ideas or concepts (*Vorstellungen*) may be classified in order to enable us to review special cases as follows:

A. NATURAL CONCEPTS.

I. *Mathematical*—Arithmetical: two, three, four; geometrical: triangle, square, circle, cube, sphere.

II. *Physical*—Astronomical: moon, sunrise, sunset, starry sky; meteorological: thunderstorm in daytime and at night; precipitations: dew, clouds, hail, sleet; atmospheric phenomena: rainbow, evening red, morning red.

III. *Natural history*—(1) Animals, (*a*) mammals: rabbit, squirrel; (*b*) birds: stork, swan, cuckoo, lark; (*c*) cold-blooded vertebræ: frog, fish; (*d*) insects and mollusks: butterfly, snail. (2) Plants, (*a*) phanerogamous: birch, pine, oak, willow, hazel bush, huckleberry bush, reed; (*b*) cryptogamous: mushroom or toadstool and moss.

IV. *Geography*—Mountain or hill, forest, meadow, lake, river.

B. HUMAN CONCEPTS.

I. *Topographical*—(1) Places or localities: Lustgarten, Unter den Linden, Wilhelmplatz, Alexanderplatz, Gensdarmenmarkt, Brandenburger Thor; (2) buildings: castle and palace of the King, museum, arsenal, city hall; (3) landscape: Friedrichshain, Thiergarten, Zoological Garden, Botanical Garden, Kreuzberg, Hasenhaide, Invaliden Park; (4) suburbs: Treptow, Stralau, Rummelsburg.

II. *Agricultural*—Flock of sheep, field of ripening grain, potato field, village, plowing, harvesting.

III. *Family and home*—Street and number of dwelling, name and profession or occupation of father.

According to this grouping of the matter the following table is made, and in order to facilitate a comparison the numbers found have all been reduced to a basis of 10,000. This enables the reader to see at a glance the relative frequency or infrequency of the existence of the 75 ideas.

TABLE I.

Number of children in every 10,000 who possessed the concepts mentioned in second column.

No.	Concepts inquired after.	Boys.	Girls.	Children from home.	Children from kindergarten.	Children from crèches.	Children in general.
1	Two	7,478	7,360	7,436	8,323	7,113	7,435
2	Three	7,478	7,298	7,418	7,355	7,344	7,399
3	Four	7,279	7,247	7,224	8,258	7,067	7,265
4	Triangle	4,274	4,096	4,078	5,484	4,111	4,182
5	Square	5,424	5,597	5,230	7,484	5,681	5,474
6	Circle	4,750	5,312	4,818	6,645	5,081	4,991
7	Sphere	7,684	7,544	7,576	8,516	7,483	7,623
8	Cube	6,971	6,940	6,800	8,064	7,159	6,957
9	Moon	6,043	6,438	6,067	8,000	6,144	6,215
10	Sunrise	3,410	2,590	3,194	2,710	2,633	3,052
11	Sunset	4,925	4,237	4,739	4,516	4,226	4,625
12	Starry sky	8,382	7,840	8,012	8,645	8,476	8,145
13	Thunderstorm at day	7,613	8,209	7,776	9,226	7,760	7,873
14	Thunderstorm at night	3,188	3,509	3,224	4,194	3,510	3,347
15	Dew	2,531	2,395	2,455	2,323	2,032	2,364
16	Clouds	6,090	5,711	5,727	6,581	6,443	5,925
17	Hail	6,606	7,544	7,055	7,677	6,628	7,015
18	Sleet	2,847	2,037	2,382	2,194	3,025	2,493

It may be supposed that, in general, those concepts or ideas are more easily gained which are found in a large number of children, considering the psychological conditions of the children and the possibility of acquiring the ideas under urban conditions, than such ideas as are possessed by a small number of children. This is the reason why in the following table (Table II) the ideas have been grouped according to the frequency of their occurrence among the children examined. This table also shows the excess of frequency in the existence of the ideas in boys over girls, girls over boys, as well as the differences or excesses in the three categories: Home, kindergarten, and crèches.¹

TABLE II.

No.	Concepts inquired after.	Number among each 10,000 children having the concept.	Excess of—					
			Boys over girls.	Girls over boys.	Home-trained children over kindergarten children.	Kindergarten children over home-trained children.	Home-trained children over crèche children.	Crèche children over home-trained children.

68	Willow	1,667	1,123	-----	-----	-----	39	203
69	Huckleberry bush	1,640	349	-----	-----	-----	1,081	-----
70	Birch	1,318	487	-----	-----	-----	16	110
71	Rummelsburg	1,242	496	-----	-----	345	-----	-----
72	Invalidenpark	1,135	379	-----	-----	-----	391	-----
73	River	1,122	11	-----	-----	236	-----	293
74	Hazel bush	907	348	-----	-----	-----	105	165
75	Botanical garden	527	-----	172	-----	-----	664	81

From the foregoing table (II) we see that by far the greater number of ideas, nearly 75 per cent, were found more frequently in boys than in girls. Greater even than that is the difference between children coming directly from home and those coming from the kindergarten. The latter have a much greater wealth of ideas than the former. The difference is less marked between children coming directly from home and those having been kept in crèches (Bewahranstalten). It is plain, therefore, that the school must assume an attitude with reference to boys different from that assumed toward girls; likewise different attitudes as regards home children, kindergarten children, and children from crèches. Many of the ideas in question may have been familiar to children who professed not to have them, they never having connected such ideas with the names by which they are expressed; or, perchance, there may have been neglect to call the children's attention to them.

One specially noteworthy peculiarity is revealed by comparing the differences between boys and girls. We notice that the girls more often surpass the boys in acquiring ideas in the case of those ideas that are most common on the whole or most frequently met with among children. Now, it is to be presumed that common ideas, those frequently found in the consciousness of children, are acquired with more facility than those found rarely among children. Hence it may be concluded that the mental range (or compass) of girls, as compared with that of boys, is more enlarged in the case of those ideas that find an easy lodgment in the minds of children generally, than it is in the case of those that are more difficult of conception. The matter can be made plainer by indulging in the fiction that each idea grows gradually, but to a greater extent the less opposition it finds, only that the opposition is also fictitious. Assuming this, we may say: The easier an idea finds entrance into the consciousness of children, the easier will it do so in girls, and contrariwise, the more difficult will it be to enter the boys' consciousness. If we divide the column of numbers of Table II into groups of ten ideas (omitting the last five) we find the following result:

Ten ideas found in—	Of these ten ideas there were prevalent—	
	Among boys.	Among girls.
From 1,318 to 2,364 children.....	9	1
From 2,368 to 2,887 children.....	9	1
From 2,909 to 3,454 children.....	9	1
From 3,467 to 4,062 children.....	8	2
From 4,182 to 5,474 children.....	7	3
From 5,496 to 7,015 children.....	7	3
From 7,265 to 9,026 children.....	6	4

The concepts which we find in girls more frequently than in boys are: Name and occupation of father, thunderstorm, rainbow, hail, potato field, moon, square, circle, Alexanderplatz, Friedrichshain, morning red, oak, dew, and botanical garden.

We leave it to psychologists to study particular phases of the results, some of which seem eminently important to psychology, as for instance: Though the sphere is the carrier of an infinite number of circles, and though every cube is bounded by six squares, and the idea triangle seems to be more easily conceivable than the square, we find nevertheless that the sphere is known by 76.23 per cent of the children, the cube by 69.57 per cent, the square by 54.74 per cent, the circle by 49.91 per cent, the triangle by 41.83 per cent.

It may be of general interest, however, to view the various groups of ideas. The totals found allow us to frame the following table (III):

TABLE III.

Ideas.	Of every 10,000 the ideas were in the consciousness of—					
	Boys.	Girls.	Children coming from home.	Children coming from kindergarten.	Children coming from crèches.	Children in the aggregate.
Arithmetical.....	7,412	7,308	7,359	7,978	7,175	7,367

Suburbs	2,253	560	-----	155	280	-----
Phanerogamous plants	1,671	493	-----	306	135	-----

The relations of children to their homes and families are so intimate and so frequently renewed after brief intervals spent in school or on the street that one can not but expect them to know family and home. But in this the more introspective life of the girls is revealed, in contrast to the life of boys, which is directed, even in early childhood, toward the outside world. This tendency of boys to look at things outside is so noticeable that the girls come to school richer than the boys in only three groups of ideas, to wit: In ideas of home and family, and in geometrical and in meteorological ideas. The fact that with girls the ideas of space, with boys the ideas of number, should predominate is certainly worthy of notice. That the concepts of thunderstorm and its attendant phenomena should be more lasting in girls than in boys shows that the girls have a greater disposition to fear and apprehension. A boy is not generally moved by thunder, lightning, and pouring rain any more than by other phenomena; they appear to him not more important than others. The same disposition in girls to apprehension may also give rise to their observing hail and dew on the grass, things less often observed by boys.

The greater wealth of ideas among children coming from crèches (Bewahranstalten), and the still greater wealth among children coming from the kindergarten, as compared with those who have attended neither of these institutions, is so striking that the decision as to whether the kindergarten for the preschool age is desirable or not can not remain doubtful for a single moment. The following somewhat condensed tables (V and VI) show this very plainly, especially the latter, which exhibits the differences:

TABLE V.

Ideas.	Of every 10,000 the ideas were in the consciousness of—					
	Boys.	Girls.	Children coming from home.	Children coming from kindergarten.	Children coming from crèches.	Children in the aggregate.
Arithmetical.....	7,412	7,308	7,359	7,978	7,175	7,367
Geometrical.....	5,821	5,879	5,701	7,239	5,903	5,846
Astronomical.....	5,690	5,276	5,503	5,968	5,370	5,508
Meteorological.....	5,051	5,129	5,015	5,749	5,114	5,085
Animals.....	4,650	3,563	3,999	5,174	4,432	4,175
Plants.....	2,122	1,598	1,904	2,294	1,706	1,893
Geographical.....	3,204	2,597	2,887	3,290	3,012	2,940
Locations.....	4,038	3,321	3,733	4,139	3,545	3,725
Buildings.....	3,193	2,793	2,874	4,090	3,196	3,021
Landscapes.....	3,662	5,022	3,281	4,046	3,533	3,332
Suburbs.....	2,498	1,938	2,297	2,452	2,017	2,253
Agricultural.....	4,048	3,415	3,717	3,973	3,907	3,772
Family and home.....	8,639	9,097	9,042	8,796	8,029	8,829

TABLE VI.

Ideas.	Of 10,000 children the idea was possessed by—	Excess of—					
		Boys over girls.	Girls over boys.	Coming from home over kindergarten.	Coming from kindergarten over home.	Coming from home over crèches.	Coming from crèches over home.
Family and home.....	8,829	-----	458	246	-----	1,013	-----
Arithmetical.....	7,367	104	-----	-----	619	184	-----
Geometrical.....	5,846	-----	58	-----	1,538	-----	202
Astronomical.....	5,509	414	-----	-----	465	133	-----
Meteorological.....	5,085	-----	78	-----	734	-----	99
Animals.....	4,175	1,087	-----	-----	1,175	-----	493
Agricultural.....	3,772	633	-----	-----	261	-----	190
Locations.....	3,725	717	-----	-----	406	188	-----
Landscapes.....	3,332	640	-----	-----	765	-----	252
Buildings.....	3,021	395	-----	-----	1,216	-----	322
Geographical.....	2,940	607	-----	-----	403	-----	125
Suburbs.....	2,253	560	-----	-----	155	280	-----
Plants.....	1,893	524	-----	-----	390	198	-----

The lessons to be derived from this table are so obvious that it is not necessary to dwell on them. We therefore proceed to the next summary:

TABLE VII.

Ideas.	Of every 10,000 the ideas were in the consciousness of—					
	Boys.	Girls.	Children coming from home.	Children coming from kindergarten.	Children coming from crèches.	Children in the aggregate.
Mathematical.....	6,418	6,415	6,323	7,516	6,380	6,416
Physical.....	5,247	5,174	5,135	5,816	5,193	5,216
Natural history.....	3,453	2,632	3,007	3,810	3,172	3,001
Geographical.....	3,204	2,597	2,887	3,290	3,012	2,940
Topographical.....	3,491	2,900	2,173	3,856	3,240	3,233
Agricultural.....	4,048	3,415	3,717	3,973	3,907	3,772
Home and family.....	8,639	9,097	9,042	8,796	8,029	8,829

TABLE VIII.

Ideas.	Of 10,000 children the idea was possessed by—	Excess of—					
		Boys over girls.	Girls over boys.	Coming from home over kindergarten.	Coming from kindergarten over home.	Coming from home over crèches.	Coming from crèches over home.
Home and family.....	8,829	-----	458	246	-----	1,013	-----
Mathematical.....	6,416	3	-----	-----	2,193	-----	57
Physical.....	5,216	73	-----	-----	681	-----	58
Agricultural.....	3,772	633	-----	-----	261	-----	190
Topographical.....	3,233	591	-----	-----	1,683	-----	1,067
Natural history.....	3,091	821	-----	-----	803	-----	165
Geographical.....	2,940	607	-----	-----	403	-----	125

From the foregoing tables it is seen that the children are the more ignorant of things the farther away the things are from home, a fact which might have been foreseen. Number of house, street of parents' dwelling, and occupation of the father, likewise simple mathematical concepts, can be acquired by a child without crossing the threshold of his home, and without being taken out into the open air into parks or into the country. In all classes of ideas, with exception of the one concerning home and family, the girls' knowledge is less than that of the boys. Those who have attended kindergartens know more than those having attended crèches, and both know more than those exclusively kept at home.

Summarizing the various groups of ideas still more, we find these facts clearly demonstrated:

TABLE IX.—Average number of children conscious of the ideas in every 10,000.

Ideas.	Boys.	Girls.	Coming from home.	Coming from kindergarten.	Coming from crèches.	Children in the aggregate.
Natural.....	4,470	4,035	4,206	4,991	4,308	4,280
Human.....	4,117	3,621	3,868	4,374	3,852	3,906
Both classes combined.....	4,329	3,869	4,071	4,744	4,126	4,128

The general conclusion, then, is that occasional instruction in families, in replies to questions such as: What is this? What is it called? is much neglected. The child comes to school comparatively poor in concepts, and school is forced either to operate with mere words or to substitute in place of observation of living or actual objects lifeless representations on charts, or, thirdly, go back to actual observation of natural objects. Only the last is sensible. School finds its work somewhat prepared by the crèches (Bewahranstalten) and the kindergartens. The latter are by far preferable. School also finds the boys better prepared than the girls.

F. CRITICISM OF THE APPLIANCES FOR TEACHING.

The importance of the existence or nonexistence of the concepts in question becomes obvious when we select from the list those which must be presupposed in order that the teacher may use the appliances for teaching, such as text-books and charts prescribed for the schools. These selected ideas are: Sunrise, sunset, starry sky, clouds, rainbow, evening red, morning red, cuckoo (its nest), lark (its song), reeds (on the banks of the water), mountain, forest, river, flock of sheep, grain field, village, plowing, harvesting. It is easily seen how little the appliances and text-books used in school are adapted to the horizon of ideas of the pupils.

Taking the total number of children again as a basis of calculation, we find the following results:

TABLE X.

Ideas.	Number of children in every 10,000 acquainted with the ideas—	
	In general.	That are presupposed.
Astronomical	5,509	5,274
Precipitations	4,449	5,925
Atmospheric phenomena	5,582	5,582
Animals	4,175	2,466
Plants	1,898	1,256
Geographical	2,940	2,672
Agricultural	3,772	3,262
Physical	5,216	5,499
Natural historical	3,091	2,212
Geographical	2,940	2,672
Agricultural	3,772	3,262
Natural	4,280	4,088
Human	3,900	3,772
Total	4,128	3,859

It is plain that the customary books and appliances which are to be considered here presuppose certain fundamental ideas with which the Berlin children are not familiar. From this results: (1) The impossibility of selecting from among the well-known text-books and appliances those which could be made comprehensible to the children of Berlin; (2) the very great difficulty of finding any books and appliances which are adapted to the ideas which may be presupposed in a given community; (3) the suggestion not to begin with the printed page at all (books or charts), but base all primary instruction on actual observation and the analysis of the thought material the child brings with it; (4) the necessity of supplying the missing ideas by the study of objects. Suffice it, the results open a wide perspective.

G. HISTORICAL IDEAS.

We now turn to the supply of historical ideas the children bring with them to school. They belong partly to the realm of religion, partly to that of fairyland. The question as to how many of the children had attended religious service in church is of no importance for our purposes, and the other question as to how many of the children had heard anything of fairy stories is so difficult to answer that it, too, loses importance. The results derived from the return, however, are briefly given in Table XI.

This table contains one fact remarkable to a high degree, to wit, that boys are more familiar with religious ideas than girls; that, on the other hand, the girls are better acquainted with fairyland in almost the same proportion. * * *

TABLE XI.

Ideas.	Of every 10,000 the ideas were familiar to—					
	Boys.	Girls.	Children coming from home.	Children from kindergartens.	Children from crèches.	Children in the aggregate.
God	7,827	5,067	6,927	5,995	5,704	6,622
Christ	6,757	4,217	5,818	5,355	5,104	5,648
Biblical stories	3,743	1,453	2,727	2,258	2,979	2,744
Prayers and hymns	5,400	4,647	5,078	5,613	4,850	5,041
Snowwhite	2,173	3,009	2,436	4,387	2,265	2,538
Red Riding Hood	2,427	3,664	2,800	4,581	3,025	2,967
Sleeping Beauty	563	1,044	661	1,871	808	773
Cinderella	1,784	2,897	2,182	3,871	2,032	2,270
Religious ideas	5,852	3,846	5,138	4,790	4,659	5,021
Ideas of fairy stories	1,734	2,654	2,020	3,677	2,032	2,137

However venturesome it may appear to draw conclusions from this upon the differences in soul life of boys and girls, yet it may be assumed that the inner natures of the two sexes are in decided contrast to each other. Since it is reasonable to suppose that both boys and girls have in general the same opportunities to acquire ideas of religion and of fairyland, the want of comprehension for or the facility for forgetting these ideas must be dependent upon an original difference in intellectual disposition.

Also the differences between children of the three classes—those coming from home, from the kindergarten, and from crèches—are remarkable. Children coming directly from home hear more of God and get more religious ideas than children having attended kindergartens or crèches. The predominance of biblical stories and of prayers and hymns found among children coming to school from crèches and kindergartens, respectively, would indicate that in the crèches biblical stories are taught and in the kindergartens prayers and hymns are memorized. Both practices may be regarded as serious pedagogical errors.

As regards the fairy stories, it is found that they are best known by children coming from kindergartens. If this indicates that fairy stories are made a subject for instruction in kindergartens, it would prove a pedagogical error, for, in our opinion, the kindergarten age is too early an age for fairy stories. But if such stories are introduced there, no others than the four mentioned in the foregoing list should be used.

The relative prevalence among children, expressed in percentages, of the four religious points of knowledge and of the four fairy stories under consideration is as follows:

Religious ideas.	Per cent of prevalence.	Fairy stories.	Per cent of prevalence.
God.....	33	Red Riding Hood.....	34.7
Christ.....	28.2	Snowwhite.....	29.7
Prayers and hymns.....	25.1	Cinderella.....	26.6
Biblical stories.....	13.7	Sleeping Beauty.....	9

It is especially noticeable that the most charming of all natural fairy stories, namely, Sleeping Beauty (the reawakening of spring), is so little known, particularly since it is the simplest of all. Has the comprehension for the intimate connection of popular poetry with natural phenomena been lost among the people?

H. ACCOMPLISHMENTS ACQUIRED AT HOME.

Lastly, we may see the result of the inquiry regarding certain accomplishments with which the child is equipped when it comes to school. Those about which the returns give information are: Correct repetition of phrases pronounced by the teacher, recital of verses, singing of a song, and sounding of a note after the teacher. The absolute numbers are found in the following summary:

TABLE XII.—*Number of children that have certain accomplishments.*

Accomplishments.	Boys.	Girls.	Children coming from home.	Children coming from kindergarten.	Children coming from crèches.	Children in the aggregate.
Repetition of phrases.....	1,093	620	1,295	104	314	1,713
Recital of verses.....	791	523	1,016	63	235	1,314
Singing of songs.....	694	440	861	61	212	1,134
Sounding a note.....	535	401	691	47	198	936

TABLE XII.—*Number of children that have certain accomplishments*—Continued.

ALL REDUCED TO A BASIS OF 10,000.

Accomplishments.	Boys.	Girls.	Children coming from home.	Children coming from kindergarten.	Children coming from crèches.	Children in the aggregate.
Repetition of phrases	8,868	6,364	7,848	6,710	7,252	7,654
Recital of verses	6,273	5,353	6,158	4,065	5,427	5,871
Singing of songs	5,504	4,504	5,218	3,936	4,896	5,067
Sounding a note	4,243	4,104	4,188	3,082	4,573	4,182

This table also offers a striking and unexpected result. Everyone of the accomplishments is found more frequently among boys than among girls; likewise more frequently among children coming directly from the family than among those having attended kindergartens, and with exception of singing of songs than among those from crèches, and among the latter more frequently in every case than among the kindergarten children.

The relative abilities, reduced to a scale of 100, of the three classes of children in each of the four accomplishments are shown in the following table:

TABLE XIII.

Children coming from—	Ability to—			
	Repeat phrases.	Recite verses.	Sing songs.	Repeat a note.
The family	36	37.1	35.5	39.3
Crèches	33.2	34.9	38.8	34.7
Kindergartens	30.8	23	25.7	26

If we consider that the children attending kindergartens are of well-to-do parents, while those attending crèches belong to poor families, the first and second columns of the foregoing table would show that poor parents occupy their time more with their children, and the very poorest probably do so less only because they lack the time. As to singing, the difference can only be explained by assuming that the children of well-to-do parents, despite their attending the kindergarten, are less allowed to sing at home than those of poor parents. Hence it seems allowed to deduce the rule: The better the parents are situated the more quiet must the child remain at home and the less is it allowed to follow its instinct of imitation. That the ability to sing is in most cases inborn is obvious from the large number of children coming from home who can repeat what is sung to them. On an average the accomplishments of children (in the four points mentioned) reared solely in the bosom of the family appear to be greater than those who have had some training in the kindergartens, as has already been remarked. However, it would seem hazardous to draw definite conclusions from this, inasmuch as the number of children coming from kindergartens as compared with the sum total examined is too small for a just comparison.

It was intended to summarize the returns with reference to the various wards of the city, so as to compare certain classes of society with others, but the material on hand is much too limited for the purpose. Hence we conclude the investigation here.

I. SUGGESTIONS FOR FURTHER RESEARCH

The first thought of establishing a system of statistics for psychological questions is to be attributed to Sigismund, who as early as 1856 expressed it in his

book, *Kind und Natur* (Braunschweig). The first attempt at realizing this thought, namely, to exhibit in statistical form the intellectual life of children, was made in the teachers' seminary at the University of Jena. The main purpose of this investigation was to show the character and intensity of the various kinds of interest in children, to wit, empiric and speculative, ethical and esthetic, religious and sympathetic interest, as well as the manner of reproduction of the matter learned with reference to exactness or confusion, completeness or omission, rhythm and degree of speed. However, a publication of the results did not follow. Hence it may be said that this attempt in Berlin is the first which appears before the public eye with tabulated results.

The presupposition upon which the work rests is quite correct, for instruction and training can be successful only if they cohere with what is present in the child's mind. Equally true is the assertion that the teacher's method, selection and use of the appliances for teaching (text-books, charts, etc.), essentially depend upon the number of ideas with which the children are supplied. According to what principles the Pedagogical Society selected the questions (enumerated in the foregoing text) is not stated, nor can it be derived from the questions themselves. It would seem to the writer as though it would be best to restrict the inquiry to the purely psychological field, for not only is psychology the most important of the allied sciences of pedagogy, and statistical investigations like the present will give valuable contributions to it, but such restricted attempts will also result in obtaining uniform material, since the inquiries will be conducted under relatively like conditions. A simple example will show this: It is a purely psychological question to ask what children had seen the Alexanderplatz, for the answer to that is dependent not only upon the children's intellectual development and the instructive activity of the parents, but also upon the location of the children's homes. On the other hand, numbers, forms, and relations of solids, colors, tones, etc., domestic, atmospheric, astronomical, etc., facts, call for a certain skill or dexterity of hand or brain, exclusively developed at home and not subject to the influence of the outer world. This is what is meant by restricting any such inquiry to a purely psychological basis.

Furthermore, it may be advised to restrict the number of queries to such as will permit of exact replies. For this purpose small groups of concepts (as numerical, geometrical, meteorological, geographical, etc.), will serve best, and they should be asked year after year. Also concepts may be chosen at times which may be especially difficult or very easy to acquire for a child in the city of Berlin.

If according to the nature of the group of questions 6 to 12 questions be proposed, they could all be answered orally and the replies recorded in a single hour. For if, for instance, about 50 children enter a school as new pupils, that school must have about 10 teachers. Distributing for examination these 50 children among all the teachers of the school would give 5 children to each teacher. In one hour they could satisfactorily establish the fact whether the children could count 2, 3, 4, etc., or whether they could distinguish such terms as right and left, forward and backward, up and down, perpendicular and horizontal or slanting, straight and crooked, angular and round, etc. This mode of procedure would not only yield results serviceable for the instruction in class, but would also furnish a sound basis for secure, scientific deductions.

With regard to physiologic-psychological questions, we refer to Sigismund's book, *Kind und Natur*, referred to above. The author advises to investigate the old assertion of nurses that fleshy and physically strong children take longer to develop mentally than lean and physically weak children; whether girls develop faster than boys; what influence nourishment or the seasons of the year have upon their mental development; to what degree school education actually promotes mental development, and how the power of using language is developed.

The field of investigation is endless, in view of the inexhaustible wealth of the human mind.

With the hope that the teachers of Berlin who have made such a promising beginning in the matter, will continue their investigations, the valuable report closes.

J. SUPPLEMENT.

The third attempt to investigate the minds of children newly entering school was made in 1879 by Dr. K. Lange, school principal in Plauen, Saxony, author of the well-known monograph, *Ueber Apperception*. He proposed the following fourteen questions:

1. Who has seen the sun rise and set?
2. Who has seen the moon and the stars?
3. Who has seen a lark and heard it sing?
4. Who has seen a fish swimming in water?
5. Who has been in a boat on the pond?
6. Who has been on the banks of a brook or river?
7. Who has been on a mountain?
8. Who has been in the woods?
9. Who knows an oak?
10. A grain field?
11. Who knows what is to be done to make bread of grain?
12. Who has seen a shoemaker, a joiner, a mason at work?
13. Who has been in a church?
14. Who knows anything of God?

The questions were submitted to 500 elementary pupils of the town of Plauen and to over 300 children in rural schools in the neighborhood. Though the tabulated summaries of these inquiries are not available to the present writer, it is known that the published statements of Dr. Lange contained the following interesting results: The ideas of natural objects were woefully lacking in the town children. Not one-fourth of the 500 children examined had seen the sun set; only one-half of their number had been at a pond or had climbed a hill or mountain. It is especially interesting to note what the author says concerning the difference between boys and girls. "According to the tabulated results, the girls have, at their entrance into school, throughout fewer ideas of the environment of their home than the boys. They have, it appears, seen less, heard less, observed less than the boys. This is true for both town children and those in rural districts. Only in one point did the girls of the Plauen school excel the boys: They knew more than the boys of God."

The fourth attempt "en masse" to examine the contents of children's minds at their entrance into school was made in Annaberg, Saxony, Germany, in 1884. It was much more searching than the attempt at Plauen, and was organized on the Berlin plan. Many of the Berlin questions were used. The tabulated results are given below. What makes these results so valuable is the fact that they

have been repeated through five consecutive years (1880-1884)—that is to say, the sum total of 1,312 children includes the new pupils of five years. Other inquiries have since been made in Saxony and other States of Germany.

The introduction of Dr. Berthold Hartmann, who published the results of the Annaberg investigation, may be here omitted, but his tables are full of unexpected results.

TABLE XIV.—*Results of the inquiry at Annaberg, Saxony.*

No.	Ideas or objects inquired after.	The idea or object was known by—			Statement in per cents.		
		Of 660 boys.	Of 652 girls.	Of 1,312 children.	Boys.	Girls.	Average.
1	Rabbit	136	81	207	19	12	16
2	Squirrel	99	69	168	15	10	13
3	Flock of sheep	235	198	433	36	30	33
4	Starling	85	68	153	13	10	12

CHAPTER XVI.

THE EDUCATION OF THE NEGRO.

By KELLY MILLER,

Professor of Mathematics, Howard University.

TOPICAL OUTLINE.

PART I.—THE ECONOMIC BASIS OF NEGRO EDUCATION.

I. THE EDUCATIONAL SIGNIFICANCE OF THE GROWTH AND TENDENCY OF THE NEGRO POPULATION.

The growth and spread of the negro population in the United States. The bulk remains in the South. Localization of national problem calls for national aid. Slight tendency toward North and West. Mixed schools in North and West. Dwindling of race in border States. Social isolation the cause. Difficulty of maintaining adequate separate school system for sparse negro element in border States. Decline of negro population in Kentucky. Black belts of the South. Area in which negroes are more than twice as numerous as whites. Area and relative density of region in which negroes are in the majority. Causes tending to perpetuate black belts. The social and educational problems of black belts.

II. EARLY STRUGGLE FOR EDUCATION, PERSONAL RISK, AND ECONOMIC SACRIFICE.

The negro's desire to taste of the forbidden tree of knowledge. How Frederick Douglass learned to read and write. The experience of John M. Langston. Regulations in the several Southern States against the instruction of the negro. Negro schools in the large cities. The colored schools of Washington, D. C. Kind-hearted slave owners who taught their slaves to read. Negroes attending school in slave States, 1850 and 1860. The establishment of negro schools by Freedmen's Bureau and other agencies. The negro ever eager and anxious to learn.

III. SEPARATE SCHOOL PROVISIONS.

Establishment of public schools by reconstruction governments. Laws and regulations of the several States establishing separate schools for the two races. Density of population of white and colored elements. The effect of division of school fund where population is sparse. Equal provision for both races. Total and per capita cost of education of the two races. Sources of public-school funds. The extent to which negroes pay for their own schooling. General educational statistics showing school population, enrollment, number of teachers, average salary, and length of school term for the two races.

IV. NEGRO OWNERS AND TENANTS OF FARMS AND HOMES.

Negroes who own and hire their own homes and farms, and negro property owners in Georgia, North Carolina, and Virginia. Unsupported assertions as to support of negro schools. The Democratic purpose of public schools. White and negro population in slave States. Number of negroes who own and hire their homes and farms. Renters are bona fide taxpayers. Negro property holders in Georgia, North Carolina, and Virginia. Ownership of corporate enterprises.

V. OCCUPATIONS OF NEGROES.

The negro as a contributing factor to the industrial life of the South. Persons engaged in gainful pursuits. Occupations of white and negro women. Negro agricultural laborers, farmers, planters, and overseers. Negro laborers acquiring self-direction. Negro employed mainly in agriculture and domestic service. Few employed in the trades or in the arts. Domestic service the chief employment in the border States. Education should be directed to industrial conditions. Persons employed during portion of the year. The negro the most important industrial factor in the South. His labor the basis of production and accumulated property.

VI. SPECIAL STUDIES OF THE ECONOMIC CONDITION OF THE NEGRO.

The importance of the studies undertaken by the Labor Bureau. The negroes of Sandy Springs, Md. The negroes of Farmville, Va. Negroes in the black belt (six groups). The city negro. Economic lesson derived from these special studies. Negro spends and is spent for the good of the several communities in which he resides. He is everywhere a contributing factor.

VII. THE EDUCATION OF THE CITY NEGRO.

The relative status of the urban and rustic negro. City and country school provisions in the South. Negro city schools fairly well equipped. The practical aim of education not fulfilled. The adaptation of school program to the needs of the negro race. Special features of negro schools. The importance of kindergarten training. The large function of negro education. Negro teachers must awaken moral enthusiasm. The necessity for training in concrete things. The need of practical judgment. Baleful effect of smattering. Industrial training. The city negro a servant and bodily laborer. The predominance of the female element influences city schools. The negro should be taught concerning himself and the condition of his race. The city schools are centers of light for the entire race.

PART II.—THE HIGHER EDUCATION OF THE NEGRO.

I. THE INTELLECTUAL CAPACITY OF THE NEGRO.

The negro regarded as an inferior order of creation. Higher susceptibilities denied, since they were not needed. Ill usage and proscription based upon innate inferiority. Intellectual manifestation the highest measure of the man and the race. The negro able to master European courses of study. Relative capacity of the races. Arguments and testimony to uphold negro's claim. Why the negro has not produced great names in the intellectual arena. Charge of Thomas Nelson Page. Plea of Thomas Jefferson. Intellectual glory depends upon social and political status. Distribution of ability in America. The intellectual position of women analogous to that of the negro. The negro has shown surprising intellectual exuberance.

II. THE NEED OF THE HIGHER EDUCATION.

Knowledge is its own reward. The negro must connect with civilization in its best form and at its highest point. Education must assist evolution. Choice youth must assimilate culture and hand it down to the masses below. Contact with superior race can not produce civilization. Education will foster self-reliant activity and teach the impersonal quality of knowledge and virtue. The negro has to compete with white youth and needs the same helpful influence to prepare him for his work. The higher education necessary to produce leadership. The evil of poorly equipped leaders. Historical example of race development. Backward races perish for want of competent leadership. The culture influence of the ancient languages. Higher education discriminates between the real and the apparent. It gives a larger tolerance for existing conditions. It fosters and stimulates industrial activities.

III. OBJECTIONS TO THE HIGHER EDUCATION OF THE NEGRO ANSWERED.

The money spent on higher education has been wasted. Education has not eradicated the negro's evil and criminal disposition. Higher education lifts the negro above the needs of his people. The negro is leaving the farm and shop for the college and the university. Education has not solved the race question.

IV. THE RELATIVE CLAIMS OF INDUSTRIAL AND HIGHER EDUCATION.

The two phases of education not antagonistic, but supplementary. The white people believe that the negro's place is to work. Philanthropist's interest in helping the most needy. The negro's view of the question. It would be useless to equip large numbers of colored men with trades in the cities. The white laborer will neither compete nor combine on equal terms. The value of industrial schools. The educational impulse proceeds from above. Life is more than meat. Agricultural and domestic education. The need of knowledge to direct.

V. THE HIGHER EDUCATION OF COLORED WOMEN.

The weaker element of the weaker race. The attitude toward the higher culture of women in general. Analogy between the cause of women and that of the negro. The lowly status of colored women. The power of education to reach and to uplift her. Home life the base of the real advancement of the race. The education of the colored women should be mainly industrial and domestic. Room for the ambitious few. Number of colored women who have graduated from Northern and Southern colleges. Examples of successful college-bred colored women. Their work in the future.

VI. THE ORIGIN OF THE NEGRO COLLEGE.

The educational status of the negro before the war. Toleration in Northern colleges. Oberlin College invites negro students. Intellectual darkness at the close of the war. The Northern missionaries came as angels of mercy. The educational work of Freedmen's Bureau. Rise of denominational educational movements. The reconstruction government. The State college. Date of founding of negro colleges.

VII. WORK, WAYS, AND FUTURE OF NEGRO COLLEGES.

The old and the new function of the negro college. Rivalry between public and private schools. Negro universities largely secondary and primary schools. A college should measure up to standard. Requirements of admission and curricula of negro colleges. Relative influence of white and colored teachers. State schools under control of colored men. Small productive resources. Colleges are too numerous. Extravagant abuse of literary degrees. Occupations of graduates of negro colleges. Their religious and philanthropic activity. Leaders in the learned professions. Captains of industry. The future of the negro college. What they have done and what they are calculated to do. Sensible modification and adaptations needed.

VIII. THE NEGRO IN NORTHERN COLLEGES.

The benefits and disadvantages of mixed schools. What makes an institution great. The existence of negro colleges does not estop colored students from attending Northern institutions. The negro college gives the negro racial enthusiasm. It develops negro scholarship by giving negroes a chance to develop beyond graduation. It does not put a damper upon his self-respect. Northern colleges do not contemplate the needs of the negro race. Northern institutions can not be relied on to take a considerable number of colored students. Negro colleges do not perpetuate prejudice. Negro graduates of Northern colleges.

IX. COLORED MEN IN THE PROFESSIONS.

The element of society from which professional men usually come. The rise of the colored clergy. The negro teacher. The negro lawyer and physician. Early negro practitioners. Statistics of professional occupations.

X. NEGROES WHO HAVE ACHIEVED DISTINCTION ALONG LINES CALLING FOR DEFINITE INTELLECTUAL ACTIVITY.

The individual the proof of the race. The African in contact with the European has produced distinguished names. Sources of information. Phillis Wheatley, Benjamin Banneker, H. O. Tanner, Paul L. Dunbar, and others.

PART I.—THE ECONOMIC BASIS OF NEGRO EDUCATION.

I. THE EDUCATIONAL SIGNIFICANCE OF THE GROWTH AND TENDENCY OF THE NEGRO POPULATION IN THE UNITED STATES.

Population lies at the basis of all human problems. All progress, development, and civilization are merely emergencies from man in the mass. A persistent group of people, however lowly its present state may be, contains all the potential possibilities of the human race. The development and expansion of population, therefore, afford the surest measure of advancement.

The one striking feature about the American negro is his physical persistence and expansion. The half million Africans who were imported into this country from their native land have so multiplied and ramified as to complicate every factor in the equation of American life. The negro element in the United States to-day exceeds the entire population of ninety years ago. The negro is found in every State and Territory, in almost every town and hamlet, ranging in relative density from fifteen to one in the black counties of the South to less than one in a hundred in the higher latitudes. This widespread distribution among the white population gives an African flavor to local and national problems. No question can be considered on its merits apart from its bearing upon the black man and brother. Religious, political, industrial, and educational problems all take on racial color and tinge.

Of all uplifting agencies one would say that education is the common lever, and applies alike to all without regard to ethnic considerations. And yet the education of the negro constitutes as urgent a special problem as any that confronts the American people for solution. A study, then, of the distribution of the negro element among the general mass of the population is essential to a clear understanding of the educational needs of the situation. It is only by this knowledge that we can locate the area where the need is greatest and where the call for agencies of enlightenment is loudest. A localized knowledge of the negro peoples will also enable the educator to adapt plans and methods to the requirements of a variant situation. No greater mistake can possibly be made than to suppose that the entire negro race requires one fixed and inflexible programme of treatment, with no variation to meet local and special conditions. A race of 9,000,000 souls, scattered over so wide a geographical area and endowed with divergent aptitudes and capacities, encompasses the entire circle of human needs.

There are four phases of the negro population which entail important educational consequences.

(1) The movement toward the Northern and Western States, where there are no separate schools, places a portion of the race on the same educational footing with children of European descent. A broad distinction, therefore, must be made between the States which divide the schools on racial lines and those which do not. Owing to the relative density of the negro population in the two sections, the scholastic separation of the races follows quite closely the line of cleavage between the slave and free States. The half million negroes in the Northern States constitute no special educational problem.

(2) The tendency of population to drift into cities presents important educational suggestions. This tendency is no doubt due, in part, to the better school facilities which the cities afford. The million negroes in the large centers have fairly adequate and ample educational facilities. The South is too poor to provide adequate schools for the population sparsely scattered over the rural area, and especially so under the policy of separate instruction for the two races. But in the cities, where the population is dense and where the wealth is amassed, the conditions are much more favorable. Nor does the duplication of schools work such an economic hardship; for where there are sufficient numbers of both races to maintain the schools with a full complement of pupils there is little waste in the dual system. The education of the city negro will be treated in a separate chapter.

(3) The thinning out of the African element in the border States, where separate schools exist for the two races, must eventually raise the question of the feasibility of maintaining an independent system of schools for so sparse a population. In the State of Missouri 150,000 negroes scattered throughout the State would demand in equity almost as many schools as 16 times as many whites, and on a corresponding scale of cost. Oftentimes there are not enough negroes in a whole county to supply children for a single school, and yet these few children may be scattered over four or five hundred square miles. This is merely suggestive of the special educational problem of the border States.

(4) The segregative tendency of the negro population to lodge itself in certain sections of the Southern States localizes what might otherwise be a national problem. If this black mass were equably diffused throughout the country, the problem, in its educational aspect at least, would lose in intensity what was gained in extension. But the stubborn tendency of this mass to settle into knots and ganglia where the institution of slavery planted it most thickly emphasizes the pressing need of special remedial agencies. The condition of the negro in these congested localities and the utter inadequacy of local provision call more loudly than anything else for national aid to popular education.

A detailed study of the negro population will bring these problems more clearly to light:

Negro population of the United States.

Year.	Colored population.	Decennial increase.	Increase, per cent.	Per cent of total population.
1790	752,208	-----	-----	19.27
1800	1,002,037	244,829	32.33	18.88
1810	1,377,808	375,771	37.50	19.03
1820	1,771,656	393,848	28.50	18.39
1830	2,328,642	556,986	31.44	18.10
1840	2,873,648	545,006	23.44	16.84
1850	3,638,808	765,169	26.63	15.69
1860	4,441,830	803,022	22.07	14.13
1870 ¹	5,391,000	949,170	21.37	13.84
1880	6,580,793	1,189,793	22.07	13.12
1890	7,470,040	889,247	13.51	11.93
1900	8,840,789	1,570,749	18.35	11.57

¹ Estimated by Gen. Francis A. Walker.

If we begin with 1810, the first census year after the constitutional abolition of the slave trade, we see that the growth of the negro element followed the ordinary laws of population, viz, a gradual decline in the rate of increase. In 1810 there were 1,377,808 negroes in the United States. In eighty years this number had swollen to 7,470,040. It more than quintupled itself in eight decades. The relative decline of the African element as a factor of the general population is due to the influx of foreign white immigration. Seven hundred thousand negro females in eighty years produced a progeny of 7,000,000. The African is without question the most prolific element in America. The race will not only persist as a physical factor of the American people, but its natural increase will be sufficient to perpetuate the race problem in unabated force. This fact suggests the wisdom of immediate action, in so far as the problem will yield to ascertained methods of treatment. To delay is not only dangerous, but is expensive as well. While it is conceded on all hands that the negro has made wonderful strides in education, yet there are probably more illiterate negroes in the United States to-day than there were in 1860. The additive difficulties keep fully abreast of the agencies of relief. If national aid to education had been extended ten years ago there is no doubt that some of the phases of the race problem would have been much nearer solution than they are to-day. Procrastination to-day will only add new complications for to-morrow.¹

Negro population of the United States, by slave and free States.

State.	1890.	1880.	1870.	1860.	1850.

¹ Race Traits and Tendencies of the American Negro, by Frederick L. Hoffman, which was published in 1896, predicted the rapid decline of the American negro through the operation of inherent degenerative agencies. This work at the time attracted wide attention. The Twelfth Census has progressed far enough to show the utter erroneousness of Mr. Hoffman's conclusions. For answer to Mr. Hoffman's argument see Occasional Papers No. 1, American Negro Academy.

Negro population of the United States, by slave and free States—Continued.

Slave States	6,889,152	6,104,253	4,538,882	4,215,614	3,432,238
United States	7,470,040	6,580,793	4,880,009	4,441,830	3,628,808

¹ Included in slave States.

This table shows that the tendency of the race is to settle in the Southern States. Notwithstanding considerable waves of immigration toward the North, 92 per cent of the race is still found in the South. Nor is there the slightest intimation that the mass center of the race will be disturbed by the northward movement. The dust may fly, but the solid earth will remain. Notwithstanding the influx of negroes toward the liberal States since emancipation, the increment in the free States from 1860 to 1890 had scarcely more than kept pace with the growth of the general negro population. All rivers run into the sea, and yet the sea is not full. This suggests the inability of the colored race to maintain itself in a higher latitude. But whether this inability is due to the rigidity of the climate or the frigidity of the social atmosphere is not apparent. The essential fact, however, remains. The Northern States are not likely to receive the negroes in such numbers as to relieve the South of its congested condition. It is often suggested as remarkable that the negro does not rush to the freer conditions of the North as a gas from a denser to a rarer medium. There civil and political rights are guaran-

teed, and educational privileges are ample and free alike to all. Why a people should prefer to remain in a region of repression, where their children must perforce be brought up without ample educational equipment, when they might remove many of these disabilities by crossing an imaginary line, might seem to be a great sociological mystery. But there are other deterrent causes that hinder. The negro is essentially a conservative race. It would rather bear the ills it has than fly to those it knows not of. The industrial proscription of the North is scarcely less depressing than the political suppression in the South. In the New England States, where the sentiment toward the negro is freest, there is evinced the least tendency to immigration. In all New England there are fewer negroes than can be found in the city of New Orleans. The increase of the negro element in the North Atlantic States from 1860 to 1890 was 73 per cent, or only 3 per cent above the general growth. The movement toward the West has been more general, but even this has not been marked enough to indicate a shifting of the base of population. A glance at the table showing the growth of the negro population by geographical divisions is sufficient to enforce the truth of this statement.

Negro population of the United States by geographical divisions.

	1890.	1880.	1870.	1860.	Increase from 1860 to 1890.
United States.....	7,470,040	6,580,793	4,880,009	4,441,830	3,028,210
Slave States	6,889,152	6,104,253	4,538,882	4,215,614	2,673,538
North Atlantic States.....	269,906	229,417	179,738	156,001	113,905
North Central Division ¹	280,928	240,270	155,009	65,736	215,192
Western Division	30,054	11,852	6,380	4,479	25,575
Total in free States	580,888	476,540	341,127	226,216	354,672

¹ Missouri is taken out of the column of the North Central States and placed with the slave States.

The above table shows that the increment in all the free States for the three decades from 1860 to 1890 was only 354,672, against 2,673,538 in the slave States. The entire negro population in the free States has remained constantly less than the colored element in the State of Alabama.

	1890.	1880.	1870.	1860.
Negroes in—				
Alabama	678,489	600,103	475,510	437,770
Free States	580,888	476,540	341,127	226,216

There is no mistaking the tendency of the bulk of the negro population to remain in the Southern States. The fascinating attractions of the North allure them not. The educational as well as the general sociological problems growing out of the presence of the negro must be worked out in the South, where the black man is destined to abide. As the localization of a national problem places too great burden on the afflicted States, the General Government should lend a hand toward wiping out the national reproach.

Negro population in border States.

States.	1860.	1870.	1880.	1890.	Increase from 1860 to 1890.
Delaware	21,627	22,794	26,442	28,386	6,759
Kentucky	236,167	222,210	271,451	268,071	31,904
Maryland	171,131	175,591	210,230	215,657	44,526
Missouri	118,503	118,071	145,350	150,184	31,681
Tennessee	283,019	322,331	403,151	430,678	147,659
Virginia	548,907	514,841	631,616	635,438	86,531
West Virginia		17,980	25,886	32,690	14,710
Total	1,379,354	1,391,618	1,714,126	1,761,104	363,770

The table shows that throughout all this region the race increase in thirty years was only 363,770, or 26 per cent, while the negro population at large increased during the same period 70 per cent. This slight apparent increment is due almost wholly to the growth of the city element. The rural negro in this section is growing scarcer and scarcer. If we could separate portions of West Tennessee, southeast Virginia, and southern Maryland, where the negro population is relatively dense and where its increase is normal, from the rest of the section under discussion, the tendency would be greatly accentuated.

Per cent of negro population in border States from 1860 to 1890, showing its relative decline.

States.	1860.	1870.	1880.	1890.
Kentucky	20.43	16.82	16.47	14.42
Maryland	26.36	22.46	22.49	21.07
Missouri	10.03	6.86	7.16	5.61
Tennessee	27.07	25.62	26.14	24.37
Virginia	34	49	41	38
West Virginia	4	4	4.1	4.2

We see that there has been a rapid relative decline throughout this section. In Kentucky the negro element declined in thirty years from 20 to 14 per cent and in Missouri from 10 to less than 6 per cent of the total population of the State.

Absolute decline of negro population outside of cities in the border States from 1880 to 1890.

States.	Outside of—	Decrease.
Delaware	1 city	258
Kentucky	2 cities	12,186
Maryland	1 city	7,961
Missouri	2 cities	5,332
Tennessee	3 cities	6,910
Virginia	2 cities	6,807
West Virginia		16,804

¹ Increase.

If we except a few cities, we see that there has been an absolute decline throughout the border region, except in West Virginia, which has had a great influx of negroes, owing to special industrial conditions which prevail. The reason for this tendency is not hard to seek or far to find. Where the negro is sparsely scattered among the white population, he is made painfully conscious of his isolation. He pines for consort with those of his color and kind. There are no schools for his children, or churches to meet his religious aspirations, or organizations to satisfy

his social desires. He is shut up to the dull routine of toil and can get only such social relaxations as the cold tolerance of his white neighbors may accord him. He is really in social captivity and pines for those communities where a more congenial environment prevails. The result is he either rushes to the cities or leaves the section for those communities where society is more congenial. The same tendency is noticeable in the Northern negro, or, rather, in the Southern negro who goes to the North. Although he comes from the farm, with whose life and methods he is tolerably well acquainted, he rarely seeks agricultural work in his new home, but goes to the cities, where he may affiliate with others of his race. The growth of negro churches in the North is significant of the same tendency. Wherever two or three dozen negroes meet together in a Northern community, there a colored church springs up among them to meet, in a large measure, their social needs and aspirations. This tendency is not to be marveled at, for the consciousness of kind is a strong incentive in all races. The Anglo-Saxon, with the spirit of enterprise, goes to the utmost ends of the earth to dwell among all kinds and conditions of men, but he never loses touch with the higher life of his race and is determined to live above the social level of the people among whom he dwells. He is also inspired by the hope of gaining a competency, so as to return to the congenial environment from whence he came or of making his new environment congenial by bringing it under control of his own race and its higher institutional life. If, however, he had to live like the negro, below the level of his social environment, with no conceivable outlook, he would doubtless pine as does the negro, and at the first opportunity fly to more congenial companionship with his own race and color.

Whatever may be the cause and its justification the effect remains the same.

In order to bring more prominently to light the serious educational problem that this movement in the population entails, let us notice a few typical counties in a single border State.

Negro population of certain counties of Kentucky from 1860 to 1890.

County.	Area.	Negro population.				Number of negroes to square mile.				Number of negroes to 100 whites in 1890.

The foregoing table shows the evolution, or rather the retroaction, of the negro population in several counties in the State of Kentucky. In order that the coun-

ties selected might be impartially chosen, every fifth county was taken in alphabetical arrangement. It appears that in 19 out of 24 counties there were less than 10 negroes to the square mile, and in 6 counties the race did not average 1 to the square mile. It is also seen that there has been an absolute decline from 1860 to 1890 in 12 of the counties, and in 15 from 1880 to 1890. Throughout the counties under discussion it will be noticed that the negro element is very thin as compared with the white. If we suppose that this relation holds good for the entire State, as indeed we have every reason to believe, it will be seen that in two-thirds of the counties in Kentucky the negro averages less than 10 persons to the square mile, and in one-third of the State the average is less than 1 negro to the square mile. Not only is this true of Kentucky, but equally, or rather to a greater degree, will it hold for Missouri, and to a lesser extent, perhaps, for the other border States.

These States are pledged to the maintenance of separate schools with equal facilities for both races. How this can be done for the less numerous element of the population at a reasonable cost is the special educational problem which the border States present.

The growth and expansion of the so-called black belts in the South possess great sociological significance. Although our modern statesmanship has not consciously set apart a land of Goshen for the abiding place of the sable sojourners, nevertheless, this land is establishing itself by the sheer force of racial gravitation. The tendency of the negro population to cluster about black centers notwithstanding the operation of potent dispersive influences has been widely noted and remarked upon. A careful study of this population shows that it is solidifying along the river courses and in the fertile plains of the South, where it was most thickly planted by the institution of slavery. In order to bring this tendency clearly into evidence the following tables have been prepared on the basis of the Federal censuses.

Table I shows the number of counties in each State in which the negroes are more than twice as numerous as the whites, the aggregate areas of such counties, and their progressive changes during the three census decades, 1860-1890. The growth of this Africanized area has been remarkable. It increased from 71 counties with an aggregate area of 35,732 square miles in 1860 to 103 counties and 66,084 miles in 1890. While these "black belts" would have covered a territory as large as South Carolina at the beginning of the civil war, thirty years later they had grown to an area greater than that of all the New England States.

TABLE I.—Counties in which negroes exceed the whites more than two to one.

United States	166	170	178	165	1,772,614	1,312,009	135

Table II shows the relative density of the negro population within the area described by Table I. There are, on the average, more than three negroes to each white person. The negro population is increasing far more rapidly than the white, having increased from 3.03 times the white in 1860 to 3.19 times in 1890; and, what is, perhaps, more surprising, is the rapid increase of this ratio during the census decade 1880-1890, which showed such a marked decline in the general increment of the negro population; 1,652,458 negroes, or nearly one-fourth of the entire race, were found in these “black belts” in 1890, against 804,329, or about one-fifth of the race, in 1860.

Tables I and II, taken together, show an unmistakable tendency of these "black belts" to increase, both in extent and intensity. The probability is that they will not only maintain themselves, but will expand with the coming decade. Much criticism has been heaped upon the successive censuses on account of alleged errors, both of an excessive and defective character; but the discrepant enumerations do not affect the tendency herein noted. This growth is steady and unmistakable. We can predict with fullest assurance that the twelfth census will confirm this general law of growth.

Table III shows the number of counties in each State in which the negroes are in the majority but less than twice as numerous as the whites, together with the aggregate population of such counties in 1890, and the number of negroes to every 100 whites. This area is much larger than that considered in Table I, and has remained almost stationary during the decades under consideration. There are 165 counties and about 100,000 square miles in this region. There are, on the average, 135 negroes to every 100 whites. Tables I and III show that the entire region in which negroes are in the numerical majority embraces 268 counties and covers an area as large as the North Atlantic division of States. There are 3,400,000 negroes, against 1,800,000 whites. Nearly one-half of the entire race is found within this Goshenized territory. We often speak of the "black belts" as being congested, but this must refer to the constantly thickening darkness and not to the absolute density of the population; for, as noted above, these belts form an area about the size of the North Atlantic States. The total population is about 5,000,000, while the North Atlantic States have a population of 17,000,000. The average density of the population is less than one-third that of the States in the higher latitude. The indications are that the negro will be able to maintain the ground already gained, but will not be able to make further headway against the "white man's country."

The opposite tendency in the Southern population is also noticeable. Just as the black spots are growing blacker the white spots are growing whiter. The line of cleavage seems to take place where the two races are about evenly balanced, and the relative densities increase in both directions. In those counties where the negroes constitute only a small fraction of the total population their relative decline is notable.

If we turn to the cities, we find the same tendency toward a geographical separation of the races. There are 25 cities with a total negro population of more than half a million. A careful study of their distribution will show that they are segregated in districts and wards as definitely marked as the "black belts" of the South. The politician is as familiar with the black and the white wards of our large cities as is a seaman with the depths and shallows of the sea.

There are several causes which conspire to perpetuate the segregative tendencies of the negro population:

1. Under the social conditions now prevailing the negro is compelled to flock with his kind. He is thrown back upon himself by the expulsive power of prejudice. The negro possesses the social instinct in a high degree, and can not endure isolation. The thinly veneered tolerance which he receives when scattered promiscuously among the whites by no means satisfies his longings. He longs for his own church and society and forms of social life.

2. The white population shuns open rivalry or contact with the negro on terms of equality. Wherever white men and women have to work for a living, they avoid those sections where they have to compete with the negroes; and if indigent to such localities, they often migrate to where the black rival is less numerous. For this reason immigration avoids the "black belts." Whenever a community of Northern agriculturists settle in the South, they usually select a white neighborhood, and, in some instances at least, they have been known to "freeze out" the negroes by methods of their own devising.

3. As manufacturing industry moves southward, the poor country whites will be drawn to the cities as operatives and workmen along lines of higher mechanical skill, leaving the negro in vast numerical preponderance in the agricultural districts.

These factors operating separately and cooperating conjointly will perpetuate the "black belts" of the South and make permanent this modern land of Goshen.

The political, social, and industrial future of these localities is a matter of serious importance. These belts are so distributed among the States that they can not maintain political integrity. They do not follow the Atlantic coast line, but are only tangential to it at several points, and therefore their commercial importance is materially lessened. The negro constitutes a majority in only two States; but even in these the white man's superior political sagacity will enable him to maintain governmental control for any calculable period of time.

The educational, social, and industrial life must be elevated by the negro himself under the stimulus of local and national assistance. It is here that must be worked out the future of the race on this continent. The great masses will be gathered in these belts or in the corresponding black wards of our large cities, from which the volatile particles will fly off in all directions to be dissipated and lost.

It is no reproach to these people to say that if left to themselves they would lapse into barbarism. No people, unaided, can lift themselves from a lower to a higher level of civilization. It is a social, as it is a physical, impossibility to lift one's self by pulling against the straps of one's own boots. But this land of Goshen is not to be left alone; there will always be a number of whites affiliating with the negroes for purposes of philanthropy or gain. Hampton and Tuskegee and Fisk are types of philanthropic helpfulness. There is need of autochthonous enterprise. Young men of ambition and education will be forced to such communities as a field to exploit their powers. The secret and method of New England may thus be transplanted to the South by the hands and brains of sons of Ethiopia. It is here that the great educational and developmental problems must be worked out.¹

II.—THE STRUGGLE FOR EDUCATION—PERSONAL AND ECONOMIC SACRIFICE.

A full knowledge of the education of the negro can not be had without making some reference to the earlier educational efforts. It is well known that slavery discouraged the dissemination of literary knowledge among persons of African descent, and, in most cases, this discouragement amounted to a positive prohibition. But despite the rigid regulations of the slave régime there were many kind-hearted slaveholders who taught their slaves to read and write. Many others picked up such knowledge in ways which it is mysterious to comprehend. The fact that book information was withheld from the negro made him all the more anxious to acquire it. Stolen waters are sweet, and the fact that they are forbidden leads those from whom the privilege is withheld to suspect that they possess mysterious efficacy. Such hungering and thirsting after knowledge amid dark and dismal discouragements is surely a compliment to the intellectual taste of the African. The antebellum struggles of the free colored people and the more ambitious slaves to acquire the use of printed characters is almost incomprehensible, in view of the liberal educational provisions of these latter days. The experience of Frederick Douglass was not without many parallels and counterparts. In his autobiography he tells us:

The most interesting feature of my stay here [in Baltimore] was my learning to read and write under somewhat marked disadvantages. In obtaining this knowl-

¹ This chapter was written before the figures of the Twelfth Census were available. This census, however, in so far as it has been completed, confirms the conclusions of this chapter in every essential particular. See Forum, February, 1902, "Expansion of the Negro Population."

edge I was compelled to resort to indirections by no means congenial to my nature and which were really humiliating to my sense of candor and uprightness. My mistress, checked in her benevolent designs toward me, not only ceased instructing me herself, but set her face as a flint against my learning to read by any means.¹

She would rush at me with the utmost fury, and snatch the book or paper from my hand with something of the wrath and consternation which a traitor might be supposed to feel on being discovered in a plot by some dangerous spy. The conviction once thoroughly established in her mind that education and slavery were incompatible with each other, I was most narrowly watched in all my movements. If I remained in a separate room from the family for any considerable length of time, I was sure to be suspected of having a book, and was at once called to give an account of myself. Teaching me the alphabet had been the "inch" given; I was now waiting only for the opportunity to take the "ell." Filled with determination to read at any cost, I hit upon many expedients to attain my desired end. The plan which I mainly adopted, and the one which was most successful, was that of using my white playmates, with whom I met in the streets, as teachers. I used to carry almost constantly a copy of Webster's Spelling Book in my pocket, and when sent on errands, or when playtime was allowed me, I would step aside with my young friends and take a lesson in spelling.²

Meanwhile, I resolved to add to my educational attainments the art of writing. After this manner I began to learn to write. I was much in the shipyard, and observed that the carpenters, after hewing and getting ready a piece of timber to use, wrote on the initials of the name of that part of the ship for which it was intended. When, for instance, a piece of timber was ready for the starboard side, it was marked with a capital "S"; a piece for the larboard side was marked "L"; larboard aft marked "L. A."; starboard aft "S. A."; starboard forward "S. F." I soon learned these letters, and for what they were placed on the timbers. My work now was to keep fire under the steambox, and to watch the shipyard while the carpenters had gone to dinner. This interval gave me a fine opportunity to copy the letters named. I soon astonished myself with the ease in which I made the letters, and the thought was soon present, if I can make four letters, I can make more. With playmates for my teachers, fences and pavement for my copy books, and chalk for my pen and ink, I learned to write.³

This was the university training of the most illustrious American negro, which could be duplicated by thousands of his fellow-slaves who remained "mute and inglorious."

A different and less strenuous phase of early educational opportunities may be found in the experience of another distinguished colored American, the late Prof. John Mercer Langston. Mr. Langston thus recounts the early schooling of his brother:

His father (a Virginia white man), manifesting the deepest interest in him, sought by his own efforts and influence to give him such thorough English education, with general information, and mental and moral improvement, as to make him a useful man. He [at 7 years] was required to appear for his recitations in his father's special apartments the year around at 5 o'clock in the morning.⁴

A second brother was put through the same régime, and John M., though too young for definite training when his father died, had ample provision made for his education.⁵

These citations represent two phases of negro education before the civil war. The one gives a picture of the dauntless, self-impelling determination to gain knowledge at any cost; the other, the kind and genial disposition of a father-master, in spite of the rigorous requirements of the law. These instances may be regarded as typical, and might be multiplied by hundreds and thousands. There were also organized efforts for the education of the colored race. Schools were established for the free colored people within the limits of the slave territory. These were mainly in the large cities. A careful and detailed study of such early educational efforts for the several States and cities affords a rich field for interesting and valuable monographic writing. This chapter attempts little more than to

⁵ Ibid, p. 20.

present some of the hindrances, embarrassments, personal and economic sacrifices under which the negro in the slave territory labored during the dark days of slavery, in order to secure what he considered the talismanic power of knowledge.

The Report of the Commissioner of Education for 1868 contains an interesting and exhaustive study upon "The legal status of the colored population in respect to schools and education in the different States." As this work is now out of print, a recount of some of the antebellum school laws and regulations may not be without interest. The sources of information for the following citations are the Report just referred to, Williams's History of the Negro Race, Chapter XII on Negro School Laws, and R. R. Wright's Historical Sketch of Negro Education in Georgia.

In Alabama the law of 1832 provided that "any person or persons that shall attempt to teach any free person of color, or slave, to spell, read, or write, shall, upon conviction thereof by indictment, be fined in a sum not less than \$250, nor more than \$500."

In 1833 the mayor and aldermen of the city of Mobile were authorized by law to grant licenses to such persons as they might deem suitable to instruct for limited periods the free colored creole children within the city and in the counties of Mobile and Baldwin, who were the descendants of colored creoles residing in said city and counties in April, 1803, provided, that said children first receive permission to be taught from the mayor and aldermen and have their names recorded in a book kept for the purpose. This was done, as set forth in the preamble of the law, because there were many colored creoles there whose ancestors, under the treaty between France and the United States in 1803, had the rights and privileges of citizens of the United States secured to them.

Arkansas seems to have had no law on the statute book prohibiting the teaching of persons of African descent, although the law of 1838 forbade any white persons or free negro from being found in the company of slaves or in any unlawful meeting, under severe penalty for each offense. In 1843 all migrations of free negroes and mulattoes into the State was forbidden.

There was no law expressly forbidding the instruction of slaves or free colored people in the State of Delaware until 1863, when a positive enactment against all assemblages for the instruction of colored people, and forbidding all meetings except for religious purposes and for the burial of the dead, was made.

While the free colored people were taxed to a certain extent for school purposes, they could not enjoy the privileges of public instruction thus provided, and were left for many years to rely principally upon individual efforts among themselves and friends for the support of a few occasional schools. In 1840 the Friends formed the African School Association in the city of Wilmington, and by its aid two very good schools, male and female, were established in that place.

In 1828 the State of Florida passed an act to provide for the establishment of common schools, but white children only of a specified school age were entitled to school privileges.

In Georgia the following law was enacted in 1829:

If any slave, negro, or free person of color, or any white person, shall teach any other slave, negro, or free person of color to read or write, either written or printed characters, the said free person of color or slave shall be punished by fine and whipping, or fine or whipping, at the discretion of the court; and if a white person so offend he, she, or they shall be punished with a fine not exceeding \$500 and imprisonment in the common jail, at the discretion of the court.

In 1833 a penalty not exceeding \$500 was provided for the employment of any slave or free person of color in setting up type or other labor about a printing office requiring a knowledge of reading or writing. The code remained in force until swept away by events of the civil war.

In 1833 the city of Savannah adopted an ordinance that if any person should teach or cause to be taught any slave or free person of color to read or write within

the city, or who shall keep a school for that purpose, he or she shall be fined in a sum not exceeding \$100 for each and every such offense; and if the offender be a slave or free person of color, he or she may also be whipped not exceeding 39 lashes.

Notwithstanding this severe enactment, there were, nevertheless, several schools for colored children clandestinely kept in Augusta and Savannah. The poor whites would often teach negro children clandestinely. If an officer of the law came round the children were hastily dispatched to the fictitious duty of "picking up chips." The most noted negro school was opened in 1818 or 1819 by a colored man from Santo Domingo. Up to 1829 this school was taught openly. The law of that year made concealment and secrecy a necessity.¹

In Kentucky the school system was established in 1830. In this provision the property of colored people was included in the basis of taxation, but they were excluded from school privileges.

Louisiana, in 1830, provided that whoever should write, publish, or describe anything having a tendency to produce discontent among the free population or insubordination among the slaves, should upon conviction be imprisoned at hard labor for life or suffer death, at the discretion of the court. It was also provided that all persons who should teach or permit or cause to be taught any slave to read or write should be imprisoned not less than one month or more than twelve.

In 1847 a system of public schools was established for the education of white youth, and one mill on the dollar upon the ad valorem amount of the general list of taxable property might be levied for its support. Prior to the civil war the only schools for colored youth in Louisiana were a few private ones in the city of New Orleans among the creoles.

St. Francis Academy for colored girls was founded in connection with the Oblate Sisters, in Baltimore, Md., and received the sanction of the Holy See October 2, 1831. There were many colored Catholic refugees who came to Baltimore from Santo Domingo. The colored women who formed the original society which founded the convent and seminary were from Santo Domingo. The Sisters of Providence is the name of a religious society of colored women who renounced the world to consecrate themselves to the Christian education of colored girls. This school is still in successful operation. A colored man by the name of Nelson Wells left by will to trustees \$7,000, the income of which was to be applied to the education of free colored children. The Nelson Wells school continued from 1835 to the close of the civil war.

Dr. Bokkelen, State superintendent of education, recommended in 1864 the establishment of colored schools on the same basis as those of the whites, and states in his recommendation—

I am informed that the amount of school tax paid annually by these (colored) people to educate the white children in the city of Baltimore for many years has been more than \$500. The rule of fair play would require that this be refunded unless the State at once provided schools under this title.

By an act of January, 1833, the legislature of Mississippi provided that the meeting of slaves and mulattoes above the number of five at any place or public resort or meetinghouse in the night or at any schoolhouse for teaching reading or writing in the day or night was to be considered an unlawful assembly. In 1846 an act was passed establishing a system of public schools from all escheats and all fines, forfeitures, and amercement from licenses to hawkers and all income from school lands. The schools were for the education of white youths.

The legislature of Missouri in 1847 provided that no person should teach any schools for negroes or mulattoes.

In North Carolina until 1835 public opinion permitted the colored residents to maintain schools for the education of their children. These were taught sometimes by white persons, but frequently by colored teachers. After this period colored children could only be educated by confining their teaching within the

¹ Negro Education in Georgia, by R. R. Wright, p. 20.

circle of their own family or by going out of the limits of their own State, in which event they were prohibited by law from returning home. The public system of North Carolina declared that no descendant of negro ancestors to the fourth generation, inclusive, should enjoy the benefits thereof.

In 1740, while yet a British colony, South Carolina took the lead in directly legislating against the education of the colored race—

Whereas the having of slaves taught to write, or suffering them to be employed in writing, may be attended with inconvenience, be it enacted, That all and any person or persons whatsoever, who shall hereafter teach or cause any slave or slaves to be taught, or shall use or employ any slave as scribe in any manner of writing whatever, hereafter taught to write, every such person or persons shall for every such offense forfeit the sum of £100 current money.

In 1800 free colored people were included in this provision. In 1834 it was provided—

If any person shall hereafter teach any slave to read or write, or shall aid or assist in teaching any slave to read or write, or cause or procure any slave to be taught to read or write, such person, if a free white person, upon conviction thereof shall, for each and every offense against this act, be fined not exceeding \$100 and [suffer] imprisonment not more than six months; or if a free person of color, shall be whipped not exceeding 50 lashes. * * * And if any free person of color or slave shall keep any school or other place of instruction for teaching any slave or free person of color to read or write, such free person of color or slave shall be liable to the same fine, imprisonment, and corporeal punishment.

And yet there were colored schools in Charleston from 1744 to the close of the civil war.

In 1838 Tennessee provided a system of public schools for the education of white children between the ages of 6 and 16, but the colored children never enjoyed any of its benefits, although the free colored people contributed their due share of the public fund.

Texas never expressly forbade the instruction of negroes, although the harsh and severe restrictions placed upon the race made such a provision scarcely necessary.

In 1831 the general assembly of Virginia enacted, among others, the following provisions:

That all meetings of free negroes or mulattoes at any schoolhouse, church, meetinghouse, or other place for teaching them reading or writing, either in the day or night, under whatsoever pretext, shall be deemed an unlawful assembly. * * * If any white person or persons assemble with free negroes or mulattoes at any schoolhouse, church, meetinghouse, or other place for the purpose of instructing such free negroes or mulattoes to read or write, such person or persons shall, on conviction thereof, be fined in a sum not exceeding \$50, and, moreover, may be imprisoned, at the discretion of a jury, not exceeding two months.

It is known, however, that schools for colored children were established and maintained in such cities as Petersburg, Norfolk, and Richmond.

The early educational efforts of the colored people of the District of Columbia have been studied with more fullness than those of any other Southern community. He who presents the movement in Baltimore, Richmond, Louisiana, Charleston, and other Southern centers with as much detail and accuracy will render no inconsiderable service to the history of education.

There does not seem to have been any express law forbidding the education of colored people in this District. In 1807 the first schoolhouse for the use of colored pupils was erected by three colored men—George Bell, Nicholas Franklin, and Moses Liverpool—not one of whom knew a letter of the alphabet. They had been former slaves in Virginia, and, like others of their condition, had an exalted notion of literary knowledge. A white teacher was secured. From this time to the opening of the new régime, brought on by the civil war, there was a tolerably adequate number of schools, supported mainly by the colored people themselves, but not

without assistance from Northern philanthropy. But that these schools did not always have plain and smooth sailing may be gathered from the fact that in 1835, on account of an alleged indiscreet utterance of a colored resident, colored schools were attacked by a mob, some of them burned, and property destroyed, while the most conspicuous negro teacher, Mr. John F. Cook, was compelled to flee for his life. This outbreak is known as the snow riot.

Many of the best-known names in the District were both products of and factors in these early schools, the most noted of whom, perhaps, is Mr. John F. Cook, who subsequently became tax collector of the District of Columbia. For substance, dignity, and influence he stands as one of the conspicuous names of the national capital, regardless of race distinction. His brother, George F. T. Cook, who was both a pupil and a teacher in the antebellum schools, subsequently became superintendent of the colored public schools of Washington and Georgetown, which position he held for thirty years.

This survey has been limited to the Southern or slave States. In the free States of the North the negro had a more picturesque and exciting educational experience. The Northern States did not expressly forbid the education of colored persons, but the hostility to such movements is attested by many a local outbreak.

It was amid such dangers and difficulties that the negro began his educational career. It must not be for a moment supposed, however, that the laws above referred to were rigidly enforced. It is known that pious and generous slaveholders quite generally taught their favorite slaves to read, regardless of the inexorable provisions of law. Quite a goodly number also learned the art of letters somewhat after the furtive method of Frederick Douglass, and in the cities schools for negroes were conducted in avoidance, connivance, or defiance of ordinances and enactments.

In 1865 there was to be found in every Southern community a goodly sprinkling of colored men and women who had previously learned how to read and write.

The censuses of 1850 and 1860 give the number of free colored people attending school in the several States. These figures, for obvious reasons, represent only a small fraction of the negroes, free and slave, who were openly or furtively gaining the elements of literary knowledge. The decline in avowed school attendance between 1850 and 1860 is due to the growing intensity of feeling which culminated during that decade.

Free negroes attending school.

State.	1850.	1860.	State.	1850.	1860.
Delaware	187	250	Texas	20	11
Maryland	1,616	1,355	Arkansas	11	5

Alabama	68	114			
Mississippi		2			
Louisiana	1,219	275	Total	32,627	26,461

It will be noticed that most of the enactments against the education of the negro were made subsequently to 1830. The Nat Turner insurrection and the opening up of the antislavery campaign in the North had a decidedly reactionary effect in the slave territory.

A people who have made such sacrifice and run such risks for the sake of knowledge, who of their own scanty means were ever willing to support schools for the education of their children, although their property had been taxed for

the support of an educational system from which they were excluded, surely deserves a larger and fuller draught of that knowledge of which the régime of slavery permitted them to gain only a foretaste. The civil war wiped out all of these restrictions, and at its close the Freedmen's Bureau, religious and benevolent associations, and the reconstructed governments of the former slave States threw wide open the gate of knowledge.

The avidity and zeal with which the erstwhile suppressed population seized upon the new opportunity furnishes the most interesting chapter in the history of American education. Educational opportunities were thus thrown open to a people who desired and needed them above all, and who had shown by long and persistent endeavor that they were fully worthy and deserving of them.

III. SEPARATE SCHOOL PROVISIONS.

Although the reconstruction governments have been charged with every known public sin, yet they have one conspicuous countervailing claim to the everlasting gratitude of the South. They established the public school system upon a broad and enduring foundation, making provision for the education of all children regardless of race or color. The South will search its records in vain for another act of statesmanship fraught with so much wisdom and beneficent consequences. No one has yet had the temerity to question the wisdom of this one redeeming memorial to the hated reconstruction régime. Be it said to the credit of the white people of the South, that when they regained political ascendancy they undertook to strengthen, rather than to upset the educational propaganda originated by their political foes.

The avowed policy of the Southern people is that equal, but separate, educational facilities shall be provided for the two races. This is with them a fundamental principle, concerning the wisdom of which it would be a mere waste of time to contend. It is the most vital clause in their social creed, and has become embedded in the fundamental and organic laws of the several States, being as fixed and invariable as the laws of the Medes and Persians. The following citations will show the unanimity of the several Southern States as to scholastic separation of the races:

Alabama.—The general assembly shall establish, organize, and maintain a system of public schools throughout the State for the equal benefit of the children thereof between the ages of 7 and 21 years; but separate schools shall be provided for children of African descent. (School Laws, p. 3.)

Arkansas.—Intelligence and virtue being the safeguards of liberty, and the bulwark of free and good government, the State shall ever maintain a general, suitable, and sufficient system of free schools, whereby all persons in the State, between the ages of 6 and 21 years, may receive gratuitous instruction. (School Laws, 1897, p. 9.)

The said board shall make provisions for establishing separate schools for white and colored children and youths. (Ibid., p. 48.)

District of Columbia.—Separate schools for white children and for colored children shall be provided. (Rules of Board of Education, 1901, p. 1.)

Florida.—White and colored children shall not be taught in the same school, but impartial provisions shall be made for both. (School Laws, 1897, p. 12.)

It shall be a penal offense for any individual, body of individuals, corporation or association, to conduct within this State any school of any grade, public, private, or parochial, wherein white persons and negroes shall be instructed or boarded within the same building, or taught in the same class, or at the same time by the same teacher. (Ibid., chaps. 43-45, sec. 1.)

Any person or persons violating the provisions of section 1 of this act, by patronizing or teaching in such school shall, upon conviction thereof, be fined in a sum not less than \$150 nor more than \$500, or imprisoned in the county jail for not less than three months nor more than six months for every such offense. (Ibid., sec. 2.)

Georgia.—It shall be the duty of said board of education to make arrangements for the instruction of the children of the white and colored races in separate

schools. They shall, as far as practicable, provide the same facilities for both races in respect to attainments and abilities of teachers and length of term time; but the children of the white and colored races shall not be taught together in any common or public school of this State. (School Laws, 1897, p. 15.)

Kentucky.—There shall be maintained throughout the State of Kentucky a uniform system of common schools. * * * It shall not be lawful, under any of the provisions of this chapter, for any white child to attend any common school provided for colored children, or for any colored child to attend any common school provided for white children. (School Laws, 1897, chap. 154.)

Maryland.—It shall be the duty of the board of county school commissioners to establish one or more public schools in each election district for all colored youth between 6 and 20 years of age, to which admission shall be free, and which shall be kept open as long as the other public schools of the county: *Provided*, The average attendance be not less than 10 scholars for two consecutive terms. (School Laws, 1898, sec. 96.)

Each colored school shall be under a separate board of school trustees, to be appointed by the board of county school commissioners, and shall be under the same laws for its government and furnish instruction in the same branches as schools for white children. (Ibid., sec. 7.)

Mississippi.—There shall be maintained a uniform system of free public schools for all children between the ages of 5 and 21 years. (School Laws, 1894, sec. 3162.)

Separate schools shall be maintained for children of the white and colored races. (Ibid., sec. 207.)

Missouri.—Separate free schools shall be established for the education of children of African descent; and it shall hereafter be unlawful in public schools of this State for any colored child to attend any white school or for any white child to attend any colored school. (School Laws, 1893, p. 17.)

North Carolina.—The school commissioners shall establish and locate in the districts, schools for the white race and schools for the colored race. (School Laws, 1897, sec. 2550.)

South Carolina.—The general assembly shall provide for a liberal system of free public schools for all children between the ages of 6 and 21 years.—(Constitution, 1895.)

Separate schools shall be provided for children of the white and colored races, and no child of either race shall ever be permitted to attend a school provided for children of the other race. (Ibid.)

Tennessee.—There shall be established and maintained in this State a uniform system of public schools. (School Laws, 1895, sec. 1.)

Nothing in this act shall be so construed as to allow or permit mixed schools of the white and colored population, but such schools shall be taught separately, as now provided by law. (Ibid., p. 23.)

Texas.—The children of the white and colored races shall be taught in separate schools, and in no case shall any school consisting partly of white and partly of colored children receive any aid from the public school fund. (School Laws, 1899, sec. 16.)

All the available public school funds of this State shall be appropriated in each county for the education alike of white and colored children, and impartial provisions shall be made for both races. (Ibid., sec. 13.)

Virginia.—White and colored persons shall not be taught in the same school, but in separate schools, under the same general regulations as to management, usefulness, and efficiency. (School Laws, 1892, sec. 77.)

West Virginia.—White and colored persons shall not be taught in the same school. (School Laws, 1897, p. 17.)

This separation of races raises important economic questions. It is well known that a dual scheme of schools covering a sparsely settled territory practically duplicates the expense of a unified system. Although race prejudice proves to be very expensive, yet the white South is pledged to its maintenance at any cost. The wisdom of this policy is not a profitable subject of discussion. The policy emphasizes the necessity of outside aid for the education of both classes of children.

Number of persons to the square mile, 1890.

State.	Total.	White.	Colored.
Maine	22.11		
New Hampshire	41.81		
Vermont	56.39

Western Division	2.58		
Missouri	38.98	36.79	2.19
Kentucky	46.47	39.73	6.71
United States	21.31		

The accompanying table shows the relative density of the population for the several geographical divisions of the United States. It is noticeable that the slave States as a group are more sparsely settled than any other section of the country, excepting, of course, the far West, with its vast stretches of uninhabited and uninhabitable spaces. The difficulty of maintaining a duplicate system of schools for such a population is clearly apparent. The inevitable result is inferior scholastic accommodations and greater hardship on the part of the pupils in securing them. Pennsylvania has an average density of 116 persons to the square mile, while Georgia has only 31, or, to count the two independent component elements, $16\frac{1}{2}$ white, and $14\frac{1}{2}$ colored. The State must be covered with a dual system of schools for the accommodation of the two component classes. If the two States were equal in proportional financial ability, and if both had a unified system, Pennsylvania could maintain far more efficient schools, because of the relative density of the pupils to be taught; but when we take into account the relative fiscal status and the solidified system in the one, and the bifurcation of funds and facilities in the other, the educational possibilities of the two become startlingly disproportional. Georgia and Iowa have approximately the same area and population. The school expenditure for Georgia in 1899-1900 was \$1,807,815; for Iowa, \$8,583,417. The population in both States is mainly rural. And yet Georgia, with only one-fourth of the school funds, must do twice the work of its northern counterpart. The result is inevitable. A dollar will go no further in Georgia than in Iowa, and a dollar applied to the education of the negro will accomplish no more than one applied to the education of a white child.

These instances are but typical of the relative educational conditions which prevail in the Northern and Southern States. National aid alone can bring the latter up to the requisite educational status.

In the second place these States, by clear declaration or imperative inference, are pledged to equal school facilities for both races. The general school fund should therefore be apportioned between the races on the basis of relative numerical strength. The colored element being shorn of political power, is wholly at the

mercy of the whites for the carrying out of this provision. It will be seen also that the schools for the less numerous race, provided equal facilities are afforded, must be proportionately more expensive than for the race numerically dominant. In all the Southern States, therefore, except South Carolina, Mississippi, and Louisiana,¹ the cost of education of the negro would relatively exceed that of the whites. Several of the States—notably Maryland, Kentucky, and Delaware—apportion only that portion of local school taxes paid by colored property holders to colored schools. The Maryland law requires that “the total amount of taxes paid for school purposes by the colored people of any county, or in the city of Baltimore, together with any donation that may be made for this purpose, shall be devoted to the maintenance of schools for colored children.”²

This does not of necessity limit the provision for colored schools to the taxes paid by colored people. It is not imperative, but permissory; and in some of the counties at least the practice prevails.

The school laws of Kentucky are more emphatic: “But no tax shall be levied upon the property or poll or any services required of any white person for the benefit of a school for colored children; and no tax shall be levied upon the property or poll or any services required of any colored person for the benefit of a school for white children.”³

In the school report for the county of Sussex, Del., 1892, we find the following components of the educational fund for the colored race:

Amount from State.....	\$2,783.33
Unexpended balance for books.....	114.93
Amount of colored taxes.....	569.89
Unexpended balance for salaries.....	45.78
Total.....	3,513.93
Reserved for books.....	464.04

The State fund is of course distributed equally according to population, the application of taxes from negro property holders to negro education applying only to county or local provisions.

In these States we have an indication of the general policy which has sometimes been advocated of assigning to colored education only the proportional taxes paid by that race. As a matter of fact the educational fund in the South is not equably apportioned between the two races except in a few States. The accompanying table clearly indicates the inequality of distribution:

*Per capita expense of white and colored schools, 1897-98.*⁴

¹ Report of Commissioner of Education, 1898-99, vol. 1.

² Specimen items are here presented at intervals of five years in order to show the progressive character of these provisions. The total is taken from the full table as prepared by the Bureau of Education.

These tables show that the per capita expense of the education of the negro child is, in the Southern States, at present about one-half of that of the white child. In North Carolina the two are nearly even, being \$1.17 for the white and \$1.03 for the colored, while in Florida the proportion is \$5.92 to \$2.27. The encouraging suggestion of these figures is that the cost of the education of the colored race has been steadily increasing both absolutely and relatively since 1870. In that year the per capita cost of the education of the white child was \$2.97 and of the colored child \$0.49, whereas in 1897 the figures were \$4.25 to \$2.27, respectively. It is but fair to state that part of the disproportion is due to the fact that the schools of the white race represent a higher grade of scholastic attainments and, as is well known, advanced courses are more expensive than the elementary branches.

The State, in so far as it controls education, must, by the very nature and theory of its function, furnish equal accommodations for all of its citizens. The funds are the common property of all the people, and therefore should not be apportioned according to class or race distinction. It is interesting to study the sources of these funds as furnishing light as to their just apportionment between the races.

These figures of nearly all of the Southern States are sufficient to show the general amounts and sources of school funds.

It has recently been urged that the negro pays only a small percentage of the cost of his own education, while the great burden falls upon the shoulders of the white taxpayer. A study of the sources of the public school funds will throw much light upon the theory sought to be upheld in this assertion. The figures for the State of Georgia are perhaps more easily analyzed than those of any other State. This question was studied by the recent Atlanta conference, with the conclusion that the negro, to a much greater degree than is generally supposed, pays for his own education.

"It was estimated that the negroes of Georgia paid during 1899 \$26,347.43 in

direct tax and \$89,003 in polls, making a total of \$115,530.43 paid directly by the race for educational purposes. The nature of the indirect taxation of Georgia is such that the negro is, without any shadow of question, entitled to his due proportion.

Western and Atlantic Railroad	\$210,000
Liquor tax	142,000
Convict lease	24,255
Dividend from stocks	2,046
Show tax	4,692
Oil tax	12,503

"The negro's pro rata share of the school fund raised by indirect taxation was \$176,898.24, making a grand total of \$292,248.67. The expenditure for negro schools, including proportional cost of superintendence, was \$288,128. This would seem to show that the whites of Georgia, at least, do not contribute one cent to negro education.

"On the same basis of calculation, though with confessed lack of definite data, the conference shows a like condition of things for the entire South. The negro is shown to have contributed in thirty years \$104,539,591 toward public education. This sum, of course, includes his pro rata share of general funds, such as land funds and indirect taxation. The total cost of negro education for the period was \$101,860,601.

"Although these figures are given out as tentative, yet there can be no question as to the substantial correctness of the conclusion that the negro's education imposes no special burden upon the white taxpayers of the South. The wide currency and general acceptance of the assertion is but another illustration of the ease with which frequently reiterated though unsupported statements concerning the negro gain currency and credence."¹

¹ Days.

² Weeks.

³ Months.

This table, while not complete, and the figures not being for the same date for all of the States, nevertheless gives a fair general impression of the prevailing educational treatment which the two races receive. In general, the white schools run longer than the colored, there are more white teachers in proportion to the population, and they receive higher average of salary. These discrepant arrangements range from the most glaring disproportions in some States to an almost exact equivalence in others. In South Carolina there are 3,000 white teachers for 123,398 pupils and 2,003 colored teachers for 146,477 negro pupils. The length of school term for the whites is 6.81 months and for the blacks only 3.65 months.

¹ Dr. W. E. B. DuBois, Independent, July 18, 1901.

Although the blacks constitute three-fifths of the population, their educational allowance absorbs scarce more than one-fourth the total school fund. In Florida the whites have 2,084 teachers for 68,077 pupils, while the blacks are allowed only 645 teachers for 41,797 pupils. The relative compensation for teachers is \$36.81 and \$27.67 per month, and the relative lengths of school terms ninety-five and eighty-seven days. On the other hand, in North Carolina, if we make the necessary allowance for the inevitable differences in the scholastic requirements of the two races, the provisions both as to length of term and compensation of teachers seem to be equitable enough. In Texas, whose school laws require equal facilities for the two races, the provisions are entirely beyond complaint, whether we consider the relative number of teachers employed, their compensation, or the length of school term. While the whites are a fraction ahead, yet this difference can be accounted for on other grounds than race discrimination. The white teachers average \$48.45 per month, while the colored teachers average \$46.86. This difference is doubtless due to the higher-grade certificates held by white teachers. The average term for white schools is 5.33 months; for colored, 4.85. This slight discrepancy may be effected by the relative distribution and density of the two elements of the population.

On the whole, it appears that while the negro constitutes one-third of the population of the original slave States, the cost of his education is not more than one-fifth the total allowance—that is, the educational provision of a colored child costs just half as much as that for a white child.

IV. NEGRO OWNERS AND TENANTS OF FARMS AND HOMES.

The census of 1890 contains a vast deal of valuable information concerning the negro race, a careful study of which throws much light upon current educational discussion. The negro problem is ever discussed, but seldom studied. In no other field of serious inquiry do we find such an extravagance of assertion coupled with such paucity of proof. We are expected to accept, without investigation, statements and solutions born of impatience and haste, although they clearly violate easily accessible and accurate data.

The assertion that the whites gratuitously impose a tax upon themselves to defray the cost of negro education has gained such wide currency and credence as to become almost a universally accepted belief. Indeed, it is postulated as an axiom in current discussions. But the potency of fact must in the end overcome the fascination of assertion. It is, however, a slow and painful process to uproot popular prejudice by scientific demonstration. A full and fair presentation of the negro as a contributing factor to the industrial and economic life of the South will be sufficient proof that his educational privileges are not bestowed as a charity, but are a legitimate part of the fruits of his own endeavor.

Interesting as such inquiry might be, it is not the purpose of this investigation to discuss the theory and function of public education, except in so far as its bearing upon the present task makes it imperative.

The public-school system is the most democratic feature of our democratic institutions. The obvious object is to produce a higher average of intelligence and good citizenship. It is undertaken and controlled by the State for the general welfare. The rich and the poor meet together on terms of perfect equality, and the State administers facilities impartially, alike to all. The taxpaying ability of the recipient is no more a legitimate factor in popular education than it is in the enforcement of law or the administration of justice. The childless millionaire is taxed to educate the progeny of the prolific peasant with as much justice and equity as when a tax is imposed upon the exemplary citizen to restrain the vicious and the lawless.

The injection of the negro usually forms a perturbing element in the sociological equation. The social formulas which pass unchallenged among white men lose

much of their force and effect when made to include the negro. This race was injected without warning or preparation, into the general body politic, and has ever since formed a disturbing and irritating factor. At the close of the war the negro, as might well be imagined, figured scarcely at all in the roll of taxpayers. When, therefore, public schools were inaugurated in the South carrying like provisions for both races it might have appeared, on first view, that the whites were being taxed for the education of the blacks. How prone men are to be satisfied with appearances without stopping to investigate the underlying principles. It is a dictum of political economy that labor pays every tax in the world. The negro did not, indeed, enjoy the privilege of passing the tribute to the tax taker, for the accumulated fruits of his labor were in the possession of another race.

But does this justly preclude him from sharing in all the public privileges which the fruits of his labor make possible? Every laborer contributes his full share and more than his share toward bearing the public burden; and even if he did not, motives of self-preservation would induce the State to abate no whit in its effort toward popular enlightenment. The argument that the rich are taxed for the education of the poor is seldom heard of outside of communities complicated with the race question. Who would have the temerity to suggest such an argument in New York or Minnesota?

A knowledge of the extent to which the negro has acquired property, upon which he pays taxes directly, or hires it, in which case he certainly meets the taxation item indirectly, will do much to correct an erroneous impression.

White and colored population of the sixteen original slave States, 1890.¹

Total	15,549,357	6,888,152	69.31	30.69

This table shows the number of whites and blacks in the slave States in 1890 and their respective percentage as a factor of the total population. As this study is concerned primarily with the negro and with the whites mainly as a concomitant factor, only persons of African descent are tabulated wherever it is possible to separate them from the Indian and Mongolian races. In the report of the Eleventh Census, Indians, Chinese, and Japanese are classed with negroes as constituting the colored element; but since the aborigines and the orientals constitute no part of the negro's educational problem, they are therefore justly excluded from the present consideration. The comparatively slight numbers of such non-Aryans do not, in general, produce any appreciable effect upon the racial equation between Africans and Europeans; but in Louisiana, where the two elements are almost equal, they constituted in 1890 the balance of population. There were 538,395 whites, 559,193 blacks, 233 Chinese, 39 Japanese, and 627 Indians. Thus the 999

¹ Omitting Chinese, Japanese, and Indians.

Mongolians and Indians were sufficient to change a negro plurality into an absolute minority.

The negroes were in the majority in two of these States, and if we consider the competing races only there would be three States in which this race predominated numerically. The per cent of the negro element ranged from 59.85 in South Carolina to 4.29 in West Virginia. In the entire region there were 15,549,357 whites and 6,888,152 colored, the negro element averaging 30.69 per cent. If we omit Missouri and West Virginia, where the African element did not exceed 5 per cent, the negroes constituted 35 per cent of the remaining fourteen States. This territory, with its mixed population, constitutes America's most serious educational problem. It is interesting to study the extent to which the negro has gained material proprietorship since emancipation. Let us not forget that he began at the zero point of materiality. He was emancipated without so much as one day's provision. Being cast upon the cruel current of material rivalry, without experience or intelligent self-direction, he has had to drift blindly in the dark, without compass or pilot. His material accumulations, therefore, should not be judged in the light of their absolute value, without regard to the disadvantageous circumstances under which they were acquired. We may regard his present ownership as an earnest of future acquisitions.

The foregoing tables contain the number of persons owning and hiring their farms and homes, by race, compiled from the Eleventh Census, for the sixteen original slave States and the District of Columbia. There were 231,568 negroes who owned their farms and homes, against 1,565,923 whites. The contributing power of the whites to the ownership of farms and homes was 10.07 per cent of the white population, against 3.23 per cent for the negroes. If we estimate 5 persons to the family, it will be seen that 50 per cent of the white families owned their farms and homes, and 16 per cent of the colored families. It would probably be a revelation to most persons who decry the lack of energy, thrift, and foresight on the part of the negro race to be told that one-sixth of them own their own farms and homes. There were 29,888 negro owners in Virginia alone. This State contained, in round numbers, 100,000 white and 30,000 negro owners of farms and homes, representing 9.82 and 4.70 per cent of the respective populations; or, to put it in other terms, 23 out of every 100 negro families were their own proprietors, against 49 out of every 100 whites. The highest average contributing power to the ownership of farms and homes on the part of the negro is found in Florida, where 32 negro families out of every 100 are their own proprietors, and the lowest in Alabama, which contributes only 11 out of 100.

It will be seen that one-sixth of the colored people of the South are taxpayers upon their own property. We must not forget also that capitation tax prevails in most or all of the Southern States, so that every negro male over 21 years of age becomes a taxpayer. These two classes contribute directly to the public revenues.

The table under consideration also contains the number of persons who hire their farms and homes. The number of blacks is in relative excess of the whites. There were 1,413,150 whites and 1,059,991 colored tenants. These might be called indirect taxpayers; for it is well known that the owner of a farm or home estimates the taxation as an essential element of cost in fixing the rental. So that whether the tenant pays in money, service, or part of crop he is the real taxpayer upon the house which he occupies or the farm which he tills. The percentage of the colored race who are owners and tenants, and therefore taxpayers, directly or indirectly, is not so far below that of the whites; or, to be exact, 19 per cent of the one against 24 per cent of the other.

It is doubtless true that the absolute values of the colored holdings are rather small by comparison. This is inevitable. The negro out of his scanty earnings acquires a small piece of land or humble shanty which he can call his own. But this does not alter the fact that a large number of the race have become owners of the farms and homes which they occupy, and that their property is subject to all the requirements of public revenue. The essential fact to be borne in mind is that nearly a quarter-million negroes in thirty years have risen from the condition of chattels to that of proprietorship. The race which a generation ago was rated with farms and homes as a part of the common asset now represents 13 per cent of the ownership of all the homes and farms in the South.

Nor do the figures reveal the whole truth. It is quite easy to take for granted that all white and negro tenancy implies white proprietorship; but, as a matter of fact, many negroes, and white persons as well, are tenants of farms and homes that are owned by members of the colored race. The census of course does not take cognizance of such cases, which, if revealed, would doubtless bring the total negro holdings to a much higher figure.

Owners of farms and homes, separately, in the former slave States and District of Columbia, 1890.

Total	425,102	109,161	72,788	8,297	484,500	117,689

This table shows that the negro owned 104,393 unincumbered farms and 9,677 incumbered ones. It is easy to assume that the property which is recorded in the negro's name is only nominally his, whereas the real owner is the white man who holds the mortgage. Of the 230,000 negro owners of homes and farms, less than 18,000 carry mortgages. It might appear that the comparatively small number of pieces of involved property held by the negro implies that he is not rapidly increasing his holdings. Those who are acquainted with his financial methods know that he is in the habit of secreting his savings until he has sufficient accumulations to make a purchase outright. An old, unobtrusive colored man often surprises his friends and neighbors by a sudden show of financial strength who had previously been regarded as impecunious.

NEGRO PROPERTY OWNERS IN GEORGIA, VIRGINIA, AND NORTH CAROLINA.

A most interesting bulletin has just been issued by the Bureau of Labor on Negro Landholders in Georgia.¹ Georgia contains a larger black contingent than any other State. The negro element amounts to more than 1,000,000, comprising 46

¹ Bulletin No. 35, July, 1901; Dr. W. E. B. DuBois, investigator.

per cent of the entire population. Record of the ownership of property by negroes in this State has been kept since 1874.

The assessed value of total property owned by negroes in Georgia, 1874 to 1900.

Year.	Assessed value.	Year.	Assessed value.
1874	\$6,157,798	1888	\$9,631,271
1875	5,393,885	1889	10,415,530
1876	5,488,867	1890	12,322,003

1885	788,376	2,362,889	1899	1,062,223	4,220,120
1886	802,959	2,508,198	1900	1,075,073	4,374,549
1887	813,725	2,598,650			

The average size of negro farms in 56 typical counties was 79 acres. These counties contained 8,065 negro farm owners, or a majority for the entire State. The average size of all farms in Georgia was 147 acres. The average value of negro farms for typical counties was \$212. The value of town and city real estate owned by Georgia negroes was \$3,642,586, or more than 29 per cent of all negro property in the State. Savannah showed \$870,767, Atlanta, \$793,910, and Augusta, \$479,495 as held by negroes in the respective municipalities.

Landholders in Virginia.

Total.....	96.8	3.2	323.3	15.7

These tables show the general economic condition of the two races in the three States mentioned. The relative values are so close together in these States that we may well take them as typical of the whole group. It would be misleading, however, to suppose that these figures reveal the whole truth. The negro's possessions are limited to real estate and personal property. The vast corporate interests, public and private, are set down wholly to the credit of the white race. As is well known, these comprise a large part of the aggregate wealth of the several States. The real ownership is not always, perhaps not generally, in the hands of local whites, but is the result of outside capital invested in the State. For purposes of taxation, therefore, they can not justly be credited to the white race, for as is well known the burden of taxation falls upon the patrons rather than upon the ownership of such enterprises.

V. OCCUPATIONS OF NEGROES.

Mr. Henry Gannett, of the United States Geological Survey, has prepared an interesting pamphlet on occupations of negroes, under the auspices of the trustees of the John F. Slater fund.¹ From this pamphlet we learn that out of a total population of 62,622,250 in the United States, 22,753,884 persons, or 34.6 per cent, were engaged in gainful occupations. Of negroes, numbering 7,470,040, there were 3,073,123, or 41.1 per cent, engaged in gainful occupations. Thus for the country at large, the negroes were more generally employed than the whites. The South

¹ Trustees of John F. Slater fund, Occasional Papers, No. 6.

boasts of her bygone days of chivalric civilization instinct with dignity, comity, and grace; and she does well. The New South, springing Phoenixlike from the ashes of the old, is fast bidding for industrial prestige and power. But underneath all her glory—past, present, or to come—lies the negro's brawny arm. It was he who cleared her forests, cultivated her fields, and covered her hills with the fleecy snow of cotton and her valleys with golden shocks of corn. The brunt of effort necessary to the new awakening will also devolve upon him the veritable "man with the hoe." In order to show to what extent the negro is a contributing factor to the industrial life of the South, the following tables have been computed on the basis of the Eleventh Census.

Persons engaged in gainful occupations, by race, 1890.

States.	White.	Colored.	Per cent.	
			White.	Colored.
Alabama	247,993	293,406	29.63	43.24
Arkansas	230,102	116,976	28.10	37.84
Delaware	51,897	12,350
District of Columbia	61,015	40,007	39.44	52.94
Florida	71,269	65,371	31.68	39.34
Georgia	299,330	369,265	30.60	43.00
Kentucky	482,602	107,666	30.34	40.16
Louisiana	179,324	243,157	32.11	43.43
Maryland	297,227	95,811	35.96	44.43
Mississippi	157,955	303,837	28.99	40.92
Missouri	823,285	60,655	32.56	40.39
North Carolina	320,277	216,590	30.35	38.61
South Carolina	151,197	289,550	32.73	42.63
Tennessee	387,896	165,734	29.02	38.48
Texas	525,393	170,085	30.09	34.84
Virginia	310,487	241,095	30.44	37.94
West Virginia	209,669	14,101	28.99	43.14
Total	4,806,918	2,805,656	30.09	40.70

The first table shows the number of persons engaged in gainful occupations, by race, for the sixteen original slave States and the District of Columbia. According to the plan of the Eleventh Census, persons engaged in gainful occupations did not include housewives and school children, but only those persons above 10 years of age who received a definite stipend for their labor. There were 4,826,918 whites and 2,815,656 negroes engaged in gainful pursuits. While the negroes constituted 30 per cent of the population, they contributed 37 per cent of the workers. Every State shows a higher percentage of negroes than of whites engaged in gainful occupations. The per cent for negroes ranged from 52.94 in the District of Columbia to 34.84 in Texas, while that of the whites varied from 39.44 in the District of Columbia to 28.10 in Arkansas. If we omit the city-State of the District of Columbia, because of its peculiar industrial conditions, the highest per cent of employment of both races is found in the State of Maryland, viz, 35.96 for whites, and 44.42 for blacks. This is due to the city of Baltimore, which contains half the population of the State. The employment of the whites in the South was far below that of the whites in the country at large, while the Southern negro shows a percentage slightly below the average for his race.

Proportions engaged in gainful occupations.¹

Class.	Per cent.	Class.	Per cent.
Total population	34.6	Negroes	41.10
Whites	35.5	Southern whites	30.93
Native whites	31.6	Southern negroes	40.70
Foreign-born whites	55.2		

¹ This table, except for Southern whites and Southern negroes, is taken from Occupations of Negroes, p. 6.

The high employment rate of the foreign whites is due, of course, to the large proportion of adults among them, who come to this country with an eye single to gainful work. Omitting this class, the negro has a higher rate than any other element, and the Southern whites have the lowest rate of all. In Alabama, Georgia, Louisiana, Mississippi, and South Carolina there was an army of 1,500,000 black toilers, constituting, approximately, three-fifths of the labor force of these States. If we assume equality among the laboring units, the negro is seen to contribute 60 per cent of the industrial strength of the cluster of States in which the race is most numerous. Throughout the slave territory there were 414 negroes engaged out of every 1,000 of the negro population, against 309 whites to the 1,000, giving an excess of 105 in favor of the negroes.

Selected occupations, by race, for the sixteen former slave States, 1890.

Total	641,978	128,828	46,379	23,630

The second table shows selected occupations, by race, for the 16 original slave States and the District of Columbia. The Eleventh Census divided occupations into 5 classes: (1) Agriculture, including mining and fisheries; (2) personal and domestic service; (3) manufacturing and mechanical industries; (4) trade and transportation; (5) professional service. The census order has not been adhered to, but the several occupations have been arranged in the order of the number of colored persons employed. It may be taken for granted that the vast bulk of

persons enumerated under the first head are engaged in vegetal agriculture, as mining and fishing are comparatively unimportant industries in the South.

The negroes were engaged mainly in agriculture and domestic service, the number in manufacturing and trade being quite small in comparison, while the number in the professions was quite insignificant. Of those listed in the professions, the majority are school-teachers and ministers, leaving comparatively few for law and medicine.

The following table shows the proportion of negro wage earners engaged in the several groups of occupations, together with those for the native and foreign-born whites for the United States:

Occupations.	Native whites.	Foreign-born whites.	Negroes.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Professions	5.50	2.2	1.1
Agriculture	41	25.5	57.2
Trade and transportation	17	14	4.7
Manufactures	22.90	31.3	5.6
Personal service	13.60	27	31.4
Total	100	100	100

It is disclosed that 57.2 per cent of negro wage earners, 41 per cent of native white, and 25.5 per cent of foreign-born white wage earners are engaged in agriculture. The negro is represented in the professions by 1.1 per cent of those engaged, or less than 1 professional representative for every 100 of the population, whereas the native whites have more than 1 in 50. In manufactures, trade, and transportation the negro shows only 10 per cent, against 40 per cent for the native whites and 45 per cent for foreign whites. It is also known that the negroes who are engaged in such pursuits are in many cases performing the drudgery of unskilled labor. This is not on account of inability or lack of desire for the higher lines of mechanical skill, but because they are excluded by intolerant regulations. Herein lies the great field for remunerative labor, and the negro, through no fault of his own, is excluded therefrom and relegated to the less desirable spheres of farm life and domestic service.

Total	2,905,640	1,719,335	790,125	396,181

This table shows the principal occupations pursued by negroes in the South. It is seen, as before suggested, that they are chiefly employed in agriculture and in

domestic service, those engaged in all other callings not exceeding 14 per cent of the wage earners:

Persons engaged in agriculture, including mining and fisheries.

State.	Whites.	Negroes.
Alabama	168,258	212,485
Georgia	191,525	226,570
Louisiana	79,192	161,244
Mississippi	113,358	245,921
South Carolina	104,483	223,496
Total	656,816	1,069,716

In the five States where the negro population is most numerous there were 1,069,716 negroes engaged in agriculture to 656,816 whites. The negro represented five-eighths of the agricultural workers in these States. In Louisiana, Mississippi, and South Carolina there were more than two negroes engaged in agriculture to one white person.

The small proportion of negroes engaged in agriculture in the border States forces itself upon attention.

Occupation of negroes in the border States.

State.	Agriculture.	Domestic service.	Other pursuits.
Delaware	4,192	6,509	1,644
Kentucky	39,464	51,577	16,525
Maryland	20,257	51,431	14,123
Missouri	16,079	34,517	10,059
West Virginia	4,840	5,977	3,284

Occupations of negroes in the far Southern States.

State.	Agriculture.	Domestic service.	Other pursuits.
Alabama	212,485	58,819	22,102
Georgia	226,570	104,390	38,365
Louisiana	161,244	62,911	19,002
Mississippi	245,421	42,939	14,977
South Carolina	223,496	44,775	21,279

In the border States more than half of the negroes are engaged in domestic service and about one-third in agriculture. In the far Southern States, on the other hand, five-sevenths of the population is engaged in agriculture and one-fifth in personal service.

This fact is not without sociological significance. It bears out the suggestion in section 1, that the border State negroes do not find a comfortable social status among their white neighbors, and they therefore leave the rural districts for the cities, where the social conditions are more to their liking. It is little less than striking that in an agricultural State like Missouri there should be only 16,000 negroes engaged in agriculture, against more than twice that number in personal service. The proximity of large cities has much to do with the distribution of the negroes among the several occupations, but they are not of themselves sufficient to account for the pronounced tendency of the border States.

These figures give rise to two pregnant suggestions:

(1) The education of the negro, in so far as its aims and intent are of a practical character, should take cognizance of the occupations which the bulk of the children must follow. If 85 per cent of this race are pursuing two main lines of

employment, it would be the utmost folly to ignore this fact in a scheme of education. Industrial education for the negroes should, in the main, be directed to those lines from which the recipient is most likely to derive a livelihood.

(2) The proportion of negroes in these callings is too large, and diversification of activities should be encouraged. It is doubtless true, however, that the segregation of the blacks in agricultural and domestic pursuits is the result of natural industrial forces. It is here that competition is least severe, and he is shielded from the fierce strife of Aryan rivalry. These are, indeed, the only fields that are open to him on anything like an adequate scale. The destiny of the race must be worked out in the rural districts of the South, and the bulwark and buttress of its strength is in the soil. It is here that remedial and educational agencies can be most wisely applied.

The two preceding tables give the occupations of whites and blacks by sex. It is chiefly valuable in showing to what extent negro women are employed in agricultural pursuits and in domestic service. In 1890 there were 427,220 negro females engaged in agriculture and 432,062 in domestic service. Nearly 1,000,000 of these women were in the list of wage-earners. It is this fact that gives the negro such a relative preponderance in the industrial world. The proportion of negro women and white women engaged in agriculture was about 3 to 1, and in domestic service about 4 to 3, the larger number in both cases being in favor of the negro women. On the other hand, the colored women scarcely figured at all in manufactures and trade and transportation, while the white woman was quite numerously represented.

It is interesting to notice the extent to which negro agricultural workers are acquiring self-direction, and are becoming farmers, planters, and overseers, instead of mere farm laborers. The accompanying table brings out this feature of the inquiry. About 700,000 males of each race were rated as agricultural laborers. There were more than 500,000 negro farmers, planters, and overseers. These figures are quite suggestive of the progress of the negro as an industrial factor in the South. We saw in the section on ownership, that about 230,000 negroes owned their farms and homes. There were 114,269 negroes who owned their farms, so that more than 400,000 others must have risen above the grade of laborers who have not yet acquired their own lands. This is the first step toward acquisition. When a man rises above the lowest grade of agricultural service and gets a foretaste of independent activity in the management and direction either of a hired farm or as overseer for the owner, the next step is personal proprietorship; so that we may say that there are 500,000 negroes who have started on the road to ownership of land. It will be a surprise to those who have never looked into the subject to be informed that the negroes constitute 24 per cent of the farmer, planter, and overseer class. The number of colored women who belong to this grade is nearly 50,000, against 92,000 white women. There were 377,679 colored female farm laborers and only 67,514 whites. The employment of so large a number of females in the hard, bone-breaking work of the farm is indicative of an unsatisfactory social and industrial state. It nevertheless helps to show that all of the available energies of the colored race are expended in developing the industrial life of the South.

Mr. Booker T. Washington is fond of telling a story of an old colored man who objected to the bringing of white immigrants to the South on the ground that there were as many white people there already as the colored people could support. The serious side of this suggestion is more significant than its humorous aspect. The burden of industry in the South falls most heavily upon the negro race. Not even its women are spared the onerous task of tiresome toil. That this labor from beneath supports the general life of the community is as certain as that the mudsill supports the superstructure which rests upon it.

While the number of negro male field hands is noticeably small in the border States as compared with the States farther South, the negro woman practically falls out of the equation as a field worker in the higher tier of States.

The number of negroes who have risen from the level of field laborer to the dignity of farmers, planters, and overseers is quite considerable, and is not far behind the number employed as agricultural laborers, so far as the males are concerned. In Arkansas, Florida, Mississippi, and Texas the number of negro male farmers, planters, and overseers surpasses the number of field laborers. This is a fact of striking significance. It shows to what extent the negro is becoming an independent worker in the agricultural industries and how indissolubly he is interwoven in the warp and woof of the agricultural life of the South. As agriculture constitutes its chief productive resource, and as the negro is at the base of this life, he is therefore the real productive factor of that section.

Part of year.....	9.33	10.15	1.39	4.05	5.42	7.07
The year round.....	49.57	65.46	6.95	22.02	30.15	34.07
Total.....						41.14

We see that 2,621,318 male whites, or 9.33 per cent of the male white population, were unemployed during part of the year, and 374,668 male negroes, or 10.15 per

cent of the male negro population; 30.15 per cent of the whites of both sexes were employed the year round, against 34.07 per cent of the negroes. It will be remembered that only 30.93 per cent of the white people of the South are employed at all; thus, if we take the negroes of the country at large, they were more generally employed the year round than the white people of the South, including both regular and irregular employment.

The assertion that we see so often reiterated that the negro is an idle and worthless incumbrance upon the life of the South is not borne out by the facts.

Summarizing the results of this chapter, we find that the negro is engaged mainly in agriculture and domestic service; that he is to a much greater degree employed in gainful pursuits than his white neighbor; that he is rapidly becoming a landowner, and much more rapidly an independent farmer and planter; that he is making little or no headway in the mechanical and industrial arts; and that the marked tendency in the far Southern States is toward agricultural labor, while in the border States the drift is toward domestic service.

Taking all these things together it is fully apparent that the negro is the most valuable productive element in the industrial life of the South, and that most of its prosperity rests upon the basis of his toil; that he is therefore justly entitled to share in all the public benefits which his labor makes possible, and that it is the part of wisdom for the white South to encourage him in the development of intelligence, virtue, and industrial skill, so that he may become a more efficient factor in the development of the general welfare.

VI. SPECIAL STUDIES OF THE ECONOMIC CONDITIONS OF THE NEGRO.

The most valuable special studies upon the economic conditions of the negro race are to be found in the bulletins of the Department of Labor. It is the purpose of this Department to make a series of investigations concerning the economic and social relations of this race. The method adopted is to present an exhaustive analytic study of well-defined typical groups of negroes in different sections of the country. Expert investigators are employed by the Department for this purpose. Several such investigations have already been made and still others are under contemplation. When the series shall have been completed the student will have accurate and reliable data from which to draw conclusions. The bulletins so far issued present special studies rather than broad generalizations and speculative dissertations. Of all problems pressing for solution, the American people seem to approach the negro question with the greatest degree of nervousness and impatience. The theorizer reaches his conclusion and leaves the investigator to furnish data for proof, and discards him if he does not. An accurate, analytic, scientific presentation of facts and rational deduction of conclusions therefrom is still an unfulfilled desideratum. The student of sociology, therefore, hails with delight the effort of the Department of Labor, which undertakes this work with adequate machinery and equipment for its successful prosecution. Such work can be done effectively only through some such central and commanding agency. The difficulty with individual and private attempts is that they lack unity of purpose and plan, and therefore the divergent methods and conclusions confuse as much as they elucidate.

Several of these bulletins have been prepared by Dr. W. E. B. Du Bois, that careful, accurate student of the race problem, who is doing more than any other worker in this field to supplant, by scientific method, guesswork and vagaries. Being himself of the race to the study of whose problems he has consecrated his splendid faculties, he not only approaches the subject with the best approved methods of sociological inquiry, but brings also the stimulus and zest of personal solicitude.

THE NEGROES OF SANDYSPRING, MONTGOMERY COUNTY, MD.¹

The Sandyspring community lies in Montgomery County, Md., due north of Washington City. The nearness to the national capital is of great economic importance to the inhabitants of the neighborhood, the southern corner of which is about $3\frac{1}{2}$ miles, in an air line, north of the northern angle of the District of Columbia. Here within a stone's throw, as it were, of the seat of Government, is a thriving agricultural community, among whom still live the descendants of negro families which have been free for a century and a quarter.

The community is of irregular shape, about 5 miles from east to west and about 5 miles from north to south. Sandyspring is in Montgomery County, some knowledge of whose social and economic condition can be gathered from the following statistics:

Population of Montgomery County, 1790 to 1890.

Year.	Whites.	Negroes.	Total.
1790.....	11, 679	6, 324	18, 003
1800.....	8, 508	6, 550	15, 058
1810.....	9, 731	8, 249	17, 980
1820.....	9, 082	7, 318	16, 400
1830.....	12, 103	7, 713	19, 816
1840.....	8, 766	6, 690	15, 456
1850.....	9, 435	6, 425	15, 860
1860.....	11, 349	6, 973	18, 322
1870.....	13, 128	7, 434	20, 562
1880.....	15, 608	9, 150	a 24, 759
1890.....	17, 500	9, 685	27, 185

a Including 1 Indian.

It will be seen that the two races have made almost exactly proportional gains in 100 years.

The county contains 267,933 acres, of which 193,937 acres are improved. There are 1,959 farms, of the average size of 137 acres; only 177 farms contain less than 10 acres, and 4 over 1,000 acres; 1,641 farms, or 83.77 per cent, were cultivated by owners. The farm produce for 1890 was estimated at \$1,531,760, and the live stock and poultry at \$1,249,790. The basis for the tax levy of 1898-99 was \$12,443,795. The amount levied for the support of the public schools, 1899-1900, was \$30,200. There were 114 public schools, which were open for nine months. Of these, 81 were white schools with 100 teachers, and 33 were colored schools with 40 teachers. For these schools the county received from the State school tax \$16,181.03; from the free-school fund, \$3,154.35; for free text-books, \$6,784.55. The total, including county levy, was \$59,546.60. For the colored schools the receipt for 1898-99 was \$7,477.44 from the State, \$1,107.74 (the proportional amount of county tax paid by negroes) from the county school board, and \$3.33 from miscellaneous sources, making a total of \$8,588.51.

Much side light is thus thrown upon the educational provisions for the two races in this county, and incidentally in other counties of the State.

For a white population of 17,500 persons, there were 81 schools and 100 teachers, at a total cost of \$50,958.09. For a colored population of 9,685 persons, scattered over the same area, there were 33 schools and 40 teachers, at a total cost of \$8,588.51. The per capita cost of the education of each negro child was \$5.74, while that for the county at large was \$16.10. There was 1 white teacher for every 175 of the white population, and 1 colored teacher for every 242 of the negro population. One white school was provided for every 5.2 square miles, and 1 colored school for every 14 square miles. The pay of the colored teachers ranged from \$180 to \$225

¹ Compiled from Department of Labor Bulletin, No. 32, pp. 43-102 (January, 1901), by William Taylor Thom, Ph. D., investigator.

per annum. The average pay of all teachers, including both races, was \$328.90, so that that of the white teachers must have been in the neighborhood of \$400.

It is rather curious to be informed by the investigator that "there is no provision made in the office of the county commissioners or of the county clerk by which property can be identified as held by white or negro owners," when both by law and practice the colored schools receive only that proportion of county taxes paid by negroes.

The settlement of Sandyspring was founded by the Society of Friends. To this fact is attributable the large number of free colored people in the community, as well as its general prosperity and thrift.

The white population of Sandyspring is estimated at about 700 and the negro population at 1,000.

There were 3 schools and 5 teachers for the Sandyspring negroes, 1898-99. The school term was nine months. The salary of the teacher was \$25 a month, and the salaries of the assistants \$20. The total enrollment was 391, only 240, however, belonging to the Sandyspring district proper. Of these 1,000 persons 484 were able to read, 38 could read but not write, while 140 were returned as illiterate. Of the 683 people reported, 70.9 per cent could read and write, 5.5 per cent could read but not write, and 20.5 per cent could neither read nor write.

The negro males were distributed as follows among the several occupations:

Barber	1	Coachmen	3
Mail carrier	1	Domestic servants	3
Mail contractor	1	Engine drivers	3
Merchant	1	Shoemakers	3
Miller	1	At home	7
Shingle maker	1	Not reported	19
Teacher	1	At school	64
Waiter	1	Laborers	65
Bricklayers and stone masons	2	Farm laborers	105
Carpenters	2		
Clergymen	2	Total	313
Hucksters	2		

The females were employed as follows:

Day workers	27	Washerwomen and housewives	51
Day workers and housewives	25	Not reported	30
Domestic servants	72	At home	23
Housewives	49	At school	80
Monthly nurses	5		
Seamstresses and housewives	7	Total	370
Teachers	4	Grand total	683

If we subtract from this number 144 school children and 49 housewives, 49 not reported, and 30 reported as being at home, we have left 411 engaged in gainful occupations. This represents 41.1 per cent of the aggregate colored population. Curiously enough, we have here the identical per cent of negroes thus engaged throughout the United States.¹ There were 153 males and 91 females who had worked at the same place from two to five years. The great majority of females had resided in their present place of residence for more than three years. This indicates a fair degree of steadiness in residence and occupation. There were 205 negro families, with an average of 4.29 to each family. Of the 165 economic families, 63 families own their own homes, 54 were renters, 44 farm hands, and 4 tenure not reported. The average annual rent was \$26.50. One-third of the families had annual incomes ranging between \$250 and \$750. The estimated income and

¹ Occupations of the Negroes, by Henry Gannett, p. 5.

expenditure of a farm hand's family of five persons will be seen from the accompanying table:

Income.		Expenditures.	
Husband (farm hand), \$12 per month ..	\$144	Food	\$88.40
Wife (washing), \$1 per week.....	52	Fuel.....	26.20
Boy, 6 months' labor, \$3 per month.....	18	Clothing.....	50.00
		Rent.....	18.00
		Miscellaneous.....	10.00
		Medical treatment.....	10.00
		Surplus.....	11.40
Total	214	Total.....	214.00

It will be seen that a family may exert itself to the utmost stretch of endeavor, and would have to spend all its earnings in order to maintain the scanty necessities of living. Its earnings are spent with the merchant, the landlord, and the professional classes, each of whom abstracts a surplus percentage in order to meet the cost of public taxation.

Sixty-three females owned their own homes, 54 rented their houses, 44 were farmhands occupying their houses free of money rent, and 4 were not reported as to tenure. There were 92 owners of real estate; the size of the average holding was less than five acres; the assessed value was \$21,590. The county tax rate was \$1.02 per \$100, so that the landed interests alone of the Sandy Spring negroes produced \$258.90 for county revenue.

In the opinion of the investigator, "from an economic point of view, the conclusions drawn from the investigation of this group would appear to be favorable. The Sandy Spring negroes seem to be acquiring and holding property, and the agricultural element of labor among them gives a good account of itself."

THE NEGROES OF FARMVILLE, PRINCE EDWARD COUNTY, VA.¹

Farmville is the county seat of Prince Edward County, Va., and contains about 2,500 inhabitants.

The white and colored population from 1790 to 1890 will be seen from the following table:

Population of Prince Edward County, 1790 to 1890.

Census year.	Whites.	Negroes.	Total.
1790	4,082	4,018	8,100
1800	4,978	5,984	10,962
1810	5,264	7,145	12,409
1820	4,627	7,950	12,577
1830	5,039	9,068	14,107
1840	4,923	9,146	14,069
1850	4,177	7,680	11,857
1860	4,037	7,807	11,844
1870	4,106	7,893	12,004
1880	4,754	9,914	14,668
1890	4,707	9,924	14,694

The white population has remained nearly stationary for a hundred years, whereas the negroes have more than doubled in number. In 1890, the negroes outnumbered the whites more than two to one. There were 487 farms, 318 of which contained between 400 and 500 acres, with only six containing less than 10 acres, and two more than 1,000 acres. Fifty-seven per cent of the farms were cultivated by their owners.

¹ W. E. B. DuBois, Ph. D., investigator. Department of Labor Bulletin, No. 14, January, 1898, pp. 1-33.

The assessed valuation of real estate and personal property was \$2,397,007. On this was raised the sum of \$24,281 for taxation, \$4,714 of which went to the support of public schools. The negroes of the county, in 1895, owned 17,555 acres of land, assessed at \$132,189, against 202,962 acres, with an assessed value of \$164,180, owned by the whites. The number of acres and the assessed valuation of lands held by negroes will be seen from the following table:

Year.	Number of acres.	Assessed value.
1891.....	12,215	\$83,212.48
1892.....	13,207	89,737.75
1893.....	14,754	97,341.53
1894.....	16,467	105,024.48
1895.....	17,555	132,188.06

Farmville is the trading center of six surrounding counties, with a population of 961 whites and 1,305 negroes. The chief industry is the storage, manufacture, and shipping of tobacco, wood-working, coopering, milling, and wholesale and retail merchandising. The total valuation of the town in 1890 was \$661,230, on which a tax of \$9,855 was raised, \$661 of which went to the State school fund and \$1,322 to the town and county school fund. In 1895 negroes owned \$51,240 worth of real estate, or about 7 per cent of the aggregate.

There were 262 families of negroes in the town, about half of whom had moved there since 1880. The town has no school for colored children, but sends them to the district school, just outside of the corporation limits. The school term is six months. The teachers' salaries do not average over \$30 a month. There were 367 children between 5 and 15 years of age, of whom 205, or 55.9 per cent, were in school. Forty-two per cent of the negroes could read and write, 17½ per cent could read but not write, while 40 per cent were wholly illiterate. Four hundred and fifty-nine males were distributed among 41 different occupations. There were 128 teamsters, 58 laborers, 16 domestic servants among the men, and 144 day workers, 65 domestic servants, 23 teachers, and 23 employees in the canning factory among the women. Six hundred and fifty-one persons, or 48 per cent, were engaged in gainful pursuits, against 41 per cent of the negro population of the United States. The average size of the real family was 5.03, and of the economic family, 4.61. Of the 262 families, 114, or 43.5 per cent, own the homes they occupy, and 148, or 56.5 per cent, rent. The estimated amount of rent paid is \$4,872 annually. The income of families ranges from \$50 to \$750. There were five families whose income exceeded the latter limit.

Estimated annual income and expenditure of family of five persons.

Income.		Expenditure.	
Head of family:		Food	\$85.28
24 weeks' labor, at 75 cents per day	\$108.00	Fuel	32.40
16 weeks' labor on farm, at 40 cents per day	38.40	Clothing	50.00
Housewife: Fifty weeks' washing, at \$1.50 per week	75.00	Rent	36.00
		Miscellaneous	15.00
		Surplus	2.72
Total	221.40	Total	221.40

Estimated income and expenditure of family of five persons owning home and in moderate circumstances.

Income.		Expenditure.	
Head of family:		Food	\$117.00
32 weeks' work as carpenter, at 75 cents per day	\$144.00	Fuel	30.00
Odd jobs	30.00	Clothing	60.60
Housewife and boy: Twenty weeks' work at tobacco factory, at \$7 per week	140.00	Taxes	8.00
		Miscellaneous	39.60
		Surplus	39.00
Total	284.00	Total	284.00

Here we see, as in Sandy Spring, that the average negro family, making the best use of its opportunities, must spend practically all of its earnings in the community, part of which, under any just estimate, goes to the support of public taxation. In 1895 there were 119 negro taxpayers in the corporation on lots and buildings, ranging in value from \$25 to \$2,800. There were 232 white holders of real estate, the highest of whom was assessed at \$16,000. There was a considerable number of negro farmers owning valuable farm lands in the district surrounding the corporation.

The investigator says that "it seems fair to conclude, after an impartial study of Farmville conditions, that the industrious and property-accumulating class of the negro citizens best represents, on the whole, the general tendencies of the group."

THE NEGRO IN THE BLACK BELT.¹

Group 1.—Six small groups, containing 920 negroes, have been studied by the Atlanta University, under the direction of Professor DuBois. All but one of these groups are situated in Georgia. Eleven representative families in Doraville and vicinity were studied, with the result that the average family was found to consist of 11.9 persons. Four of the heads of families could read and write; 5 owned their homes. The farms varied from 1 to 11 acres in extent and were worth from \$100 to \$400. Six families rented their farms on shares and cleared from \$5 to \$10 in cash at the end of each year. Women and girls were employed as farm hands.

Group 2.—Lithonia is a small village of about 800 persons in Dekalb County, Ga., 25 miles east of Atlanta. Negro stonecutters are employed at from \$5 to \$5.50 per week. They rent, for the most part, small two-room frames at \$4 per month. The whites have a private and public school, giving them a term of from eight to nine months. The negro schools comprise a Methodist and a Baptist school, each of which has a term of three months. Sixteen negro families were specially studied. Six of these families owned their homes and had an average yearly income of \$369. The other 10 families paid on an average between \$4 and \$5 a month. Five of these families had an income of less than \$200.

Group 3.—Covington is a village 41 miles southeast of Atlanta, Ga., and contained, in 1898, 3,000 persons. There were between 250 and 300 negro families, 50 of which were chosen for study. The average size of these families was 3.76. There is a public school for negroes open nine months in the year. The principal receives \$50 a month; his two female assistants \$30 a month. The illiteracy among the 50 families does not exceed 10 per cent. There were 8 porters, 6 teachers, 4 barbers, 5 carpenters, 4 laborers, 3 gardeners, 3 office boys, 2 mail agents, 2 drivers, 2 draymen, 2 grocers, 2 ministers, 2 waiters, 1 bartender, 1 fireman, 1 quarryman, 1 contractor, 1 brick mason; of the females there were 11 teachers, 10 seamstresses, 6 cooks, 3 washerwomen, 1 boarding-house keeper, 1 housekeeper, making a total of

¹ Labor Bureau Bulletin, No. 22, May, 1899, pp. 401-417. W. E. B. DuBois, Ph. D., investigator

85 persons, or 45 per cent, engaged in the gainful occupations. The average income is between \$300 and \$500. The majority of the better class of negroes are buying property. The yearly income of the mass of negroes is between \$100 and \$300; of the better class, between \$300 and \$500. Of the 50 families studied, 41 own their homes and 9 are renters.

Group 4.—Marion is in the midst of the black belt of Alabama, where the negroes outnumber the whites 4 to 1. The town has 2,000 inhabitants, equally divided between the races. Thirty-three negro families were studied. The average family contained 5.3 persons. Twenty-eight owned their homes; five were renters. Among the mass of the negro population there are a number who own their homes. Sixty-one persons, or 41 per cent, were engaged in gainful occupations. The public school is poor, but is supplemented by three missionary schools.

Group 5.—Marietta is a town of 4,000 inhabitants, 23 miles northwest of Atlanta. It has a negro population of 1,500, of whom 40 families, comprising 162 persons, were studied. The public schools are fair. Twenty-four families own their homes. Negroes are employed in local industrial works, receiving from 50 to 75 cents per day. The average negro family lives on from \$2 to \$4 a week.

Group 6.—Athens is a city of 10,000 inhabitants, of whom one-third are negroes. Forty-five families were studied. Ten or fifteen were illiterate. Their public schools are well conducted. Thirty-nine of these families own their homes and six are renters. Thirteen families have an income of \$750 a year; sixteen, between \$500 and \$750.

It is probable that the families of the several groups were of the better class, and therefore show a higher average of living and industrial activity than would be true for the groups at large.

CONDITION OF THE CITY NEGRO.¹

The first of the special studies relating to the negro race issued by the Labor Bureau was upon the condition of negroes in cities. The work was accomplished under the general direction of the Atlanta University. Reports were made from 50 negro investigators. These were for the most part college graduates, teachers, doctors, and lawyers, each of whom was expected to study one or more small groups of negroes in his own vicinity. From 10 to 20 houses standing together in portions of the city thought to be representative were taken as constituting a group. The number and distribution of the groups thus studied may be seen from the accompanying table:

City.	Groups.	Fami- lies.	Individ- uals.
Atlanta, Ga.....	16	324	1,292
Nashville, Tenn.....	10	246	1,090
Savannah, Ga.....	5	96	380
Cambridge, Mass.....	1	98	366
Washington, D. C.....	4	66	293
Macon, Ga.....	4	30	90
Jacksonville, Fla.....	3	77	327
Columbia, S. C.....	3	15	81
Birmingham, Ala.....	2	17	63
Tuskegee, Ala.....	2	21	119
Orangeburg, S. C.....	2	22	109
Sandford, Fla.....	1	24	116
Athens, Ga.....	1	16	73
Cartersville, Ga.....	1	10	53
Louisville, Ky.....	1	15	70
Macon, Miss.....	1	17	64
Chattanooga, Tenn.....	1	21	89
Jackson, Tenn.....	1	22	67
Total.....	59	1,137	4,742

¹ Labor Bureau Bulletin No. 10, May, 1897, pp. 257 and 373. Atlanta University graduates et al., investigators.

The observations were sufficiently widespread to be typical of general city conditions. The average family contained 4.17 persons: This was considerably below the average size of a family for the cities under discussion, as shown by the Eleventh Census. Of 324 families in Atlanta, Ga., 73, or 22.53 per cent, owned the houses in which they lived, while 249, or 76.85 per cent, paid an average rent of \$4.25 per month. Of the 246 families in Nashville, Tenn., 116, or 47.15 per cent, owned their houses, while 123, or 50 per cent, paid an average rent of \$4.68 per month. In the 32 groups located in other cities, of 469 families embraced therein, 157, or 33.48 per cent, owned the houses in which they lived, and 284, or 60.55 per cent, paid an average rental of \$5.51 per month. Some families were paying for their houses on the installment plan.

The occupations and earnings, by families, may be seen from the accompanying typical tables:

GROUP 10.—*Atlanta, Ga.*

Family No.	Head of family.			Children.
	Occupation.	Weeks employed.	Average weekly earnings.	Earnings for the year.
1	Fireman, stationary.....	50	\$7.00	\$132

These figures give quite a clear idea as to the steadiness of employment among negroes, as well as to the character of their occupation; 41 out of 60 heads of families in the groups here presented were employed 52 weeks during the year.

In the city of Atlanta, Ga., out of a total of 324 families, 73, or 22.55 per cent, were supported wholly by male head of family; 31, or 9.57 per cent, wholly by a female head, and 81, or 25.93 per cent, wholly by a male and a female head of family. It is suggestive that 63.27 per cent of the families were supported wholly or in part by the mother; all of which goes to show to what an extent negro females are wage-earners in our cities.

The death rate of the negro race was given much attention in this investigation. The vitality of a people affects all the relations which it sustains to the community, whether economic or social. The general conclusion on this point is that the negro's death rate is about as 8 to 5 when compared with the whites, and that this excess is due mainly to remedial sanitary causes.

While these studies are not sufficient to enable us to draw infallible conclusions, yet we have here a body of data covering a wide area and a great diversity of conditions. We are at present concerned only with the economic side of these investigations in so far as they throw light upon the negro as a contributing factor of the several communities, who thus helps to support the burden of public taxation; and more especially the extent to which he contributes directly and indirectly to the education of his children. To this end it is essential to know (1) to what extent he has become a property owner; (2) to what extent he is tenant, and the money value of his rental; (3) how generally he is engaged in gainful occupations, and the manner in which he disposes of his earnings.

We saw that of 1,000 persons composing 165 families, at Sandy Spring, Md., 92 persons were owners of real estate; 63 families, or 38.2 per cent, owned the houses in which they lived; 54, or 32.7 per cent, paid money rent for the houses they occupied, and 44, or 26.7 per cent, occupied houses on the farm as a part of the stipulated agreement; 4 were not accounted for as to conditions of tenure. Forty-one per cent of the entire population was engaged in gainful occupations, and on the average a family must spend in the community nearly or quite all of its earnings in order to meet the ordinary requirements of living.

In Farmville, out of 262 families, 114, or 43.5 per cent, owned their own houses;

148, or 56.57 per cent, rented the houses they occupy, at an average rental of \$4.872 annually. Forty-eight per cent of the entire population was engaged in gainful pursuits, and, as at Sandy Spring, the average family must spend nearly or quite all of its earnings in order to live. The Black Belt reveals the same conditions.

In group 1, 5 out of 11 families owned their own homes, the other 6 rented their farms, and both sexes worked as farm hands.

In group 2, 6 out of 16 families owned their homes, and 10 families paid rent, from \$4 to \$5 monthly. The men were generally employed.

Forty-five per cent of group 3 were employed and the majority were reported as buying property. Of 50 families, 41 owned their own homes and 9 were renters.

In group 4, 28 out of 33 families owned their homes, and 5 were renters. Forty-one per cent were distributed among the various lines of industrial pursuits.

Group 5 showed 26 out of 40 families owning their own homes.

Group 6 yielded 39 home owners out of 45 families studied, and 6 renters.

When we turn to the cities, in Atlanta, Ga., 73 out of 324 families, or 22.53 per cent, owned their own homes, while 249 families, or 76.85 per cent, paid an average rental of \$4.25 per month. In Nashville, Tenn., 47.15 per cent of the families studied owned their homes and the rest paid an average rental of \$4.68 per month. For the other cities in which investigations were made, of 32 groups in all, 33.48 per cent owned the houses in which they lived and the rest paid \$5.50 average monthly rental.

That these families were steadily employed at wages not much more than sufficient to meet the urgent necessities of life can be judged by glancing at the tables under the head of city groups. Thus we see that the negro spends, and is spent in the several communities in which he resides, the little mite which, by the most rigid economy, goes to permanent accumulation after meeting the physical necessities of life, representing only an insignificant fraction of his energies. The productivity of his labor enhances the industrial and economic power of the community. His expenditures swell the bulk and profit of the merchants' business. From the rents collected from his black tenant the landlord pays the taxes on his tenements, and in every sense the negro is a vital contributing factor in the economic welfare and is justly entitled to his due share of public privileges.

VII. THE EDUCATION OF THE CITY NEGRO.

The urban negro constitutes a distinct problem from his rural brother. In their industrial status, social environments, and educational facilities they are widely asunder.

In discussing the education of the negro it is not usual to discriminate between the two classes, but to include the entire race under the same formula. The economic conditions of the Southern cities are so different from those of the country, and the educational provisions are so glaringly discrepant, that the two must be separated in any scheme of profitable discussion. The negro's educational fortunes have, perhaps, the widest margin of variation. His school opportunities in the cities are more nearly equal to those of the whites than in the rural districts. Thus the gap between the educational status of the two classes is emphasized. In the rural districts, where the school term covers only four or five months, and where economic and industrial conditions are such that the scholars do not attend regularly for even so short a term, it may be easily seen that the curriculum can not profitably be patterned after the city courses, with their superior advantages and facilities. When we consider that an average country child attends school for only a few terms, it appears that his entire schooling is scarcely equal to four grades of the city curriculum. On the other hand, the negro city school has all of the essential advantages of up to date scholastic requirements.

Cities of more than 5,000 colored inhabitants in 1890.

The foregoing table reveals 46 cities in the Southern States with a negro population of more than 5,000, ranging from that limit up to 75,000. Twenty-two cities have a negro population above 10,000, 11 cities above 20,000, and three above 50,000. We have here an aggregate population of well nigh three-quarters of a million negroes collected in large municipal centers. The number of urban negroes exceeds the population of the State of Maine. Constituting about 10 per cent of the entire race, this body is too large to be ignored in any comprehensive treatment of the race problem.

The movement of population toward cities constitutes one of the most marked sociological phenomena of our times. The negro follows in the wake of this movement, and, although he does not seem to possess a profitable economic status in the centers of commerce and marts of trade, he is attracted by the allurements of city life as a moth by the glare of a candle. Perhaps the most pressing phase of the

race problem is presented by city conditions. The country negro is embalmed, as it were, in a state of nature, where he will be preserved, physically at least, until his opportunity comes. With the city negro, on the other hand, it is immediate rescue or destruction. The rural negro flees from the country, with its meager opportunities, to the city, with its congenial social circles and school privileges, unmindful of the fact that he is swapping industrial conditions with which he is familiar for those of which he has no knowledge. This constant influx of raw rural recruits imposes new problems upon city schools, for with a crude and undeveloped people the schools must fulfill not only the ordinary function of education, but must supplement defective home training. The city negro therefore presents a distinct educational problem with many interesting and peculiar features.

In the rural districts of the South the school fund is woefully inadequate to support a satisfactory system. The duplication of schools in the same territory for the two races serves to accentuate this inadequacy. In the cities the funds are much more ample, and though they fall far short of the educational provisions made in the other sections of the country, nevertheless they are sufficient to provide the essential facilities of instruction and to keep the schools in operation for the full length of term. The division of the school funds on racial lines does not work so great a hardship in cities as in rural places, where the population is sparse.

This table shows the school funds for the several States and cities under discussion, and the cost per capita for school expenditures. It is seen that the provisions for the cities enormously exceed those for the State at large. In Alabama the per capita cost of education is only \$0.71, while in the three leading cities of that State it is \$1.84. In South Carolina the State educational fund is only \$0.57, while for Charleston and Columbia it is \$2.06. If we should separate the cities from the rural districts, it will be seen that the per capita cost of the rural schools would fall much below the figures in the table. Let us not forget, also, the relative densities of the population as an essential factor of efficiency.

The courses of instruction for the colored schools embrace the ordinary primary and grammar grades, and in some of the cities high schools are also provided. The Supreme Court of the United States has recently decided, however, that a city is not compelled to maintain a high school for the colored race because it maintains one for whites.²

¹ Population for 1890 and expenditure for 1898-99.

² One hundred and seventy-fifth United States Reports, p. 523, decided December 18, 1899.

The teaching force in city colored schools is more or less proficient from a professional standpoint. The colored teachers compare quite favorably with their white collaborators. The schools furnish the only avenue of profitable employment above domestic service for colored women, and therefore the best equipped members of the race are thus engaged. The colored school teachers, male and female, receive on an average better pay than any other class of colored men or women in the several communities. They are looked up to as leaders in social life and public activities. This gives to the colored schools a relative advantage which the whites do not enjoy, for their best energies flow in other channels.

On the whole, it might be said that the urban negro's educational opportunities, so far as elementary instruction is concerned, are fairly ample, though of course far from ideal. Intellectual opportunities are open to every colored boy or girl which, among white youth, are counted sufficient to prepare for the ordinary duties of life. The educational facilities for colored children in the communities under discussion are, perhaps, superior to those offered the white race on a similar scale thirty years ago.

The true aim of education is to make the recipient wiser and better and to render him a more efficient instrument for service. Its beneficial effect is measured in terms of knowing, being, and doing. That the education of the negro has vastly increased his knowledge and tightened his intellectual grasp upon the problems of life can not be denied or doubted. The practical function, however, is far from fulfillment. The industrial life of the race has in no sense kept pace with its intellectual improvement. The negro labors to-day under the same industrial disabilities as he did thirty years ago. His education has neither enabled him to counteract the effect of hostile industrial influences nor to make himself independent of them. Indeed, he is daily losing industrial ground which he occupied when the dissemination of knowledge was not so general. It is doubtless true that to a large degree the cause of industrial decline is due to the operation of social forces which he can in no way direct or control; but the plain fact remains, and the educational effort of the future must occupy itself largely with means of meeting these industrial deficiencies.

Just here arises the perplexing question as to what modifications must be made in the general pedagogical programme in order to answer the peculiar needs of the negro race. All will agree that in any rational plan of education the scheme of instruction should be adapted to the needs, capacities, and probable vocation of those for whom it is proposed.

Existing programmes were adapted to the capacities and needs of the white race, and handed down to the negro on the somewhat generous principle that what is good for the white goose is good also for the black gander. It is true that in fundamental requirements and laws of growth the human mind is one and has the same formative needs. Knowledge and virtue have no ethnic quality. The multiplication table and the sermon on the mount do not accommodate themselves to local environments. The mind of the negro has the same faculties, powers, and susceptibilities as that of his white confrère. No competent authority has ever pointed out just where the two differ in any evident feature, and yet the average status of the races are so far asunder that the educational needs must be divergent at many points.

It would not be wise here to enter upon the intricate question as to the relative capacity of the two races. Any discussion of potential capacity would be wholly speculative and void of practical value. The practical educator must be governed by that component of capacity which is available for practical work. Suppose the pupil can attend school only a fraction of the time, or that by reason of necessary detention he is habitually absent or tardy, or that he is so poorly fed and illy clad that the strain and stress of physical necessity enfeebles his intellectual energy, or that the course and tone of his home life stifles rather than stimulates

his budding faculties. Can these factors be ignored with impunity? Would it be wise to proceed as if such obstacles did not exist? The negro constitutes the submerged element, and of necessity furnishes an excess of the defective, delinquent, and unfortunate classes. We should not forget that the object of public schools is to benefit the masses. Their plan and scope should be adapted to the capacity and condition of those for whose welfare they are intended.

The main concern of the college and the university is with the highest common factor, but the public schools must deal with the lowest common multiple. There are in every community many colored children who, by reason of exceptional faculties or good early influences, would easily take intellectual rank with superior persons of the dominant race. This fact is demonstrated wherever mixed schools exist. But the negro race is a race of extremes; there is little continuity of development; his growth is by leaps and bounds. The field hand or house servant of yesterday becomes class orator at a Northern college to-morrow; but the 10,000 field hands and domestic servants whom he leaves behind continue to pursue the daily humdrum of their stupid toil. It is perhaps generally true that the effect of the diffusion of knowledge is to increase the general capacity rather than to improve the extreme cases of ability. While three centuries of intensive culture has lifted the average status of the English race by many degrees, it has not enabled England to produce individuals superior to Shakespeare or Bacon. If this contention be correct, it is but natural to expect that the exceptional colored pupil will deviate widely from the normal average. This fact makes a just and equitable scheme a matter of great perplexity. The main feature of the programme should be placed near the center of gravity, with as wide a latitude of privilege as is compatible with the main purpose.

If, therefore, it should appear that prevailing schemes are not suited to the exigencies of circumstances, there should be no hesitancy in adopting such modifications as the necessities of the case require. No maudlin sentimentality should be allowed to prevent such sensible adaptation.

It might be argued with a considerable show of reason that it would be an unwise and dangerous acquiescence to acknowledge that there might be any divergence in the plan, scope, or method of public instruction. It is here that the humble are exalted and the mighty brought low until they meet upon a common level. The rich and the poor meet together; the state is the teacher of them all. The state, it may be claimed, has no right to discriminate among its subjects. The primary fact of discrimination is seen in the scholastic separation of the races. We should make the best use of the agencies in hand.

It might also be argued that it is inexpedient from the negro's standpoint to acknowledge that the negro child requires any treatment different from that of the white child. This feeling is already too prevalent, and if once the precedent be established there is no telling where the innovation will end. Many believe that the whites are only waiting for a reasonable excuse to readjust the negro's education to what they think it ought to be. This objection is not without much validity and goes to show that such modification should proceed along wise, cautious, and conservative lines, effecting only a sensible adaptation of effort to condition. Our duty is to our day and generation. Future generations will have their own problems and their own facilities for solving them. We can no more establish educational régimes for the future than we can prescribe the style of bonnet or cut of gown for our great-granddaughters. If at any time in the future the social and economic status of the races should come nearer together than they are to-day, can we not rely upon the wisdom and good sense of that time for a wise readjustment of régimes? All the hopes of the negro for a larger and better future rest upon the basis of this reliance.

The wild clamor for identity of plan and method without examining into fitness and adaptability shows a lack of self-knowledge, self-confidence, and self-respect.

Imitation without intelligence leads to grotesque and dangerous results. It is related of a Chinaman that when taking his first lessons in cooking he observed that his preceptress rejected every other egg out of a dozen, and when it came his turn to repeat the experiment this disciple of the kitchen, exercising a characteristic facility for imitation, rejected the eggs in the same order in which he observed his mistress had done; but as the rotten eggs happened to be differently distributed in the two cases, the pupil was subjected to the double chagrin of wasting his mistress's eggs and of spoiling her cake. By apish imitation, without intelligent discrimination, we may waste eggs and spoil the cake in a pedagogical as well as in a culinary sense.

Every subject in a programme of study, as well as every plan and method of impartation, should be interpretable in terms of actual needs and conditions. In a community where there is a considerable fraction of foreign population, there might be sufficient reason for introducing the vernacular of that element in the school programmes. Such language might be serviceable in the conduct of business and social intercourse, or might lead to a cultivation and enjoyment of ancestral literature and life; but there could be no such motive for adding similar lines to the colored schools. This does not apply to the educational value of language, but to its practical bearing and use. The attempt to master a foreign tongue before the pupil can secure harmony among the parts of speech in his own vernacular is grotesque and irrational.

A large proportion of white pupils on leaving school will enter upon business careers, either as occupants of prepared places or on their own responsibility. It is but reasonable, therefore, that professional business courses should form a part of their regular programme. But not one colored child in a hundred is likely to enter upon such a career. While the negro needs to be instructed in business forms and methods, the motive in the two cases is entirely different. The subject should be approached from the direction of the motive, reason, and end in view, and not in the spirit of observing a superficial sameness. Prof. Booker T. Washington will go down to history as one of the greatest educators of his day, perhaps as the greatest. His success is due mainly to the fact that he does not copy methods that have been exploited under other and more favorable conditions, but has devised plans for his constituency adapted to their present environment.

It must not be supposed, however, that the state owes less to the colored than to the white child. Although the needs of the negro child may often differ from those of the white child, yet they are rather greater than less. It certainly requires as great an outlay and as assiduous an effort to bring him up to the required standard of good citizenship.

Let us now consider some of the especial and distinctive features which should be made prominent in colored schools. Although many of these features are common to the needs of all schools, nevertheless in their application to the negro in the present state of his needs specialty of condition demands a more decided emphasis.

There is much dispute among educators as to the exact function and value of kindergarten training, but all will agree that it is of the highest importance to children of the neglected classes. No clearer statement of the case can possibly be made than was done by the superintendent of schools for Baltimore in a recent annual report:

Many children are compelled to leave school by the time they are old enough to earn wages to help support the family. Consequently many of them must receive all of their schooling before they are 10 years of age. In order to afford this class of children, found generally in the slums and in the most forlorn parts of the city, better opportunities for improvement it is very desirable to organize schools in such sections for the instruction of children between 3 and 6 years of age. Kindergartens would lengthen the school life of such children about three years and rescue them, for a time at least, during the most impressionable period of their

lives from the evil influence of homes in which idleness, vice, and crime are the daily examples set for their imitation. If the young children of idle, thriftless parents could be taken from their homes and subjected daily to the humanizing and enlightening influences of good schools, in charge of properly qualified teachers especially adapted to the performance of such work, many of them would be doubtless rescued from leading such lives as they see daily those among them living, and instead of growing up in ignorance and vice, to increase the number of idle and lawless, they would become industrious and law-abiding citizens. Such schools must constitute an important feature of any successful scheme the city may be compelled to adopt in its own protection.¹

These words apply with especial emphasis to the colored race, which supplies a large part of the submerged element. The criminal and vicious tendency of a large fraction of the negro population is alarming in its proportions. The ordinary process of education seems to have but little beneficial influence. Some method must be devised to reach, to help, and to save them. The state will be forced to animadvert to this matter for its own protection and defense. The kindergarten is the only institution yet proposed which promises the desired relief. The expense of such schools would doubtless be enormous; but it is poor economy that saves in the educational department only to add to the criminal budget.

There are only two ways by which children of degrading environments can be rescued. One is to take hold of them at a tender age, before they reach the ordinary school period, and give their thoughts, feelings, and aspirations the proper direction and trend. The other is to keep them in school for a sufficient length of time to appreciate the transforming power and refining influence of knowledge and culture. So far as the masses are concerned this last remedy is impossible. The first years of school life are spent in mastering the hard mechanics of learning. There is little or no reflex influence upon the life and character. This must come, if at all, at an earlier or a subsequent date. The school influence must reach lower down in the life of the negro child. The human twig is given its moral bent and inclination before reaching the ordinary school period, and the whilom effect of routine instruction can scarcely prevent it from growing into a twisted and distorted trunk.

The State establishes and maintains schools for the sake of producing a better grade of citizenship. In order to succeed with the submerged element it must step in loco parentis and take hold of the child while it is yet susceptible to moral impressions. This is not a charity or vicarious benevolence, but a plain duty demanded by every consideration of enlightened self-interest. It is as essential that the State protect itself from such internal evils as it is to maintain the Army and Navy to ward off foreign foes. The great difficulty with the ordinary colored child is that he enters the school too late and leaves too soon to derive from it the full benefit which it is calculated to impart. The term can be lengthened more easily and more profitably from below than from above. Let the education of the negro reach down before reaching up, and if there needs be a choice let it reach down rather than up, but let it always reach as far as possible in both directions.

To the white child the essential aim of education is to enable him to fit into an established social and industrial order. The negro child must endeavor to improve the status of his race. There is no one who has gone before to prepare a place for him. The teacher of the negro child needs more of the spirit of the missionary to arouse and quicken his lethargic energies into life and activity. Every successful teacher must be devoted to duty, but the colored teacher should be consecrated to a cause. He needs not only professional zeal for the work, but also the ardent devotion of a moral enthusiast. Every such teacher should regard himself as a laborer in the vineyard of humanity and not merely as a pedagogue peddling his services for pay.

¹ Seventeenth annual report of the Board of Commissioners of Public Schools of Baltimore, 1898, p. 102 et seq.

The Northern missionaries who came South immediately after the war to labor among the recently emancipated slaves would hardly be accounted educators in the modern sense of that term. Many of them were not even educated, and yet by reason of their missionary zeal and moral enthusiasm they wrought marvelous transformations. The State, with its more competent secular agencies, has supplanted them in the educational field, but it can neither hire nor demand the subtle spirit. It can only exact outward decency of behavior and a reasonable proficiency of service. The spirit of enthusiasm and consecrated zeal must spring from the consciousness on the part of the teacher that his own welfare is indissolubly linked with that of the masses whom he is commissioned to enlighten.

The negro child needs especially to be rooted and grounded in the concrete principles of things. It is characteristic of tropical temperaments to revel in intellectual subtleties and fine flights of fancy while ignoring the material things by which they are surrounded. Races and nations remain in a backward or barbarous state because they fail to heed the divine injunction to subdue the earth. All attempt to escape the difficulties of earth by building a tower to reach to the skies must end in a confusion of tongues. The Anglo-Saxon has gained his present eminence among the nations because he is of the earth earthy. He delves while others soar; he applies while others speculate. The Anglo-Saxon is not superior to other men in intellectual gifts or moral endowments. For intellectual subtlety and spiritual perception the Hindoo is conceded to be his equal, if not his superior, and yet when it comes to bringing things to pass one Englishman is equal to a thousand Asiatics. A close study of the Yankee reveals the fact that he is equal to almost any practical emergency, even when he has a rather slender basis of intellectual equipment. On the other hand, the negro is rather theoretical than practical. He knows immensely more than he can do. His practical prowess has by no means kept pace with his intellectual achievements. Slavery taught him to work by rule and rote, but not according to plan and method. The first effect of intelligence was, naturally enough, to disgust him with manual toil, which stood to him as a reminder of slavish drudgery. He has never learned the gospel of work or the joy of service, because he has never entered into it with intelligent plan and purpose. A thought is married to a thing and an enterprise is born, but when thought is divorced from things there is nothing but sterile speculation and barren criticism.

The greatest need of the negro is to bring the wild energy of his muscle under the guiding intelligence of his mind. In all his experience he has not been compelled to observe the fine adaptation of effort to task, but he has been confined to such crude lines of service that the vaguest approximation was deemed sufficient.

There are only two ways by which a people may gain proficiency in practical things. One is by long familiarity and practice in controlling affairs until the habit becomes fixed and is handed down by heredity. The other is by means of education of the young. The latter process is by far the more rapid, and is indeed the only course open to the negro at the present time. The child learns in a few years what it took the race half a dozen generations to acquire. If education can not overcome heredity, it can at least discount it by an enormous per cent.

The negro child needs to be trained in practical judgment, a faculty in which it must be conceded he is woefully deficient. He is too apt to commit to memory rather than to the understanding. If the average child were put to the test as to the weight and value of things which have become familiar by glib recital or required to interpret the verbal image of ideas in terms of their concrete equivalents, the results would be grotesque indeed. His information should be interpreted in terms of his own thoughts, feelings, and volitions. He should be made to feel that all lines of knowledge radiate from him as a conscious center. The method of impartation should be actual, tactual, factual. The old adage tells us that knowledge is power, but this applies only to digested and assimilated knowl-

edge. If one takes food into his stomach and fails to digest it, it not only does not give him added strength, but saps from him the strength already acquired. Intellectual indigestion acts in about the same manner as the corresponding physical ailment. Negro youth are everywhere suffering from intellectual indigestion, and there is danger of a race of mental dyspeptics. The only remedy is through a method of education which shall observe a just balance between the abstract and concrete.

The complaint is universal that our school curricula are overcrowded and that the pupil can get only a smattering of the kaleidoscopic programme. If this be a detriment to the white youth, it must be doubly so to the negro child, who may be the first, or well nigh the first, in the history of his race who has learned the use of letters. A little learning is a dangerous thing, and especially so if dissipated over too wide an area. The white child is apt to be steadied and balanced by his setting in society; the negro can hope for no such corrective influence. He is likely to overestimate his capacity and attainments and to make a miserable fizzle in an ambitious career, where he might have made a useful and respectable citizen in a more modest sphere. Or he may become a vainglorious, self-conceited egotist, disgusting sensible men with a showy display of shallow learning. To correct this tendency the courses should be judiciously limited in range and scope and a thoroughness of mastery rigidly insisted upon.

All that has been said under the head of concrete methods emphasizes the importance of manual training. The negro was brought to this country to labor with his hands. For more than two centuries he has fulfilled this manual mission; and for many years to come this must be his chief function in society.

He should be taught to do with skill, accuracy, and method that which inevitably devolves upon him. Being shut out from the shops he must look to the school for the only means through which he may be prepared to gain and retain a satisfactory status in the industrial order.

Manual training must be carefully discriminated from industrial education. The one looks forward to definitely established lines of work, the other to the acquisition of power. So far as we can judge the future by the present, it would be almost useless to equip any considerable number of our colored youth in our large cities with mechanical trades. They would have few facilities for plying them. The colored workman is rigorously excluded by organized effort. He labors under the double disadvantage of being weak and of being black. This makes the negro's industrial outlook a very unpromising one. The real hope is that he may be driven to take the industrial initiative, as the spirit of caste has already developed in him ecclesiastical independence and social self-sufficiency.

The real demand is for manual training which will enable him to do with mind as well as with might what his hands may find to do.

Nine-tenths of the negroes in cities must make their living by bodily labor and domestic service. More skill, intelligence, and character must be put into these lines of work.

Whatever may be said of the universal requirement of a system of education in the abstract, all will agree that the practical programme must have reference to the probable vocation of its recipients. The negro race can not escape this law. The bulk of them for all time that we can foresee must earn their livelihood by some form of manual labor. The following table shows the occupations in which city negroes are generally engaged. There are no potent forces at work which will materially modify this programme within any calculable period of time. The table shows that in all of the largest cities of the South 98,470 males and 79,429 females were employed in gainful occupations, making a total of 177,899. Of this number 60,172 men were employed as laborers, servants, draymen, teamsters, messengers, etc., and 37,686 women followed domestic and laundry service. It is

within these industrial lines that the negro must live and move and gain a livelihood. His education, therefore, should have direct bearing upon that sphere of industrial activity.

The question of sex as a factor in education has recently received much attention. One of the most striking phenomena of the city negro is the relative excess of women. Strangely enough, this phenomenon seems to have escaped attention. The economic conditions which prevail in the rural districts are sufficient to account for this condition of things. The women are not well suited to farm labor; they can not enter into competition with men in such arduous tasks. On the other hand, there is an unlimited demand in the cities for competent and efficient colored females in the domestic sphere. It is not surprising, therefore, to find an enormous preponderance of women in the large centers. This excess of the female element conditions all phases of urban negro life, whether in home or church or general society. The school also feels its controlling influence.

Total population, school population, and school attendance of negroes in cities having more than 5,000 negro inhabitants.

Total	384,433	397,990	111,074	134,689	30,758	37,623

This table shows the excess of colored females in the Southern cities which contained in 1890 more than 5,000 colored inhabitants. There is an excess of 63,557 colored females, who are in the majority in all the cities named except Baton Rouge, La., Chattanooga, Tenn., Raleigh, N. C., Kansas City, Mo., and Dallas, Tex. The preponderance of men in these cities can be explained on the ground of special industrial conditions. It is known that there is great demand for colored male labor in the works of Chattanooga; and the excess in Kansas City can be accounted for by the fact that the males outnumber the females generally throughout the Western country. The relative excess of females of school age can not be

wholly accounted for by industrial conditions, and is a phenomenon which still awaits an explanation. That there should be 63,000 more females than males in the population at large, or 119 females to every 100 males, is surely a less striking phenomenon than that for ages between 5 and 20 the ratio should be 121 to 100. When the school attendance is considered the disproportion is still more glaring, there being 122 females to every 100 males. These figures should be studied in the light of proportion rather than as absolute numbers. The figures relative to a few cities are not given. For example, the census does not give the pupils for the city of Washington, whose numbers would have much weight on the general result; but it is also probable that the omitted figures bear about the same disproportion as those which are presented, so that the value of the table is not affected by their omission.

The female excess for the 11 cities which contained in 1890 a colored population of more than 20,000 is here presented:

Excess of colored females over males.

City.	Colored males.	Colored females.	Excess of females.	Number of females to 100 males.
Baltimore	29,165	38,131	8,966	131
Richmond	14,216	18,138	3,922	128
Atlanta	12,400	15,717	3,317	127
Washington	33,831	41,866	8,035	123
New Orleans	28,936	35,727	6,791	123
Nashville	13,334	16,061	2,727	120
Charleston	14,187	16,849	2,662	119
Savannah	10,493	12,485	1,992	119
Memphis	13,333	15,396	2,063	115
Louisville	13,348	15,324	1,976	115
St. Louis	13,247	13,819	572	104
Total	196,490	239,513	43,023	121

This table bears out the general tendency. There are 121 females to every 100 males, the total excess of females being 43,023. This surplus would form a city as large as Jersey City, N. J.

Such a disproportion in the population makes an unsatisfactory condition of society. But it presents a problem with which the schools must grapple. This is especially significant as applied to industrial education. These girls must become wage-earners. The investigations of the Atlanta conference showed that a large per cent of negro homes were supported wholly or in part by female wage-earners.¹ The preponderance of the female sex renders their participation in wage-earning pursuits inevitable. There is practically but one field open for them, and that lies in the sphere of the household industries. When we speak of industrial education, reference is usually had to work in wood or metal or training in some manly vocation; but the city negro presents a unique industrial problem. The negro male has no fixed industrial status. The trade organizations exclude him from participation in the higher mechanical pursuits. There is no assurance that any considerable number could find means of plying their trades, even if they were equipped with them. It is true that the spirit of trades unionism is fiercest in the North, but there seems to be no doubt that the same policy will be adopted in the South whenever the exigencies of industrial rivalry make it necessary. The whites belong to the preferred class, and the negro is forced out of any pursuit which they wish to occupy themselves. This unpleasant, though stubborn, fact renders a programme of profitable industrial training for the city negro very difficult to formulate.

¹ Bulletin Labor Bureau, No. 10, p. 267.

On the other hand, the colored woman holds undisputed sway in the field of domestic service, and nothing but her own incompetence can ever dislodge her. This affords one of the chief means of support of negro families, more than half of whom subsist in whole or in part by such service. The industrial education of the city negro must take cognizance of these facts and should be shaped largely to the requirements of domestic economy and household industries.

The negro pupil should be taught a knowledge of the conditions and circumstances of his race. As he must live the life conditioned by his race, his training should give him some adequate notions about that life. The German, the Irishman, the Scandinavian, or any other element of our cosmopolitan population need not of necessity study the status of their racial stock. What to them may be a matter of sentiment or pride, to the negro is a stern necessity. They are not compelled to live the life of their race unless they elect to do so. They are eligible to become at once full-fledged American citizens, without any hyphenated prefix. But not so with the negro. He can not escape the onus of his race. Mr. Douglass used to say that wherever the negro goes he carries himself with him. Every person who is tainted with his blood is circumscribed and conditioned by that fact. If it is the function of education to teach the pupil to enter upon the life which lies before him, should not the negro pupil be taught something of that life of which he must ever form a part? The American pupil is instructed in the history, institutions, and traditions of his country, in whose economy he must soon take his place. The negro is an American, but he is none the less a negro. Unlike the Jew, who of his own choice prefers to cling to the traditions of his fathers, the negro has little opportunity of gaining accurate or beneficial knowledge of his race through personal and domestic channels. His main reliance here, as in all other relations, must rest in the schools.

The ordinary text-books that treat of ethnological topics are often humiliating to his pride and revolting to his sense of self-respect. A hideous picture of an African savage and some reference to a domesticated race are about all he can hope to find about himself in the ordinary text which is placed in his hands. Whatever is creditable to the negro is merged in the credit of the general population, while the odious and repugnant stand out in bold relief. Some special corrective influence is necessary in order that the negro may not despise himself, for no class of people who despise themselves can hope to gain the respect of the rest of mankind. While he is feasting upon the fruits of the tree of knowledge, he should beware lest he should be eating and drinking unto his own damnation. It is folly to feed the intellect and starve the spirit. The negro child has a right to know of the contributions and achievements of his race, however insignificant these may appear in the eyes of his white neighbor. "These little things are great to little men." Inspiration is a more valuable function of education than information. Youth are inspired to noble endeavor mainly by the deeds of those of their own kind and condition.

It is indeed true that a people may become too painfully self-conscious. This will make them too proud and elated or too abject and mean. The negro whose time is spent in lachrymal lamentations over the woes and miseries of his race would not make an ideal citizen. The colored boy or girl, on the other hand, who grows up ignorant of the special condition of the class to which he is relegated would be as deficient in practical knowledge as the American youth who knows nothing of the history, institutions, and laws of his country. No negro can afford to be incurious as to the status of his race. It would be as great a manifestation of folly as it would be on the part of a convict to attempt to ignore the fact that he is in durance vile.

Wherever separate schools exist—and the fact of their existence is the most persuasive argument that the negro is shut in to a racial circle and range—there should be some definite instruction in subjects that pertain to the race. Of course,

there should be the highest prudence and caution in the selection of subject-matter and in the manner of impartation. All frictional and inflammatory methods should be discarded, and only subjects that are accurate, comprehensive, and sensible should find favor. There might be placed in parallel columns wrongs suffered and benefits received, rights withheld and duties neglected, present proscription of privilege and the larger promise of the future.

We have in the city negro a special educational problem of peculiar importance. The entire negro population must look to the cities for diffusion of light. The perfection of their educational régimes, therefore, is not only of prime importance to the 700,000 therein collected, but also to the 8,000,000 who are scattered abroad.

PART II.—THE HIGHER EDUCATION OF THE NEGRO.

I. THE INTELLECTUAL CAPACITY OF THE NEGRO.

The negro is scarcely ever considered with reference to the primary problems of life. Those needs of the human race which do not depend upon temporary conditions and circumstances are not generally deemed predicable of him. The African is not regarded in his own right and for his own sake, but merely with reference to the effect which his presence and activity produce upon the dominant Aryan. He is merely a coefficient which is not detachable from the quantity whose value it may either increase or diminish. The black object is always projected against a white background, producing a grotesque and gloomy silhouette. The whole history of the contact of the races deals with the negro as a satellite whose movements are secondary to those of the central orb about which it revolves. Civilization was not thought possible for the sons of Ethiopia. The sable livery of the Tropics was deemed impervious to ennobling influences. The negro could only contribute to the wants and welfare of the higher race. With a self-debasement surpassing the vow of the anchorite, he was expected to bow down to this white god and serve him, ascribing unto him "the kingdom, the power, and the glory, forever." The whole scheme of the subjugation and oppression of the African is based upon the theory that the negro represents an inferior order of creation, and therefore his needs are secondary to and derivable from those of his white lord and master. The ordinary attributes and susceptibilities of the human race were denied him. When it was first proposed to furnish means for the development of the nobler side of the negro race, those who possessed the wisdom of their day and generation entertained the proposition either with a sneer or with a smile. Ridicule and contempt have characterized the habitual attitude of the American mind toward the negro's higher strivings. The African was brought to this country for the purpose of performing manual labor. His bodily powers alone were required to accomplish this industrial mission. No more account was taken of his higher susceptibilities than of the mental and moral faculties of the lower animals. The white man, as has been wittily said, saw in the negro's mind only what was apparent in his face—"darkness there, and nothing more." His usefulness in the world is still measured by physical faculties rather than by qualities of mind and soul. Even after the wonderful transformations of the past thirty years, many claim to discern no function which he can fill in society except to administer to the wants and wishes of others by means of bodily toil. The merciless proposition of Carlyle, "The negro is useful to God's creation only as a servant,"¹ still finds wide acceptance. It is so natural to base a theory upon a long-established practice that one no longer wonders at the prevalence of this belief. The negro has sustained servile relations to the Caucasian for so long a time that

¹Occasional Discourses on the Nigger Question.

it is easy, as it is agreeable to the Aryan pride, to conclude that servitude is his ordained place in society.

As the higher susceptibilities of the negro were not needed, their existence was, at one time, denied. The eternal inferiority of the race was assumed as a part of the cosmic order of things. History, literature, science, speculative conjectures, and even the holy Scriptures were ransacked for evidence and argument in support of this theory. It was not deemed inconsistent with divine justice and mercy that the curse of servitude to everlasting generations should be pronounced upon a race because their alleged progenitor utilized as an object lesson in temperance the indulgent proclivity of an ancient patriarch.¹ Science was placed under tribute for support of the ruling dogma. The negro's inferiority was clearly deducible from physical peculiarities. In basing the existence of mental, moral, and spiritual qualities upon the shape and size of skull, facial outline, and cephalic configuration, the antinegro scientists outdistanced the modern psychologists in assuming a mechanical equivalent of thought.

But in spite of scientific demonstration, learned disquisitions, prohibitive legislation, and alleged divine intendment, the negro's nobler nature persisted in manifesting itself. The love, sympathy, tender fidelity, and vicarious devotion of the African slave, the high spiritual and emotional fervor manifested in the weird wailings and lamentations of the plantation melodies, the literary taste of Phillis Wheatley, the scientific acumen of Benjamin Banneker, the persuasive eloquence of Frederick Douglass, were but faint indications of smothered mental, moral, and spiritual power. The world has now come to recognize that the negro possesses the same faculties, powers, and susceptibilities as the rest of mankind, albeit they have been stunted and dwarfed by centuries of oppression and ill usage. The negro, too, is gradually awakening to a consciousness of this great truth. The common convergence of religious and secular thought is toward the universal fatherhood of God and brotherhood of man. This universality of kinship implies commonality of powers, possibilities, and destiny. It is difficult to estimate the importance of this belief to the backward races of the earth. We have of late heard a strangely discordant jangle from the jungles of India, with contemptuous reference to "lesser breeds without the law." Rudyard Kipling regards all other races of the earth only as contributory factors to the glory of his own. This conviction is betrayed even in what he intends for a kindly reference:

But the things you will learn from the yellow an' brown,
They'll 'elp you and 'eap you with the white.²

The backward races, according to this new light of Asia, have no inherent capacities, rights, or prospects, but are merely a part of the "white man's burden," a load more grievously to be borne than the weight which mythology assigned to the back of the ill-fated Atlas. But this note is strangely discordant to the prevailing sentiment of the opening century. How much broader in comprehension, truer in prophecy, and nobler in sympathy and spirit are the lines of Walt Whitman:

A man's body at auction!
(For before the war I often go to the slave mart and watch the sale.)
I help the auctioneer, the sloven does not half know his business.
Gentlemen, look on this wonder!
Whatever the bids of the bidders, they can not be high enough for it.
For it the globe lay preparing quintillions of years without one animal or plant.
For it the revolving cycles truly and steadily rolled.
In this head the all-baffling brain.
* * * * *
Examine these limbs, red, black, or white, they are cunning in tendon and nerve,

¹ Genesis, IX: 21-27.

² Seven Seas, p. 171.

Exquisite senses, life-lit eyes, pluck, volition,

* * * * *

And wonders within there yet.

Within there runs blood,

The same old blood! the same red running blood!

There swells and jets a heart, there all passions, desires, reachings, aspirations,

(Do you think they are not there because they are not expressed in parlors and lecture-rooms?)

This is not only one man—this the father of those who shall be fathers in their turns,

In him the start of populous states and rich republics,

Of him countless immortal lives with countless embodiments and enjoyments.¹

It is a matter of prime importance for the negro to feel and to convince his fellow-men that he possesses the inherent qualities and therefore the inherent rights that belong to the human race. Carlyle, though blinded by narrow prejudice when handling the negro in the concrete, is nevertheless a true philosopher when dealing with general principles. The same author who regards the negro as an "amiable blockhead," and amenable only to the white man's "beneficent whip," also exclaims, "that one man should die ignorant who had the capacity for knowledge, this I call a tragedy, were it to happen more than twenty times in a minute."² When it is granted that the negro has capacity for knowledge and virtue, all of his other problems flow as corollaries from the leading proposition.

The lack of capacity on the part of colored youth to secure the higher lines of education has, until recently, in this country at least, been generally assumed. The few negroes who showed any intellectual development during slavery days were exceptions, sufficient only to prove the rule. It used to be an accepted dictum that the negro's skull was too thick to learn. This dictum, however, seems to have been founded upon a desire rather than a belief; for in order to justify the assertion laws were made forbidding the attempt. It was made a crime for the negro to perform the impossible. Why reenact the laws of God?

It will be noticed that those who deny the negro mental capacity may fairly be suspected of a motive. This was certainly true in the case of the slaveholders before the war. It is equally true in certain quarters to-day. Men will resort to all kinds of arguments in order to shape their consciences to their dealings. All the resources of knowledge were exhausted to show that the negro was not like other men, and that God had designed him for an inferior station in life. All this was undertaken to justify the system of slavery, or, slavery being dead, to shut out the negro from the full privileges of manhood and citizenship. It is easy as it is safe to shift responsibility from men's guilty consciences and place it upon divine intentment. The process was a logical and a cunning one. Admit the negro's mental and moral endowments and all justification for inhuman, unfair, or proscriptive treatment falls to the ground.

If I'm designed yon lording's slave,

By nature's law designed;

Why was an independent wish

E'er planted in my mind?³

John C. Calhoun was by all odds the most sagacious defender of slavery. He placed its justification squarely upon the ground of the negro's intellectual and moral inferiority. He is reported to have said that if he could find a single negro who understood the Greek syntax he would regard the race as human and worthy to be treated as men.⁴ This statement sounds very remarkable in the light of

¹ Leaves of Grass, p. 85. ² Sartor Resartus (Helotage). ³ Robert Burns's Man was Made to Mourn.

⁴ On account of the importance and widespread currency of this statement, I deem it advisable to give here an account of its origin.

The late Rev. Alexander Crummell, founder and first president of the American Negro Academy, gives the following account:

In the year 1833 or 1834, the speaker (Rev. Alexander Crummell) was an errand boy in the

subsequent developments. If Mr. Calhoun could be reincarnated and could visit his old alma mater at New Haven, he would undoubtedly change his opinion. This remarkable statement should serve to make us heedless of all sweeping denunciations and hostile generalities against the race, however arrogantly they may be put forth or with however high authority they may be supported.

The mental capacity of the negro with reference to this higher education gives rise to two distinct questions: (1) Can he master and assimilate the branches usually placed in the college curriculum? and (2) is he equal in capacity to the white man?

The first proposition needs no argument. Nobody whose opinion is worth quoting doubts at this late date that the negro can master the higher branches of European learning and interpret them in thought and action. Whoever affects to doubt it himself needs to be pitied for his incapacity to grasp the truth. The only excuse for introducing this proposition is that it was at one time denied.

Duty depends upon and is proportionate to ability. Even though it be shown that the white man has larger gifts of mind than the negro, that does not relieve the latter from the duty of cultivating his mind by means of higher education. If the Russians should find that they are intellectually inferior to the Germans, would that make it any the less incumbent upon Russian youth to cultivate their minds to the highest possible degree? The possessor of one talent is called upon to make returns as well as the holder of ten. It is only the sloth who hides his talent in the earth because he imagines that somebody else has a larger allowance. The claim for the higher education of colored youth is not based upon relative capacity, but upon their ability to profit by it. There is a principle in mechanics that no more work can be gotten out of a machine than power is put into it. The problem of machinery is to so adjust force and friction as to bring out the largest possible fraction of useful work. The analogy applies with much strength to the case in hand. It is not attempted to create capacity. God alone can do that. But the problem is how can we best prepare the negro to do the work before him and that, too, with the capacity with which God has endowed him. The wisdom of mankind has decided that the best preparation for any serious duty is a careful training and discipline of the mind.

Although the relative capacities of the races can not be decided by arrogant assertions on the one hand and indignant denials on the other, nevertheless it is a matter of much speculative interest. Affirmation is worth no more than denial, and continued asseveration on either side is worth little more than a spirited contest of "did" and "didn't" between two pugnacious boys.

It will take ten generations to decide this question. The intellectual ascendancy of the various races and tribes is subject to strange variability. The Egyptian, the Jew, the Indian, the Greek, the Roman, the Arab, and the modern European has each had his turn at intellectual domination. When the early nations were at the zenith of art and thought and song, Franks, Britons, and Germans were roaming through dense forests, groveling in subterranean caves, practicing barbarous rites, and chanting their horrid incantations to savage gods. In the days of Aristotle the ancestors of Sir Isaac Newton and Kent and Gladstone could not count beyond the ten fingers. Tacitus tells us that the British youth were incapable of learning music and philosophy.

antislavery office in New York City. On a certain occasion he heard a conversation between the secretary and two eminent lawyers of Boston—Samuel E. Sewell and David Lee Child. They had been to Washington on some legal business. While at the capital they happened to dine in the company of the great John C. Calhoun, the Senator from South Carolina. It was a period of great ferment upon the question of slavery, State's rights, and nullification; and consequently the negro was the topic of conversation at the table. One of the utterances of Mr. Calhoun was to the effect that if he could find a negro who knew the Greek syntax he would then believe that the negro was a human being and should be treated as a man. (American Negro Academy, Occasional Papers, No. 3, pp. 10-11.)

To affirm that all races are equal in intellectual capacity is a rather hazardous proposition. There is not wanting, however, eminent authority to support it. Leaving this broad proposition untouched, let us now deduce some of the arguments which support the negro's claim to intellectual capacity.

1. Within the limits of the white race there is the widest possible divergence of mental capability. A philosopher and an idiot may not only be members of the same race, but of the same family. Such divergence is equally true of the negro race. No intellectual classification is possible which will put all whites in one class and all blacks in another. Some negroes are unquestionably superior in intellectual endowment to most white men.

2. Where mixed schools exist there is no discoverable difference of capacity or aptitude on the part of the pupils of the two races. This phenomenon has manifested itself not only in the case of the negro in the United States, but it is equally true of the children of all the so-called inferior races who have been brought in intellectual competition with Caucasian children. It has been observed, however, and remarked upon by Herbert Spencer, that the children of weaker races do not continue their mental activity after reaching maturity with the same vigor as their white competitors. This inactivity is clearly due to a lack of stimulus and incentive and not to incapacity.

3. Colored students pass through Northern colleges with success and sometimes with distinction. Their average rank is exceptionally high when we consider their early environments and opportunities. From time immemorial negro students from Africa, Haiti, South America, and the islands of the sea have passed through the universities of Europe. This occurrence is so common that it no longer excites remark.

4. The race has produced from time to time individuals who show unmistakable evidences of the highest susceptibility of mind. Such instances are so numerous that it would be invidious to mention a few of them, not being able to mention all.

5. Of the numerous authorities that might be quoted in this connection I will cite only a few. William Matthews, LL. D., one of the most successful American authors, in discussing negro intellect, says:

We affirm that the inferiority of the negro has never been proved, nor is there any good reason to suppose that he is doomed forever to maintain his present relative position, or that he is inferior to the white man in any other sense than some white races are inferior to others.¹

Benjamin Kidd, author of *Social Evolution*, says:

The children of the large negro population in that country [United States] are on just the same footing as children of the white population in the public elementary schools. Yet the negro children exhibit no intellectual inferiority; they make just the same progress in the subject taught as do the children of the white parents, and the deficiency they exhibit in later life is of quite a different kind.²

Prof. N. F. Shaler, of Harvard University, dean of the Lawrence Scientific School, writes in the *Arena*:

There are hundreds and thousands of black men in this country who in capacity are to be ranked with the superior persons of the dominant race, and it is hard to say that in any evident feature of mind they characteristically differ from their white fellow-citizens.³

The following citations from the highest academic authority furnish valuable testimony as to the negro's intellectual capacity:⁴

¹North American Review, July, 1889. ²Social Evolution, p. 295. ³Arena, December, 1890.

⁴These citations are taken from *The College-Bred Negro*, p. 81 et seq. The *College-Bred Negro* appeared as *Atlanta University Publications*, No. 5, and contains the fullest extant historical and statistical account of the negro's higher educational efforts. Dr. W. E. B. Du Bois is secretary of the Atlanta conference, and the success of this work is due largely to his efforts.

From the University of Kansas we learn (January, 1900):

I am pleased to state that this year we have twice as many colored students in attendance at the university as ever before; in all, 28. The rule is that no student shall be allowed to take more than three studies. If he fails in one of the three, it is a "single failure;" in two of the three, a "double failure." The latter severs the student's connection with the university. There are 1,000 students in attendance at the present time. The semiannual examination was held last week, and as a result there are 200 "single failures" and 80 "double failures." The gratifying part of it is that not one of the colored students is in either number.

The secretary of Oberlin writes (February, 1900) in sending his list: "It is a list containing men and women of whom we are proud."

Colgate University, New York, writes of a graduate of 1874 as "a very brilliant student," who "was graduated second best in his class. It was believed by many that he was actually the leader."

A graduate of Colby College, Maine, is said by the librarian to have been "universally respected as a student, being chosen class orator."

Wittenberg College, Ohio, has two colored graduates. "They were both bright girls and stood well up in their respective classes."

A negro graduate of Washburn College, Kansas, is said by the chairman of the faculty to be "one of the graduates of the college in whom we take pride."

The dean of the faculty of Knox College, Illinois, writes of two negro students—Senator Bruce, of Mississippi, and another—who graduated and were remembered because of "their distinguished scholarship."

A black student of Adrian College, Michigan, "was one of the best mathematicians I ever had in a class," writes a professor.

Adelbert College, of the Western Reserve University, Ohio, has a negro graduate as acting librarian who is characterized as "one of the most able men we know;" while of another it is said, "We expect the best."

Lombard University, Illinois, has "heard favorable reports" of its single negro graduate.

The dean of the State University of Iowa writes (December, 1899) of a graduate of 1898:

He distinguished himself for good scholarship, and on that ground was admitted to membership in the Phi Beta Kappa Society. He is a man of most excellent character and good sense, and I expect for him a very honorable future. He won the respect of all his classmates and of the faculty. As president of the Phi Beta Kappa Society, I received him into membership with very great pleasure as in every way worthy of this honor.

Boston University writes of one graduate as "a fine fellow." He is now doing postgraduate work at Yale, and the agent of the Capon Springs negro conference writes (November, 1900) "I continually hear him mentioned in a complimentary way. On the other hand, two negro boys were in the freshman class not long ago, and both were conspicuously poor scholars."

Otterbein University, Ohio, has a graduate who "was a most faithful and capable student."

The dean of Dartmouth College, New Hampshire, writes (December, 1899) of its graduates:

The last two or three are hardly established in business yet, but the others are doing remarkably well. These men have been in each case fully equal to if not above the average of their class. We have been very much pleased with the work of the colored men who have come to us. They have been a credit to themselves and their race while here and to the college since graduation. I wish we had more such.

The president of Tabor College, Ohio, says of two colored graduates: "They are brainy fellows who have done very much good in the world."

One of the most prominent colored Methodist ministers in Philadelphia said to the president of Allegheny College, Pennsylvania, speaking of a colored graduate: "Any college may be proud to have graduated a man like him."

The University of Idaho graduated in 1898 a young colored woman of "exceptional ability."

Westminster College, Pennsylvania, has graduated two negroes. "Both were excellent students and ranked high in the estimation of all who knew them."

Of a graduate of Hamilton College, New York, the secretary says:

He was one of the finest young men we have ever had in our institution. He was an earnest and consistent Christian, and had great influence for good with his fellow-students. No one ever showed him the slightest discourtesy. On leaving college he spent three years in Auburn Theological Seminary; was licensed to preach by one of our Northern presbyteries, and then went to Virginia, near Norfolk, where he built a church and gave promise of great usefulness, when, about two years ago, he suddenly sickened and died. He had many friends in Clinton outside of the college. He prepared for college in the Clinton Grammar School. On leaving the school for college the wife of the principal of the school made to me the remark that it seemed as if the spirit of the Lord had departed from the school. I received him into the church and was his pastor for a number of years. Everybody was his friend. Members of the Presbyterian Church of Clinton contributed to the erection of his church in Virginia, and the Sunday school has educated his sister. His untimely death caused deep sorrow in this community, where he was greatly beloved. We felt that he was destined to become a power for good among his people in the South.

At the larger colleges the record of the negro students has, on the whole, been good. At Harvard several have held scholarships, and 1 a fellowship; there has been 1 Phi Beta Kappa man, 1 class orator, 2 commencement speakers, 3 masters of art, and 1 doctor of philosophy. In scholarship the 11 graduates have stood: 4 good, 3 fair, 2 ordinary, and 2 poor.

At Brown one of the most brilliant students of recent years was a negro; he was among the junior 8 elected to the Phi Beta Kappa.

At Amherst the record of colored men has been very good, both in scholarship and athletics. A colored man captained the Amherst foot-ball team one year and is now one of the chief Harvard foot-ball coaches.

At Yale and Cornell colored men have held scholarships and some have made good records.

But, say the objectors, if the negro possesses this great capacity of mind, why has he not given the world the benefit of it during the course of history? By their fruits ye shall know them. Mr. Thomas Nelson Page, in his otherwise delightful book on the Old South, asks with supercilious disdain: "What of value to the human race has the negro race produced? In art, in mechanical development, in literature, in mental and moral science, in all the range of mental action, no notable work has up to this time come from a negro."¹ Henry Ward Beecher's sneer against the negro race is a hackneyed recital, viz, that "If all the negroes in the world were sunk to the bottom of the ocean, the bubbles that would come to the top would be of as much benefit to civilization as the bodies that went down."

Mr. Thomas Nelson Page and Mr. Beecher make the mistake of confounding intellectual capacity with intellectual activity. Capacity is potential and not kinetic energy. Whatever native energy the mind may possess, it must receive reinforcement from the prevailing tone of society before it can show any large results. In arithmetic a figure has an inherent and a local value, the latter being by far its more powerful function in numerical calculations. So it is with intellectual achievements. The individual mind may count for much, but the tone of society counts for more. It is absolutely impossible for a Bacon to thrive among barbarians or a Herbert Spencer among Hottentots.

In confirmation of this view let us for a moment follow the career of the Greeks, who were undoubtedly the most intellectual people that ever lived.

Mr. Lecky tells us in his *History of European Morals*:

I regard it as one of the anomalies of history that within the narrow limits and scanty population of the Greek states should have arisen men who in almost

¹The Old South, p. 314.

every conceivable form of genius, in philosophy, in ethics, in dramatic and lyric poetry, in written and spoken eloquence, in statesmanship, in sculpture, in painting, and probably also in music, should have attained almost or altogether the highest limits of human perfection.¹

Mr. Galton, in his *Hereditary Genius*, tells us:

We have no man to put beside Socrates and Phidias. The millions of all Europe breeding, as they have done, for the subsequent two thousand years have never produced their equals. It follows from all this that the average ability of the Athenian race is, on the lowest estimate, very nearly two grades higher than our own;² that is, about as much as our race is above that of the African negro.³

These remarkable statements are supported by the highest possible authority, and yet this intellectual race, this race of Phidias and Plato, of Homer and Socrates, has continued for two thousand years in a state of complete intellectual stagnation. In the words of Macaulay, "Their people have degenerated into timid slaves and their language into a barbarous jargon."³

Can there be any stronger proof of the fact that intellectual activity depends upon the environing stimulus, political and social stability, and not upon capacity?

It is often said that no negro has written a book fit for a white man to read. In so far as this is true, it grows out of the fact that the negro has not had favorable intellectual environment. The Dumas, père and fils, have laid the world under a debt of literary gratitude, but they did not write as colored men. They were not hindered by the environments of that race.

Our own country has not escaped the odium of intellectual inferiority. The generation has scarcely passed away in whose ears used to ring the standing sneer: "Who reads an American book?" It was in the proud days of Thomas Jefferson that a learned European declared: "America has not yet produced one good poet, one able mathematician, one man of genius in a single art or science." In response to this charge, Jefferson offers an eloquent, special plea. He says:

When we shall have existed as a people as long as the Greeks did before they produced a Homer, the Romans a Virgil, the French a Racine, the English a Shakespeare and Milton, should this reproach be still true, we will inquire from what unfriendly cause it has proceeded.⁴

How analogous to this is the reproach which Mr. Page hurls against the negro race! Let the negro shield himself from the reproach of Page under the plea of Jefferson.

Quoting again from Dr. Matthews's contribution to the *North American Review*:

Hardly two centuries have passed since Russia was covered with a horde of barbarians, among whom it would have been as difficult to find any example of intellectual cultivation and refinement as at this day to find the same phenomenon at Timbuctoo or among the negroes of Georgia or Alabama.

But subsequent events have shown that the Russians are in no wise inferior to any other European race.

It is an evident fact that the thought, the culture, and progressive spirit of our country is confined chiefly to certain sections and localities. According to Henry Cabot Lodge's *Distribution of Ability in the United States*,⁵ Massachusetts has contributed more stars to the galaxy of America's intellectual greatness than all the South and West combined, leaving out the single State of Virginia. Would it be fair, therefore, to assert that an inhabitant of Georgia or Illinois is God-ordained to be intellectually inferior to a native of Massachusetts? The difference in age, wealth, culture, and refinement of the communities accounts for the disparity in the results. The negro claims the benefit of the same argument. He

¹History of European Morals, vol. 1, p. 418.

²Hereditary Genius, p. 331.

³Macaulay's Essays (Mitford's History of Greece).

⁴Jefferson's Notes on Virginia.

⁵The Century, September, 1891.

has never, during the whole course of history, been surrounded by those influences which tend to strengthen and develop the mind. It takes long generations of culture and leisure to produce the best results in scholarship and learning. The negro may not be expected to equal James Russell Lowell in letters, or Bancroft in history, or John Fiske in philosophy until the community in which he lives, as well as the special society to which caste assigns him, has developed a corresponding intellectual tone.

The intellectual equality of the sexes has recently gained many advocates, and yet, in all the list of civilized years, the feminine sex has contributed to history scarcely a single name of the first degree of luster. The explanation is offered that their energies have been directed along other lines of endeavor, and that they have not been competing for intellectual distinction. It would be as unfair to upbraid them for not reaching intellectual heights after which they have not been striving as it would be to chide them for not shining on the field of military renown. The cause of woman and the contention of the negro have many interesting parallels, but none more striking than the common argument which they advance to account for the lack of superior intellectual manifestations.

Leaving the speculative question in abeyance, it can certainly be said that history fails to reveal any people who, under such adverse circumstances of heredity and environment, have ever equaled the negro in the exuberance of intellectual qualities.

II. THE NEED OF THE HIGHER EDUCATION.

Culture, like virtue, is its own reward. It needs no vicarious excuse. The possession of a faculty justifies the development of it. The negro needs the higher education because, as was shown in the first section, he is susceptible of the culture which it affords. Civilization is due to the evolutionary process and grows by slow and imperceptible stages. Each generation does not begin its acquisitions *de novo*, but starts with the inheritance of all that has gone before. It must, however, take some time to digest and assimilate its inheritance. Suppose each generation had to rediscover for itself the propositions of Euclid, the state of mathematical learning would always remain in its infancy. This principle is equally true of a race which has recently entered the arena. The eleventh-hour adventurer enters into equal enjoyment with those who have borne the heat and burden of the day. No greater mistake can be made than to suppose that the colored race must pass through every variety of physical and mental vicissitude which the Caucasian race has undergone before it can attain like renown. This erroneous supposition lies at the basis of much of the opposition to the higher education of colored youth. Civilization was not an original process with any race known to history. The torch is handed down from age to age and gains in brilliancy as it goes. A race can not lift itself independently into civilization any more than a man can sustain himself by pulling against the straps of his own boots. The negro, as much as any, can boast, in the lines of Tennyson, "I, the heir of all the ages, in the foremost ranks of time."¹ Other men have labored, and he has entered into their labors. In order for the negro to assimilate the civilization into which he has been suddenly thrust, he must contemplate its highest models and latest forms.

It is said that the negro is a great imitator. This is a compliment rather than a reproach, provided only that he imitates the purest, the loftiest, and the best. The wearisome repetition of the slow steps and stages by which present heights have been attained is impossible and absurd. It will be readily agreed that language is the surest measure and gauge of a civilization. Wherever the language of a people prevails, their customs, laws, and institutions are sure to follow. Would anyone argue, therefore, that because the negro is a new creature in modern civilization

¹ Locksley Hall.

he must follow the course of historical development in the employment and use of English speech? That he must dwell for generations upon Anglo-Saxon forms and Chaucerian diction before he is prepared for the language of Gladstone and Lowell? Such questions need no answer. Whites and blacks have the same linguistic needs. They study the same forms of language and strive alike for excellence in syntax and diction, in spoken and written style. What has been said of language applies with equal force to all the complex elements of modern life. The higher education is the gateway to the best that civilization has to offer.

Civilization may be defined as the sum total of those influences and agencies that make for knowledge and virtue. This is the goal, the ultima thule, of all human strivings. The essential factors of civilization are knowledge, industry, culture, and virtue. Knowledge comprehends the facts and truths of the universe; industry embodies them in concrete form; culture leads to rational enjoyment; virtue preserves and makes eternal. The African was snatched from the wilds of savagery and thrust into the midst of a mighty civilization. He thus escaped the gradual process of evolution, and education must span the gap. Education must accomplish more for a backward people than it does for those who are in the forefront of progress. It must not only lead to the unfoldment of faculties, but must fit for a life from which the recipient is separated by many centuries of development. The fact that a backward people are surrounded by a civilization which is so far in advance of their own is by no means an unmixed advantage. In the tempestuous current of modern life the contestant must either swim on the surface or sink out of sight. He must either conform or succumb to the inexorable law of progress. The African chieftain who would make a pilgrimage from his native principality to the city of Washington might accomplish the first part of his journey by the original mode of transportation—in the primitive dugout and upon the backs of his slaves—but he would complete it upon the steamship, the railway, the electric car, and the automobile. How swift the transformation, and yet how suggestive of centuries of toil, struggle, and mental endeavor. It required the human race thousands of years to bridge the chasm between savagery and civilization; but now it must be crossed by a school curriculum of a few years' duration. The analytic process is always more rapid than the synthetic. The embryologists tell us that the individual, in developing from conception to maturity, must pass in rapid succession through all the stages traversed by the race in its struggle upward. We are also informed that social evolution must take a somewhat similar course. The European child is supposed to absorb the civilization of his race in about twenty-five years of formative training. The negro is required to master, *de novo*, the principles of civilization in a similar and, indeed, in a shorter time.

In a settled state of society education is conservative rather than progressive in its main feature. Its chief function is to enable the individual to live the life already attained by the race. The initiative of progress is reserved for the few choice spirits of the human race. The bulk of any people can only live up to the level of their social medium, and can be uplifted only by social impulses imparted by some powerful personality. It is a wise provision of nature that large bodies move slowly, otherwise they would acquire dangerous momentum. The progress of the race must be provokingly slow as compared with that of the individual. Education prepares for a statical rather than a dynamical condition of society. And yet, notwithstanding these stern truths, every educated negro must be a reformer, a positive, aggressive influence, in uplifting the masses, and that, too, in spite of the fact that he belongs to a backward breed that has never taken the initiative in the progressive movements of the world. He must therefore be aroused to a consciousness of personal power, the energy of the will, the individual initiative, that subtle, indefinable quality which has always exerted a control-

ling influence upon human affairs, in spite of the theories of doctrinaires and the formulas of philosophy.

The first great need of the negro is that the choice youth of the race should assimilate the principles of culture and hand them down to the masses below. This is the only gateway through which a new people may enter into modern civilization. Herein lies the history of culture. The select minds of the backward race or nation must first receive the new cult and adapt it to the peculiar needs of their own people. Did not the wise men of Greece receive the light from Egypt? The Roman youth of ambition completed their education at Athens; the noblemen of northern Europe sent their sons to the southern peninsulas in quest of larger learning; and up to the present day American youth repair to the European universities for a fuller knowledge of the culture of the Old World. Japan looms up as the most progressive of the non-Aryan races. This wonderful progress is due in a large measure to their wise plan of procedure. They send their picked youth to the great centers of Western knowledge; but before this culture is applied to their own needs it is first sifted through the sieve of their native comprehension. The graduates of the higher schools of learning and other institutions are forming centers of civilizing influence in all parts of the land, and we confidently believe that these grains of leaven will ultimately leaven the whole lump.

That mere contact with a race of superior development can not of itself unfold the best possibilities of a backward people is a proposition which, I think, no student of social phenomena will be inclined to dispute. For four hundred years the European has been brought in contact with feebler races in all parts of the world and, in most cases, this contact has been as the blighting finger of death. Nowhere do we find a single instance in which a people has been lifted into civilization thereby. Outward conformity may be enforced by a rigid discipline; but outward forms and fair practices are of little or no avail if the inward appreciation be wanting. Civilization is a centrifugal and not a centripetal process. It can not be injected hypodermically. Healthy growth can not be secured by feeding a child when he is not hungry or by forcing upon him a diet which he can neither digest nor assimilate.

Aside from political ambition and commercial exploitation, the chief motive of the European in treating with feebler races has been to civilize and enlighten them. The conversion of the Indian to the Christian faith was the chief motive assigned for the early colonization of America, and yet the influence of such schools as Hampton and Carlisle has, perhaps, done more to uplift the red man than all of the contact with the white race since Columbus first planted his Catholic cross in the virgin soil of a new world. Indeed, the superficial, the frivolous, and the vicious qualities are most easily communicable. The substantial qualities of mind and soul can only be developed by independent activity.

For four centuries the Portuguese have been touching the life of the east coast of Africa with their missionary propagandism, commercial enterprise, and governmental policy, but, according to the highest testimony, they have made no more abiding impression on the life of that continent than one might make upon the surface of the ocean with the dent of his finger.

The negro has now reached a critical stage in his career. The point of attachment between the races which slavery made possible has been destroyed. The relation is daily becoming less intimate and friendly and more business like and formal. It thus becomes all the more imperative that the race should gain for itself the primary principles of knowledge and culture. Civilization can not be imparted by attrition, but is the unfolding of the seed whose potency is in itself.

It becomes all the more needful for the negro to pursue the higher lines of education, because this is the principal avenue of refining influence now open to him. There is no long line of ancestors to inspire to noble thoughts or deeds. The

present basis of society does not admit the negro to close social and personal touch with the best forms of culture and refinement. Just as it is more needful for the crude rustic lad to study English syntax than it is for the son of a refined family who gains facility of speech by familiarity and use, so it becomes all the more necessary for the colored youth of crude antecedents and environments to gain culture and refinement through the medium of the school.

That servile and domestic contact has greatly benefited the race, at least so far as outward conformity and the graces of life are concerned, can not be doubted. This kind of contact served its purpose in its day, but its spirit is repugnant to the instincts of manhood. Slavish conformity growing out of favor or fear is not the kind of development that makes men. The helping hand that is most helpful must not be inclined downward, but stretched out on the horizontal. The alarm is sounded that as the negro is being freed from the restraining influence of the master class he is, in some localities at least, relapsing into barbarism. The fact is, slavery has never lifted them much above that deplorable state. The boasted benefits of slavery are superficial, not real. It reminds one of induced electricity, that lasts only so long as the inducing influence is present. Slavery can not elevate a people. The real uplifting influence has been the schoolhouse and the college. These are to become more and more effective as the other influences are removed.

Another great need of the race, which the schools must in a large measure supply, is self-reliant manhood. Slavery made the negro as dependent upon the intelligence and foresight of his master as a soldier upon the will of his commander. He had no need to take thought as to what he should eat or drink or wherewithal he should be clothed.

Knowledge necessarily awakens self-consciousness of power. When a child learns the multiplication table he gets a clear notion of intellectual dignity. Here he gains an acquisition which is his permanent, personal possession and which can never be taken from him. It does not depend upon external authority; he could reproduce it if all the visible forms of the universe were effaced. They say that the possession of personal property is the greatest stimulus to self-respect. When a man can read his title clear to earthly possessions, it awakens a consciousness of the dignity of his own manhood. And so when one has digested and assimilated the principles of knowledge he can file his declaration of intellectual independence; he can adopt the language of Montaigne: "Truth and reason are common to everyone and are no more his who spake them first than his who speaks them after; 'tis no more according to Plato than according to me, since he and I equally see and understand them."¹

Primary principles have no ethnic quality. We hear much in this day and time of the white man's civilization. We had just as well speak of the white man's multiplication table. Civilization is the common possession of all who will assimilate and apply its principles. England can utilize no secret process of art or invention that is not equally available to Japan. We reward ingenuity with a patent right for a period of years upon the process that has been invented; but when an idea has been published to the world it is no more the exclusive property of the author than gold, after it has been put into circulation, can be claimed by the miner who first dug it from its hiding place in the earth. No race or nation can preempt civilization any more than it can monopolize the atmosphere which surrounds the earth or the waters which hold it in their liquid embrace.

In passing through the streets you may notice a young man accommodate his companion with a light from his cigar. After the spark has once been communicated the beneficiary stands upon an equal footing with the benefactor. In both cases the fire must be continued by drawing fresh supplies of oxygen from the atmosphere.

¹ Essay on the Education of Children.

From whatever source a nation may derive the light of civilization, it must be perpetuated by the exercise of its own faculties. All of the visible forms of civilization have been dug out of the ground. We boast of our towns and cities, of our steamships and railways, and of the mighty works of art and invention, but the voice of time is ever whispering, "Dust thou art, to dust returnest." But after all these shall have crumbled into dust, the ingenuity of man will be able to produce mightier works than those that perished. Mind and matter are the irreducible elements. Mind is the common heritage of man, and matter is indestructible.

The negro race has not yet directed its energy to the solution of primary problems. It has been content to receive the crumbs that fall from the white man's table.

Several years ago I received from my florist a fine rosebush that had been grafted upon a Manetti stem, with instructions that the Manetti must be buried out of sight and that its shoots must be pinched back as fast as they appeared above the ground. The strength which its hardy roots derived from the soil was to be diverted from the natural course of developing the plant itself and infused into the more lordly rose, thus insuring greater vigor of growth and brilliancy of bloom. I was forcibly reminded of the analogous situation of the negro in the industrial world. While the race has, in a sense, been dealing with industrial first principles, it has, nevertheless, served only a vicarious purpose. The negro has been suppressed below the social surface, and wherever an individual emergence appeared it was forthwith pressed back to the common level. The substance which his sinews derived from the soil went to enrich, adorn, and glorify another race. But now, under the guidance of intelligence, the substance of his toil must be utilized to promote his own growth and expansion. "Each plant must grow from its own roots" is the botanical equivalent of the old mechanical adage, "Every tub must rest on its own bottom."

The negro race hitherto has been as the vine, which must cling to the tree or trail in the dust; but now it must imitate the oak, which gains independence of foothold and dignity among its rivals of the forest by sending its roots into the soil and expanding its foliage upon the happy air. It is knowledge that must rouse the negro to self-conscious activity.

Whatever system of education is good for Anglo-American youth is good also for Afro-American youth, who have to confront the same issues, and that, too, under much severer conditions. White youth, fortified and reenforced as they are by every advantage of opportunity and environment, find it necessary to pursue the higher education in order to equip themselves for the duties of life which lie before them. Should colored youth be less well prepared? Are their tasks any less difficult? Do the problems that await them call for an inferior order of ability or tact? The arbiter of success is a cruel master, reaping where he has not sown, gathering where he has not strewn, demanding fruit in abundance where he has not planted the seed of advantage. The stream of modern competition is a tempestuous current. The contestant must either swim on the surface or sink out of sight. The world in its cruel demands will accept no excuse. It makes little or no allowance for a man because his ancestors lived under a vertical sun. If you can not do the world's work, it will say to you, if it is in the humor to stop long enough: "'Tis true 'tis pity; and pity 'tis 'tis true," and pass on to some one who can. Men demand the best services available for their needs. No one is willing to trust his life in sickness, his cause in litigation, nor yet his moral and spiritual needs to half-trained or incompetent hands. That the higher education increases the efficiency of service goes without saying. If it is believed that the negro race is doomed to everlasting servility, and that its ordained mission is to hew wood and carry water, then discouragement of higher education is consistent. If all the ennobling vocations are to be filled by white men only and menial stations

assigned to the negro, then his higher culture is a delusion and a snare. But if the negro has wrapped up in him all the possibilities of humanity, he should prepare himself for the larger responsibilities.

Again, the class of men who justify human degradation has not yet passed away. Great learning and scholarship have always been employed against the negro. Men of great ingenuity and mental cleverness have always been arrayed against human rights. History, anthropology, ethnology, and the whole range of the inexact sciences, from which men derive the doctrines they are looking for, have been ransacked for testimony against the African. Our magazines frequently startle us with some amazing article, from authority of high repute, tending to degrade and belittle the race. Scholarship must be combated with scholarship. The situation calls for negroes who shall be able to accept the challenge on any plane and to meet and match the adversary in deep research, in logical acumen, in persuasive rhetoric, or disquisitional skill.

The work of educated colored men is largely that of leadership. They require, therefore, all the discipline, judgment, and mental balance that long preparation can afford. The more ignorant and backward the masses, the more skilled and efficient should the leaders be. It is easier to lead a trained army than a mob of raw recruits, ignorant of the discipline and tactics of war. It requires less wisdom to direct those who need no guidance than to control those who do not know their intellectual right hand from the left. It must be remembered, too, that the matters in which the negroes are to be directed are of the highest importance. It requires high qualification to deal wisely with finance, economics, and the general matters of government and state. But does it not require superior wisdom to deal wisely with human hopes and destiny? No man or set of men can be too learned or too profound into whose hands are committed the temporal and eternal welfare of a people.

Leaders will arise whether qualified or not. If the blind lead the blind all will land in the ditch. Who does not know of the harm which such leaders have inflicted by their rash judgment and ill-advised counsel? It is not contended that a college education makes a man a leader or that a lack of liberal culture disqualifies him for useful service. America has produced scores of men of the highest renown who were not the product of the schools. There are negroes, not a few, who are doing valiant service for the race by means of their virile common sense and untutored energy. Far be it from me to detract one iota from their usefulness or dim the luster of their renown. But when all that has been claimed is conceded the balance of advantages will be found on the side of culture. The whole trend of liberal learning is toward noble manhood and exalted service. The situation is too serious, the crisis too critical, to neglect any means whereby help might come.

In selecting the choice youth of a backward race and giving them a liberal education as the best means of preparing them to uplift their own people, we are only following ancient precedent. The Hebrews labored under disadvantages remarkably similar to those of the American negro. God's idea of a leader was a man identified in blood and sympathy with the downtrodden races, who should be learned in all the wisdom of his day and generation. He must be able to cope with the wisdom of Pharaoh's court. It seems that in ancient as in modern times learning frequently arrayed itself on the side of arrogance and oppression. Moses, in order to succeed in his mission, must match the wisdom of Egypt in logical argument, in persuasive speech, and in the manifestation of magical power. If the wise men of the Nile could perform wonders, he must do mightier works than these. His serpent must swallow up the rest. The culture of Moses, however, was of the greatest service to him in leading the undisciplined hosts through the wilderness and in laying the foundation of their national and permanent greatness. Can we not learn lessons from history? Although under the

present circumstances a single commanding leader is almost or altogether impossible, nevertheless the same principle holds now as then. There is no doubt that there were to be found both Egyptians and Hebrews who decried giving a Hebrew youth an Egyptian education, on the ground that it unfitted him for his place and made him think that he was as good as Egyptians.

It was the common practice of Rome to select the most promising youth of the provinces and give them a complete education in order that they might disseminate an uplifting influence among their own people. To-day the Japanese send their choicest youth to the universities of Europe and America as the best means of transplanting Western civilization to oriental soil. It is the highest ambition of missionaries in all parts of the world to send the best specimens of the native youth to the home country to take on the higher education and bring back the good influence to their own race. It will be noticed that in all these cases it is the higher education that is sought for—the highest that the recipient will take. The select negro youth of this country have as much need to absorb the higher culture and disseminate the beneficial influence throughout the race. This race needs teachers, preachers, physicians, and lawyers, aggregating more than 50,000, all of whom will be the better prepared for their functions by the higher education, or at least by a flavor of its influence. The higher education tends to develop superior individuals who may be expected to exercise a controlling influence over the multitude. The individual is the proof, the promise, and the salvation of the race. The undeveloped races, which in modern times have faded before the breath of civilization, have perished probably because of their failure to produce commanding leaders to guide them wisely under the stress and strain which an encroaching civilization imposed. A single Indian with the capacity and spirit of Booker T. Washington might have solved the red man's problem and averted his impending doom.

The contention among scholars as to what place the classical or dead languages should occupy in a system of education is of much general interest. The friends of liberal learning need to stand firm against all short cuts to culture and the mad rushes after practical results. It is the part of wisdom for the educators of colored youth to adhere to the orthodox standards of culture approved by long centuries of trial and usage. The safest road to culture runs through Greece and Rome. "From thence," says Macaulay, "have sprung directly or indirectly all the noblest creations of the human intellect." It is especially necessary for colored youth to acquire acquaintance with classical institutions and life. The negro borrows his civilization from those who borrowed in their turn. A recent writer argues:¹

It is quite important that the higher education of the negro should include Latin and Greek. The Anglo-Saxon civilization in which he lives is a derivative one, receiving one of its factors from Rome and the other from Athens. The white youth is obliged to study the classic languages in order to become conscious of these two derivative elements in his life, and it is equally important for the colored youth. A liberal education by classic study gives the youth some acquaintance with his spiritual embryology.

The belief that a sound scholastic education will enable the negro to discriminate between the real things of life and the superficial appearances is clearly set forth in the following citation:

They say that egotism and self-conceit are characteristic of the African race, and especially the Afro-American of academic training. You will have to deal with a population that places a premium upon bombastic display and a discount upon unpretentious merit. You should devote your powers to the masses to uplift them and not to exploit them for your vainglory and unrighteous self-aggrandizement. It is said that a native African struts proudly when decorated with flaming European neckwear of the latest Parisian pattern, though he wear

¹ W. T. Harris in *Atlantic Monthly*, June, 1892.

not a single other article of dress. Men cross the seas, and even go to college, without changing their natures. Witness those Afro-Americans who decorate themselves with the highest-sounding literary and scholarly degrees, making heavy demands upon the alphabet to express them, without a single other item of intellectual adornment to support this gaudy display. Reprobate all such childish infirmity. It will only make you ridiculous in the eyes of sensible men. Be natural. Be simple. "Be whatever you may, but yourself first." Do not impose cheap and shoddy standards upon the masses, but teach them to appreciate the noblest and the best. Grasp the real things of life rather than the superficial and showy. It is perfectly natural for a people who are rapidly acquiring civilization, and in whom the faculty of imitation is strong, to be captivated by the superficial aspect of things, to grasp after the frith and froth rather than the life-giving liquid upon which it floats. If a wild man from Borneo should plunge into the gayeties of the European capitals, should become initiated into the latest style of dress and forms of fashionable display, he might vainly flatter himself that he had leveled the immense lift between savagery and civilization, totally oblivious of the fact that he is separated from that life whose forms he slavishly imitates by ten centuries of solid development. It is true that other men have labored and you have entered into their labors, but you must prove your right to this inheritance by striving to comprehend its inner spirit and meaning, and to unravel its secret and method. I have said that your education has brought you in touch with the fundamental things of life. Return ever and anon to these first principles as your standards and data of reference. In Greek mythology we learn that Antæus, the giant, in wrestling with Hercules, received new vigor whenever he touched his mother earth; but Hercules, discovering the secret of his strength, lifted him into the air and squeezed him to death in his herculean grasp. I advise you to make sure of the firmness and fixture of your foothold in the basis of solid things for fear that you be lifted into the delusive realm of unreal allurements and be intoxicated by the frivolous demigod of this unsubstantial region.¹

In the same discourse it is also shown that a knowledge of the laws of growth of human institutions will give the negro a larger patience with the temporary ills of his lot.

Do not waste time complaining against the existing order of society. Enter a manly protest against all forms of wrongs and injustice, but do not pass your days in wailful lachrymations against the regulations of a civilization whose grandeur you have done nothing to make and whose severities you are doing nothing to mollify. Leave that to the ignorant demagogue. Bring your knowledge of history and of human nature to bear upon the situation. I have already pointed out to you that the adjustment of man's relation to man constitutes one of the primary problems of life. Where this adjustment is complicated by diverse physical peculiarities and by different inherited or acquired characteristics the problem becomes one of the greatest intricacy that has ever taxed human wisdom and patience for solution. Race prejudice is as much a fact as the law of gravitation, and it would be as suicidal to ignore the operation of the one as that of the other. Mournful complaint is as impotent as an infant crying against the fury of the wild wind. History has taught you that the path of moral progress has never taken a straight line, but has ever been a zigzag course amid the conflicting forces of right and wrong, truth and error, justice and injustice, cruelty and mercy. Do not be discouraged, then, that all the wrongs of the universe are not righted at your bidding. The great humanitarian movement which has been sweeping over the civilized world from the middle of the eighteenth century to the present time, manifesting itself in political revolutions, in social and moral reforms, and in works of love and mercy, affords the amplest assurance that all worthy elements of the population will ultimately be admitted to share in the privileges and blessings of civilization according to the measure of their merit.²

One of the chief functions of higher education for the negro is to stimulate his industrial energies.

Many able and earnest advocates of the negro's cause seem to have lost the power of binocular vision and have become one-eyed enthusiasts over a narrow feature. The two forms of education are not antagonistic, but supplemental; the one applies to the few, the other to the many; the one supplies the motive, the other the method. The negro needs, first of all, lofty ideals. The surest way to

¹ Address to graduating class, Howard University, June, 1898, by Kelly Miller, p. 10.

² *Ibid.*, p. 11.

induce a people to provide for the material needs of life is to teach them that "life is more than meat." In order that the negro may feel a zest for work and enter into the joy of service he must have prospect and vista.

The day laborer pursues the mechanical rounds of his stupid toil, conscious only of the fact that "time and hour run through the whole day." Under a more enlightened view he would be inspired and sustained by the anticipated enjoyment of the fruits of toil. The negro lacks enlightened imagination. While slavery inculcated the regular habit of labor, it held out no incentive beyond the master's crib. The negro does not make provision because he lacks prevision. The prayer "Give us this day our daily bread" to him has a material and literal significance. The industrial incapacity of the negro is due largely to the fact that he has been confined to the low grounds of drudgery and toil without being permitted to so much as cast his eyes unto the hill of aspiration and promise. "The man with the hoe" is of all men most miserable, unless, forsooth, he has also a hope; but if he be imbued with the spirit of hope and promise he can wield the hoe with as much zest and satisfaction as any other instrument of service.

It is true that a people must be rooted and grounded in the concrete principles of things. When a seed is sown in the ground it first sends its roots into the soil, but only that it may rise out of it, so as to bring forth foliage and flower and fruit in the air above. The incentive to noble endeavor comes from a rational conception of the true end of existence. We can not reach the sky on a pedestal of brick and mortar, and all attempt to do so must end in bewilderment and confusion, as it did on the plains of Shinar in days of old. Even the builders of the tower of Babel derived their inspiration from above. They were inspired by the conceit that they were descended from the skies, and sought by mechanical contrivance only to regain the blissful seat. The negro needs a wider and a larger range of vision. He can not see beyond the momentary gratification of his desires. He does not look before and after. The most effective prayer that can be uttered for him is, Lord, open Thou his eyes. Such influences can be brought to him by means of the higher culture only.

Prof. Booker T. Washington is the greatest man which the race, under freedom, has produced. But his success is due wholly to his intellectual and moral faculties—his enlightened mind, consecrated zeal, and persuasive ability. The mastery of a hundred handicrafts would add nothing to his usefulness or power. Those leaders who have been most effective in guiding, directing, and controlling the life, in stimulating the lethargic energies, and in quickening the zeal of the masses, have derived their inspiration, either directly or indirectly, from contact with higher culture. This is true of Douglass, the orator; of Washington, the educator, and of Dunbar, the poet. The architect must plan before the artisan can execute. The idea comes from above and descends until it strikes the basis of popular needs, and then rebounds, bringing the concrete fulfillment up toward the level of the ideal from which it sprang.

III. OBJECTIONS TO THE HIGHER EDUCATION OF THE NEGRO ANSWERED.

Of late it has been all but the universal fashion to discourage and discredit the higher education of the negro. So widespread has this spirit become that it is doubtful whether the proposition to afford facilities for the higher education of this class would receive substantial support were it now made for the first time. Indeed, many who were most enthusiastic in making the experiment have become hostile or indifferent in the light of experience.

In the first place, we are told that the cost is out of proportion to the result; that the higher education has been fostered at the expense of primary and industrial instruction, which are more essential in the present state of need. The late Charles D. Warner, who had been a lifelong friend and advocate of the negro's

cause, espoused this view in his last striking public utterance. In his notable address delivered before the American Social Science Association, in 1900, he said:

But the effort at education went further than the common school and the primary essential instruction. It introduced the higher education. Colleges—usually called universities—for negroes were established in many Southern States, created and stimulated by the generosity of Northern men and societies and often aided by the liberality of the States where they existed. The curriculum in these was that in colleges generally—the classics, the higher mathematics, science, philosophy, the modern languages, and in some instances a certain technical instruction, which was being tried in some Northern colleges. The emphasis, however, was laid on liberal culture. This higher education was offered to the mass that still lacked the rudiments of intellectual training, in the belief that education—the education of the moment, the education of superimposed information—can realize the theory of universal equality.

This experiment has now been in operation long enough to enable us to judge something of its results and its promises for the future. These results are of a nature to lead us seriously to inquire whether our effort was founded upon an adequate knowledge of the negro, of his present development, of the requirements for his personal welfare and evolution in the scale of civilization, and for his training in useful and honorable citizenship. I am speaking of the majority, the mass to be considered in any general scheme, and not of the exceptional individuals—exceptions that will rapidly increase as the mass is lifted—who are capable of taking advantage to the utmost of all means of cultivation, and who must always be provided with all the opportunities needed.

Millions of dollars have been invested in the higher education of the negro, while this primary education has been, taking the whole mass, wholly inadequate to his needs. This has been upon the supposition that the higher would compel the rise of the lower with the undeveloped negro race as it does with the more highly developed white race. An examination of the soundness of this expectation will not lead us far astray from our subject.¹

This is not saying that the higher education is responsible for the present condition of the negro. Other influences have retarded his elevation and the development of proper character, and most important means have been neglected. I only say that we have been disappointed in our extravagant expectations of what this education could do for a race undeveloped and so wanting in certain elements of character, and that the millions of money devoted to it might have been much better applied.²

Dr. G. A. Alderman, president of Tulane University, New Orleans, has quite recently claimed that the money contributed to negro education by Northern philanthropy has been, for the most part, literally wasted.³

These views have been assigned to these distinguished persons rather for the sake of definite location than for the weight of personal authority, for they represent stock assertions which have gained much headway by persistent asseveration. And yet, when we look the facts squarely in the face, the charge that the money spent on the higher education of the colored race has been wasted or even misapplied is indeed a remarkable one.

Does this charge come from the South? When we consider that it was through Northern philanthropy that a third of its population received its first impulse to better things; that these higher institutions prepared the 30,000 negro teachers whose services are utilized in the public schools; that the men and women who were the beneficiaries of this philanthropy are doing all in their power to control, guide, and restrain the South's ignorant and vicious masses, thus lifting the general life to a higher level and lightening the public burden; that these persons are almost without exception earnest advocates of harmony, peace, and good will between the races, to say nothing of the fact that these vast philanthropic contributions have passed through the trade channels of Southern merchants, it would seem that the charge is strangely incompatible with that high-minded disposition and chivalrous spirit which the South is so zealous to maintain.

¹ Education of the Negro, by Charles Dudley Warner, pp. 4-5.

² *Ibid.*, p. 12.

³ Independent, September 5, 1901.

Does this charge come from the North? It might not be impertinent to propound a few propositions for consideration.

Is it possible to specify a like sum of money spent upon any other backward race which has produced greater results than the amount spent upon the Southern negro? Is it the American Indian, upon whom four centuries of missionary effort has produced no more progress than is made by a painted ship on a painted sea? Is it the Hawaiian, who will soon be civilized off the face of the earth? Is it the Chinese, upon whom the chief effect of Christian philanthropy is to excite them to breathe out slaughter against the strangers within their gates? It is incumbent upon him who claims that this money has been wasted to point out where, in all the range of Christian activity, the contributions of philanthropy have been more profitably spent.

Those who disparage the higher education because it has not banished ignorance and poverty and obliterated vicious tendencies are too impatient. If it takes twenty-five years to educate a white boy, it must require an incalculably longer period to educate a black race. It is true that \$40,000,000 or \$50,000,000 have been already contributed by philanthropy for the education of the negro. This is about equal to the biennial expenditure of the city of New York for educational purposes. And yet, if we are to believe the reports of the low state of municipal morality and the rumors of corruption and wrongdoing, we see that education has by no means done its perfect work in our national metropolis. Then why should we rave at the heart and froth at the mouth because a sum of money scarcely equal to the biennial educational cost of a single American city, when scattered over a territory of a million square miles and distributed through a period of thirty years has not completely civilized an undeveloped race of some ten million souls?

The American people must yet learn to apply the simple principles of political economy to the race problem. A dollar contributed by philanthropy is not necessarily any more efficacious than one appropriated out of the public treasury. Money devoted to the education of the black race need not be expected to yield any greater return, either of knowledge, virtue, or practical capacity, than a like sum devoted to the white race. Although the Southern States have contributed to the full amount of their ability, it is still true that the combined contributions of Northern philanthropy and Southern statesmanship have been woefully inadequate to the task imposed. Fifty millions of dollars is indeed a princely sum, but on examination we find that it would not average one dollar a year for each negro child to be educated. Why should we marvel, then, that the entire mass of ignorance and corruption has not put on enlightenment and purity? We should be patient with the slow evolution of social forces. The human race makes very slow progress toward the goal of righteousness. After the lapse of nineteen centuries of Christian endeavor the curse of sin is still in the world. It is no marvel, then, that the negro has not put on the perfect dress of civilization and righteousness because exhorted to do so in proverb and psalm.

Wisdom is justified by her children. As an illustration of the value of the higher education to the negro race, I point to Howard University, which is the largest and best equipped institution of its class. The establishment and maintenance of this institution during the past thirty-four years has cost between \$2,000,000 and \$3,000,000. As the returns on this investment, it has sent into the world, in round numbers, 200 ministers of the gospel, 700 physicians, pharmacists and dentists, 300 lawyers, and 600 persons with general collegiate and academic training, together with thousands of sometime pupils who have shared the partial benefits of its courses. These graduates and sometime pupils are to be found in every district and county where the negro population resides, and are filling places of usefulness, honor, and distinction, as well as performing works of mercy and sacrificial service for social betterment. Not a half dozen of the entire number have a criminal record. They serve as an inspiration and a stimulus,

quicken the dormant energies of the people and urging them to loftier ideals and nobler modes of life. It devolves upon the complainant to present some plan by which a like sum of money, in a like space of time, can be expended so as to produce a more wholesome or more widespread effect upon the general social uplift.

Another potent objection against the higher education is that it has not checked the evil disposition and vicious tendencies of the race. Prof. John Roach Straton, in the *North American Review*, sets forth this view with much erudition and argumentative skill.¹ As this phase of the question has never had a more learned or effective advocate, it seems well to consider at length the arguments which Professor Straton advances.

In the first place, he contrasts the present criminal status of the race with its moral behavior under the régime of slavery.

Several weighty considerations must have escaped the author while he had this topic under discussion.

Slavery did not improve the moral nature of the negro, but merely compelled outward conformity by physical force. If convicts in prison are well behaved, it is from physical necessity and not from moral choice. Herein lay the chief evil of slavery. It suppressed overt manifestations of wrongdoing, but did not implant the corrective principle. When the physical restraint was removed there was no corresponding moral restraint to take its place. It was inevitable that when let loose this pent-up momentum would expend itself in wild license and excessive indulgence. It is manifestly unfair to compare the behavior of the race under freedom of action and liberty of choice to its conduct when under the control of an alien will.

The parallel increase of crime and intelligence is not peculiar to the negro, but is a common phenomenon of the country at large. "After the war the education of the negro began and rapidly advanced, but side by side with it has gone his increase in crime and immorality in even greater ratio."² If the author had left out the word "began" and substituted "the American people" for "the negro" in this recital, he would have told the whole truth and not merely a disjointed fragment, to the disadvantage of a discredited class.

The negro constitutes the lower stratum of society, where the bulk of crime is always committed. His social degradation is the greatest factor contributive to his high criminal record. If corresponding social classes among the whites could be segregated for the sake of comparison, equally damaging conclusions would doubtless be revealed. The foreign element of our cosmopolitan population shows a much higher criminal average than the native whites, because they represent a lower social stratum, and they have not yet become adjusted to their new environment. Both of these arguments, with intensified force, apply to the case of the negro. The polished granite may look with contempt upon the rough and uncut stone buried beneath the mud and mire, but its lordly eminence is due to the unseemly foundation which it affects to disdain. The amplest proof that the criminal record of the negro race, alarming though it be, is not due to inherent trait is furnished by the fact that the presence of a large number of negroes in any community does not increase its total criminal average. While it is true that 12 per cent of the population commit 30 per cent of the crime, does anyone believe that if this 12 per cent were supplanted by a corresponding class of the white race the criminal quality of the whole population would be improved? According to the Eleventh Census the North Atlantic Division of States, in which the negro element constitutes only a slight sprinkling, had 833 prisoners to every million inhabitants; the South Atlantic Division, where the race is densest, had only 831,

¹ *North American Review*, June, 1900. See also Booker T. Washington's reply to Professor Straton, *North American Review*, August, 1900.

² Professor Straton in *North American Review*, June, 1900.

while the Western section, where the negro is a negligible quantity, had 1,300. The same condition of things is revealed if we limit our study to States and municipalities. In 1890 New York had 1,369 prisoners to the million, California 1,703, Alabama 720. According to the police reports of 1896 the percentage of arrests in Boston was 9.37, whereas in Washington, D. C., one-third of whose population is colored, it was only a slight fraction above 8.¹ If it were asked why, according to the revelation of statistics, the white people of the North Atlantic States were not so well behaved as the mixed population of the South Atlantic Division, or why New York and California have a higher criminal record than Alabama and South Carolina, or why Boston has a greater percentage of arrests than Washington, it would be manifestly unkind to attribute the lower ethical average of the higher tier of States to race degeneracy or to superior education.

Professor Straton urges as unassailable proof of his position the fact that the Northern negro is two or three times as criminal as his more unfortunate brother in the South. He fails, however, to make suitable allowance for the restlessness and recklessness due to unsettled conditions. The Northern negro population is recruited very largely by emigration from the South, many of whom leave their homes for reasons best known to the police. He is apt to mistake liberty for license, and to make the largest possible use of his new-found privilege of apparent social equality, which culminates in the dens of vice and crime. The employment of the Northern negro is unsteady and intermittent, affording a wide latitude of idleness, thus giving the evil one his coveted opportunity for mischief. Again, the Northern negro meets with a wider hostile area than his Southern brother, and is more apt to resent insult from the white race. The prejudice in the North is as narrowing and as harrowing as it is in the South, albeit it may reveal itself under a different mode of manifestation. The disparity between profession and performance in the North is as great a provocative as the repressive treatment of the South.

It is useless to attempt to gainsay the alarming criminality of the negro, so far as this can be tested by statistics. The facts presented by Professor Straton are not disputed, only he fails to credit them to the proper account. It is environment, not race; condition, not color; and education, instead of being a contributing factor, as the author avers, is a partial though not a complete deterrent.

Our philanthropists have expected too much from education, especially when it is applied to the negro. It is folly to suppose that the moral nature of the child is improved because it has been taught to read and write and cast up accounts. Tracing the letters of the alphabet with a pen has no bearing upon the golden rule. The spelling of words by sound and syllable does not lead to the observance of the Ten Commandments. Drill in the multiplication table does not fascinate the learner with the Sermon on the Mount. Rules in grammar, dates in history, sums in arithmetic, and points in geography do not necessarily strengthen the grasp upon moral truth. These things constitute the mere mechanics of knowledge. It is only when the pupil begins to feel its vitalizing power that it begins to react upon the life and to fructify in character. While the criminal tendency of the race, so far as it can be tested by the statistician, shows an alarming tendency to increase, it is notable that the products of those schools with prolonged courses of study and continuous discipline have met every expectation from the standpoint of conduct and demeanor. We do not hear one word of criticism as to the behavior of the graduates of Howard, Fisk, Atlanta, Hampton, Shaw, Wayland, and other institutions of rank.

It is sometimes said that the higher education of the negro will carry him beyond his race and make him dissatisfied with his lot. Discontent is a necessary condition of progress. What American is there who is not trying to improve his lot?

¹ See police reports for Boston and Washington, 1893.

Then, why should the negro be satisfied with his, which is the most miserable of all?

If nature intends one for a fool no amount of education can alter the design. Intellectual sham, vainglorious display, and pompous pretense are, unfortunately, unavoidable. This is the fault of too little rather than too much education. The familiar lines of Pope are pertinent:

A little learning is a dangerous thing;
 Drink deep, or taste not the Pierian spring;
 There shallow draughts intoxicate the brain,
 And drinking largely sobers us again.

There is no danger that education will lift the recipient above the needs of humanity. The missionary work among crude and primitive peoples calls for men of the best minds as well as the highest consecration. Jonathan Edwards, who, perhaps, possessed the most philosophical mind that America has yet produced, spent the last years of his life as preacher among the savage Indians. The schooling which leads away from sympathy with the race is a perversion which experience shows to be quite unusual. Prejudice, relentless and cruel as it is at points, is nevertheless not, perhaps, an unmixed evil. It keeps within the race serviceable elements which otherwise would be lost to it. All such volatile elements are thrown back upon the race by the repellent power of prejudice. The attempt to escape is as suicidal as the conduct of the caged eagle which beats its wings to insensibility against the iron bars of its prison house. Give the negro the higher education and his sense of duty and love of humanity will make it effective for the good of his race; or, this failing, a meaner motive necessitated by prejudice will make it available also.

It is assumed that the negroes are leaving the farm and the shop and are rushing in disproportionate numbers to the college and the university. This race is affected with great material and intellectual poverty. After abstracting all who are able to think there will be left sufficient to toil.

The following table taken from the Reports of the Bureau of Education ought to forever silence this assertion:

Number of pupils in secondary and higher institutions in the United States.

1.	2.	3.	4.	5.	6.
Year.	Population.	Number of secondary and higher students.	Same per million of population.	Number of pupils in secondary and elementary public schools.	Percentage of column 3 on column 5.
1879-80.....	50,155,783	218,809	4,362	9,867,505	2.22
1889-90.....	62,622,250	437,303	6,982	12,721,581	3.44
1897-98.....	¹ 72,800,000	752,776	10,342	15,038,636	5.01

THE COLORED RACE.

1879-80.....	6,106,695	7,874	1,289	² 784,709	1.00
1889-90.....	6,954,840	14,338	2,061	1,296,959	1.11
1897-98.....	¹ 7,923,000	17,446	³ 2,202	1,506,742	1.16

¹ Estimated.

² Former slave States.

³ 2,517 in 1899-1900.

Mr. A. F. Hilyer, in commenting upon these figures, says:

This table shows that the proportionate number of secondary and higher students to the whole number of children attending school in the United States as a whole had increased from 2.22 per cent in 1879 to 5.01 per cent in 1897, nearly two and one-half times, while the proportion of colored in secondary schools and colleges

had increased very little, indeed, from 1 per cent to only 1.16 per cent, and that now, at the height of all this outcry against any further aid, public or private, for the higher education of colored youth, there is only one-fifth as many colored students in secondary and higher institutions as the average for the United States as a whole. But the story is not yet half told. According to the Report of the Commissioner of Education, 1897-98, volume 2, page 2097, the total number of students taking the higher education in the United States as a whole was 144,477, being 1,980 to each million of the total population. The same Report, page 2480, gives the total number of students pursuing collegiate courses in these much-discussed colleges as 2,492. This is only 310 to the million of colored population; whereas the whole of the United States, as shown above, had 1,980 to the million, nearly six and one-half times as many in proportion to population.

This does not look as though the whole of the colored race is rapidly stampeding to the higher education, or that the labor supply in the Southern States is falling off from this cause. This is an age of higher education for the masses. The increase in the number of students taking the secondary and higher education in the United States during the last ten years has been phenomenal—unprecedented. Is the person of color so much superior to the white that he does not need so much educational training? I think not. In view of the history and present condition of this race the obvious necessity for a large number of educated and trained teachers, ministers, physicians, lawyers, and pharmacists; and in view of the statistical fact that this race has only one-fifth of its quota pursuing studies above the elementary grades, what fair mind will not say there is great need of more of the secondary and higher education for the colored youth instead of less of it?

According to the Report above cited, there are 161 academies and colleges for colored youth in the United States. The total number enrolled was 42,328, of whom 2,492¹ were reported in collegiate grades, 13,669 in secondary grades, and 26,167 in elementary grades. Even in these colored colleges less than 6 per cent of their students are pursuing collegiate courses, and perhaps not more than 2 per cent are pursuing a college course equal to that offered at Howard. Nearly two-thirds of the total enrollment in these colored colleges are receiving elementary instruction in "readin', ritin', and 'rifmetic." Classified by courses of study, 1,711—217 in a million—were taking the classical course; 1,200—150 in a million—the scientific; 4,440—555 to the million—the normal course, preparing for teaching; 1,285—160 in a million—professional courses; 9,724 English, and 244 the business course. In each of these courses the colored race has only about one-fifth or one-sixth of its quota. Is there anything in these figures to alarm the nation?

About one-third of the total number of students in these 161 colored schools and colleges are taking industrial training.² There is surely no need of further proof or assertion on this score.

Again, we hear that higher education for the negro does not solve the race problem. It was a shallow philosophy that predicted this result in the first place. The race problem divides itself into two leading divisions: First, the development of a backward race, and, second, the adjustment of two races with widely divergent ethnic characteristics.

These two factors are in many respects antagonistic to each other. The more backward and undeveloped the negro, the easier is the process of adjustment to the white lord and master, but when you give him Greek and Latin and metaphysics he begins to feel his manhood stirring within him and frictional problems inevitably arise. The good old negro servant, ever loyal and true, is esteemed and honored, but his more ambitious son with a Harvard diploma in his knapsack is persona non grata. Under slavery the adjustment between the races was complete, but the bond was quickly burst asunder when the negro was made a free man and clothed with full civil and political privilege. It would be rather a hazardous statement to affirm that education will solve social and ethnic problems. The development of humanity would be a simple task indeed if a few years schooling could facilitate the adjustment between the European and Asiatic, African and Aryan. The adjustment of peoples, races, and social systems lies in the sphere of statesmanship, philanthropy, and religion.

¹ The investigations of Professor Du Bois show that there can not be more than 1,000 negro students of collegiate grade, according to the average American standard.

² Popular Science Monthly, August, 1900.

The function of education is to develop the faculties of the individual in order to fit him for the life of that society of which he forms a part. The function of the education of the negro is to develop in the individual and in the race the requisite degree of personal and social efficiency. And if it does not eradicate deep-seated prejudices and batter down race and ethnic barriers, it is because the wrong remedy has been applied to the disease. Wise men do not expect to gather grapes of thorns or figs of thistles.

IV.—THE RELATIVE CLAIMS OF INDUSTRIAL AND HIGHER EDUCATION.

Whenever the higher education of colored youth is advocated somebody is sure to suggest industrial training as a counterirritant. The higher and industrial phases of education are not mutually exclusive, and neither can properly be played off against the other. They are both essential to the symmetrical development of any people. Both factors are equally essential to the common product. The one-sided advocates of a particular kind of education for all colored youth remind us of the disputants in rural debating societies who decide, once for all, the momentous question: "Which is the more indispensable element of civilization, fire or water?" The fact is, civilization could not exist without either of these elements, neither can the negro race reach the full measure of development without receiving both kinds of education. It is deemed timely, however, to point out and compare the relative advantages to the negro derivable from industrial training and the higher education, and especially so since the trades school is being prescribed as a panacea for all the ills of the situation, while literary culture is being decried and disparaged. As there are several parties to this contention, it may be well to analyze the motives that give rise to the prevailing preference for industrialism.

1. The vast majority of white people in this country believe that the ordained mission of the negro is to do manual labor—to perform personal and domestic service. This belief is vaguely founded upon a scriptural reference: "Cursed be Canaan; a servant of servants shall he be unto his brethren." The old method of textual interpretation has been superseded by Biblical research and rational criticism. The traditional classification of the human family has been abandoned by most authors of scholarly repute. The Hametic origin of the negro race is accepted by few modern archæologists, yet the agreeable belief in the ordained servility of the negro still lingers. It was on the basis of this belief that the African was first enslaved. Las Casas, the philanthropic priest, first suggested the enslavement of the African as a means of merciful relief to the poor Indian, who sickened and died in the house of bondage. The negro was brought across the sea to be made a hewer of wood and a carrier of water. Human slavery had a benevolent origin. It was regarded more philanthropic to enslave captives in war than to slay them. But there was not a bit of philanthropy in the establishment of African slavery. It was a business measure pure and simple. The only part of the negro deemed to be valuable was his hands. No account was taken of his mind, his soul, or his all-baffling brain. For well-nigh three hundred years he fulfilled the purpose of his enslavers. Although the civil war overthrew the system of slavery it did not materially alter the minds of the white people as to the negro's place in the social scale. He is still looked upon as a servant whose mission is to minister to the wants of others. Among men of this way of thinking it is easy to gain popularity by advocating industrial training for negroes—any policy that has work for its main object is heartily approved, but the higher education is held up to ridicule and scorn.

2. The second class to this controversy may be called the philanthropists, or those who have a special friendly interest in the colored race. It is this class that has already done so much to rescue the perishing and to lift up the fallen. They

have sent millions of dollars into the South to educate and enlighten the blacks, and have hitherto constituted the leading factor in the upbuilding of the race. It is easy to discern that their sentiment also, during the last few years, is shading toward industrial training, to the disparagement of higher culture. This is easily intelligible. Charity should be applied where it is most needed and where it will reach the largest possible number of the helpless. Its aim is to help those who are lowest in the scale of want and distress. Benevolent people are easily and willingly persuaded that assistance rendered an industrial institution will be more widespread in its application than if given to a college. Colored universities have almost without exception added on industrial courses, largely for the sake of gaining the favor of Northern philanthropists. The literary education of colored youth is so far discredited in the public mind that institutions of higher learning have to attach industrial courses in order to gain financial favor and support. This is practical wisdom, if not pedagogical prudence. Experience bears out the opinion that trades schools and colleges should be maintained as separate and distinct institutions, unless reasons of financial policy suggest otherwise. Blending of the two reminds us of Horace's ridiculous picture with the head of a beautiful woman and the tail of a horrid fish. But, as suggested above, the drift of benevolent sentiment is easily explainable. Charity aims to help the beneficiary to go so far and no farther. We do not aim by charity to lift others into complete equality with ourselves. It is not human nature to assist those whom we deem our inferiors to reach our own plane. The unwritten law of human charity demands that we relieve acute distress when it is easily within our power to do so, but our civilization is not yet sufficiently altruistic to require us to take the unfortunate creatures thus relieved on terms of equality with ourselves. We give a crust to the starving poor. Even Lazarus in the parable fed of the crumbs that fell from the rich man's table. But we do not invite them to attend the banquet which we spread for our friends. Let us marvel not, then, that benevolent friends are ready to assist the negro to a knowledge of letters and the use of tools, but are totally indifferent as to whether or not he studies Greek philology, or the differential calculus. They do not feel any obligation to sustain the beneficiary in those pursuits of truth and beauty which themselves and their children enjoy. A donation to Harvard or Yale can hardly be called charity; it is simply giving on one's own level, to perpetuate one's own name or to advance some favorite idea. But colored schools need not expect gifts of this character from white men; in all such benefactions eleemosynary intent is plainly apparent. Industrial education of the colored race will doubtless continue to be considered of more importance than literary culture by Northern philanthropists, and will continue to receive the bulk of their benefactions.

3. The negro himself is the most interested party to this contention. He bears the same relation to the race problem that a beast does to the burden which has been placed upon its back. How does he think that the youth of the race should be educated? The time has come when the race should do its own original thinking on such vital questions, and not regulate its conduct according to the opinion of white men. However kindly the intentions of the Anglo-Saxon may be, still it seems impossible for him to view the situation under the negro's angle of vision. The sentiment of the white race is well-nigh unanimous that the colored race should confine its energies chiefly to manual and industrial pursuits, and they will make it so in so far as they can control the situation. But the negro can not accept the estimate which the white race places upon him, and consequently must in a large measure reject the treatment prescribed. The sentiment of every self-respecting negro, when clothed in his right mind, must be: "I am a man, and all things which are human appertain to me, although circumstances and environments may hamper me for a season, I will suffer it to be so now, but will relinquish none of the ultimate claims of my species."

There are two leading aims of education: (1) To develop the faculties and powers of the mind, the accomplishment of which is a uniform and invariable process, the same for all minds under all conditions of outward life; and (2) to prepare the individual for the special work which he has to perform; this preparation varies according to environment, opportunity, or the ambition and aptitude of the learner. In any well-regulated community the inhabitants will be distributed among the various industries, trades, and professions according to the needs and opportunities of the community and the capacity, aptitude, and natural bent of individuals. The negro race in this land occupies a peculiar and unique position. The vast majority of them follow agricultural pursuits, domestic service, and other forms of crude, unskilled labor. The number outside of these lines is so small that it would hardly form a homeopathic fraction of the population. They are also the creatures, or rather the victims, of circumstances over which they have no control. In this discussion, then, we are shut up to special circumstances rather than general principles. The unwisdom of an exclusive industrial and mechanical education of the colored race will appear from the following considerations:

1. It would be almost useless to equip a considerable number of colored men with the mechanical trades, for they could find no opportunity to ply them. This is an age of great combinations; both capital and labor are organized and solidified. What the trusts are to capital the trades unions are to labor. Neither the small dealer nor the individual workman can compete with these gigantic monopolies. This is an age in which "the individual withers and the trust is more and more." These trades unions will not admit the negro, in large numbers, on equal terms, and he is absolutely powerless to combat them. They will not combine with him, and he can not compete with them. If any one industrial fact in our history is clearly demonstrated it is that white labor will not compete with black labor. The poor whites of the South, rather than compete with negro labor, betook themselves to the woods, and lived in the mountains and pine thickets in idleness and poverty, constituting that thriftless element known far and wide as "poor white trash." The complaint goes up from all sections of the country that white men are driving negroes out of employments which were hitherto considered peculiarly theirs. It is not because the negro is not a competent and efficient workman in these lines that he is thus supplanted, but it is simply a case of the stronger element driving the weaker to the wall. The Asiatics were excluded from the western coast because they manifested too much skill, thrift, and economy. They were shut out on the plea that competition with them would lower the American white laborer to the level of Mongolian life. The same argument could and would be advanced against the negro. As a further evidence that it is not a lack of skill which renders the negro unable to hold his own in the labor world, he is being crowded out of occupations where no complaint has ever been uttered against his efficiency, and where his supplanters are not more apt or competent than the black competitors. It is a notorious fact that in all the large centers of population positions of waiters, coachmen, and barbers are being filled by white men to the exclusion of his brother in black, or rather, his brother in colors. The competency of the colored waiter has never been questioned. White men do not make more courteous, safe, and reliable coachmen. The whole world acknowledges that the negro is an expert with the razor. The labor wars between the races precipitated in the mines of Tennessee and Alabama and along the levees of New Orleans were not inaugurated because of the inefficiency of colored labor, but because white men wanted the places. It is the policy of most Southern railroads to employ negro firemen, but with the express understanding that they shall never be promoted to positions of engineers. No incapacity is alleged; but white labor zealously guards all such employments against black encroachment.

There was a time when the mechanical work of the South was performed by colored men; but the Northern laborer has gone there and carried his trades unions and his exclusive policy, and the result is the negro is being relegated to the rear. The industrial war has been carried into Africa. It requires no gift of prophecy to predict that in the near future negro mechanics will be as rare in Richmond and Atlanta as they are in Boston and Philadelphia. All will agree that under the present circumstances the negro can not compete with the Anglo-Saxon for political domination; he is equally incapable of sustaining the contest for industrial supremacy. The stronghold of the race hitherto has been its ability to do crude, unskilled work, along lines where white men did not care to compete; to work with the body under a tropical sun where the white man pants for rest and shade. But it has not been able to stand the onward march of skilled labor and machinery. It was announced some time ago that a machine had been invented for picking cotton. An influential Southern journal announced with triumph that the introduction of this invention would settle the race problem for all time. The picture is indeed a dark one. The situation calls for the highest wisdom on the part of negro leaders and the friends of the race. But it is more than foolish to shut our eyes to the facts before us. It is absolute folly to advise remedies which reason tells us in advance can not be effective.

The chief value of the mechanical and industrial schools in the South is that they inculcate in the minds of the crude agricultural population notions of thrift, economy, and decency, and not because they teach the mechanical and scientific trades. Hampton, Tuskegee, and Claflin are among the most useful institutions in America, because their graduates go to and fro throughout the South and carry with them their newly acquired notions of character and life, and disseminate them among the people. They are for the most part engaged in teaching school. I venture the assertion that not one such graduate in ten finds an opportunity to ply the trade which he learned in school. The literary and moral features of their courses are after all of the greatest value. Prof. Booker T. Washington is the most remarkable product of this class of schools. No colored man of his generation has rendered a moiety of the service which he has done in a visible, tangible shape. He is justly accounted one of the great men of America. But the chief element of his success has been his mind, heart, and character, and his unselfish devotion to the welfare of his race. No mere artisan or mechanic could do the work which Professor Washington has done; no, nor 10,000 of them rolled into one. Professor Washington is endowed by nature with splendid mental and moral gifts which he has developed by wide observation and study. He possesses the sagacity to see the needs suggested by special circumstances, and the constructive ingenuity to devise ways of meeting those needs.

2. A supply of labor, skilled or unskilled, can never create a demand for it; but where there is a demand the supply is always forthcoming. Where is the demand for colored mechanics? It certainly is not in the North; it is not in the large cities North or South. There is no considerable demand for colored mechanics in Boston, Philadelphia, Baltimore, or Washington, and I fear not in Richmond, Atlanta, or New Orleans. When there was a demand for such workmen they were always to be found. If there were 5,000 such artisans in Washington City, as skilled as the master workman whom King Hiram sent to Solomon to build the Temple at Jerusalem, they would starve to death under the shadow of the national Capitol for the want of employment. The trades schools may turn out these workmen, but they can not create a demand for them. It is not wise to have in a community a number of men with trades but with no opportunity of plying them; they usually have not the aptitude or willingness to turn to any work except their particular trade, and the last state of the community will be worse than the first. It is often urged as an argument against the negro's higher education that after he has filled

his mind with knowledge he can not find a field in which to use it; but can not this objection be urged, and that, too, with a greater show of probability, against too much industrial training? A trained mind is likely to be more fertile in expedients than a mere "hand;" if it does not find a way it will make one. The one will do with his might what his hands find to do; the other will find with his mind what his hands might do.

3. The educational impulse proceeds from above downward. "Mens agitat molem." I am not arguing, be it borne in mind, against industrial education in its proper place, and under those favorable circumstances where it can be wisely applied; but against the general policy of shutting up the negro to a particular kind of training. It is sometimes objected that the negro race began on top. The top is the natural birthplace of progress. Does Jewish history boast of greater names than Abraham and Moses, the one the founder of the race and the other of the nation? Does not every good and perfect gift come from above? The philosophy of evolution has clearly established a close analogy between the development of organic life and the growth of human society. Even biological progress, it is claimed, is from above downward. Some individual by accident acquires some valuable acquisition to the life of the race, and by a slow process it infiltrates into the life of the species and finally lifts it up to the level of the lucky individual. History reveals the fact that the same law governs the growth of races, states, empire, and republics. It seems as if Providence raises up in the outset some commanding genius so that the common people may have some model to work to. Then why should the negro race not strive to imitate worthy models and lofty ideals? Stimulus can not come from the workbench, the furrow, and the dull routine of daily toil, but must be handed down from "the radiant summit." True, great lights have arisen from lowly occupations, but it was because their avocations could not contain them; they burst their bands asunder and swiftly leaped beyond them. In a certain industrial school which is deservedly famous throughout the country a majority of the instructors in influential positions are college-bred men and women. This is only natural; the educated mind will direct its energies where the need is greatest. All true progress grows out of applying the thought within to the thing without; but the thought is the primary agency, and the outward thing only the object operated upon.

4. The negro is a man and is entitled to all of the privileges of manhood. Why should his education be circumscribed and limited? Why should the larger elements of his nature be left un nurtured, while the mechanical side only is developed? Life is more than meat. As important as the material element is in our civilization, there is danger of pushing it too far. The highest possessions of man do not consist in material wealth. A slaveholder was once asked what was his object in farming. He replied, "I raise corn to raise hogs; I raise hogs to raise niggers; I raise niggers to raise corn." Thus the gross material circle begins and ends in itself. The great evils which confront the negro race are rather of a moral than of a material nature. Truth and justice do not hinge upon industrialism and trade, but are abstract, eternal verities. The negro cries for justice and is offered a trade; he pleads for righteous laws, and is given an industrial school. The case is wrongly diagnosed; the remedy does not apply to the disease. It is sometimes urged upon the negro to get money as the surest means of solving the race problem. Those who argue thus show themselves ignorant of the law of moral reforms. In all the history of the human race, the possession of money has never corrected an evil or righted a wrong. But, on the other hand, it lies at the bottom of most of the ills which our nature is heir to. The greed for gold is the fundamental cause of the negro's misfortune in this land. Will this same love for gold when transferred from the white man to his victim remedy the evil? The accumulation of

evils do not usually counteract, but aggravate each other. The love of money is the root, not the remedy, of all evil. God's truth will not be altered in order to suit the convenience of the negro.

That the negro can have no great industrial future in the large cities, especially where the climatic conditions are such that white men are willing and able to work, has been clearly seen by students of social problems for many years. There are sufficient white men in such communities to perform the skilled mechanical work, and as they belong to the preferred class they will always receive first consideration. They will not combine with the negro, nor are they willing to compete with him on terms of equality. This intolerant policy relegates the negro to those classes of work which white men do not particularly care for.

The negro is excluded not so much because he is black but because he is weak. The same exclusive policy is exercised toward all feeble classes, because there is not enough of the higher lines of work for all of the contestants. The negro is being driven out of his erstwhile industrial strongholds. The colored coachman, barber, waiter, and private domestic is a vanishing quantity in all of the large cities. The white workmen have filled up the ranks of their accustomed vocations and are pushing over the boundaries into the territory occupied by their weaker neighbors. This industrial contest, or rather conquest, is exactly analogous to what is taking place in the political world. As fast as the stronger and more powerful nations have populated their own countries up to the limit of comfortable subsistence, they push over the boundaries into the possessions of the weak, helpless, and feeble races. In sociology, as in physics, when a stronger body comes in contact with a weaker one, the motion of the weaker is reversed and that of the stronger proceeds in the same direction as before, though with a lesser velocity.

It is true that industrial discrimination lies at the base of much of the negro's social degradation. We may say that it is unjust, un-Christian, and unreasonable, but still the fact persists; nor is its force or sanction one whit diminished by the bitter denunciation. The industrial rivalry is fierce and brutal. Kindness is not characteristic of sharp competition. It is an old maxim that business and philanthropy are dissociable. Each competitor is bound to use every advantage at his disposal. To suppose that the white man is going to voluntarily surrender the advantage which his color confers, in order to admit the negro into industrial rivalry on equal footing with himself, is to expect too much of weak human nature. Mankind is not yet sufficiently sanctified for such sublime acts of self-surrender.

Of late we can hear nothing but the hue and cry about the industrial education of the colored race, and, indeed, great good may reasonably be expected to come from this worthy movement. A training in system, order, and method, and a knowledge of how to do things with skill, accuracy, and science will be of incalculable advantage to the possessor in whatever station of life he may be. But who believes that the industrial disadvantages of the negro, in the large cities at least, can be overcome or even materially altered by industrial education? To equip a considerable number of colored boys in Philadelphia, Baltimore, or Washington with the mechanical trades would be simply to furnish them with edged tools without anything to cut.

That form of industrial training which alone offers any considerable relief lies in the field of agriculture and the domestic industries. It is encouraging to note that thoughtful colored people are giving this matter serious attention. The resolution touching this topic, adopted by the Second Hampton Negro Conference,¹ is significant:

¹ Report of Second Hampton Negro Conference.

We call upon our teachers and preachers in the country districts to advise the people to develop the agricultural and industrial resources of their respective communities, and not to be deceived by the glare and glitter of city life. The flocking of the agricultural masses to the cities constitutes one of the great social evils of the period. This evil is especially emphasized in the case of the negro immigrants. They do not form a part of the industrial current and are apt to drift into the alleys and dens of squalor and vice, and their last state becomes worse than their first. On the contrary, every effort should be put forth to induce those who are now in the alleys and byways of the city to seek the country. No one should be encouraged to migrate from the country to the city unless he or she has some definite employment or plan of work previously determined upon.

The negro must dig his civilization out of the ground, as all other races have done. In the country the competition is not so sharp and color forms no barrier. The rain falls and the sun shines on white and black alike. The earth will yield for him just as much as his skill and industry can persuade her to bring forth. Corn and cotton are supremely indifferent to the color of the planter. The markets ask only the quality of the produce and not the color of the producer. He who succeeds in inducing the negroes to work out their industrial salvation in the fertile soil of the South and under conditions with which they are familiar, rather than to rush to the large centers of population, where they have no industrial status, and whose evils they know not of, may truly be denominated their guide, philosopher, and friend. But in every instance it will be found that the wisdom which comes from the higher culture is alone profitable to direct.

V.—THE HIGHER EDUCATION OF COLORED WOMEN.

If the higher education of the colored man seems or seemed ridiculous in the eyes of the wise and prudent, that of the colored woman must appear too absurd for a moment's consideration. The function of the higher culture for the female element of a backward race still waits to be clearly set forth.

The cause of woman in general bears many analogies to that of the negro. They are both characterized by weakness and have had to fight every inch of their way to their present degree of opportunity. All of the arguments which are now being urged against the education of the negro were at one time put forth against the enlightenment of woman. The general attitude on this question at the beginning of the nineteenth century is well expressed in the following citation:

In the very first year of our century, the year 1801, there appeared in Paris a book by Sylvain Maréchal entitled "Shall Woman Learn the Alphabet?" The book proposes a law prohibiting the alphabet to women, and quotes authorities, weighty and various, to prove that the woman who knows the alphabet has already lost part of her womanliness. The author declares that woman can use the alphabet only as Molière predicted they would, in spelling out the verb "amo;" that they have no occasion to peruse Ovid's *Ars Amoris*, since that is already the ground and limit of their intuitive furnishing; that Madame Guyon would have been far more adorable had she remained a beautiful ignoramus, as nature made her: that Ruth, Naomi, the Spartan woman, the Amazons, Penelope, Andromache, Lucretia, Joan of Arc, Petrarch's Laura, and the daughters of Charlemagne could not spell their names; while Sappho, Aspasia, Madame de Maintenon, and Madame de Staël could read altogether too well for their good; finally, that if women were once permitted to read Sophocles and work with logarithms or to nibble at any side of the apple of knowledge there would be an end forever to their sewing on buttons and embroidering slippers.¹

This sounds very much like the objections that used to be put forth, and, indeed, in some quarters are still putting forth, against the higher education of the negro.

There has been a radical change of sentiment on this question during the progress of the nineteenth century. Indeed, this century did more than all the list of preceding years to emancipate the weak and lowly and to place them on equal

¹ A Voice from the South, by Mrs. Anna J. Cooper, pp. 48-49.

footing with the rich in the rivalry of life. Educational facilities have been furnished for women on a scale and schedule approximating those provided for men. In this matter, as in all other phases of human emancipation and broadening of the bounds of opportunity, the United States has taken the leading part and played the most conspicuous rôle. All of this, however, has had reference mainly to the gentler sex of the favored race. But while the showers of blessings were scattering so freely, some of the surplus droppings have fallen even upon the weaker sex of the weaker race. The negro woman represents the most unfortunate class of American womanhood. The mere contemplation of her condition fills the soul with infinite pity. No negro can think of the unfortunate status of the womanhood of his race without feeling the force of the wailful plaint of the prophet of old: "Oh, that my head were waters, and mine eyes a fountain of tears, that I might weep day and night for the slain of the daughter of my people."¹ The sins and weaknesses of both races were and are visited upon her. No one has described the condition out of which negro womanhood sprung with more clearness and accuracy than the late Dr. Alexander Crummell:

In her girlhood all the delicate tenderness of her sex has been rudely outraged. In the field, in the rude cabin, in the press room, in the factory, she was thrown into companionship of coarse and ignorant men. No chance was given her for delicate reserve or tender modesty. From her childhood she was the doomed victim of the grossest passions. All the virtues of her sex were utterly ignored. If the instinct of chastity asserted itself, then she had to fight like a tigress for the ownership and possession of her own person, and oftentimes had to suffer pains and lacerations for her virtuous self-assertion. When she reached maturity all the tender instincts of her womanhood were ruthlessly violated.²

Her home life was of the most degrading nature. She lived in the rudest huts, and partook of the coarsest food, and dressed in the scantiest garb, and slept in multitudinous cabins upon the hardest boards.³

Gross barbarism, which tended to blunt the tender sensibilities, to obliterate feminine delicacy and womanly shame, came down as her heritage from generation to generation; and it seems a miracle of providence and grace that notwithstanding these terrible circumstances so much struggling virtue lingered amid these rude cabins; that so much womanly worth and sweetness abided in their bosoms.⁴

On first view one would say that bringing the facilities for the higher culture within the reach of such a condition is like casting pearls before swine. But it has been abundantly demonstrated that the influence of culture is able to reach and to relieve, even unto the uttermost limit of degradation. The world has probably never witnessed a more heroic struggle than these women, hampered, as it were, with a millstone chained about their necks, have made and are making for virtue, knowledge, and light.

Mrs. Mary Church Terrell, ex-president of the National Association of Colored Women, who is herself a college-bred woman, and whose life adds emphasis and exemplification to her words, says:

Nothing, in short, that could degrade or brutalize the womanhood of the race was lacking in that system from which colored women then had little hope of escape. So gloomy were their prospects, so fatal the laws, so pernicious the customs, only fifty years ago. But from the day their fetters were broken and their minds released from the darkness of ignorance to which for more than two hundred years they had been doomed, from the day they could stand erect in the dignity of womanhood, no longer bond, but free, till now, colored women have forged steadily ahead in the acquisition of knowledge and in the cultivation of those virtues which make for good. To use a thought of the illustrious Frederick Douglass, if judged by the depths from which they have come rather than by the heights to which those blessed with centuries of opportunities have attained, colored women need not hang their heads in shame. Consider, if you will, the almost insur-

³Ibid., p. 65.

⁴Ibid., p. 66.

mountable obstacles which have confronted colored women in their efforts to educate and cultivate themselves since their emancipation, and I dare assert, not boastfully, but with pardonable pride, I hope, that the progress they have made and the work they have accomplished will bear a favorable comparison at least with that of their more fortunate sisters, from whom the opportunity of acquiring knowledge and the means of self-culture have never been entirely withheld; for not only are colored women with ambition and aspiration handicapped on account of their sex, but they are everywhere baffled and mocked on account of their race. Desperately and continuously they are forced to fight that opposition, born of a cruel, unreasonable prejudice which neither their merit nor their necessity seems able to subdue. Not only because they are women, but because they are colored women, are discouragement and disappointment meeting them at every turn. Avocations opened and opportunities offered to their more-favored sisters have been and are closed and barred against them. While those of the dominant race have a variety of trades and pursuits from which they may choose, the woman through whose veins one drop of African blood is known to flow is limited to a pitiful few. So overcrowded are the avocations in which colored women may engage and so poor is the pay, in consequence, that only the barest livelihood can be eked out by the rank and file. And yet, in spite of the opposition encountered and the obstacles opposed to their acquisition of knowledge and their accumulation of property, the progress made by colored women along these lines has never been surpassed by that of any people in the history of the world. Though the slaves were liberated less than forty years ago, penniless and ignorant, with neither shelter nor food, so great was their thirst for knowledge and so herculean were their efforts to secure it, that there are to-day hundreds of negroes, many of them women, who are graduates, some of them having taken degrees from the best institutions of the land. From Oberlin, that friend of the oppressed, whose name will always be loved and whose praise will ever be sung as the first college in the country which was just, broad, and benevolent enough to open its doors to negroes and to women on an equal footing with men; from Wellesley and Vassar, from Cornell and Ann Arbor, from the best high schools throughout the North, East, and West, colored girls have been graduated with honors, and have thus forever settled the question of their capacity and worth. But a few years ago in an examination in which a large number of young women and men competed for a scholarship, entitling the successful competitor to an entire course through the Chicago University, the only colored girl among them stood first and captured this great prize. And so wherever colored girls have studied their instructors bear testimony to their intelligence, diligence, and success.

With this increase of wisdom there has sprung up in the hearts of colored women an ardent desire to do good in the world. No sooner had the favored few availed themselves of such advantages as they could secure than they hastened to dispense these blessings to the less fortunate of their race. With tireless energy and eager zeal colored women have, since their emancipation, been continuously prosecuting the work of educating and elevating their race, as though upon themselves alone devolved the accomplishment of this great task. Of the teachers engaged in instructing colored youth it is perhaps no exaggeration to say that fully 90 per cent are women.¹ In the backwoods, remote from the civilization and comforts of the city and town, on the plantations, reeking with ignorance and vice, our colored women may be found battling with evils which such conditions always entail. Many a heroine, of whom the world will never hear, has thus sacrificed her life to her race, amid surroundings and in the face of privations which only martyrs can tolerate and bear. Shirking responsibility has never been a fault with which colored women might be truthfully charged. Indefatigably and conscientiously in public work of all kinds they engage that they may benefit and elevate their race. The result of this labor has been prodigious indeed. By banding themselves together in the interest of education and morality, by adopting the most practical and useful means to this end, colored women have in thirty short years become a great power for good.²

The home life of a people lies at the basis of its progress, and by the intendment of nature and the decree of society woman is regnant in the domestic sphere. Let it be frankly conceded that the education of the colored woman should be mainly of an industrial and domestic character. The higher education has a much narrower function in general for woman than it has for man. In its application to the colored race its function is proportionately restricted for the two sexes. If

¹ This estimate is too high.

² Progress of Colored Women, pp. 7-9.

the demand for college-bred men is small in proportion to the population, that for colored women is indefinitely more so.

The programme laid down by Dr. Crummell for the education of the colored woman of the South has never been, and perhaps can not be, improved upon:¹

1. Boarding schools for industrial training.
2. Intellectual training in the rudimentary branches.
3. Domestic industries.
4. The cultivation of flowers, fruits, and vegetables.

But there is ample scope for the few ambitious and determined spirits in the higher reaches of intellectual pursuits. School-teaching is very largely in the hands of colored women, and it is necessary for those who would occupy commanding places in the educational arena to equip themselves thoroughly for such exalted stations. There are other fields calling for higher preparation on the part of colored women. Not a few such women have entered the arena as authors, lecturers, and as practitioners in the learned professions. The distinctive schools for colored girls which have done and are doing so much to elevate negro womanhood are Scotia Seminary, in North Carolina; Spellman Academy, in Atlanta, Ga., and Hawthorn College, in Richmond, Va. These schools do little more than cover the scope as laid down in Dr. Crummell's programme, although they make excursions into the field of secondary studies.

Most of the institutions for the education of the colored race admit women on equal terms with men. Females are to be found in all of the courses, although they do not so generally patronize the higher reaches of the curricula.

The number of graduates from the collegiate courses can be seen from the accompanying table:

Colored women college graduates to 1898.

¹ Africa and America, p. 80.

² Du Bois: College-bred Negro, p. 55.

There have been 82 colored women to graduate from Northern and 170 from Southern colleges. Of the colored colleges, only two institutions, both of which are under control of the Presbyterian Church, do not admit girls.

In the year 1898-99, of the college students of Howard, Atlanta, Fisk, and Shaw 22 per cent were females. The proportion shows a decided tendency to increase.¹

Of 100 college-bred women reporting their conjugal condition, one-half had been married. It is interesting to note the tendency of college-bred women to marry and develop cultivated homes. The great need of the negro is to develop a higher tone of family life. The highest culture of negro women will not have been in vain if it is exploited in the domestic sphere. There have been 2,272 college-bred negro men and 252 negro women, making a total of 2,524, of whom the females constitute 10 per cent. These college-bred women are or have been for the most part engaged in the work of teaching. Their influence for good has been felt in scores of communities throughout the country. Many of them have become wives of influential colored men, and have thus merged their talent and influence with the work of their helpmates and the development of cultivated family life.

Mention might be made of a few college-bred women who may be regarded as typical, albeit perhaps a little more conspicuous than the general average of their class.

Mrs. Fannie Jackson Coppin:² Fannie M. Jackson was born a slave in Washington, D. C., in 1837, and was purchased by her aunt. She was sent to Oberlin College, where she was graduated with honor.

She has the distinction of being the first colored person to teach a class at Oberlin College, which she taught with good success for two years. In 1865 she took a position in the Institute for Colored Youth, Philadelphia, and in 1869 was made principal of that institution, which position she has held for thirty years. She is the wife of Bishop Levi J. Coppin, of the African Methodist Episcopal Church. Perhaps no single individual influence among the colored race has done so much to stimulate high aspirations and zeal for knowledge and service as Fannie Jackson Coppin.

"Without doubt she is the most thoroughly competent and successful of the colored women teachers of her time, and her example of race pride, industry, enthusiasm, and nobility of character will remain the inheritance and inspiration of the pupils of the school she helped to make the pride of the colored people of Pennsylvania."³

Miss Lucy E. Laney is a graduate of Atlanta University. She has, mainly by her own endeavor, built up the Haines Institute, of Augusta, Ga., of which she is principal. This institution is under the auspices of the Presbyterian Church, and is one of the best secondary schools in the South.

Mrs. Booker T. Washington, wife of Prof. Booker T. Washington, principal of Tuskegee Institute, Tuskegee, Ala., was graduated from Fisk University in the class of 1889. She was a teacher at Tuskegee, where she met and married Professor Washington. She is a coworker with her distinguished husband and has been very successful in improving the social life of the black people in the black belt of Alabama. She is vice-president of the National Association of Colored Women.

Mrs. Anna J. Cooper was born in Raleigh, N. C. Mrs. Cooper entered Oberlin College in 1881, after the death of her husband, Rev. G. A. C. Cooper, a talented

¹ College-bred Negro, p. 57.

² The interesting work, *Women of Distinction*, by L. A. Scruggs, A. M., M. D., published at Raleigh, N. C., 1893, contains an account of a long list of notable colored women. Much of the information presented is from this book, although it has been confirmed by other sources of information and brought nearer to date.

³ Williams's *History of the Negro Race*, Vol. II, p. 449.

Episcopal divine. She was graduated from Oberlin in 1884 and has taught at Wilberforce University, Wilberforce, Ohio, St. Augustine Normal School, Raleigh, N. C., and the Colored High School, Washington, D. C., of which she is at present the principal. Her book, *A Voice from the South*, has elicited flattering encomiums from competent critics and forms a valuable part of the literature of the race problem.

Mrs. Mary Church Terrell was born in Memphis, Tenn., and was graduated from Oberlin College in 1884. She has taught at Wilberforce University and the Washington High School; has served as trustee of the public schools of Washington, D. C., and was the first president of the National Association of Colored Women. Mrs. Terrell is listed among the regular lecturers before the Western Summer Chautauquas, where her addresses are always well received.

Mrs. Josephine Turpin Washington was born in Richmond, Va., and was graduated from Howard University in 1886. She taught for several years in her alma mater before she was married to Dr. S. S. H. Washington, of Alabama. She has written quite widely in Southern and Northern papers and magazines and is well known as a worker for the general social betterment of the people.

College-bred women are everywhere doing their full share to lift the social life of the race to a higher level, which is ample justification of the training they have received.

The strivings and triumphs of colored women are well expressed in the following citation:

And so, lifting as we climb, onward and upward we go, struggling and striving and hoping that the buds and blossoms of our desires will burst into glorious fruition ere long. With courage born of success in the past, with a keen sense of the responsibility which we shall continue to assume, we look forward to a future large with promise and hope.¹

In the fruition of these desires and the fulfillment of this crescent promise the higher education will exercise no inconsiderable influence.

VI.—THE ORIGIN OF THE NEGRO COLLEGE.

Before plunging "in medias res," as Horace would say, let us take a brief survey of the educational opportunities of the colored race before the war. Schools for persons of color had been established and maintained at scattered points throughout the North for well nigh two hundred years. These schools usually met with the good will and approval of the white people in the several communities, although in some instances hostility and opposition were encountered. Several States from the earliest times admitted colored pupils to the general school system without distinction. One searches their records in vain for any legislation upon this question. It is a curious fact that the colored girl who was the initial, though innocent, cause of Miss Prudence Crandall's troubles had received her primary education in the district schools of Connecticut along with white pupils. In general, however, it might be said that the ante-bellum opportunities for an education on the part of the colored man were few and far apart. The training obtained in the schools was of the most meager and rudimentary sort. It embraced the fundamental processes, reading, writing, and arithmetic, and but little more. In the larger centers, such as New York, Philadelphia, and Baltimore, efforts were made, with more or less success, to establish academies and schools of higher training. A few white institutions would now and then admit a colored man who was preparing for the ministry. An occasional college would open its doors to him, but not very often and not very wide. It was late in the forties, I believe, when Harvard first let him in. When the colored applicant,

¹The Progress of Colored Women, by Mrs. Mary Church Terrell, p. 15.

Williams by name, first knocked at the door of this ancient seat of learning there was great confusion and uproar. The usual tactics were resorted to—the patrons threatened to withdraw their support—but President Everett manifested that deliberate courage which always conquers. He informed the objectors that if every other student should be withdrawn from the institution he would use all of its resources and machinery to educate this sole colored man. Dartmouth College was founded about the middle of the eighteenth century for the education of the Indians. So far as I have been able to ascertain, it has never made any discrimination on account of race or color. Those who have gone unto her with the proper intellectual and moral qualifications she has in no wise cast out.

By all odds the greatest stimulus which the educational interest of the colored race received before the war was the foundation of Oberlin College in 1833. A few other institutions extended to colored youth a cold permission; Oberlin a warm welcome. She cordially invited all colored people who were hungering and thirsting after knowledge to come unto her and be supplied. This, indeed, they did. They flocked to her in such numbers that in 1865 fully one-third of the students of Oberlin College were of the colored race. The policy of Oberlin in this regard can not be better set forth than was done by Miss Sophia Jex Blake, an English woman, who visited the leading American schools and colleges in 1865, for the purpose of studying their coeducational feature as applied to women. In her report published in England, entitled *A Visit to American Schools*, we read:

In 1834-35, the trustees [of Oberlin] took up their definite position with regard to one of the questions then even more bitterly agitated than now, and decided it by the free admission of all colored students on equal terms with the whites. This step marks an epoch in the educational history of America; for though solitary colored students had been admitted to Dartmouth College, New Hampshire, and possibly elsewhere, no such proclamation of welcome had hitherto gone forth from any educational body, and the extreme opposition which the measure called forth is the best testimony to the merits of its supporters.

The Ashum Institute was established by the Presbyterian Church in 1853, and chartered by the legislature of Pennsylvania in 1854. Its aim and purpose are clearly set forth by the action of the Presbytery which founded it: "There shall be established within our bounds and under our supervision an institution called the Ashum Institute, for the scientific, classical, and theological education of colored youth of the male sex." This institution still survives under the name of Lincoln University. It is the largest and one of the most prosperous and useful of the negro colleges.

When we turn from the North to the South, we are confronted by an appalling situation. As we look upon the intellectual horizon and mental sky, despair and gloom are everywhere—"darkness there and nothing more." Here and there it was indeed possible to find a few negroes who had furtively snatched a few morsels of knowledge. In the earlier stages of slavery, it was not uncommon to find slaves who had been taught to read and write. But the Missouri compromise, the Nat Turner insurrection, and the growing abolition sentiment of the North inflamed the Southern passion. It was at this time that the antinegro sentiment reached the acute stage of malignity. The legislation of most of the Southern States forbidding the teaching of negroes bears about the same date.

The educational value of slavery is thus portrayed by Col. George W. Williams:

The institution of American slavery needed protection from the day of its birth to the day of its death. Whips, thumbscrews, and manacles of iron were far less helpful to it than the thralldom of the intellects of its helpless victims.¹

The real intellectual life of the race began with the overthrow of slavery. This applies to the North as well as to the South. When the smoke of war had blown

¹ History of the Negro Race, by George W. Williams, Vol. II, p. 147.

away, when the cessation of strife proclaimed the end of the great American conflict, when "the war drum throbbed no longer, and the battle flags were furled," there emerged from the wreck and ruin of war 4,000,000 of human chattels, who were transformed, as if by magic, in a moment, in the twinkling of an eye, from slavery to freedom, from bondage to liberty, from death unto life. These people were absolutely ignorant and destitute. They had not tasted of the tree of knowledge which is the tree of good and evil. This tree was guarded by the flaming swords of wrath, kept keen and bright by the avarice and cupidity of the master class. No enlightened tongue had explained to them the deep moral purpose of the Ten Commandments and the Sermon on the Mount. They were blind alike as to the intellectual and moral principles of life. Ignorance, poverty, and vice, the trinity of human wretchedness, brooded over this degraded mass and made it pregnant. The world looked and wondered. What is to be the destiny of this people? Happily at this tragic juncture of affairs, they were touched with the magic wand of education. The formless mass assumed symmetry and shape. Order began to rise out of chaos. Contrast that day with this day. Turn back 40 pages of the leaves of history. Look on this picture, and then on that. The words of prophecy are fulfilled: "Though ye have lien among the pots, yet shall ye be as the wings of a dove covered with silver, and her feathers with yellow gold." Nowhere in the whole sweep of history has the transforming effect of intelligence had a higher test of its power. Nothing is great or small, high or low, except by comparison. The same power, mainly educational, that has brought the negro safe thus far, will lead him on and on until he reaches the climax of his destiny.

The circumstances amid which this work had its inception read like the swift-changing scenes of a mighty drama. The armies of the North are in sight of victory. Lincoln issues his immortal emancipation proclamation; Sherman, with consummate military skill destroys the Confederate base of supplies and marches through Georgia triumphant to the sea; Grant is on his road to Richmond; the Confederate flag has fallen; Lee has surrendered; the whole North joins in one concerted chorus: "Mine eyes have seen the glory of the coming of the Lord." These thrilling episodes will stir our patriotic emotions to the latest generations. But in the track of the Northern army there followed a band of heroes to do battle in a worthier cause. Theirs was no carnal warfare. They did not battle against flesh and blood, but against the powers of darkness entrenched in the ignorance of a degraded people. A worthier band has never furnished theme or song for sage or bard. These noble women—for these noble people were mostly of the female sex—left homes, their friends, their social ties, and all that they held dear, to go to the far South to labor among the recently emancipated slaves. Their courage, their self-sacrificing devotion, sincerity of purpose and purity of motive, and their unshaken faith in God were their pass keys to the hearts of those for whom they came to labor. They were sustained by an unbounded enthusiasm and zeal amounting almost to fanaticism. No mercenary or sordid motive attaches to their fair names. They gave the highest proof that the nineteenth century, at least, has afforded that Christianity has not yet degenerated into a dead formula and barren intellectualism, but that it is a living, vital power. Their works do follow them. What colored man is there in all this land who has not felt the uplifting effect of their labors? Their monument is builded in the hopes of a race struggling upward from ignorance to enlightenment, from corruption to purity of life. These are they who sowed the seed of intelligence in the soil of ignorance and planted the rose of virtue in the garden of dishonor and shame. They had no foregoers; they have left no successors. It is said that gratitude is the fairest flower which sheds its perfume in the human heart. As long as the human heart beats in grateful

response to benefits received, these women shall not want a monument of living ebony and bronze.

The National Government inaugurated the work of education among the colored people of the South. Early in the war, Gen. U. S. Grant appointed Rev. John Eaton, afterwards United States Commissioner of Education, to take charge of the instruction of the colored people who were following in the wake of his army. The work developed into enormous proportions. General Banks undertook similar work in New Orleans. The Union Army was turned into a band of schoolmasters. Teachers from the North came down to work under the protection of the Federal Army. Northern churches and benevolent associations soon entered the field. Freedmen's aid societies were organized in all the leading denominations. Contributions poured in both from this country and from Europe. This work on the part of the Government soon grew too large and bulky to be wisely managed by disjointed agencies. In 1864 the Freedmen's Bureau was organized, with Gen. O. O. Howard at its head. The working of this bureau is too well known to need comment here. The reports of General Alvord, the superintendent of education for the bureau, are most valuable contributions to the history of this subject. The work of the Freedmen's Bureau was largely that of education. It confined its efforts chiefly to building schoolhouses and furnishing facilities of instruction, leaving Northern benevolence to supply and support teachers. It is estimated that the General Government thus spent fully \$5,000,000 for the education of the freedmen.

The need of the higher education was soon felt. Teachers and leaders must be provided. Hence arose the negro college and university. When the Freedmen's Bureau came to an end it turned its educational interests over to religious and benevolent societies, which had cooperated with it in the work. About this time also the reconstruction movement was under way. A great many things have been written in condemnation of this unwise experiment in government. The rule of black ignorance under the guidance of white villainy proved a failure. But it has left the South one monument that should take away some of the unsavory flavor from its memory. It established the public-school system throughout the South, and thereby conferred upon that section the greatest boon which it has received since the adoption of the Constitution. It is upon this corner stone that the South must build all her hopes for future years. Naturally enough the religious and denominational associations did not want their work swallowed up in the public-school system. These schools became chartered institutions. They assumed the high-sounding name of college or university, while their work was mostly of an elementary character.

In addition to the institutions of the class above described, almost every Southern State has established a State college for colored youth as an offset to the State institutions maintained for the whites. The National Government appropriates a large sum of money for colleges of agriculture and the mechanic arts. Wherever a State has separate schools it is stipulated that the division of this fund between the races must be in numerical proportion to their numbers. Thus the negro colleges were born in weakness. May they be raised in power.

The accompanying table will show the order in which the negro colleges were established, and under what auspices they were founded and supported.

*Negro colleges, in the order of establishment.*¹

VII. WORK, WAYS, AND FUTURE OF NEGRO COLLEGES.

"New occasions teach new duties." The conditions out of which the colored institutions grew are quite different from those by which they are surrounded to-day. A great wave of philanthropic enthusiasm swept the country immediately after the war. Institutions had been founded to meet the immediate needs of the situation. These schools must adjust themselves to the change of environments. The experimental stage has passed. The following announcement of the trustees of the John F. Slater fund is eloquent with suggestion:

"The trustees believe that the experimental period in the education of the blacks is drawing to a close. Certain principles that were doubted thirty years ago now appear to be generally recognized as sound. In the next thirty years better systems will undoubtedly prevail."¹

When these schools were first founded the work was an untried experiment, now it is settling into definite lines; then the great demand was to provide teachers, now there are more teachers than can be supplied with schools; then the public-school system had not been organized in the South, now schools are well established in all the States; then high and normal schools were unknown, now each Southern State has one or more of them under its jurisdiction. The relation between private and public schools is one of primary importance. There is some jealousy and not a little rivalry between them in many instances. The private schools were first in the field and do not wish to give way. It is, however, decidedly unwise for private instruction to rival the public schools in their legitimate

¹ The trustees of the John F. Slater fund, Occasional Papers, No. 1, page 4.

territory. According to our theory of government primary education is the duty of the State. It is true that the Southern States are too poor to do their full duty in this regard. The effort which they put forth, however, is commendable in the highest degree. No other community in this country lays such heavy proportional taxes upon itself for school purposes as the South.

Any supplement to the public schools of the South has always been welcome. The Peabody and Slater funds have added greatly to the educational progress of that section. But the question arises as to the wisdom of private institutions, calling themselves colleges and universities, duplicating the work of the public schools. An examination of the catalogues of many of the colored colleges will show that they are for the most part huge primary schools with the college course attached for ornament and style.

Proportion of college students to total enrollment in negro colleges, 1898-99.

	*		

The poet Horace tells us that a lawyer of mediocre ability may be held in high esteem, though he be not so eloquent as Messalla nor so learned as Aulus; but neither gods nor men nor booksellers will tolerate a mediocre poet. What the Apulian bard remarks of the poet will apply with equal force to a college. There can be no excuse or toleration for an inferior institution of high pretension. The old adage, "a whole loaf or none," suggests a principle that is at once salutary and sound. One had better remain untaught in the higher branches of learning than to be imperfectly instructed. From an intellectual standpoint it is better not to see at all than to see through a glass darkly. The worst possible condition of the mind is to have it crammed with smatterings of undigested and unassimilated knowledge. This is the state of mind from which spring bigotry, conceit, and shallow pretense. A self-respecting individual can not afford to be very different in his dress and habits of life from the society in which he moves; if he finds it too difficult to keep pace with his class, he is relegated to the grade below by the law of social gravitation. So it is with an institution of learning; it can not afford to be much different from other schools of like grade and pretension; and if it can not maintain itself on such a plane, it had better fall back to the next lower grade of academy or fitting school. Colored colleges need not expect

exemption from the usual tests of excellence. Knowledge is color-blind. Science and philosophy do not accommodate themselves to the various hues of the human species.

The requirements for admission to colored colleges, as well as the extent of courses and allotment of time to the several subjects of study, may be seen from the accompanying tables:

Requirements for admission to negro colleges.

Institution.	Length of preparatory course.	Number of years of preparatory study required in—					Weeks of study per year.
		Latin.	Greek.	Mathematics.	English.	Other important studies.	
Lincoln	0	0	0	0	0	$\frac{1}{2}$	32
Biddle	2	2	1	$1\frac{1}{2}$	1	1	35
Fisk	3	3	2	$2\frac{1}{2}$	0	$2\frac{3}{4}$	37
Howard	4	4	2	$2\frac{1}{2}$	$1\frac{1}{2}$	2	36
Shaw	2	2	1	2	2	2	32
Atlanta	3	3	1	2	1	3	34
Wilberforce	3	3	2	2	1	$1\frac{1}{2}$	39
Virginia Normal and Collegiate Institute	2	2	0	$1\frac{1}{2}$	$1\frac{1}{2}$	$1\frac{1}{2}$	33
Leland	4	3	2	$3\frac{1}{2}$	$\frac{1}{2}$	$1\frac{1}{2}$	31
Livingstone	3	3	2	2	1	5	28
Paul Quinn	3	3	2	3	0	2	36

From this it would seem that these colleges ranked in the severity of their entrance requirements about as follows:

1. Howard: Nearly equal to the smaller New England colleges.
2. Fisk, Atlanta, Wilberforce, Leland, Paul Quinn: From one to two years behind smaller New England colleges.
3. Biddle, Shaw, Virginia Normal and Collegiate Institute, Livingstone: From two to three years behind smaller New England colleges.
4. Lincoln: A little above an ordinary New England high school.

Table showing what fractional part of the four-years' college course is devoted to certain studies.

¹ Ten additional hours to be chosen from these. The figures in parentheses indicate a probable course.

² Five and one-third hours of electives to be chosen from these. The figures in parentheses indicate a probable course.

The best of these schools are almost on par with the average New England college, so far as standard of admission and reach and range of curriculum are concerned. Howard University stands at the head of the list. It would certainly not fall far below the prevailing collegiate standard, with Fisk and Atlanta as close seconds. From these the range is downward until they reach the level of a New England fitting school.

The chartered institutions are usually located in the large centers of population, where the provisions for public institutions are more or less ample. Men who

have carefully studied the situation are asking themselves the question whether it is good policy to entreat Northern philanthropy to carry on a work which the States themselves can more easily perform. There is no doubt that there will be outside benevolence to assist in this work for a long time to come. Begging at best is a disagreeable task. It should never be indulged in unless there is some overshadowing necessity. It is the unanimous opinion of thoughtful observers, as well as the dictate of common prudence, that these institutions should relegate to the public schools all the work that properly belongs there, and should confine their energies to that class of work which falls beyond, or at least outside of, the range of public instruction.

The relative influence of white and colored men in the management and conduct of the schools is a matter of much moment and not a little delicacy. This question, however, is a persistent one. It will not down at our bidding and has no regard for our delicate scruples; it requires brave, heroic treatment; it should be handled with all the plainness of English speech. Most of these schools are under the management and control of some church or religious organization. These societies have founded the work, developed the plants, and accumulated the property. This class of schools is usually directed and officered by white men. There is a good deal of human nature even in the persons who are engaged in missionary work. Nowhere do we find it a common thing for men to voluntarily yield up authority when it is possible for them to retain it. It is only reasonable to suppose that this class of schools will continue to be dominated by white men. The argument is advanced that white people furnish the means, and it is but fair that they should dispose of it in any manner which they deem fit. It is true that practically all of the money for this work is furnished by the whites. However it may be liked or disliked, it will probably continue to be the fact that as long as the whites contribute the support they will continue to wield the dominant influence.

Those institutions which are supported by the States are under the control of colored men. It is the policy of the South to let the negro manage his own affairs. It is found that those institutions which are under colored management are in no wise behind the rest in point of discipline, order, and good results.

There is still another class of institutions, originally supported and managed wholly by colored men. These are to be found for the most part within the limits of the A. M. E. Church. There are as many as 40 such institutions, several of which take high rank as colleges. It is here that we must look for the best illustrations of independent action in many directions. These institutions are of the colored people, by the colored people, and for the colored people.

The resources of these schools are a matter of serious concern. The total productive endowment of all the higher institutions is about three-quarters of a million dollars. This is about sufficient to run one small college alone. The small amount which colored men have contributed to these funds is remarkable. There have been several illustrious examples of colored men in the A. M. E. Church who have left the bulk of their fortunes to the educational institutions; but I know of no others who have followed their example. The race spends immense sums of money for the support of their religion, but very little for education. The value of negro church property is placed at \$26,000,000, all of which has been contributed or solicited by themselves; but their contribution to education would hardly amount to a tenth part of that sum. One thing seems to be certain, the support as well as the management of colored institutions must ultimately be transferred from the white to the colored race, if they are to be permanent. The resources of charity will not last forever. A people who really deserve and appreciate institutions for their moral and intellectual welfare will sustain them. It is a physical impossibility for a body to remain in stable equilibrium whose center of gravity falls outside of the basis of support.

There are entirely too many of these colleges. Every school that teaches the least bit of classics is ambitious to confer the academic degrees. There is not a fitting school pure and simple in the whole range of the educational work. There are more universities for colored people in the United States than there are altogether in England or France and quite as many as there are in Germany. If the educational work could be harmonized and systematized, so that a majority of the universities could be reduced to fitting schools and academies, leaving two or three stronger ones to carry on the higher lines of study, the work could be done with half the present expense and with thrice the efficiency.

The denominational feature is largely responsible for the great number of institutions with high-sounding names. Every denomination is anxious to have its own schools, to enforce its own principles, and inculcate its own doctrines. Hence it is not an uncommon thing to find two or three universities of as many different denominations in a single Southern city. Any unity of action or harmony of plan is made exceedingly difficult on account of this denominational rivalry.

A university in its complete growth and equipments represents the ripest product of a civilization. The colored schools, notwithstanding their shortcomings, represent more fully than anything else the progress of the race. They not only show what has already been accomplished, but are the surest promise of what is to be.

The collegiate prerogative of conferring degrees is one which these schools exercise without the least modesty. Degrees were originally conferred upon students as a license to teach. In course of time they came to stand for various achievements in several branches of learning. Some of them indicated the courses of study pursued, while others stood for eminence or proficiency in the arts and sciences. A love of cheap distinction seems to be the greatest malady which afflicts the American mind. The theory is that under democratic institutions the love of titular distinctions is eradicated. Our Government grants no titles of nobility. To be an American citizen is supposed to be honor enough for any man. We laugh at the number of worn-out counts and earls and what-nots of the old world, but we can overmatch them in the number and variety of degrees. Few people seem to be satisfied with a plain name; they want some addition either before or after it. Our civilians who never saw action in the field and who know no more about military operations than Shakespeare's arithmetician are dubbed "captain," "colonel," or "general." Men are called "judge" whose judgment would not be respected on a single item of human interest from a horse race to metaphysics. Masonic societies load down their votaries with a list of degrees that seem to exhaust the letters of the alphabet. American heiresses swap their millions for a titled name.

It should not be wondered at, then, that colleges, which hold the exclusive patent of literary degrees, should partake of this same lavish spirit. The smaller and feebler colleges seem to make up their deficiencies by the number and variety of degrees which they confer. It is said that in many cases they are sold outright. The story is told of a certain Southern institution that its faculty consisted of two members of the same family. The father was president and the son was professor of the whole curriculum. The faculty met on a day and voted to confer the degree of LL. D. upon the president, and, in order to return the compliment, the president conferred the degree of Ph. D. upon the faculty. The writer is familiar with the facts of the following case: An eminent divine was invited to deliver the commencement address before a certain college class. After having performed the task to the best of his ability the institution offered either to pay his railroad fare or to give him a D. D. The railroad fare was preferred. This evil has become so prevalent that not only educators but common-sense men in all walks of life have become aroused to its serious nature. Several of the leading institutions have decided not to confer any more honorary degrees. Mr. James R. Garfield has recently introduced a measure in the Ohio legislature to have that

body regulate the matter of degrees from the colleges of the State. President Cleveland several years ago declined the honor of an LL. D. from Harvard University; more recently he has declined the same proffer from Wilberforce. His declension is based on the ground that he is not a college graduate and is not otherwise entitled to literary distinctions.

What has been said so far upon this topic refers to the abuse of degrees in general and is not especially applicable to colored schools. This abuse is a general one. Our 400 or more colleges have so flooded the land with learned degrees that they have lost their intended significance. They are not recognized by the institutions of Europe. There is an old adage in the South, "If you want to see a thing run in the ground, let the negroes get hold of it." This adage has been more than justified in the present instance. The matter of degrees has been carried to ridiculous, even to disgusting, extremes. The extravagant lavishness with which persons who in the nature of the case can have no claim to them are loaded with literary degrees would be amusing if it were not so amazing. Colored men are no longer willing to have their attainments properly characterized by the three R's; they must be represented by the various combinations of L's and D's. It has been facetiously stated that a great many colored men who stagger under the heavy load of A. B., A. M., D. D., LL. D., etc., would have their acquisitions more accurately described by A B C and the other letters of the alphabet. There are hundreds of colored men dubbed D. D. who can not give a critical rendering of a single passage of Scripture in the original or give an opinion on any phase of theology that would challenge respect, or write a single line on any topic, sacred or secular, that will live six hours after they are dead. Many of these degrees have been conferred on account of useful work, pious life, holy consecration, or ecclesiastical eminence. Too much can not be said in praise of these things. But it is pure mockery, a travesty upon learning, to decorate such persons with honors which they do not deserve and whose significance they can not appreciate. Do men gather grapes of thorns or figs of thistles? So far has this practice prevailed that when it is announced that the Rev. Mr. Blank, D. D., LL. D., is going to preach at such and such a church, we no longer think of a learned scholar who can partake of the things of God and show them unto us with logical clearness and power, but instead our risible emotions are aroused. Ecclesiastical degrees are not more abused than those of purely literary or scientific import. Many of the colleges fall short of the average standard. Their regular degrees, therefore, do not stand for a fair amount of culture. The goods are not properly labeled. Thus the land is full of A. B.'s and A. M.'s which could not stand the test of severe standards. It was but yesterday that the negro race first saw the light of intellectual day. The bulk of the race is still illiterate or nearly so. So it is marvelous beyond words that so many of them have reached the highest pitch of literary honors. Where else in history is there such a sharp contrast of bright lights and deep shadows? When we think of the suddenness with which this has been brought about, we can but suppose that these learned men must have sprung into being full fledged, like the Grecian Minerva from the brain of Zeus.

This question has its serious as well as its facetious side. It points out an evil and suggests a duty. It is positively damaging to sound scholarship and to high standards. If the highest honors are so easily won, and when won are of so little significance and worth, what stimulus is there for young men to struggle for honest acquisitions? There needs to be cultivated a wholesome public sentiment which will not tolerate such intellectual sham. Institutions which have no higher appreciation for this collegiate function than to abuse it so shamefully should meet with stern popular disfavor. The educators of colored youth can render no greater service to the intellectual welfare of the race than to discourage intellectual dishonesty under the guise of unmerited degrees. These colleges and universities should see to it that these bogus honors are stopped.

There have been 1,941 graduates from negro colleges, and 339 from white institutions. Their occupations, usefulness, and influence must be taken as the highest measure of the value and importance of the higher education. The fifth Atlanta conference was at great pains to study this phase of the question. The 1,312 negro graduates reporting were distributed as follows among the several vocations:

	Number.	Per cent.		Number.	Per cent.
Teachers.....	701	53.4	In business.....	47	3.6
Clergymen.....	221	16.8	Farmers and artisans.....	35	2.7
Physicians.....	83	6.3	Clerks, secretaries, etc.....	23	2.2
Students.....	74	5.6	Editors.....	9	-----
Lawyers.....	63	4.7	Miscellaneous.....	5	-----
In Government service.....	53	4			

Commenting on these figures, the report continues:

These figures illustrate vividly the function of the college-bred negro. He is, as he ought to be, the group leader; the man who sets the ideals of the community where he lives, directs its thought, and heads its social movements. It need hardly be argued that the negro people need social leadership more than most groups. They have no traditions to fall back upon, no long-established customs, no strong family ties, no well-defined social classes. All these things must be slowly and painfully evolved. The preacher was, even before the war, the group leader of the negroes, and the church their greatest social institution.¹ Naturally, this preacher was ignorant and often immoral, and the problem of replacing the older type by better-educated men has been a difficult one. Both by direct work and by indirect influence on other preachers and on congregations, the college-bred preacher has an opportunity for reformatory work and moral inspiration, the value of which can not be overestimated. The report of the Atlanta conference on "Some efforts of American negroes for their own social betterment," shows the character of some of this work.

It has, however, been in the furnishing of teachers that the negro college has found its peculiar function. Few persons realize how vast a work, how mighty a revolution has been thus accomplished. To furnish 5,000,000 and more of ignorant people with teachers of their own race and blood in one generation was not only a very difficult undertaking but a very important one, in that it placed before the eyes of almost every negro child an attainable ideal. It brought the masses of the blacks in contact with modern civilization, made black men the leaders of their communities and trainers of the new generation. In this work college-bred negroes were first teachers and then teachers of teachers. And here it is that the broad culture of college work has been of peculiar value. Knowledge of life and its wider meaning has been the point of the negro's deepest ignorance, and the sending out of teachers whose training has not been merely for bread winning, but also for human culture has been of inestimable value in the training of these men.²

Another question which philanthropists have a right to ask about these graduates is, What are they doing for the general social betterment of the race aside from the vocations from which they derive a livelihood? The following table throws much light on this question, which gives a list of college-bred negroes who are engaged in religious, philanthropic, and literary work:

Occupation.	Number.	Occupation.	Number.
Active in religious service.....	101	Organized charity.....	15
Investing in negro business enterprises.....	48	Kindergartens and mothers' meetings.....	7
Contributing to newspapers.....	105	Building associations.....	7
Editing and publishing newspapers.....	46	Hospitals.....	10
Lecturers.....	21	Farming and truck gardens.....	4
College and student aid.....	20	Savings banks.....	10
Benevolent club work.....	9	Contributing to magazines.....	11
Nurseries, orphanages, and homes.....	12	Papers before societies.....	9
Slum, prison, and temperance work.....	16		

¹ Cf. The New World, December, 1900, article Religion of American Negro.

² College-bred Negro, p. 65.

It is true that the college-bred negro has not as yet entered, in appreciable numbers, upon productive pursuits, but has followed the line of least resistance, and fitted into positions that were already prepared. The college-bred men of New England, up to the middle of the present century, sought the ranks of the learned professions and political careers, but seldom entered upon practical pursuits. When the educated negro finds prepared places all occupied, he too will be compelled to launch out into profitable industry and productive enterprises. And then he will be found to be a captain of industry, just as he is now the leader in the more leisurely and learned callings.

The negro college has a valuable function in the general educational equation and will occupy an important place among American institutions of the future. They have been centers of light that have illuminated the darksome path of an entire race. They antedated the public schools, and gave to the negro his initial impulse toward the better things of life. There is scarcely an educated colored man or woman in the South who has not been touched by their beneficent influence. The value of an object is enhanced by contemplating its absence or withdrawal. We do not dare even think what the condition of the negro would be if it had not been for these colleges. It is equally painful to speculate as to the conditions of the future if these institutions should be withdrawn. How could the preachers, of whom there is need for many thousands, be prepared for the work? Where would the lawyers and doctors and teachers in the higher range of instruction qualify for their function?

The vital question of perpetuity is one of financial support. Only two of them, the Gammon School of Theology and the Lincoln University, are adequately endowed. The others must depend for the most part upon current contributions from the State, religious denominations, and private philanthropy. Those schools which have been fostered by religious denominations will doubtless continue to receive such support as a means of religious propagandism. Fisk University and the Union University at Richmond, Va., will doubtless be upheld as representing the highest expression of the missionary and philanthropic endeavor of their respective denominations. The future of those schools which have no definite mooring, but which must depend upon the ebb and flow of public and private favor, is more precarious and uncertain.

It can not be denied that the trend of private philanthropy is toward the industrial and practical idea to the discouragement of the higher culture. This turn in public sentiment is scarcely due to the abiding conviction that the industrial policy will come any nearer solving unsettled problems than the higher knowledge, but is perhaps the outgrowth of the feverish spirit of the Athenian, which is ever in quest of some new thing. When the new idea has been exploited as fully as the old, there will in all probability be a redistribution of public favor between the two according to their proper proportion and balance.

The tendency on the part of the State colleges is to eliminate everything that flavors of the higher culture, and to adapt their courses to the requirements of an agricultural and industrial régime. There can be but little doubt that the State institutions will relinquish what little claim they now have to collegiate distinction and take rank in the more elementary and practical class.

There is need of a sensible adaptation of the negro college to the requirements of its function in the light of what experience has taught us.

1. Let it be conceded that a backward and suppressed race must of necessity be afflicted with great intellectual poverty. Such a race can, at best, produce only a small number of youth who, with their present incumbrances, are likely to profit by the advanced courses of learning. The mass of any people must ever fall short of the collegiate grade. At present the negro shows only 1 student in 3,000 of the population, who by the widest stretch of courtesy can be said to be pursuing the

higher education. After abstracting all who are able to think, there will be left sufficient to toil.

2. The courses of study should be thorough and the instruction competent. Nothing is so dangerous to a backward race as a smattering of learning. The people need sane, safe, cautious, conservative standards. They are already too prone to superficiality and show.

3. The Northern college is not likely to inspire colored youth with enthusiasm and fixed purpose for the work which destiny has assigned them. The white college does not contemplate the needs of the negro race. American ideals could not be fostered in the white youth of the country by sending them to Oxford or Berlin for their tuition. No more can the negro gain racial inspiration from Harvard or Yale. And yet it would be a calamity to cut them off from these great centers of learning. They need the benefit of contact and comparison, as well as the greater facilities which they afford. If the negro is shut in wholly to himself he becomes too painfully self-conscious; on the other hand, if allowed to stray too far from his race, he finds himself stranded on the barren shores of culture, or, like Mohammed's coffin, suspended in mid-air, without upper or nether support. The negro college in the South and the larger institutions of the North will preserve a just balance between these conflicting principles.

4. Negroes should contribute liberally toward their own higher education. You who have been benefited ought therefore to be enlarged. Thousands of colored people are better able to contribute to such movements than many of the regular contributors in the North. No equilibrium can be stable when the center of gravity falls outside of the basis of support.

5. There are by far too many schools which claim the collegiate function. The number might well be reduced to three or four—perhaps one for each of the leading denominations and a central one in the city of Washington.

6. There is a great need of fitting schools which should be content to do thorough secondary work without the ambition to assume full academic prerogative. Most of the schools which now call themselves colleges and universities might easily confine themselves to this work without suffering the least in real character.

7. The work of primary grades, now a prominent feature of most of the negro universities, should be relegated to the public schools, and their courses should be confined to those lines of instruction which fall beyond, or at least outside of, the scope of public instruction. The work now undertaken could thus be done at a tithe of the present cost with thrice the efficiency. The higher educational interest of the race needs to be rationally modified and sensibly adopted. There should be a sharp definition of the function and sphere of the college and those of the industrial school. Appeals should be made to philanthropic sources on the basis of relative, not rival claims. It would be as unwise policy on the part of philanthropy to abandon the higher education of the negro as it would be to give up his industrial training. They are supplementary parts of a symmetrical whole. This ought ye to have done and not to have left the other undone.

VIII. THE NEGRO IN NORTHERN COLLEGES.

There are, or were in 1890, 442 universities or colleges in the United States, counting the good, the indifferent, and the bad. Many of these—generally the poorer and feebler ones—are located in that section of the country where the races are not accustomed to be taught together. The largest, richest, and most influential of these, however, are open to all, without regard to race, color, or previous servitude, regardful only of the present intellectual rating of the applicant. There are 25 or more universities, for the most part courteously so called, which were established for the benefit of the negro race. These schools, together with the higher institutions of the North, are open to colored youth. Let us now consider the relative advantages of the two classes of institutions to the negro.

It is not perhaps profitable to discuss the larger question of mixed schools, except in so far as the logical exigencies of the subject require. It offers such wide latitude for difference of opinion and friction of feeling that I would gladly avoid it altogether if the subject in hand permitted me to do so. Some notice of it here, however, is unavoidable. A stranger with a keen, inquiring, critical sense and unbiased prepossessions who should visit a community for the first time and should notice the existence of parallel courses of instruction, maintained at increased public cost and care, for different elements of population would begin to suspect that there must be some maladjustment of social forces. If, on closer scrutiny, he should find that the same distinction obtains in all the other relations of life, in business, in politics, in society, and even in religion, and that the separation in each case rested upon a racial basis, he would speedily conclude that there must be a race problem on hand. He would also be convinced that separate schools do not form an isolated distinction, but are only a part of the prevailing social status of the two races. Nor would he, if he were wise and liberal minded, rail against the existence of separate schools, knowing in the fullness of his wisdom that they were expedient just so long as the causes that make them necessary exist; seeing also that protest would be of no avail, but would serve only to engender bad feelings and harmful friction. Separate schools are not the cause, but simply one of the effects of the race problem. The effect is less than the cause. This problem will be on our hands for many a long day, and that, too, whether our schools be separate or mixed.

The advantage claimed for mixed schools is that the colored pupils gain much by contact with the white race, and that the two races being brought into close association will learn to appreciate and respect each other. It is argued, on the other hand, that where mixed schools prevail the negro teacher is excluded, and the colored pupil, accustomed to seeing all ennobling stations filled by white men and women, imbibes, consciously or unconsciously, a feeling of the inferiority of his race, and consequently loses ambition and self-confidence. The isolated instances of colored teachers, whose tenure of office is more or less precarious in such schools, do not materially relieve the situation. Some advocates of mixed schools are so enthusiastic as to claim that they will furnish a panacea for all the ills which the race suffers. Unfortunately, this roseate view is not sustained by the facts of experience. Those who believe that prejudice is not strong enough to survive class-room contact are greatly mistaken. The Jews in Germany attend the universities and rise to the highest ranks by reason of their undoubted mental endowments, and yet prejudice against them seems to abate no whit on that account. The University of Salerno, founded in Italy in the ninth century, received Jews both as students and teachers at a time when persecution against that unfortunate race was at its highest pitch.¹ There is, indeed, a democracy of letters, but its liberality of spirit is largely confined to its own domain. The inefficacy of mixed schools in our land to solve the race problem is too painfully apparent. It has nowhere been shown that they have had any appreciable effect in softening the asperities of prejudice. On the other hand, many honest observers are convinced that prejudice in the North is more hurtful than in the South, and that it is on the increase. True, it takes on another form, but only to accommodate itself to a change of circumstances. Nor have mixed schools produced such striking results for the good of the race as to justify us in ascribing to them any extravagant advantage.

No one, I presume, would undertake to justify separate schools, unless it be on the ground of expediency. The ideal school system is one in which such questions as we have been discussing do not enter, but where all elements of the population stand on an equal footing in management, instruction, and pupilage. But, unfor-

¹ Britannica Encyclopedia—Universities.

tunately, we are creatures of circumstances. We have, therefore, to deal with things as they are, and not as we fancy they ought to be. It is a fact which is as certain and as convincing as the law of gravitation that where the colored people form a considerable fraction of the population the races are taught in separate schools; wherever there is sufficient of the African element to give decided color, it is secluded and set apart. This is not a question of geographical lines and political divisions. It depends simply upon the relative weight of the colored element in the community. The negro is the weaker vessel. He can only accept, it may be with an ineffectual protest, conditions which are forced upon him. His frantic outcry against existing discriminations will have no more effect than the wail of an infant crying in the night.

There are three elements of greatness in an institution: (1) Great wealth, which enables it to secure the best equipments and facilities of instruction and to surround itself with learned professors and distinguished scholars; (2) age and scholarly tradition, filling the atmosphere with a bracing influence and intellectual tone; (3) an enthusiastic constituency and a large and widespread body of influential alumni. The better colleges of the East possess all these elements of strength. Contrasted with these, the negro colleges are young, poor, and struggling. It must not be taken for granted, however, that because a college is small and comparatively poor it can not do good and efficient work. If such an institution has sufficient funds to employ a competent faculty, and adhere to a conservative policy of restricting its energies to a definite, limited range of work, there is no reason why it might not accomplish as much in its scope as a school of greater pretensions. Success in the ordinary studies of a college curriculum does not depend so much upon large libraries and laboratories, showy and imposing surroundings, nor yet upon the exalted abilities of the professors, beyond a fair degree of competency, as upon faithfulness, diligence, efficient direction, wholesome enthusiasm, and serious purpose. The smaller college can not rival the great universities in the range and variety of courses, in the liberty, sometimes amounting to license, of electives, nor in the upper reaches of post-graduate and special lines of work. The mission of the small college is to do faithful and efficient work along definite if somewhat limited lines, stamping a deep moral and intellectual impress upon its products; to turn out handmade instead of manufactured articles, not hiding the man in the multitude. Many of the best scholars and most prominent citizens are products of feeble colleges.

The colored student is drawn to the Northern university because of the imposing surroundings and the attractive power of a great name. His ambition is indeed noble, his motive worthy. It is also true that the colored man who attends a white school seems to gain, for a time at least, an enhanced preferment among his own race. This can be explained partly because of his supposed superior equipment and partly on the same ground that a New Englander, in years gone by, who had visited the national capital was looked upon with something of bewilderment by his less fortunate associates. The old doggerel couplet, though wanting perhaps in dignity, is not without direct applicability:

How much a monkey that has been to Rome
Excels a monkey that has stayed at home.

The colored youth from the South, on entering a Northern institution, finds himself in such different relations to white men from those which he has been accustomed to sustain (and which, alas, he is not destined to sustain again) that he is often carried beyond himself by the first heat of enthusiasm. In the minds of many the fear exists that the Southland may be thus decimated of its best intelligence and strength. This would indeed be regretful—a sheer waste of energy. The negro, under the present circumstances, can add nothing to the civilization of the North. If the intelligence and vigorous manhood of the colored race be thus

wasted in unprofitable fields, the negro youth would take to the North that which does not enrich it, but would rob the race in the South of that which leaves it poor indeed. Education should not cause the recipient to shrink from duty, however difficult or disagreeable, but to meet it manfully and to bring all of one's added mental resources to bear upon its accomplishment. The claim of the colored colleges is advocated on several grounds:

1. The existence of a colored college does not prevent those colored youth who prefer to do so from going to Northern institutions. It rather stimulates them to go. There has recently been planted at Washington the Catholic University of America, but that does not imply that all Catholic students will forthwith cease to attend Protestant schools. Denominational institutions never include all the students of a particular faith. It need not be supposed, then, that negro schools must include all negro pupils. It would be a great misfortune if the colored race were cut off from intellectual contact with the Caucasian. The negro has not yet learned a title of what the white man can teach him. The time has not yet come for a declaration of intellectual independence. I adopt for the purposes of this argument the words of the late W. W. Patton, D. D., LL. D., president of Howard University. "But," he says in his inaugural address, "to secure this result (the higher education of the negro), so difficult and yet so essential, the process must be such as to throw the colored man under every possible quickening influence. Hence it is not best to separate him carefully from his white brother and raise him in an institution by himself, like a tender plant in a hothouse. He needs the contact with the more advanced race. The acknowledgment of his manhood thus given will add to his self-respect and will fire his nobler ambition."¹

I will venture the proposition that the most wholesome and beneficial contact between the races in the schools is to be found in those cases where the colored student has first passed through some first-class negro college, and afterwards goes to a Northern institution for work in special lines or professional equipment. This view is borne out partly by facts of experience and partly by considerations of a general nature. So far as the results of experience are concerned, let each look around and judge for himself. On general principles, it might be said, the graduate of the colored school has been trained in the atmosphere in which his future lot must be cast. He is impressed on every hand by the vast magnitude of the work which awaits him. If urged on by a desire to extend his knowledge in a greater school, he does so with the fixed purpose of applying his wider acquisitions to the needs of his race. He has also a definite attachment to some school as his alma mater; his zeal for the advancement of education is thus localized and heightened. Mr. S. W. Powell, writing in the *Century Magazine* on a topic of like import, says: "By getting their education where they would be brought face to face with the heartbreaking destitutions of their race, they would be more apt to acquire the enthusiasm and fixed purpose of the missionary. Lack of these is one of the most marked defects of the negro who has a little education. Unless these qualities are developed in those of higher gifts and attainments the task of elevating the race will be much more formidable." Graduates of colored schools, having reached a considerable degree of maturity and soberness, are not likely to be carried away by false enthusiasm and lose their racial balance because of a quasi equality with white men, artificially fostered, and destined to last only for a day. The graduates of these schools should not limit their further search after knowledge to American schools, but should be encouraged to go to the English, German, and French universities, and to gather the sparkling gems of knowledge wherever they glitter.

2. The colored college serves to develop negro scholarship by giving members of the race an opportunity to make their education effective. The scholar must have

¹ Inaugural address as president of Howard University.

time, leisure, and opportunity to observe, study, and reflect. Many usually finish their education, in the strict literary sense, at the college commencement, unless, luckily, their vocation in life calls for constant literary activity. A college is a seat, and not merely a dispensary of learning. It is not more a distributing center than a depository of knowledge. The mission of the college professor is not merely to teach, but to study, to investigate, and to grow. The great minds of Europe are gathered in the universities. Harvard, Yale, and Princeton mean most to American scholarship. If the negro student is to be permitted to go to the universities, but is to be given no opportunity to develop beyond graduation, the intellectual status of the race will always be low.

One of the striking peculiarities of the colored race is that its members are not inspired by the great achievements of white men. It seems to be taken for granted that the Caucasian should do great things. The negro seems to think that the white man is removed from his plane of competition. It seldom, if ever, occurs to the colored pupil to equal or surpass his white teacher. He is at most a pupil, never a disciple of his Caucasian master. But when one colored man rises, every other colored man begins to look upward. The negro does not care how far the white man outstrips him, but will do his level best to keep pace with one of his own color. There should be colored men of approved character, culture, and racial enthusiasm conspicuously at the front in these schools of higher learning. They stand out before the students as a typical embodiment of the possibilities of their kind. The abolition of the negro college would be the death knell of the higher education of the race. Colored youth would soon cease to attend Northern colleges if there were no stimulus beyond the commencement. The negroes of the North have often been upbraided for not taking better advantage of the educational facilities by which they are surrounded. They answer this reproach with the query, "Cui bono?" Let us notice the harmful effect of this principle when applied to another situation. In a publication of the Bureau of Education, entitled *Education in Maryland*, the author attributes the backwardness of that State in higher educational matters, until quite recently, largely to the fact that in the early history of the colony the youth were sent abroad for their higher education, to the neglect of home institutions. Some went to William and Mary in Virginia, others to England, and still others of Catholic parentage, like Charles Carroll, were educated on the continent of Europe.

3. "Practical education" is the cant phrase of the hour. Let us repudiate the cheap sentiment that all negroes should be taught a mechanical trade. What is here meant by a practical education is one that will enable the recipient to deal wisely with the issues which he must grapple with in after life. One's education should, as far as possible, fit for the special circumstances of his environment. Dr. Edward W. Blyden, the world-renowned negro scholar, tells us: "The object of all education is to secure growth and efficiency, to make a man all that his natural gifts will allow him to become, to produce self-respect, a proper appreciation of our own powers and the powers of other people, to beget a fitness for one's sphere in life and action, and an ability to discharge the duties it imposes."¹ The negro's "sphere of life and action" in this land is well known. The American negro may attempt great works, may plant fields and build houses, may gather silver and gold and the precious treasures of the earth—yea, may turn himself to the pursuit of wisdom and surround himself with the highest delights known to the sons of men—but unless he measures it all by the gauge of his racial circumstances he will find that it is all vanity and vexation of spirit. During the civil war all of the moral, mental, muscular, and material resources of the North were called into use to defend and uphold the Union. The skilled mechanic must build ships and devise engines of war; the chemist must invent destructive com-

¹ *Islam and the Negro Race*, p. 85.

pounds; the philosopher must uphold the theory of the government in dispute by his erudition; the scholar must write books and the poet must sing songs full of the Union sentiment and patriotic devotion. The negro race is in the midst of a life and death struggle for a higher existence, for racial development and manly recognition. All available powers need to be impressed into service. The colored college is necessary in order that the youth may be educated consciously and enthusiastically as to the needs of the race.

4. The courses of study in the Northern colleges do not contemplate the needs of the negro. They were made out without reference to him, and indeed without any thought that he would ever participate in them. These may include subjects which to the negro student's manly instinct and sense of self-respect are worse than a chilling blast. In one of the most liberal of American universities there is, or was, a distinguished professor who is the author of a book which sinks the negro to the lowest depths of degradation, from which, according to its learned dictum, he shall be lifted nevermore. Think of a self-respecting colored student learning the science of man from such a source! I can more easily think of a Baptist minister putting his children under the tutelage of a Jesuit priest, or a Union general during the war sending his son to school in South Carolina. Quoting Dr. Blyden once more: "In all English-speaking countries the mind of the intelligent negro child revolts against the descriptions—given in elementary books, geographies, travels, histories—of the negro; but though at first he experiences an instinctive revulsion from the caricatures and misrepresentations, he is obliged to continue, as he grows in years, to study such pernicious teachings. After leaving school he finds the same thing in newspapers, in reviews, novels, in quasi scientific works, and after a while, *saepe cadendo*, they begin to seem the proper thing to say about his race."¹ There is to the colored race a baneful influence lurking in that literature which sets forth the negro in every mood and tense of contempt.

The Southern white people, if we omit a single issue, possess many admirable traits and qualities. Their sense of self-respect is most highly commendable. No Southerner would send his child to a school where any doctrine was taught repugnant to his sense of dignity and self-esteem. No text-book reflecting in any way on Southern character can be introduced into their schools.

The new woman, clamoring for what she considers to be her rights, has learned the same lesson. No institution is too venerable, no book too sacred to be attacked, if in her opinion it degrades and humiliates her sex. She has rendered a new interpretation of the Bible itself in accordance with the new notion of the dignity and elevation of womanhood. A distinguished bishop of an influential denomination has suggested a new rendering of the sacred book in its reference to the negro. All these parties are doubtless extreme in their sensitiveness, but the whole trend of manhood is to accept nothing that insults one's own soul. The negro university, then, in its fuller development, can be a bulwark of strength to the race as a friendly interpreter of science and learning.

5. It would be very unfortunate if the negro in Texas who desired a higher education should have to go all the way to Massachusetts to procure it. Should there not be some higher institutions of learning accessible to him nearer home? Emperor Frederick II gave as his reason for founding the University of Naples in 1225 that his subjects in his Kingdom of Naples should find in the capital adequate instruction in every branch of learning and "not be compelled in the pursuit of knowledge to have recourse to foreign nations or to beg it in other lands."²

6. It is not wise to depend wholly upon the Northern institutions for the higher education of colored youth. It can not be predicted at what point they may fail. Prejudice is a capricious frenzy. It obeys no law and is subject to no rational principle. Its slightest whim will put to naught our profoundest plans and pur-

¹Islam and the Negro Race, p. 88.

²Encyclopedia Britannica—article Universities.

poses. It is impossible to make the operation of prejudice conform to the formulas of logic. It is illogical and inconsistent and cares nothing for the discomfiture of its victim. If prejudice orders it so an institution will close its doors to the negro to-morrow, notwithstanding it received him yesterday with open arms. Can anyone predict what would be the policies of the universities of the North should the negro contingency become "too numerous?" Dr. J. E. Rankin, president of Howard University, in a notable utterance before the second Mohawk Conference on the Negro Question, tells us: "It is true that colored men can go to Northern institutions of learning; that is, as an individual—one of him. But ten of him would break up any college class. Even Harvard would cease to elect him class orator. He can not be educated in large numbers except in institutions established for his benefit. Christian as are our theological seminaries, I believe that the white students of a class would regard one colored man as a curiosity, a phenomenon, and two colored men as a double enigma, but ten colored men would put 10,000 of them to flight."¹

7. It is objected that separate institutions tend to perpetuate prejudice. There is time and patience for but a word to objectors of this class. The best possible way to perpetuate prejudice is for the negro to do nothing and to have nothing, but to live like the sponge and the parasite. If the time is to come when the foundations of prejudice are to be broken up, separate institutions, especially if they be good ones, will not stand in the way. The wisest way to break down prejudice, if that is possible to be done, is for the negro to have something which white men want and not always be wanting something which they have.

IX. COLORED MEN IN THE PROFESSIONS.

In a homogeneous society where there is no racial cleavage, only the select members of the favored class occupy professional stations. In India it is said that the populace is divided horizontally by caste and vertically by religion; but in America the race spirit serves both as a horizontal and vertical separation. The isolation of the negro in all social and semisocial relations necessitates independent ministrative agencies from the lowest to the highest rungs on the ladder of service. It is for this reason that the colored race demands that its preachers, teachers, physicians, and lawyers shall be for the most part men of their own blood and sympathies. Strangely enough this feeling first asserted itself in the church—that organization founded upon the universal fatherhood of God and brotherhood of man. In the estimation of its founder there is neither Jew nor Greek, Barbarian, Scythian, bond nor free. According to a strict construction of its requirements, there is no difference in kind among those who are spiritually akin. And yet the organic separation of the races first asserted itself in the matter of religion. Whenever the colored adherents became sufficiently large to excite attention, they were set apart, either in separate communion or in separate assignment of place in the house of worship. When the negro worshiper gained conscious self-respect, he grew tired of the back pews and upper galleries of the white churches, and sought places of worship more compatible with his sense of freedom and dignity. Hence arose the negro church and the negro clergy. This was the first professional class to arise, and is still relatively the most numerous. The religious interests of the race are almost wholly in the hands of the colored clergy. Outside of the Catholic Church it is almost as difficult to find a white clergyman over a colored congregation as it is to meet with the reverse phenomenon. The two denominations, Methodists and Baptists, that are wholly under negro ecclesiastical control, include well-nigh the entire colored race.

The proportional number of church communicants for the colored race exceeds

¹Report of second Mohawk Conference on the Negro Question.

that for the white race. In 1890 the colored race had one communicant for every 2.79 of the negro population, while the whites had one out of every 3.04.

The negro church communicants were distributed as follows among the several religious denominations:

Regular Baptists	1,348,989
African Methodist Episcopal	452,725
African Methodist Episcopal Zion	349,788
Methodist Episcopal	246,249
Colored Methodist Episcopal	129,383
Regular Baptist North	35,221
Disciples of Christ	18,578
Primitive Baptist	18,162
Presbyterian (Northern)	14,961
Roman Catholic	14,517
Cumberland Presbyterian	12,956
Other denominations (17)	34,443
Total	2,673,977

This vast host of church members is, as above stated, almost wholly under colored ecclesiastical control. There is need for at least 25,000 trained men to administer to the spiritual needs of this multitude. Herein lies one of the most powerful arguments for the higher education of select members of the negro race. The tendency of the times is to require of candidates for the professions sound academic training as a preparatory basis for their professional equipment. It is idle to say that because the negro race is ignorant and undeveloped therefore its clergy need not measure up to the average of professional requirements. It surely requires as much discretion, resourcefulness, and sense to meet the needs of the lowly as to administer to those who are already exalted. It is true that the negroes have been gathered in the church in great multitudes under the guidance of men who had little academic equipment for their work; but we know full well that this is but the first step in their spiritual development, and that their future welfare requires not only men of consecration, but men of definite training for their work. Let us not forget also that the negro church has a larger function than the white church. Therefore the negro preacher must be not only the spiritual leader of his flock, but also the general guide, philosopher, and friend.

The rise of the colored teacher is due almost wholly to the outcome of the civil war. The South soon hit upon the plan of the scholastic separation of the races, and assigned colored teachers to colored schools as the best means of carrying out this policy. Hence a large professional class was at once injected into the arena. As the negro preacher is responsible for the spiritual life of the race, so the negro teacher is charged with its intellectual enlightenment. The 2,000,000 negro children of school age constitute the charge committed to the keeping of 30,000 negro teachers. There were at the inception a great many white laborers who generously entered upon this work, of whom there still remains a goodly sprinkling. But their function was and is mainly to prepare colored men and women for the responsible tasks. It was inevitable that many of the teachers, for whom there was such a sudden demand, should have been illy prepared for the task imposed. It was and still is in many cases a travesty upon terms to speak of such work as most of these teachers were able to do as professional service. We find here as strong an argument for the secondary and higher education of the negro as was furnished by ecclesiastical necessities. The duty imposed upon negro teachers is as onerous and requires as high a degree of knowledge and professional equipment as that imposed upon any other class engaged in educational work.

The special needs of their constituency call for a higher rather than a lower order of training, preparation, and fitness.

The colored doctor and lawyer have only recently entered the field in anything like sufficient numbers to attract attention. The same spirit that demanded the negro preacher has also operated in favor of the negro doctor. The relation between patient and physician is close and confidential. The social barrier between the races often operates against the acceptability of a physician of the opposite race. The success of the colored physician has often been little less than marvelous.

The colored lawyer has not been so fortunate as his medical confrère. The relation between client and attorney is not necessarily close and personal, but partakes of a business nature. The client's interest is also dependent upon the court and jury, with whom the white attorney is generally supposed to have greater weight and influence. For such reasons the negro lawyer has not made the headway that has been accomplished in the other professions.

It must be said for the professions of law and medicine that the applicants are subjected to a uniform test, and therefore colored and white candidates are on the same footing. Colored practitioners, therefore, must have a fair degree of preliminary training and professional preparation.

Macon B. Allen was the first colored attorney regularly admitted to practice in the United States. He was admitted in Maine in 1844. It is claimed by some that the husband of Phyllis Wheatley was a lawyer. Robert Morris was admitted to the Boston bar in 1850, on motion of Charles Sumner, where he practiced with splendid success until his death, in 1882. Prof. John M. Langston was admitted to the Ohio bar in 1854. James Durham was born a slave in Philadelphia in 1762. His master was a surgeon. He purchased his freedom and became one of the most noted physicians in New Orleans. His practice is said to have been worth \$3,000 a year. The following account attests the success of a black physician:

Dr. David Ruggles, poor, blind, and an invalid, founded a well-known water-cure establishment in the town where I write (Northampton, Mass.), erected expensive buildings, won fashionable distinction as a most skillful and successful practitioner, secured the warm regard and esteem of this community, and left a name established in the hearts of many who feel that they owe their life to his skill and careful practice.¹

Dr. John V. Degress was admitted in due form as a member of the Massachusetts Medical Society in 1854.

The above are only samples of negroes in the learned professions before the civil war. Of course, there was a larger number of ministers and teachers. Out of such meager beginnings has grown the great number of professional colored men and women of to-day.

The number and distribution of colored and white men among the different professions for the sixteen former slave States and the District of Columbia can be seen from the following table:

*Professional occupations.*²

ALABAMA.

Profession.	Number.		Number of persons to each.	
	White.	Colored.	White.	Colored.
Teachers	3,188	946	262	718

The colored preachers are quite as numerous in proportion to the population as the white, and in some cases more so. In West Virginia there are 425 whites and

only 802 blacks to each minister of the respective races. One might expect a preponderance of colored ministers for two reasons: (1) There is a larger relative church membership; and (2) the colored population has not more than half the density of that of the white in the area under consideration. In the State of Missouri, for example, 735 colored preachers cover the same territory as 3,439 white ministers; and while each of the former has on an average 375 persons to the parish to the latter's 735, yet his geographical area is five times as extensive. If we turn to the States where the negroes predominate, we may expect to find a reversal of conditions. In Mississippi and South Carolina the colored parish is smaller in area but more populous than that of the whites. The clerical demand of the negro population is fully supplied in a numerical sense, albeit there is much need for a higher standard of professional equipment for its most arduous and delicate duties.

In no case has the colored race as many teachers in proportion to the population as the white. In some cases, like South Carolina and Alabama, the disproportion is glaring, the number of persons to each teacher being 217 to 775 in the former, and 262 to 718 in the latter, in favor of the more fortunate race. It must be said, however, that the number of persons to each teacher does not necessarily represent the actual distribution of the work between the races; for it is known that in every Southern State there are white teachers working among colored people. These are mainly in private and philanthropic schools, however, and do not materially affect the general equation, or rather the inequality, of educational conditions. If we take geographical conditions into account, and the fact that the two sets of teachers operate over the same area, it will be seen that the disparity is greatly enhanced. Taking all in all, it appears that the negro teaching force is in no sense adequate to the task imposed upon it.

The colored lawyers and doctors form so small a proportion of the general population as scarcely to merit mention as a professional class. In Texas there is 1 negro doctor in 9,000 and 1 negro lawyer in 40,000 of the population, while in South Carolina there are 22,000 and 29,000 to a colored practitioner in the respective professions. In Alabama there is 1 black doctor to look after 24,000 patients, and each colored lawyer has 52,000 clients. The work in these professions is conducted mainly by the whites, although the Twelfth Census will undoubtedly show a large increase in the colored practitioners. Where numbers are small, proportions are sensitive. The number of persons to each practitioner will be materially reduced. The argument which we sometimes hear that negroes are leaving the farm and the shop to rush into the learned professions is not borne out by the collected facts in the case. In Alabama, for instance, only 1 negro in 50,000 has entered upon the practice of law and 1 in 25,000 upon the profession of medicine. While it is true that there is no large demand for colored men in these professional pursuits, especially outside of the large centers, nevertheless the steady progress of the people in property, intelligence, and diversified material and commercial interests calls for a conservative increase in the number of professional colored men both in medicine and in law.

It can not be claimed that the colored race has developed superlative names in the several professions. There are not a few ministers of piety and eloquence. The teacher in the public service must maintain the average proficiency of the system to the satisfaction of the white superintendents. The negro lawyers are in open competition with their white collaborators, and must render satisfactory service, else they would have no clients. Colored physicians generally have a good record for professional skill and integrity. There is no movement affecting the lot and life of the colored race so suggestive of its educational needs as the size of the professional class.

X. NEGROES WHO HAVE ACHIEVED DISTINCTION ALONG LINES CALLING FOR DEFINITE INTELLECTUAL ACTIVITY.

The individual is the proof of the race, the first unfoldment of its potency and promise. The glory of any people is perpetuated and carried forward by the illustrious names which spring from among them. As we contemplate the great nations and peoples, whether of the ancient or of the modern world, their commanding characters rise up before us, typifying their contribution to the general welfare of the human race. On the contrary, no people can hope to gain esteem and favor which fails to produce distinguished individuals illustrative and exemplary of its possibilities.

For four centuries the African race has been brought in contact with the European in all parts of the globe. This contact has not been of an ennobling character, but of the servile sort, affording little opportunity for the development of those qualities which the favored races hold in esteem. And yet there has arisen from this dark and forbidden background not a few striking individual emanations. This race, through a strain of its blood, has given to Russia her national poet and to France her most distinguished romancer. Toussaint L'Ouverture, the negro patriot, is the most commanding historical figure of the entire West Indian Archipelago. In South America persons of negro blood have gained the highest political and civil renown.

The Anglo-Saxon deals with backward peoples on a different basis from the Latin races. While he has a keener sense of justice and is imbued with a spirit of philanthropic kindness, yet he builds up a barrier between himself and them which it is almost impossible to overcome. To him personal solicitude and good will and racial intolerance are not incompatible qualities. On the other hand, the Latin races, while possessing a much lower order of general efficiency, accept on equal terms all who conform to the prevailing standards. Under the Latin dispensation color offers not the slightest bar to the individual who exhibits high qualities of mind or soul. We need not be surprised, therefore, to find that the colored men who have reached the highest degree of fame should have sprung from the Latin civilization. The persons of African blood who are most nearly comparable with names of the first order of renown among Europeans are Toussaint L'Ouverture, of Haiti; Alexander Pushkin, of Russia; Alexander Dumas, of France. In France, Italy, or Spain color is only a curious incident. The Afro-American therefore belongs in a category by himself. His circumstances and conditions are so different from those of his European brother that although of same color they are not of the same class.

Several lists of distinguished colored men have been prepared, the most important of which, perhaps, was published by Abbé Grégoire, and was prepared to answer the argument of Thomas Jefferson and others, who undertook to prove the negro's intellectual inferiority. This work contains accounts of negroes in all countries who had reached eminence and distinction in all lines of endeavor.¹ An account of the part played by colored men in the Revolutionary war contains the deeds and achievements of noted negroes.² Rev. William J. Simmons brings the former work nearer to date and includes many colored men now living.³ A list of distinguished colored women has also been compiled.⁴

Numerous magazine articles have appeared on this subject from time to time.

¹ De la littérature des Nègres, ou Recherches sur leur facultés intellectuelles, leur qualités morales, et leur littérature; suivies par notices sur la vie et les ouvrages des Nègres qui se sont distingués dans les sciences, les lettres et les arts. Par H. Grégoire. Paris, 1808.

² Colored Patriots of the American Revolution, by William Cooper Nell, with introduction by Harriet Beecher Stowe. Boston, 1855.

³ Men of Mark, 1141 pages, by William J. Simmons, D. D. Cleveland, 1887.

⁴ Women of Distinction, by A. L. Scruggs, M. D. Raleigh, 1893.

The two which are, perhaps, of the greatest importance, and which include the substance of the rest, appeared in the *International Quarterly Review*¹ and in the *North American Review*²

An interesting syllabus has recently been prepared by Mr. A. O. Stafford on "Negro ideals," which gives a good outline of the efforts of the negro toward better things.³

It is with some hesitancy that a few names of the more distinguished Afro-Americans are here presented. In such a restricted list it is inevitable that many should be omitted who are equally worthy as some who are mentioned. The names here presented have not been selected because of general distinction, but rather for technical, artistic, and intellectual achievements in the scholastic sense.

Only those have been included of whose achievements the world takes account. There is no name in the list which may not be found in Appleton's *Cyclopedia of American Biography*. Nothing is great or small except by comparison. The names here presented are at least respectable when measured by European standards. It is true that no one of them reaches the first, or even the second degree of luster in the galaxy of the world's greatness. The competing number has been so insignificant and the social atmosphere has been so repressive to their budding aspirations that it would be little short of a miracle of genius if any member of this race had reached the highest degree of glory. It is true that if not one of these had ever been born the bulk and quality of science, literature, and art would not be appreciably affected.

While these contributors must be measured in terms of European standards in order that there may be a sane and rational basis of comparison, yet there is another measure which takes account of the struggles and strivings out of which they grew. In the light of European comparison it appears that they represent more than the marvelous vision of a one-eyed man among the blind, but rather the surprising visual power of a one-eyed man among two-eyed men. The significance of these superior manifestations, however, must not be measured solely by their intrinsic value. They serve both as an argument and an inspiration. They show the American people that the negro, at his best, is imbued with their own ideas and strives after their highest ideals. To the negro they serve as models of excellence to stimulate and encourage his hesitant and disheartened aspirations.

One will be struck by the versatility and range of the names in the list. They cover well-nigh every field of human excellence. It will be noticed that the imitative and esthetic arts predominate over the more solid and severe intellectual acquisitions. Is this not the repetition of the history of culture? The poet and the artist precede the scientist and the engineer. This meager fruitage does not furnish cause of self-complacent glorification on the past of the negro, but is only an index of the promise of the tree of which they are the initial bearings. With its extended range and scope, the rising generation can look upon them in the light of promise rather than fulfillment.

That which they have done but earnest of the things that they shall do.⁴

Phyllis Wheatley was born in Africa and was brought to America in 1761. She was bought from the slave market by John Wheatly, of Boston, and soon developed remarkable acquisitive faculties. In sixteen months from her arrival she could read English fluently. She soon learned to write, and also studied Latin. She visited England in 1774 and was cordially received. After returning to Boston

³ Hampton Sumner Normal Institute Papers, July, 1901.

⁴ Tennyson's "Locksley Hall."

she corresponded with Countess Huntington, the Earl of Dartmouth, Rev. George Whitfield, and others, and wrote many poems to her friends. She addressed some lines to Gen. George Washington, which were afterwards published in the Pennsylvania Magazine for April, 1776. General Washington wrote a courteous response and invited her to visit the Revolutionary headquarters, which she did, and was received with marked attention by Washington and his officers. Her principal publications are *An Elegiac Poem on the Death of George Whitfield*; *Poems on Various Subjects, Religious and Moral*, published in London in 1773, and republished as *The Negro Equalled by Few Europeans*, two volumes, Philadelphia, 1801. The letters of Phyllis Wheatley were printed in Boston in 1864, collected from the proceedings of the Massachusetts Historical Society.¹

Benjamin Banneker was born November 9, 1731, near Ellicotts Mill, Md. Both his father and grandfather were native Africans. He attended a private school which admitted several colored children along with the whites. Although his early educational facilities were scanty, young Banneker soon gained a local reputation as a miracle of wisdom. In 1770 he constructed a clock to strike the hours, the first to be made in America. This he did with crude tools and a watch for his model, as he had never seen a clock. Through the kindness of Mr. Ellicott, who was a gentleman of cultivation and taste, he gained access to his valuable collection of books, and was thus inducted into the study of astronomy. In this study he gained great proficiency and constructed an almanac adapted to the local requirements of Pennsylvania, Virginia, and Maryland. This was the first almanac constructed in America, and was published by Goddard & Angell, Baltimore. Banneker's Almanac was published annually from 1792 to 1806, the year of his death. It contained the motions of the sun and moon; the motions, places, and aspects of the planets; the rising and setting of the sun, and the rising, setting, southing, place, and age of moon, etc., and is said to have been the main dependence of the farmers in the region covered. He lived mainly from the royalty received from this publication. Banneker sent a copy of this almanac to Thomas Jefferson, which elicited a flattering acknowledgment on the part of the philosopher and statesman. Banneker assisted the commissioners in laying out the lines of the District of Columbia. A life of Banneker was published by Hon. J. H. B. Latrobe, Baltimore, 1845, and another by J. S. Norris, 1854.² That Thomas Jefferson believed in the intellectual capacity of the negro and appreciated the force of the argument that the treatment of this race found justification in its assumed low state of mental possibility is revealed by his letter to Benjamin Banneker, the black astronomer:

SIR: I thank you sincerely for your letter of the 19th instant and for the almanac it contained. Nobody wishes more than I do to see such proofs as you exhibit that nature has given to our black brethren talents equal to those of the other colors of men, and that the appearance of a want of them is owing merely to the degraded condition of their existence, both in Africa and America. I can add with truth that nobody wishes more ardently to see a good system commenced for raising the condition both of their body and mind to what it ought to be as fast as the imbecility of their present existence and other circumstances which can not be neglected will admit. I have taken the liberty of sending your almanac to M. de Condorcet, secretary of the Academy of Sciences at Paris and member of the Philanthropic Society, because I considered it as a document to which your color had a right for their justification against the doubts which have been entertained of them.

I am, with great esteem, sir,
Your most obedient humble servant,

THOMAS JEFFERSON.

Mr. BENJAMIN BANNEKER,
*Near Ellicotts Lower Mills, Baltimore County.*³

¹ See Appleton's Cyclopedia of American Biography, Vol. VI, pp. 449, 450.

³ Jefferson's Works, Vol. III, p. 291.

Lemuel Haynes was born in Hartford, Conn., July 18, 1753. His father was an African, his mother a white woman. He received the honorary degree of A. M. from Middlebury College in 1804. After completing a theological course he preached in various places and settled in West Rutland, Vt., in 1788, where he remained for thirty years and became one of the most popular preachers in the State. He was characterized by a subtle intellect, keen wit, and eager thirst for knowledge. His noted sermon from Genesis 3 and 4 was published and passed through nine or ten editions. His controversy with Hosea Ballou became of world-wide interest. The life of Lemuel Haynes was written by James E. Cooley, New York, 1848.

Ira Aldridge was born at Belaire, Md., about 1810.¹ There is some dispute as to the exact composition of his blood, some claim that he was of pure African descent, while others contend that he was of mixed extraction. He was early brought in contact with Mr. Kean, the great tragedian, and in 1826 accompanied him to Europe. Mr. Kean encouraged his dramatic aspiration, and on one occasion, at least, permitted him to appear as Othello, while he himself took the part of Iago. As an interpreter of Shakespeare he was very generally regarded as one of the best and most faithful. He appeared at Covent Garden as Othello in 1833, and in Surrey Theater in 1848. On the Continent he ranked as one of the greatest tragedians of his time. Honors were showered upon him wherever he appeared. He was presented by the King of Prussia with the first-class medal of arts and sciences, accompanied by an autograph letter from the Emperor of Austria; the Grand Cross of Leopold; a similar decoration from the Emperor of Russia, and a magnificent Maltese cross, with the medal of merit, from the city of Berne. Similar honors were conferred by other crowned heads of Europe. He was made a member of the Prussian Academy of Arts and Sciences and holder of the large gold medal; member of the Imperial and Arch Ducal Institution of Our Lady of the Manger in Austria; of the Russian Hof-Versammlung of Riga; honorary member of the Imperial Academy of Arts and Sciences in St. Petersburg, and many others. Aldridge appeared with flattering success in Amsterdam, Brussels, Berlin, Breslau, Vienna, Pesth, The Hague, Dantzic, Konigsberg, Dresden, Berne, Frankfort-on-the-Main, Cracow, Gotha, and numerous other cities in the leading parts of the standard plays of the times. He was an associate of the most prominent men of Paris, among whom was Alexander Dumas. When these two met they always kissed each other, and Dumas always greeted Aldridge with the words "mon confrère." Aldridge died at Lodz, in Poland, 1867.

Col. George W. Williams was born in Pennsylvania in 1849. He was educated in public and private schools and completed his theological training at West Newton Theological Seminary. His *History of the Negro Race in America* is the sole existing authority on the subject of which it treats, and forms, without doubt, as valuable a literary monument as any yet left by a colored man.

Paul Laurence Dunbar is still a young man under 30 years of age. He has already made an impression on American literature that can never be effaced. He has published *Oaks and Ivy*, *Majors and Minors*, *Lyrics of Lowly Life*, and *Lyrics of the Hearthstone*, together with half a dozen volumes of fiction and short stories. Several of his works have been reprinted in England. Speaking of his early poems, William Dean Howells says: "Some of these [poems in literary English] I thought very good. What I mean is, several people might have written them, but I do not know anyone else at present who could quite have written his dialect pieces. There are divinations and reports of what passes in the hearts and minds of a lowly people whose poetry had hitherto been inarticulately

¹ There is some dispute as to the exact date of his birth; 1804 is the time given by Simmons in *Men of Mark*.

expressed, but now finds, for the first time in our tongue, literary interpretation of a very artistic completeness."¹

Henry O. Tanner, son of Bishop B. T. Tanner, of the African Methodist Church, was born in Pittsburg, Pa., in 1859. His early educational opportunities were good, having studied at the Pennsylvania Academy of Fine Arts, and subsequently at Paris. His pictures have been hung on the line in many a salon exhibition, and now the Government of France has crowned the long list of medals and prizes which Mr. Tanner has received by buying one of his most important works, *The Raising of Lazarus*, for the Luxemburg Gallery. The picture has already been hung in the Luxemburg Gallery, and in the course of time will naturally be transferred to the Louvre. Other notable pictures by the same artist are *Nicodemus*, owned by the Academy of Fine Arts, Philadelphia; *The Annunciation*, which now hangs in the Memorial Hall, Philadelphia; the *Betrayal*, in the Carnegie Gallery, at Pittsburg.²

Dr. Daniel H. Williams, of Chicago, is widely known throughout the medical profession. He has performed several noted operations that taxed the skill of surgical science.

In 1897 Dr. Williams performed an operation on account of a stab wound of the heart and pericardium, a report of which was published in the *Medical Record*, March 27, 1897, attracted the attention of the entire medical and surgical fraternity, and was published in the medical journals of nearly every country and language. It has also been referred to in most recent works on surgery, especially in *International Text-Book on Surgery* and *Da Costa's Modern Surgery*.

An article on "Ovarian cysts in colored women," by Dr. Williams, published in the *Philadelphia Medical Journal*, December 29, 1900, had for its purpose the refutation of the idea that had been almost universal among surgeons, that colored women did not have ovarian tumors. The record of the cases collected by Dr. Williams furnishes sufficient data to sustain his contention. It is also shown in this article that the same may be said of fibrous tumors. This article has been considered of such value to the profession that it has been copied extensively in medical literature and notably in some of the best German and French medical journals.

Dr. Williams has performed various important operations that have been published in medical journals and widely commented upon in the medical world. He was surgeon in chief of the Freedmen's Hospital, at Washington, D. C., from 1893 to 1897.

Charles W. Chestnut was born in Fayetteville, N. C., about fifty years ago. He moved to Cleveland, Ohio, where he was employed as court stenographer. Mr. Chestnut has written several works of fiction which, according to competent critics, place him among the foremost story tellers of the time. *The Wife of My Youth*, *The House Behind the Cedars*, and *The Marrow of Tradition* are published by Houghton, Mifflin & Co., Boston, Mass.

Prof. W. S. Scarborough was born in Georgia in 1852, was graduated from Oberlin College in 1875, and is professor of Greek at Wilberforce University. He is a member of the American Philological Society and of the Modern Language Association. He has published *First Lessons in Greek* (New York, 1881), and the *Theory and Functions of the Thematic Vowel in the Greek Verb*.

Prof. W. E. B. Du Bois was born in Massachusetts about thirty-three years ago. He was graduated from Fisk University and subsequently from Harvard, after which he studied two years in Germany and earned his Ph. D. degree from Harvard. He has been a teacher in Wilberforce University, associate in sociology at the University of Pennsylvania, and professor of history and political economy at Atlanta University. His chief works are *The Suppression of the African Slave*

¹ Introduction to *Lyrics of Lowly Life*, by W. D. Howells.

² See "A negro artist of unique power," by Elbert Frances Baldwin, *Outlook*, April, 1900.

Trade, published in the Harvard Historical Series; The Philadelphia Negro, published under the auspices of the University of Pennsylvania, and numerous special studies and investigations that have appeared in the proceedings of the Atlanta conferences and the bulletins of the Bureau of Labor, as well as sundry magazine articles. Mr. Du Bois has done more to give scientific accuracy and method to the study of the race question than any other American who has essayed to deal with it.

It is generally believed that while the negro possesses the imitative he lacks the initiative faculty; that while he can acquire what has already been accumulated, he can not inquire into the unrevealed mystery of things. As an illustration of how easy it is for the achievements of the negro to escape his fellow-colaborers, the following incident may be regarded as typical. The Patent Office sent out circulars inquiring as to the number and extent of colored patentees. One of the leading patent attorneys responded that he had never heard of the negro inventing anything except lies; yet the Patent Office record reveals 250 colored patentees and more than 400 patents. Many of these show the highest ingenuity and are widely used in the mechanical arts.

Granville T. Woods was born in Ohio, and is 44 years old. He has more than twenty patents to his credit. Mr. Woods is the inventor of the electric telephone transmitter, which he assigned to the American Bell Telephone Company for a valuable consideration, said to amount to \$10,000. This transmitter is used in connection with all the Bell telephones.

Elijah T. McCoy, of Detroit, Mich., has taken out 30 patents, mainly devoted to the improvement of lubricating devices for stationary and locomotive machinery. His inventions are in general use on locomotive engines of leading railways in the Northwest, on the lake steamers, and on railways in Canada.

There are numerous colored people who have achieved distinction in fields calling for practical energy, moral courage, sound intelligence, and intellectual resource. Mr. Frederick Douglass and Prof. Booker T. Washington are, in general average of distinction, the most renowned of their race, although their fields of exertion are not mainly intellectual, in the academic sense of the term—and yet Mr. Douglass was one of the most eminent American orators, and his autobiography forms an integral part of the literature of the antislavery struggle; and Mr. Washington's *Up from Slavery* is one of the most popular books printed in the first year of the twentieth century. As Mr. Douglass's life is woven in the warp and woof of the great epoch ending in the civil war, so Mr. Washington's life and work have become a vital part of current educational literature, and his place in the history of education is assured.

1480. *Mirror of the World* (Caxton's translation):

Hier begynneth the book called the myrroure of the worlde, etc. (W. Caxton: Westminster, 1480.) fol.

The myrroure and descrypcyon of the Worlde, etc. (reprinted with some alterations from W. C.'s translation). (1527?) fol.

Thymage, or Myrroure of the Worlde. Emprysed and Fynyshed in the xvi year of the regne of the most crysten Kyng, Kyng Edward the fourth.

The following chapters are of educational import:

	Cap.
Wherefore and how the vii Arts liberal were found, and of their order	v
Of three manner of people, and how clergy came first into France	vi
And first it speaketh of grammar	vii
After of logie	viii
And after of rhetoric	ix
And after of <i>ars metrike</i> , and whereof it proceedeth	x
After of geometry	xi
After of music	xii
And then of astronomy	xiii

Similarly in the work ascribed to John Lydgate: *The Werks (or Court) of Sapience*, 1510, 4°, there is a "distinct survey throughout the palace and domains of Sapience, of all the products of nature, in distinct chapters, and of arts and sciences; with further reference at the end of each to the authors who have written on them."

1484. La Tour Landry (Geoffroy de).

*Begin. Here begynneth the book whiche the knyght of the toure made, and speketh of many fayre ensamples and thensygnementys and techyng of his doughters (translated oute of Frenssh in to * * * Englysshe by W. Caxton) B. L. enprynted at Westmynstre (by W. Caxton), the last day of Ianyuer the fyrst yere of the regne of Kyng Rychard the thyrd, (1484). fol.*

(Reprinted in the E. E. T. S.'s publications, ed. by Thomas Wright, M. A., F. S. A., 1868.)

Written by Geoffroy de la Tour Landry in 1371 for his three daughters, it is essentially a "treatise on the domestic education of women." La Tour Landry had previously written a parallel book for the right bringing up of young men. Many of the stories which are given to incite to good conduct or to give a warning against bad conduct are taken from the Scriptures or from the lives of saints. Other stories are taken from popular tales. The collection of "ensamples" brings out very clearly the ideal of women's education at the time. The knight was assisted in his work by two priests and two clerks. The book was very popular. The first edition in English was printed by William Caxton, as stated above, in 1484.

There are sections of great interest in connection with women's education in—

Womankind in Western Europe, from the earliest times to the seventeenth century, by Thomas Wright. London, 1869. 4to.

Miss A. T. Drane, in her interesting account of "English Education in the Fourteenth Century," in *Christian Schools and Scholars*, gives the following summary of the rules for the regulation of his household drawn up by Elzear:

Every one in my family shall daily hear Mass. Let no one curse, swear or blaspheme, under pain of chastisement. Let all persons honour chastity, for no impure word or deed shall go unpunished in the house of Elzear. The men and women shall confess their sins every week, and communicate every month, or at the least at the chief festivals, viz. Christmas, Easter and Pentecost, and on the feasts of our Lady. No one shall be idle, but in the morning after prayers, let all go to their work, the men abroad, the women at home. The life of the pious woman is not merely to pray, but to ply her work, and take care of her household. Therefore, the ladies shall read and pray in the mornings, and afterwards spend their time in useful work of some kind. Every evening all my family shall assemble for a pious conference, in which they shall hear something said for the salva-

tion of their souls. And let none be absent on pretence of attending to my affairs. I have no affairs so near my heart as the salvation of those who serve me. I will have no playing at dice or games of hazard; there are plenty of innocent diversions, and time passes soon enough without being thrown away; yet I do not wish my castle to be a cloister, nor my people hermits. Therefore let them be merry but without offending God. If any quarrel fall out, let not the sun set before it be appeased. And I strictly command all under my jurisdiction to hurt no man in goods, honour, or reputation.

Miss Drane holds that this household-education of Elzear, and Delphina his wife, was not exceptional, but rather the type of that of most of the knightly houses, in which numbers of youth were received to be brought up. Dr Furnivall, in his *Forewords to Manners and Meals in Olden Times*, for the Early English Text Society (1867), gives a number of instances taken from English history. The account of the lives of Elzear and his wife appeared in English in—

*The Lives and singular virtues of Saint Elzear, Count of Sabran, and of his wife, the blessed Countesse Delphina * * * Written in French by R. F. Stephen Binet, S. J. and Translated into English by Sr T. H. Lond. 1638. 8vo. (I. e., Sir Thomas Hawkins.)*

Further accounts of early education in England will be found in Thomas Wright's *The Homes of Other Days: a History of Domestic Manners and Sentiments in England from the earliest known Period to Modern Times*. Lond., 1871.

Robert Henry in his *History of England* gives sections at the end of each period dealing with the learning and education of the period.

For English Home Life and Education in later times see Henry Barnard's *English Pedagogy*, 2nd Series pp. 369-400.

1486. Bernes (Juliana).

The Gentleman's Academie or The Booke of S. Albans. Compiled by J. B.

Printed by the Schoolmaster at S. Albans, 1486. Revised by Gervase Markham 1595. 4to.

(Fac-simile reprint, ed. by Wm Blades, published by Eliot Stock, London, 1881.)

The first two sections—on Hawking and Hunting—may be described as the first English treatise on courses of physical training. It is indeed curious that the first book on men's sports should be by a woman, Dame Juliana Bernes. Very little is known of this lady. She probably lived at the beginning of the 15th century. Though no doubt great credit is due to Dame Bernes for her treatises (on Hawking, Hunting and Heraldry, and, in a separate volume, on Fishing), yet they are probably founded on earlier writings. Mr Blades, very justly, drew attention to the similarity between Dame Bernes's opening verses on hunting and some lines in a small MS in the Bodleian:

Bodleian MS.

Mi dere sones, where ye fare, be frith or by fell,
Take good hede in his tyme how Tristam wol tell.

Dame Bernes.

Wheresoever ye fare, by frith or by fell,
My dear child, take heed how Tristam doth you tell.

The authoress, in the treatise on Hunting, gives an account of different kinds of beasts, and a very full nomenclature. There is also a dialogue between the master of the hunt and his man. It is worth noting that throughout the book, remarks are addressed to "my deare childe". "Do so, my child". "Think what I say, my son". "My lief childer", and so on. Clearly, as Mr. Blades points out, the portions where such expressions occur were written "for a mother to use as a school-book, which her son would learn to read, and at the same time, become familiar with the terms of venery".

As illustration of the connexion of treatises such as these with the school, it may be mentioned:

1. The schoolmaster printer supplies the "Prologues" to the Book of Hawking, the Book of Hunting, and the Book of Coat Armour.

2. The Bodleian MS, quoted above, contains as colophon, *Explicit, explicat, ludere scriptor eat*, giving plausibility to the conjecture that the MS was "copied by a youth".

1520. Child.

Here begynneth a lytell treatyse called the wyse chylde of thre yere olde. The infant sage beyng of thre yeres of age demaunded by Adryan Emperoure. The whiche hym answered unto everythinge he asked. B. L. Imprynted in london in Fletestrete at the sygne of the Sonne by Wynkyn de Worde (1520?) 4to.

This is a short book of little more than nine pages. Answers are given by a child of three years to questions put by the Emperor Adrian. There is no idea of appropriateness to the age of the child in the answers given, but some insight is afforded as to what knowledge was considered of most worth. One of the earliest questions asked is to explain the Trinity. The child explains by reference to the sun (curiously enough Wynkyn de Worde's sign), which contains substance, shining, and heat. The following are amongst the subjects of enquiry: Time of creation of world; chance of salvation for merchants (little); for labourers (great); number of ways a man may be saved (baptism, martyrdom, confession and penance, tears weeping, alms-deeds, indulgences, works of mercy); creation of woman; growth of the soul; the hour at which Adam ate of the forbidden tree; number of languages in the world (seventy-two is the answer, why that number is not explained); who made the first church (S. Paul); Noah's ark; the present position of the ark (in Armenia); the greatest gift ever asked by man (the body of Christ, asked by Joseph of Arimathea); the reasons for fasting on Friday (seven); the ways in which a man may be damned (four, viz., negligence, anger and open sin, doubt as to troubling over amending his sins, and to be constantly in sin); the first to sing mass (Melchisedech); the composition of man (five things "principally," viz.: the flesh is made of the slime of the earth, the blood of the water of the sea, the bones of the stones, the breath of the wind, and the soul of the Holy Ghost). The child also states the main positions of the Apostles' Creed. 1527. *Coleti Aeditio*, of the Introduction to the Latin Grammar, commonly called Lily's Latin Grammar.

John Colet is so well-known as the founder of St. Paul's School, that everyone feels sure he has only to look up his name in a catalogue to see his works. As a matter of fact, he left very little. The Rev. J. H. Lupton has assiduously and worthily gathered the little together, and published it; but Colet wrote no educational treatise. To what is known as the *Coleti Aeditio* of 1527, Colet contributed the following:

A LYTELL PROHEME TO THE BOKE.

Albeit many have written and have made certain introductions in to Latin speech, called Donates and Accidens, in Latin tongue and in English, in such plenty that it should seem to suffice. Yet nevertheless for the Love and the Zeal that I have unto the new school of Paul's, and to the children of the same, somewhat I have also compiled of the matter, and of the VIII parts of grammar, have made this little book, not thinking that I could say any thing better than hath been said before, but I took this business, having great pleasure to show the testimony of my good mind unto the school. In which little work if any new things be of use, it is alonely that I have put these parts in a more clear order and have made them a litle more easy to young wits than (methinketh) they were before. Judging that no thing may be too soft nor too familiar for little children, specially learning a tongue unto them all strange. In which little book I have left many things out of purpose, considering the tenderness and small capacity of little minds: and that I have spoken, also, I have affirmed it none otherwise but as it happeth most commonly in Latin tongue. For many be the exceptions, and hard it is anything generally to assure in a speech so various. I pray God all be to his

honour, and to the erudition and profit of children, my countrymen, Londoners especially, whom digesting this little work I had always before mine eyes, considering more what was for them than to show any great cunning, willing to speak the things often before spoken in such manner as gladly young beginners and tender wits might take and conceive. Wherefore I pray you, all little babes, all little children, learn gladly this little treatise, and commend it diligently unto your memories. Trusting of this beginning that ye shall proceed and grow to perfect literature, and come at the last to be great clerks. And lift up your little white hands for me, which prayeth for you to God. To whom be all honour and imperial majesty and glory. Amen. Prologi finis.

As Colet is a prominent figure in the education of his period, though he wrote so little on education, I give the following references:

1. *A life of John Colet, D. D., Dean of S. Paul's and Founder of S. Paul's School. With an Appendix of some of his English Writings, By J. H. Lupton, M. A., Surmaster of S. Paul's School. London. George Bell and Sons, 1887.*

In an Appendix to this book are *The Statutes of S. Paul's School*, as drawn up in John Colet's words; and Colet's *Catechism* and *Articles of Admission* to S. Paul's School.

2. *The Life of Dr. J. Colet*, by S. Knight. 1724.
3. *The Oxford Reformers; John Colet, Erasmus, and Thomas More.* By F. Seebohm. 3rd ed. 1887.
4. *Erasmus's Lives of Vitrier and Colet.* Written in Latin. Translated, with notes, by J. H. Lupton. George Bell and Sons. 1883.

1529. Erasmus (Desiderius). 1466–1536.

(Born at Rotterdam, 1466. Educated at Deventer (under Hegius, who had learned Greek from Rodolph Agricola). Entered upon the novitiate at Stein, near Gonda, and afterwards ordained priest. Became secretary to the Bishop of Cambrai. He soon left to become a student in the University of Paris. He came to England in 1497, and for the next three years lived in Oxford. He then is found moving continually between France and Holland, and with constant difficulty warding off poverty. In 1506 he is again in England, in London and at Cambridge. Later in the year he visits Italy, where he stays till 1509. He then returns to England as the guest of Sir Thomas More, and later removes to Cambridge, where he becomes Lady Margaret's professor of divinity and afterwards Regius Reader of Greek. In 1513 he left England and went to Strasburg and to Basel. In 1520 Erasmus settled at Basel as general editor and literary adviser to Froben's press. He helped to make this press the most important in Europe for a time. In 1527 Froben died, and in 1529 Erasmus moved to Freiburg. He returned to Basel in 1535 and died 1536.)

For the life of Erasmus in detail, the following books may be consulted:

- Jortin. *Life of Erasmus.* London. 1748. 4to.
- Knight, Samuel. *Life of Erasmus.* Cambridge. 1726. 8vo.
- Burigny, Jean Lévesque de. *Vie d'Érasme.* Paris. 2 vols. 1757. 12mo. Dans laquelle on trouvera l'histoire de plusieurs hommes célèbres avec lesquels il a été en liaison, l'analyse critique de ses ouvrages, et l'examen impartial de ses sentimens en matière de religion.
- Seebohm, F. *Oxford Reformers.* London. 1887.
- Drummond, R. B. *Erasmus: his Life and Character.* London. 1873. 2 vols. 8vo.

There are two collected editions of his works, viz.

1540. Basel. In 9 volumes, fol.
- 1763-6. Lugd. Bat. In 10 volumes fol. (Ed. Le Clerc.)

In the British Museum Catalogue the epitomised Index has reference to 266 different works of Erasmus, and the Catalogue entries of editions of separate works run to 58 printed columns.

Besides the books described hereafter, the following books or booklets of Erasmus are in the British Museum Catalogue and have some bearing, more or less, on education (they were not translated into English): *Adhortatio ad Christianæ philosophiæ studium* (or *Paraclesis*), *Catechismus*, *Christiani principis institutio*,

Ciceronianus dialogus, Life of Colet, Concio de puero Jesu, Libellus de constructione, Copia verborum, De conscribendis epistolis, De duplici copia verborum et rerum, De ratione studii, De civilitate morum puerilium, De pueris ad virtutem instituendis, De recta Latini sermonis pronuntiatione, Epicureus, Ratio colligendi exempla, Institutum Christiani hominis, Lingua, Militis Christiani enchiridion, Octo orationis partium constructio, Parabola sive similitium liber, Syntaxis, Annotationes in Testamentum Novum, Life of Vitrier.

The letters of Erasmus, of course, are of very high importance in the educational as well as the general literary history of the time. As an illustration of the side light they afford on the history of education at that period, I would quote the words with which the Cambridge M. A. answered Erasmus when the latter was endeavoring to get an assistant master for Colet's school, "Who would endure to be a schoolmaster who could possibly manage to get a living any other way?"

Whereupon Erasmus modestly urged that he thought the education of youth was the most honourable of all callings, and that there could be no labour more pleasing to God than the Christian training of boys. At which the Cambridge doctor turned up his nose in contempt and scornfully replied, "If anyone wants to give himself up entirely to the service of Christ let him enter a monastery." Erasmus ventured to question whether St. Paul did not place true religion rather in works of charity—in doing as much good as possible to our neighbours? The other rejected altogether so crude a notion. "Behold," said he, "we must leave all; in that is perfection." "He scarcely can be said to leave all," promptly returned Erasmus, "who, when he has a chance of doing good to others, refuses the task, because it is too humble in the eyes of the world." "And then," wrote Erasmus, "lest I should get into a quarrel I bade the man good-bye."—Seebohm: Oxford Reformers, p. 221.

Here is an example in much more detail. Erasmus, in one of his letters to Dean Colet (in whose new school of S. Paul's he was deeply interested), described his idea of the schoolmaster's academic equipment:

In order that the teacher might be thoroughly up to his work, he should not merely be a master of one particular branch of study. He should himself have travelled through the whole circle of knowledge. In philosophy he should have studied Plato and Aristotle, Theophrastus and Plotinus; in theology the Sacred Scriptures, and after them Origen, Chrysostom, and Basil among the Greek fathers, and Ambrose and Jerome among the Latin fathers; among the poets Homer and Ovid; in geography, which is very important in the study of history, Pomponius Mela, Ptolemy, Pliny, Strabo. He should know what ancient names of rivers, mountains, countries, cities, answer to the modern ones; and the same of trees, animals, instruments, clothes, and gems, with regard to which it is incredible how ignorant even educated men are. He should take note of little facts about agriculture, architecture, military and culinary arts, mentioned by different authors. He should be able to trace the origin of words, their gradual corruption in the languages of Constantinople, Italy, Spain and France. Nothing should be beneath his observation which can illustrate history or the meaning of the poets. But you will say what a load you are putting on the back of the poor teacher! It is so; but I burden the one to relieve the many. I want the teacher to have traversed the whole range of knowledge, that it may spare each of his scholars doing it. A diligent and thoroughly competent master might give boys a fair proficiency in both Latin and Greek in a shorter time and with less labour than the common run of pedagogues take to teach their babble.—Seebohm: Oxford Reformers, p. 217-8.

Erasmus (Desiderius).

An exhortation to the diligent studye of scripture made by Erasmus. And translated into inglissh (by W. Roy). B. L. Hans Luft; Malborow in the lande of Hesse, 1529. Svo. Another edition: R. Wyer. (London, 1540?)

This exhortation was prefixed to Erasmus's Paraphrase of S. Matthew's Gospel. It is a plea for the study of the Scriptures by all, learned and unlearned. To the learned he says:

Plato's adherents, Pythagoras' scholars, the Academics, the Stoics, Epicures, the fautores [flatterers] of Aristotle and disciples of Diogenes know groundly [thoroughly], yea and by heart, the traditions of their own sect. And fight most fiercely for them, ready rather to die than to forsake their patron and author. And why

do we not much more give our minds and studies, unto our maister and prince Christ, who wolde not count it a foul thing yea a great rebuke to him that professeth Aristotle's philosophy if he be ignorant what his maister judgeth concerning the causes of the thunder, of the rainbow, of the earthquakes, and of such other natural causes. * * * Howbeit for what intent use we this comparison, since it is extreme madness to compare Christ with Zeno and Aristotle and his heavenly doctrine with their trifling traditions.

To those who are not learned he says:

I would to God the ploughman would sing a text of the Scripture at his plough-beam. And that the weaver at his loom with this would drive away the tediousness of time. I would the wayfaring man with this pastime would expell the weariness of his journey. And to be short, I would that all the communication of the Christian should be of the Scripture, for in a manner such are we ourselves as our daily tales are.

The warm, enthusiastic catholic spirit of such words as these are in marked contrast to that of the man who would not lend Erasmus his copy of Suidas.¹ It is the readiness to communicate the best that is in him to all, even the ploughman, the weaver, the wayfaring man, that marks the in-coming of the modern spirit of education. Erasmus felt it, and such words as the above are a statement of it. He pleads for education not only to be given to the humblest, but to begin with infancy.² He offers thus an interesting parallel to Comenius, in both ideas.

The Colloquia of Erasmus. 1519, editio princeps.

By far his most popular, his best known, and after the *Moria* his most characteristic work, a book once literally known to every school-boy, inasmuch as it was universally used as a Latin lesson-book, and which will always continue to be read by all lovers of excellent humour, as well as by every one who would understand the spirit and recall the manners of the early part of the sixteenth century.—R. B. Drummond, *Erasmus: His Life and Character*, Vol. ii, p. 151-2.

Method of composition.—Some were youthful exercises for the improvement of style; others were dictated as I walked up and down, thinking of nothing less than of publication. Some were written for the benefit of backward pupils. Of this kind were the Colloquies, which one Helenius obtained—I know not how, for I never had a copy by me—and sold at a high price to John Froben, pretending there were other printers who wanted to buy them.—*Letters of Erasmus*, 1536.

The Colloquies was first printed in 1519, and was a mere pamphlet. By successive additions, in 1530 it became of a considerable size. It was written at first for the benefit of Froben's son, Erasmus.

As it now lies before us, it consists of a large number of conversations on a great variety of subjects, whose easy flow and natural, graceful manner are not the least of their charms, full of delicate humour, keen irony, biting satire, elegant criticism, and lively description, wherein now a text of Scripture, now a passage from the classics, is made the subject of discussion, now some folly turned into ridicule, now some superstition exposed, while occasional autobiographical touches or allusions to contemporaneous persons or events lend a great additional interest.—Drummond: Vol. I, p. 153-4.

It is by reference to such a book as this that one sees the religico-classical influence of the Renaissance unconsciously displayed. For instance, Erasmus says he had never read Cicero on Old Age, or Friendship, or the Offices, or the Tusculan Questions, "without pausing now and then to kiss the page and pay homage to that holy soul whom God's spirit has so manifestly possessed." And again, after quoting a passage from Socrates, one of the speakers in a dialogue says: "When I read such passages as these, I can scarcely keep myself from saying, *Sancte Socrates, ora pro nobis.*" (Quoted by Drummond.)

English Editions of the Colloquia:

1. Colloquiorum * * * Familiarum opus aureum. (Edited by J. Clarke.) London, 1676. 8vo. Also 12mo, 1697.

¹ See p. 870.

² See pp. 873-4.

English Editions of the Colloquia—Continued.

2. Colloquiorum * * * familiarum opus aureum. (Edited by S. Patrick.) London, 1773. Svo.
3. The Colloquies; or, familiar discourses of D. Erasmus * * * rendered into English * * * By H. M., Gent. London, 1671. Svo.
4. All the familiar colloquies of D. Erasmo * * * translated into English. By N. Bailey. London, 1725. Svo. Also 1733.

Reprints of Bailey's translation:

1. Glasgow, 1877. Svo.
2. Ed. by E. Johnson, 2 vols. London and Boston, England, 1878. Svo. This is decidedly the best edition in English.

Selections:

1. Studium Pietasque Puerilis ex D. Erasmus. 1530. Svo.
2. D. Erasmi Colloquia familiaria selecta * * * In usum scholarum, pp. 142. Perthensi, 1791. 12mo.
3. Desiderii Erasmi Colloquia duo. (Edited by C. H. O. Daniel.) Oxonii. (1880.) 16mo.
4. Epitome Colloquiorum Erasmi. London, 1557. Svo.
5. Epitome Colloquiorum Erasmi continens in se communiores quotidiani sermonis formulas, nunc denuo in puerorum usum editas. Excudebat J. Harrison, impensis Roberti Dexter. Londini, 1602. Svo. Also editio novissima, R. Daniel, Cantabrigiæ, 1634.
6. Erasmi Colloquia selecta, or the select colloquies of Erasmus with an English translation, by J. Clarke. Lat. & Eng. Nottingham, 1720. 12mo. Also 1725? 1727, 1736, 1742, 1752, 1785 (R. Raikes, Gloucester), Philadelphia, 1804.
7. Erasmi Colloquia selecta: arranged for translation and retranslation; adapted for the use of boys, who have begun the Latin Syntax. By E. C. Lowe. pp. XII, 192. Oxford and London, 1866. Svo.
8. Two dyaloges wrytten in laten by the famous clerke D. Erasmus of Roterdame, one called Polyphemus * * * the other dysposying of thynges and names, translated in to Englyshe by E. Becke. B. L. Canterbury (1550). Svo.
9. Seven dialogues both pithie and profitable * * * Compiled first in Latine by * * * Erasmus, and now * * * translated into English by W. B[urton]. B. L. London, 1606. 4to.
10. Pleasant dialogues and drama's, selected out of * * * Erasmus, &c. 1637. 12mo.
11. Twenty select Colloquies out of Erasmus * * * pleasantly representing several superstitious levities that were crept into the Church of Rome in his days. Made english by R. L'Estrange. London, 1680. 12mo.
12. Twenty-two select Colloquies out of Erasmus, 2nd edit., corrected and amended, of above. 1689. Also 1699, 1711, 1725.
13. Seven new Colloquies translated out of Erasmus. By Mr. Brown. London, 1693. 12mo.
14. Selections from the Colloquies. Edited by V. S. Clark, with notes and vocabularies. Ginn & Co., Boston, U. S. A. pp. xiii, 197. Svo.

It is interesting to add that the German educationist, J. B. Basedow, edited an edition, entitled:

Encyclopædia philanthropica Colloquiorum Erasmi. Dentis illis partibus quæ erant adolescentium nocivæ. Svo. pp. x, 324. Lipsiæ, 1775.

SUBJECTS OF THE COLLOQUIES.

Colloquies of Erasmus. London, 1578. Vol. I. (Bailey's translation.)

Subjects: Courtesy in Saluting, Family Discourse, Of Rash Vows, Of Benefice-Hunters, Of a Soldier's Life, The Commands of a Master, The Schoolmaster's Admonitions, Of Various Plays, The Child's Piety, The Art of Hunting, Scholastic Studies, The Profane Feast, The Religious Treat, The Apotheosis of Capnio, A Lover and Maiden, The Virgin averse to Matrimony, The Penitent Virgin, The Uneasy Wife, The Soldier and Cartusian, Philetymus and Pseudocheus, The Shipwreck, Diversoria, The Young Man & Harlot, The Poetical Feast, An Enquiry concerning Faith, The Old Men's Dialogue, The Franciscans, *Πτωχολούσιοι*, or Rich Beggars, The Abbot & Learned Woman, The Epithalamium of Petrus Ægidius, The Exorcism or Apparition, The Alchemist, The Horse-Cheat, The Beggars' Dialogue, The Fabulous Feast, The Lying in Woman.

In the dialogue on The Schoolmaster's Admonitions, the boy is instructed as to the modesty, civility, and manners becoming his age, in what posture he ought to stand while he talks to his superiors; and what concerns habit, discourse, and behaviour at table and in school. In the dialogue Of Various Plays, the boys send Cocolus, their messenger, to the master to get leave to go to play. Heshews that moderate recreations are necessary for mind and body. The master admonishes boys to keep together at play. Then are discussed stool-ball, bowls, ball and ring, dancing, leap-frog, running, swimming. A further dialogue takes up Hunting. The Child's Piety gives views on religious education, here inspired by the Scholastic Studies, treats of the whipping master, saying a lesson, fear hurts the memory, of writing, and of making a (quill) pen. In The Abbot & the Learned Woman, the latter is praised for reading Latin and Greek rather than confining herself to French.

Colloquies of Erasmus. London, 1578. Vol. II. (Bailey's translation.)

Subjects: The Religious Pilgrimage, *Ἰχθυοφαγία*, The Funeral, The Echo, The Unequal Feast, Of Things and Words, Charon, The Assembly of Grammarians, The Unequal Marriage, The Imposture, Cyclops or the Gospel Carrier, The Impertinents or Cross-Purposes, The False-Knight, The Play of Cockall, The Assembly or Parliament of Women, Diluculum or the Early Rising, The Sober Feast, The Notable Art, The Sermon or Merdardus, The Lover of Glory, Opulentia Sordida or the Wealthy Miser, The Seraphick Funeral, Amicitia or Friendship, Problema, the Problems, The Epicurean, The Conflict between Thalia and Barbarism, Concerning the Profitableness of Colloquies, Of the Method of Study.

In Of Things & Words Erasmus, a hundred years before Comenius, exposes "the preposterous judgments of some people who are more ambitious of names than they are of the things themselves, to be esteemed than to deserve esteem," but he deals rather with the abstract than the concrete, e. g., name of a liar and thief. The Assembly of Grammarians ridicules the pretensions of hair-splitters about words. The Notable Art derides the vain boastingness of a bold pretence of a certain book promising the knowledge of languages and science in fourteen days' time. In The Conflict between Thalia and Barbarism Erasmus inveighs against the barbarous Latin in those days, commonly allowed and approved, particularly in a great school or college at Zwoll, a town twelve miles from Daventer, where, instead of pure Latin authors, the scholars were put to learn books stuffed with inelegancies and barbarisms. The Method of Study gives such advice as the following:

By no means have your study furnished with learned books, and be unlearned yourself * * *. If you are in doubt of anything, don't be ashamed to ask: or if you have committed an error, to be corrected. Avoid late and unseasonable studies, for they murder wit, and are very prejudicial to health. The Muses love the morning and that is a fit time for study. After you have dined, either divert yourself at some exercise or take a walk and discourse merrily, and study between whiles * * *. Always keep this sentence of Pliny's in your mind, "All that time is lost that you don't bestow on study."

Erasmus (Desiderius).

De Civilitate Morum puerilium per Des. Erasmum. Roterodamum libellus nunc primum et conditus et editus. Roberto Whitintoni interprete. A lytel booke of good maners for chyl dren newe lately compyled and put forth by Erasmus Roterodam in Latin tongue, with interpretation by Robert Whityngton laureate poet. Wynkyn de Worde, 1532.

One of the many books of manners of the period, as to which consult Dr. F. J.

Furnivall's book (Forewords and Text) on *Manners and Meals in Olden Time*—one of the publications for the Early English Text Society. Trübner, 1867.

Erasmus (Desiderius).

Proverbs or adagies with neue addicions gathered out of the Chiliades of Erasmus by R. Taverner. Hereunto be also added Mimi Publani. B. L. Imprinted in Flet-strete at the sygne of the whyte Harte, London, 1539. 8vo. Also 1552.

Later editions in English:

Adagia, in Latine and English, contayning fyve hundreth proverbs. (Selected from the Chiliades of Erasmus.) E. Raban, Aberdeen, 1622. 8vo.

Proverbs, chiefly taken from the Adagia of Erasmus with explanations; and further illustrated by corresponding examples from the Spanish, Italian, French and English Languages. By R. Bland. 2 vols. London, 1814. 8vo.

These are small selections from the large folio Adagia of Erasmus published by Aldus at Venice in 1508. The Aldine edition is not the first, for the Adagia had been published at Paris in 1500, but in a much shorter form. In the earliest form it consisted of some 800 proverbs, but in the later of 4151. Mr. R. B. Drummond (Vol. I, Cap. X) gives a long and very interesting account of the book and its compilation. In it he says:

What a boon it must have been to the student in an age when books were rare and expensive, supplying him as it did, with apt and elegant phraseology on all sorts of subjects, serving as an introduction to the Greek and Latin classics, and furnishing besides eloquent declamations against kings and monks, war and priestcraft! To those, too, who desired an easy method of learning Greek, it must have been a valuable aid, all the Greek quotations, of which there were several thousands, being carefully rendered into Latin. Thus, besides to a great extent serving the purpose of a dictionary and a grammar, it is a common-place book, a journal and a book of travels, all in one.

In the beginning of the second "Chilias" of Proverbs, under the heading *Festina lente*, Erasmus himself describes his relations with the Aldi. He had the free run of the library of the Aldi at Venice. He was helped by Lascar, Marcus Musurus the poet, and Aleander. He complains of a Northern friend of his, contrasting his conduct with that of the Italians (Drummond, Vol. I, p. 279). "He had applied for the loan of a Suidas which he knew his friend to possess, and which had the Proverbs noted on the margin. He wished to have it merely for a few hours, until his amanuensis should copy some sentences into his notebook. The owner of the Suidas refused, in spite of repeated applications. Erasmus, having tried in vain to overcome his obstinacy, suggested that, perhaps he intended publishing a collection of proverbs himself. No: he vowed he had no such notion in his head. At last the admission was forced from him that he was afraid that learned men would be held in less esteem if what had hitherto been their monopoly should be made public property."

Erasmus (Desiderius).

Apophthegmes, that is to saie, prompte, quicke, wittie and sentencious sayynges, of certain Emperours, Kynges, Capitaines, Philosophiers and Oratours, as well Grekes, as Romaines. First gathered and compiled in Latine by the ryght famous clerke Maister Erasmus of Roterodame. And now translated into Englyshe by N. Udall. B. L. Richard Grafton. London, 1542. 8vo. Also 1564.

Of this book there is a handsome reprint published at Boston, England, by Robert Roberts and edited by himself, 1877, with notes by the Rev. E. Johnson. The second edition (1564) is followed. The variations in spelling from the edition of 1542 are considerable.

A very short form of Erasmus's book translated into English is as follows:

Flores aliquot Sententiarum ex variis collecti scriptoribus. The Flowers of Scencies gathered out of sundry wryters by Erasmus in Latine and Englished by R. Taverner. Lat. and Eng. W. Middilton. London, 1547. 8vo. Also 1550.

Taverner clearly intends his book to be used by boys. In his preface he writes: "En edo hic vobis, florentissima pubes Britannica, flores sententiarum nonnullos * * *."

Vives (J. L.).

An introduction to wysedome, etc. (With "sentences of wise men, gathered together by Erasmus, and translated into English.") (1540 ?) 8vo.

Ten pages of Vives's book are occupied in accordance with the following announcement:

For the filling of void pages here following, we have inserted certain flowers of most notable sentences of wise men, gathered together by Erasmus of Rotterdam, and translated into English.

I have noted that Taverner intends his very small book for boys—and those probably in a low form. Erasmus early in his preface points out that only one man in many thousands has time to read regularly his Plato and Aristotle and the other ancient writers, and therefore he has chosen some of the more notable sayings of great men. Later on, however, he adds (Udall's transl.):

I am of this opinion, that young children might much more to their profit and benefit be exercised in the Grammar Schools with themes, or arguments to write on, of this sort, than with matters to make upon, such as are commonly used (which themes for the most part, as they contain nothing but little trifling senses, devoid of all pith or point, so do they nothing open the mysteries of the Latin tongue) so that the schoolmaister do open and declare the rules and ways, how that which is briefly spoken, may be dilated and set out more at large, and how that that is so fondly spoken, that the hearers or readers cannot but laugh at it, may be turned or applied, to a serious use and purpose.

The writers from whom Erasmus mainly quotes are: Socrates, Aristippus, Diogenes the Cynic. "Next after these three philosophers, but the same in this kind, most excelleng, we shall add like number of Kings and no mo, which for their saynges with civility and good fashion replenished have a name of honour above all other Kings—Philip, Alexander, and Antigonus the first, King of the Macedonians." "To the intent that we may after a sort make some likely match of Romans with the Greeks, we shall to Alexander set Julius Cæsar, to Philip we shall set Augustus, and to Antigonus we shall turn Pompeius of Rome." Then follow the sayings of two or three of the "very best" of the orators: Phocian, Cicero, Demosthenes.

The number of sayings given is as follows: Socrates, 102; Aristippus, 62; Diogenes, 231; Philip, 35; Alexander, 65; Antigonus, 30; Augustus Cæsar, 66; Julius Cæsar, 36; Pompey the Great, 21; Phocian, 23; Cicero, 70; Demosthenes, 23.

At the end of Udall's translation is the curious notice:

That thou mayest the soner and easlyer fynde (moste gentle reader) either the name of any persone or any other good mattier contained in this booke, I have here added a large and plaine Table after the ordre of the A B C set out with the noubre of the leafe, where thou shalt fynde any suche thyng as thou desyrest to have therein.

Each saying is followed by an exposition of Erasmus. The following, from Udall's translation of Erasmus's Apophthegmes, will serve as an example:

Aristippus firste of all the scholars of Socrates, sette up teaching of philosophie for money.

The familiar ghost or aungell of *Socrates*, called in Greke *δαίμων*, in Latin, *Genius*.

82. When Aristippus, the disciple of Socrates had of his gaines, of setting up the teaching Philosophie for money (which thing he first of all the scholars of Socrates, did set up and begin to doe) had sent 20 poundes unto his maister: Socrates sente the money backe again unto hym forthwith, alleging that his familiar good Aungell, would in no wise suffer him to take it.

Socrates allowed not that any man should take money for teaching vertue, and esteemed money so gotten, to be sacrilege.

For *Socrates* saied, that he had a familiar ghost or Aungell peculiar and proper to himself, of whom he was by a privie token forbidden, if he attempted, or went about to dooe any unhoneſt thyng. Verely, that familiar good Aungell, I suppose, was reason. And in the meanetyme, unto *Aristippus*, he did after a gentle sort, signifie hymself not to alowe, ne to thinke well doen, that he kept a schoole of morall Philosophie for money, and therefore the same gifte of his as a thyng gotten by plaine sacrilege, he utterly refused, and would none of it.

In connexion with the Book of *Apophtegmes* of *Erasmus* it is convenient here to say something of the translator:

Nicholas Udall. (1505, died c. 1556.) Born in Hampshire 1505. Scholar of *Corpus Christi College*, Oxford, 1520. Master of *Eton*, 1534. His severity has been noted by *Tusser* in *Five Hundred Points of Good Husbandry*:

From Paul's I went, To *Eton* sent,
To learn straightways The Latin phrase,
Where fifty-three stripes given to me,
At once I had:
For fault but small, or none at all;
It came to pass that beat I was,
See, *Udall*, see the mercy of thee
To me, poor lad.

(He appears to have been headmaster of *Westminster School*, for the two years preceding his death.) He held the livings of *Briantree* in *Essex* and (in 1553) *Calborne* in the *Isle of Wight*. At one time he was Canon of *Windsor*. Besides the *Apophtegmes* of *Erasmus*, he translated the following books:

1. *Flowers for Latin speaking*, selected and gathered out of *Terence*, and the same translated into English. 1533, 1538, 1560, 1568, 1575.
2. *Erasmus's Paraphrase on the Gospels and Acts of the Apostles*.

The *Encomium Morie*, or *Praise of Folly*, was printed at *Strasburg* in 1511. In English, the first edition is:

The praise of Folie. Morie Encomium, a booke made in Latine by that great clerke Erasmus Roterodame. Englished by Sir Thomas Chaloner, Knight. B. L. Anno 1559. (T. Berthelet.)

Recent edition: Translated by *James Copner*, M. A., Vicar of *Elstow*. London. *Williams and Norgate*. 1878.

Mr. Drummond says of it (Vol. I, p. 185): "It really contains, in a short compass, his whole philosophy of man—all that he ever wrote on the abuses of his time, on the superstition of monks, and the pride of kings. Abounding in wit and eloquence, and displaying great knowledge of the world and keen observation of men and things, it has also its deep and serious meanings underneath the light satire that plays upon the surface." The book is of great importance, therefore, as giving an insight into the condition of the age, but has only, for the most part, an indirect bearing on education. The following passage, however, is of direct interest:

[Amongst those in eager pursuit of "wisdom's golden branch"] a foremost place is occupied by the schoolmasters, a class of men who would indeed be in the most calamitous, the most afflicted, the most God-forsaken condition conceivable were it not that I (Folly) of my benevolence ameliorate the wretchedness of their most wretched profession by making bitter lives perceptibly sweet to them, rendering them, to a very considerable extent, insanely happy in the midst of their most insane and most laborious drudgery. Verily their lot is a woeful one indeed, cursed—not, as the Greek epigram has it, with five—but with five hundred

drawbacks. It is a lot of semi-starvation and of debasing slavery. In their schools—well; schools I call them, though “schools” is indeed far too good a name for those hotbeds of care and misery, those grinding mills, those dens of torture, in which, superintending flocks of small boys, these unfortunate pedagogues are destined to eke out the measure of their days. In these schools, then, these bride-wells of uproar and confusion, do they grow prematurely old, exhausted by their labours, deafened by continual hubbub, and with their constitutions shattered and broken down, owing to the close fogginess of the atmosphere that day by day they are necessitated to breathe. Yet, notwithstanding all this, thanks to my good services, they are by no means such miserable creatures as you might at first sight be inclined to imagine. In their own estimation they are important personages enough, and think themselves mightily fine fellows; but whilst they strut about with stern looks and scolding voices, striking terror and alarm into the breasts of a set of trembling urchins, half scaring the little wretches occasionally with canes, and birches and straps, and exercising their arbitrary tyranny over them in all sorts of other ways, they after all, do but ludicrously perform the part of the ass in the well-known fable. [They take no steps to remove the dust and dirt from their schoolroom.] In fact evidently to them filth is as cleanliness, and bad smells as perfumes. [They have a wonderfully good opinion of themselves and are able to impress parents with a belief in their ability. The more out-of-the-way their knowledge is, the better pleased they are.] Dear me! if any one of them happens to discover who was Anchises’s grandmother; or if, in some worm-eaten chart, he chances to light upon a word or two of barbarous, unused Latin, such as *bubsequa*, for instance, or *bovinator* or *manticulator*; or if—never mind where—he is lucky enough to dig up the fragment of an old stone containing a few mutilated characters of an ancient inscription upon it, verily, by Jove! he is thrown into such a transport of triumphant exultation that you might imagine he had conquered Africa, or captured the city of Babylon! [They also think they are gifted with a marvellous genius for poetry. They flood upon one another mutual congratulations, laudations, and flatteries, if they happen all of them to agree in opinion. They wrangle over pronunciation and grammatical distinctions.] In consequence of all this discord among grammarians we have naturally an endless number of conflicting grammars—as many grammars as there are men to write them—nay, more; for I know one grammarian—a friend of mine of the name of Aldus—who alone has produced five different grammars! No new grammar that comes out, however barbarously and unintelligibly written, does he allow to escape his notice. He pores over it with avidity, and criticises with a jealous eye every sentence it contains; for he can brook no one who attempts any thing, however indifferent in this department of literature, being always in a wretched, morbid state of nervous trepidation lest, amongst the numerous makers of grammars who are perpetually springing up, some fresh aspirant should arise who, by forestalling him in the promulgation of new grammatical ideas, should deprive him of his reputation as a grammarian, and of the fruits of his years and years of labour.—Copner’s translation, Chapter vii.

In this connexion, the fact may be recalled that Melancthon wrote a tractate, *De Miseriis Paedagogorum*.

A treatise of Schemes and Tropes very profytable for the better understanding of good authors, gathered out of the best Grammarians and Oratours by Rychard Sherry, Londoner. *Whereunto is added a declamacion, That chyldren euen strayt fro their infancie should be well and gently broughte vp in learnynge. Written fyrst in Latin by the most excellent and famous Clerke, Erasmus of Roterodame.* (1550. J. Day.)

The second portion is an important contribution of Erasmus to the educational literature of the age. The following is his own summary of its argument:

Consider how dear a possession your son is, how diverse a thing it is and a matter of much work to come by learning, and how noble also the same is, what a readiness is in all children’s wits to learn, what agility is in the mind of man, how easily those things be learned which be best and agreeable to nature, inespacially if they be taught of learned and gentle maisters by the way of play: further how fast those things abide with us, wherewith we season first of all the empty and rude minds which self things an elder eye perceiveth both more hardly and sooner forgetteth; Beside this how dear and the loss never recovered, time is, how much it availeth to begin in season, and to learn everything when it should be, how much continuance is able to do, and how greatly the heap that Hesiodus speaketh

of doth increase by putting to little and little, how swiftly the time flieth away, how youth will always be occupied, how unapt old age is to be taught: If thou consider these things thou wilt never suffer that thy little child should pass away (I will not say) seven year, but not so much as three days, in the which he may be either prepared or instructed to learning, though the profit be never so little.

The following are dissertations on the educational aspects of Erasmus:

Das Ideal der Bildung und Erziehung bei Erasmus von Rotterdam. By Dr. G. Glöckner. Dresden: Bteyl & Kaemmerer, 1889.

Die pädagogischen Anschauungen des Erasmus in ihrer psychologischen Begründung. By Hermann Tögel. Dresden: Bteyl & Kaemmerer, 1896.

1531. Sir Thomas Elyot. (? 1490—1546.)

(The facts of the life of Elyot have been investigated with thorough-going care by Mr. H. H. S. Croft in his very valuable reprint of *The Boke Named the Governour*, from the first edition of 1531. The following points may be useful for reference. Elyot was, probably, a native of Wiltshire, and was born about 1490. He had a home education in Greek and Latin, but it is not certain if he was at either of the Universities. In 1511 Elyot, as clerk of assize, accompanies his father, who was the judge on the western circuit. In 1522-3 Elyot came, by his father's death, into the possession of the Combe estate near Woodstock. Elyot attracted the notice of Wolsey, then of Thomas Cromwell, and was appointed to various offices. In 1530, however, he was discharged from the clerkship of council. From this time forward he became converted to literature. He was induced to become ambassador to Germany, but bitterly complains that for his diplomatic and other official duties he has received no payment. He was married, about 1522, to Margaret Abarrow of North Charford, Hampshire. They had no children. He died in 1546, and was buried at Carleton.)

Elyot (Sir Thomas).

The boke named the Governour, devised by Thomas Elyot, Knight. B. L. MS. notes. In ædibus Tho. Bertheleti, Londini, 1531. Svo. Also 1546, 1553, 1557, 1564, 1565, 1580, and other editions.

Reprints:

- I. Based on the text of 1564—edited by Mr. A. T. Eliot, Scholar of Catherine Hall, Cambridge, published at Newcastle, 1894. Not satisfactory, on account of the attempt to "simplify" the composition of Sir Thomas Elyot, and also on account of the omissions.
- II. The scholarly reprint of 1880 (London: Kegan Paul), edited by Mr. H. H. S. Croft. This has a complete apparatus of Preface, Life, Notes, Index, Glossary, with Appendices of Obsolete Words formed from the Latin, Obsolete Words formed from the French.

In the shorter histories of education, e. g., Compayré's, and Joseph Payne's Lectures, there is no account of Elyot. Mr. Quick mentions Mr. Croft's Reprint, and quotes the following sentence from Elyot: "Good Lord! how many good and dear wits of children be now-a-days perished by ignorant schoolmasters."

James Parmentier, in his *Histoire de l'éducation en Angleterre*, devotes Chapter II to Elyot.

There is a dissertation entitled, *Ist Thomas Elyot ein Vorgänger John Locke's in der Erziehungslehre?* Leipzig: Oswald Schmidt, 1896.

The Boke Named the Governour is modeled on the *De regno et regis institutione* of Francesco Patrizi (Paris, 1518). Elyot is also clearly indebted to the *Institutio principis Christiani* of Desiderius Erasmus (Basilea, 1516), and to the *De principe* of Joannes Juvianus Pontanus, 1513.

On the other hand the Boke Named the Governour probably gave rise to, or at least influenced:

Sturm, J.—*De institutione Principis.* Walsingham's Manual for Statesmen.
Raleigh, Sir W.—*The Prince—Maxims of State* drawn up for Prince Henry,

Mr. Croft names also: 1555, *The Institution of a Gentleman*, and, 1606, Ludovick Bryskett's *Discourse of Civil Life*.

Sir Thomas Elyot divides the Booke of the Governour into two books, the first of which gives his ideas on education. He thus explains his general aim:

I have expressed my concepte and opinion touching nat only the studies, but also the exercises concernynge the necessary education of noble men and other, called to the governance of a publike weale, in such fourme as, by the noble example of their liues and the frute thereof coming, the publike weale that shal happen to be under their governance, shall nat faile to be accounted happy and the autoritie on them to be employed well and fortunately.

The following subjects are treated by Sir Thomas Elyot in his Chapters on Education:

The form of education of a gentleman's son with a view to service to the Commonwealth. Education up to seven years of age, with order of subjects. Appointment of tutor. Music. Painting and carving. Choice of masters. Order of learning and the sequence of authors. The poets. The most necessary subjects after the poets. Comparison of ancient and modern learning. The teaching of law. The causes why in England there be few perfect school-masters. Gentlemen's exercises, for recreation and profit. Hunting. Dancing. Providence, industry, circumspection, election, experience, modesty. Other exercises. That shooting in a long-bow is principal of all other exercises.

Sir Thomas Elyot is the first English writer on education who has felt the full force of the Renaissance. His views are vividly coloured, not to say formed, by the humanistic revival. He is proud of his knowledge of Greek. He was a friend of Sir Thomas More and familiar with the writings of Erasmus. He insisted on the necessity of a liberal and disinterested education for specialists, and although this term usually in his age, and indeed up to the present time, has been taken to mean those having a knowledge of Latin and Greek literature and language, yet Elyot no less delighted in his facility in writing English.

Some of the contents of Sir Thomas Elyot's "Governor" deserve more detailed mention. In his own words can be given the reason why he deals with education of noblemen's sons rather than with that of the vulgar:

I will use the policy of a wise and cunning gardener: who purposing to have in his garden a fine and precious herb that should be to him and all other repairing thereto, excellently commodious or pleasant, he will first search throughout his garden where he can find the most mellow and fertile earth; and therein will he put the seed of the herb to grow and be nourished: and in most diligent wise attend that no weed be suffered to grow or approach nigh unto it: and to the intent it may thrive the faster, as soon as the form of a herb once appeareth, he will set a vessel of water by it, in such wise that it may continually distil on the root sweet drops; and as it springeth in stalk, underset it with something that it break not, and alway keep it clean from weeds. Semblable order will I ensue in the forming the gentle wits of noble men's children.

This garden-like nurture of children is described in detail, especial stress being laid upon the necessity of employing a nurse of "approved virtue, discretion and gravity", and exercising a stern censorship over playfellows permitted. Were it not that Elyot wrote *A Defence of Good Women* (London: 1545), it might be gathered that he had some mistrust of women's influence on children. He considers it highly desirable that a nobleman should instruct his own children, if he be able, for even a king, Dionysius the tyrant, taught grammar in a common school, in the days of his exile. Why should not, then, the children be exercised at home in speaking Latin? "As touching grammar", Elyot adds, "there is at this day better introductions, and more facile, than ever before were made, concerning as well Greek as Latin, if they be wisely chosen."

At seven years of age, the child should be taken from "the company of women," and put under a tutor who is to make it his business to know the character and power of his pupil. Music, in a temperate degree, is to be cultivated, because it is necessary to the knowledge of a public weal. The commonwealth, like music, is made up of an order of estates and degrees, and therefore contains within it a

"perfect harmony". Elyot's book is a direct reflection of the revival of Plato's Republic in his insistence on music and gymnastics.

Though a predecessor of Comenius by a century, Sir Thomas Elyot has a clear idea of the teaching of things as well as names. He would have the teacher inform the child of the names in Latin of "all things that cometh in sight, and to name all the parts of their bodies" (the subject of one of the chapters of Comenius's *Janua Linguarum reserata*). Further, in giving children what they covet or desire, Elyot would wish the teacher, "in most gentyll manner", to get the child to "ask it again in Latin!" Or, again, is there not a forecast of Comenius in such a conviction of the importance of realistic teaching as the following: In geometry, astronomy, and cosmography (called in English the description of the world)—in these studies, "I dare affirm a man shall more profit, in one week, by figures and charts, well and perfectly made, than he shall by the only reading or hearing the rules of that science by the space of half a year at the least; wherefore the late writers deserve no small commendation which added to the authors of [in] those sciences apt and proper figures."

A fortiori, goes on the argument, if the pupil learns to draw for himself there will be a great gain to education. Not that the author wishes to make a nobleman's son a common painter or carver, "which shall present himself openly stained or embued with sundry colours or powdered with the dust of stones that he cutteth or perfumed with tedious savours of the metals by him yoten" (melted)—but he thinks drawing, carving, etc., excellences in themselves in their training of the eye (like music, of the ear), and also because of their "adminiculation" (service) to the other serious studies.

Throughout Elyot's treatise is discernible the desire that education should be liberal. He is particularly persistent in requiring the teacher to be "excellently learned both in Greek and Latin," and to be a clear and pure example of gentle thought and life. From seven years of age, for three years the child is to "learn Greek authors, and to use the Latin tongue as a familiar language". If Latin were only spoken it might be learned as is French. Elyot points out that French grammar in his time had come to have nearly as many rules and figures as Latin or Greek. Greek Grammars were innumerable (*even by 1531*), and Elyot would only add, "Detain not the child too long in the tedious Grammars. Let not the child's fervent desire of learning become extinct by the time he cometh to the most sweet and pleasant reading of old authors". When Elyot reaches the discussion of his beloved authors, his views are very different from those of Comenius.

These are the books for the child to read—a long list, over which Sir Thomas Elyot revels: Æsop's Fables, Select Dialogues of Lucian, Comedies of Aristophanes, Homer, Virgil, Silius, Lucanus, Hesiodus. These will suffice up to twelve years of age! It is explained, however, that from each should only be chosen so much instruction as is fitted to the child, and at least it is to be expected that the spirit of poetry shall enter his soul to inflame his courage and to condemn folly. To these poetic and human studies succeeds the more "serious" learning of logic, rhetoric, cosmography (in which Elyot has "incredible delight"). "I cannot tell," he says of pictures and maps, "what more pleasure should happen to a gentle wit than to behold in his own house everything that within all the world is contained." After cosmography, history should be taught. Livy, Xenophon, Quintus Curtius, Julius Cæsar, Sallust, and Tacitus are to be read. At seventeen, moral philosophy is to begin, with the reading of Aristotle's Ethics and of Tully's Offices. Above all, Plato. Elyot breaks forth:

Lord God, what incomparable sweetness of words and matter shall [the pupil] find in the said works of Plato and Cicero; wherein is joined gravity with delectation, excellent wisdom with divine eloquence, absolute virtue with pleasure incredible, and every place is so infarced [stuffed full] with profitable counsel,

joined with honesty, that those three books be almost sufficient to make a perfect and excellent governor. The proverbs of Solomon with the books of Ecclesiastes and Ecclesiasticus be very good lessons. All the historical parts of the Bible be right necessary for to be read of a noble man, after that he is mature in years. And the residue (with the new testament) is to be reverently touched, as a celestial jewel or relic, having the chief interpreter of those books, true and constant faith and dreadfully to set hands thereon.

I have quoted the above passage at length to show the complete sway which the Renaissance spirit had over Elyot. Aristotle, Cicero, and Plato are named before the books of the Bible in the subject of moral philosophy. To these is added Erasmus's Institution of a Christian Prince. In accordance with the Renaissance ideal, Elyot was *laudator temporis acti*. Learning had declined, he says, on account of the pride of parents, which rose above "clerkship;" the avarice of parents causes them chiefly to inquire with how small a salary a teacher will be contented, and never how much good learning he hath; the negligence of parents allows children, as long as they are educated up to a certain point, to remain comparatively idle and self-indulgent.

Having dealt with his Neo-Platonic music-teaching, Elyot enters upon gymnastic training. He treats the subject very learnedly on the historical side. The topics spoken of are: wrestling, running, swimming (interestingly illustrated, of course, by the examples of Horatius Cocles and Julius Cæsar), defence with battle-axe, riding and vaulting, hunting of all kinds, dancing, shooting with the long-bow. The most honourable of all exercises is riding a "great horse and a rough", the "principal" of all exercises is shooting.

A most interesting study would be a comparison between gymnastic training as treated by Elyot, and that of Richard Mulcaster in his "Positions" (1581). It would be found that Mulcaster excels on the expository side, and Elyot in his historical illustrations.

Elyot (Sir Thomas).

Of the knowledge, whiche maketh a wise man. B. L. *In ædibus T. Bertheleti. Londini, 1533.* Also 1534.

Five dialogues between Plato and Aristippus—written after reading the life of Plato "in the book of Laertius", and containing an account of the Platonic doctrine of wisdom.

In the Proheme, Sir Thomas Elyot states: "Wherefore after that I had applied the more part of my life in perusing diligently every auncient work that I might come by, either Greek or Latin, containing any part of philosophy necessary to the institution of man's life in virtue, I have endeavoured myself to set forth such part of my study as I thought might be profitable." He refers to King Henry VIII's kind reception of The Boke named the Governour, and says how he there intended "to augment our English tongue, whereby men should as well express more abundantly the thing that they conceived in their hearts * * * as also interpret out of Greek, Latin and other tongne into English." A justification is offered of his "Pasquill the Playne" (1533), which seems to have given offence. Finally, he undertakes during the residue of his life to now and then set forth such fruits of his studies as may be profitable to his country.

Elyot (Sir Thomas).

A sweete and devoute sermon of Holy saynt Ciprian of mortalitie of man. The rules of a Christian lyfe made by Picus erle of Mirandula, bothe translated into englyshe by syr Thomas Elyot knyghte. Londini in ædibus Tho. Bertheleti. 1534. 12mo.

The sermon is described by Elyot (Preface to Image of Governance, 1540) as "No little comfort in plagues and calamities."

The translation from Pico della Mirandola is interesting, not for the contents of the Rules, so much as showing Elyot's direct contact with the writings of the Italian revivers of learning.

Elyot (Sir Thomas).

The Doctrinal of Princes made by the noble oratour Isocrates, translated out of Greke in to Englishe by syr Thomas Eliot, knight. 1534. 12mo. (Thomas Berthelet.)

This oration of Isocrates to King Nicocles may be described as an essay in Greek translation—an attempt to see “if our English tongue might receive the quick and proper sentences pronounced by the Greeks”. At the end of the book there is a curious “Addicion to fill up vacant pages” on the subject of clemency as a quality in kings. As to the “Doctrinal,” Elyot says: “This little book is to be compared in counsel and short sentence with any book, holy scripture excepted.”

Elyot (Sir Thomas).

The Bankette of Sapience, compyled by syr Thomas Eliot, knyghte, & newly augmented with dyverse tytles and sentences. B. L. In cedibus T. Bertheleti. Londini. 1539. 8vo. Also 1542, 1545, 1557.

Suggested by the symposia of Plato, Xenophon, and Plutarch. The “Banquet” consists of sundry wise counsels gathered out of the works of most excellent persons, “as well faithful as gentiles”.

Elyot (Sir Thomas).

The Dictionary of Syr T. E., Knyght (Latin, English; with MS. letter of the author to Thomas Lord Cromwell in Brit. Mus. Copy.) Thomas Berthelet, Londini, 1538. fol. Also 1545, and, under the editorship of Thomas Cooper, 1550, 1552, 1559.

In 1565, 1573, 1578, 1584, there followed a further dictionary by Cooper on the basis of Elyot’s Dictionary, called *Thesaurus lingue Romance et Britannice*. See further account, p. 880.

Elyot (Sir Thomas).

The Education or bringinge up of children translated oute of Plutarche by syr Thomas Eliot, Knyght. (Berthelet, 1535.)

Sir Thomas Elyot begs the reader not to exact of him the “exquisite diligence of an interpretour”, as he is simply employing his leisure in translating this book of Plutarch. He would not like his book to be compared with the “delectable styles of Grekes or Latines.” “It shall suffice me”, he says, “if by this littel labour I may cause you, my myn entierly beloved syster, to folowe the intent of Plutarche in brynginge and inducyng my litell newewes into the trayne and rule of vertue”. His sister is Margery Puttenham, to whom he dedicates the translation, and for whose benefit he enlarges the histories touched upon by Plutarch.

Elyot (Sir Thomas).

The Defence of Good Women, devised and made by Sir Thomas Elyot, Knyght. 1534, 1545. 16mo.

The argument: “A contention betwene two gentill men, the one named Caninius, the other Candidus. Caninius, like a curre, at womens condicions is alway barkyng: but Candidus, whiche maie be interpreted, benigne or gentill, judgeth ever well, and reproveth but seldom. Betwene them two, the estimation of womankind cometh in question. After long disputa- tion, wherein Candidus (as reason is) hath the preheminence, at the last, for a perfect conclusion, Queen Zenobia (which lived aboute the yere after the incarnacion of Christe 274, the noble Aureliane being emperoure of Rome) by the example of hir life, confirmeth his argu- mentes, and also vanquisseth the obstinate mynd of froward Caninius, and so endeth the matier.”

Zenobia is called upon to account for the fact that she did not marry before the age of “twenty and above”. The reason was that the years between sixteen and twenty were given to study, especially in moral philosophy. She shows the use which this study afforded to her when she married, and the great advantage it was to her, as a widow, in the choosing of tutors for, and in bringing up of her children. She therefore considers it well that a maiden should “well tarry” before she marries, so as to give herself up to earnest and continued study. Her conclu-

sion on the subject of what we call the higher education of women is: "I see well enough, that women, beyng well and virtuously brought up, do not only with men participate in reason but some also in fidelity and constancy be equall unto them."

Elyot (Sir Thomas).

The Image of Governance compiled of the Actes and Sentences notable, of the moste noble Emperour Alexander Seuerus, late translated out of Greeke into Englyshe by Syr Thomas Eliot, knyght in the fauour of Nobylitie. T. Berthelet, 1541. 4to.

"And this present book which I have named the Image of Governance shall be to all them which will read it sincerely a very true pattern, whereby they may shape all their proceedings."

This Image of Governance has an interesting preface, which contains some account of his previously written books, by himself. The book was written when "almost fatigate with the long study about the correcting and ampliing of my Dictionary, Latin and English."

The names of the following books, written by Sir Thomas Elyot, though not definitely bearing on education, are added to make the list of his works complete.

Pasquyll the Playne. 1533 and 1540. T. Berthelet. 16mo.

A dialogue between Pasquillus, Gnato, and Harpocrates on the advantages of speech and silence. The title Pasquyll, "although he may be merry and plain, teaching as well servants how to be faithful unto their maisters, as well as maisters how to be circumspect in espying of flatterers."

The Castell of Helth. T. Berthelet. 12mo. 1534, 1539, 1541, 1564, 1572, etc.

After writing this book, Elyot was plainly told by doctors that he had much better write on matters with which he was better acquainted. They admitted that he was "prettily seen in histories", but denied that he was "learned in Physick". Elyot replies:

For before that I was twenty years old a worshipful physician [supposed to be Linacre] and one of the most renowned at that time in England, perceiving me by nature inclined to knowledge read unto me the works of Galen * * * and some of the aphorisms of Hippocrates. And afterward by mine own study I read over in order the more part of the works of Hippocrates, Galen, Oribasius, Paulus Celius, Alexander Tralianus, Celsus, Plinius the one and the other, with Dioscorides. Nor did I omit to read the long canons of Avicenna, the commentaries of Averroys, the practices of Isake, Haliabbas, Rasis, Mesue * * *.

This may be taken as a representative list of authors in a good medical education of the time. Elyot once more delights in having written a book in English, and says, with his spirit aroused:

If physicians be angry that I have written physicke in English, let them remember that the Greeks wrote in Greek, and Romans in Latin, Avicenna and the other in Arabic, which were their own proper and maternal tongues. And if they had been as much attacked with envy and covetise, as some now seem to be, they would have devised some particular language, with a strange cipher or form of letters, wherein they would have written their science, which language or letters no man should have known, that had not professed and practiced Physick. But those, although they were Paynims and Jews, yet in this part of charity, they far surmounted us Christians, that they would not have so necessary a knowledge as Physic is, to be hid from them, which would be studious about it.

How one maye take profite of his enemyes. Translated from Plutarche. T. Berthelet. n. d. 8vo.

A Preservative agaynste deth. Berthelet, 1545.

This consists of passages from the Old and New Testaments, and from the fathers of the Church. Elyot, in his preface, shows his fear lest, as in his "Castell of Helth" he had stirred the doctors, now in his "Preservative" he should offend by encroaching on the domain of the priests. Yet, he concludes, "no Christian man is excluded to give good counsel."

The Dictionary of Sir Thomas Eliot knyght. Londini in ædibus Thomæ Bertheleti typis impress. Cum privilegio ad imprimendum solum. fol. 1538.

This book marks an interesting point in the history of copyright. For in it is a copy of Henry VIII's "gracious privilege" to Thomas Berthelet to print Eliot's Dictionary, and an injunction that no one during the life of Berthelet should print any manner of books which he had first printed, or should "print again on other men's corrections the same within the space of six years next ensuing the printing of every such book."

Elyot's Preface is addressed to Henry VIII and is full of subservient loyalty. Elyot declares how he first began his Dictionary, in spare time from his busy life, and found that he could not thus make a perfect dictionary, but had been encouraged by the king to proceed. Dissatisfied with what he had already done he says, "I caused the printer to cesse, and beginning at the letter M where I lefte, I passed forth to the last letter with a more diligent study. And that done I eftesones returned to the fyrst letter, and with a semblable diligence performed the remenant."

The following passage gives an insight into Elyot's manner of making his Dictionary and into the materials at hand:

I well perceyued, that all though dictionaries had been gathered one of another, yet nethelesse in eche of them ar omitted some latin wordes, interpreted in the boke, whiche in order preceded. For Festus hath manye, which are not in Varros Analogi: Nonius hath some, which Festus lacketh: Nestor toke nat all that he founde in them bothe. Tortellius is not so abundant as he is diligent: Laurentius Valla wrate only of wordes, which are called elegancies, wherein he is undoubtedly excellent: Perottus in Cornucopie, dyd omitte almost none that before him were written but in wordis compoude he is to compendious: Fryere Calepine (but where he is augmented by other) nothyng amended, but rather appeared that which Perottus had studiously gathered: Nebressensis was both well lerned and diligent, as it appereth in some wordes, which he declareth in latin: but because in his dictionarie wordes are expoude in the Spanish tunge, which I do not understand, I can nat of hym shewe myn opinion: Budens in the exact triall of the native sense of wordes, as well greke as latine is assuredly right comendable, but he is moste occupied in the conference of phrasis of bothe the tungen, whiche in comparison are but in a fewe wordes: Dyvers other men have written sondry annotations and commentaries on olde latine authors, among whom also is discord in their expositions.

Elyot feels that amongst men of so great reputation as these it is rash for him to enter the lists, but the "comfort" which he had lately received from the king had caused his spirit to be revived and set up the "sail of good courage." And he dares affirm that, having finished the Dictionary after two years' labour, "there may be found a thousand mo latin wordes than were in any one Dictionarie publyshed in this royaume."

The "Dictionarie" was improved and issued (fol.) in 1553 under the title:

Bibliotheca Elioteæ. Eliotes Dictionarie the second tyme enriched and more perfectly corrected, by Thomas Cooper. In ædibus T. Bertheleti: Londini.

This was eventually expanded by Cooper into the Thesaurus Linguae Romanæ et Britannicæ in 1565, and republished 1573, 1578, 1584.

The following book contains a reference to Elyot's "Dictionarie," and shows how Elyot's work was continued and developed.

An Alvearie or Triple Dictionarie in Englishe, Latin, and French: Very profitable for all such as be desirous of any of those three languages. Also by the two Tables in the ende of this booke, they may contrariwise, find the most necessary Latin or French wordes, placed after the order of an Alphabet, whatsoever are to be founde in any other Dictionarie: And so to turn them backwardes againe into Englishe when they read any Latin or French aucthors, and doubt of any hard worde therein. 1573. Second edition 1580.

The Alvearie is by John Baret, a fellow of Trinity College, Cambridge.

The Address to the Reader gives so picturesque and vivid a view of teaching at the time that it is too interesting to omit.

BARET AND HIS PUPILS.

About eyghteene yeares agone, having pupils at Cambridge studious of the Latin tongue, I used them often to write epistles and themes together, and daily to translate some peece of English into Latin, for the more speedy and easie attaining of the same. And after we had a little begunne, perceyving what great trouble it was to come running to mee for every word they missed, knowing then of no other Dictionarie, to helpe us, but Sir Thomas Eliot's Librarie, which was come out a little before, I appoynted them certaine leaves of the same booke every day to write the English before the Latin, and likewise to gather a number of fine phrases out of Cicero, Terence, Cæsar, Livie etc. and to set them under severall Tytles, for the more ready finding them againe at their neede. Thus within a yeare or two they had gathered together a great volume, which (for the apt similitude betweene the good scholars and diligent Bees in gathering their wax and honny into their Hive) I called them their Alvearie both for a memoriall by whom it was made, and also by this name to encourage other to the like diligence, for that they should not see their worthy prayse for the same, unworthily drowned in oblivion.

HOW THE DICTIONARIE CAME TO BE PUBLISHED:

Not long after, divers of our friendes borrowing this our worke which we had thus contrived and wrought onely for our owne private use, often and many wayes mooved me to put it in print for the common profit of others and the publike propagation of the Latin tongue: or else to suffer them to get it printed at their proper costs and charges. But I both unwilling, and halfe ashamed to have our rude notes come abrode under the viewe of so many learned eyes, and especially finding no leasure from my prefixed studies for the polishing of the same, utterly denied their request, untill at length comming to London, the right worshipfull Maister Powle and Maister Garth, with other and singular favourers of all good learning and my very especial friendes, with their importunate and earnest exhortations had cleane overcome my contrary minde. Then immediately laying aside all other studies, I was faine to seeke for writers and workemen about the same, to make it readie for the presse.

BARET GOES TO HIS OLD PUPILS FOR HELP.

Therefore I went to divers of mine olde pupils then being at the Innes of Court, deliueing each of them some part of their olde discontinued worke to see it writen faire againe (and for other peeces which I thought unperfect, I gat certayne of ye best scholars of two or three schooles in London to write after my prescription): but in the French and Tables, although I had before traueyled in divers countries beyonde the seas, both for language and learning; yet not trusting to mine owne skill, I used the help of M. Chalmer and M. Claudius.

It may be mentioned that for Baret's Alvearie, Richard Mulcaster wrote a commendatory Latin quatrain for the 1st edition, which he exchanged in the 2nd edition for a Latin poem of 30 lines.

The progress of dictionary-making is an interesting chapter in the history of Education. But it is not within the scope of this book to include even a general sketch. The course of the development of dictionaries may be studied by reference to the works quoted in the following authorities:

1. In the Appendix to Mr Way's edition of the *Promptorium*: Notices of Glossaries, Vocabularies and other works, illustrative of the English Language and of Mediæval Latinity and used for the most part in this edition of the *Promptorium*. The full title of the book is: *Promptorium Parvulorum, sive Clericorum, Dictionarius Anglo-Latinus Princeps, Auctore Fratris Galfrido Grammatico dicto, ex ordine Fratrum Predicatorum, Northfolciensi, Circa 1440*. Edited by Albert Way, M. A. for the Camden Society, London, 1865.
2. J. E. B. Mayor's Latin-English and English-Latin Lexicography, in the *Journal of Classical and Sacred Philology*, December 1855, and March 1857.
3. Chronological Notices of the Dictionaries of the English Language, by Henry B. Wheatley, Esq., in the *Transactions of the Philological Society*, London, 1865.
4. Article *Dictionary* in the *Encyclopædia Britannica*. Ninth edition, 1877.
5. The Romanes Lecture in the University of Oxford, 1900, by Dr J. A. H. Murray, Editor of the *Oxford Historical Dictionary*, on *The Evolution of English Lexicography*.

Dr Murray traces the development of the dictionary through the stages of glosses and glossaries, through vocabularies, and he might have added nomenclators. He

mentions the *Medulla Grammatices*, the *Ortus* (i. e., *Hortus*) *Vocabulorum* of 1500; the *Promptorium Parvulorum*,¹ i. e., *Children's Store-room*, about 1440; 1483, the *Catholicon Anglicum*; in 1538, Sir Thomas Elyot's *Dictionary*;² in 1554, J. Withals' *Short Dictionary for Young Beginners*. He then names William Horman's *Vulgaria*, 1519; Huloet's *Abecedarium*, 1552; and Baret's *Alvearie*, 1573; in 1570, Peter Levins' *Manipulus Vocabulorum* (an English rhyming dictionary). English dictionaries are then tracked through Robert Cawdrey, 1604, *The Table Alphabetical of Hard Words*; 1616, Bullokar's *English Expositor*; 1623, Henry Cockeram's *English Dictionary*; the *Glossographia* of Thomas Blount in 1656; and *The New World of Words*, of Edward Phillips, of 1658. The whole lecture of Dr. Murray is very interesting and should be read as a whole on the subject.

Dr Murray also mentions the following:

FRENCH.

1521. Alexander Barclay.³
Introductory to write and pronounce Frenche.
1527. Giles du Guez (or du Wes).
Introductorie for to lerne to rede, to pronounce & to speak French trewly.
1530. John Palsgrave.
Esclaircissement de la Langue Françoise.
1611. Randall Cotgrave.
French English Dictionary.

POLYGLOTT DICTIONARY.

Minshen, John

Ἦγεμων εἰς τὰς Γλωσσάς, id est, Ductor in Linguas. The Guide into Tongues. Cum illarum harmonia, et etymologiis, Originationibus, Rationibus, et Derivationibus, in omnibus his undecim linguis, viz. 1. Anglica. 2. Cambro-Britanica. 3. Belgica. 4. Germanica. 5. Gallica. 6. Italica. 7. Hispanica. 8. Lusitanica seu Portugallica. 9. Latina. 10. Græca. 11. Hebraea. Lond. 1617. fol.

2nd ed. of 1626 contains also an exposition of the terms of the "Lawes of this Land," with the etymologies of proper names of the Bible.

WELSH.

Salesbury (Wm.).

A Dictionary in Englyshe and Welshe, moche necessary to all suche Welshemen as will spedly learne the Englyshe tōgue * * * whereunto is p̄fixed a little treatyse of the englyshe pronūciation of the letters. B. L. Few MS. notes in Brit. Mus. copy. J. Waley, London, 1547. 4to.

SPANISH.

1599. Richard Percevall, Gent.
Dictionary in Spanish and English.

ITALIAN.

1599. John Florio. (Italian-English.)
World of Words. Republished in 1611 as Queen Anna's *New World of Words*.

I add here names of further dictionaries. Dr. Murray is concerned to show the development of dictionary-making, but such a list as the following (though not complete) may serve to show some of the variations from the types. It should be added that books like the *Officina* of Ravisius Textor (1522) and the numerous phrase-books in many cases served as dictionaries for school use.

Marbecke (John).

A Concordāce, that is to saie, a worke wherein by the ordre of the letters of the A. B. C. ye maie redely finde any worde conteigned in the whole Bible etc. (by J. M.) 1550. fol.

¹ Edited by Mr Albert Way for the Camden Society. 1865.

² Thomas Cooper, Dr Murray points out, not only edited three editions of Elyot's *Dictionary* but in 1555 compiled his *Thesaurus* based on Robert Stephen's work.

³ Barclay also wrote a *Grammatica Latina*. 1516. 4to.

Harrison (Luke). Printer.

A Dictionary French and English. Lond. 1570.

Crespin (Jean). Edited by Grant, E.

Lexicon Græco-Latinum * * * repurgatum * * * multisque vocabulorum Chiliadibus locupletatum, opera et studio E. G[rant]. H. Bynneman, 1581. 4to. (Originally appeared at Geneva, 1562. 4to.)

Waddington (Rudolphus).

A Dictionarie in Latin and English, heretofore set forth by Master John Veron, and now newly corrected and enlarged; for the utilitie and profit of all Young Students in the Latine Toong, as by further search therein they shall find. Lond. 1584. 4to. (Originally published, according to Watt, Lond., 1575.)

Patten (William).

Calendar of Scripture; wherein the Hebrew, Chaldean, Arabian, Phœnician, Syrian, Persian, Greek and Latin names of Nations, Cuntreys, Men, Weemen, Idols, Cities, Hills, Rivers, and of other places in the Bible mentioned, by order of Letters, are set and turned into our English Toonge. B. L. Lond. 1575. 4to.

An exposition of certaine difficult and obscure wordes, and termes of the lawes of this Realme * * * in French and English, for the helpe of such yonge Students as are desirous to attaine the knowledge of the same. R. Tottel, 1579. 8vo. Also 1602, 1629, 1636.

Hutton (Richard).

Lexicon Latino-Græco-Anglicum ad Gul. Morelii Archetypum, accuratissime excusum. Lond. 1583.

Martinius (Petrus).

The Key of the Holy Tongue; wherein is conteineid, first the Hebrue Grammar (in a manner) woord for woord * * * out of P. Martinus. Secondly, a practize upon the 1st, 25th, and 65th Psalmes, * * * Thirdly a short Dictionary containing the Hebrue wordes that are found in the Bible with their proper significations. All Englished by I. Udall. 3 pts. Francis Raphelengius, Leyden, 1593. 8vo.

Minshen (John).

A Dictionary in Spanish and English * * * Enlarged * * * by J. Minshen. 1599. fol. (See Richard Percivall.)

Withals (John).

A dictionarie in English and Latine * * * with Phrases * * * Recognised by Dr Evans; after by A. Fleming; and then by W. Clerk. And now at this last impression enlarged with an increase of words, sentences, etc. T. Purfoot, London, 1616. 8vo.

Minshen (John).

Vocabularium Hispanico-Latinum et Anglicum copiosissimum, etc. A most copious Spanish Dictionarie, with Latine and English (and sometimes other Languages) and enlarged with divers thousands of Words, etc. Lond. 1617. fol.

Rider (John) and Holyoke (F.).

Rider's dictionarie corrected, and with the addition of above five hundred words enriched. Heereunto is annexed a Dictionarie etymologicall, deriving everie word from his native fountaine * * * by F. Holyoke. Eng. Latin. 2 pts. A. Islip for T. Man, London, 1617. 8vo. 1621, 1623, 1633, 1641.

Featley (Daniel).

A complete Concordance to the Bible of the last translation, etc. (With a preface by D. F. etc.) 1631. Fol.

Cotton (Clement).

Complete Concordance to the Bible of the last translation, 1631. fol.

Davies (John).

Dictionarium Latino-Britannicum. Begun and greatly improved by Thomas Williams, Physician, before 1600. To which is added, Adagia Britannica, Authorum Britannicorum Nomina et quando floruerunt. 1632.

Sherwood (Robert). Cotgrave.

A Dictionarie of the French and English tongue * * * Whereunto is also annexed a * * * Dictionarie, of the English set before the French by R[obert] S[herwood] L[ondoner] 1632. fol.

Therndike (Herbert).

Epitome Lexici Hebraici, Syriaci, Rabbinici et Arabici, una cum Observationibus circa Linguam Hebræam et Græcam. Lond. 1635. fol.

Alabaster (William).

Lexicon Pentaglotton, Hebraicum, Chaldaicum, Syriacum, Talmudico-Rabbinicum, & Arabicum, etc. Guilielmus Jones, Londini, 1637. fol.

Barlement (Noel).

Colloquia et Dictionarium octo Linguarum; Latinae, Gallicae, Belgicae, Teutonicae, Hispanicae, Italicae, Anglicae, & Portugallicae, etc. By N. Barlement. Excudebat E. G. impensis Michaelis Sparke, Londini, 1639. obl. 8vo.

Bagwell (John).

In. T. Wilson's A Christian Dictionary * * * Whereunto is * * * added a large edition, both of words and phrases, by J. B. (1640?) 8vo.

Pasor (George).

Lexicon Græco-Latinum in Novum Testamentum. Lond. 1644, 1650. 8vo.

Rowley (Alexander).

The Scholar's Companion; or all the Words in the Greek and Hebrew Bible interpreted, by A. R. Lond. 1648. 8vo.

Hexham (Henry).

English and Nether-Dutch Dictionary. Rotterd. 1648. 4to. Enlarged and enriched by Dan. Manley. Rotterd. 1675, 1678. 4to.

Robertson (William).

A Gate or Door to the Holy Tongue, containing i. The chief and necessary Grounds of the Hebrew Grammar; ii. A Table for the Hebrew Roots, etc. Part First. Lond. 1653. 8vo. Part Second, being a compendious Hebrew Lexicon, or Dictionary, etc. Lond. 1654. 8vo.

Walker (William).

The Taste of English and Latin Phraseology, or a Dictionary of English and Latin Idioms. Lond. 1655. 8vo. Enlarged. Lond. 1670.

Edmondson (Henry).

Lingua Linguarum; or a Vocabulary in Latin and English. Lond. 1655. 8vo.

Symson (Andrew).

Lexicon; or English, Greek and Latin Concordance of the New Testament. Lond. 1658. fol.

Somner (William).

Dictionarium Saxonico-Latino-Anglicum cum Grammatica et Glossario Ælfrici. Oxon. 1659. fol.

Dugard (William).

Lexicon Græci Testamenti alphabeticum. Una cum explicatione grammatica vocum singularum * * * apposita, etc. London 1660. 8vo.

Dugard's Lexicon.

"Mr. Dugard hath lately completed his Lexicon Græci Testamenti Alphabeticum [etc.]; which, were it once committed to the press, as it now lieth ready in his hand, would be a most excellent help to young scholars to proceed in the Greek Testament of themselves, in an understanding and grammatical way. And I hope it will not be long ere he publish it for common use."—Chas. Hoole.

CHAPTER XVIII.

THIRD ANNUAL CONFERENCE OF THE ASSOCIATION OF CATHOLIC COLLEGES.¹

HELD IN CHICAGO, APRIL 10, 11, AND 12, 1901.

CONTENTS.—Officers of the association—Delegates present—President Conaty's address: "The Catholic college of the twentieth century"—Paper by Rev. James A. Burns: "Catholic secondary schools"—Letter from the apostolic delegate—Paper by Rev. Henry J. DeLaak: "The teaching of science"—Paper by Rev. Laurence A. Delurey: "The teaching of history in college"—Paper by Prof. Edmund J. Ryan: "The teaching of English in college"—Discussion: "Educational legislation in the United States"—Report of committee on entrance conditions, Rev. James P. Fagan, chairman—Paper by Rev. Candidus Eichenlaub: "Greek in our Catholic colleges."

OFFICERS OF THE ASSOCIATION, 1901-1902.

President: Rt. Rev. Mgr. Thomas J. Conaty, D. D., rector Catholic University, Washington, D. C.

Standing committee: Rt. Rev. Mgr. Conaty, ex officio chairman; Rev. John A. Conway, S. J., Gonzaga College, Washington, D. C., secretary-treasurer; V. Rev. P. Vincent Huber, O. S. B., president St. Bede College, Peru, Ill.; V. Rev. William L. O'Hara, A. M., president Mount St. Mary's College, Emmitsburg, Md.; Rev. James French, C. S. C., vice-president Notre Dame University, Notre Dame, Ind.; Rev. L. A. Delurey, O. S. A., President Villanova College, Pa.

DELEGATES PRESENT.

Rt. Rev. Mgr. Conaty, D. D., Catholic University of America, Washington, D. C.
Rev. Benedict Boebner, C. PP. S., president St. Joseph's College, Collegeville, Ind.

Rev. Aloysius Bradley, O. S. B., St. Benedict's College, Atchison, Kan.; St. Bernard's College, Cullman County, Ala.

Rev. John C. Burke, S. J., vice-president St. Louis University, St. Louis, Mo.

The conference was formally opened by the Rt. Rev. Mgr. Conaty, rector of the Catholic University, with an address on

THE CATHOLIC COLLEGE OF THE TWENTIETH CENTURY.

I have no intention to speak as a prophet, nor have I any special knowledge by which I may discern clearly and describe accurately the college of the future. My purpose in this paper is rather to place before you certain facts which may serve as a basis for the solution of the problems of the future. In the perfecting of our collegiate system we should know the difficulties that surround us, find means for solving them, and thus aid this conference in reaching some practical results. My point of view is not so much the detail of college life as it is a larger and broader view of the college as an element in our educational system.

It would be most interesting to study the work of Catholic collegiate education in the United States in the century which has just closed, and which has culminated in the establishment of this conference of Catholic colleges. To describe our first attempts at collegiate instruction, to watch the gradual development of the college from one diocese to another, to note the increase and improvement in our colleges, until to-day nearly 200 institutions designated as colleges are com-

peting in one form or another in the field of higher education, would indeed furnish opportunities for serious study. Originally intended as feeding schools for the theological seminary, they have also developed preparation for the professions and business. The religious orders, with their centuries of traditions as teachers and educators, have built their college systems upon methods which have to their credit the successes of the past in the education of mankind. Prepared by years of careful study and sanctified by sacrifices, they have been honored by the results. The Benedictine, the Franciscan, the Augustinian, the Dominican, the Jesuit—these names represent a body of teachers who have preserved civilization and educated the world. The system of church schools developing into the university has been the foundation stone upon which the success of the Church as a teacher among the nations has been built. During the hundred years of our educational life these and other religious orders have been the fostering parents of the schools in which the college training of our American Catholic youth for the greater part has been received. Institutions established and maintained by the diocesan clergy and laymen have acted no small part in our educational development and are to-day prominent factors.

It is not necessary to dwell on the difficulties experienced during a century of development, from the day when Georgetown College in 1789 opened its doors to instruction in classics until the eventful day in 1889, one hundred years later, when the Catholic University welcomed to its graduate school in theology the representatives from the different dioceses of the country and began the work which has since developed into a great university. The French Revolution, which was so destructive of the external development of Catholic educational work in France, the trials and difficulties under which the English-speaking Catholic world labored in the maintenance of all forms of religious effort, the newness of this great country, which had opened its doors to the refugees from tyranny in all sections of the world—all these presented a serious handicap to the development which the church so ardently desired. Missions had to be established, chapels and churches built, and missionaries found to care for the spiritual wants of a rapidly increasing population. For the first fifty years this demanded the largest share of church interest. The school, the college, the university, representing the intellectual growth of the people, were to follow what might be called the brick and mortar period in church building. Then, again, large means were lacking among the people, who were mostly poor and generally exiles flying from tyranny and oppression abroad. Wealth was not found to any extent among the Catholic people; yet the spirit of sacrifice which dominated them is nowhere more evident than in their unwillingness to accept the education which the State schools, supported in part by their taxes, stood ready to give them. They submitted to a double taxation in order that they might establish and maintain parish schools in which their children might receive the blessings of a religious education. Competition with richly endowed State schools has not resulted in diminishing the luster of the record which the Catholic educational system has made. We need but refer here to the exhibit at the World's Fair in 1893 and listen to the encomiums passed on the educational results obtained in the Catholic schools. A college development, built upon a somewhat different basis from that of the parochial school, yet experiencing much of its difficulty, is glorified by much of its sacrifice, and shares in the same results. We owe almost wholly to the religious orders the foundation of the collegiate institutes which, without their unselfish devotion, would have been unable to live. We now have an almost complete system in educational work, which may well be called the educational system of the church, and which, despite all difficulties, may claim its right as a factor in the educational life of this country. The last century witnessed the foundation and growth of this system; the present century has for a duty its perfect development.

Though we have much to be proud of, and though we may point with pride to

the results of the last one hundred years, it is unwise for us not to realize that entering upon the new century we are practically at a very critical period. Against our system, as against the systems of all private schools, and especially religious ones, is the well-equipped and thoroughly unified organization of State instruction sustained by public funds. Starting with the primary grades, reaching as a desired result to the completion of intermediate work, the State system at public expense has developed into the high schools, and in many States maintains the university, in which, at public expense, even professional schools are found. The trend is toward national unification and national education which, we may remember, in 1871 were laid down as the planks in the platform of a great national political party.¹ All powers of government were to be centralized in the General Government, and social and religious unification was to be established by means of universal and compulsory education. It has also been said recently, by a prominent educator, that the past century has witnessed the organization of system in education, and that the State and State alone has been the controlling influence in education; adding that before this century the church controlled it. The mighty machine of secularized education is threatening to destroy all effort on the part of the individual or the church in the fields of educational endeavor. To unify and solidify, as well as to improve our system in all its parts, from kindergarten to university, is most urgent, and inasmuch as the college is an important element in the system the main purpose of this conference is to consider its place and duty. Whether we shall succeed in blocking the way of absolute State control in education, and thus secure the success of Catholic education in the twentieth century, may largely depend on the action of this association. To my mind there never has been a more critical moment in the battle of religious education against the secularized ideal than at the present time. I believe that danger is imminent to all forms of private schools and colleges, and it behooves us, devoted as we are to the idea of religion in education, to so build our system that it may be proof against all attacks of the nonreligious system. Christianity is dependent upon the life of the Christian school idea.

The paternal idea in education is being carried very far. The Washington Post, which has combated paternalism, said, editorially, in its issue of April 3: "All shades of political belief and all sorts and conditions of men seem to have accepted this tremendous expansion of the free-school idea as a proper exercise of the taxing power." It is important for us to take counsel together, strengthen our position, and solidify our system while we have yet full liberty to act. The danger from State legislation interfering in every possible way with private enterprise in education, the disposition of every experimentalist, in the name of education, to still further enlarge the sphere of State paternalism, the ever-increasing encroachment of State universities upon all forms of public instruction, even in private schools, the disposition to centralize education to the extent of national control, and last but not least, the political machine which threatens to lay hands upon educational forces for its own ends—all these are reasons which urge us in self-protection to safeguard the principles upon which our education depends and bind together all parts of our system for the purposes of successful defense. The time for isolated action is past. As educators we must not allow ourselves to be occupied exclusively with minor present advantages. The mere success of the particular system to which we may belong, or the immediate results from the particular well-equipped institution of which we are a part, should not blind us to the fact that the system as a whole is in danger and demands our earnest, unselfish consideration and devotion. In the struggle in which we are engaged other motives than those of education should not absorb our attention. The only way to secure even a particular interest is by concerted action for the general

¹ Henry Wilson, Atlantic Monthly, January, 1871.

good. All for each and each for all, that there may be no weak strand in the chain which binds us together, for the test of the system is in the weakest and not in the strongest part.

Until the present the general church interest has cared for us and aided us to success. Conditions are changing, and the mere name Catholic is not enough. We are to be judged by results and must submit to comparisons with other systems. No allowance will be made for our poverty or our weakness. We must compete with the best and in the ways in which the best-equipped colleges work or we lose the field. Hence more system is demanded. There must be a differentiation of the elements that unite to form the system. Business is dividing labor so as to reach better results. The master of all trades is a thing of the past. The man needed is the man who can do at least one thing well rather than many things poorly. We suffer from lack of definition of terms. We need to know just what we are expected to do, that there may be no overlapping nor confusion in our work. While we hold in general to the principle of a four-years' course for an A. B. in classics one college ideal is clearly defined. The entrance conditions and the qualifications for an A. B. degree show us the limits within which our collegiate work lies. This conference will discuss the first, and I trust that we shall soon consider the second. The moment seems ripe for our colleges to cease to be preparatory schools as well as colleges. Separate the two very distinctly, and leave to the preparatory school or high school what is but the fitting for college. Overlapping brings confusion, divides our attention, prevents concentration upon our real work, and leads to weakness and injury. There need be no friction and no jealousy once we have carefully defined and set apart the different elements of the system and insisted that each part shall do the work for which it has been fitted. What we need is not more colleges, but that our colleges do good college work.

It is well for us to be thoroughly acquainted with the facts of the situation, in order that we may intelligently discuss this question. To open a school or college, and to make it a part of the educational system, may seem to be a very simple matter of supply and demand. The school is opened, the people urged in the name of religion to patronize it, the instruction we deem best given, degrees after a time conferred, and then there is a certain pointing of pride to the alumni occupying the positions of honor and trust in the community. All this may be true, and yet only be on the surface; the real situation is much more complicated than such statements would warrant. Let us examine the facts which lie around and about these, and which our educational system has really to face. The first fact we meet is the general extent of the State school system, with its rapidly increasing high school, college, and even university development. The free school was originally aimed to fit the people for the ordinary needs of citizenship, and was established particularly against illiteracy. Developed as it is at the present time, it aims to fit students for the practical business of life, as also to give them admission directly to the university. Its purpose seems to be to make the step easy from the State school to the State university. The addition to the high-school course makes it possible for the university to stoop down and assume the higher grades of collegiate work, and thus, by copying the German model, to do away altogether with the college. This is a condition growing more and more threatening, which stands face to face with our collegiate system. A second fact is to be noted in the institutions of all sorts that are being endowed by the private munificence of non-Catholics. Business colleges, schools of engineering, art schools, conservatories of music, trade schools are springing up in all large centers, attracting even Catholic students, and doing so the more easily because they do not appear as State schools, but rather as the effort of generous individuals in the broader education of the public. But the fact remains they are not Catholic, and the tendency in teacher and instruction is not toward a respect for the Catholic ideals. This must surely be reckoned with, as our educational system faces the problem. We may find a

third fact in the effort very clearly defined during the past few years by which universities with rich endowments are striving for the control of State schools, the dictation of the schedule of work, the papers for the examination of teachers, the definition of the scope and purpose of all public instruction, the desire to have all teachers receive the university degree or certificate of university approval. The trend of educational legislation is the result in many quarters of the universities' desire for control of all schools—private as well as public. The history of school boards in many of our large cities would show us that all those who desire to become teachers, no matter where they have been instructed nor what may be their qualifications, are forced in some way to be approved either by the universities or by the normal schools or by the regulations suggested by either or both. Examples are not wanting to substantiate this fact. We have only to remember the discussions in the Chicago schools and elsewhere and the attempts in some of our State legislatures for enactments along these lines.

There is another fact which we would do well to carefully consider, and it is that which refers to strictly scientific publications. We have only to consult the library table of every scientific department to find that such publications come largely from non-Catholic sources and chiefly from universities equipped in every way for research. Even the more popular publications which flood the market regularly and are read on all sides, even by Catholics, spring from practically the same source. They are all helps in the education of the people, and they impress upon them the idea that for anything first-class in science or literature they must go to a non-Catholic source. By constant experience with these statements our Catholic people are led to look upon the scientific and literary work of Catholics as something quite inferior. It seems to me that these are some of the hard facts which stand over against us in our educational work.

To offset this there is the very patent and splendid fact that the Catholic Church, out of her poverty, and in spite of all other serious demands upon her for church and charitable development, has spent on education during the past year the magnificent sum of \$25,000,000 and has had under her educational training over 1,000,000 pupils, 13,000 of whom were under Catholic collegiate instruction. In this estimate there is no account of the money spent for buildings. This means on the part of thousands of teachers most conscientious self-sacrifice, on the part of parents generous devotion to conscience and an ideal, and on the part of students the willing sacrifice of the best years of their lives.

During the first half of the century a very small proportion of Catholic children found it possible to go beyond the grammar grade of school; in fact, the same was proportionately true of all children. The increase in collegiate attendance during the past fifty years, in view of the circumstances, has been remarkable, while the number seeking advanced courses has necessarily been small. It is safe to say that in this century, as in the past, the parochial school and the college will continue to supply the demand of those who, for one reason or another, will not be able to pursue advanced courses; but it is also true that, with the material development of the Catholic element in our population, the number of students able and willing to obtain the university advanced degrees will be much larger. The danger from the high-school movement to the collegiate and university parts of our system, to my mind, is greater than even that which threatens the parochial school. Hence I assert that this is one of the most important problems for the college. Take the high school from our system, or neglect to develop it according to the demands of the people, and you are practically forcing the graduates of your parochial schools into the State high schools, which, even more in the future than in the past, are to be the feeders upon which the universities depend. The problem is before us and is becoming more and more urgent, Shall Catholic undergraduate schools serve as feeders to non-Catholic universities? It is not merely the question, which of itself is a serious one, Shall Catholic colleges aim

to fit students for non-Catholic universities? The question is deeper and farther reaching. Shall Catholic parochial schools aim to fit them for preparatory schools which lead to non-Catholic colleges as well as non-Catholic universities? Can we consistently urge Catholics to send their children to lower Catholic schools, and then, when these children are a few years older and are just beginning to think seriously, shall we encourage them to enter the non-Catholic colleges and universities? The danger from the non-Catholic college and university is that instruction is given in them at a time when young men and women are beginning to think for themselves; and we know that if there be no religion at all, or if religion play a minor part, the instruction must be not only defective, but dangerous to the intellectual and spiritual life. It is not likely that men who graduate from non-Catholic colleges and universities will become ardent supporters of the parochial schools and the Catholic college. They may feel that individually they have suffered no loss of faith, no diminution of luster in their religious beliefs; but they fail to see the thousand and one others who have either lost faith altogether or have drifted into absolute indifference in religion. Where men receive their highest diploma will be the center around which their affections will turn. If, then, the parochial school act as a feeder to the non-Catholic school, it is highly probable that a large element of Catholics graduating from the high schools will find its way into non-Catholic colleges and universities, and thus our parochial school without its high school is apt to become a feeder to the non-Catholic college and university. It is idle to say that our Catholic colleges have their preparatory schools which continue the work of the parochial schools. These colleges are not to be found in every community, and convenience as well as expense has much to do in determining the place to which students may go.

You may ask, What is the solution of this difficulty? One solution is in the unification and coordination of the Catholic system of education, which links parochial school with high school and college and leads to the university, which holds the headship of the system. No one will question the wisdom of unification. It has always been a characteristic of the church. It is the watchword of the hour. It is seen in her government, her discipline, her doctrines, and her methods. Her unity has made her irresistible. The rods tied in the bundle can not be broken. Education unified, systematized, coordinated, makes the union which will have strength wherewith to battle successfully against false education. One strand needed to our cable is the high school. How the high-school system will be worked out is a question of serious consideration. We know that it is largely a question of finance, while there is also the question of principle as to the right to tax the people for education beyond the grammar grade. Face to face with conditions as they exist, the working out of the high-school problem is one that demands the careful attention of all who are interested in Catholic higher education. As to the college, between the upper millstone of the university and the lower millstone of the high school, it is important not to lose sight of the trend in public opinion as made by the state and non-Catholic universities upon the high-school movement. We can not brush the difficulties aside; we must face them like men and carefully consider them.

It will not be amiss to discuss briefly at this point the question of graduate work in college. Although the universities have given to it the proper place in the university proper, yet we know that there is a disposition to introduce it into college or have it done by college instructors. As an element in collegiate discussion it may be touched upon at this moment.

As to the graduate instruction, for which there is an ever increasing demand, as it seems to me, two answers offer themselves. One is in the willingness of Catholic colleges to undertake this instruction; the second, in their readiness to allow this work to be done by the university which is intended and equipped for the work. Looking at the first answer, it is wise to see how far this can be done and what it

costs to do it. It is not merely sufficient that there be willingness on the part of instructors to undertake this work. The adding of the name to the college catalogue does not make the graduate school. There must be preparation on the part of the instructors and equipment on the part of the school. Here again we face facts. Graduate work to-day is the accepted function of the university in the proper sense of the term. It demands scientifically trained men, who, by their scholarly attainments, are prepared to enter into the field of specialism and fit students to be specialists. It goes beyond mere specialism and enters the broad field of scholarship and produces scholars capable of adding to the knowledge of the world. It requires laboratories and libraries thoroughly equipped with the best and latest scientific apparatus. Competition is so keen that if we would enter into it we must be prepared to do the work as it is done by the universities liberally endowed. It costs millions to properly endow a modern university. I have carefully compiled a statement by which you may see what is spent in Harvard, Columbia, Johns Hopkins, Chicago, Cornell, and other leading universities, especially in the work of graduate studies. Just as the Catholic college has to compete with the non-Catholic college, so the Catholic graduate school must compete with the non-Catholic university or else withdraw altogether from the higher education. It is not a question here particularly of professional schools. It is a question of what is known as graduate work, and this affects in large part the future training of teachers for our collegiate work. It is unreasonable to expect graduate work from our college teachers. They are already overtaxed with their present work. No body of men in educational circles are more deserving of consideration and gratitude than the army of teachers who are engaged in maintaining our collegiate instruction, but anyone who studies carefully the relation between collegiate and graduate work, especially in the light of modern university requirements, will readily understand the necessity of special training as well as special fitness for graduate instruction. In specialization alone not a year, nor even three, added to college work can be expected to do the work. It is the effort toward original research; it is the real reaching out of the student in his own personal development in scholarship; it is the accuracy from concentration of thought, from contact with library and laboratory by which he adds something to the science to which his life is devoted. The teacher, the library, the laboratory are the elements that train the specialist, the scholar.

You can not transform the college into a university by the mere change of name; you can not do graduate work by the mere declaration of a catalogue. The State charter makes neither the college nor the university; it simply bestows upon teachers a corporate existence and the power to confer degrees. The character of the college and university is in teaching and equipment, in the ability to do what education demands of them. Its real character is to be tested by the scholars it produces. If we merely change our name and add graduate work to our college without at the same time being prepared to do the graduate work which graduate degrees call for, we will find ourselves at the end of this century as we find ourselves somewhat at present—imperfectly developed institutions sometimes not deserving to be colleges, yet by charter called universities. Catholics possessing the truth of life and commissioned to develop it in the minds and hearts of the people, we should be the most honest of men in doing the best of work in whatever department we invite people to enter.

What seems to me the practical solution, as also a practical conclusion, is that we recognize the fact that we can not with our present means maintain several schools equipped to do graduate work capable of competing with non-Catholic institutions. It is the duty of the colleges, out of loyalty to the system and with desire for the best results, to do their best to build up the university, which our Holy Father, in accordance with the wishes of our hierarchy, has constituted as the head of our educational structure and to which he wishes all schools and colleges affiliated. Listen to what Leo XIII said to the bishops of the United States March 7, 1889: "We exhort you all that you should take care to affiliate with your

university, your seminaries, colleges, and other Catholic institutions according to the plan suggested in the constitution in such manner as not to destroy their autonomy." That was Pope Leo's idea of unification. It behooves us to more thoroughly equip our colleges and perfect our instruction. The teacher makes the school. Let us feel that the first duty of the college is to be a thorough college, doing the best collegiate work, ready to stand side by side with its non-Catholic competitor, and showing in its graduates the result of a Catholic college system. Its duty is not to reach beyond that which it is competent to do well, and, consequently, it should be found encouraging that class of students who seek advanced education along graduate lines to go to the university for it. It has the right to expect that the university should be prepared to enter into competition in graduate work with the best universities in the land. Catholic generosity has built the university primarily for university work in every department of scholarship, and it can not succeed unless every part of the educational system be loyal to it.

What would be the result of this united effort? First, there would be a strengthening of the entire system, a perfection of our educational scheme, a culmination of the efforts of a century, which would make us absolutely independent in education. Second, there would come from the university to the colleges a body of well-prepared teachers, religious and lay, who, equipped in all that the best universities can give, will be the better prepared to reach excellent work in our collegiate instruction. They will also be loyal to all the elements that enter into the educational life of the church. Third, the scholarship thus developed will stand ready to defend the truth against any and all of its enemies and to meet error based on false science by truth supported by true science. Fourth, there will be the preparation of teachers for the university, that thus we may provide for the future and build up a body of Catholic scholars prepared to stand side by side with the leaders of intellectual thought throughout the country. Fifth, there will come a splendid toning up in Catholic educational ideals, which will be a safeguard of the faith and traditions of Christianity. The layman, the clergyman, and the religious teacher will thus make it possible for the Catholic Church in the United States to send out into the world scholars competent to take first place in the fields of literature, in science, in professional, and in business life. It will develop the scholarship which in God's own time will find itself in scientific and literary magazines protecting science and literature from error and showing to the people that the perfect intellectual development is in entire harmony with the doctrines and practices of the church.

You gentlemen, representatives of the collegiate system, hold the traditions of the hundred years' struggle in the educational life of the church in this country. It has been a tremendous struggle; it has attained marvelous successes. Upon you falls a far-reaching responsibility as you stand to-day looking back on the century that has closed and forward to the century that is opening. Shall our Catholic educational system succeed or fail; shall it obtain but the minimum of results; shall we be able to resist the oncoming tide of secularized instruction? The answer largely depends upon the work of this association. Every one of our colleges should feel that that responsibility falls upon it, for the work which education demands of it is as important as that demanded from any other part of the system. Loyalty not merely to our own ideals, to our personal success, but loyalty to the wider and more general principle of the educational life of the church demands that it mortise itself into the system; that it stand by every part of the system, so that the entire system may stand by it, and thus the unification which results will give us the strongest resistance to the dangers which threaten us. Every college should feel that it exists not merely for the students, few or many, that pass through its halls, but for the schools below it, as also for the university above it, the university existing for it as well as for the whole system. * * *

CATHOLIC SECONDARY SCHOOLS.¹

By Rev. JAMES A. BURNS, C. S. C.,

President of Holy Cross College, Washington, D. C.

Among the striking phenomena in the educational world at the present time is the movement observable in the domain of secondary education.² The mere numerical growth of the secondary schools is remarkable enough. Within the past decade the public high schools in the United States increased in number from 2,526 to 5,495, and the pupils from 202,963 to 476,227. This is an increase of 117 per cent in the number of schools and 135 per cent in attendance. The rate of increase in the number of pupils is nearly five times that of the population of the country during the same period, and is rightly regarded by Commissioner Harris as "one of the most remarkable facts in the educational history of the decade."³

But this numerical increase is only one of a series of phenomena which evidence the action of a cause or of causes profoundly affecting the whole status of secondary education. Side by side with the growth in numbers there has been a movement making for the increased efficiency of the public high schools. The standard of scholarship in the teachers has steadily risen. The curriculum has been enriched and extended. In most places its length is now four years, but here and there it is being prolonged to six, and the strong current setting in this direction is made plain by the adoption of a resolution recently by the National Educational Association favoring "a unified six-year high-school course of study, beginning with the seventh grade."⁴ At the same time the ideals and spirit of the school have broadened, the principle of election of studies along broad lines has been introduced, and the requirements for entrance and graduation have been so raised that the claim is made that the public high school of to-day is almost the equal in these respects of the college of a generation or two ago.

The relation of the high school to the college has also undergone an important change. The original purpose of the public high school seems to have been simply to place within reach of the masses the opportunity for an education superior to that of the elementary school. The college interests were not considered. In fact, at the time the high-school movement began, in the second quarter of the nineteenth century, there already existed a system of secondary schools known as academies, one of whose principal objects was to prepare boys for college. To-day the public high-school system, comprising 82 per cent of the secondary students of the country, is securely linked to the State college system, and the natural evolution of the present conditions can only result in binding the two together more firmly.

Among the causes which have operated to bring about this affiliation, legislation must be mentioned. The board of regents in New York and the boards of education in the various States afford familiar instances of the influence of legislation in this direction. The accrediting system, by which the graduates of certain specified schools are admitted to a college without examination, has also contributed powerfully to the same result, and it is being practiced to-day by some institutions on a scale that may help to account for their rapid increase in attendance. In 1896 there were 42 State universities and colleges and about 150 other

¹ This paper is given as reprinted, in amplified form, in the *American Catholic Quarterly Review*, July, 1901.

² The term "secondary" throughout this paper is used in the sense which generally attaches to it in this country, and in which it is used by the national Bureau of Education. It embraces the work between the grammar grades and the college.

³ Report of the Commissioner of Education for 1898-99, p. 1844.

⁴ Proceedings of the National Educational Association, 1899, p. 659.

institutions in which this system has been adopted.¹ The University of Michigan has now 200 on its list of formally accredited schools, and more than one-half the freshmen who entered Cornell last year were admitted without examination on the certificates of their respective high schools.² Another strong influence which has made for closer union between high school and college has been their cooperation in joint associations. There is the National Educational Association, the associations for the several groups of States, besides those for the individual States, and in all of these bodies the schools and colleges meet upon common ground, discuss matters of mutual interest, and cooperate for the solution of problems common to both school and college, but which from their very nature neither can successfully solve alone. Such a problem is that of uniform entrance requirements for colleges. A plan has been formed to establish a joint entrance examination board, composed of school and college representatives, which is to give uniform examinations that will suffice for both high-school graduation and admission to college, and it is now being put to a practical test by the Association of Colleges and Preparatory Schools of the Middle States and Maryland. This is an attempt to complete, at a single stroke, the work of unification, and if successful it is likely to have important consequences. Catholic educators may watch the experiment with profit.

“Public education,” a distinguished Catholic educator has said, “is a people’s deliberate effort to form a nobler race of men.” The position of the secondary school, between the primary and the higher education, makes it naturally the chief point of stress for the application of this progressive educative effort. The secondary school is the hinge upon which the modern educational system turns. In Germany the new ideals in education, springing from the new industrial and political conditions and the new ideals of national life, have found expression chiefly in the present movement for the reform of the gymnasium; and in France, outside of the religious question altogether, as well as in other nations of Europe, the burning questions of the day in education concern the secondary schools. In America the secondary school is more important than anywhere else. From its academic independence it is able to influence powerfully the higher education; while, through its organic relation to the primary school, it is able to reach the masses and mold their intellectual ideals. In America, as nowhere else, the public secondary school opens up to the whole people, irrespective of social conditions, the possibility of fullest mental development. It brings the rudiments of the higher culture to the threshold of every home, and offers to every child a free and easy passage to the open gates of the college. It is preeminently “the people’s college.” It can not be doubted, therefore, that the public high-school movement, whose surface manifestations I have touched upon, is the expression of a popular demand for more and better education, and that it is destined to exercise a profound and far-reaching influence in shaping the education of the future.

In view of these conditions it seems opportune to inquire into the status of Catholic secondary education.

Catholic secondary schools for boys belong to three widely different classes. There is, first of all, the secondary school proper, represented by academies and high schools, whose curriculum as a rule extends no farther than the freshman year, although in the other direction it generally includes the studies of the grammar school. Many of the institutions of this class are of long standing, but a large number are of a comparatively recent date, probably one-third having been established within the past decade. Most of them are conducted by religious orders, and are entirely independent of parish control, deriving their means of support from the tuition fees of their pupils. Then, there are the high schools attached to

¹ Education in the United States, Vol. I, p. 125.

² President Schurman’s Report, 1899-1900.

parochial schools. These high schools consist of one or more grades of secondary work, serving as a sort of appendix to the ordinary work of the school, although they often carry the pupil as far as the freshman year. The number of these schools has increased very rapidly of late, and although their total attendance is comparatively inconsiderable and their methods often open to criticism, yet, as instancing an increasing popular demand for secondary education, and as pointing the way to a possible solution of problems of Catholic secondary education, they are worthy of serious study. Finally, there are the preparatory departments of our colleges, which still contain the majority of Catholic secondary students.

With the view of ascertaining some facts not otherwise attainable, I sent a letter of inquiry to each of the 90 secondary schools of the first class and received replies from 49. In these 49 schools the number of students of high-school grade was given as 2,947, and of elementary grade 4,917. There were 992 boys studying Latin, and 244 in Greek. The average age of pupils in 47 schools when entering the high-school curriculum is 14.7 years. The average annual tuition fee, if we exclude those schools that aim at educating only the wealthier classes, was found to be \$36.85 in 40 schools. The number of schools not answering my letter of inquiry was 41. The total number of students in these last year, as given in the Catholic Directory for 1901, was 6,706. Assuming that the ratio of secondary to elementary pupils obtained in the case of the schools heard from holds good for these also—although I think it is somewhat too high for the latter—we get for these 41 schools 2,513 pupils of secondary grade and 4,193 of elementary. This would give a total of 5,460 students of secondary grade in the 90 Catholic secondary schools.

In reflecting on these results, one is struck by the comparatively large number of pupils pursuing the classics. Those studying Greek constitute 8.3 per cent of the whole number of secondary pupils in the schools reporting. The percentage of pupils in the public high schools studying Greek is only 3.1.¹ Those studying Latin are 37.5 per cent of the whole, a number which compares favorably with the 50.4 per cent in Latin in the public high schools, when we remember that some of the religious orders most prominent in secondary school work do not teach the classics at all, and the further fact that in the 25 schools reporting pupils in Latin their percentage was as high as 66.5.

The average age of entrance upon secondary studies is much higher than I had expected. It is quite as high as in the case of the public schools, and invites serious attention to the need of shortening and enriching the curriculum of the elementary school—a problem that far-seeing educators like President Eliot long ago pointed out as of fundamental importance to college as well as school.

It is interesting to compare the cost of secondary education in Catholic and in public secondary schools. The Commissioner of Education has kindly furnished me with some statistics relative to the cost of public high-school education, from which it appears that the average annual cost per pupil for salaries and incidentals in 10 of the principal cities of the country is \$52.44. The average annual tuition fee in 40 Catholic secondary schools is, as stated, about \$37. As the only source of revenue to these schools is the tuition fees, it is safe to say that secondary education in the Catholic school costs considerably less than in the public high school.

So far as the efficiency of Catholic secondary schools of this class is concerned, such examination as I have been able to make has convinced me that they will fairly bear comparison with the preparatory schools in our colleges. There are exceptions, it is true. There are secondary schools graduation from which would not fit for the freshman year in any reputable college, just as there are colleges whose preparatory curriculum is inferior to that of any reputable high school.

¹ Report of the Commissioner of Education, 1898-99, p. 1846.

But in general, making due allowance for the fact that many of our secondary schools are commercial in character, I believe that our college preparatory departments have little to offer the Catholic boy in the way of educational facilities beyond what he can get, often nearer home and at lesser cost, in the Catholic secondary school.

Catholic high schools attached to elementary schools are represented in the current Report of the Commissioner of Education by 53 schools, with an attendance of 646 boys and 1,342 girls. This is an average of 12 boys to a school. These schools are mostly in the hands of the various orders of teaching nuns, and are nearly all coeducational. Most of them offer four grades or years of high school work, although the average number of teachers to a school is only three. It is worthy of note that the pupils preparing for college in these high schools formed 9.6 per cent of the whole. In the public high schools those preparing for college form 11.6 per cent of the whole.¹ The comparatively large number preparing for college in Catholic secondary schools of this class is a fact of highest interest for college men, and suggests what might be expected in the way of increased college attendance, if we had a comprehensive, efficient, and well-articulated system of parochial high schools.

The list of Catholic secondary schools of this class, given in the Report of the Commissioner of Education is, however, far from being exhaustive. Scattered over the country are hundreds of other parochial schools in which one or more grades of high school studies are taught, the general disposition being to keep the pupils, especially the brighter ones, as long as possible. The total of attendance, however, is not large. Thus in the archdiocese of Boston there are a number of schools of this class not enumerated above, but the total of secondary pupils amounts, in the case of boys, to but 108. It is no uncommon thing to find a school of several hundred pupils with half a dozen or so of secondary grade, who stand in about the same relation to the rest of the school as do the "post-grads" in a small college, and who pursue their studies in much the same loose and leisurely way. Sometimes a number of these inchoate high schools are found in the same city, and we have the condition of a series of ill-supported rival establishments where not more than a single one is needed or can be successful. In such cases, so far from the high schools being a source of strength to the parochial schools, as they could not fail to be if combined in one central, well-graded institution, they become only an element of weakness and a drag, because the teaching they get, scant and feeble as it may be, has to be subtracted from that which is due the elementary grades. There is an enormous waste of energy going on in this way in our schools. Nevertheless, the attempt to project the parochial school beyond what has been hitherto regarded as its proper limits seems to be in answer to a popular demand, and is doubtless destined to continue. The movement is bright with possibilities, for the secondary schools of this class, however unsatisfactory and open to criticism they may be in some respects at present, constitute a firm forward step in the work of bridging over the gap that now separates Catholic higher education from the parochial schools.

In estimating the number of collegiate and secondary students in Catholic colleges I have classed as colleges all institutions recognized as such by the Commissioner of Education, and have added such others as I could ascertain to have an actual collegiate attendance. This gave a list of 68 Catholic colleges. The total number of students in these, as given in the current Catholic directory, is 12,031. If we take the estimate of Dr. O'Malley,² made in 1898, and based on direct investigation, that the proportion of preparatory to collegiate students in our colleges is as two to one, then the number of collegiate students in the 68 Catholic colleges

¹ Report of the Commissioner of Education for 1898-99, p. 1846.

² Catholic World, 50, 399.

ter of the classics, for instance. Only a little over 3 per cent of the public secondary pupils study Greek. It is one of the most unpopular branches in the high school. Yet many of our colleges will not admit to the freshman class without Greek. The practical consequence is that whereas the high-school graduate who has not taken Greek is welcomed to the State university, he may not be able to enter the freshman class in the Catholic college without extra preparation or irksome conditions. On the other hand, the path from the public school to the State university is short, straight, and enticingly easy. The high-school diploma often admits without examination. The last year of the high school is made to dovetail into the freshman curriculum. There is no gap, no break, no jar of any kind. It is an interlocking, double-action combination. The lack of endowment in our colleges is, of course, an element of importance here. The foundation of scholarships would unquestionably operate in favor of increased attendance; but it may reasonably be questioned, I think, whether, even if our colleges were not behindhand in this respect, the fact would be sufficient to offset the strong current now flowing in the other direction, since Catholic boys would have equally good chances for financial assistance in the non-Catholic institutions.

If, on the other hand, we accept the hypothesis that the falling off of the attendance in Catholic institutions is due, in whole or in part, to the fact that Catholic youth, owing to the general poverty of our people, do not get as much education as the children of their fellow-citizens, the argument for the Catholic high school rests on reasons none the less cogent. The poverty of the majority of Catholics is a fact not to be gainsaid. It undoubtedly diminishes their opportunities for education, and is certainly responsible, to some extent, for the comparatively low attendance at Catholic institutions. But since the church discountenances the acceptance by her children of the lavish opportunities for education offered them by the State, are we not bound to provide for them opportunities not inferior to those provided in the public schools? In a democracy like ours and in times of universal education such as these, education is, ordinarily speaking, the measure of influence and success. To be without it is to be to that extent crippled for the race of life. To be deprived of opportunity for it is to be robbed of that which is, after religion, best and most ennobling in life. Surely we can not look without concern upon conditions by which any class of the church's children are deprived of educational opportunities to which they are entitled. Yet such conditions obtain. Taught to distrust the public schools, Catholic parents, in the absence of Catholic high schools, too often come to look upon the completion of the parochial school curriculum as the natural term of the mental development of the child.

The preparatory departments of our colleges are not a satisfactory substitute for a system of Catholic high schools. Purely from the point of view of college interests, much might be said against the continued union of preparatory school and college, for it may be questioned, I think, whether collegiate attendance depends so much as is commonly supposed upon the presence of preparatory departments in the colleges. A record of observation, telling how many third-year preparatory boys in any given college kept on through the college course to graduation, would be highly interesting and instructive. However, I am concerned now, not with the relations of preparatory school and college, but simply to state the reasons for my contention that our preparatory departments are not acceptable substitutes for Catholic high schools in the case of pupils who do not intend to go to college—and it is pupils of this class that constitute nine-tenths of all secondary students. Besides the fact that the day colleges are neither numerous nor well distributed enough, the distance between the parochial school and the college is too great. The absolutely private character of our colleges, so far as management is concerned, seems to make anything like close affiliation with the parochial school system a difficult if not an impossible matter. Moreover, the curriculum of the

preparatory school looks chiefly, if not solely, to the interests of boys who are fitting themselves for college. In many colleges no attempt whatever is made to reach out after the great mass of boys of secondary grade, by providing courses of study that shall offer opportunities to fit more directly for active life. But the chief reason that militates against the preparatory departments is the fact of expense. Education can not be given as cheaply, grade for grade, in the college as it can in the secondary school. The average annual tuition fee of \$37 in 40 of our secondary schools, including many of the strongest schools of this class, is far less than the average annual tuition fee for day scholars in the preparatory departments of our colleges; and it is to be noted that the tendency in many colleges is steadily toward the increase of tuition and other fees. I am aware that some colleges in the larger cities have reduced their rates to a comparatively low figure and are making heroic sacrifices in order to give the children of the poor a chance; but, speaking generally, the cost of tuition and its inseparable accompaniments in college preparatory departments puts it entirely beyond the reach of many parents who could and would send their children to a free or cheap Catholic high school. How many there are who are prevented in this way from giving their children an education superior to that of the parochial school may be a matter for dispute; but it is worth remembering that an investigation made some years ago in the case of the public high school pupils in a number of the principal cities of Massachusetts revealed the fact that fully 25 per cent were children of parents who were too poor to possess taxable property.¹

Parochial schools, even more than the colleges, will benefit by the establishment of a system of Catholic high schools. "Progress," says Bishop Spalding, "spreads from the summits." The greatest need of the parochial school at the present time is the stimulus that would come from affiliation with a superior school. The impetus given to parochial school education by the third plenary council of Baltimore has largely subsided, and there is evident in many quarters a growing spirit of indifference. The number of pupils, which increased very rapidly in the decade immediately following the promulgation of the decrees of the council, is still less than one-half of the normal, and in the last half dozen years, as the tables of the Catholic Directory prove, the increase in parochial-school attendance has not kept pace with the increase of the Catholic population.

Nor have the expected results followed from the general adoption of the elaborate scheme of examination and supervision devised by the council. The practical difficulties in the way of the efficient enforcement of the plan are immense, and although a great deal of progress has been made in some dioceses, in many others things run on much the same as before the examining boards and committees were appointed. In many places the parochial schools are still deplorably in need of definite and regular grading. There is much confusion in the matter of text-books, preventing any approach to a common standard of grades. Many of the religious orders have their own series of text-books, and in the larger cities, where the religious orders often work side by side, the variety of text-books is a frequent source of trouble and expense. The influence of a Catholic high school, with which all the parochial schools of a city would be affiliated, would tend to eliminate these and similar defects. It would set the standard of a definite quantity and quality of work, and school grading and substantial uniformity in grades and text-books would follow as a matter of course. Above all, the Catholic high school would benefit the parochial school by strengthening and elevating its tone, by awakening a sense of healthful ambition and rivalry in both pupil and teacher. Experienced parochial school-teachers with whom I have discussed the matter assure me that it is this lack of tone, due to the absence of conditions that inspire intellectual ambition, that constitutes the most deadening and difficult evil they have to contend against. A boy who is ambitious to go to the high school will do

¹ Educational Review, 2, 48.

better work, as a rule, than one who is not, and parochial school-teachers would find in the establishment of Catholic high schools a most effective remedy for the pupil's disinclination to home study. The annual entrance examination for the high school would become a test of the strength and competitive standing of the various schools, and would spur the teachers on to the best possible work in their respective spheres. These convictions, I may add, are not based upon fancy or speculation, but are the result of a careful study of the influence of Catholic high schools actually existing, and of the views of those most competent to discuss parochial school conditions and problems the country over.

I have said nothing thus far about practical plans for overcoming the difficulties in the way of the establishment of Catholic high schools. The difficulties are certainly not slight, but the chief difficulty does not consist in any lack of practical plans. There are several admirable plans in successful operation that may be studied in the concrete by anyone. There is the plan of the free, endowed high school, such as the magnificent Catholic High School in Philadelphia; there is the free high school supported by the funds of the parish or parishes, as in New England; there is the high school supported by the tuition fees of the pupils, and in charge of a religious order. There are plenty of religious men and women for the work of Catholic secondary schools, and with the inevitable evacuation of the field of the parochial school by religious men these ought to be available in increasing numbers for their greater, more pressing, and more proper work in the secondary school.

The main obstacle in the way of the Catholic high-school movement lies deeper than the question of means. It is due rather to widespread lack of faith in the utility and desirability of Catholic high schools, and it is not confined to the laity. Pastors who are zealous enough in the cause of the parochial school disavow belief in the necessity or possibility of Catholic high schools, and permit without scruple the attendance of Catholic children at the public high school. Men in the walks of higher education look with coldness or disfavor upon the project of a system of Catholic high schools, out of the fear that they might injure existing institutions. The result is apathy and indifference well-nigh universal.

And yet what sound reason can be given, outside of the reason of necessity, why the Catholic parent should be freely allowed to send his child to the public school in the one case and strictly forbidden in the other? Is there less need of the religious instruction and moral tone of the Catholic school for the boy of 16 than for the lad of 12? Are the dangers of companionship less great in the public high school than they are in the grammar school? Does the subject-matter of the lessons or lectures bear less upon matters of morals and religion? As a matter of fact, it is in the high school that the boy gets his first world view of things. Literature and history are the two eyes through which the soul scans the universe of human life. Is it tolerable that the view may be distorted or colored for the Catholic boy by non-Catholic bias? If history and literature may be studied in the public school without danger to faith, why may not, with greater reason, grammar and arithmetic? If the boy of 16, with his ripening passions and impressionable moral nature, may live in a "godless" atmosphere without harm, why may not the boy of 12, with his less-developed impulses to evil? And the same argument would apply with no less truth and cogency to the question of higher education. There is really no more reason to prevent a Catholic boy from going to a non-Catholic college than there is to prevent his going to a public high school. The logical applicability to parochial school and college of any general principle that may be admitted for the secondary schools is too plain to be missed by even the most ignorant, and the present widespread attitude of indifference in respect to Catholic high schools must, if continued, extend eventually to the parochial schools and the colleges, and profoundly affect the entire system of Catholic education.

It is because of the realization of this that our ecclesiastical councils, in con-

formity with the instructions of the Holy See, have insisted so strongly and steadfastly upon the necessity for a complete system of Catholic schools, along the lines of the national education, and that our ablest and most far-seeing leaders are devoting so much of their practical efforts in education to the building up of Catholic secondary schools in their respective dioceses. The vast expansion of public secondary schools in recent years, the rapid educational evolution going on visibly about us, with the possibility of the complete unification of all public education, makes the question of Catholic high schools, with which that of the systematization of Catholic education is intimately bound up, a vital and a pressing problem for Catholics. It commends itself especially to the attention and earnest study of Catholic educators. The present conditions are abnormal and illogical, and in the nature of things must operate to the detriment of the religious as well as the educational interests of our people. In the words of one whose abilities and experience entitle him to rank as an authority: "There is far less danger in allowing young children to attend the ward schools and young men to attend the non-Catholic technical schools and universities than in permitting the frequentation of the non-Catholic high schools and academies. We believe it would be better to frankly accept the public-school system as a whole and make special provisions for supplying its deficiencies in religious teaching than to expose our children to the influence of a dual system."¹

DISCUSSION.

In discussing this paper Dr. Carroll, of Dubuque, said that in the diocese of Dubuque widespread interest was being taken in the high-school movement, the pastors of the city zealously cooperating with Archbishop Keane in his efforts to build and maintain a Catholic high school.

Monsignor Conaty remarked that in Providence a meeting of laymen and clergy was lately held for the purpose of establishing a Catholic high school in that city.

Rev. M. P. Dowling, S. J., of Omaha, said that he doubted whether we had any power to establish Catholic high schools. All we can do, he said, is to encourage pastors and prelates to establish these schools. He was convinced that apathy existed not only in regard to Catholic high schools, but also to an extent in regard to all Catholic education. Moreover, as a practical question, in small cities where a college already existed a Catholic high school would not only be unnecessary, but decidedly detrimental to the academic department of the college. He would also put in a disclaimer against the addition of one or two inefficient high-school grades to the ordinary parochial schools, as experience showed that these classes were generally only makeshifts.

Rev. James P. Fagan, S. J., of Washington, replied that the same difficulties now urged against Catholic high schools had formerly been urged against all high schools. In his opinion Catholic high schools should be maintained where local conditions demanded them, and not in other places.

Father Fagan also objected to several current maxims as calculated to give false impressions. The expression sometimes used of "uplifting Catholic education" was calculated to convey the idea that Catholic education was not as good as other kinds of education, which in his opinion was decidedly not the case. "To shorten and enrich elementary courses" was to his mind another catch phrase which was self-contradictory, to enrich a course meaning to multiply the studies, which was certainly incompatible with abbreviating the time for seeing these studies. "Fitting pupils directly for life" was a modern coinage which seemed to imply that the older and approved systems of education had failed to fit students for life.

The following letter was read from Cardinal-elect Martinelli, apostolic delegate:

APOSTOLIC DELEGATION, UNITED STATES OF AMERICA,
Washington, D. C., April 23, 1901.

Rt. Rev. THOMAS J. CONATY, D. D.,
Rector Catholic University of America,

Chairman of the Association of Catholic Colleges:

RT. REV. DEAR SIR: * * * The educational work done by Catholics up to the present time is deserving of great praise. Wonders have been wrought in the

¹ Rev. John T. Murphy, C. Sp. S., in *American Catholic Quarterly Review*, 22, 461.

face of difficulties which have been by no means light. That so much has been done is the chief reason why more ought to be attempted. To achieve still greater results what would seem to be needed is precisely what your association aims to do. Unification and coordination of educational work, so that a complete and perfect system shall exist, based on the strong and broad foundation of good parochial schools, the superstructure consisting of well graded and highly perfected academies, colleges, seminaries, and undergraduate universities, all culminating in the institution, the foundation of which our holy father counts as one of the glories of his pontificate, are, it would seem to me, the things most to be desired at present to enable the Catholic efforts to cope successfully with those being made by secular or sectarian forces. It is only by such coordination that the desired elevation in standard can be brought about. The time should be hastened when an academic degree conferred by a Catholic institution in this country shall be equal in all respects to one conferred by any other, and when this equality shall be recognized by all. We live in times when natural values are appreciated first. Catholic education, it is true, offers first and as most important, supernatural value. This it must and shall always continue to do. But there is no reason why it should not offer at the same time a natural value equal to and surpassing that which non-Catholic education can possibly hope to offer. Let Catholic educators, then, unite their strength, and it will not be long before we shall have a system in this country which will give to our young men results which they can find nowhere else—diplomas and degrees which are equal and superior in value to those obtained in the same grades of other institutions, up to university degrees which no other institution could dream of presenting. * * *

With sentiments of highest esteem and fraternal charity, I remain,
Yours fraternally in Christ,

SEBASTIAN, ABP. OF EPHEBUS,
Apostolic Delegate.

THE TEACHING OF SCIENCE.

By Rev. HENRY J. DE LAEK, S. J.,

Professor of Physics in the St. Louis University, St. Louis, Mo.

To a school man of a hundred years ago a modern college would in all probability be an unfamiliar institution. It might surprise him that his own favorite studies were all but crowded out of the curriculum as discredited and a multiplicity of subjects never heard of by him introduced in their stead. Though he might soon discover that the new structure was largely built upon utilitarian foundation, and that education was largely estimated as a commercial asset, he would also concede the existence of a remarkable intellectual activity, stimulated by the new world-power, Science.

Were he now to find himself in the position of a twentieth century college president his own education would prompt him to reckon with the new factor, for he would perceive that a youth's education must adapt him to the age in which he lives. Centuries differ, and markedly so. Consequently no course of studies is final. The purpose of education is always the same. The means may vary. There is rise and fall in educational matters as there is elevation and subsidence in the earth's strata. The story of the human mind is a history of oscillations. We must take the pendulum in the phase in which we find it. It is the scientific phase now.

The purpose of an education is attained when by its means a young man's faculties are awakened and made available to him to their full extent. Theoretically it may not matter how this is done. But the method and means taken should not

launch him into an unfamiliar world. In past ages the schools kept in view the civil life of the age, while at the same time they considered themselves recruiting offices for the university. The curriculum was shaped as much as possible to give an available education. The same reasons for shaping a course hold now, and perhaps more strongly. It is obvious that availability is more operative to-day than ever, and if science is therefore found qualified as a sound educating factor it can not to-day be excluded from the college. This is not the strongest reason. Science dominates more than the industries—a point which shall be referred to later.

It is hardly the question whether science is to be excluded from a college course or not, but rather its limits in the course, what specific subjects should be taught, when, how much time should be given, what should be the manner of teaching.

These questions were not assumed in a day at any time in the history of education concerning any branch of study, and it is not to be expected that anything but experience can give the answer in this matter.

If there were no difficulty or obscurity, opinions would not be so divided as they are on all the issues mentioned. Outside of extreme views, however, sufficient convergence exists. It is conceded that the old classics are true educators, and also that the claim of science to such distinction can not be overlooked. Inspection of the many catalogues of secondary schools and colleges shows, however, the greatest divergence concerning the practical questions alluded to. Such an unsettled condition proves the existence of an uncertainty as to the best evaluation of science education, and is therefore unsatisfactory. It is a more or less necessary condition, however, and one which, it seems, tends actually to the solution of the problem. Educational institutions, we may believe, keep a conscious, or at least subconscious, watch upon one another and note the success or failure of a given curriculum in order to profit thereby. In one sense, therefore, the more divergence there is the sooner will the fittest survive. The eliminating and constructive process seems thus far to show that the classics will not be much curtailed. Their educational importance is to-day recognized even more than it was ten years ago. The Gordian knot of the course is, then, how to accommodate science in addition.

The student's capacity is to-day about the same as it always was. The student whom our pedagogue of yore had in hand was as heavily taxed as his modern successor—who is not known to be more studious. Nevertheless, it would seem as if the latter had a right to protest against being "run under overload." This will assuredly be the student's lot unless the course be arranged with prudence and forethought. The college is here battling with a difficulty; if it is to educate, then science must be taken seriously and a reasonable time be given to it, or it had better be let alone. It is impracticable to greatly extend the course. The age is too impatient—boys would not be graduated; perhaps not enter at all. On the other hand, if for the sake of old-time thoroughness in the humanities, an institution should exclude science, its roll call would certainly be answered by an ever-decreasing number of students. But a "struggle for existence" motive is a poor one to determine the opening of the doors to science. A college will not really accomplish anything in that department if within the inner circle of the faculty science is looked upon as a sop to Cerberus. But it is no better to convert a college into a technical or science school in order to appear up to date in modern educational movements. There must be a golden mean somewhere, and our colleges must be given time to find it. "Die Zeit ist kurz—die Kunst is lang!" and a much older adage advises circumspection when the occasion would urge hurry.

But for the strain put upon the old course with the advent of science, it is unlikely that elective or alternative courses of study would be seriously discussed. An elective arrangement suggests early specializing, the direction of which is to be determined by certain capacities and tastes of the pupil. It has not been shown who is to discover the latter's specialty. To say it is the young scholar himself would attach singularly great importance to uneducated

and inexperienced judgment. At the same time, the teacher can not be supposed to possess intuition, and has not the data for deduction. That the boy betrays strong inclination and readiness in some direction does not constitute an infallible diagnosis of his case, though the symptom is well worth noting and keeping in mind. Such manifestations, however, are not nearly as common occurrences as theorists would be glad to believe. Nearly all boys, moreover, betray varying tastes within a six or eight years' course; that is, if they betray any at all, and do not reserve their whole enthusiasm for athletics, for example. This is particularly true of scientific tastes; literary tastes seem to be less fugitive. Many science teachers can, I dare say, be found who remember scientific prodigies of 16; one designing a creditable dynamo machine, another contriving chemical experiments, and a third quite expert in classifying natural history objects. Spontaneous evaporation within a few years' time finished the history of the youthful talent.

Furthermore, it does not appear to be true that a boy as heavily charged with science as an electric system can compass, has, for that reason, better prospects for an opening when he leaves college except it be a chance opportunity. The ranks of science are as crowded as those of any other profession. Should an institution advertise for a science teacher, or an establishment for any talent of that kind, it would be answered quickly; possibly by a number of applicants, and by men of first-class attainments. Even if there were not this difficulty, scientific specializing as made possible by elective courses did not benefit a boy greatly. It is certain that he will not meet college laboratory conditions in actual life, and can not possibly have enough technical knowledge to command the consideration that could legitimately be expected by the university specialist. He has, therefore, to serve his time in an enterprise wherein his science is applied, as well as his rival from the regular course, or drop its pursuit. Generally the latter happens. In either case, given equal ability and opportunity, his rival has good chances to pass him on the road, and, in fact, will probably do so. If statements now and then appearing in professional and technical journals are adverted to, it will be found that managers of large corporations applied to for an engagement are likely to inquire concerning a diploma or certificate to show appreciation of the regular "classical course" document. Experience has shown them the alertness of such applicants, and the absence of conceit based upon their "science," though they are not unfamiliar with its elements.

As an instance, I may cite an inaugural address delivered by Sir Andrew Noble (October 3, 1899) before the faculty, students, and patrons of a purely technical college. "The best education for engineers," was his subject. "You can form but little idea," said he, "of the number of persons of both sexes who have assured me that their sons had no taste for books, but had shown a marvelous talent for engineering. I need not tell you that the marvelous talent generally turns out to be an incapacity—probably from defective education—for seriously applying the mind." He adds: "One of the great abuses I take to be that technical education is often begun too early in life; that is, that it is substituted for a general education, and a boy attempts to put his knowledge to practical use before he has learned how to learn."

Sir Andrew Noble is at the head of an army of not less than 30,000 men, representing the late Lord Armstrong's industry centering about Elswick, England. As a preparation for Elswick he recommended: "Send the lad to the best school you can, keep him there as long as you can; do not curtail his time, and do not stunt his growth by narrowing him down to any special study. My own impression is that, as a sharpener of young intellect, it would be difficult to improve the curriculum which, in the main, has been in force for so many centuries." He declares his disapproval of science in primary schools, and goes on to say that, as far as efficient education was concerned, such things as "engineering shops" or "laboratories" in secondary schools, and their equivalents, for older

boys, were a failure and a loss of time in hours better devoted to more valuable study; though he was ready to credit them with "offering reasonable diversion for recreation." "Nor am I," he continues, "in accord with those who think that modern languages should supersede the classics as a means of education, and I should regret more than I do the attempts made in this direction did I think these attempts would be likely to be successful." Candidates from the time-honored curriculum he considers easily picked out in a crowd of applicants, and he refers to them in the words: "Speaking as an employer of labor, I should say that we find in them a pleasant speech and manner, tact in dealing with others, and some power of organization." He finds a freshness in such young men absent in the school specializing scientist who has become "half stale with too much technical school work." It is to be noted that Sir Andrew Noble spoke, not as a professional educator, but as a business man, who has had an almost unparalleled opportunity for noting the influence of various educational schemes upon thousands of young men.

Contrary opinions to this come usually with most outspoken definiteness from teachers; of course, science teachers. Not a few claim practically the whole field for science, or, at least, for "scientific methods." It is particularly their science that is of commanding importance. The smallest boy must make physical measurements. Time for it must be lopped off from subjects not science; necessarily, of course, for these scientific methods require time. Laboratory work is slow. Hence more hours must be given to science, and small classes are essential. Consequently a large staff of teachers is required and comprehensive equipment. Hence criticism of the too "literary" headmaster, president, or prefect of studies, who does not understand science and therefore neither the "requirements of modern education."

So it comes to pass that the boy is a bone of contention to those who would educate him. The boy survives it very well; he does not borrow trouble from that source. Theories and text-books are in high flood for his benefit—most of them "scientific." Their purpose is to peptonize science for him, and, for that matter, peptonize it for his teacher also. That the campaign is urged with vigor and varying success is evident from the great difference in requirements made nowadays by colleges. While in few science has almost no foothold, others are adding laboratories and workshops on all scales and multiplying the subjects offered in alternative or elective courses. This is evidently experimental.

There does not appear to be an imperative need to dislocate or dismember, much less to cast aside, the old curriculum to make room for science. No serious inroads upon the course have been made in colleges conducted under old traditions. Some have added a year; others have contracted the classics somewhat. There seems to be an uneasiness, however, about the years and hours per year allotted to science; the occasional shifting about of science instruction shows this. But, on the whole, our colleges can hardly be reproached with being niggardly. One-quarter of the class hours for a minimum of two years can not be called a small percentage. A further two hours a week in a third—the graduating year is usual—and if it be remembered that the mathematics can be made directly to support at least physics and astronomy, 10 per cent of the whole school course can easily be shown to be the share allotted to science. Some colleges are trying the experiment of increasing this by the introduction of natural history into the lower classes. This, however, will probably not be indulged in largely; for, though it is true that the child may thus be put temporarily into the possession of many facts, it is a question whether the time had not better be given to pursuing fewer subjects—the old ones—with more vigor. A child's knowledge can be so dissipated into heterogeneous fragments that it no longer represents an education. Education seeks to produce ability—"Können" more than "Wissen."

If it becomes necessary for a college graduate to look into one of the subjects

covered by the general term "science," he should certainly find no great difficulty in becoming familiar with it, with the ability which we have a right to suppose he has acquired. His ability will probably be the better for it, if in his early years he has not formally studied botany, zoology, physiology, biology, as class matter. Moreover, it is plainly improbable, that he will find any more direct use for these than for his classical knowledge, and just as probable, on the other hand, that he will promptly forget all he knew and therewith lose what these hours were worth.

This does not mean that no benefit can be derived from science in all the years of the course. The teacher ignorant of all science, in any properly so-called college class, is an anachronism. Besides knowing what is formally his subject, he should not be devoid of erudition. The teacher of to-day must know something of the natural sciences—the more the better—and that, if for no other reason, in order to teach his own subject effectively. He can find illustrations and analogies in endless variety in the fields of science. He will not only interest his scholars, but expand their horizon. Their estimate of him will rise when he shows grasp of many subjects.

This point need not be pursued further. It is too well known that Catholic educators and educating bodies have always sought erudition in teachers. But it may not have been encouraged as much as it deserves in the scientific direction. Scientific knowledge is a real educational lever in any teacher's hands, if he knows how to make use of it. Young boys instinctively appreciate science. Teachers to whom natural history is not unfamiliar should find in grammar and preparatory classes, even, fair fields to cultivate with the help of science. Geography alone, for example, suggests meteorology, zoology, botany, ethnology. Digressions into these can be made to excellent purpose without making it necessary to burden the pupil's recitations and examinations. The formal, printed "course of studies," whilst it does not take cognizance of this kind of science teaching, and in consequence looks scant and jejune, does not therefore prohibit it. On the contrary, it may be said to suppose the same by taking a good teacher for granted.

When the time arrives to exercise the young mind in science the teaching must be more formal. It is clearly not best to look for this training in subjects that are largely classification of phenomena—full of nebular hypotheses, uncertainties, speculations, subject to cataclysms, and wholly depending upon other sciences. The proper sciences are those that coordinate facts, possess a logically constructed edifice, and are fundamental. They are not restricted to educating the power of observing by means of the senses. Aboriginal tribes possess this power, but they are not therefore said to be educated. "*Cognito per causas ultimas*"—the definition of a true science—means an achievement of the human mind. It is not probable that a student could follow this achievement of mind through difficult paths without his own intellectual ability being powerfully reenforced. This is one of the reasons why science has educating power. It has a strongly intellectual character; therefore a tendency to the abstract, and to comprehensive generalizing. It is therefore best, since it requires a corresponding mental power, to leave it to the later years of the course. If begun too early it will cause lack of interest, because of lack of novelty, when the true difficulty of the subject is opened, and the boy is disappointed in not finding it all showy experiment.

Physics and chemistry have with justice been looked upon as well adapted to education. In proportion as a subject of investigation becomes scientific, so it ordinarily appeals to these fundamental sciences. In the sense taken physics covers astronomy. Chemistry itself is rapidly being organized as molecular physics, and physics in their turn in their wide sense is the development of mechanics. This reduction will show at once that science is nothing really new in a college. In the form of astronomy it was a familiar subject ages ago, and as mechanics also. This is a significant proof that no new educational factor has

been discovered in modern times, but an old one developed and pushed into prominence. Physics and chemistry may be reckoned as the descendants of the "philosophia naturalis" of the schools, as modern astronomy is that of the "cosmologia." Modern chemistry is willing to trace its genealogy to the alchemia of old—which the schoolmen, however, were prudent enough not to commit themselves to, for they had the instinct to recognize it as not a science.

In the old days the horizon of the natural sciences was limited; education was therefore literary and philosophical. But nothing taught in the class could be "transmitted" in an examination. Science as far as it went had standing in the curriculum. Having grown to be of much more consequence, more important in every sense, and of acknowledged value in education, it would appear curious if to-day a quarter of the time should be given for several years to science, and that it at no time should become the subject of inquiry concerning the students' progress therein. It does not look consistent, in view of the time sacrificed, not to make this subject one that must be satisfactorily accounted for by the student in examinations intended to test his qualifications for advancement. If the anomaly is to be accounted for by the fact that science is too difficult, it may be found that it is begun too early; if other, even more important elements are not to be questioned. Whatever may be the reason, the fact will bring about unpleasant consequences. No real attention will be paid to class lectures. We must take the boy as he is—he is a fact, like any other fact. He is also able occasionally to discover a fact; and when he discovers the particular one that a certain branch "does not count," he will not trouble himself about seriously studying it. Foresight and conscientiousness about his purpose at school are not his strong points. He will be alert when an experiment by the professor entertains him. Apart from that he will be inattentive or worse. This is electivism of the worse type; to leave it to the student whether he will study or not. It is not nearly so objectionable to let him choose what he would study. There is no more reason to suppose science to possess a self-supporting interest than any other branch. Its entertaining features, its practical features, its possible direct future usefulness, are no guaranty whatever that it can do without the moral force of an impending examination or the equivalent, and one that "counts," i. e., qualifies for standing. No boy can be educated if he can not or will not work, and an examination is the only reason the average boy can see why he should work. There is another objectionable feature in not giving science the full importance of the other studies. A science teacher's work is peculiarly laborious, far more than any other, and the more and better facilities and equipment he has at his disposal the more will this peculiar laboriousness weigh upon him. He will never be "through." The classroom is but a fraction of his work, and a small one at that. It is not encouraging to teach what will not be studied. Under such conditions science is not furthering education, but rather demoralizing it. Any branch of study in which the student need not qualify and independently of which he may go on to a higher class loses caste, and its teacher influence. Not only with the student; it may come to be a vague impression among the faculty that science is tolerated, perhaps, because it is an advertisement. It will therefore be considered a "chair" anyone can fill, as there will be no call for results. College boys, in their own way, are liable to be logical in such a juncture, and they will carry the spirit of the science class into the other rooms also. This may not be a case of "poetic justice," but it may be expected to happen, because there is sympathy and reaction between the constituent parts of a moral unit—the college course.

Supposing, therefore, that its importance is recognized, how should science be taught? The time-honored method in which the teacher is the chief factor does not lose its value here. By the time they enter upon the field of science the scholars are accustomed to the method. It should be followed for the sake of uniformity, and, above all, because of its intrinsic merit. It is, moreover, particu-

larly valuable in science. A determined young man could learn Latin and Greek from a text-book; he could not get an equal grasp on science in this way in the same time. It can not be taught, either, even by a teacher simply expatiating on a few paragraphs of a text-book and making the experiments according to the directions in the text (many of these books are constantly patronizing the teacher).

There is something singularly elusive about scientific knowledge in itself. A teacher may for a number of seasons work, read, study, and teach, all along believing he is certain of his doctrine, and then somehow a new light breaks in and he discovers gaps and vacancies in his scientific knowledge. The legitimate title to a "potest docere" is no more easily acquired in science than in any other subject, even if experimental resourcefulness and manipulative skill were spontaneous and not dependent also on ability developed by application. "Elements of mechanics" does not sound forbidding, but it is not synonymous with "Easy lessons in science." This statement might be illustrated by referring to a prolonged controversy in which some years ago the leading physicists of England figured concerning "mass" and "weight." Yet almost anybody, except a physicist who has taught and thought, will expound these notions fearlessly!

The teacher must be sure enough of his subject not to make a statement in optics which he retracts in electricity, whether he is aware of his inconsistency or not. The teacher to whom science is a dreary task is fated to do this as a regular thing, and it is not probable that there is a science teacher who has escaped such a mishap altogether.

For many reasons a good text-book is indispensable to teacher and student alike; particularly in science classes. It may be looked upon as a secondary teacher, and as such all its paragraphs are of importance to the scholar. But it should be the teacher's servant and not constrain him, except topically. One of its advantages is that it saves extensive "taking notes"—a labor which the leisurely work of the laboratory more especially demands.

Far more text-books are published in science than in any other subject. While this may be owing, to a degree, to the notion that science has come to control, if not to save, education, it is more likely owing, to a greater extent, to the diversified status of science in the various institutions of learning. Few of these books seem satisfactory. Publishers foster the notion that the text-book is everything, and they are ready to furnish one that will teach the teacher as well as the pupil. Text-book worship is not conducive to good results. The student feels secure with his fetich against the day of account. "It is all in the book," and he has been given to understand that the book contains it all. Thereupon he comes to resent any departure from the inviolable text. Exactly as, e. g., in geometry when its text-books do the teaching. Invert the figures or change the letters and the student's demonstration collapses. The text-book should not use the teacher, but the teacher the text-book. Of course, where the text-book is the teacher's life-preserver, this "lysteron proteron" arrangement is the only possible one. The text-book, whether it be permitted to figure as the court of appeal or not, had better be severe and a little "too hard" than too easy. "Science primers" have no business in a college. Students instinctively measure the importance or difficulty of the whole subject by using the text-book as the yardstick.

With occasional exceptions, the youthful mind seems to oppose a high resistivity to mathematics. It is hopeless to teach science unless, beginning in the lower grades, the teaching of mathematics has been kept at a sufficiently high potential to penetrate the insulation. While elaborate demonstrations in college science classes are probably out of place, the discussion of simple formula should be within the reach of the pupils. Graphical presentation of such expressions by coordinate diagrams is welcomed, as a rule. To a certain extent, such diagrams show "how the thing works," and the youth of our inventive race may be expected to appreciate this and grasp the meaning.

Science teaching is a specialty as much as any other difficult subject, and therefore it is a man's work, for a man's time, as teacher, and can not, without its collapse as a branch of a study, be committed to anyone at any time with incessant change. If a college possesses a material equipment of any value, there will be a marked "depreciation of plant" in consequence of such changes.

A class will more quickly find it out in science than in other subjects whether the teacher is "at home" or "at sea." Owing to the vast extent to which scientific applications dominate not only industry but domestic life, some inquisitive freshman (boys can be trusted to do a great deal of observing, though their intentions may not be scientific) will always be found of whose questions the teacher will be afraid. Science is precisely the subject in which boys do not like an evasion, and are most disinclined to condone ignorance and sharpest to discover it. A teacher beginning his career in the classics has a better chance to escape having his soundings taken than a science master, not precisely a beginner, either.

The college intrusts to the scientific teacher implicitly a share of the responsibility of the professor of mental philosophy. Metaphysics, general and special, is without doubt the culmination of the college course. Through this study the course reaches its purpose, imparting to the student an ability to weigh and consider, on broad lines, at least, in a rational manner and with judgment, the most important field by far of all, that of human thought. This means intellectual self-possession.

The science teacher can and ought to lend his aid. The professor of metaphysics can hardly be expected to more than touch science theories, and can not be reasonably expected to do so, since he must till fields illimitable beyond that. While working with these theories technically, the science teacher has opportunity over and over again to weigh them philosophically. The text-book and the teacher who has only a text-book horizon will leave the student under the impression that there is no appeal from atoms and molecules. Scientific propositions—almost all of them—are "working hypotheses," some of which may be objectively true, while many of them are certainly not true. But they are treated, and quite properly so, for science purposes as if they were true. The world overlooks this, and does not question the objective validity of the "placita" of science. This is philosophically the most powerful reason why science must be taught in a college, taught properly, and not taught exclusively. For of itself science has no tendency whatever to develop a "broad," well-balanced habit of mental estimate, any more than the discredited "metaphysics of the schools" with its quibbles. A warped mind—one fed on a single pabulum—is always cock-sure, and that is the very reason why our army of sciolists (largely the "writers" and science camp-followers, but seldom the workers) is agreed that science is everything, and all else "antiquated." This "schlagwort" is particularly directed against metaphysics, and then does service for stronger terms which would declare it ridiculous if not grotesque.

Though a man may, with increasing administration as the years of his work in science increase, note the marvelous compactness, solidity, simplicity, and beauty of the theories of physics and chemistry, as they have been worked out, altered, and bettered gradually by real master minds, it is not true that they gain in the same proportion in the objective probability of their being final. Serious reflection, or better, years of experience, in conjunction with reflection, will convince a man that on the one hand a true master in the physical sciences is the least inclined to be a dogmatizer, and that on the other a discovery, such as that of the existence of undreamed-of "radiations," does not at all signify the "collapse of another scientific theory." In fewer words, all this means that the science teacher can work in a wide educational field, and ought not to forget to state the standing of science in intellectual court. The text-book will not—nor the self-

styled "great educator of the people"—the press. For much of what passes as science the proof is iteration of statement—

"I've said it thrice;
What I say three times is true."

It is therefore greatly to be desired that the science teacher should stand for more than the explanation of the parallelogram of velocities, or as the mouth-piece of the text-book. He should be the mentor of his class, for he is supposed to educate.

Catholic colleges so thoroughly recognize the importance of a well-trained and able teacher that if nothing further were involved there would be no reason why they should not occupy prominent positions in the field of science. A circumstance working against it seriously is the general meagerness of equipment. Even if it were lavish, the science teacher is never going to escape the issue of becoming at least half artisan, besides being a whole teacher. He must possess resourcefulness and try conclusions in almost every handicraft. I need not say that this forms the laboriousness of science, and that it is unavoidable, and can not be wholly left to "help"—financial or otherwise.

Experimental demonstration must accompany science teaching. A successful experiment well arranged and clearly managed, indorses what the teacher says, and impresses it. It is worth a hundred repetitions of the statement which it demonstrates. Even with it, science does not become easy, and is intangible to young minds without it. The youth had better go to school to a first-class experimenter, provided the latter is a teacher, than to a powerful reasoner on abstract formulas. This does not mean that a good, roomy "blackboard" does not rank high as "apparatus." It is part of the class room, and a suitable lecture and laboratory room outrank everything in importance in the matter of equipment. It will not do to assign to science anything left over after all the other branches have been solicitously housed. With such a handicap a "cabinet" may figure in the catalogue and not in the course. I am certain that any science teacher with experience will care much more for a good class room than for an array of apparatus, and would rather work in a shed reasonably well built to keep out the weather—if such quarters were designed for the purpose—rather than in a palatial college building, which an architect had "planned" largely with a view to demonstrating to the town's folk what he could do with the outside of a house. The grand building may cause the science teacher to rank more than half his working day not even up to the level of an artisan. He will be carrying on a quixotic fight against the windmills of adverse circumstances for the sake of a few handicapped experiments. Science teaching ought to be relieved from the necessity of displaying heroism.

If an institution is proud of its library, it has precisely the same reason to appoint its cabinet. This is also a reference library; apparatus instead of books. A library may be injudiciously selected, and so also may capital be invested in a cabinet without proper returns. A man should not buy a carriage when he does not expect to own a horse—unless it be an automobile—and for the same reason ought not to provide a costly instrument by its very nature intended for abstruse "private research," when no such purpose is compassed by the course, and when essential class room apparatus is wanting. Of course, I would not object to donations. For college purposes the cabinet would permanently be intended to serve the teacher's lectures. It is an art to select wisely; just as a wise head is required to see to the increase of the library. Instruments should be on a sort of uniform scale, and meet the condition of working together as much as possible. The import of this remark may be too technical to enlarge upon here, but a science teacher will understand. To administrators of colleges, however, it should suggest the fact that a dozen pieces of apparatus may, if well chosen, cover the field

of a half hundred not mutually adaptable. A very useful book could be written on the subject, "How to select apparatus." It would probably be written by a man who had made a lot of mistakes.

If the above be kept in view, it appears that the expensiveness of science may be overrated, while a great university might feel starved with the interest on a million devoted to science purposes, a college with no specializing ambitions—an ambition out of place—might thrive scientifically on the interest of one-tenth of that amount. Undoubtedly many a college professor of ours ekes out a scientific existence on the cube root of that sum and annually rejoices.

The college that sees its way to it and undertakes to establish the laboratory as a complement to and to go hand in hand with the class room, enters upon a commendable enterprise. The laboratory entails no little labor, and therefore the drudgery and detail of it should not fall upon one and the same teacher, if possible. He will do poor class-room work, and an inferior laboratory results. The laboratory need not invade class hours, and it is perhaps safer not to make it compulsory. Too many students would, after the first rush of enthusiasm is over, be found to lose interest and drag the rest. This proceeding has its analogies in other studies. Not uncommonly the interests of even a single student are consulted in language, mathematics, the humanities, etc., out of class hours. Teachers are always willing to do this and colleges encourage both teacher and scholars to do it. While the latter are therefore free to avail themselves of such advantage, it is obvious that the study of a given subject is not therefore made elective. The elective laboratory is simply a standing offer to the student to assist his progress. It is well, nevertheless, to encourage his accepting it.

Large claims are made nowadays as to the necessity of laboratory work for college boys. To what extent they are well founded experience seems not to have made entirely clear. There may be the confusing of issues again between stocking a student with facts and educating him. Making a boy expert in performing a certain set of experiments is not necessarily identical with an increase of scientific knowledge. Possibly it is owing to the confusion of these two things that so much clamor is made about the laboratory and the indescribable importance of a child in knickerbockers measuring the laboratory table with a meter stick, or, more ambitiously, rediscovering the principles of electro-magnetism with an assurance that leaves the child with little reverence for the prince of experimenters, Michael Faraday. In primary classes it certainly seems useless to do this sort of work unless for recreation. But for the maturer students it is undeniably true that personal observation is an incentive and check together, an excellent combination not easily cultivated in the class room alone. Exact method of observation and measurement is the aim of the laboratory directly. It is a distinctly human way of learning, and for that reason engages interest. It improves the student for the next class lecture and recitation.

But "ne quid nimis." One reason, possibly, why the laboratory is supposed to be a distinctly modern method which has driven out or forced into obscurity the class room, is because too much science and too much laboratory are responsible for the host of poor teachers. I do not mean ignorant men.

Physics alone will not make a teacher. A young man primed with physics and laboratory work and entirely up to date in scientific methods has not, therefore, his success assured in the class room. Therefore, he will take refuge in the laboratory. He may have been taught by just such a professor. His education gave him no idea how to present a subject—no command of language, no delivery, and, with all his sharpness of observing power and manipulative skill, no address. It seems not uncommon in modern institutions to engage a teacher whose recommendations have an air of nobility. He has done such and such "original work" under professor so and so, in that commanding university, and has published

papers. Of course the effect is cumulative, and hence the ratio of efficiency of the laboratory against the class room rises in favor of the former with successive generations. The first-class teacher of the old times, who was educated with all his faculties in equilibrium, is vanishing and the professor, demonstrator, and tutor, who knows much and can write abstruse books and publish "papers," but who is as communicative as a sphinx before an audience (unless he has his lecture written), is taking his place.

Teaching is largely inspiration. Where, owing to training, this can not be looked for, the proof is at hand that the laboratory is the acme and "ne plus ultra" of teaching.

Every college graduate ought to be something of a teacher of men, and ought to have something of a teacher's command of his surroundings. This is not a laboratory product directly. It is more that of the old-time liberal education. Nevertheless, the training of the laboratory will teach that same man how to weigh his data and observe relations critically and dispassionately. If it accomplishes this—and there is good reason to think that it does—then college laboratory work, added to the old curriculum, will materially improve college education. A live teacher may fairly well cover the requirements of college science in the class room if circumstances make the laboratory impossible. But the old course did not take it for granted that a single man could teach any number of students simultaneously. If 25 is a large enough number on the roll call of the rhetoric professor, then, for the same reason, that number is enough for the science class. An unsatisfactory state of affairs obtains not unfrequently. The same teacher teaches not only all the sciences, but mathematics as well, and has a composite audience of 50 or 60 in most of his teaching hours. There is little to show that it is advantageous to add a laboratory to his hours. He is already overloaded. There is only one remedy: Increase the teaching personnel; decrease the number in the classes. If in the order of studies of a college you find a laboratory figuring, and classes involving the teaching of a number of difficult experimental sciences to a minimum of a half hundred students in each class, and then discover that in the list of officers and faculty all the responsibility for it can be traced to one man, you may be sure that the science situation is not comprehended. You will find, very probably, that the laboratories, e. g., are not used—about the best use that could be made of them under the circumstances.

Many "modern" institutions are evidently working science for more than it is worth. They aim at being universities as primary schools aim at being high schools, and these in turn build into the college campus. Among our own, however, the tendency seems to be the other way, owing, no doubt, to the above-named conditions—want of facilities in class or laboratory rooms, equipment, teaching personnel, and over-crowded classes. When a laboratory is essayed (somehow it looks like a psychological phenomenon!) it is always chemical. Work in it never gets beyond the stage of qualitative analysis and rarely even passes what the text-books call "experiment." That is, in the latter case nothing is really added to what has been witnessed in the class room, except the risk of doing it yourself. Of course it is not useless! The privilege of trying an experiment yourself will assuredly engage attention to the class lecture. But the real laboratory begins only when the student's ability to show quantitative results is challenged. Making hydrogen gas in a flask or burning the handle of a "static" machine are experiments that can be matched by a hundred others without, properly speaking, representing the laboratory. It may be interesting, but has not particular educating value. The laboratory will prove an educator when it is carried to such a point that the light begins to dawn upon the student, by which he sees how science comes to its conclusions. This light will illuminate a new horizon for him. He will begin to realize limitations, begin to weigh evidence, and find his self conceit checked, while at the same time he learns rapidly and improves his ability to learn.

Where laboratory work is of the right kind it may now and then take the place of the regular class lecture. But the teacher must be at hand. He, too, should select the work judiciously; excluding what is too obvious or only of special import. Specializing is university work, or, under circumstances, that of the technical school. Measurements pretty sure to result in discomfiture, owing to unsuitable apparatus, or to their being open to too many abstrusive sources of error, should be avoided. It is not good policy, generally, to discourage a laboratory fledgeling with his first flight. It is easy to check too great assurance at any time, when it is necessary to impress upon a scholar what scientific accuracy means.

The statements made may be summarized as follows: While science is not a new element in college courses, it has, within the century, assumed proportions that appear to put the education question in a new phase.

Physical science demands admission to the course upon very good credentials. But the interests of education are not best served by a revolution in the curriculum, nor by a reconstruction which involves a radical change. Science may crowd, e. g., the humanities somewhat, but not necessarily to an extent which would sacrifice them.

It should not be permitted to do so. The reason is that though it might be proved that science educates, trains and cultivates as well as other subjects, it also, like other subjects, can not alone stand for a complete education.

Just as the college course does not contemplate philology, for instance, in the pursuit of classic study, so, too, and for the same reason, science does not specialize, but remains general. Science is not technical or professional information.

While best placed in the later years on account of its difficulty, there is a plain advantage in having scientifically informed teachers in all the classes.

The teacher rates higher than text-book or laboratory. It is always to be remembered that the college trains the still young mind. This needs the teacher. The intellectual independence of the university "auditor" can not be assured in the college alumnus. It is not, therefore, "quia traditum est" nor "quia a majoribus institutum," that stress is laid on the teacher, though it is true that credit must be given to our "Majores" for their appreciation of Providence's truly scientific method, which is plainly that of direct personal teaching.

It is precisely because the science teacher takes his pupil directly into the Lord's infinitely rich, though only material creation, that he ought to be a cicerone worthy of the name. The best informed and most experienced science teacher will best realize that for one stone he has looked under, a million remain unturned.

"Exercises" such as are called for by the teacher of classics and compositions (from simple narrations and descriptions to ambitious orations) can, in science, be properly paralleled only by the laboratory. This justifies its introduction, and its claim to being properly managed, and having its purpose clearly understood. A camera club does not represent this element. On the contrary, it may represent a nuisance.

The apprehension of its expensiveness may lead instinctively to an unformulated, but nevertheless existent bias to repress science. Not a little depends on how science is conducted. Chemistry at college need not involve heavy financing. Physics investments are usually permanent. Some equipment is necessary, and it is perilous not to face this issue, for the demands of science are not going to diminish in the near future. It is therefore prudent to improve science conditions steadily—a little at a time.

Finally, students' libraries, for the same and, perhaps, even greater reason, should be looked to. Science should have its shelf. It is much better than that our "illustrated magazines" should command shelves and the reading tables besides. Also, science is better than fiction. The classroom, laboratory, and

library go together. Where one is meager you will find the others scant. The rank of the library needs no plaidoyer. If I could not get both I would rather have books than apparatus, and would choose a good teacher in preference to both, if I were limited to one out of three elements. Where they can be brought together, the best results can be expected, and education will prosper under the influence of the physical science.

THE TEACHING OF HISTORY IN COLLEGE.

By Rev. LAURENCE A. DELUREY, O. S. A.,

President of Villanova College, Villanova, Pa.

To prove the value and indispensability of the study of history would almost seem a task as superfluous as the exertion to prove the value of the sun upon animal life. Those who are familiar with the rich enjoyments and the vast treasure which the temple of history contains, will not deign to consider the arguments even in its favor. Those who have feasted upon the solid nourishment which Clio spreads before the guests who gather around her banquet table need no argumentative inducement to acquiesce in a proposition which finds their approval in advance. If, however, our approval of a certain subject for study should prove the superfluity of argument in its favor, it would equally apply to every topic upon the programme of this conference. Moreover, it can not be denied that the teaching of history in college is not emphasized as it deserves to be. Nor does the method of teaching history receive the attention which the importance of it demands.

By training and view point we do not belong to the category of those who make the study of the classics a debatable question. But the difficulty of acquiring the knowledge of the classics and of mastering them makes it more than an open question with students and often requires much persuasion to acquiesce in the quantity and quality prescribed by the college curriculum. Not so in the study of history. There is a natural feeling which attracts all men to the study of history which argues strongly in favor of teaching it. The imagination dwells with pleasure upon the past and the mind becomes enriched in meditating upon the pictures which history draws upon its canvas. This feeling is deeply noted in the emotional as well as in the moral nature of mankind, and whenever that nature is not tainted by corruption and is in a healthy and normal state of development it will manifest its sympathy with the struggles and victories of the human family as it is sketched by the faithful hand of history. To know this great human family to which we belong; to understand its intellectual and spiritual life; to follow the great stream upon which its skiff was pushing on toward the golden shores of Ideality, and upon which we oft drift along in uncertainty, must be and is regarded as of the highest human interest.

The true life of humanity is unfolded and recognized in history as in no other branch of knowledge. Here the energies, the aspirations, the struggles, the hopes, and the ambitions of mankind are laid bare for the reflection of the student. Without history each generation would go its own way, and would be doomed to tread the same path forever. In history all generations are linked together, and she thus becomes the consciousness of humanity. In the study of history the student learns to realize the traditions and experiences of centuries. The ideas, the knowledge, and discoveries of all nations and all ages. What wise men thought, what great heroes suffered, what the heart of man craved for, is transmitted to him as a precious heritage, together with the last testament of the dead past, that he may develop it into perfection.

A part of the object of education is to furnish the student with such instru-

ments of knowledge as will make him comprehend the better and the easier all that may occur in private and public life, and thus enable him to press these occurrences into service for the highest good; but without the study of history every book will be to him valueless because unintelligible, the most important events only so many accidents, the present a riddle, and the future a sealed book. Philosophy, at once the most daring and the noblest aspiration of human thought, is soaring aimlessly without the compass which history furnishes, and is inevitably lost in the unintelligible without her guide. The precious twins of cultured life, art and poetry, become a mere pastime, a wild phantasy of a fevered imagination, unless they are nursed upon the breast of history which throws light upon the times which produced them and the inspirations that gave them life. In history the student is able to overlook from an elevated position the ever-changing actions of individuals and nations, to learn that nothing that happens is new and startling. By the guidance of history he is made to discern easily the hidden motives of human action and to divine the consequences, and thus the past becomes the key to the present, and the present the mirror of the future. It helps to remove the prejudice of early training or of environments; it broadens the sympathies of the student and teaches him to trace the footprints of God in his dealings with the human family in history.

All sciences stand in some relation to each other, and one aids and explains the other. In this wide sense we might say that all the philosophical, mathematical, physical, and philological sciences stand in some relation to history; but even in a stricter sense many sciences, like chronology, geography, genealogy, diplomacy, sphragistics, heraldry, numismatics, and statistics are the essential auxiliary sciences of history, and they receive much light from her. History is the school of the statesman, the text-book of the laws and the cults of nations for the jurist, and inspiring gallery of a struggling brotherhood, and of moral heroes for the priest, the holy and ever-burning fire for the imagination of the poet and artist, a source of inexhaustible themes for the orator, and the mother of half of the sciences.

Nor should it be overlooked that history furnishes the student with powerful weapons in the defense of truth and religion. Not in vain did the church, especially in the last century, by the mouth of her pontiff, argue for a deeper study of history. True history, and only such, should be taught. True history bears testimony to our most holy faith, and under her torchlight the beauty of our faith is heightened, and heresy, incapable of the blush of shame, appears more shameful and repulsive. Righteousness and virtue have their power in their charm and greatness. Righteousness is not always victorious, and virtue does not always bring happiness; and this highness, their moral dignity and their luster, consist in self-sacrifice and self-abnegation. This is the teaching of morality, but the abstract idea of duty wins more cheerful followers by the aid of symbolized examples of actual life. In the examples which history furnishes, which inspire love and compel admiration, the abstract moral system is transformed into a living picture of acting individuals and nations. He who enters into the gallery of great and noble men is permeated with the dignity of human nature, and his energies are spurred on to exercise in true imitation. True, these examples may be few, but they are not less elevating, nor they are rather more so, in contrast with vices of the majority.

These are some of the charms and immense advantages which urge strongly in favor of emphasizing the teaching of history, and here are some of the dangers in the path of him who wishes to suck the honey of history, a beautiful flower full of thorns in the garden of the sciences.

History can accomplish all I have claimed as long as she is permitted to remain in the service of truth and to be the handmaid of religion; but history has been perverted and made to serve partisan ends and to plead the cause of unrighteousness. In the letter to the Cardinals de Luca, Pitra, and Hergenroether, dated August

15, 1883, and dealing with the advancement of the science of the study of history, our holy father Leo XIII characterizes most eloquently: "Those who in order to cast suspicion upon the church and the papacy attack most powerfully and with cunningness the part of history which belongs in a specific manner to the Christian period. These weapons of attack," proceeds the pope, "were made use of three hundred years ago by the centuriators of Magdeburg. Seeing that the originators and followers of the new sect could not destroy the fortifications which surround the Catholic Church, they attempted by strategy to force the church into historical discussions. This method of treating history was followed by all the schools that alienated themselves from the church. The same strategy is still employed at the present time, and to-day more than ever may it be said that the art employed in historiography is nothing less than a conspiracy against the truth. The worst of it is that this method of treating history found entrance into the schoolroom, and very often the children received their historical instruction from books which are filled with misrepresentations. If the teacher is frivolously and wickedly inclined, the young reader is made acquainted with a history which inclines him to treat with contempt a venerated antiquity and to proudly despise holy things and persons. The danger increases in the higher studies of history where, from a mere statement of facts, the study leads on to the investigation and critical examination of the facts themselves, and there the student is made to start from false stories which are in sharp contrast with revelation and have for their aim the denial of the blessings of Christian institutions in the life of the nations.

"Once history becomes the abettor of partisan tendencies and human passion, the extent of the danger and the disastrous consequences are hardly conceivable. For then she is no longer the teacher of life and the light of truth, as she was of old, but a participant in crimes and a courtesan in corruption, and especially for the young student, whose mind is filled with romances and whose sense is disinclined toward reverence and modesty. The youthful mind, easily impressed, is taken possession of, and the false presentation of the events and men which pass before him in a vivid manner, are engraved upon his mind for the whole of his life. The poison thus instilled in tender age into the mind can hardly be eradicated in later life, for but few are prepared in matured age to devote much time to a closer investigation of history, and the fatal training of earlier days is only confirmed by erroneous views of maturer life. It is therefore of supreme importance to obviate such dangers and to prevent such a noble science as history from becoming a storehouse of material for the destruction of the individual or the world at large."

The danger so vigorously pictured by the pontiff, and which is familiar to every student of history, is the result of unreliable text-books, such as are colorless, written by men who in modern times boast of being historiographers without an opinion, and which leaves the young student ample opportunity to form his own opinion, which, by the very nature of things, inexperience in forming judgment, lack of information, disinclination for the truth as a result of early training, must, in the majority of cases, prove fatal in the end. As I intend to speak of this later on, a hint is sufficient here. The modern destructive method of interpreting history, which inclines the mind not to search in order to find the truth, but which with the skeptic's eye is eagerly seeking to find evidences against it, has contributed no little toward the dangers against which the words of Leo XIII, above cited, warn and exhort us.

To remove, or at least minimize these dangers, we must adopt a proper method of treating history, a few suggestions of which are submitted for your kind consideration.

A mere mechanical memorizing of dates, facts, persons, and names is to be studiously avoided. All these skeletons must be clothed with a body, and a living soul must be infused into them, so that the student can see and comprehend the

action of persons and the significance of dates, facts, and events. No other science abhors so much scattered, isolated, and fragmentary treatment as does the science of history, and in no other field of investigation as in that of history can the teacher expect less results under such treatment. In teaching history more than in the instruction of any other branch of knowledge, is disconnection more marked, and the absence of a unifying principle more painfully felt. The time, the place, and the persons must be treated in a coherent process by the teacher, and in a manner that will throw light upon the events, and make them comprehensible to the student, and thus impress them upon his mind. This requires a somewhat philosophical treatment of the causes of the events, and especially of institutions, and more particularly so of religious institutions, or of the moral causes calling such institutions into being, or contributing toward their development. The various causes leading up to the various events, mediate or immediate; internal or external; physical or moral, must be carefully treated and critically examined. The most important events in history are sometimes the result of apparently most insignificant circumstances, so that one is justly astonished to notice the apparently weak link to which is fastened the most heavy chain of events. These small events must not escape the critical eyes of the teacher. In the physical world the little pebble thrown into the river causes the extended ripple, the dewdrops an avalanche, a spark the destructive flame, and a grain of sand will destroy the balance of a loaded wagon. So in history, that which decides the fate of nations for centuries is often produced by the most insignificant circumstances or persons. In these remarkable and often insignificant incidents, the student should be made to see, not the blind accidents, but to adore the mysterious operations of an infinite spirit, whose ever-seeing eye penetrates the future, who brings the calculations of human wisdom to naught, and uses the power of human ambition to carry out His plan. These workings of an infinite spirit in history must ever be pointed by the teacher as the golden linings over the darkest clouds in human events, and as the silvery thread that holds them all together. A teacher may gather his pupils in the forest, around a nightingale's nest, to discuss, critically, the nature and characteristics of the bird, while the bird itself, scared by their noisy disputations, leaves the nest, and from beneath the shadow of a far-off thicket are heard the melodies of its music. Likewise, the method of teaching history may be ever so critical, but it must not so deafen the moral teaching of the students as to make them miss the sweet music of Him who guides the actions of individuals and nations, and holds them all in the hollow of His hands.

The development of each one in the manifestation of His vast powers and energies, and the development of the individual in communal life of the family, the tribe or the nation where the ideas, powers, and energies of the individual are supplemented by the ideas of the other members of society; and where the labors and achievements of one generation are bequeathed for another generation forms the history of a particular nation. The particular characteristics, habits of thought, customs and culture of the various nations, in a word, the history of the world, of mankind upon earth, the changes of the earth through man, and the changes in lives of man and nations, by virtue of living upon earth, or in a particular spot on this earth at a particular time, tracing these various changes to their final causes and to sum up the final process of development of humanity as a whole, is the specific office of the teacher of history.

To apply this treatment to the whole of history in detail would indeed be a task which no professor could undertake or solve with any degree of success within the narrow limits of a college curriculum. Such a method of teaching history might justly be condemned as impossible, and hence impracticable for the purposes which are the aim of this assembly. However, this task will draw its own sphere and determine its own limitations.

An individual is oft manifested in a single act or word. The spirit which ani-

mates a whole nation or epoch in history, the principal motives which guide a nation, and the underlying principles which form the soul of a whole epoch, all of which may appear like a net to the student, will be braced and gathered by the skillful teacher from a few features. The teacher will not direct his attention in the class room to the manifold manifestation of each individual or nation or epoch, but his aim will be to deal with some particular characteristic act or acts of such person or persons, whose marked influence upon the destinies of the particular period is predominant, and only such multifariousness which form themselves into unifying historic characters will he attempt to deal with and to bring them conspicuously clear before the mind of the student, and only such nations or group of nations will he admit for consideration into his philosophic discussion whose contribution toward the development of history, and especially on a certain period of history, is preeminent.

There is no reason why the treatment of history which I have spoken of could not be applied successfully to the various parts or sections or epochs of history. In Catholic colleges the history of the Middle Ages would seem a most interesting, and certainly most fruitful, epoch to deal with. The specific features and characteristics of that age, the various institutions, the church, the state, the relation of one to another, education, art, science, all of which is so little understood in even educated Catholic circles, and so much misrepresented by non-Catholic writers, ought to receive our particular attention. The chapter of the Renaissance, where much of the historic cobweb which modern historians hung around its door as the drapery of their fervid and partial imagination, covers also the face and understanding of the student, which the teacher should clear away, and thus prepare the way for a profitable study of the history of the sixteenth century.

The history of the so-called Reformation, the personages and their characteristics, their principles, religious and civil, their motives and their temperament, the changes of a temporal or religious nature of permanent value, all demand a careful treatment at our hands, and all are not too extensive. The same is true of the French Revolution, of the period of constitutionalism, of the *Cultur-Kampf*, and many other periods in history.

Nor should the teacher be unmindful of the fact that the college is only the barrack where men are to be drilled for future action in battles which life provides. Hence, he must acquaint the student with the instruments which he is to use, their nature and character, and how to use them. He must acquaint the student with the key or keys to the study of history; how and with what temper he should approach the study of history and each particular epoch. In this modern age, where every newspaper and periodical pretends to have mastered every department of science, where everybody reads everything indiscriminately, the student comes to the study of history with a confusion of ideas which we who deal with the problems of education are too painfully aware of, and which the proper method of teaching history, which the initiation of the proper study of history forms a part, should eradicate.

The history of the United States demands our particular attention. The difficulties in this particular study can hardly be overestimated. But a few works of any permanent value are on hand. The changes in this country have been great and rapid. Most writers on American history were either led astray by external glitter and a startling manifestation of material power, and some were guided by partisan prejudices, which is natural under the prevailing circumstances, and not a few could not dominate the complexity of the national character and the intricacies of our peculiar form of government. For the Catholic student a thorough comprehension of the history of this country is indispensable. However, a thorough grasp of the history of the Reformation period will considerably aid both the teacher and the student in the study of the history of the United States.

That the task which is herein outlined for the teacher of history is not an easy one is readily admitted, but it is one fully worthy of him who is to train the young and inspiring to contemplate.

Bodin says: "*Quis dubitat, quin historicus vir gravis, integer, severus, intelligens, disertus et quasi communis ac privatæ vitæ, omniumque rerum magnarum scientia instructus esse debeat.*" Much the same is true of the teacher of history. Hence in my scheme I speak of the stress that should be laid on the knowledge, skill, and religious view of the teachers of history in colleges.

The teacher of history must be possessed of historic knowledge, or, rather, filled with the historic spirit. He must possess a lofty historic intellect, that goes around the globe, and not one that is limited by his own horizon. His posture and bearing toward all truth must be enterprising, ever ready to plunge into new fields of investigation; vigilant, precise, and even tempered in his investigation; but withal imbued with a spirit of reverence toward all that passes before his critical mind—a childlike spirit, ever open for the truth—for, as Bacon well remarks, the kingdom of science, like the kingdom of Heaven, is open only to the child, the docile, the recipient and reverent mind.

The teacher of history must have the historic spirit in the sense that history to him is not a mere volume of biographies of avaricious individuals, a mere catalogue of events. One whose theory of history is atomic, a theory that does not recognize the common humanity to be manifested in the millions of individuals and the multitudes of ages and epochs, a theory of history which has no principle, no organization—such a one is unfit to occupy the high and honored position of a teacher of history. To the true historic mind there is nothing in history irrelative; every account of a particular period is to it but a small section of the great historic protest born of the same historic spirit which preceded, and which will again be a factor in the future; the several ages of which it takes cognizance have some inward connection with each other, a common tendency, and consequently the whole, entire task stands in some relation to the present. That modern spirit of unguarded enthusiasm for everything new and modern, which abhors the past and idolizes the present, that modern spirit which has revived the pagan spirit of nationalism whereby the Englishman regards the German from his standpoint only, and vice versa, is one that deprives men of historic spirit and makes the possessor of it unfit to teach history and his presence in the class room a danger.

The teacher of history must have skill—skill in presenting historical events, skill in narration—so that all the events and persons must pass before us like a drama, captivating our interest to a degree that we feel impelled to live the same life and to participate in the same plans; skill to attract and hold the intense attention of the student and to carry him higher through the many ages and various events. It may be objected that the qualities in the teacher above insisted upon would result in the presentation of history from a subjective, and not from an objective, view point. Objectivity in the presentation of history, I readily admit, is not only desirable but indispensable in the teacher no less than in the historiographer. But objectivity must not be confounded with a void, empty, and blank mind in the professor of history. Professor, I said for the first time, and not without intention. There is quite a distinction between the preceptor and professor.

Profitemur. We who teach in a college must have something to profess of our own views, of the result of our studies and investigation, and not be ashamed of our scientific convictions, or we cease to be professors and become mere school masters. Objectivity in weighing evidence, in a critical examination of documents, in comparing various facts with each other, is more assuredly to be insisted upon, but the teacher must nevertheless approach the study of each nation and epoch with some view point after careful investigation, and these conclusions he must profess before his students. *Profitemur.*

That the view point of the professor of history is a matter of most vital concern goes without saying. Upon the view point of the professor will depend whether persons in history—as, for instance, those prominently figuring at the introduction of Christianity—will be regarded as fanatics, hypocrites, and knaves, or as Heaven's messengers dying in the interest of immortal truth. We must assuredly insist that the historic view point of the professor should be a religious one. He must occupy theistic Christian ground. He must see in history but one lesson, one truth. Down through the ages and generations he must be able to trace but one line, and along this line must be the truth, and out of it error. The teacher of history is this earth and world of ours; but to the professor Christ must be the central figure around which all clusters. The aim of historical life must be the erection of the kingdom of God on earth and the salvation of men. The history of the Decline and Fall of the Roman Empire, by Gibbon, with its many excellencies, with its vast erudition, with its attractive and imposing rhetoric, lacks the truly historic spirit, tainted as it is by Gibbon's religious skepticism, which paralyzes the whole. The reader feels that in spite of the pomp and panorama he must look elsewhere for information of the true cause of that decline and fall. The lesson, "Righteousness exalteth a nation," is here missing, and the scenic representation of the period is not a substitute for it. With a professor with such a religious view point the question of a text-book with a bias tendency will easily settle itself.

But it is incumbent upon the college authorities to exclude from the class room any text-book of history which might endanger the mind of the student or impede his progress in the right direction. * * *

THE TEACHING OF ENGLISH IN COLLEGE.

By Prof. EDMUND J. RYAN, A. M.,

Professor of English at Mount St. Marys College, Emmitsburg, Md.

College education is in its scope not specific, but general. It trains not for a particular vocation, but for all vocations, and aims to make man wiser, nobler, and better, and to lay the foundation for a broad culture which will advantage man in whatsoever sphere his duties may lie. With these ends no branch of learning is in so full harmony as the language studies. Properly taught, not only do they serve as discipline for the mind; but, involving as they do an acquaintance with the thoughts and deeds of men, they make for the widest knowledge. Language is as intimately connected with reason as breathing is with living, and is the outward manifestation of the inner life of the soul. Hence, in all true courses of general instruction to it is given the most prominent place.

Of the relative value of foreign languages, whether dead or living, there may be some question; but of the vital importance of the mother tongue there can be no doubt. "If a gentleman is to study any language," says Locke, "it ought to be that of his own country;" and surely English, regarded merely as a medium of communication, is not unworthy of deepest consideration.

From its composite character it has a unique interest. The simplest means to an end is the best, and that grammatical simplicity toward which all languages tend, English achieved, almost at once, by a political change, which, at the same time, was a prime factor in our wealth of words. Simple in its structure, and combining some of the warmth and grace of the South with the rugged strength of the North—rich, as its literature clearly shows, in expressiveness of the nicest shades of thought and feeling—English is a fit instrument of speech for those

peoples who, by their "energy and determination," are gradually making it a "world language."

It is not, however, by its excellence as a tool that English appeals to most of us. Its chief claim to preeminence in our college course lies in this, that it is the tool that we must use—our native speech. By its impression is made upon our minds and expression given to them. In it we feel and think; by it we act. Upon a knowledge of English the rest of education largely depends, because through it must come the greater part of our information and instruction. Without a thorough acquaintance with it almost all other learning is vain; for knowledge, like money, is useful only when circulated, and it is by means of English that we must pay our tribute to the store of the world's wisdom. It is the one study that is applied in all walks of life, the one that is most needed for the highest success, and the one, therefore, that demands from educators the greatest attention.

While the supreme importance of the mother tongue is generally recognized, it can hardly be said that the actual teaching has been in accord with such recognition. Familiarity with the subject has bred carelessness in both teacher and pupil; and from this, as well as from a too great dependence on the benefits accruing from the study of the classics, the teaching of English has suffered. It is not so long since a candidate for admission to the larger colleges in the country displayed, by his ability to translate foreign tongues, enough knowledge of his own language for entrance, and preparatory courses in English consisted of only some desultory composition work. That the study of other languages, and in a lesser degree all the branches taught, are aids in developing and strengthening the power of expression is undeniable; but that this preparation was insufficient for the best results is evidenced by the more recent requirements, which have done much to quicken interest in English in secondary schools.

There yet remains much to be done, and especially among us. In any course in which the time given to it is less by almost one-half than the time given to another language, English can not be considered the principal subject.

There is, moreover, in the teaching of English another fault which hinders true progress. Too often the real intent of the instruction is lost sight of, each particular branch is taught for itself, and that which is a means becomes an end. The primary object is not to know, but to do; it is not science, it is art. Viewed in this light, the study takes on an attractiveness that adds zest to its pursuit. Science is truth, but cold, hard, matter-of-fact truth; art is not less truth, but it is truth warm and rich, appealing by its beauty. The best interests of the student are served only when it is never forgotten that the aim is practice, but not alone that practice whose success is measured by mere material gain. If the end of education were to insure our daily bread, all instruction should be specific. But, "Not by bread alone doth man live, but by every word that proceedeth from the mouth of God." God speaks through man, and for us, in English. The chief purpose of the study, then—to be remembered, no matter what particular branch is pursued—is that man may perfect himself as a mouthpiece for God, and so, with most effect, give to his fellow-men his individual gospel, howsoever lowly, of truth and beauty and goodness.

The other object of the study of English—the mastering of its literature—is implied in the first. The true motive in this is not the empty one of art for art's sake, but, rather, art for the sake of developing soul power. By understanding and appreciating what is noble, man becomes noble; and the literature of a language, the treasury of the exalted thought of the past, the richest inheritance of the present—is man's noblest inspiration. Through it, more than through aught else save religion, are nourished those high ideals without which the soul languishes and dies; and, rethinking, its lofty thought not only communicates something of the wisdom that it contains, but stimulates into activity whatever there

may be of original greatness. Besides it is through the literature that the language must be learned and self-expression taught.

Training in English, then, includes the study of the language in itself; the study of the principles that underlie effective expression, with continual application of these in practice, and the study of the literature. All these, it is true, may be cultivated without a teacher. There are those who have an innate taste for words and literary effects; and genius may supply not only the grand conception, but the laws for artistic execution. But such natures are rare; the many must follow a leader into light. Even genius must serve his apprenticeship, and better results are obtained when this is done under judicious direction. The instruction in our colleges should supply the necessary guidance, and this instruction should be systematically progressive and free from the dogmatism that dwarfs originality.

In arranging a course of study it is well to bear in mind that college education has its limitations. It does not make finished scholars. What has been learned is but a preparation for knowledge. Sometimes courses, possibly only of imperfect realization, are evolved; and in the endeavor to do too much nothing is done well. This is true in particular branches, as well as in the whole course. Far better is it to teach fundamentals well than to attempt a wide range, which can lead but to shallowness and mental dissipation; and English teaching will gain more from thorough instruction in the principles of composition and earnest study of a few masterpieces than from an effort to impart a knowledge of the whole field of its letters and of comparative literature. If the foundation is good something may safely be left to later life, or to still higher instruction.

It is now generally agreed that before entering college a student should have been taught to express himself correctly, and with a degree of efficiency, and, to this end, should have made some study of literature. The discipline necessary for this is afforded by our preparatory departments, which, for us, take the place of the secondary or higher school. This early training should lean as much as possible to the constructive side, and be occupied with the building up of pure, effective sentences, and the uniting of these into paragraphs. It is, indeed, inadvisable to neglect entirely the critical view; but the acumen of the student preparing for college is still undeveloped, and a forced growth of it too often induces unintelligent repetition of secondhand judgments and kills all individual power. No further criticism should be expected than that which may proceed from the pupil's own insight and the application of what he has already learned. A practical three-year preparatory course shaped upon such ideas might be made to consist of, first, sentence structure from the standpoint of grammar; second, sentence structure from the standpoint of rhetoric, and third, paragraph structure.

With the instruction in these years appropriate works of literature should be studied and constant compositions exacted.

English grammar, with which the first year's work is concerned, has been rendered almost ineffectual by the character of its teaching. Few are they who can look back with satisfaction to the instruction received in this branch, and the reason for this is not hard to find. The true grammarian is not he who makes rules, but he who, from the usage of a people, discovers the laws of the common speech with a view of imparting a knowledge of correct expression. All distinctions of words, all rules of syntax, that do not tend to this end are worse than useless, inasmuch as they serve only to confuse the mind and waste intellectual power. Yet English, simple enough in its structure to almost justify Richard Grant White's "grammarless tongue," has, through its grammarians, been so imposed upon by Latin syntax that a study which can and should be made both pleasant and profitable has become a subject for abuse from even cultured men. Much time is spent in loading the memory with technical definitions and princi-

ples which have little or no bearing on the vernacular; while little practice in the actual use of the language is given. If the teaching were confined to the structural peculiarities of English, instead of being employed upon what is almost a science of grammar, incomprehensible to those forced to learn it, less difficulty and more benefit would ensue.

The province of grammar is the sentence; with words by themselves it does not deal. The true method of teaching it, then, in a language like English, which is nearly free from inflectional perplexities, is analytical. But by analysis must not be understood the simple naming of the kind of sentence, with the subject and predicate. The word groups should be thoroughly taken apart and, from the functions that they perform in the sentence, classified into parts of speech, their accidents noted, and the laws of their relation derived. Single words need little attention, except those of transition and connection, upon which, because of the lack of terminations, pure English construction so much depends. In this way grammar may be taught easily and logically, and it will be found of the greatest help in securing clearness, the foremost quality of literary style. Moreover, for the value of this method as an aid to the pursuit of other tongues, there is the authority of the late Professor Whitney, who says: "Give me a man who can, with full intelligence, take to pieces an English sentence, brief and not too complicated even, and I will welcome him as better prepared for further study in other languages than if he had read both Cæsar and Virgil, and could parse them in the routine style in which they are often parsed."

Presuming on the knowledge that a student should have obtained before he begins his immediate preparations for college, one year is ample for mastering grammar, and the second year may be devoted to the teaching of clear, energetic and graceful sentences. This will involve the study of words and their arrangement, with a view to the effect to be produced, and will include an investigation of figurative language. To cover in so limited a time the whole ground comprised herein is manifestly impossible; all the years of education are to some degree busied with this. Few, however will deny the advisability of forming early habits of exact expression, for these beget habits of exact thought. Accordingly, especial attention should be given to the instilling of an appreciation for words, and a precise understanding of them, not indeed for their own sake, but for the sake of their effective combination. Not too soon can the pupil be taught to meditate on the words that he meets, and to realize that they are live forces for good or evil; not too soon can his mind be opened to the depth and richness of their wisdom and poetry, and to their potency in awakening intellect and emotion.

What words are to the sentence, the sentence is to the paragraph. Separate words may call up a wealth of association, but until combined they have no cogency in the world of thought. So detached sentences, no matter how beautiful, are of small moment until united in continued discourse. To give unity and symmetry to discourse, to have all the parts coherent and orderly, is for all good writing the first requisite, applying with equal force to sentence, paragraph, and whole composition. But the sentence exhibits these qualities in so simple a form as to offer little material for successful study, while to study them from whole compositions is too complicated a process for immature minds. For early teaching, therefore, the paragraph becomes the easiest and most natural unit of discourse; and for this reason it is made the subject of the third year's instruction. In the perfection of the paragraph and its sequence lies the merit of the entire work, and he who has overcome the difficulties of the one will be well prepared to cope with those of the other.

The literature which should have a place in the curriculum of these years ought to be chosen in the light of the pupil's capacity and needs. Ordinarily by neither

experience nor education is he fitted to grasp firmly the meaning of the great masters who have sounded the depths of the human soul, and authors like Shakespeare or Milton, whose appeal lies outside his intellectual plane, become to him bugbears of class routine. Compulsory study of masterpieces the beauty of which he but dimly apprehends puts him in the double danger of imbibing for these a distaste which is hardly overcome by later cultivation and of relying so much on the opinions of others as to form no habit of independent criticism. Furthermore, since the early teaching is mainly constructive, the literary studies should illustrate as much as possible present usage, and should be drawn from periods as near to the student as is consistent with the best results. There is no dearth of good literature, which is recent enough for this purpose and well adapted for higher standards, and from which may be taken the material for class work. But not so much upon what is recited in class as upon a wide acquaintance with the best thought does knowledge of English depend, and to inculcate a habit of reading with taste and judgment should be one of the principal objects of the teacher. For this reason additional authors, who for lack of time can not be subjected to closer scrutiny, should be selected for careful reading as a basis for composition work.

To attempt to teach an art without continual practice in it is an obvious absurdity, and above all else for the successful study of English is the necessity of frequent composing. But for true progress writing must undergo careful and competent revision, for otherwise what is the best means of fostering and making permanent the power of good expression becomes an equally strong way of fixing error. This revision is the teacher's task—a task often burdensome, and always to the conscientious teacher full of fear. The danger of imposing too many restrictions, of curbing instead of guiding individuality, is a grave one, and a realization that English, being a living language, can not be corrected upon the same set of principles as Latin or Greek, must be ever present. To have full effect, too, the corrections should not be made outright, but should be indicated by signs which the writer understands and from which he himself may revise and transcribe his work. From this and from classroom criticism, which avails much if it be not so harsh as to discourage effort, faults and merits are impressed upon the mind and the habit of correctness engendered. For the preparatory years the qualities to be sought are originality and simplicity, and the themes, which ought to be assigned not less than once a week, should be determinate in character and within the range of the pupil's experience.

Such a preparatory course as the one outlined is not difficult of attainment, and he who can give evidence of having followed it successfully will be not less well grounded than he would be had he prepared especially to meet the modern requirements for entrance to college. He will have learned at least the primary essentials of good writing, and will have developed sufficient critical power to enable him to begin hopefully his higher education. This, in English, can not transcend rhetoric and literature, for these two include all that is to be learned. They go hand in hand, the one demanding the other, but for advantage in teaching the years of college instruction may be divided between them, making rhetoric the particular study of the first and the last year and literature that of the intermediate ones.

The teaching of the first year should be a far-reaching but not too deep exposition of the laws of artistic writing. Its aim is to equip the student for a critical study of the great authors, that he may himself, "under the influence, but not in imitation, of these models," give utterance to his own thought. From the very beginning he should be treated as an intelligent reasoner. Brought to understand that rhetorical rules do not take their authority from those who have conformed to them, but from a source above and beyond this and inherent in human nature—that they are not mere arbitrary inventions, but derivations from immutable principles, true at all times and for all peoples—he will find a fascination in his task

and take delight in discovering their application for himself. It is the knowing of the wherefore that makes the rule impressive—that informs with vital interest what would otherwise be but a dull and soon-forgotten adjunct to the class room.

When a student enters college he should be far enough advanced to follow in rhetoric the natural order of study. His first instruction then will be in the process of invention. This should consist in a drilling in the analysis of subjects and in the logical arrangement in a framework of the thoughts arising under them, as well as in the amplification of these thoughts in description, narration, exposition, and argumentation. Next comes the discussion of the qualities of style, and this can be only an extension and a full explanation of what he has already been taught. To be complete this course must include some consideration, necessarily brief, of the functions and technique of the principal prose forms and of the nature and elements of poetry. The necessity and importance of this training should need no urging. The first year of college ought to lay the foundation for both the critical and constructive work of the subsequent years, and this foundation can be had in no other way than through a knowledge of the principles of rhetoric, which furnishes the student with the theory of his practice.

Literature, the study of which for both illustration and inspiration must accompany the English instruction of every year, is of too great consequence to be always relegated to a secondary place. From it alone a practical knowledge of the language could be obtained, and the whole value of the theoretical discipline is derived from the accuracy with which the maxims are induced from an investigation of the greatest literary efforts and from the compactness with which they are presented. But the source is open to all; and while a lifetime is not long enough to know it in its entirety, surely college education ought to afford to its clients such an introduction to literature and such an acquaintance with it as will later lead to an intimate friendship with good books, one of life's greatest joys and blessings. For this reason two years may wisely be devoted especially to this study, but not to the history of the art and the biography of the writers.

The teaching of general histories of English literature is a valuable example of the failure of an attempt to do too much. These books are encyclopedic in their nature, and encyclopedias are poor text-books. The advantages which they may possess of presenting a bird's-eye view of the whole vast field of letters and of being guidebooks for courses of reading are, if the teaching is confined to them, more than offset by the superficiality of the information imparted and by the habit of dependence which their criticism creates. Except in a few rare instances, even their influence as guides is lost, for the memory, laden with a mass of names and dates and facts which have little appeal to the intellect or to the heart, soon relieves itself in forgetfulness. These books are not literature, and apart from the doubtful value of their biographies and their disinterestedness their worth by themselves in teaching literature is hardly greater than would be a publisher's catalogue, containing the usual press notice advertisements of his wares. It is to be remembered, moreover, that it is not a habit of reading which is to be cultivated, but a habit of reading with taste and judgment. There is no need of implanting the former. We are a nation of readers, but much of the present-day literature, which has a vogue even among college students and graduates, is a species of mental food proper only for the weak-minded. The antidote for this is to be found in a critical examination of masterpieces that will awaken in the student's soul a love not satisfied with less than the highest beauty.

The best way to study literature, then, seems to be in the works themselves. Where there is so much room for choice there is need of the nicest care in choosing. Not all the works of one great author should be taken, for this would give too limited a view, but as many single works of representative writers should be selected as can be assimilated within the allotted time. These should be examined in the light of the time and life of the author, about whom may be grouped

the other leaders of his period, and, for this grouping, a history of English literature might make a convenient reference book. There is, too, an advantage in tracing the progress of modern English letters from their beginning, in the fourteenth century, to the present time, and there is no valid reason why this could not be accomplished within two years. Even in one year, by making a selection of one prose and one poetic work from each of the different periods, the study could be brought down to the nineteenth century, and thus leave the whole of the second year for the study of the literature which is nearest to the student in point of time. Such a course is not proposed as the best possible one in literature, but it has in its favor that it will give, from actual study of masterpieces, an idea of the history of English letters; that it will furnish the student with a wide field from which to suit his own taste; and that it will offer inducements to further study in the different periods. The method of teaching should not be mere lectures by the professor. These may be entertaining, but they are not education. The student should be taught to analyze the works and to apply, in criticism, what he has learned of the principles of artistic composition. There is, of course, a danger that this laboratory method may be carried too far and the life of literature lost in its dissection, but there is no system of teaching not liable to abuse. Something must be left to the judgment of the teacher.

To the last year of college is again assigned the study of rhetoric, but such a deeper investigation as may be termed philosophic. This will mean the deduction of the laws from the primal principle of beauty from which they flow, and will involve an extended discussion of taste, imagination, and beauty itself, together with style and the literary forms. A proper conception of these demands all the knowledge to be obtained from the student's previous instruction. Moreover, his reasoning power, hitherto insufficient for a complete understanding of what rhetoric implies, will, by this time, have been so developed and strengthened by his formal study of logic and his general training as to enable him to comprehend something of the force of the æsthetic truths that underlie the art. The teaching may be best accomplished by the lecture system, and this will prepare the way for university methods, but, that it may not degenerate into mere entertainment, there should be at least weekly recitations from the questions, submitted beforehand, upon the matter of the lectures and of the parallel reading which must attend them. Instructions of this kind will not take away from the philosophical character of the final year's work; it can be made a summary of the conclusions to be induced from the whole range of English teaching and will lead to the broadest culture.

In the course of English instruction thus far suggested no provision has been made for philological study beyond what is implied in the teaching of words and literature. The student's time in our system of education is so occupied that, without a curtailment of some of the branches, no very deep knowledge of philology can be given, and this is not so necessary as to justify a change. But while this deeper knowledge is not essential, and may be better left to the post-graduate work, an acquaintance with the sources and developments of English is of too great benefit to be neglected. The value of Latin, whence is the origin of so many of our words, is acknowledged by all; few of us, however, seem to set any store upon a knowledge of Anglo-Saxon. Yet it is upon the Saxon foundation that the Latin superstructure is built, and no extensive training in English can be complete without its cultivation. It accounts for most of our idioms, and gives a deeper insight into the meaning of those words that are the bone and sinew of our speech. It has, too, all the disciplinary advantage of an inflected language, and possesses a literature which, if not so highly finished as the classics, is none the less a true record of the people's thought and feelings. There should be, then, some place for it in our curriculum; and if, as has been deemed wise, the preparatory course is to be lengthened, old English might as well be made the subject of

the fourth year's instruction. It can not be considered too difficult for those who have already made some progress in Latin and Greek, and if studied early, the information obtained from it may be applied and strengthened in the later teaching. Middle English, too, ought to demand some attention, and might have a part in the years devoted to literature. In this way the student could obtain a knowledge of the origin and history of his language, and this would prove not only interesting in itself and broadening in its influence, but useful in his practice.

But no matter what the course or what the method of teaching in English, the best results are due to the teacher himself. He is the living voice; he is more than the text. From the very nature and importance of his subject he has a higher privilege and greater responsibilities than most teachers. He can make the study a dry, lifeless task, or he can inform it with a vitality that will effect even more than is demanded. Upon the atmosphere that he creates, more than upon all the rest of the college teaching, depend individuality and good taste, which is not only an aesthetic but a moral faculty. One of the great objects of his work is to arouse such an interest in the language and its literature as will lead to further study, and to impart this interest he must have it himself. College education is not the end of English training, nor does it produce eloquent writers. "To acquire a few tongues is the labor of a few years, to be eloquent in one is the labor of a life;" and this eloquence flows more from a God-given source than from man's instruction. But while great masters of style are not made by teaching alone, a student, unless he is so invincibly ignorant as to preclude all possibility of his ever graduating, can and should be taught to express himself in idiomatic, graceful English, adequate to his thought, and to appreciate and to love the ideal beauty of which noble literature is the exponent.

DISCUSSION.

Taking up the discussion of this paper, Father Tracy, of Niagara, said: "There was allusion made to the necessity of critical study and examination of the masterpieces of the language. That is as it ought to be, and no course in English is complete without it. The point I wish to make is this: We are giving an education not only in English, but we are giving an education in English to Catholic children. For a matter of fact, we seem to be casting the minds of our children, from a literary point of view, in a Protestant mold. This is obviated only by extra work on the part of the teacher in entering into detailed explanations which will minimize the harm that we know non-Catholic works would do. The literary texts are taken from the great masters, such as Wordsworth, Browning, Macaulay, Longfellow, Hawthorne, and Whittier. The nobility of mind in the great geniuses reduces any harm that might otherwise be attached to their works to a minimum. Not so the authors of less note. They have done a benefit to humanity at large, but there must be discrimination if we do not wish to neutralize our efforts at Catholic teaching. Now we have Newman, we have Manning, we have Vaughn, we have Ward, we have Brownson, we have Spalding. We have a host of writers who are without the slightest doubt equal, perfectly equal, from a literary point of view, and superior in the domain of thought to many whose texts are placed before our pupils. Why can we not give to our own the attention and the respect that we are according through the publishing houses to the non-Catholic writers? If the publishers know that we want a particular class of work, they will very willingly secure it for us.

Rev. Father Cassilly, of Chicago, voiced the gratitude of the delegates to Professor Ryan for giving them such an able paper, and thought the remarks of Father Tracy very appropriate also. One point which he did not like to have pass without notice, however, was the secondary place given to grammar, which he held to be one of the essentials to develop accuracy of thought, in which men of the present day are so deficient. Grammar should be taught thoroughly and scientifically, especially in the academic grades.

Professor Ryan replied that English grammar suffers from the manner in which it is taught, and from its text-books—in the technical definitions and principles which are imposed upon it by foreign languages, and gave several illustrations of his meaning. He took the position that a boy can easily be taught all the English grammar he needs in one year—not, however, the science of grammar.

Rev. Father Bradley, of Atchison, disagreed with Professor Ryan in regard to divorcing the English grammar from the grammar of the other languages, and believed there should be a comparative study of languages; that it is impossible for the young student to understand English grammar without understanding Latin grammar or some other foreign tongue; that the modern way of eliminating everything from the English grammar and reducing it down to the ordinary language lessons as we have it to-day is wrong and detrimental to the best interests and a thorough understanding of English grammar. In reference to literature, the same objection to the study of the text-book in literature presents itself as in the study of history, and the same method, adverted to by Father Vincent, of studying history, viz, by groups, might be employed for studying literature; let the principal author of a period represent the period, and around this author group all the lesser portraits. Another point which Father Bradley considered very essential in the thorough study of literature was the study of the history of the times in which the authors lived, since it is impossible to appreciate the conditions of literature of certain periods without understanding the history of those periods. While English is undoubtedly one of the principal studies of the classical course, and should receive the principal attention, he did not consider it necessary to give it the same number of hours as we do to Latin, for the reason that private study can accomplish a great deal more in English than it would in the case of young boys studying Latin.

In this connection Monsignor Conaty said that one of the most important questions in the college curriculum is this very study of English, and dwelt at some length on the marked deficiency in English of students entering the university department. "They have a knowledge of authors oftentimes," he said, "without a knowledge of the author's works, and in this there seems to be a defective foundation. This is the fault of the college, and may also be traced beyond the college to be the fault of the preparatory school; but it is really the fault of the teaching of English, to which sufficient attention is not given; oftentimes the attention is more in the catalogue than it is in the working power of the college. And it seems to me, as a college conference we have reason to study fundamentally the question of the teaching of English in our college curriculum, for as gentlemen—finished scholars from college—we are oftentimes judged by our knowledge of our own language, and it is hard for us to know other languages and to acquire a reputation in other languages when we are defective in our own, especially in the history of our own literature or in the knowledge of the great authors that have made literature. This is the feeling of the universities, and it certainly is the feeling that expresses itself in our own university."

EDUCATIONAL LEGISLATION IN THE UNITED STATES.

A paper on this subject was read by Rev. James P. Fagan, S. J., vice-president of Georgetown University, District of Columbia. On account of its length this paper was not printed in the report of the conference, but the following discussion, to which it gave rise, is given:

Father Burns said he was sure the conference was profoundly grateful to Father Fagan for the keen-sighted, exhaustive, scholarly exposition he had given of the educational legislation going on about us, and, summarizing the facts presented by Father Fagan concerning the growth of the educational system of secular schools and colleges, thought we might profit by the experience of those who have had charge of public education. That is precisely the great question to-day—the systematization of all Catholic education—and he suggested the consideration as to whether the foundation or the conversion of this conference into a joint association of secondary Catholic schools and colleges would not be a most practical and most easy step in this direction. Such an association might consist, as in the National Educational Association, of sections—a section of higher education, a section of secondary-school education—which might hold sessions simultaneously.

Father Dowling said: "It seems to me the golden thread running through the discourse of the paper of Father Fagan amounts practically to this: We are convinced that we take the right and the proper view of education; that it is the only reasonable view to take—the one which requires religion to go hand in hand with the acquisition of secular knowledge. We have not as yet been able to impress that upon the American public, and the question arises how are we to reach that desired end? Certainly we count for comparatively little in the educational field,

and it may be it is not owing to any prejudice against us or our cause, but to want of the proper presentation of ourselves and our principles and our ideas. I have a great respect for the innate love of justice and fair play of the American people, and that we do not get fair play I can not believe is owing to anything else except our indifference. Now, it seems to me that we have not, up to the present time, worked along the line of our American institutions successfully; we have not made use of the salient points of our system of government, and we ought to make use of every possible means and every possible occasion to put before the American people what we want. We do not come before them claiming any special privileges as Catholics. What we require is the rights we are entitled to as American citizens, and they are infringed upon, and we do not receive justice, not because we are Catholics, but because we are American citizens that have certain convictions that are interfered with by certain laws and legislation adopted. While we, as clergymen, can not enter into the field of politics, can not go and lobby in the legislatures, why do we not enlist the energies, the intelligence, and all the other good qualities the Catholic laity possesses? The layman represents the citizen; he represents the taxpayer; he represents the parent. To the American public the clergyman represents the church, and what has the church to do with our internal system of government? We can not make use of money in bringing about these results, but I think it is in our power to make use of fear. Now, we have back of us a population of about 12,000,000 of Catholics in America, but we have not yet found out the means we are to make use of for reaching the great American public, and having our ideas and principles set before them. Foremost among these I would mention the press. And why would it not be possible for us to hold our meetings at the same time as the great National Educational Association—get ourselves in touch with the thoughts and prejudices of our people—in order to influence them for good and prevent them from entertaining or considering the passage of laws that would be inimical to religion in any form?

Rev. Father Dolphin, of St. Paul, stated in this connection that Catholics in all parts of the country have too long been apologizing for their existence; that we ought to convince the great American Republic that we are a part of it; that the fair-mindedness of the people of this country would certainly make more concessions to us if we would come out a little more, as Father Dowling suggests, meet other institutions in their conventions, and show that we are really taking an active part in the affairs of the United States.

Rev. Father Higgins called attention to the first part of Father Fagan's paper, in which he speaks of the committees appointed by the National Educational Association, the reports of these committees, etc., and said that the latter constituted a literature that is very important to all of us; though they are not legislation, they have always pointed the way to legislation, they have foreshadowed the tendencies of the educational mind, they have shown, as it were, the direction of the stream. But a very striking feature of these reports is, they show that the state of mind in the educational world is a very restless, very unsettled, very unsatisfactory state, and the instability of that educational mind is known to the members of these committees, as evidenced by their varying opinions regarding the length of course to be given.

The right reverend chairman said that before leaving this question of educational legislation he thought it well to again emphasize what was said in the paper and by the different members of the conference; that it is important that everyone interested in education should be familiar with the trend of educational legislation; that there is no doubt at all as to a well-defined movement toward the destruction of the college, toward the absolute control of all education, and the destruction by that same method of private enterprise in education. While, as Father Higgins has said, there is a great uncertainty even in the minds of the men who are moving along those lines, there is no doubt at all as to the establishment of the high school as the feeder to the State education and as to the absolute requirement for all who desire to enter into the educational work of the State. There is no doubt as to the determination on the part of the universities to control all schedules of educational work. And we need to have our eyes thoroughly open to the fact that we are absolutely ignored in all those phases of educational work. No consideration whatever is directed toward the Catholic educational system for means of consultation in any matter of education, but there is always a spirit of opposition to everything that bears the name of Catholic education. There is the difficulty of being recognized as conforming in any way whatever to the requisites for admission to the different opportunities that are offered in the way of education (illustrating this by the existing conditions in Massachusetts). "It is well for us to bear in mind all these things," Monsignor Conaty said, "and realize that the trend of educational legislation is against the private school, and it is against the private religious

school, and it is in particular against the Catholic educational system." And, as Father Dowling said so well, we are not here by sufferance. We are American citizens. We have our rights under the law, and we have our conscience obedient to God. We have our duty to perform in the work of education. We are doing it conscientiously and faithfully, notwithstanding all our difficulties, and we should not lose sight of the fact that we have rights as citizens as well as duties as Christians. And consequently it is well for us to have had that lesson read to us to-day of the educational legislation which brings close to us, as the result of Father Fagan's patient research, the trend of thought relative to the State authority in all matters of education. Therefore I wish to emphasize again, as the last word on this subject, the importance of being thoroughly familiar with all legislation that bears the name of educational, because it is something in which we are intensely interested, not only as Christians and Catholics, but as citizens.

REPORT OF COMMITTEE ON COLLEGE ENTRANCE REQUIREMENTS.

The committee on college entrance requirements made the following preliminary report, giving their views and conclusions, so far as they had been formulated:

To begin the college course and to pursue it successfully and profitably we think that it is necessary and sufficient that on leaving the preparatory school a young man should be able to stand the following tests:

1. In Latin he should be thoroughly grounded in grammar, including prosody. He should be able to read ordinary Latin prose at sight and to write Latin with some degree of ease. He should have seen the authors usually selected for beginners' work in the order in which they are usually read: Nepos, Cæsar, Cicero (Letters and in *Catilinam*), Phædrus, Ovid, and selections from Virgil's *Georgics*, with perhaps one book of the *Æneid*.

2. In Greek he should have a good knowledge of Greek grammar, including the rules for accents and simpler rules of prosody. He should be able to translate simple sentences, illustrating constructions, etc. He should have seen the usual Greek authors read in our preparatory department, beginning with the easy witticisms of Hierocles and the fables of *Æsop*, and going to the *Anabasis* and *Cyropædia*, St. Luke's Gospel, the Odes of Anacreon, and at the end perhaps taking one book of Homer.

3. In English. The study of English should be correlated with that of the classics, the aim being to secure that fluency and command of language, that accuracy in the use of words, that refinement of diction, which is invariably the reward of careful work in translating. The elements of rhetoric should be mastered—i. e., the principles regulating the use of words and the structure of sentences and paragraphs—and the principles of good prose style, etc. The student should, moreover, be made acquainted with what is best in our literature.

History should, as much as possible, be correlated with literary studies. In this way the student should be made acquainted with sacred and ancient history, Roman and Grecian history, the outlines of ecclesiastical history, and of the political history of his own country. Selected topics and periods of church history, therefore of English and American history, should be mastered, both for the sake of the facts and in the two higher classes for the sake of gradually training the student to observe and to note the relation of cause and effect, etc.

Modern languages should find a place in the curriculum, and on entering college the student should have a reading knowledge at least of French or of German, or of both.

In mathematics he should have finished algebra and geometry, plane and solid.

As regards the sciences, we believe that a certain amount of time should be set apart for physical geography, physiology, elementary biology, and perhaps elementary astronomy or physics and chemistry.

As to religion we need not go into details. It is clear that a young man entering college should be able to explain his belief and be able to give valid reasons for the faith that is in him.

We urge the importance of insisting on living teaching in religion, history, and English literature, not mere text-book work.

We would urge, too, the importance of oral work in Latin, so that the usage of the Latin tongue be not lost among us, seeing that Latin is the universal language of the church.

Your committee wishes to close by recommending that the matter of entrance requirements be not allowed to drop, but that a special committee be appointed to study the matter thoroughly and to report in detail on the study of English literature and of science in the preparatory school.

It was moved and seconded that the report of the committee be accepted, which motion was duly carried by a vote of the conference.

GREEK IN OUR CATHOLIC COLLEGES.

By Rev. CANDIDUS EICHENLAUB, O. S. B.,

Of St. Bede's College, Peru, Ill.

In the question of Greek we happen on a subject of discussion which has been the cause of much dissension among the school men of our times. Already for some years there exists a faction that would sway public opinion toward rejecting the classics and accepting instead the more modern sciences as instruments of education. Judging from existing conditions, and seeing the strong efforts continually being made to introduce new courses into the schools, the conclusion lies patent that if the schools do not deteriorate to the level of manual-training schools, they will be productive of nothing more than polished seekers of material advancement, or progressively civilized but naturalistic sociologists. The tendency toward this kind of education is more noticeable in the common secondary school, although it has gained strong foothold elsewhere. For the secondary school, witness the report of the committee [of the National Educational Association] on college entrance, page 158: "The attention of educators has been of late repeatedly called to the truth that a four-years' course, consisting almost exclusively of classics and mathematics, with scant recognition of English literature, practically no modern history, and no physical or natural science, is a course so unsymmetrical as to be a monstrosity. The relation of the different educational institutions to each other ought to be such that a course preparatory to college will also be a course well adapted to fit the student for the later work of life and for social and civil duties in case he should fail to take a college course. It can not be claimed that the present classical course in high schools, constructed with reference to the classical course in colleges, makes any approximation to this result. The student who has completed a high-school course in preparation for the classical course in college has gained, not a tolerably complete and symmetrical education as far as it goes, but a wretched torso of an education. Nor is the exclusion of science injurious only to those whose studies are interrupted at the end of the high-school course. For those who enter college the ignoring of the study of nature in preceding years tends to unfit them for success in such studies. Their powers of observation and imagination of physical phenomena are well-nigh atrophied by disuse, and they have lost their native curiosity about the world in which they live. It would tend to correct this evil if a certain amount of science were required for admission to the classical course."

Notwithstanding this, the reaction setting in within the past few years gives

hopes for a wider appreciation of the classics. The same report quoted above, after enumerating the statistics, goes on to say: "From these figures it appears that the study of Latin in the last eight years has gained in the enrollment of pupils at a rate greater than that of any other high-school study. The total gain of 174 per cent is more than double the percentage of increase in the total enrollment of pupils in the schools. While the enrollment of pupils in Latin has thus increased 174 per cent, the increase of enrollment in Greek has been 94 per cent. In the same period the increase in the enrollment in physics has been only 79 per cent, and in chemistry only 65 per cent, a percentage smaller than that of the increase in the total enrollment in the schools. It is at least encouraging to the friends of classical study to notice that in 1897-98 almost one-half of all the pupils enrolled in the secondary schools (49.44 per cent) were engaged in the study of Latin. With this general increase of interest in Latin studies undoubtedly will come also a fuller recognition of the importance of Greek as an educational instrument. In the next decade an even more rapid increase in the enrollment of students in Greek may be expected than the very promising one of 94 per cent reported for the period covered by the table."

To what extent the Catholic schools have suffered under the influence of the secular sentiment need not now be investigated. We do know, however, that in many instances, both in matter and in manner, Greek has not received attention commensurate with its educational value. How many of all our college graduates do we ever meet who will admit of having profited by their course in Greek, or who have attempted, after completing the course, to avail themselves of their knowledge for further improvement? If these facts be conceded, might not the educators as well agree that the opportunity is ripe to debate whether Greek is of sufficient importance to retain it in the college curriculum at all? But, surely, for Catholic educators there can be no question of dropping this study from the curriculum. The meeting of this venerable body here to-day betokens rather an intention toward a readjustment of this branch, giving it its proper position and bringing the method of teaching it up to a uniform standard. Now, these points may not be solved except with reference to the educational value of Greek.

Let it be assumed that with Greek, as with any other branch of study, its value in the curriculum must be determined by its own intrinsic worth, as well as relative superiority to other studies. In the case of Greek the criteria establishing its superiority are: (1) The supremacy of this language as a vehicle of thought; (2) The fact that it offers the best literary productions of all ages; (3) Its excellence as a means of training the mind to comprehensive intellection, accuracy of reasoning, and nicety of expression; (4) That it has been made so important a factor in transmitting to man the Divine message of eternal truth and salvation.

And truly Greek is easily the peer among languages, the perfection of its structure, responding with fullness of harmonious flow to every movement of thought. The wealth of its vocabulary and the rich variety of its forms are unparalleled for giving appropriate expression to any conception of the mind, be it of concrete form or motion, with its attendant mode and vesture, or be it abstract (and immaterial) ideality, or sentiment and passion in the various degrees of tenderness or power. How superbly flexible and expressive to eye and imagination alike are the groupings of terms with their modifications, according as they are arranged to parade apart for emphasis, or are united in closed phalanx to lend strength to a leading idea! Still more, beside the color of moods and numbers of time, there is also the harmony of sound, wherein a discordant touch is scarce allowed to mar the pleasing tones. Greek, indeed, is a language than which none is more fittingly appropriate for instrumentation of human thought.

Well, too, have those master minds of cultured Greece employed the language to mold the edifice of their sublime conceptions. Never were passion and pur-

poses of mortals expressed with truer reality and more perfect taste and polished execution than in the epics of Homer. Demosthenes, in his love for country and his people, furnishes those imperishable models of oratory which, by their faithfulness to objective reasoning, could sway the people contrary even to their meanest inclinations. But why enlarge on the merits of these great men and their works; why speak singly of a Pericles, Aristophanes, Plato, Aristotle, Thucydides, and so many others, while we know that throughout so many centuries the ablest talents have sought delight in the refinement of Grecian literature? The schools of all civilized countries never could demean themselves by slighting the artful grandeur of Greek speech. Where is the college to-day, unless existing for mere material advancement, that refuses to invite studious minds to sit at the models of Attic lore—models which we can not help but liken to those other works of theirs, viz, those plastic imitations of the ideal human form, made always to be admired, always and everywhere recognized as the standard pattern for unfolding genius?

Can we wonder, then, that a language possessing such ready material and perfected by such subtle intellects, is so eminently fit to training young minds to comprehensive intellection and accuracy of judgment? In truth, there is no letter instrument to develop the various faculties of the mind. It is herein we find that Greek is so profitable a branch in the classroom. The facility of surrounding single words with their modifiers to convey an adequate expression of subject and object of thought with accompanying circumstance or ornament, the infinite ways of rendering verbal terms with modes and conditions, can not but open up a more comprehensive view to the imagination. The variety of uses to which the same roots of words are adaptable, whether occurring in their original and real sense, or transferred to a moral or abstract signification, compel the student to have regard for the context, and ever to subordinate his judgment of the signification of a term to the sense conveyed in the complete sentence. In a similar way must he use his judgment in determining the function of terms according to forms defined by etymological regulation. The continual exercise in testing the fitness of all must eventually produce the ability of accurate judgment which is the distinguishing mark between the sound thinker and the voluble talker.

However indifferently the Catholic educator may think of the advantages enumerated, there is one other which he can not ignore, namely, that the knowledge of Greek prepares the student for a more perfect acquaintance with the deposit of our holy religion. Especially must those who, by the reason of their higher education, are looked upon as exponents of truth be in position to make themselves conversant with the sources whence the supposed coryphæi of biblical criticism derive their misguided conclusions; and if our adhesion to Christianity is to be a "rationale obsequium," how can the teachers of it permit those whom they are educating to remain without the means of discriminating between distorted deductions and lawful explanations, based on the text of the language chosen to communicate to man so great a part of divine revelation.

Thus, then, must we draw the conclusion that the study of Greek in a course leading to higher education dare not be neglected, if indeed Catholic institutions would do themselves justice. For, taking the advantage pointed out collectively, there is no known discipline of such universal value as a means toward individual, as well as social, intellectual, and moral attainments. Of course, religion, the vernacular language, and Latin must claim priority in as far as they are of simple necessity or that they are the medium without which what is necessary could not be obtained. Greek, therefore, if taught in accordance with its value, would demand a full course of six years or at least five, supposing the conditions exceptionally good.

What part of this course is to be allotted to the secondary or preparatory school is the question which, I understand, is to be more specially discussed in this meeting. An adequate decision on this topic can not be given unless the twofold object of the secondary course receive due consideration. Now, undoubtedly the first aim ought to be development of the intellective powers; the second, knowledge. And it is precisely herein so many schools are sadly deficient. We see this so clearly manifest in the prevalent tendency to cram the student with information by the introduction of numberless "ics" and "ologies," to the detriment of logical development. Well aware of the results so forcibly impressed on our minds, we can the better persuade ourselves to hold more steadfastly to the past and its methods, seeing they have stood the test of worlds and centuries, only that we be mindful to give later improvements fair trial and recognition. Development, then, is the first desideratum, and since Greek is a means exceedingly well adapted thereto, the method to be pursued in teaching it can not be purely that of grammar, or the natural, the pure, the phonetic, the psychological, or the reading method; but it must combine what is most serviceable in each in order to be conducive to an all-around training.

Moreover, the teacher should steadily aim to have regard for the mental operations. The first of these is that of apprehension, which is acquired not only by memorizing terms of the vocabulary, but more by close attention to the value of words and signs arising from their peculiar forms. This enlarges the power of observation and definite apprehension. The second operation naturally following upon the preceding is to find the relation of ideas and expressions, and, again, to distinguish them from each other according to the different functional value they have as parts of a simple unit of connected thought. This operation, in turn, increases the power of discernment, and must precede the third, which consists in tracing a whole period of reasoning, in arranging a series of judgments according to their coordinate and subordinate relations. This work tends to expand the grasp of the mind and to unify intellectual activity into a harmonious whole. More than this, a fourth operation, that of analyzing the various modes of expression, the disposition and grouping together of the leading ideas and judgments, with their accompanying modifications, leads directly to a comprehensive view, extending the power of intellectual vision. But superior to this is the fifth operation, wherein all mental activity is shown to be restricted to general laws, by means of which alone a language becomes the property of a nation or community. By close study of these laws, frequently so extensive in their generality, the mind is still further trained to intellective expansion, being led to recognize an indefinite array of possibilities therein; and by again applying and seeing applied these laws in the concrete it learns to become accurate, and its judgment gradually becomes more definite in objective correctness. A proper regard being had for these operations, under a competent teacher, no one can fail to see that such training will be productive of solid education and such development as is inseparable from independent thought and rational judgment.

Though development must be the first aim in education, the acquisition of knowledge can by no means be neglected. The student of the secondary department should become acquainted with so much knowledge that his further progress be profitable. It will never do to have learned merely a set of forms and rules, with some notion of their use, nor will it do to know a compendious collection of words without understanding their function. In order to obtain an equable result the secondary course must have its own end, besides preparing merely for a university course. It ought to afford a good working knowledge of Greek, so that the student be in position to pursue intelligently and independently his reading of Greek, without stumbling against so many and difficult obstacles as to cause him to lay aside his books in despair.

It may therefore be considered as established that in the academic¹ course the student be trained to acquire an accurate knowledge of etymological forms, all principal rules of syntax, and a sufficiently extensive vocabulary. This directly implies an answer to the question, What should be exacted of a candidate presenting himself for entrance to the university? for it excludes mere questioning on time and quantity of matter seen and demands that the student, besides manifesting such intellectual development as will render him capable of undertaking profounder studies, will also give proof of knowledge sufficient as a foundation for easily assimilating its higher branches. If such is the general expression for the standard required, then the candidate must be able to read fluently and translate correctly any matter previously seen in the course completed; to parse and analyze, giving account of forms and constructions, and must be able, without too frequent recourse to dictionary or grammar, to handle intelligently such parts of the easier authors not studied beforehand, i. e., to read at sight.

Working on this fundamental standard, it is evident that the young student must already possess a good idea of the grammar of his own language, and be well versed in the knowledge of the value of terms and periods. And, if otherwise, he is not to be crowded with a superfluity of matter apt to overtask his assimilative powers; the study of Greek should be deferred to the second year after Latin has been completed. This practice the Catholic institutions in this country have almost uniformly adopted, and they seem the more inclined to wait till after the second year, finding it preferable to begin Latin as soon as the schoolboy has graduated from the elementary department.

How long a time thereafter, and under what best method the object of the Greek class may be attained, must be decided by the experience of observant teachers. Withal, there seems to be a divergence of opinion regarding the method of teaching Greek. With the variety of methods now in vogue, no precise regulation may seem feasible for allotting the time; nor does it even seem possible to introduce one and the same method as long as the teachers themselves are not equally equipped to perform duty on the same branch. Yet all are certain that there is a universal movement toward improvement. Let, therefore, the experienced outline a course, serving as a model for the perfection to be attained. An attempt at an outline is made in the following schedule:

Schedule for a three years' course (four hours per week); for day schools five hours per week.

First year: Grammar, including all to the verbs in "mi."

Exercises, accompanying each lesson in grammar; translating Greek into English, and English into Greek, from memory; toward the end of the year, memorizing small stories or fables, the difficult parts receiving extra explanation.

Second year: Grammar, repetition; from the verbs in "mi," through irregular verbs and the cases.

Prepositions.

Exercises, accompanying grammar same as above; translation ditto; Xenophon. Memorizing select passages.

Third year: Grammar, repetition of previous year; modes and tenses, etc. Grammar completed.

Exercises, Xenophon, Homer, a few chapters of Sacred Scripture, some Greek Father of the Church, preferably St. John Chrysostom.²

¹ Academic must here be taken as equivalent to secondary, or preparatory—i. e., that course offering adequate training for entering a first-class university course. This does not imply any change (to be made) in the collegiate course preceding the clerical seminary; for the arrangement of four years of Greek in classics, followed by a year or two in philosophy, is considered admirable.

² The reading of Homer, S. Scripture, etc., in this course is intended chiefly for training in Greek synthesis, and for acquiring a large vocabulary, which must be the foundation for a more extensive study of Greek literature later on.

N. B.—It may be remarked that the grammar to be used be Kuehner's, Buttman's, or Spiess's, or some similar elementary grammar. To give a better view of the whole outline of grammar, the grammar and exercise book should be separate. It will be found very advantageous with students entering upon their course in Greek rather late, or students that are farther advanced in other branches, to give them an occasion of seeing the whole grammar with its principal features, and exercises corresponding, for a first year, which may serve for two years of the regular course.

Treated in such or a similar manner, the study of Greek, besides furnishing the student with desirable knowledge, will be a powerful aid in training the mind to facility in acquiring that definition of concept so essential for accurate reasoning, and give it, at the same time, that faculty of expansion wherewith it intuitively comprehends a variety of possibilities, of which it knows but one to be selected as the best and most fitting. This, then, must be the object of the Catholic teacher whose faith in the unchangeable truths of revelation and Christian philosophy is supreme, and who will not sacrifice quality of intellectual development, a part of true education, to a mass of confused information, the outgrowth of which is and can not be other than complacent self-sufficiency and opinionated sciolism. If, finally, the teacher acquaint the student with the reason and merits of the system he would conscientiously follow out, the student will not only readily become reconciled to an apparently difficult system, but also gradually take more delight in cooperating with his professor for obtaining results ending in solid satisfaction to both student and professor.

CHAPTER XIX.

EDUCATION IN GREAT BRITAIN AND IRELAND—1900-1901.

Great Britain and Ireland, constitutional monarchy; area, England and Wales, 58,186 square miles; population (estimated, 1899), 31,742,588; Scotland, 29,820 square miles; population (estimated, 1899), 4,281,850; Ireland, 32,583 square miles; population (estimated, 1896), 4,535,516.

^a Owens College, Manchester; University College, Liverpool, and Yorkshire College, Leeds, are associated together as the Victoria University; and the Welsh colleges at Aberystwith, Bangor, and Cardiff as the University of Wales. A university, with which Mason College is incorporated, has been established at Birmingham.

^b Undergraduates. At Oxford in 1899 there were 856 matriculations; at Cambridge in 1900, 932.

^c Also 3,189 evening students.

^d Includes 1,125 evening students.

^e Includes 809 evening students.

^f Also 70 evening students.

^g Also 3,781 evening students.

^h Average enrollment.

ⁱ Grants by board of education.

BRIEF CONSPECTUS OF THE SYSTEM OF ELEMENTARY EDUCATION IN ENGLAND.

From the above table it will be seen that the public elementary schools of England enrolled 5,705,675 pupils in 1900. They were distributed in 20,117 schools under Government inspection, and maintained by the combined action of Government and local authorities. The total current expenditures, day and evening schools, reached the sum of \$60,500,000, of which the Government supplied 64 per cent and local sources 36 per cent.

The current expenditure for day schools only was \$58,538,923, equivalent to \$12.54 per capita of the average attendance, viz, 4,666,130. This number is 81.8 per cent of the enrollment.

Origin and essential features of the system.—The organized system of public elementary schools is based upon the education law of 1870, commonly known as the Forster law, from the name of its author. Subsequent laws have fortified and extended the system, but without changing at all its essential principles.

As early as 1833 Government had made an appropriation of \$100,000 for elementary schools under the management of religious societies. The policy was continued and developed from year to year, but with ever-growing evidence of the inadequacy of the effort to meet the needs of the people. By the law of 1870 Government assumed the responsibility of securing school provision for all children, and, without prejudice to the existing denominational schools, created a new local agency—school boards—for the establishment of elementary schools. These boards were to be elected by the taxpayers in each rural parish and municipality, as circumstances might demand, either upon local initiative or upon the order of the Government. The existing denominational schools were to be recognized as public elementary schools in the meaning of the law and were placed upon the same footing as the board schools with respect to the Government grant.

The law provided that board schools should be strictly nonsectarian, and by a "conscience clause" prohibited private schools from forcing religious instruction upon children whose parents should object to the same. No public grants are allowed for religious instruction. The law of 1870 also transferred to school boards the power previously exercised by prison authorities of contributing to the establishment and maintenance of industrial (reform) schools.

The denominational or "voluntary" schools, as they are termed, were excluded from a share in the local taxes upon which the boards might levy for the support of the board schools. The conditions for sharing in the Government grant, which are the same for both classes of schools, are set forth in annual regulations (codes). These regulations are sanctioned by Parliament and have the same force as the law. They relate to buildings, number and qualifications of teachers, course of study, and length of school year.

The total enrollment in 1900 (5,705,675) was distributed between the two classes of schools as follows: Voluntary or denominational schools, 53.3 per cent; board schools, 46.7 per cent. The current expenditure for the "voluntary" schools was met from Government grants, 78.2 per cent; from endowments, subscriptions, and fees, 21.8 per cent. The current expenditure for board schools was met from Government grants, 53 per cent; local taxes (rates) 45 per cent, and the small balance from fees and other local sources.

The central authority.—The Government grant, which forms the chief source of income, is administered by the board of education created in 1899 (replacing the education department created in 1865 to administer the grant to denominational schools).

The distribution of the grant since 1895 has been made principally on the basis of the average attendance in individual schools, the rate per capita being determined by the reports of the Government school inspectors. These comprise 12 chief inspectors, 107 inspectors, 45 subinspectors, and 152 inspectors' assistants, a special inspector of music, a directress of needlework, and an inspectress of cookery and laundry work. The experiment of appointing women to serve as subinspectors, first tried in 1896, has proved eminently successful.

Local authorities.—Apart from the requirements for sharing in the grant, local authorities, whether private managers or school boards, have large powers and great freedom in respect to the management of the schools.
