The school districts, or areas for which a school board should be formed under the law, are the metropolis, every municipal borough excepting Oxford, and every parish not included in the former. The number of school boards in 1900 was 2,545, representing 69.5 per cent of the population. In districts having no school board, comprising at present 30.5 per cent of the population, school-attendance committees are appointed to enforce school attendance (law of 1876).

Free tuition.—The law of 1891 providing a special grant for all schools, whether board or voluntary, remitting fees, has had the effect of making elementary education practically free throughout the land. Of 20,117 schools on the list for inspection in 1900, it appears that 91 had refused the fee grant altogether, and 2,660 continued to receive such fees as the law allows (2,725 the year preceding). Of the total number of enrolled pupils, 88 per cent paid no fees whatever.

Teachers.—The teaching force in the day schools, numbering 143,379 (excluding 2,565 probationers), was composed as follows in 1900: Certificated teachers, 44.6 per cent of the total; assistant teachers, 22.6 per cent, and pupil teachers 20.5 per cent; additional women teachers, 12.3 per cent. The pupil teachers are regarded as teachers in training, and an additional grant is made to the school on their account.

The average annual salary of certificated teachers is, for men, \$635, as against \$457 in 1870, and, for women, \$425, as against \$279. For the training of teachers

there are 44 residential colleges attended, in 1899-90, by 4,085 students, and 16 day colleges, with 1,523 students. Of the former institutions 42 are denominational and 2 are private and undenominational. The day colleges, with two exceptions, are departments or annexes of university colleges. The training colleges are all under Government inspection and receive annual grants for "Queen's scholars," who are admitted upon proof of required attainments and who pledge themselves to adopt and follow the profession of teacher in a public elementary school or other specified schools. The expenditure for the residential colleges for 1898-99 was £210,786 (\$1,024,419), two-thirds of which was met by the Government grant. The expenditure for the day colleges was £47,459 (\$230,650), three-fourths of which was met by Government grants.

The superannuation law of 1898 provides for the retirement of teachers for age (65 years) or disability with an annual allowance. This allowance is made up partly by an annuity purchased by small sums—£3 for a man and £2 for a woman—deducted annually from each teacher's salary, and partly by a State pension calculated according to the years of actual service performed by the teacher.

Legislation since 1870.—The most important modifications of the system of elementary education introduced since the passage of the law of 1870, either by amending laws or by annual regulations having the force of law, are as follows:

Law of 1876, restricting the employment of children under 14 years of age and making it the statutory duty of every parent to cause his children to receive efficient elementary instruction in reading, writing, and arithmetic; also creating school-attendance committees in districts having no school boards. Law of 1880, obliging local educational authorities to make by-laws for the enforcement of compulsory school attendance. Annual regulations of 1875 and 1880, extending the list of optional or specific subjects and adding a seventh grade to the six already established, thereby laying the foundation for higher grade schools. Annual regulations 1882, introducing a merit grant, to be awarded upon the basis of average attendance.

Annual regulations, 1890, making important provision for teaching science and drawing, also providing for Government aid to day training colleges (normal schools).

Law of 1891, providing for an extra grant in lieu of fees at the rate of ten shillings per capita of average attendance for all schools remitting fees.

Laws of 1893, (1) making eleven years the minimum age for exemption from school attendance and requiring an examination in a grade not lower than the fourth for every child seeking exemption from school attendance; (2) authorizing school boards to make special provision for the elementary instruction of blind children and of deaf and dumb children.

Annual regulations, 1893, constituting evening schools as evening continuation schools. Annual regulations, 1895, substituting for the system of formal and individual examinations by the Government inspector two annual inspectorial visits, to be made without notice, and apportioning the Government grant on the basis of average attendance.

Law of 1897, providing a special grant for the benefit of "voluntary" (chiefly denominational) schools at the rate of 5 shillings per capita of average attendance; also authorizing the federation of voluntary schools and the allotment of the grant at the discretion of the governing bodies of the federations.

Laws of 1899, (1) defective and epileptic children's act "empowering local educational authorities, at their discretion, to establish special schools or classes for mentally or physically defective children and special boarding institutions for juvenile epileptics;" (2) law raising the minimum age for exemption from school attendance from eleven to twelve years; (3) creating a board of education to replace "the education department and the science and art department, providing also for the transfer to the new board of certain powers exercised by the charity commissioners with respect to educational trusts and endowments, and for the transfer to the board of the educational functions of the board of agriculture." Further, the law authorizes "a consultative committee, to be constituted by an order in council, consisting of persons qualified to represent the views of universities and other bodies interested in education for the purpose of framing, with the approval of the board of education, a register of teachers and of advising the board of education on any matter referred to them by the board." The law also authorizes the board "to inspect any school supplying secondary education and desiring to be so inspected." Thus a step has been taken toward unifying in some measure the agencies of secondary and of elementary education.

Law of 1900, extending the period of compulsory attendance.

Auxiliary legislation.—1889-1891. Technical instruction laws authorizing county councils to levy a tax not exceeding a penny in the pound for the support of technical schools.

1890. Local taxation, customs, and excise law, placing the surplus of the liquor duties at the disposal of county councils, with the privilege of applying the same to technical instruction.

BRIEF CONSPECTUS OF THE SYSTEM OF EDUCATION IN SCOTLAND.

The system of education in Scotland was organized by a law of 1872 on a basis similar to that of the English system as regards support from the public treasury and the Government inspection of schools. Scotland had, however, a system of public schools dating from a law of 1696 which required that a school be established in every parish. The country was thus prepared for a system of universal school boards as provided for by the law of 1872. The law differed also from the English law of 1870 in that, following the traditions of the old parish system, it made provision for both elementary and secondary schools. The latter did not share in the treasury grant, but by subsequent laws were allowed support from local taxes. Whereas compulsion has been gradually introduced into the English system, the Scotch law made education compulsory for all children between the ages of 5 and 13 (raised to 14 in 1883), or until a certificate of exemption should be secured. The standard or grade for exemption was made the fifth (law of 1878); the age for exemption is twelve (law of July, 1899).

A law just passed, 1901, strengthens the compulsory measures without, however, changing the age limits.

Religious instruction in the schools of Scotland was left to local authorities with the simple restriction of a conscience clause making the attendance of children at the religious exercises optional with the parents. A grant in lieu of fees (law of 1839) has had the effect of making the schools practically free schools.

In 1885 the Scotch education department arranged for the inspection of endowed and other secondary schools applying for the service. In 1888 the department established a leaving certificate for students who, on the completion of a course of secondary study, pass the certificate examination.

The number of secondary schools inviting inspection in 1900 was 93, of which 32 were higher class public schools, 25 endowed schools, and 36 private schools. The number of candidates for the leaving certificate in 1899 was 16,771; in 1888 it was 972.

A large number of university and professional authorities accept the certificate in lieu of such preliminary examinations as are held under their direction. Through the service of inspection and examination the secondary schools of Scotland have been brought into close relation with the education department.

Under the local taxation (customs and excise) act 1890 and other acts providing for the application of public funds to secondary and technical education, the local authorities expended for these purposes in 1900-1901 the sum of £67,658 (\$338,000).

SYSTEM OF NATIONAL EDUCATION IN IRELAND.

The system of national education in Ireland dates from 1831, when a board of commissioners for education was created by the Government. In 1845 the board was incorporated by royal charter, and in 1861 a supplemental charter was granted, under which 10 members must be Roman Catholics and 10 Protestants. The board is composed always of representative men, who adhere to the policy of strict impartiality in religious matters. The schools under the supervision and fostering care of the board are supported by State and local funds. They may be denominational schools (i. e., Roman Catholic or Protestant) or mixed, in respect to religion, but the rights of parents in the matter are strictly guarded by a conscience clause in the school regulations, which provides that no child be allowed to attend a religious exercise of a denomination other than his own, except upon the written request of the parent.

Grants in aid for the building of schoolhouses are allowed by the commissioners, but must be proportioned to the amount raised locally. The State pays also the larger proportion of the salaries for teachers, requiring a minimum annual augmentation from local funds of £12 (\$60). Altogether the State bears about 94 per cent of the annual expenditure for the schools.

To avoid religious complications the State provides the text-books for secular branches, which are issued at a small cost to the pupils.

For purposes of Government supervision the country is divided into 60 districts, which are grouped in 6 divisions, each in charge of a head inspector. Under these are 29 district inspectors, 7 unassigned inspectors, and 10 inspectors' assistants. Inspectors and their assistants are appointed upon examination testing their scholastic and professional qualifications.

Local civil authorities have no control over the schools. The local managers

of schools, who are generally clergymen, come into direct relations with the board of commissioners. They appoint and dismiss teachers and arrange the details of the school work. Of a total of 2,936 managers in 1899, four-fifths were clerical.

The commissioners have direct control of a special class of schools called "model schools," for which they provide the buildings.

"They are intended, as their name indicates, to afford models of the best methods of instruction and organization, and to serve as practice schools for students in training colleges or normal schools." These schools numbered 30 in 1899, with an enrollment of 9,615 day pupils, included in the enrollment given in Table I.

A compulsory school law was passed in 1892, but it has been imperfectly enforced, and Ireland still stands below the other divisions of the United Kingdom in respect to school attendance, as is shown by the most recent statistics. These give the following rates of attendance to enrollment:

	Per cent.
England	82.3
Wales	77.9
Scotland	83.7
Ireland	62

Convent and monastery schools afford a large part of the provision for elementary education, and receive, under certain conditions, aid from the Government.

The number of such schools fulfilling the conditions for aid reported in 1899 was 336, with an enrollment of 107,196 pupils.

For the training of teachers there are one national and four denominational normal schools, which receive grants in aid from the Government. There were 891 students in training in 1899. Provision for agricultural instruction is an important feature of the system. Instruction in the theory of agriculture is compulsory in all rural schools for boys in the fourth, fifth, and sixth classes, and optional for girls.

The commissioners maintain also two model agricultural schools, and in 1897 they reported 38 school farms in connection with elementary schools and 116 schools having school gardens attached.

An intermediate education board was established in 1878 for the examination of intermediate or secondary pupils. In 1899 the number of candidates for examination was 7,768 (5,726 boys and 2,042 girls), as compared with 9,073 in 1898 and 6,952 in 1881. There was paid to the managers of the schools the sum of \$365,000 on the results of the examination. The expenses of the board are met by a Government grant of £34,240 (in 1899) and local revenues amounting to £60,591, or a total of £94,831 (\$474,155).

In 1897-98 twelve local authorities in Ireland expended altogether £5,649 (\$28,245) on technical instruction, the money being granted out of rates (local taxes) under the "technical instruction acts."

REVIEW OF EDUCATIONAL MOVEMENTS IN ENGLAND IN 1900-1901.

MEASURES AFFECTING HIGHER GRADE BOARD SCHOOLS.

The most important events of the year pertaining to education in England grew out of judicial decisions affecting the higher grade board schools. These schools have been sanctioned by the annual regulations for elementary schools, which have authorized the teaching of advanced subjects and awarded special grants for the same, and they have been fostered by additional grants from the science and art department. The latter have been allowed upon the condition that certain equipments and faculties were furnished and have thus promoted the organization of higher grade schools distinguished as schools of science. The development of evening schools has followed somewhat the course of that of the higher grade day schools. They have ceased since 1893 to be merely elementary schools and have become continuation schools, chiefly for scientific and commercial training, and providing also for social recreation and improvement.

By the judicial decisions referred to above it was declared illegal for school boards to apply the funds derived from local taxes (rates) to the support of higher-grade schools or for the instruction of adults. As the aid to the advanced schools from the science and art department had been previously withdrawn, these deci-

sions virtually deprived the school boards of funds for the work. The particular case upon which the decision was rendered was that of the London school board, against which surcharges were brought by a municipal auditor (Mr. Cockerton) on account of expenditures incurred for instruction in subjects not recognized as elementary.¹

Upon an appeal to the courts the case was decided against the board. The effect of this decision, commonly known as the "Cockerton judgment," was thus defined by Sir John Gorst, vice-president of the education department:

The judgment does practically two things. First, it decided that school boards could not employ the fund procured by the school rate for giving instruction in any of their schools which was not elementary. It is quite true that the court did not, and probably could not, define the exact meaning of the word "elementary," but they intimated that the day school code of the board of education was what I think they called the high-water mark of elementary education. The second point decided was this: That school boards could not give any instruction of any kind whatever to persons who were not children. Again, the court did not define where childhood ceased; but the board of education had been advised, as the London school board appears to have been advised by its counsel, that it would not be safe to place the limit of childhood higher than 15.

The chief causes for the opposition thus suddenly developed to a work previously sanctioned by the Government appear to be, first, the fact that the school boards are gradually encroaching upon the domain of secondary education. The studies and the methods of the higher grade schools make it necessary indeed to consider them in any scheme for systematizing the divers and conflicting agencies engaged in secondary education; second, the natural antagonism of the two forces that are contending for supremacy in educational affairs. The elementary school system, as shown in the introductory prospectus, comprises denominational schools under private management and board schools under public control. The former not only antedate the Foster law, but by their church and private affiliations preserve traditions of a policy interwoven with the entire religious history of the country. Before the Reformation "there were schools for the poor, connected in many cases with the monasteries. Such as were founded after the Reformation were, for the most part, independent bodies, but the general character of the objects which the founders proposed to themselves was the same—that of giving special advantages to poor children who were either distinguished for special aptitude or were the natives of particular districts, or related to the founders."²

This policy of private or of ecclesiastical endowment of education has been gathering strength from age to age, and preserves to this day the practical monopoly of secondary education. In the field of elementary education these traditional forces are unable at present to prevail against that later civic impulse which gave rise to the law of 1870 and the new agency of elected school boards. The complications have been increased by the functions of the county councils under the technical instruction laws.

An immediate demand for some measure which should continue the schools interfered with by the court decisions arose from the vast number of students affected thereby. In evening schools alone there were not less than 150,000 pupils who, under that decision, must cease their attendance. Dr. Macnamara, in a speech before the House, said:

There were 260,000 pupils who took up and were qualified for grant in one or other of the elementary subjects; 62,000 in English subjects; 18,500 in languages—French, German, Welsh, and Latin; 32,000 in mathematics; 42,000 in science subjects; 101,063 in commercial subjects; 113,000 in miscellaneous subjects—vocal

¹For the full particulars of this decision see articles by Hon. E. Lyulph Stanley and Sir J. G. Fitch, cited in the Commissioner's Report for 1899-1900, pp. 1210-1223.

²See report of commissioners appointed in 1858 to inquire into the state of popular education in England. Vol. I, p. 15 (issued 1861).

music, ambulance, home nursing, and shorthand; 80,851 in domestic economy and needlework, and 1,846 in other subjects. The point he wished to bring out was that 260,000 pupils took up elementary subjects, and would honorable members not say that their impression of the right honorable gentleman's speech was that these people were engaged upon science? A point he wished to make with regard to the 260,000 pupils was that many of these were persons whose early education had been entirely neglected. Many of them were over 15 years, and whose education had been neglected early in life and they did not come back to science and art instruction. They came back for rudimentary instruction, and it was a calamitous thing if, even at 15, pupils were to be prohibited from continuing this education.¹

Upon a close analysis of the numbers it was found that of 80,000 pupils on the roll of the London board evening schools, 30,000 were over 16 years of age. The number of pupils in day schools affected by the decision was variously estimated. Sir John Gorst, having regard only to branches distinctly recognized as higher, put the number as low as 900. The president of the "Association of Headmasters of Higher Grade and Organized Science Schools" estimated that the limit of age would affect directly 7,000 pupils. Moreover, the impossibility of maintaining the schools on the basis on which they had been organized would actually extend the unfortunate effect of the decision to the entire body of pupils in those schools.² Parents, philanthropists, and labor organizations united with school boards in protests against a measure which threatened to put an end to the instruction of such a large number of aspiring pupils from the laboring classes. Petitions poured in upon members of Parliament insisting that some provision should be made to prevent the threatened evil. Meanwhile the Government endeavored to allay the excitement by an adjustment which it was supposed would meet the needs of all pupils in elementary schools who were able to prolong their studies up to the age of 15, but who are not likely to remain at school beyond that age. This was done by including in the annual regulations for elementary schools dated March, 1901, a minute³

¹ Quoted from a report of Dr. Mcnamara's speech.

² A return issued by the House of Commons regarding higher grade board schools has been received as this goes to press. This return includes all the higher grade board schools (48 in number) which comprised a school of science in 1900-1901. These 48 schools enrolled 19,774 children 10 years old and upward, and of this number 8,670 were in the school of science section. The "Schoolmaster," commenting on the return, says:

These 8,670 pupils all received an education that includes the work of the first six standards at least; they belong almost exclusively to the industrial and lower middle classes, and they are now receiving a course of instruction which, though not so perfect as it might be, includes English, one foreign language, drawing, and two or three of the basal sciences. It ought to be a matter of congratulation that something is being done in these schools to fit the future generation for the keen competition that the country has to meet. Add to these considerations the undoubted fact that but for these higher grade board schools most of the pupils would finish their education sooner than they do, our satisfaction ought to be all the greater, and our efforts to induce more of them to complete the full course increased.

The school of science course is divided into an elementary course and an advanced course. The elementary course occupies two years, and gives a complete grounding in the subjects already enumerated. In the advanced course the pupils continue their studies further, taking, for example, the advanced stage of certain science subjects and a course of mathematics that includes four books of Euclid and plane trigonometry. From the first two tables of the return we learn that in the year 1900-1901 about 12½ per cent of the pupils in the schools of science were doing this advanced work. This is not so great a percentage as we should like to see, but it must be remembered that it is a percentage of the number then in the schools, and not a percentage of the smaller number in the schools three years ago, and these pupils of the advanced course are pupils of at least three years' standing. It does not follow that 87½ per cent finish their education with the elementary course, for many pupils leave this course to become pupil-teachers, or to continue their training with a scholarship in a technical or other high school.

The return includes also certain higher grade schools (40 in London, and the girls' department of 4 London schools included in the former class and 8 provincial) which do not include a school of science. These schools enrolled 23,968 pupils 10 years of age and upward, of whom 910 were above 15 years of age.

³ The text of the minute is here reproduced from the Report of the Commissioner for 1899-1900:

[Minute of the board of education, April 6, 1900, establishing higher elementary schools.]

A public elementary school may be recognized by the board of education (hereinafter called the board) as a higher elementary school under the following conditions:

1. The school must be organized to give a complete four years' course of instruction approved by the board.
2. No child shall be admitted into a higher elementary school unless he (a) has been under

of the board of education, issued the year before, which provided for the establishment of higher elementary schools of a new type to be fostered by the Government. The minute had not been included in the regulations for elementary schools at the time of its adoption and was generally interpreted as a part of the policy which was excluding the school boards from any further participation in advanced work.

It had been the avowed intention of the London school board to appeal the Cockerton case from the courts to the House of Lords, but they were induced to abandon this purpose by the announcement that the education department would make provision for the continuance of the advanced work. A general expectation was created that the matter would be adequately adjusted, but the mere inclusion of the minute in the code satisfied no one. Its provisions were not well adapted to the higher board schools and its restrictions were fatal to the hopes of a large body of pupils. The hampering conditions of the "minute" are fully set forth in

instruction at a public elementary school other than a higher elementary school for at least two years, and (b) has been certified by an inspector of the board to be qualified to profit by the instruction offered in the higher elementary school.

3. The fitness of any child to continue, or be promoted from one year's course to another, in a higher elementary school shall be certified by an inspector of the board.

4. (a) Attendances may not be recognized in a higher elementary school for any scholar who is upward of 15 years of age, and (b) no scholar may remain in a higher elementary school beyond the close of the school year in which he or she is 15 years old.

The average attendance for any period is found by dividing the total number of attendances made during that period by the number of times for which the school has met during such period. For the purpose of reckoning the average attendance at a higher elementary school an attendance shall mean attendance during two and one-half hours.

5. (a) The school year of every higher elementary school is the year ending on July 31, and no scholar may be admitted for any year's course later than November 1. (b) After November 1, 1900, scholars newly admitted into a higher elementary school must commence with the first-year course.

6. *Temporary article.*—Up to August 1, 1901, the qualification for admission to the first-year course shall, as a rule, be competency to pass Standard IV of the code as shown to the satisfaction of an inspector of the board.

7. (a) The school must be shown to the satisfaction of the board to be necessary in the locality, and (b) the premises must be recognized by the board as suitable for the purposes of a higher elementary school.

8. The teaching staff of the school must possess such qualifications as may be laid down from time to time by the board for the purposes of a higher elementary school.

In the first and second year courses there shall be a teacher, accepted as qualified by the board, for every 40 scholars (or less); in the third and fourth year courses there shall be a teacher so qualified for every 30 scholars (or less) in average attendance.

The grant may be reduced at the rate of not more than 10s. per annum for every unit of annual average attendance above the number for which the school staff is recognized by the board. This reduction will as a rule be one-twelfth of 10s. for every month during which the staff has been insufficient for the annual average attendance.

9. The managers of any school who desire such school to be recognized as a higher elementary school must submit for the approval of the board before July 1 in any year proposals for a curriculum and time-table and such other information as may be required by the board.

10. The grants made to higher elementary schools are as follows:

Principal grant.

	Higher scale.	Lower scale.
First year	s. 27	s. 23
Second year	35	30
Third year	47	45
Fourth year	65	55

The board shall decide which, if either of these grants shall be paid in the case of each year's course after considering the report and recommendation of the inspector upon each of the following four points: (a) The suitability of the instruction to the circumstances of the scholars

the following motions formulated by the executive of the national union of teachers before the decision to incorporate it in the ordinary school regulations was known, but reported and unanimously carried in the annual conference which was held after that decision was made public.

That this conference again puts on record its appreciation of the official recognition of the higher elementary education which is given by the minute of the board of education of April 6, 1900, but it protests against those terms of the higher elementary schools minute and against that official interpretation of them which degrade the higher grade and organized science schools to elementary science schools. It calls upon Parliament to remedy the following defects, which will be detrimental to the interests of these schools of the people: First, the restriction of admission to those children who have been for two years in an elementary school; second, the restriction of admission subject to the absolute decision of the inspector; third, the limitation of age to 15 years; fourth, the condition requiring scholars to commence with the first year's course, whatever their qualifications and abilities may be; fifth, the provision in clause 12 which precludes the engagement of special teachers for special subjects.

That this conference claims for English and Welsh children advantages and opportunities equal to those which have been granted to higher grade schools and departments in Scotland with regard to (a) discretionary power as to curricula; (b) grants on an equally liberal scale; (c) recognition of higher departments; (d) extension of school age.

That where the circumstances do not permit of the establishment of higher elementary schools or departments due provision should be made for similar education by means of suitable grants to higher classes in public elementary schools where such classes are established with consent of the board of education.

That, in the opinion of this conference, the age limit of 15 years in regard to the new code is far too low to allow of a full course of higher elementary education and is of opinion that it should be raised to 18 years, as it is in Scotland.

That the higher grant be not only given to higher grade schools, but also to higher grade classes.

That this conference is of opinion that the board of education is interpreting the minute on higher elementary schools in such a way as to injure the cause of national education.

Especially do we deplore the attempt to stereotype the higher elementary school as an "elementary school of science," because, in all large industrial and commercial centers, another type of school giving a training for commercial pursuits is at present urgently required.

and the neighborhood. (b) The thoroughness and intelligence with which the instruction is given. (c) The sufficiency and suitability of the staff. (d) The discipline and organization.

The inspector will recommend the higher grant unless he is unable to report favorably upon the school under these heads.

Grant for practical work.

	Higher scale.	Lower scale.
	s.	s.
First year	8	6
Second year	12	10
Third year	18	15
Fourth year	25	18

This grant will only be awarded where special provision for such work, as regards premises and equipment, is made to the satisfaction of the board. The board shall decide which, if either, of these grants shall be paid in the case of each year's course after considering the report and recommendation of the inspector upon each of the points named in paragraphs (a) to (d) of this section.

11. No grant may be received from the board of education by any higher elementary school in addition to the grants named in section 10 of this minute, with the exception of the fee grant.

12. No member of the teaching staff may undertake duties not connected with the school which may occupy any part whatever of the school hours.

13. Separate registers and separate accounts must be kept for the higher elementary school.

14. No scholar may attend a higher elementary school who is attending an evening school or class under the regulations of the board. This does not apply in the case of a scholar attending an art class above group 1, under the regulations of the board.

In the opinion of this conference the local educational authority is the best judge of the type of school suited to the local needs; and the liberty with regard to curriculum which the code extends to elementary schools in general should be extended to the higher elementary schools.

In the opinion of many the inclusion of the minute in the regulations for elementary schools did not empower the school boards to undertake even the advanced work for which it provided; such was the conviction of the Liverpool school board, as expressed in the following letter addressed to the secretary of the board of education:

SIR THOMAS STREET, LIVERPOOL, *May 2, 1901.*

SIR: I am desired to inform you that the board have at once taken into their very earnest consideration the position with regard to the instruction in their schools in which they are so suddenly and so unexpectedly placed by (what they can not help considering) the extremely ill-advised action of the London school board in withdrawing the important points raised by the "Cockerton case" from the decision of the highest tribunal in the land. The board look upon the judgment of the court of appeals in that case, which by the action of the London school board becomes now the law of the land, as a most disastrous blow to the cause of elementary education and to the welfare not only of the vast industrial classes of this country, but also to the interests (moral, social, and commercial alike) of the whole community.

The board, however, feel that they would not be morally justified, even if they were prepared to accept the legal consequences of their doing so, in failing to comply immediately with an authoritative statement of the law, however much that statement may fall short of what they believe to be wise, and of what they have hitherto been advised to be legal. They have, therefore, at once decided to bring the instruction in their schools at the earliest possible moment into harmony with the law as it appears to be laid down in that judgment, leaving it to the action of the constituencies and to the wisdom of Parliament to find a remedy for the evils that will arise therefrom. They say "appears to be laid down," because after the most careful consideration they have been able to give to the judgment they have been unable to satisfy themselves completely as to the meaning of its somewhat ambiguous terms. The judgment appears to them to affirm the following propositions:

1. That under the act of 1870 school boards are not justified in giving in their public elementary schools, whether day or evening, anything beyond elementary education, as the latter may be understood for the time being.
2. That the "education prescribed by the Whitehall code" for the time being in force "embraces elementary education up to its high-water mark."
3. That whatever instruction is given by school boards, whether in day or evening schools, must be confined to "children;" i. e., apparently to young persons under 16 years of age; and
4. That it is not competent for either branch of the board of education, by "code or directory," to extend in any way the statutory powers of school boards.

Put shortly, the conclusions from the judgment appear to be that whatever instruction is compulsory under the code for the time being in force may legally be given by school boards at the cost of the rates; whatever is merely optional may not.

If this view is correct, the following appear to the board to be its practical consequences:

- (a) The course of instruction prescribed by article 15 (a) and (i) is legal in all board schools.
- (b) That prescribed by article 15 (b) (ii) is also legal "wherever the circumstances of the school, in the opinion of the inspector, make it desirable."
- (c) That contemplated in article 15 (b) (iii), being optional, is illegal.
- (d) The further education of any child beyond the standards, or of any child over 14 years of age who has been twelve months in Standard VII, would also appear to be illegal, and this difficulty to be in no way remedied by the special minute for the establishment of higher elementary schools, the adoption of that minute not being within what are now declared to be the limits to the statutory powers of school boards; and
- (e) The conduct of evening schools as at present carried on becomes wholly illegal, for where the instruction is in elementary subjects it is illegal because given to persons who are not "children," and where it is given to children it is illegal because it is not in elementary subjects.

The board therefore desire to urge the board of education to promote legislation at the earliest possible moment for restoring, as far as may be, the powers of school

boards to what those powers have hitherto been understood to be, and to render legal the valuable work in day or evening schools which has hitherto been carried out by them.

Failing such legislation, however, they desire me to say that after the close of the current educational school year, in July next, they will be compelled to discontinue—(a) manual instruction for boys; (b) cookery and laundry work for girls; (c) all instruction for ex-standard scholars; and (d) the whole of the evening school work they have hitherto carried on.

They have accordingly felt themselves compelled, though with the utmost reluctance, to give provisional notice to terminate the engagements of all their teachers employed in manual instruction, cookery, and laundry work—most of whose appointments require three months' notice—and to notify the managers of voluntary schools who send scholars in these subjects to the board's centers that they can no longer enjoy this advantage after the 31st July next.

They are also taking steps to intimate to the parents of all their scholars now in Standard VII and upward that it will be impossible for the board to continue the education of their children after the close of the current educational school year.

It will be necessary for them also to inform the students who have been in attendance at their evening schools that the board can no longer provide similar opportunities of self-improvement, and to intimate to the managers and teachers of voluntary schools in which they have hitherto carried on evening schools, as well as to their own teachers, their inability to reopen such schools.

With regard to much of the instruction hitherto given in their schools in subjects included in article 15 (b) (ii) of the code as relate to children within the standards, the board are in communication with His Majesty's inspector as to how much of it, in his opinion, the circumstances of the respective schools render desirable, and further action on their part may be necessary when they have received his decision thereon.

As an indication of the urgency of action in the desired direction being taken by your board with the least possible delay, I am desired to mention that the number of boys now in the board's schools who would be deprived of manual instruction at the commencement of next session is over 7,000, and the number of similar children from voluntary schools is 1,332, comprising 900 from Church of England, 216 from Roman Catholic, and 216 from Nonconformist schools; that the number of girls similarly affected with regard to cookery is, from the board's schools nearly 7,000, from the voluntary schools nearly 500; that with regard to laundry work there are nearly 1,000 from board schools, as well as 26 from voluntary schools. In reference to the latter subject it may be mentioned that the board have not at present accommodations for dealing with all the girls eligible, but are engaged in supplying the deficiency. The number of Standard VII and ex-VII scholars affected is slightly over 2,000; the number of evening-school students who were in attendance during the last session amounted to nearly 8,500, and this number would, in the ordinary course, be materially increased during the coming session.

EDWARD M. HANCE, *Clerk*.

The Liverpool school board at once took energetic measures to make the facts widely known. A copy of the above letter was sent to every member of Parliament from Liverpool, and the following circular was prepared for circulation among parents:

I am desired to inform you that by a recent judgment of the court of appeal upon certain surcharges made upon members of the London school board it has been decided that it is not competent for school boards, as the law stands at present, to provide at the expense of the rates any education other than that which is purely elementary.

This judgment is, in many respects, a material alteration in what has hitherto been understood both by school boards and by the Government educational department to be the powers of the school boards; but as the London school board has decided not to carry the appeal further, the judgment must, in the absence of fresh legislation, be taken to determine the matter for the future.

One of the consequences of this judgment is that it is no longer legal for school boards to incur any expense on the further education of children who have passed through the seven standards of the board of education's code—except, perhaps, by a repetition of the work of the seventh standard—or upon that of any child who, being over 14 years of age, has been under instruction for twelve months in Standard VII. As, unfortunately, this change will from July 31 affect the education of your child at the above school, unless in the meantime Parliament confers additional powers upon school boards, I am desired to convey this intimation to you

at the earliest possible moment, and to suggest that you take an opportunity of conferring with the head master of the school upon the subject.

From the appreciation which the parents have shown of the educational advantages hitherto provided in the board schools of this city, the board feel sure that the effect of this judgment in seriously restricting, so far as the children of the whole of the industrial and of a large part of the commercial classes are concerned, the opportunities of self-improvement and of preparation for their future commercial or industrial careers will be in the highest degree unacceptable to the parents of the great bulk of the scholars in the board schools.

The board would venture to suggest that every parent who feels himself or herself aggrieved in this matter should at once write to the Parliamentary representative of his or her division—whose name will be found on the accompanying slip—and to the board of education, Whitehall, London, S.W., urging them to press upon the Government the immediate introduction of a measure to restore to the school board the full power of continuing unabated to provide for the young people of this great commercial center the educational advantages they have hitherto supplied.

A form of petition to Parliament was also drawn up for circulation among parents and ratepayers. This petition expressed "the dismay which the legal decision excited and the belief that it would affect most prejudicially" the well-being and industrial prospects of the petitioners' children, and would place them at serious disadvantage in the competition of life, not only with regard to the citizens of other states, but also in respect of their fellow-subjects north of the Tweed, and closed as follows: "The petitioners, therefore, pray that the honorable House make such legislative provision as shall secure to your petitioners and their children equal educational advantages to those which your honorable House has provided for our fellow-citizens in Scotland."

LEGISLATIVE MEASURES.

Under the pressure of these events the Government suddenly determined to renew the endeavor made in 1896 to deal with the entire problem of the local administration of secondary education. In May an education bill was submitted to the House of Commons by Sir John Gorst, who styled it a bill "to establish in every part of England and Wales a local education authority for the supervision of education of every kind, whether elementary, secondary, or technical." This measure excited scarcely less opposition than the similar bill of 1896, but as, like that bill, it was speedily withdrawn, its actual provisions and the criticism which it provoked are of little general interest save for the light they throw upon what appears to be the present policy of the Government with respect to education. In this view the article by Hon. E. Lyulph Stanley appended to this review has historic interest. One clause of the bill provided for the continuance of the higher-grade schools, and its withdrawal was followed immediately by the introduction of a short bill (education bill No. 2) dealing solely with this matter. The text of this second bill is as follows:

Where a school board has at any time during the twelve months immediately preceding July 31, 1901, maintained out of school funds, any school or class to the maintenance of which the school fund is not lawfully applicable, the council of the county or county borough within which the school or class is held, or, with the sanction of the board of education, any other local authority under the technical instruction act for the district within which the school or class is held, may empower the school board to carry on for a period of one year from that day the work of the school or class to such extent and on such terms as may be agreed on between such council or local authority and the school board, and to supply for the maintenance of the school or class such sum out of the school fund as the council or local authority may sanction. Where any expenses incurred by a school board in respect of such school or class before the said day are sanctioned by the local government board the legality of these expenses shall not be questioned in any court.

This bill, rushed through Parliament and passed in the short space of a month, has not allayed the excitement caused by the previous measures. The most

obnoxious features of the general bill reappeared in fact in the urgency bill. Its bearing was set forth in a dispassionate manner in the House of Lords by Lord Reay and Earl Spencer. The former, in offering an amendment, said:

The bill proposed to constitute county councils or county borough councils the authority for secondary education, or any other local authority under the technical instruction acts. But what the bill actually did was to leave a school board free to make arrangements with the local authority, and the county council would have to decide upon various disputed points, and the result would be decisions varying in different parts of the country, whereas a decision by the board of education would have general application. The fact that the county or town council would determine the number of these continuation schools and the question of overlapping would be certain to lead to friction. It might be said that the local authorities would not spoil their holiday to make investigations, and would simply allow the school boards to proceed. But there were no guaranties for this in the bill, which must be interpreted by the minute of July 12. The action of the Leeds city council in making their consent contingent upon the adoption of their suggestions for the avoidance of overlapping showed the necessity for an appeal in these questions to the board of education. Such an appeal was given in bill No. 1. As to the financial aspect of the question, if the estimates for next year, out of which the grant for the new schools would be paid, were framed as those of the present year were framed, then the grant under article 17 of the minute would not be available for any schools but public elementary schools. The parliamentary grant must be appropriated as prescribed by the act and for the purposes mentioned in the act, for if the new claims were allowed to come on the grant, the money available for the other claims would be reduced. In order to place on record their views in opposition to this bill, he begged to move that no bill can be satisfactory which does not enable the board of education to empower school boards to carry on out of the school fund any schools affected by the recent judgment for the period of one year to the same extent and on the same conditions as was sanctioned by the board of education for the year 1900-1901.

Earl Spencer, who followed in support of the amendment, dwelt upon the general policy which the bill embodied.

They were told [he said] that this bill was due to the Cockerton judgment, but the Cockerton judgment might have been dealt with in a different way. The illegality of the schools affected by the Cockerton judgment might have been taken away. Ever since the act of 1870, gradually, no doubt, but with increasing force, the school boards of the country had established higher education schools, continuation schools, and they had given education to adults, to those over 15 years of age. He ventured to think that it would have been a much wiser way of dealing with the difficulty to legalize the old method than to meet it by this bill. He said now, what he had said before, that to draw the line too tightly and too strongly between elementary schools and secondary schools would be a serious blow to the education of the people. There was a large number of children who might remain, and therefore it was, to his mind, a very serious matter if they deprived them of this secondary education. The noble duke said there was another mode, and with that the amendment of his noble friend dealt—namely, that the matter should be referred to the education board. He did not for a moment say that this ought to be continued for long, but as a temporary expedient in getting over the difficulty of the Cockerton judgment, he believed it would be a far better solution than that proposed by the bill. The noble duke spoke of the great interest which had been taken in this question, and he should give him the reason why there had been such a great amount of opposition. The Government attached immense importance to establishing in this temporary bill a great principle of education—namely, laying down the principle by which secondary education should be governed in the future. That was one of the reasons why many of them opposed this bill in the form in which it was presented to them. They did not think the Government was justified, in a temporary measure like this, in carrying a great principle with regard to secondary education. It was a great principle to lay down what in the future was to be the local authority for managing secondary education. At first it seemed as if the Government were going to put all education under one authority, and it was wondered whether possibly they were going to put it under the school boards. But they very soon saw that that was not to be the policy, and the authority chosen under the bill was county councils. His noble friend had shown what great difficulties might arise in regard to this. Many of the county councils were already overburdened with work. In his own county a resolution was passed against this very thing. In a large county like Northampton, where men come long distances

to attend the county council, they found it almost impossible to add any new labors to the work of the council. If they added secondary education and then primary education—for this bill was a step in that direction—they would find that the county councils could not carry out the work. He thought that was a very grave consideration. They would have to establish schools in order to give the secondary education which was required, and that would involve an enormous increase of the work, which he knew they had done exceedingly well in connection with technical education. At present county councils were entirely free from the religious difficulty and its unpleasant consequences. The moment they had a number of secondary schools placed under the councils there would be a struggle for the management of them between those who were in favor of certain denominational teaching and those who were in favor of a more generous education. And if elementary education were put under the control of the county councils as well this difficulty would be enormously increased. He was glad to hear what the noble duke had said about school boards, and he was glad to think that he did not agree with what had been said elsewhere, that it was a farce to think that school boards were elected with any educational object. Personally he thought it would be a great disaster if any serious check were put on school boards, which had done enormously good work in the country. He most heartily supported the amendment of his noble friend, which embodied a much more sensible proposal than that contained in the bill now before the House. It dealt with the temporary difficulty in a way which did not create such great and wide differences of opinion as the bill did, and if his noble friend pressed his amendment to a division he should be heartily glad to vote with him.

Though the amendment was lost, these speakers voiced the sentiments of many members of both Houses and also of a large constituency, especially in the great industrial centers. Already the forces for and against the policy of the Government are organizing for what promises to be a bitter and protracted struggle.

In considering the action of the Government in restricting local activity in respect to popular education, it must be remembered that every new impulse toward democracy in England is offset by a conservative movement for the preservation of what is established. The attitude of the Government in the matter of higher grade board schools apparently does not imply hostility to progress so much as concern for its methods and bearings. This view is very clearly set forth in an article by Mr. Cloudesley Brereton entitled "A national system of education," which is included among the papers appended to this chapter.

EDUCATIONAL PROGRESS—STATE OF RURAL SCHOOLS.

While the higher departments of the elementary school work of England are suffering from confused and adverse policies, there are not wanting many signs of vigor and progress in respect to the work as a whole. Among such evidences should be noted the deep concern everywhere manifested in the condition of rural schools. The public agitation of this subject has led to an official inquiry into the financial status of all the public elementary schools of England. The tabulated returns make it evident that the great mass of the rural schools have not sufficient funds for their work. This is true not only of the denominational schools, which predominate in the country districts, but of the small proportion under school boards. The situation was forcibly summed up by Dr. Macnamara, M. P., in a speech at a public conference held in connection with the annual meeting of the national union of elementary teachers:

The village schools, he insisted, were being most shamefully neglected. The State did as little as it could for them, and the localities did less. Pinchbeck and shabby to a degree was the financial treatment accorded to these schools. The grants from the central exchequer were paid to all schools, town and rural, on the capitation principle. The plan might be all right where the number of children by which the capitation payment was to be multiplied was pretty large; but where the number of children was small, the capitation plan was disastrous. The small school must have a lump sum from the exchequer every year sufficient to meet its annual charges for maintenance and establishment. Without this the head teacher would remain scandalously underpaid and shamefully unaided in his labors. Again, the local aid to the village school was shockingly meager.

Mostly the villagers are too poor and too doubtful about the advantages of education to supplement the central aid with anything like generous local subventions. Where there is a school board the area is so restricted and the ratable value so low that a large portion of the local rate raised is eaten up in machinery expenses; and where there is not a school board the majority of the people escape any local charge altogether on the plea that they prefer denominational to undenominational religious instruction, the real preference being a disinclination to pay for either. Now, this grotesque and haphazard plan of financing the village school means, first of all, shocking understaffing. Roughly, throughout the rural areas he might safely say that one-third only of the teachers employed were properly qualified adults. The other two-thirds were either juvenile pupil teachers or unqualified young people with little or no claim to the genuine title of teacher. As a fact, there was only one certificated teacher to every 90 village children in the country. The Government education bill, he hoped, would provide for the creation of county education boards generally to supervise and direct the operations of the village schools, the great bulk of whose income, if not, indeed, the whole of it, should come from imperial sources.¹

The following resolutions on the subject offered by Dr. Macnamara, who has devoted himself particularly to this cause, were unanimously adopted by the union:

This conference is of opinion that a larger proportion of the cost of maintenance of national education should be supplied from the national exchequer, so as, first, to provide adequate financial treatment for all schools; second, to diminish the present unequal, oppressive, and often unjust incidence of the school-board rate; third, to distribute the cost of education fairly over the whole country; fourth, to abolish the present eleemosynary system of insufficient and varying voluntary contributions.

And this conference resolves (1) that the accounts of all voluntary schools should be subjected to the same strict audit at the hands of the public auditor as are the accounts of board schools; (2) that it is desirable to secure the abolition of all charges for rent in voluntary schools.

In his speech on presenting the resolutions Dr. Macnamara stated further that there were—

five millions of children in the elementary schools at the present time. Three millions of these were on the roll of the voluntary schools and 2,000,000 on the roll of board schools. The difference between the two systems arose partly as a result of the difference in local management, partly as a result of the difference in the character of religious instruction, and partly as a result of the difference in the nature and the amount of local financial support. It was the last of these differences to which he wished to draw particular attention. With regard to the central exchequer money they might say that practically board and voluntary schools got pretty much the same amount. The local support, in the case of the board schools, came from the rates of the locality, and to a small extent from school fees. In the case of voluntary schools it came from voluntary contributions, income from endowments, and from school fees. There was no claim upon the public rates. The difference in the character and nature of the local support given was this: Last year the board schools were able to get from the local rates and the small amount of school fees 24s. 2d. per child, whereas the voluntary schools were able to get from their sources only 7s. 9d. per child. The difference was 16s. 5d. a child for the year. That difference had been mitigated by certain preferential acts of Parliament, which did not come to much, so that in the net it came down to a difference of 10s. 6d. a child. That was what Mr. Balfour called the "intolerable strain" which he put on the managers and supporters of the voluntary schools. But the real persons who bore the intolerable strain arising from this differentiation were the voluntary-school teachers. The net difference of 10s. 6d. was almost entirely accounted for when they looked at the salary sheets of the voluntary schools and those of the board schools. A preference for denominational instruction was often given, and no doubt truly given in many cases, as a reason for voluntary schools, but in the great bulk of cases the preference was not for denominational as against undenominational instruction, but the preference for a system under which they could get out of paying for either. They had to get rid of the grotesque anachronism of endeavoring to maintain the intellectual equipment of the people at the hand of charity. School rates were levied over two-thirds of the country; the other one-third had not a local rate.

¹ Quoted from report of speech.

The incidence of the rate was most grotesque. It was a halfpenny here, a penny there, sixpence somewhere else, 1s. somewhere else, 1s. 6d. somewhere else, 2s. in another place, and it went up as high as 3s. 4d. in one particular place. In the rural area the school board was largely eaten up by an unnecessary multiplication of miniature pieces of local administration. Take the county of Norfolk. Leaving out the county boroughs of Yarmouth and Norwich, there were 140 school boards for 22,000 school board children. London had one school board for 550,000 children, and whatever did they want 140 school boards down here for? Look at the incidence of the local public rate. In the parish of Firsfield (Norfolk) it was 1½d. In the parish of New Buckenham it was 2s. 1d. They must get away from this hotch-potch work. Take the village of Little Framsham. He had nothing against Little Framsham—he did not even know where it was—but according to the Blue Book it was in Norfolk. In that village there was one board school, with an average attendance last year of 36 children. That board school, with that average attendance, necessitated the triennial election of a school board of 5 members, and it had a paid clerk. See how that worked out. A penny in the pound in Little Framsham raised a precept of £4 17s. If they wanted one decent pupil teacher there was a four-penny rate gone. The election cost £6 19s. 1d. That was nearly three halfpence gone. The clerk's salary was £8. That was nearly two-pence gone. The legal expenses cost £3 1s. 1d., so that the total administrative charges—this was educational home rule run mad—in Little Framsham amounted to £18 2s., so that a threepenny rate out of the sixpenny rate which they levied, or half of the local support, was gone before they got to the school at all. That was not, as they might suppose, an extreme case. It was a common experience to find in a village school board half the rate eaten up by the multiplication of miniature pieces of administrative machinery before they had got to the school at all. They must throw the great bulk of the charge on the central exchequer. Education was a national matter just as much as the army and the navy. They ought to treat the matter as an essential necessity to their progress as a nation. He demanded a larger support from the central exchequer, and if they had a local margin, they must collect it over all the area, and nobody must be allowed on any account to escape. He did not begrudge the expenditure of £120,000,000 last year and this year on the army and the navy and the war, but what he said was that the intellectual equipment of any great nation, to-day, at any rate, was far more important than the physical equipment, having regard to the future of the nation. "Not out of the mouth of the knitted gun, nor the smoothed rifle, but 'out of the mouths of babes and sucklings' is the strength ordained that shall still the enemy and the avenger." Their disregard for public education was costing them dear all the world over. They were only a small people numerically, and they had got to make up for the smallness of their numbers by the higher equipment of the individual unit. Their people must give up the idea that some divine power had given them a monopoly and the supremacy all the world over. They had got to fight their way according to their capacity, and it was for them to claim that the financing of their schools was placed on as generous a basis as their army and navy, and to see that the British people of to-morrow, who were in the schools of to-day, were equipped so that they might adequately and properly carry forward the great heritage which was falling into their hands—the heritage of the imperial greatness of their country.¹

DEVELOPMENT OF BOARD SCHOOLS IN THE CITIES.

The phenomenal progress in popular education in England during the past thirty years pertains to the cities and is due chiefly to the aroused interest of parents and the active propoganda maintained by the school boards.

Table II presents the statistics of London and 65 county boroughs, from which it appears that 59.7 per cent of the pupils enrolled in elementary schools within the borders of these administrative areas are in board schools. For the whole country the proportion of pupils enrolled in the board schools is 47 per cent, and for the counties, excluding the county boroughs, only 37.5 per cent. Thus it appears that board schools, which did not exist prior to 1870, have become the great educational agency in the cities. The purpose of the law of 1870, as already stated, was to provide for the education of the large proportion of youth who were not drawn into the denominational schools. The neglected children belonged chiefly, although not exclusively, to the poorer classes, and the school boards have

¹ Quoted from report of speech.

studied every means of securing the attendance of such children. The first necessity was to get children into the schools, but it soon became evident that this was a small part of what must be done to dissipate the ignorance of the masses. The policy of allotting the Government grant to schools at a certain rate per capita for individual passes in the Government examination (technically payment upon results), bad as it was, educationally had the advantage of showing the necessity of favorable conditions in the schools themselves and of a certain measure of health and strength in the children to be instructed.

Grading and the sifting out of hopelessly defective children have been promoted, indirectly, at least, by the policy. It has served also to show in a very convincing manner, that half-starved, overworked children can not reach even moderate requirements in the most elementary subjects. Thus the sense of public responsibility for the education of the poor, which developed *pari passu* with the extension of suffrage, has led to other public efforts in behalf of the unfortunate classes. The detailed school statistics of six selected cities (Table III, Parts A and B) show the relative strength of the board and the nonboard schools in these cities and the direction of efforts for the adjustment of the school provision to the needs of special classes. The success of these efforts is an interesting proof of the flexibility and the comprehensiveness of the system under which they have been fostered.

The proportion of children classified as infants (column 3) is large. With few exceptions, these are children below 7 years of age (the lower limit of the compulsory school age). The Government has promoted the interests of these younger children by allowing a higher per capita grant where special facilities are provided for them. The latest requirement for the highest grant (\$8. per capita as against 7s., the lower grant) is a separate department for infants under a certificated teacher of their own, or a separate class under a teacher not less than 18 years of age approved by the inspector.

^aThese pupils are not all in secondary studies, as the higher grade schools include also elementary grades; on the other hand there are pupils in elementary schools taking one or more advanced studies.

^bOf these, three under private managers.

The following statements relate to the progress in the work of school boards or to special features of the work comprised in Table III B.

London—Increase of school accommodation and enrollment.—The school board for London, which consists of 55 members, was created immediately after the passage of the school law of 1870. At that time there were 574,673 children of school age in London, and there were only 261,158 school places available for them. The board is organized in several distinct committees, each responsible for a particular part of the work, but for many years the energies of all the members were taxed to the utmost by the mere effort to secure sites for required schools, erect buildings, and get the neglected children into them. According to the official report for 1900, there were scheduled in March of that year 827,712 children between the ages of 3 and 13, and for these 781,553 school places were required. The actual school provision was 767,470 places (546,483 in board schools, 220,987 in nonboard schools).

The average number of children on the rolls was 755,940, of which number 70 per cent were enrolled in board schools. The increased accommodation has been made wholly by the board, the number of places in nonboard schools being less than in 1870, when the board was created.

The number of children between the ages of 3 and 13 who were not upon the rolls of efficient schools in 1900 was 119,538. These were accounted for as follows:

Two thousand and ninety children were under instruction in some other way, viz, 1,017 receiving efficient instruction at home and 1,073 attending nonefficient schools. Of those who are not under any instruction at all, there were 97,511 children under 5 who did not and can not be compelled to permanently attend school. The remaining 19,937 children comprised the following: Those who were wholly exempt, those who were permanently disabled, those who were in the country, those who are ill or delicate or who reside in houses where there is infectious illness, those who were out of school owing to the want of accommodation or owing to accommodation being unsuitable, those who were under surveillance by the respective divisional committees, and a few others who could not be classified.

There were 57,395 children over 13 on the rolls of efficient schools.

The enormous effort expended in keeping track of the children is indicated by the staff of the committee engaged in this work. It includes 10 divisional superintendents, with 11 assistants, 33 clerks, 14 office attendants, 332 ordinary visitors, and 13 unattached visitors who serve in the absence of ordinary visitors.

The street visitors, of whom one is attached to each division, are engaged in dealing with the cases of those children who frequent the streets or open spaces, markets, railway stations, etc.

Schools for special classes.—The board maintains eight day schools for blind children, which had an attendance of 202 pupils in 1900. In these schools the children have medical attention and are often so benefited that they can be returned to the ordinary schools. A few are subsequently advanced to the Royal Normal College for the Blind.

The board has also opened 19 day centers for the education of deaf children. The average attendance for the year 1900 was 472, and the number of teachers employed 63. The oral method of instruction is employed excepting in the case of extremely backward children who can not be taught on purely oral methods. During the year a number of the younger children were grouped together for separate instruction. Of this school the report says:

It is an ideal infant school, and the interest and intelligence of these young deaf children is being stimulated in a marked degree. It is hoped that the methods employed so successfully here will be copied by all the infant teachers at the other centers, and with that end in view they are paying visits to the school. The delight these young deaf children take in drawing, especially in color, is something akin to the blind child's fondness for music.

The London board established schools for feeble-minded children as early as 1891. The work has steadily increased, and for 1900 there were reported 43 schools or centers, as they are called, with accommodation for 2,030 pupils of the class designated. The schools are under the supervision of Mrs. E. M. Burgwin, a distinguished specialist, and all the teachers are trained for the work, which is largely individual and exceedingly arduous. In the poorer districts the children attending these schools are supplied with milk during the morning session and a meal at midday, the cost being defrayed by private funds.

The senior boys where possible attend the manual-training center, and it is a matter of regret that all the capable lads can not for want of room obtain this form of instruction. Many of them could also probably be prepared to earn their living in laundries and restaurants if able to attend the proper classes. The girls, by needlework, housewifery, cookery, and laundry instruction, leave school well able to earn their own living. A master of a boys' school writes: "You will be pleased to hear that I have this morning sent one of the lads who came to me out of the special school a year ago to a good place in a stick factory, where the training in design, etc., which he began in the special school and continued here, will be of use to him. He is to have 6 shillings a week to begin with." This proves that the time spent upon drawing, design, and color work is a profitable form of instruction as well as an agreeable change from the drudgery of the three R's.

For neglected, unruly, and incorrigible children the board maintains 3 residential schools, 1 day industrial school, and 2 truant schools, and is also empowered to commit children to other certified industrial schools. In 1900 the total number of children under the care of the board in industrial and truant schools was 3,893.

An interesting department of the provision for incorrigible boys is the Shaftesbury training ship. Here the boys are subjected to regular discipline and training which prepares them for the merchant marine and naval service, in which several lads from the ship have already distinguished themselves. Measures are taken by the board to maintain some care over the boys even after they have left the ship.

Birmingham.—The Birmingham schools have been particularly distinguished by the provision for physical training. On this subject the Government inspector reports:

No account of school life in Birmingham, however incomplete otherwise, ought to fail to notice the provision for physical training, which is, I believe, unique. Apart from the regular and systematic exercises carried on in all the schools of the city, a very comprehensive scheme exists for the encouragement, promotion, and control of outdoor games, as well as drill and gymnastics. This scheme is a section of the work of the Birmingham Athletic Institute, by whom it is fathered and financed. It is managed by a committee of 8, upon which board and denominational schools, head and assistant masters are equally represented, with a member of the institute council as chairman and the general secretary of the institute as secretary. Under these auspices, cricket, football, swimming, running, and gymnastics are systematically organized. Challenge shields are competed for annually, while medals and books are awarded to the individual boys of the winning teams, with free passes to the county cricket ground for cricket, and medals to the teachers who have acted as trainers. The only condition of entry is that the competitors must be under 14, and not above the sixth standard; they must have been on the register of the school continuously for the previous three months, and must remain so during the period of competition. It is particularly pleasing that the leading athletic clubs of the city foster and partially support those branches of sport with which they are particularly concerned, thus keeping themselves in touch with the boys, creating a recruiting ground for their own ranks, and giving them a keen desire to excel.

To add importance to the various competitions in the eyes both of the boys and of the public the finals are contested publicly and in classic places, e. g., the final match for the cricket shield is played on the county cricket ground, with county professionals as umpires and judges of the prizes. That for the football shield is

played immediately before the final for the Birmingham District and Counties Football Association challenge cup, with the same officials for both matches. The 100-yard interschool race is decided at the Ashton Villa ground—the best athletic ground in the city—the race being managed in every way as at a senior meeting; the swimming finals are taken on a night specially set apart at the best first-class baths in the city with a leading public person as chairman; and those for drill and gymnastics at a public gathering in the gymnasium of the Athletic Institute, the leading professors acting as judges.

The chief difficulty—I need scarcely say how great it is—as regards cricket and football is the want of public playing spaces; but the senior clubs recognize this and occasionally allow the use of their grounds. A great deal is done by the city baths committee to foster the learning of swimming in elementary schools. Poles with bands attached are kept for the use of teacher and boys, and free passes are awarded to the boys who learn to swim one length of the bath—about 30 yards. These free passes entitle the holders to admission to the baths for a year, even though they may have left school for work during that year. Better still, they are now renewed yearly so long as the boy is a scholar; so, that if, as it does happen, a boy of 7 or 8 years of age can swim a length of the bath he is entitled to free admission for the remainder of his school days. During the past year 350 boys have become entitled to free passes, in addition to 67 old holders still at school. I much regret to notice that out of the 35 schools represented 6 only are voluntary schools. Here again are the disabilities of limited staffs; a teacher can not be spared to take the boys.

I am glad to have the opportunity of recognizing the untiring and successful efforts of Mr. J. Adams, headmaster of the City Road board school and secretary of the Athletic Institute, in connection with the sports section of school life in Birmingham. (Report of Board of Education 1899-1900, pp. 173, 174.)

Bradford.—The educational authorities of Bradford have been active in endeavors to correlate the different classes of schools. The technical college of that city was transferred to the municipal authorities in 1899. The statute under which it has been reorganized provides that no secondary day school or school of science shall be carried on in the college, but that day and evening classes may be held—

(a) In the subjects of art and of manual, scientific, or technical instruction connected with the trades and manufactures of Bradford and the neighborhood, to which none shall be admitted under the age of 15 years, except on the recommendation of the governing body of the school in which they have been taught, and in no case under the age of 14 years.

(b) In advanced commercial subjects at day and evening classes, to which none shall be admitted under the age of 16 years.

Pupils are prepared for the college in the higher grade board schools and in the "grammar school." For the benefit of poor children of marked ability free scholarships tenable at the higher grade schools have been established. In March, 1900, an examination was held at which 587 candidates were present and 259 obtained scholarships.

In this connection the report of the school board for 1900 presents the following statement:

Maintenance scholarships.—The granting of maintenance scholarships to poor scholars, thereby enabling the parents to forego their earnings and securing the attendance at school of bright and intelligent children, has been continued and extended, though the committee regret that their action has been greatly curtailed owing to the city council's grant not being of a more liberal character. With the view of meeting the case of the added areas, 15 additional scholarships have been granted during the year 1900. The allowance in each case is 12s. 6d. per month.

Gifts for maintenance scholarships.—A letter was read at the board meeting held on August 30, 1899, offering to give £22 10s. in order to provide three maintenance scholarships for one year on condition that the name of the donor was not divulged. It was resolved that the thanks of the board be forwarded to the donor, with an expression of regret that he does not wish his name to be coupled with the scholarships. A similar gift was reported on October 24, 1900, from the same donor.

In connection with the opening of the new commercial school in Carlton street 176 free scholarships have been awarded, 26 scholars electing to pay the fee of 6d. per week.

Scholarships won by board school scholars.—During the term of the present board the following scholarships have been won by pupils attending the board's schools:

	1898.	1899.	1900.
Nutter scholarship at grammar school (boys)		1	1
Higher grade school scholarships (boys and girls)	318	176	235
Commercial school scholarships (boys)			138
Brown scholarships at grammar school (boys)	2	1	
Governors' scholarships at grammar school (boys)	4		
Lister scholarships at grammar school (boys)		2	
Private scholarships at grammar school (boys)	1		
City Council scholarships at grammar school (boys)	16	41	9
City Council scholarships at grammar school (girls)			2
Foundation scholarships at grammar school (girls)	2	2	3
Total	343	223	388

It should be noted in connection with the second item recorded that free scholarships—tenable at the higher grade board schools—are awarded to scholars from both board and voluntary schools, without distinction, but the numbers given do not include the scholars from the latter. Numerous scholarships have been won at the technical college, but a complete statement can not be given.

Liverpool.—In their report for the triennial period ending November 25, 1900, the Liverpool school board give interesting particulars respecting the conduct of their day industrial schools. Of the industrial schools, both residential and day, it should be said that they are a modified kind of reform school, to which unruly children may be sent by the school authorities without the process of conviction in the courts. The residential industrial schools date back to a law of 1866, but the school law of 1870 transferred the power of commitment to these from the prison authorities to the school authorities. The law of 1876 authorized the establishment of day industrial schools for the children of drunken and dissolute parents for whom the ordinary penalties of the compulsory school laws have no terror. Most of these children, by reason of dirt, nakedness, or hunger, are both unfit and unable to attend other schools. In the day industrial, in addition to ordinary instruction, manual training and food are provided.

The law of 1876 gave rise also to truant schools, in which special arrangements are made for the discipline and detention of vagrant and unruly youth.

With respect to the day industrial schools the Liverpool board report as follows:

The treasury make an allowance of 1s. per child per week toward the expenses of this kind of school; and this amount, with that which the parents have been ordered by the magistrates to contribute, if the latter were fully paid, would, until recently, have defrayed the entire cost of maintenance. The number of children under commitment to these schools has, however, fallen off so much lately (from 1,222 in 1891 to 673 in 1900—a decrease of 549, or nearly 45 per cent) that the cost per head on the average attendance has risen from 2s. 10d. to 3s. 9d. per week. During the year ended December 31, 1899, the deficiency arising from this cause involved a charge upon the rates of £1,817. It has, however, been found impossible, owing mainly to the change in the mode of procedure introduced by the summary jurisdiction act, 1879, to enforce the payment, by the parents, of any large portion of the amount ordered; with the result that the actual cost of these schools to the rates during the twelve months which ended on September 29 last amounted to a little over £4,900. The following figures will show even more strongly the disastrous effect of the alteration introduced by the act referred to. The sum which, under the magistrates' orders, became due from the parents during the three years ended September 29, 1900, was £7,374; of which sum only £1,256, or 17 per cent, was actually collected from them, a further amount of £413 being received from the various boards of guardians. Out of a corresponding amount of £6,611, which fell due in the three years preceding the operation of the summary jurisdiction act, 1879, no less than £3,942, or nearly 60 per cent of the whole amount, was actually received from the parents.

The present board have recently, for hygienic considerations, adopted for these schools a somewhat more varied and slightly more liberal dietary scale, which will, no doubt, to some little extent, add to the future cost of the schools.

Through the continued kindness of some few gentlemen, the children of these schools have, during the term of the present, as during those of some preceding boards, enjoyed each year a holiday, varying in length from a week to a fortnight, in camp near the Meols shore, under the care of their teachers. The only charge involved thereby to this board has been the provision of a slightly more generous dietary than that which is provided for the children when at their respective schools, and the cost of carriage of the provisions to the camp. This holiday is found to have a very beneficial effect, not only upon the health of the children, but also upon their relations with the teachers of the school. It brings teachers and children together, and inspires mutual confidence and regard between them, in a way that the ordinary intercourse of the school can not effect; and it thus greatly assists the superintendents in learning the real character and individual needs of the young people intrusted to their care.

The board are also much indebted to lady members of the Kyrle Society for the interest they take in these children, and for devoting in each of the schools, to their amusement and elevation, an hour once a fortnight in the afternoon, in providing "happy afternoons."

The order in council under which children are committed to day industrial schools requires that the religious denomination of each child shall, as far as practicable, be ascertained and be specified in the warrant of commitment; that a child shall be sent, when possible, to a school conducted in accordance with the tenets of the religious body to which he belongs; and also, that ministers of religion shall be admitted, at times to be approved by the secretary of state, "for the purpose of instructing him in religion." The elementary education act of 1876, also, under whose provisions this order in council is issued, extends to day industrial schools those provisions of the elementary education act, 1870, which affect industrial schools established by school boards, one of which is that such schools, when established, shall be subject to the provisions of the industrial schools act, 1866, and not to those of the elementary education act itself.

In view of these provisions, a former board adopted, after consultation with the then secretary of state, and the present board have continued, the following regulation on this important subject, viz:

17. Religious instruction shall be governed by the following rules:

(1) Religious instruction and observances shall take place each day from 9 to 9.30 a. m. and from 5.40 to 6 p. m.

(2) The ordinary religious instruction and observances shall consist of prayers and hymns and reading from the Bible, with such explanations and instructions therefrom in the principles of religion and morality as are suited to the capacity of children; and in the selection of such prayers and hymns, and in explanations and instruction from the Bible, no attempt shall be made to attach children to or to detach them from any particular denomination.

(3) No child shall attend the religious instruction or observances or shall be taught the catechism or tenets of any religion to which his parents or guardians object, or other than that to which he is stated in the order of detention or attendance order to belong.

(4) With regard to children who are specified in the order of detention or attendance order as belonging to any particular religious persuasion, the managers shall, so far as practicable, make arrangements that such children shall, during the times set apart for religious instruction, attend religious instruction or observances conducted voluntarily by ministers of such persuasions, or by such responsible teachers of the school or other persons as are delegated by such ministers with the approval of the board.

(5) While any religious instruction or observance is going on none of the scholars or teachers shall be employed in any other manner in the same room.

(6) Facilities shall be provided for special religious instruction being given at stated times on Sunday, by volunteers, to such of the children of their respective churches as of their own free will may attend such instruction.

Under the terms of paragraph (4) of this rule most of the board's teachers in these schools, delegated by ministers of their own respective denominations, with the sanction of the board, give distinctive religious teaching to the children belonging to those denominations.

Manchester.—The following account of one of the free schools of Manchester is given by a correspondent of the Manchester Guardian:

The school which I visited has at least two claims to distinction. In the first place, it has a roof playground. The children go for their school games up among the chimney pots and the lightning conductors, which they might almost touch. This dizzy playground is, of course, walled and railed securely, but at one end there is a wire-barred window through which you may look down upon and over the back yards and smoking chimneys of the city, hearing the while the murmur of its unceasing "labor anthem"—surely a fit watchtower for Carlyle's night philosopher. In the second place, this was the first school in Manchester to be built on the class-room principle. Formerly all the classes in an elementary school were taught in one large hall. The national society in its early years laid down the lines upon which, in its opinion, the schools for the common people should be

built. "A barn," its circular said, "furnishes no bad model, and a good one may easily be converted into a school." For many years, even far into the era of school boards, elementary schools were planned upon the barn model. But the up-to-date school building is divided into class rooms, with a large central hall which is intended to be a reservoir of fresh air and to be occupied by the children only in the hours of prayer and singing, but which too often, owing to the crowded state of the school, has to be used for the ordinary work of class teaching. A third characteristic of the school under notice is that it is a "mixed" school—that is to say, boys and girls are taught in it side by side. In Great Britain the dividing line between mixed schools and schools in departments seems to be a line of latitude. In the south there are no mixed schools; in the north mixed schools are universal. That is a broad and general statement of the fact. The Wesleyan Methodists have mixed schools both north and south, but that is because they learned their educational ideals from David Stow, a great Scotch educationist of the first half of the century. The objections to the mixed system are mostly morbid. One excellent member of the Manchester school board a few years ago held that even the infants ought to be separated according to sex. But the system has been found to be successful in Manchester, and it has now been applied to some 30 schools.

In the large infants' hall fires were blazing cheerfully in two open fireplaces. Without there was all the dreariness of a typical Manchester day; here rain and fog, and Manchester itself could easily and agreeably be forgotten. Even the school canary, which ought to have special prejudices in his blood against a Lancashire October, was expressing his giant soul in delighted song. Plants and flowers were suspended around him and stood in the windows and upon shelves. Answering my look of pleasure as my eyes fell upon detail after detail of this bright nursery school—the green plants, the singing canary, the goldfish in a tank—the head mistress, who is tireless and cheerful because she is in the midst of work which she enjoys, said, "We can't take the children to the country in Manchester schools, so we bring the country to them as much as possible. We plant and grow in the school acorns and beans, and hyacinths and crocuses. Our school pets include a newt, a snail, and a beetle," which were produced before me. There is a small museum in a glass case placed on the floor, so that all the children may see it. It contains, among many articles of natural history, a wasp nest and a bee hive, without, however, "the singing masons building roofs of gold."

Another case holds models of three landscapes—one in the Arctic regions with a snow hut, the second a desert in Africa with a camel, and the third an English meadow "with," as an awe-struck little girl says, "a cow that moos." The little boys and girls are all happy and clean and well. They were fixing the letters of the alphabet upon their minds or learning to count or to write. The wonder of babyhood had not quite left their faces, and yet they had made some beautiful artificial flowers, produced neat specimens of writing, and begun simple painting.

The babies' class is pretty much what its name says—a class of babies. "Is there any good in having such very young children here?" I asked. The teacher, who looks ahead, replied: "It is good for the children to come here and learn a little at their play; it is good for the mothers to have such a place as this to send them to, and it is good for the schools and the teachers—afterwards," which means that children who have been through the babies' class are easier to teach in the standards than those who are not sent to school until they are 5 years of age. A little boy 3 or 4 years old was pulling at my coat. "We have a white mouse," he said, "and it comes out and eats bread." I witnessed the mouse feeding, to the delight of his baby owners. The classroom of these very little children is perhaps more a nursery than a schoolroom. They play at skittles and count as they bowl one over, and a swing and a see saw aid their instruction similarly. In the glass cupboard there is a tea service, and the babies have occasional tea parties. When I saw them most of them were nursing dolls. One little girl, who had just come to school and was not yet reconciled to her new surroundings, had laid her doll on one side and was sitting apart, not crying, but brooding over what no doubt was a very deep sorrow. In place of the dolls, engines and working donkeys are provided for the boys, "for boys," says the teacher, "like change." But the toy of which the babies think most is a model of a coast scene. In this there is a sandy beach with a sailing boat and a bathing van, and there is a light-house tower in which, on rare occasions and as a great treat, a night light is burned. All the time the babies are learning something, and what is perhaps more important, they are unconsciously becoming related and attached to school and school life.

In the senior school, which is under an earnest and zealous teacher, there is naturally a look of more serious purpose in the eyes of the children. They are older and more is expected of them. Boys and girls sit side by side. In mixed

schools in some other parts of the country the boys sit all on one side of a table and the girls all on the other, and a boy is sometimes sent to sit among the girls as a punishment, which is a thing terrible to be borne. But in this school the mixing is real, and sometimes a boy is at the head of the class and sometimes a girl. Though of course there are no games or toys here, the hall of the senior school is, like that of the infants, made bright with flowers and plants. The children are neat and sharp. At the sound of a gong they change from one lesson to another with the simultaneous punctuality of soldiers. Looking at their bright, interested faces I could almost believe that some of them liked school, and I confided the suspicion to their teacher. "I am sure the boys of to-day like school much more than the boys of a dozen years ago," he replied. "Their teachers are more qualified, more humane, and more satisfied with their conditions, and these things make school life more pleasant." One boy confessed to me in the presence of his teacher that he liked algebra. I should have been inclined to doubt it and to suspect him of a sinister design had he not declared with perfect candor (also in the presence of his teacher) that there was one lesson which he "detested," and that was the lesson in singing and ear tests. I thought it equally creditable to the boy and to the teacher that such a bold declaration should be made without hesitation on the one side and without rebuke on the other. The incident goes some way to account for the improved tone which has of late years been noticed in the elementary schools. Boys and girls are now rational beings, and not pieces of a great machine.

Manchester stands preeminent among English cities for progress in the coordination of different classes of schools. This work is incidentally disclosed in the following article:

TECHNICAL EDUCATION IN MANCHESTER.

In no English city is a more sensible or more thorough provision for technical education to be found than in Manchester. Whatever standard of comparison is adopted, be it the number of students under instruction in proportion to the population, the amount of annual expenditure, the number of the schools, or the enthusiasm of its administrators and teachers, Manchester will take one of the foremost places in the educational ranks of the country. In some particulars, indeed, Manchester stands almost alone. In the arrangements which the technical instruction committee of its city council and its school board jointly have made to secure the coordination of all educational efforts within their borders, and so avoid that overlapping which is such a prolific source of loss and disappointment in many other districts, this center of the great cotton industry may well serve as an example of a community where the first object of public men is to secure educational efficiency and not to assist the glorification of a particular board or committee.

This success is largely to be attributed to the recognition of the fact that any successful system of technical instruction must be adequately based upon a graduated supply of elementary and secondary education. It is too often imagined that technical education is independent of the work of the public elementary and the grammar schools. But in Manchester it has been for years borne in mind that it is only those youths who have received a thorough preliminary education who reap any advantage from the lectures and laboratory work of the technical school, be it never so perfectly equipped and staffed. The student of education consequently finds, when he endeavors to account for the satisfactory system of technical instruction in Manchester, that, in addition to the ordinary public elementary schools, supplying besides the three R's an elementary introduction to the principles of physics and chemistry, the school board have provided four higher grade schools, all of them furnished with a "school of science," and, as readers of Nature know, the curriculum of schools of this type is eminently suitable as an introductory course for boys and girls who will later proceed to the technical school.

Adequate provision is also made for the children of a higher social status. Manchester is well provided with secondary schools. Its grammar school and its high school for girls both deservedly occupy high places among the public schools of the country. Manchester grammar school, moreover, appears to have been one of the first to teach practical chemistry, for it possessed a small laboratory as long ago as 1868.

There is, too, every facility offered to bright children of the elementary schools to pass forward either to the higher grade school or to the grammar school, this desirable end being secured by a sensible scheme of scholarships. By the same means a vital connection is assured, by way of the secondary schools, between the elementary schools and the municipal technical school and the university college.

Nor are the educational needs of youths who have begun the serious business of life neglected. All the schools, to the work of which brief reference has been made, are intended for young people who have as yet entered neither trade nor profession. But in all manufacturing districts the great mass of the workers have to complete their education by well-sustained efforts in evening classes of one kind or another. The authorities in Manchester are fully alive to this fact, and a wonderfully complete system of evening classes has grown up, in which it is interesting to note that the school board and the technical instruction committee can work together without friction and with the best results. Two sets of these classes are in vogue. First, there are the classes with which the school board are more directly concerned—the evening continuation schools in which youngsters from 12 to 16 years of age who have left the public elementary school for the shop, the warehouse, or the factory are either preparing themselves for the more advanced classes of the technical school or are perfecting and continuing the work they did at school with a view to making themselves of greater value to their employers. Secondly, there are the evening classes of the technical school, intended for young men and women of 16 and upward, of which it is difficult to give an adequate idea in a few sentences. To really appreciate what is being done in such classes every winter's evening in large manufacturing districts, it is necessary to visit the schools where they are held. The determined efforts the young men and women, who, be it remembered, have generally spent a laborious day earning their daily bread, will make in order to become acquainted with the principles of science on which their work depends, or to become familiar with the canons of art they hope to apply in designing, are well calculated to inspire the hope that this country will some day take its former position in the industrial contest among the nations.

The students of the day technical school and day school of art are composed chiefly of the sons of middle-class parents. In the majority of cases they do not enter seriously into the work of manufacture and distribution until after completing their studies. It is gratifying to be able to report that there are some exceptions to this rule. Some enterprising employers have made arrangements for sending certain of their employees to the technical school during the day—the employers themselves bearing the expense thereby incurred. It is much to be desired that this far-seeing policy may be more generally adopted. And there are also the scholarship holders from the higher grade schools. Such is, in skeleton form, the system of technical education which has been gradually evolved in Manchester. * * *

Another cause of the high state of development of education in Manchester is the broad view which the technical instruction committee have taken of their duties. On at least two separate occasions they have arranged for their director, with certain members of the committee, to visit foreign countries to study other systems of technical instruction, and on another occasion they have sent him alone to visit the United States. In this way these Manchester authorities have become practically acquainted with German and American ideas of education. They have not endeavored to follow slavishly such methods in their entirety, but have not hesitated to import notions they considered suitable for the peculiar needs of their own district.

The same committee have also taken a large part in the formation of public opinion in matters educational in Lancashire. At their instigation several conferences have been held of representatives of the numerous county boroughs in their immediate neighborhood. Resolutions have been adopted and widely circulated urging the need of legislation to insure that secondary (including technical) education shall be placed under the control of municipal councils, though the desirability of coopting upon the educational committee an effective minority of persons of special experience in all grades of instruction, as well as of encouraging the joint action between the authorities of county boroughs and that of the administrative county have been recognized. But, if they would consider this question more from the national point of view, this enterprising local authority for education might come to a different conclusion. What is the state of affairs in southeast Lancashire? For the sake of example let Manchester be taken as a center, and consider chiefly the technical education of the district. In this central city there will shortly be, in full working order, a technical school, erected and equipped at a cost of upwards of a quarter of a million, and really provided with accommodation enough for all the advanced technical students which the whole area under consideration could provide. Yet, within easy walking distance, there is the Salford Royal Technical Institute, also admirably organized and generously staffed, and this simply because Salford happens to be a separate borough. The other boroughs of this same area are, moreover, very close together. Stockport, with its own technical school, is within about 5 miles, and has a splendid train service connecting it with Manchester. Bury, Bolton,

Oldham, Rochdale, and other boroughs are sufficiently near for their advanced students to be drafted to Manchester for instruction—the railway fares could easily be provided by means of scholarships. It would certainly seem as though, in the best interests of technical education, an area much larger than that of a county borough is desirable. With boroughs so near as they are in southeast Lancashire there is bound to be duplication and reduplication of buildings and appliances. To have a school, like the new technical school at Manchester will be, engaged in elementary work, which could be done equally well at much less cost elsewhere, is to lose a grand opportunity of providing one center at least for advanced technical instruction, of which the country stands in growing need. Experience shows, too, that the same staff can not successfully undertake to teach crowds of elementary pupils and also really be of assistance to the comparatively few picked students who will well repay any opportunities placed in their path for advanced study and subsequent research in applied science.

That there is no difficulty in getting students to travel, as has been suggested, is borne out by an appendix to the last report of the Manchester committee for technical instruction. It is there set forth that last year there were, among the 4,318 students of the technical school, no fewer than 2,266 students from out-districts, of whom 18 came from Bolton, 25 from Bury, 44 from Oldham and Hollinwood, 16 from Rochdale, 348 from Salford, and 43 from Stockport, to name only a few towns from a long list in the report before us.—A. T. Simmons, *Nature*, Jan. 31, 1901, p. 337.

Sheffield—Increase in school provision.—In a retrospective survey of the work of the Sheffield board of education for thirty years, from November 28, 1870, to November 28, 1900, the clerk of board, Mr. John Francis Moss,¹ says:

Looking back to the time when the only education obtained by hundreds of children in Sheffield was got by fitful attendance at dame schools, some of them carried on in miserable hovels by persons who could not write simple sentences, and, indeed, not properly spell many words of one syllable, and having regard to the ample provision now made as compared with that which existed thirty years ago, one may well be thankful for the wonderful development of our educational system. Fortunately, the voluntary schools of those days did noble service, as they are doing now, but they were deplorably handicapped and the people were sadly wanting in appreciation of their value. The average attendance at efficient schools of all kinds in 1871, in Sheffield, was 11,985. The average for the year 1900 was 54,681. We roughly estimate that more than 140,000 children have passed through our board schools alone since the time we started with ten small temporary schools in January, 1872, and I will not hazard an appraisalment of the good influence which must have been exercised on the lives and characters of those who now join in ruling the destinies of this great city. I say without affectation and without fulsome flattery that Sheffield owes a deep debt of gratitude to the members of the ten successive school boards who have devoted themselves with so much zeal and self-sacrifice to the responsible and arduous duties which have devolved upon them. They have had the distinction of being pioneers in various important developments, and they have seen some of the results of their enlightened and broad-minded policy in the successes gained by those for whom adequate training was heretofore unobtainable, and who now fill important and specially useful positions. The intellectual life of the community has been quickened, the pleasures of life have been extended to greater numbers, wider views of the duties and responsibilities of citizenship have obtained, and our industrial and commercial interests have been advanced; while looking at the question from another point of view we find that juvenile crime has diminished in a remarkable degree throughout the United Kingdom, and as the schools have increased the prisons of the country have been reduced. Sheffield has fully shared in this improvement. But I must not trouble you with details further than to indicate the extent of the work in which you are directly concerned. The Sheffield school board has already accommodation in its own schools for 41,675 children and preparations have been made for further extensions. Its teaching staff (including pupil teachers and candidates on probation) numbers 1,146, and the administrative staff, 53, while there are also 66 caretakers, skilled workmen, and laborers regularly employed, making altogether 1,265 persons engaged. The board is responsible for looking after the attendance of 66,957 children on the rolls of public elementary schools, and bigger responsibilities still await us when the corporation act of 1900 comes into operation.—*School Board Chronicle*, December 8, 1900: 629.

¹Mr. Moss has held the position of clerk to the board during the entire period of thirty years.

STATISTICS OF ELEMENTARY SCHOOLS OF ENGLAND, CURRENT AND RETROSPECTIVE.

The following statistics from official sources¹ give the principal school statistics for 1900, and also show the progress of the system from year to year:

Table IV shows the comparative growth of board and "voluntary" schools, the latter chiefly denominational, as indicated by average attendance for successive years from 1870 to 1899, inclusive. The relation is emphasized by the accompanying diagram. Table V shows the accommodation and enrolment in the different classes of schools for the years 1890-1900.

TABLE IV.—*Number of children in average attendance in public elementary day schools, board and voluntary, inspected during the year.*

Year ending Aug. 31—	Board.	Volun- tary.	Board.	Year ending Aug. 31—	Board.	Volun- tary.	Board.
			<i>Per cent.</i>				<i>Per cent.</i>
1870		1,152,289	0.9	1886	1,251,307	2,187,118	36.4

^a Census of 1871.

^b Census of 1881.

^c Census of 1891.

This census is the latest that has been taken. It is estimated that the census for 1901 will show a much larger population under school boards than that shown for 1900.

^d This population is under the jurisdiction of 2,527 school boards, viz, the London school board, 193 municipal borough boards, and 2,333 parish boards.

^e This population is under the jurisdiction of 788 school-attendance committees, viz, 117 in municipal boroughs, 92 in urban districts, and 579 in unions.

The board of education has issued summaries of the "standards of exemption" in England and Wales, the last issue being for 1900. The following are the essential facts:

TABLE VIII.—*The standards (grades) of exemption.*

I. Local authorities fixing for half time:		
Standard II		121
Standard III		1,180
Standard IV		1,462
Standard V		177
II. For full time:		
Standard IV		886
Standard V		2,003
Standard VI		363
Standard VII		72

The advance since 1897 is indicated by the following:

	1897.	1900.
Local authorities fixing for full time:		
Standard IV	1,209	886
Standard V	1,843	2,003
Standard VI	140	363
Standard VII	4	72

The latest measures affecting school attendance are explained as follows in the Report of the Board of Education for 1900-1901.

The elementary-education (school attendance) act, 1899, was followed last year by the elementary-education act, 1900, which introduced further changes into the law of school attendance. It enabled school authorities to extend their by-laws so as to include children up to the age of 14, raised the penalties that could be inflicted on parents from 5s. to 20s., and increased the number of attendances required for exemption by the elementary-education act, 1876, from 250 to 350. The law of school attendance under the elementary-education acts, as it now stands, may be summarized as follows:

(1) If the by-laws contain a special provision to this effect, children may be employed in agriculture at the age of 11, provided that they attend school 250 times a year up to the age of 13.

(2) With this exception, no child subject to the by-laws can obtain either partial or total exemption under the age of 12.

(3) A child between 12 and 13, or (if the by-laws are extended) between 12 and 14, can only obtain total or partial exemption on the conditions prescribed by the by-laws.

(4) In districts where the by-laws are still restricted to children of 13 years of age a child between 13 and 14 can obtain total exemption either on passing the fourth standard, or on making 350 previous attendances after 5 years of age in not more than two schools during each year for five years.

(5) A child between 12 and 14 may claim partial exemption on making 300 previous attendances, but in the view of the board this exemption can only be claimed in cases where the by-laws themselves contain a provision for partial exemption.

Since the passing of the act school authorities have been actively engaged in revising their existing by-laws, and some 1,300 new sets of by-laws have been either finally or provisionally approved by the board. In all these cases the board has secured the adoption of at least the fifth standard for total exemption, and with a very few exceptions of at least the fourth standard for partial exemption. The local authorities have, as a rule, availed themselves of the power to extend the age limit to 14, only some 150 having up to the present time declined to do so. The "agricultural" by-law has been adopted in about 500 cases, principally, of course, in rural districts. The process of by-law revision is still being actively proceeded with, and it is hoped that within another year the by-laws throughout the country may become adapted to recent legislation.

TABLE IX.—Expenditure on public elementary education (England and Wales), 1871–1895 (current and capital).

Year.	(a) Paid from rates (local taxes board schools only).	(b) Voluntary subscriptions and income from endowments.	(c) Total of columns (a) and (b).	(d) Fees of scholars in elementary schools and students in training colleges.	(e) Total of columns (a), (b), and (d).	(f) School board loans for building purposes. ^a	(g) Estimated subscriptions for voluntary school buildings.	(h) Grand total of columns (a), (b), (d), (f), and (g).	(i) State expenditure (education department and science and art department).

^a The law of 1870 authorized school boards to borrow money on the security of local taxes (rates) for the building of schoolhouses. Up to the 1st of April, 1901, the education department had sanctioned loans to the amount of £41,324,464 (£208,122,320). The new accommodation thus furnished is sufficient for 2,788,120 children. The estimated cost per child is thus about £14 18s. 7d. (£37). The department has also sanctioned loans to the amount of £132,993 to 10 school boards for providing accommodation for 729 blind and deaf children, and also £25,818 18s. to 5 school boards for providing accommodation for 330 defective children.

SECONDARY EDUCATION IN ENGLAND AND SCOTLAND.

A.—ENGLAND.

Secondary, or, as it is sometimes termed, middle-class education in England is unorganized, and there are no complete statistics of schools of this grade. The report of the Royal Commission on Secondary Education (1894) followed provisionally the classification of schools adopted by the previous commission of 1864. The latter body "distinguished three grades of secondary schools, according to the age up to which the pupils normally remain at school. For the first grade this age is 18 or 19; for the second grade, 16 or 17; for the third grade, 14 or 15." The

schools of each grade were further distinguished by their mode of support as endowed, proprietary, and private.

During the century just closed the Government made repeated efforts to deal with the endowed schools. In 1853 a law was passed which constituted a charity commission to inquire into the condition and management of charities and to frame schemes for their proper administration. Educational endowments were thus brought under supervision, and as a final result the endowed schools' law was passed in 1865, under which the administration of many educational endowments has been reorganized.

Several royal commissions were also appointed during the last half of the nineteenth century to investigate specified classes of secondary schools. The first of these was Lord Clarendon's commission, 1861, to inquire into the nine leading public schools; that is, as defined by Mr. Balfour, "schools of the order which, receiving the sons of the higher and wealthier classes of the country, have sent the largest proportion of pupils to the universities and adhered more exclusively to a classical education. Seven of the schools—Eton, Winchester, Westminster, Charterhouse, Harrow, Rugby, and Shrewsbury—were boarding schools. The youngest of them, Charterhouse, had been in existence since the beginning of the seventeenth century; the oldest, Winchester, since 1357. In 1861 they were educating 2,696 boys." Mr. Balfour adds in a footnote: "In 1897 they had nearly 5,000 boys, and the whole of the schools of about the same caliber in England admitted to the Headmaster's Conference, about 90 in number, had 24,000 pupils, including these 5,000."¹

In 1864 a commission was appointed under Lord Taunton to inquire into the education given in secondary schools which were included neither in the preceding commission nor in the Newcastle (elementary schools) commission of 1859. In 1867 Lord Taunton's commission presented a very comprehensive report. The total number of endowed schools that came within the scope of their inquiry was 830, of which 572 were endowed secondary grammar schools. The number of scholars in these schools, excluding 198 that had become purely elementary, was nearly 40,000. The report also included 86 proprietary schools for boys and 36 for girls. The commissioners devoted a separate chapter of their report to the secondary education for girls, which they found to be in a very backward state. "The effect produced by this revelation," says Mr. Balfour, "was so great and gave so much impetus and so much support to those who were devoting themselves to this work that within ten years' time endowments had been provided for 45 new schools for girls, containing from 50 to 400 pupils each. The Girls' Public Day School Company, founded in 1873 on a business basis, had 34 schools in 1897, with 7,150 pupils."²

The commission of 1894, of which Mr. Bryce was chairman, was appointed to consider "what are the best methods for establishing a well-organized system of secondary education in England, taking into account existing deficiencies and having regard to such local sources of revenue from endowment or otherwise as are available or may be made available for this purpose." Their report, in nine volumes, was presented in 1895. No attempt at any complete enumeration of secondary schools was made by the commission, but the education department ten years later undertook a voluntary census of all schools in England (omitting Monmouthshire, which comes under the Welsh intermediate education act of 1889) between the public elementary schools and the universities and university colleges.

In the arrangement of the information thus obtained it was found difficult to classify the schools according to grade or efficiency; they were consequently

¹ Educational Systems of Great Britain and Ireland, by Graham Balfour, p. 157.

² Educational Systems of Great Britain and Ireland, p. 160.

grouped in five classes, according to the constitution of their controlling authorities, as shown in the following table:

Form of control.	Schools for boys.		Schools for girls.		Mixed schools.	
	Number of schools.	Boys in them.	Number of schools.	Girls in them.	Number of schools.	Pupils in them.

Ages.	Boys.	Girls.	Percentage of total.	
			Boys.	Girls.
Under 12.....	64,329	60,866	40.6	45.7
Between 12 and 16.....	79,259	57,040	50	42.9
Over 16.....	14,804	15,136	9.3	11.3
Total.....	158,502	133,042

No pupils were included in this return for whom grants were claimed from the education department or who might only be receiving instruction in occasional classes or evening schools. Students at universities, university colleges, and technical institutes (except so far as regarded secondary day schools conducted in the buildings otherwise devoted to technical instruction) were also excluded from the return.

The public authorities connected with secondary education up to the establishment in 1899, of the board of education were: (1) The charity commissioners, whose jurisdiction was limited to dealing with endowments in England and Wales. (2) The department of science and art, through which Government aid was extended to science and art schools and classes. (3) The education department, whose statutory connection with secondary education extended simply to the approval or disapproval of schemes for endowed schools submitted by the charity commissioners. The influence of the department upon the development of secondary education has not, however, been limited to this slight relation with the endowed schools. It has been a growing and forceful influence through the recognition accorded to higher grade classes and schools in connection with the elementary schools and also from the authority to distribute Government grants to university colleges and training colleges (normal schools). (4) The board of agriculture, which by the law creating it (1889) was authorized to inspect and report upon "any school (not being a public elementary school) in which technical education, practical or scientific, is given in any subject connected with agriculture (including horticulture) and forestry."

The functions of these various Government agencies are now merged in the board of education.

The local authorities, county councils, and county borough councils are brought into relation with secondary education by powers given them under the Technical instruction laws (see pp. 942, 943).

The following particulars relating to secondary education are from the report of the board of education for 1900:

The total number of students who received, under the board, science or art instruction in science classes or schools of art and art classes, and scientific and general instruction in schools of science, was 292,111, and the total number of schools or institutions in which such instruction was given was 2,330. The grants paid amounted to £279,286 7s. (\$1,357,331.)

Scotland is included in the above statistics.

For inspection and examination of secondary schools in Wales and Monmouthshire there is, under the Welsh intermediate education acts of 1889, an intermediate education board of 80 members, appointed by the councils of the counties and county boroughs, the school-governing bodies, and other bodies interested. The number of schools examined in 1893 was 88, being 20 for boys, 20 for girls, 41 dual, and 7 mixed. The permanent teaching staff numbered 408 (219 male and 189 female) exclusive of 178 visiting teachers. The number of pupils examined was 6,913, of whom 3,274 were girls. * * *

Under acts passed in 1889-1891 funds may be applied by local authorities in England and Wales to technical instruction. The amount so applied in England in 1897-98 was £759,400 (about \$3,797,000) and in Wales £40,062 (about \$200,310). In some cases local authorities expend the money directly in providing instruction, but usually they make grants to schools and other institutions, or provide scholarships or other assistance for successful students. The instruction includes science, art, and technical and manual instruction; in Wales it embraces also secondary education.

B—SECONDARY EDUCATION IN SCOTLAND.

In view of the confused state of secondary education in England and the recent action with respect to the higher-grade board schools, it is interesting to note the liberal policy in respect to such schools pursued by the department of education for Scotland and the progress made in coordinating the various classes of secondary schools, as stated in the brief outline of education in Scotland (p. 943). The law of 1872 made provision for secondary schools, and subsequent laws authorized their support from local taxes. The secondary schools of Scotland have been brought into relation with the department by the inspection service, and the leaving examination, and great progress has been made in systematizing and coordinating the agencies of secondary education under private, and those under public management.

With respect to this work the Scotch education department in their report for 1900-1901 make the following statement:

The lines of organization of secondary education in day schools are fixed by the education act (Scotland) of 1872, which distinguishes between those public or other schools which may share in the Parliamentary grant, and those others defined in the act as "higher-class schools," which may not. It has been thought more in accordance with sound administration that all forms of instruction in the former class of schools should be aided from the Parliamentary grant, and accordingly in the code of 1899 and succeeding codes provision has been made for the payment of very substantial grants, obtained in part from the commutation of science and art grants formerly paid to these schools, on account of the instruction of the pupils who by obtaining the merit certificate (offered on the completion of an elementary course), have shown their fitness for more advanced instruction. In very few of these schools do the pupils remain beyond the age of 15 years, and regard must be had in framing a curriculum for the advanced departments of these schools to this circumstance, as well as to the fact that a very considerable proportion of these pupils will on leaving school follow occupations of an industrial or commercial nature. Great stress has accordingly been laid on the teaching of science, drawing, and modern languages in such schools, in comparison with subjects which, although intellectually valuable, are less likely to be of practical use to pupils who will leave school at a comparatively early age. Further, it has been thought that the teaching of science should consist rather in

the experimental investigation of fundamental principles than in detailed study of some special branch, while in the teaching of such subjects as arithmetic, drawing, and languages, opportunities of practical application should be constantly in view. But considerable freedom will be left to managers to adapt curriculums to special schools, and the grant will be paid on a satisfactory completion of the curriculum as a whole, and not according to the number of separate subjects which may be taken up.

Higher-class schools are, as already stated, not eligible to share in the Parliamentary grant, but some of them have, in the past, been in receipt of considerable sums of varying amount from the science and art vote on account of instruction in a variety of special subjects according to syllabuses of the science and art directory (issued by the education department). Certain others have received aid from this vote in a different form, namely, as schools of science, the grants to which are for the most part paid on a general curriculum embracing a definite amount of instruction in specified branches of science and art. It is our desire to foster instruction in science and art in higher-class schools in every possible way consistent with a due regard to the general aims of these schools, and to that end special regulations have been devised, and have met with general approval.

The further instruction in special subjects of pupils who have already completed their day-school course is at present conducted under two sets of departmental regulations, viz, the provisions of the code for evening continuation schools, and the science and art directory. Certain subjects of instruction, for example, certain science subjects and various forms of drawing are common to both, and though the instruction in science and art classes is as a rule of a more advanced character, this is not necessarily and has not always been in point of fact the case, and for the more elementary stages of these subjects the rates of payment proposed do not differ greatly. Grants to the former set of classes are made from the parliamentary vote, and to the latter from the vote for science and art. It is obvious that under this arrangement there is no very clear line of demarcation between the two sets of classes and even considerable risk of duplication of grants. Guided by our experience of the working of these classes since the transfer of the administration of science and art grants in Scotland to this department, and proceeding upon principles which were set forth at length in our report of last year, we have now devised a set of regulations applicable to all classes for the further instruction of those who have left school. This code of regulations is at present before Parliament.

A further step in the consolidation of educational administration in Scotland has been taken during the past year by the transfer to this department of the charge of the Museum of Science and Art in Edinburgh. It will be our object, while maintaining to the full the efficiency of the museum for its former purposes, to use it where possible to reinforce other educational agencies, and particularly to turn it to account for the benefit of the classes dealt with in this section of our report.

In view of the fact that under the proposed code of regulations for continuation classes one-fourth at least of the expenditure upon these classes must be found locally, it becomes important to consider what aid may be expected for these classes and also for the central institutions referred to in the code from the residue grant allotted to town and county councils under the local taxation customs and excise act, 1890. The sum allotted varies in amount, but under the local taxation act of 1898 it is relieved of certain prior charges by which it was formerly liable to be decreased, and according to the return to Parliament for the year 1899-1900 it amounts to £71,192 2s. 9d., as compared with the sum of £58,793 13s. 1d., available in the year 1898-99 and £48,073 2s. 9d. in the year 187-98. Of this sum of £71,192 2s. 9d., £17,359 6s. 8d. was allocated by local authorities to the relief of rates, while £53,832 16s. 6d. was allocated for purposes of technical education.

While this sum is larger than the sum allotted to this purpose in previous years, it forms a smaller proportion of the total sum available, which would seem to indicate a retrograde attitude on the part of local authorities as regards technical education. The sum of £53,832 16s. 6d. allocated to technical education from the grant of the year was augmented from unexpected balances and other sources to the sum of £72,527 1s. 2d., of which £54,136 6s. 4d. has been expended during the year, leaving a balance (reserved for purposes of technical education) of £18,390 14s. 10d. This balance shows a progressive increase in succeeding years. It would thus appear that the sum at present reserved for technical education might, if carefully applied, of itself go far to supply the local contribution necessary under the continuation school code, which will in certain directions have a more extended application than the regulations which it supersedes, and may embrace a wider variety of classes, while that sum by no means exhausts the funds at the disposal of local authorities for purposes of technical education.

HIGHER EDUCATION IN GREAT BRITAIN AND IRELAND.

Higher education is provided in Great Britain and Ireland by universities and university colleges, and professional education by special schools of medicine attached to the principal hospitals and by schools of law and of theology.

The number of students in the universities and university colleges for the successive years of the decade 1889-1900 is shown in the following table:

TABLE XIX.—Attendances at universities of Great Britain, 1889-1900. ^a

^aThe statistics are taken from the Statesman's Year-Book for the dates specified.
^bFor account of the Carnegie Trust for the universities of Scotland see Chapter XXIII and the Commissioner's Statement.
^cThe unusually high attendance this year seems due to excess of evening students.
^dIncludes 2 London colleges.
^eDecrease from 1892 to 1899.

University colleges and the new universities.—The rise of university colleges in the great centers of industry is the most important event in the recent history of higher education in Great Britain. These colleges are characterized by their liberal provision for science instruction and for technical training, and also by the admission of women on the same terms as men. Private and public resources have combined in their support, and the last and most striking phase of their development is their ascent into university organization. Owens College, Manchester (dating from 1851); Yorkshire College, Leeds (1874), and University College, Liverpool (1881), are comprised in Victoria University, incorporated in 1880. The three colleges of Wales—Aberystwyth, Bangor, and Cardiff—pertain to the University of Wales, incorporated in 1893, and Mason College, Birmingham, is the nucleus of Birmingham University, incorporated 1900. The development has been stimulated also by a parliamentary grant which has been appropriated annually since 1889 to be shared by the university colleges of England on the condition that they submit reports to the education department.

The grant which began at £15,000 was raised to £25,000 in 1897. Upon similar terms the three university colleges of Wales receive each annually £4,000 from the treasury.

The University of London has been reorganized in accordance with the statutes and regulations drawn up by the royal commission appointed under the "University of London acts," 1898. Under these statutes, which received the royal assent June 29, 1900, the university undertakes teaching-functions in addition to the examination work which was formerly its exclusive function.

The schools of the university as named in the statutes are as follows:

(1) University College and King's College (admitting women in all the faculties), (2) the 10 medical schools, (3) the 6 theological colleges, (4) the Royal College of Science and the Southeastern Agricultural College (in agriculture only), (5) the City and Guilds Institute (in engineering), (6) the London College of Economics, (7) the Royal Holloway College and Bedford College. To this list the senate may add at its discretion any public educational institution within the prescribed limits. All schools will be open to visitation, and are liable to be removed from the list.

The "Inns of Court," which at first refused to consider the proposal of the commissioners, have since come into the scheme, which insures the organization of a faculty of law.

Two new faculties are created: (1) Engineering and (2) economics and political science (including commerce and industry). Students in these subjects are not granted distinct degrees, but the diploma of their degree in science will indicate the courses of study pursued.

The royal commission on the state of university education in Ireland.—The appointment of a royal commission to report on the state of university education in Ireland is the most important event in the current history of higher education in that country. In the article appended the history and present state of the problem are set forth very clearly from the standpoint of a Roman Catholic. It is important that this standpoint should be understood, since it is the dissatisfaction of Roman Catholics with the present adjustments that has led to the appointment of the commission.

THE IRISH UNIVERSITY COMMISSION, AND UNIVERSITY EDUCATION IN IRELAND.¹

The commission has at last been appointed which the Government promised a long time ago was to report on the state of university affairs in Ireland. The inquiry has been limited, and also extended beyond what was expected would be the case; it is not to refer to Trinity College, Dublin; it is to embrace "technical"

¹ From the *Fortnightly Review*, September, 1901.

as well as academic teaching. This arrangement tends to divert attention from the paramount object of the commission's labors, the high education of Catholic Ireland, and so far is, I think, a mistake; and, without making invidious remarks, the selection of the commissioners is hardly well fitted to satisfy the just claims of the Irish Catholics. The commissioners, however, are able and conscientious men, and, if they are not sufficiently "racy of the Irish soil," if the Catholic element in their composition is too weak, if the majority, judging from their antecedents, are, not improbably, indisposed to favor the Irish-Catholic demand, still they will investigate their subject with assiduous care and skill, and will doubtless make a valuable report upon it. But I am not very hopeful that, whatever they may do, the Irish university question will be settled in accordance with what, I am convinced, is justice, within a short space of time, or even in the present Parliament. The Government is notoriously divided in this matter, and has put it off to a more convenient season; in two very striking instances at least it appointed, or pledged itself to appoint, commissions, and has not taken a single further step, though the subjects on hand were of the first importance. But whatever may be the result of this commission's work, the principles on which high education in Ireland will be adjusted at last are, I believe, hardly open to doubt; like Catholic emancipation and other reforms of the kind, what is rightly due to Catholic Ireland will, in time, be conceded. Many forces and influences, some extremely strong, may prevent this consummation in the near future, may possibly retard it even for years. The fanatics, who cling to the evil memories of a sectarian ascendancy, all but dead in Ireland; the philosophers, who would make the State indifferent in education to the Divine, and would place it on a purely secular basis; and the self-styled Liberals, who insist that even the highest education must, in their phrase, "be free," but also flout the profound objection that to throw open places of superior learning to all comers, without regard to their religious faith, all but implies that religion is to be set at naught in them, if stringent precautions, at least, are not taken—of course, deprecate or denounce the Irish-Catholic claim. Nor is it to be forgotten that large parts of Protestant England have a deep distrust in this matter of the Irish priesthood; nor yet that the recent conduct of the Irish Nationalist members has made English public opinion estranged from Ireland. Truth and justice, however, will in the long run triumph. If the Irish Protestant and the Irish Catholic are to be placed on equal levels in university life; if high Irish education is not to show the taint of the domination of sect; if the equitable rights of Catholic Ireland are not to be ignored; and if in the sphere of the conduct of man the Irish Catholic is to be given bread instead of a stone, the conditions of university affairs in Ireland will be ultimately transformed in legitimate Catholic interests.

In this cursory survey I shall chiefly consider high education in its different bearings on the position and the case of Catholic Ireland. To understand the subject it is necessary to glance back at the history of university life in Ireland. There was no Irish Oxford or Cambridge in the Middle Ages; an attempt to establish a university failed, in a land torn by feudal and tribal dissension, and in which the Roman Church of the pale and the old Celtic Church were in perennial strife. Elizabeth founded Trinity College toward the close of her reign on a site of a monastery "near" Dublin, lately suppressed. It was the purpose of the Queen, and of the two first Stuarts, that the college should, like Oxford and Cambridge, comprise other colleges, and should expand into a university in the true sense of the word. This consummation, however, became impossible during the civil wars and troubles of the seventeenth century. Trinity College absorbed into itself the germ of the university that was never formed, and when the evil reign of Protestant ascendancy had set in in Ireland it became an institution confined to the dominant caste, which lorded it over a subjugated race. Its governing body, its dignities, its honors, its degrees, were limited to the ruling class of Protestant Ireland. The Catholic pariah was shut out from its walls, and the same restriction applied to the Presbyterian Irish, held in special dislike as Swift's writings prove, by the college authorities in the first part of the eighteenth century. The college was thus an appanage of a dominant minority of sect, resting on an artificial and narrow basis, and not a university in any respect. But a great moral change passed over it by degrees, due in part to the teaching of one of its most splendid ornaments, and in part to the influences of the better era which began in Ireland after the reign of George II. Berkeley had the genius to perceive that Protestant Ireland could not prosper in any of its parts if left in isolation, apart from the people. He certainly wished that education of all kinds should be diffused through the Irish community; he probably desired that, to some extent at least, the Irish Catholic and the Irish Presbyterian should have access to Trinity College as a great place of learning.

At all events, a school of enlightened men grew up in the college after his day; and as the evil spirit of the penal laws of Ireland died out and the liberalism of the latter part of the eighteenth century made itself felt, a movement began in the Irish Parliament and found support in the college itself, the object of which was to remove or to weaken the exclusive barriers which fenced it round and to open it to all Irishmen without distinction of creed. In 1793-94, the year of the first great measure of relief for Catholic Ireland, Trinity College brought to an end the system of mere Protestant ascendancy which had prevailed within it; it admitted Catholics and Presbyterians to its degrees. Very probably, in the true spirit of Berkeley and Grattan, it would have made all its members eligible to even its highest distinctions, including a position in its governing body, had not its statutes and ordinances made this impossible. This noble reform anticipated by half a century what was afterwards done at Oxford and Cambridge.

This change placed the college on a broader basis, made it less than before the exclusive monopoly of a sect, even made it a national institution in a limited sense, and this has not been without beneficent results. The Irish Presbyterians, indeed, have not largely availed themselves of the excellent education it has always afforded, especially of late years. They have, more and more, had recourse to seats of academic learning in their province of Ulster. But a certain number of the upper and of the upper middle classes of Catholic Ireland have been for more than a century trained in the college and have had the advantage of its discipline in the battle of life. This body of men comprises eminent scholars, brilliant luminaries of the bench and bar, names illustrious in the arts of healing, statesmen and orators who have shone in the Imperial Parliament. And though Trinity College, from 1793 to the present day, has in its government, its teaching, and its essential character remained practically a Protestant place of learning with an immense majority of Protestant members, it has never been whispered that its authorities have tampered or made attempts to tamper with the faith of its alumni not of the prevailing communion. They have never dreamed of making a proselyte. In this respect they have been above reproach and suspicion. It should be added that the college fully kept up with the march of intellect in the nineteenth century. It has freed itself from the stigma of the "silent sister," at no time properly attached to it; it has ever held a high place in the letters and science of Europe; it has been called, indeed, the one institution in Ireland of which all Irishmen are proud. This great foundation, nevertheless, has never been a university in the highest sense of the word, and has never met the requirements of the Irish community as a whole. Students of all creeds are made eligible to its degrees; but its governing authorities, its fellows, its professors, and its scholars, could for many years be composed of Protestants only; its régime was that of the small Protestant upper class in Ireland. There was no place in this for members of other communions; and this restriction, though lately removed by law, continues virtually in existence to the present day. The teaching of the college, too, has been anti-Catholic to some extent; the genius loci has been always anti-Catholic. The Catholics it has educated have been extremely few in number, and, if not as distinctly as of late years the Catholic Church of Ireland has ever disapproved of the entrance of Catholics within its walls and of their participation in its studies and training. The college, moreover, has no sister colleges and no power of expansion like Oxford and Cambridge, and if its endowments are not very large, these have practically been confined to members of the one favored religion. Trinity College, in a word, reformed as it has been and admirable as it is as a place of learning, has never ceased to be a survival, in fact, of the Protestant ascendancy of a bygone age, and it retains this peculiar character to this hour.

The anomalies of the Irish University system, its inequalities, nay, its marked injustice, attracted the serious attention of Peel, when, after the repeal movement of 1833-44, he addressed himself to the task of reform in Ireland. His policy, as enlightened as the opinion of the day permitted, was to leave Trinity College completely intact as a bulwark of the Irish established church protected by the treaty of union; but to place by its side institutions of a university type, which would redress what was vicious in the existing order of things and would meet the case of Presbyterian and especially of Catholic Ireland. The principles on which the great minister founded his scheme were in harmony with the rather shallow liberalism of the time, but, I believe, were essentially false; assuredly they were ill-designed to effect his chief object, the advancement of high education among the Catholic Irish. Peel tried to embody in Irish university life the ideas which, under conditions very widely different, had been established in primary, or "national education," as it has been called in Ireland. The government of Lord Grey had set up the "national" system in the hope¹ that the warring races and

¹ This hope, it is unnecessary to say, has not been realized.

faiths of Ireland would be reconciled, to a certain extent, by instruction given their children in our new schools. The method adopted was that secular teaching should be afforded by masters and mistresses appointed by the State to pupils collected under the same roofs, but that religious instruction should be afforded to the pupils kept apart by the clergy of their respective communions.

To those who are convinced that, in the training of the young, the divine should be combined with the human, and certainly should not be postponed to it, this system was open to grave objections; and it was generally condemned by the clergy of the Irish established church and by a considerable section of the Irish Catholic priesthood. But the "national" schools were mere day schools, in which children were assembled for a few hours each day; the simple rudiments only could be taught in them; instruction, therefore, of a purely secular kind could be given to the young together in these, and religious instruction could be given apart without much offense to conscientious scruples; the "religious difficulty," in a word, was not prominent; and, if not without opposition, the "national" system has been accepted in Ireland, and, as a scheme of primary education, has become largely successful. The "national" system, I have said, was as far as possible made the model of the new university system to be formed in Ireland. The Queen's colleges of Belfast, of Galway, of Cork were founded, the first for the higher education of the Irish Presbyterians, the two last for the higher education of the Irish Catholics; they were liberally endowed and furnished with a staff of professors, masters, and heads; and they were affiliated to the Queen's University, as it was named, which, like Trinity College, was empowered to grant honors and degrees. The principles of education in these places of learning were assimilated to those in the "national" schools; that is, secular knowledge was to be imparted, in these seminaries, to the students together, as part of the collegiate and university course; and this, indeed, was all that was to be taught. But religious instruction, as such, was not to be given; they had to pick up this, as they best could, apart; it was abandoned to the clergy outside the college walls; in a word, was left to shift for itself.

This system was founded on a basis essentially unsound. The objections to it were numerous, and, I think, decisive. Secular instruction, if confined to the mere rudiments, can be rightly made, as the phrase is, "combined;" that is, it can be afforded to children in schools together; but in the case of high education this is well-nigh impossible, for here it is scarcely practicable to lay down what is really secular. Religious questions of all kinds, for example, enter into moral philosophy, metaphysics, modern history, even physical science; it is all but hopeless to teach young men these subjects under a common system; the necessary result is that, under this condition, these great studies must be disregarded or largely neglected. Religious instruction, again, can be dispensed with in simple day schools, and, in accordance with the "national" system, may be left to the parents of the pupils and to their clergy; but how, consistently with Christian duty, could it be dispensed with in collegiate and university life, and in the case of youths, at a most critical age, be virtually excluded from collegiate and university teaching? The new university institutions set up by Peel in Ireland were thus, in the strictest sense of the word, "nonreligious;" and it requires little knowledge of the nature of man to be convinced that they were "irreligious," for this very reason, with whatever fine names they might be tricked out, as "free," "liberal," "undenominational," etc., their spirit and tendencies were anti-Christian. They were calculated, in the case of superior minds, to form men of the type of Gibbon and Hume, and in the case of inferior to promote religious indifference and many kinds of scepticism. The Queen's colleges and the university were at once denounced as "godless" by the high church party in the House of Commons, and though its opposition was easily overcome, the objections it made have never been answered and have since that time been sanctioned by most real thinkers. The reception of the measure was, for a while, uncertain in Ireland. The "Young Ireland" party, rather jealous of the Catholic priesthood, and earnest in the cause of education of the highest order, desired that the experiment should be tried; but O'Connell denounced the whole scheme from the outset, and after a few days' hesitation the Irish Catholic bishops concurred. In 1850 this decision was solemnly confirmed by the judgment of the Catholic Church of Ireland; the Queen's colleges and university were proscribed as seats of education, "dangerous to faith and morals;" true Catholics were enjoined to avoid them, and the anathema of the synod was ratified at Rome. As the result the two Queen's colleges of Cork and Galway, designed for Irish Catholic youths, proved almost failures, and though the Queen's College of Belfast struck root and flourished, and has become filled with Presbyterian students, this system of education, as a whole, has not been successful. In 1854 the Irish Catholic bishops, seeking to promote education on the principles they deemed true, founded the "Catholic University

of Ireland," as it has been called; its first head was the illustrious Newman. The work of this institution has been most praiseworthy, though it has depended on the contributions only of a very poor communion. But the Catholic University was no more than a high school. Unlike Trinity College and the Queen's University, it could not grant degrees and it was left without any support from the State.

This position of affairs in Irish high education continued unchanged during a series of years. More than one statesman, indeed—notably the late Lord Mayo—was alive to all that was faulty in it. That Trinity College with its endowments should remain practically an academic close borough for a fraction of the Irish community, and that the Catholic University, designed to be a seminary for the large upper middle classes of Catholic Ireland, should not have a university status and should not receive a shilling of public money was obviously in a high degree unjust, and in spite of "liberal" pœans, noisy and bold, the Queen's colleges and university were not fulfilling their mission. Feeble efforts at reform proved abortive. It was not until 1873 that Mr. Gladstone took up the Irish university question and made an attempt to effect a settlement of it.

The minister addressed himself earnestly to his task; high education in Ireland, he had recently exclaimed, was the third branch of the famous upas tree, the baleful shadow of which was blighting the land; but the measure he proposed was the worst of his Irish reforms of this period; it ended in complete and ignominious failure. With characteristic historical leanings Mr. Gladstone recurred to the policy of Elizabeth and her two first successors, and sought to create a university for the whole Irish community, a foundation which Trinity College had, as it were, swallowed up, and which after the passing of the infamous penal code could not include the Irish Catholics within its precincts. This university was to be the only authority to confer degrees in Ireland; it was to be supreme in Irish university life; its governing body was to be composed in part of the nominees of the Government and in part of the heads of the institutions to be connected with it; the Queen's University was to disappear; Trinity College, and two of the Queen's colleges—that of Galway was to be suppressed as hopeless—the Catholic University, and a few other colleges were to be affiliated to it as subordinate members. The position, however, of these different groups of colleges, under this scheme, was to be wholly unequal. Trinity College was to retain its endowments, with the exception of £12,000 a year, to be transferred to the new National University, as it was called; and it was to be thrown open, from top to bottom, to the fullest extent, on "liberal" and "undenominational" principles. The two Queen's colleges, too, were to preserve their "free" character as before, but to be subsidized by the State; but the Catholic University was not to receive a farthing, and this, too, was to be the case of any other colleges, if these were "denominational," and of a sectarian complexion. The project, therefore, was, on the face of it, unjust, and scandalously unjust to Catholic Ireland; and yet this was, perhaps, not the worst of its features. Mr. Gladstone applied to education of the higher kind in Ireland the principles which Peel had unfortunately applied to the Queen's colleges and University many years before, principles not only essentially vicious, but denounced as "Godless" by High Churchmen, and at the Synod of Thurles, and proved to be mischievous in Ireland after long experience. The education in the National University was to be strictly secular; it was to be afforded to the students together; religious education was not to be countenanced by the State; it might be afforded to the students apart as they pleased, but it was not to enter university life; and that secular education should be wholly secular, moral philosophy, metaphysics, and modern history were to be left out of the university course.

The eloquence of Mr. Gladstone, and his power over the House of Commons, sustained this ill-conceived measure for a few short days. Ere long, however, protests came in from all kind of quarters, and it was universally condemned in Irish opinion. Admirable debates were held in Trinity College; its leading men recognized the just claims of Catholic Ireland, and acknowledged that they were not satisfied by the bill; but they were indignant that their time-honoured foundation should be stripped of part of revenues by no means excessive; they especially resented that Trinity College should be, in a great degree, placed under the control of the castle, a provision fatal to its independence and its free life, and that the noblest studies of the intellect of man should be banished from the alma mater of Berkeley and Edmund Burke. In all this educated Irishmen fully concurred, and, as a matter of course, the Irish Catholic bishops, backed by the laity without a dissentient voice, were loud in their condemnation of the minister's project. They reiterated with emphasis the objection of their predecessors, that the new university would be simply "Godless," a "place in which Mammon was set above God;" they declared that they would do all that in them lay to keep Catholic Ire-

land away from it, as in the case of the Queen's colleges; they dwelt strongly and rightly on the gross unfairness of leaving the Catholic University and colleges of the same type unendowed, and practically imposing on them a heavy, and even a shameful penalty. This general manifestation of adverse opinion had a powerful effect on the House of Commons; a formidable opposition was arrayed against the bill. Disraeli described the measure as "simply atheistic," and the epithet expressed his real view, for in high education he was of the faith of Edmund Burke; he singled out for censure the exclusion from university teaching of the best and most fruitful parts of learning, though on the "unreligious" principle which was of the essence of the scheme, this limitation was, no doubt, logical. One of the best speakers against the bill was Ball, one of the ablest representatives of Trinity College, an orator, who, in after years, held the great seal of Ireland; his comments were moderate, just, and wise. The Conservative party followed, of course, its leader; not a few Liberals fell off from Mr. Gladstone; the members from Ireland, almost with one voice, voted against the measure. The bill was rejected by a small majority; one of the most powerful administrations of the century was virtually wrecked.

In the year that witnessed the defeat of this sorry measure, Parliament, under the auspices of the late Mr. Fawcett, effected a change in the constitution of Trinity College, which was "to settle the Irish University question." The "free," the "liberal," the "undenominational" principle was applied to this seat of learning with a stringency that never applied to an old university before. Every office and privilege in the college was made open to its members without regard to religious faith; "not only a Roman Catholic, or any Dissenter, even a Unitarian, but a Jew, a Turk, or an avowed Atheist might become a fellow or a teacher of the college; it is possible that any one of these, even the latter, might be provost."¹ It is a mistake to suppose that anything like this was done at Oxford and Cambridge by the legislation which relaxed their tests; the essentially religious character of these great foundations has been fully preserved. Trinity College was thus in theory made "nonreligious," that is, I think, "irreligious;" it was assimilated, in conception, to a Queen's College; but it was idle to suppose, as was vainly imagined, that Irish Catholics would resort to it more largely than before, or that the Irish Catholic Church would be satisfied. On the contrary, now the college has been placed on this new footing, the Irish Catholic bishops have more than ever condemned it, and quite rightly, on the principles they maintain; the Catholics educated in it are now a mere handful of students. Happily, however, for Ireland and Irish Protestants, Trinity College has not been divested of its religious character; in fact it remains, to all intents, a Protestant place of learning; its governing body and dignitaries are nearly all Protestants; it is a Protestant institution in every sense of the word. It is, therefore, still regarded by the Irish Catholics and by the heads of the Catholic Church of Ireland as a relic of the Protestant ascendancy and consequently to be avoided as a place of high education; and the only result of Mr. Fawcett's "reform" has been to strengthen the barriers which exclude the great majority of Irishmen from university life. After Disraeli had become minister, in 1874, that great statesman made an attempt to redress the injustice, of which he was fully conscious, in the condition of high education in Ireland; no doubt can exist that he wished to provide the Catholic University of Ireland with funds from the State, and, perhaps, to raise it to the level of Trinity College. But English opinion would not permit this; Disraeli, now Lord Beaconsfield, made a compromise in 1879-80. The Queen's University was abolished; and other seats of education having been left as they were, a Royal University was established, empowered to confer degrees on the students of all foundations, who should pass the examinations required for the purpose. The Catholic University and other institutions of this type were thus enabled indirectly to obtain degrees for those who were educated within their precincts; and this has certainly been a beneficent reform. But the Royal University is merely an examining board, not a university in the true sense of the word; and the Catholic University remains unendowed, while Trinity College and the Queen's Colleges possess sufficient endowments and wealth. The Catholic University, it should be added, has been divided into separate colleges; but it fully retains its original character; it is a Catholic foundation ruled by the heads of the Irish Catholic Church.

This, therefore, is the state of high Irish education in the first year of the twentieth century. Trinity College provides an admirable training for the Irish Protestant; but it is a Protestant institution in its essential nature; and, just and liberal as its authorities are, it contains very few Catholic students, and it is discountenanced by their religious directors. The Queen's College of Belfast satisfies

¹See *Irish Education*, by Butt, p. 35. A masterly tract.

Presbyterian Ireland; but the Queen's Colleges of Galway and Cork have failed to bring Catholics within their spheres in anything like their due proportion; and they are proscribed as "Godless" by the Irish Catholic bishops, as they were proscribed by High Churchmen in the House of Commons. The Irish Catholic, therefore, as a matter of fact, is all but practically excluded from these institutions; and though, if he happens to be a member of the Catholic University, and of foundations of the kind, he may obtain a degree given by an examining board, he has really hardly any place in Irish University life: he is virtually nearly shut out from it. And Trinity College and the Queen's colleges are supplied with the funds they require by the State, and the Catholic University, a place of learning, to which the upper middle class of the Irish Catholics would naturally resort, which is a seminary upheld by the leaders of their Church, and which, many as its disadvantages are, has done excellent work, is left out in the cold, and as such does not receive a shilling. I do not envy those who refuse to see that this whole scheme of education is radically unjust, and gives Catholic Ireland a real and great grievance; indeed, the arguments of its supporters ought to reduce them to silence. It is said that high education in Ireland has long been placed on a true basis, because it is "free," "liberal," and "undenominational;" because Trinity College and the Queen's Colleges admit all persons within their spheres, whatever may or may not be their religious faith, and because in any case the Royal University can grant degrees to those who choose to avail themselves of it. But what is the value of these pleas in the face of long experience and the simple facts of the case? Abstractedly, Trinity College is "open;" but really it is closed to nine-tenths of the Catholics, who ought to have a share in a university career in Ireland; they believe it to be an institution perilous to their faith, and a monument of the sectarian domination of the past.

It is exactly the same with the Queen's colleges, save that the objection is more decisive. They are practically barred to the Irish Catholic, for, "free," "liberal," and "undenominational" as they may be, the heads of his church have pronounced them "godless," and he keeps studiously aloof from them. And can it be said that these scruples of conscience and even these prohibitions are mere blind bigotry? Reverse the instance of Trinity College. Were the State to set up a great Catholic seat of learning in Dublin and to surround it with the traditions of Catholic power, how many Irish Protestants would have recourse to it, even though it were fully thrown open to them? Or, were the colleges of the great foundations of Oxford and Cambridge assimilated to the Queen's colleges, would not the cry go forth that what was "nonreligious" was "godless," and how many English parents would send their sons to them? For myself I agree with Newman and Edmund Burke on this grave question. I believe that the Catholic aversion to Trinity College and the Queen's colleges is perfectly right; at all events, it has been unequivocally shown during a long series of years. And this being so, on what pretense of justice can Irish Catholics be virtually kept out of the only seats of education endowed by the State in Ireland and relegated to an examining board and to a Catholic seminary which the State has starved? Is not this a palpable and gross wrong; nay, may it not be described as a sinister attempt to compel or to bribe the Irish Catholic into accepting a system of education of which he disapproves at heart?

One argument, indeed, if it can be called an argument, against doing right to Catholic Ireland in university education and all that it involves can not be passed over, even within my scanty limits. "Popery," it is said, is an intolerable thing; Protestant England must have nothing to do with it. To establish and endow in Ireland a place of learning for "papists" is therefore touching the unclean and bowing down to Baal. Irish "papists" must put up with Trinity College and Queen's colleges as they are. This pernicious stuff is not without effect on the masses in England; it especially gratifies the "nonconformist conscience," given to straining at gnats and swallowing camels. Its influence was seen in a singular Radical vote, which, when home rule was before the House of Commons in 1893, enabled the Irish parliament to set up a Catholic university of the most exclusive type, which Radicalism would have tabooed in the Imperial Parliament. The strength of this prejudice can not be ignored; it is still a real danger to the Irish Catholic claim. But if an argument such as this were to prevail, many Catholic institutions ought to be shut up, and it is only worthy of Mr. Kensit and those who follow in his train; no statesman, openly at least, would adopt it. The newly appointed commission will no doubt consider the question they have to deal with in its various aspects, and especially with reference to the demand of Catholic Ireland. Two general schemes of reforming high Irish education on equitable and enlightened principles have been advocated within many years; I shall briefly direct attention to them. The first scheme would to some extent be modeled on the lines of Mr. Gladstone's defunct measure; but it would be free from its palpable

errors, and certainly would be a great improvement on it. A national university would be set up in Ireland; it would be the supreme seminary of high Irish learning; it should have the power to confer degrees and honors; but probably the Royal University would be left unchanged, and should have a right to grant degrees as an examining board. The governing body of the new institution should be composed of the heads of the colleges to be connected with it, with no admixture of nominees of the Government; it should be independent, but should receive adequate support from the State. Trinity College would lose its privilege of conferring degrees, but in other respects it would remain intact; it would retain the revenue it possesses; it would be free to maintain its present system of teaching and training. But Trinity College, the Catholic University, and the Queen's colleges—those of Galway and Cork—being perhaps suppressed, but Belfast College being left as it is, with the possible addition of a few other colleges, would be affiliated to the university that would represent Ireland. This should have its professorial and teaching staff, and it should of course hold examinations of the students of the subordinate colleges, in order to grant degrees and other honors. The Catholic University should be reasonably well endowed, as Trinity College and the Queen's colleges are; but it should cease to be wholly under Catholic Episcopal control. Its governing body should contain a lay element, and its professors and teachers should not be exclusively Catholics, though it would remain essentially a Catholic seat of learning. In consideration of the assistance to be afforded by the State, the heads of the Catholic Church in Ireland, it is well known, would agree to these terms.

The advantages of this scheme can not be gainsaid; theoretically, it is entitled to very high praise. That it would tend to reconcile the hostile races and faiths of Ireland by bringing their youth together in the province of learning is a vain imagination, in my judgment; the hopes of the authors of the "national" system in this respect have in no sense been realized. But certainly it would remove the anomalies and the one-sided and manifold wrong which high education in Ireland as it exists presents; it would produce equality within this important sphere: it would place the Irish Protestant and the Irish Catholic on the same level; it would make high Irish education really free. Were it carried into effect probably we should hear no more about "Protestant ascendancy" and "godlessness" in the university system of Ireland; a great Catholic grievance would be removed; parents who wished for a Protestant, a Catholic, or a "nonreligious" education for their sons would have a complete unbiased choice.

A national university, too, in Ireland would have this special merit; it would promote general competition in university life; the youth of the affiliated colleges would vie with each other in the race for university degrees and honors; the ablest students would secure the best prizes; "a career would be thrown open to every kind of talent." The value of all this must be acknowledged; this scheme, nevertheless, I greatly fear, would practically not succeed in Ireland under the actual conditions of the national life. The heads of the affiliated colleges would, under this system, be the governing body of the university to be brought into being: is it probable, things being what they are in Ireland, that they would agree even in the administration and the management of the new foundation? Place Dr. Salmon, the provost of Trinity College, Archbishop Walsh, to whom the Catholic University owes so much, and Dr. Hamilton, the president of the Queen's College of Belfast, in supreme command on the university board, and could they be expected to conduct its general affairs in harmony? And if things, as is but too likely, should be brought to a deadlock, would not the "castle" have a plausible excuse to intervene, to place its nominees on the governing body, and thus to deprive the university of its independence, its most precious possession? And even if this apprehension were to prove vain, would there not remain an obstacle of even much greater force? How could the chiefs of the university fix a standard of common studies, in subjects in which religious questions would arise for the examinations to be held for degrees and honors? Would not "the religious difficulty" cause discord that nothing could reconcile? And would not the inevitable result be that moral philosophy, metaphysics, modern history—nay, physical science—would, as the three first were under Mr. Gladstone's project, be excluded from the university course; and that this plan of learning would be a mere *caput mortuum* as regards the noblest pursuits of the intellect of man?

The second scheme is much less ambitious; but it is less open to objections I fear very grave; it is more conservative and in unison with existing facts. Trinity College should be left completely untouched; it should preserve its right to confer degrees; its funds and its mode of education should remain as they are. Two of the Queen's colleges would disappear as useless, but the Queen's College of Belfast should be made a place of Presbyterian learning, with a power to grant degrees

and with increased endowments; it should become a university in the proper sense of the word; the Royal University should continue to be an examining board, empowered to grant degrees and honors to all who should merit both, and notably to the many students in Ireland who can not afford residence. The Catholic University and its dependent colleges should receive full and frank recognition from the State; it should be supplied with suitable buildings and sufficient funds; it should have the same privilege as its rivals to confer degrees and honors. But, as in the case of the first scheme, it should not be wholly under Episcopal control; its governing body should, in part, be composed of laymen; its professors and teachers, if in the main Catholics, should not necessarily be all of that faith. This scheme would be free from the immense difficulties which the establishment of a national university in Ireland presents; it would remove the injustice which, in high Irish education, stares us in the face; it would, as far as possible, leave things as they are, and it would be more consonant to Irish opinion, and more in accord with Irish ideas than any national university that could be set up. It would also make high education wholly untrammelled; and if it is urged that it forms a "denominational" system in Irish university life, it is sufficient to say that this is what all communions in Ireland desire at heart to possess. It is generally understood that a project of this kind is favored by the authorities of Trinity College; it would doubtless be well received by Presbyterian Ireland; it would be acceptable to Catholic Ireland and her heads. Apart from the miserable pretense that "it is a vice to pay and bribe Popery," which I only notice to pass it by, the only plausible argument against this plan is that the power given to different places of learning to confer degrees and honors might lower the standard of their value; the degrees of the Catholic University, it is hinted, would be almost worthless. But this is the affair of the students who seek degrees; the value of these are quickly gauged, so to speak, in the market; inferior degrees would soon be found to be inferior; and as to the sneer at the presumed bad qualities of Catholic university degrees, the great success of the students of this foundation at the examinations of the Royal University during a series of years, many as are the disadvantages in their way, is a sufficient guaranty that this offensive hypothesis is false. The argument, in a word, is mere dull bigotry; besides, the degrees of the Royal University are open to all men, if those of the Catholic University were not up to a proper standard, as most certainly would not be the case. For the rest the Irish university question is pressing; the unfairness of the present arrangements can not long continue; if justice is not done to Catholic Ireland in this matter, Trinity College and the Queen's colleges will, in the long run, probably go the way of the late Irish Established Church. The commission, I trust, will at least lay down the lines of an equitable, comprehensive, and wise reform.

WILLIAM O'CONNOR MORRIS.

APPENDED PAPERS.

THE GOVERNMENT EDUCATIONAL BILL.¹

[From the Contemporary Review, June, 1901.]

It is not easy to overstate the importance and far-reaching effect of this bill. If it passes into law it revolutionizes our whole educational system, not only by what it enacts, but still more by what it directly contemplates, by the avowal of the Government which introduces it and by the creation of machinery which, once in existence, is proposed to be made applicable to all grades of education.

It will probably be well to state what the bill does, and to examine how it may be worked, and probably will be worked.

The title of the bill is significant. It is a bill to make provision for and confer certain powers on local educational authorities in England and Wales.

The authorities are not authorities for education "other than elementary," as in the bill introduced by the Duke of Devonshire last year. They are general education authorities over the whole country. The first clause says: "The council of every county and county borough, acting through an Education Committee, constituted in accordance with a scheme made by the council and approved by the

¹ Introduced May 7, 1901. Withdrawn June 27.

board of education, shall be the education authority for the county or county borough."

Sir John Gorst, in introducing the bill, at the outset declared that it was intended that this authority should deal with all education. In the House of Commons on Tuesday, May 7, he stated: "The bill is to establish in every part of England and Wales a local educational authority which is intended to supervise education of every kind, whether elementary, secondary, or technical," and Mr. A. Balfour is reported in the Times of May 18 as writing to Mr. Gray, M. P.: "The Government quite recognize that until both primary and secondary education in each district are confided to a single educational authority we can not regard our educational system as properly organized." He goes on to say that the present bill, though incomplete, "is evidently a necessary preliminary to any such advance."

Thus we may take it that the authority now proposed to be set up is to be the one authority in its district for all grades of education, and it is from this point of view, and not for the mere instalment enacted by the bill, that it must be examined. Moreover we must look at several clauses of the bill in their operation when elementary education is placed under this new authority.

Now, what is the authority which it is proposed to create. It is not the county council or the county borough council, which, though not elected for education, is nevertheless a body based on local popular election. It is to be the county or county borough council, acting through an education committee. There was a great deal of discussion in 1896, when the Government introduced their bill setting up the county council, as to what was to be the relation of the council to its committee.

In that bill it was enacted that the education authority was to be the county council, acting through a statutory education committee; and a great deal of interesting discussion was necessary to elicit the intention of the Government.

Those who are in favor of representative institutions will desire that the elected representative local authority should not only be theoretically, but practically, the effective local authority for administrative purposes.

Much turns on whether by the words "acting through an education committee" it is intended that the proceedings of that committee shall or shall not be liable to confirmation or rejection by the county council.

Sir John Gorst, on April 16, 1896, in answer to a question on this point gave a Delphic utterance which hardly helped the inquirer. He said: "The reports (of the education committee) will be governed by section 83, subsection 2, of the local government act, 1888," and again he said they would be under the general law.

Mr. Chamberlain, the great champion of universal municipal authority, in a letter to Mr. Ansell, a constituent wrote: "The committee will be subject to the general instruction of the council, and they will no doubt report to it, like other committees, so that their proceedings will be public, and subjected to popular criticism and control." Nevertheless, Sir John Gorst, on another occasion, said that the education committee would be like the watch committee, which, on many points does not obtain the confirmation of its acts by the council, but acts *proprio vigore*. It was most important that this point should be cleared up. But the readers of the debates of 1896 will find that as explanations multiply the clouds thicken. Mr. Balfour will be found (Hansard xli, page 1384) saying that he agrees with Mr. Chamberlain and with Sir John Gorst, and that the committee will be like the watch committee.

Sir William Harcourt, however, and Mr. Evans both made it clear that the statements and references of the Government were incorrect. Mr. Evans pointed out that the law creating a watch committee did not make the council, acting through the watch committee, the authority for dealing with the police, but made the watch committee itself that authority. It was further pointed out that there is a marked distinction between allowing a watch committee, composed exclusively of members of a town council and sometimes composed of the whole town council, to act without confirmation; and allowing a body which is only partially representative, and in which the representative element may be only a bare majority, to act in the same way. Sir William Harcourt finally completed the exposure by quoting the operation of section 88 of the local government act of 1888, which provides that every committee shall report its proceedings to the council by whom it was appointed, but to the extent to which the council so direct, the acts and proceedings of the committee shall not be required * * * to be submitted to the council for their approval.

If in the bill now before the House of Commons the words were "in accordance with the provisions of section 82, subsection 2, of the local government act of 1888," then the county council might, in such instances as it pleased, delegate the power of acting without confirmation to its education committee, but except so

far as the council granted such delegation the committee would require confirmation of its acts. But it is clear that the intention and purpose of the Government in 1896, and also, presumably, at the present time, is to create education committees which, when once the money has been voted to them by the council, will act in substantial independence of the council. Further, the bill of 1901 limits the powers of the council much more than the bill of 1896. In 1896 the council were free to compose their committee with or without outsiders. They might retain the complete representative character of that committee with no element of nominees, and they had a free hand in the event of their admitting outsiders to settle how many there should be and how they should be admitted. They could also modify the composition of their committee from time to time.

The present bill puts practically the whole power in the hands of the board of education. The council may submit a scheme, and the board of education may approve it or reject it, or suggest modifications. But if the board of education withhold their consent for twelve months they then acquire the absolute right to frame the scheme by themselves. All they are bound to do is to provide that a majority of the members shall be members of the council. The bill does not even say that they must be members elected by the council. Thus, with a conservative board of education and a conservative county council, all may go smoothly; but suppose a radical council in a town like Leicester or Halifax. If the board of education objects to the scheme submitted, they may, at the end of a year, frame a scheme in which they may nominate the members of the town council, and add any person they please to represent, as Sir John Gorst twice said was intended, the various "interests" of the district—"interests" being probably hostile to any expansion of education which might clash with those interests.

And it is intimated that this unrepresentative body is hereafter to be entrusted with the control of primary as well as of secondary education. The promoters of the project by these means could represent the forces hostile to popular education twice over. In a school board, on a town council, the whole community is represented, the friends of a liberal measure of education and the foes, the friends of undenominational education under public control, and the friends of denominational schools under private management. In many towns the latter have the majority on the school board. It is, however, suggested that such school boards as those of Liverpool and Manchester, elected by all the citizens, are not adequate to deal fairly with church interests, and we shall probably have the claim put forward that on the new committee the Diocesan Association, the Wesleyans, the Roman Catholics, shall, *ex officio*, be represented, to say nothing of associations of teachers in secondary schools, and so forth. The moment people are put on a public board as advocates of "interests" it will be found that they are apt on that board to act as advocates, not as impartial colleagues. This has already been noted on certain technical boards, where special associations have been invited to nominate representatives, and these representatives have been heard in debate frankly to admit that they sat there to watch over the interests of those who sent them. But what will be the effect on the education committee as a whole?

In our local civic life parties are often fairly balanced on the county or borough council, and the committees are also constituted to reproduce the proportions of the main body. Thus, if we had an education committee of 31 in a large borough such as Birmingham or Manchester, of whom 16, or even 18, were taken from the council, these 16 or 18 would be not very unequally divided, but if to these we add a dozen representatives of "interests," the greatest interest of all—that of a liberal supply of good education to the unorganized mass of the industrial population—will be in danger of going to the wall. Let anyone read the organs of the secondary teachers, papers such as the *Journal of Education* and the *Educational Times*, and they will see a bitter jealousy of what they consider the encroachment of popular education. See also the utterances of the deputations from the bodies of secondary teachers who wait on the Duke of Devonshire. They go so far that even the Duke is obliged mildly to remind them that the higher grade schools of the school boards are doing useful work, and that what is needed is not their abolition or destruction but their coordination.

If elementary education is to be put under these new committees, the whole life and activity which have characterized the growth of elementary education in our large towns will disappear. Not only will the instruction be reduced as low as possible, and few or no higher elementary schools will be promoted, but on questions of school provision districts will be left unprovided for and the interests of denominational schools will be energetically protected. That one of the effects of superseding school boards by town councils is to secure rate aid to denominational schools is admitted by Sir John Gorst himself in an article written by him in the *Nineteenth Century Magazine* of November, 1896. He there says (p. 705) that if

the school board were a committee of the town council it would have had regard to the general interest of the town. "It would have clearly been the interest of the town at large to keep the already existing schools on foot—to make them perfectly efficient, and to build new schools only so far as it might become necessary to supplement existing accommodation. The interests of the managers of voluntary schools would have been identical with those of the town, and when interests are identical parties easily come to terms." There is no doubt that it is part of the scheme of the bill before us that shortly the education authority shall take over elementary education in day schools, and that then the denominational schools shall be aided out of the rates. This it is which makes the proposed constitution of the new education authority a matter of such serious moment. Once constituted, the education committee can not be changed without the consent of the board of education.

Passing now from the constitution of the education authority to its powers, we come to clause 2 of the bill.

Here the ridiculous inefficiency of the bill for good, side by side with its wide-reaching effect for mischief, stands out. Both in the bill of 1896 and in last year's bill, it was enacted that the whole of the beer and spirit money (residue under section 1 of customs and excise act, 1890) should be applied to education.

This year the money is merely applicable—that is, county and county borough councils are free if they please to apply a whole or part in relief of the rates. Surely the least that should be done, if we are in earnest in creating new authorities to develop higher education, is to require that the whole of this fund shall necessarily be applied to this purpose.

In clause 3, subsection 2, we come to a very important provision, to which little attention has hitherto been directed. It is here enacted that the council may levy a rate for "special county purposes," and the council may determine what parishes are to be liable to contributions for any special county purposes.

There is nothing said as to the right of the ratepayers in the specially-rated area to have a voice in the spending of this money. But at once we see the power of levying a rate in aid of a denominational privately-managed school. The county authority has power to establish or to aid elementary evening continuation schools. By levying a rate in a rural parish with no school board, they may materially aid the day school by paying an extra salary to the head teacher for evening work, by paying a rent for the building, and in other ways; and, of course, when the other elementary restrictions are removed, as we are warned they will be, this packed county education committee may subsidize by means of local twopenny rates any voluntary schools in the county without any provision that the ratepayers so assessed shall manage the schools to which they contribute, or secure equal opportunities, regardless of churchmanship, for the appointment of teachers or even of pupil teachers in the school. Fancy in a Nonconformist county like Cornwall, if by means of a judicious admixture of "interests" in the education committee, the village church schools were to be aided in this way. In a Conservative county like Dorsetshire, Berkshire, Sussex, and many others that might be mentioned, the future of the villages would indeed be gloomy, with irresponsible management and exclusive religious ascendancy permanently imposed upon them. The remedy, perhaps, will be little better than the mischief—the introduction of the ecclesiastical question into county council elections, and the transference from school boards to the new educational authorities of the so-called "religious question." It will be noticed that clause 5 contains the restrictions upon an education authority as to the aid they may give to schools. There is no prohibition against a county council establishing or maintaining a school in which there shall be exclusive religious teaching of one type—for instance, Church of England—and in which the head teacher and all the staff may be required to be in orders or members of a particular church. If the school is a boarding school, there need not even be a conscience clause. Thus an education authority might take over one of the notorious Woodard schools, with all its existing rules, and maintain the present committee of managers as a local committee, maintaining also all the practices which have raised so much apprehension among ordinary Protestants.

They might by the terms of the act take over and support a Roman Catholic convent school, taught and managed by nuns. All the safeguards which were contained in the technical-instruction acts are swept away.

The least we should demand is that in any school established or maintained by the new authority there shall be no preference or disability for any member of the teaching staff, or for any scholar, by reason of his belonging or not belonging to any church, and that care shall be taken in constituting any committee of management that no persons be excluded by reason of their church membership, but that both in teaching and in management the whole constitution shall be free from all denominational bias.

Equally stringent conditions would not be applied to all schools aided, but at any rate provision should be made that where the public aid exceeds the private income from subscriptions and endowment somewhat similar conditions should be imposed, and where they are not accepted the aid should be limited so as to secure that sectarian institutions shall be in substance maintained by the contributions of those who manage them and enforce their sectarian character.

Clause 6 is a very complicated one, and is intended to overcome the difficulty which was perhaps the principal cause of the shipwreck of the bill of 1896, namely, the jealousy between the county and noncounty boroughs. It is here proposed that where any urban district will raise any rate not exceeding one penny in the pound sterling for the purposes of the act, they may, by agreement with the county authority, or, failing agreement, by the decision of the board of education, do so, and in that case the urban authority in question shall manage the schools or colleges within their immediate area to such an extent as may be agreed between them and the county authority, or, failing agreement, may be decided by the board of education.

Everything is here finally left to the board of education, who are masters of the situation. This is another of the numerous provisions of the bill which substitute bureaucratic absolutism for definite constitutional rights. It is, of course, hoped that this offer will appease the lesser boroughs. But they will still be at the mercy of the county authority, for supposing the smaller urban authority to levy its rate and get the support of the board of education, it will be in the power of the county authority then to levy under clause 3, subsection 2, the twopenny rate as a special purpose on the urban district in question, and thereby force them to maintain what would be a county school out of a special local rate; or, again, the county might leave them the county school to manage without any funds by which to support it, in which case we may readily imagine that the urban authority would not make the request for management contemplated in the section.

Before we come to the important schedule of acts repealed, we may deal briefly with clauses 8 and 9, which profess to get over the difficulty caused by what is known as the Cockerton judgment.

Briefly the facts are these:

For many years, ever since the passing of the act of 1870, and before that act, grants were paid to elementary schools by the science and art department. Public elementary schools were recognized as recipients of these grants by the directory, which is the official set of regulations of the science and art department, and by the code, which similarly regulates that part of the education department which is administered from Whitehall.

Briefly to illustrate how far this went it may be mentioned that in 1868-69-70 the science and art department founded scholarships to be competed for in elementary schools, and to be held by scholars in elementary schools up to the age of 16, subject to passing yearly in one or more subjects of science and art set forth in the scheme.

Similarly the code in 1871 provided that grants should not be paid to scholars in public elementary schools from Whitehall for any subjects for which the same scholars were receiving grants from the science and art department. At that date scholars working in Standard IV could be presented and earn grants from the science and art department; but the limit was gradually raised till at length no scholar who was not working as high as Standard VII was eligible for the general grants of the science and art department.

But during the last few years the board of education has changed its policy, which for many years encouraged and stimulated the teaching of science to scholars in elementary schools, and through successive limitations so changed its regulations as at length to lay it down that no scholar on the roll of a public elementary school could receive grants from the science and art department. At the same time the regulations of this department, which for more than forty years had proclaimed that it existed for the benefit of the industrial classes, were changed so as to transfer to the middle class those grants which Parliament had so long voted for the industrial class.

Under these circumstances the school board for London was surcharged by the auditor for certain payments made in connection with the science and art department on the ground that school boards had no power to spend the rate or the school fund upon teaching under the science and art department, either in day or in evening schools.

When the matter came before the court judgment was given in favor of the contention of the auditor, and it must therefore be taken as legally decided that the practice which has prevailed ever since the passing of the education act is illegal, and that school boards have no power to mark their scholars on the registers of the science and art department, or to obtain grants from that department. But,

in addition, other points were touched upon and other intimations of opinion given by the judges which, though not essential to the judgment, yet raise serious doubts of legality in the minds of all members of school boards.

One is, how far the code is not only a standard of obligation but also a limit of the right to teach.

The school boards had generally considered that the code laid down the conditions of Parliamentary grants but did not fetter the right of school boards any more than that of other managers to teach other subjects, provided they conformed to the definition of an elementary school laid down in the act that "the principal part of the instruction should be elementary."

In support of this opinion they bore in mind that the code, down to 1883, paid grants for scholars in day schools up to 18, implying many years of teaching beyond the highest standard; that the free education act gave parents a right to free education up to 15, which implied one or two years' instruction beyond the range of the standards, and that the code itself, even at the present day, recognizes payment for scholars beyond the seventh standard up to the age of 14.

The new higher elementary education clauses in the code also recognize payment for scholars up to 15 and attendance up to the close of the year in which they reach 15. All this, however, is now shrouded in an atmosphere of doubt and obscurity owing to various incidental dicta of the judges. There is, moreover, another vital question raised in reference to evening continuation schools.

At the passing of the education act, 1870, the Government and Parliament recognized attendance in these schools and payment for scholars up to the age of 21. Subsequently the code from time to time varied the upper age for payment, but in 1892 abolished all upward limit and paid for adults of any age.

In consequence of this school boards have greatly extended their evening school work and large numbers of adults attend these schools, not only for more advanced teaching, but also for teaching of a very elementary kind. The judges, however, who heard the case stated that, in their opinion, the act of 1870 dealt only with children and that the rights of school boards were limited by that act, and consequently, that while it was quite lawful for the board of education and for Parliament to vote money for the instruction of adults in evening schools it was not competent for school boards to take advantage of those grants.

As school boards are the bodies which have done far the most in the work of evening schools, this intimation of opinion came as a matter of great surprise and threatened to close a large number, in some cases nearly all, the evening schools. In the year ending August, 1900, there were on the roll 509,000 scholars in evening schools; of these 332,000 were in board schools and 177,000 in other schools.

Of the scholars in board schools, 51,000 were over 21, about 44,000 between 18 and 21, and 73,000 between 16 and 18.

If we take the opinion of the judges in the strictest sense, all these, amounting to 168,000 scholars, or more than half those attending board schools, would have to be excluded. Even if only those over 21 were reckoned as adults enormous injury would be inflicted on the work, and every one is agreed that this work not only should not be arrested, but should be encouraged to go forward. The Government, by clauses 8 and 9, claim that they are dealing adequately with the question. They proposed that where a school board, at the passing of the act, is maintaining out of the school fund a school which it is not lawful for them so to maintain, they may apply to the education authority and pending the constitution of the educational authority they may apply to the county council, who may authorize them to continue the school on such terms as they may agree, and failing agreement, on such terms as the board of education may decide.

First of all, it may be pointed out that this clause is not adequate. What is wanted is a declaration by Parliament of what it is and what it is not lawful for a school board to do. In the case of all public elementary schools it had not hitherto been doubted that the code indicated a range within which at least all public elementary schools were entitled to teach. This is now discredited. No one questions that the recognition of adults in evening schools was a wise recognition and is doing much good in the country. We want an affirmative Parliamentary enactment that all managers of public elementary schools, board and voluntary, are legally entitled to take full advantage of all the provisions of the codes for the time being.

The code is brought before Parliament yearly. Parliament votes money yearly for the purposes of the code. Should Parliament disapprove of the code in any item no one can doubt that the Government, which depends on Parliament for its existence, would modify any clause to which Parliament seriously objected. We have therefore sufficient sanction for the conformity of the code to the prevalent opinion of the country, and have a fair claim to ask that a clause be enacted pro-

viding that school boards shall be entitled to use the school fund for the purpose of all teaching which is recognized by the codes in force for the time being.

As to the grants under the science and art department, the Government is at liberty to modify its conditions from year to year, and it has so modified them as, apart from the Cockerton judgment, to exclude school boards from benefiting by them. Some of us regret that policy, but in face of the action of those who have power to act we can only regretfully submit, and hope that, pending the day when the English democracy will insist upon being as well treated in their schools as their fellow-citizens in Scotland, the Government will administer the higher elementary education section of the code in the spirit they promised when they first introduced the minute and not in the spirit by which they have subsequently minimized and defined it away. Then, at any rate, all those who wish for as liberal a scheme of education as the law offers up to 15 will be able to obtain it without obstruction.

But suppose clauses 8 and 9 to become law—at the soonest this bill, with its numerous wide-reaching and serious innovations, can not become law till the end of July. By that date the boards and the county councils will have adjourned for the summer holidays, and even if they had not, can anyone suppose that the negotiations necessary could be rapidly completed, even if they did not result in an appeal to the board of education. Meantime all the arrangements for the autumn session of even ng schools should even now be nearly complete, and if put off till August or September can not be completed. Nothing will meet the present deadlock short of a bill of one clause, authorizing school boards which, during the session preceding the passing of the act, have conducted schools declared illegal by the recent judgment, to continue those schools for one year, and for another year if authorized by the board of education, pending the settlement by a well-considered bill of all the questions raised.

The clause under observation is also inadequate in that it only deals with existing schools, but the need for evening schools for adults is a growing one, and school boards should have power not only to continue those they have, but also to open new ones where they are necessary.

We now turn to the acts repealed. It would seem that by the repeal of the technical instruction act Ireland is left without any provision for technical instruction. But more important is the loss of the safeguards already referred to.

Sir John Gorst, in his speech introducing the bill, said that as the provisions of the technical acts were reenacted there was no longer any need for them. The following facts should be considered in connection with that statement:

In lieu of the provision of the act of 1889 prohibiting the local authority from supplying or aiding instruction to scholars in the standards in an elementary school, the local authority is now merely forbidden from making a grant to or establishing or maintaining a public elementary day school.

If a school refuses the conscience clause of the act of 1870, and thereby is prevented from being a public elementary day school, it may be aided or even maintained by the new authority. Moreover, so long as the new authority does not give a grant to the school, it may supply instruction to scholars working in the standard, and thereby intrude itself into the sphere of elementary instruction.

The technical act, 1889, made the appointment of a committee optional. The new bill makes it compulsory.

Subsection 3 of section 1 and section 2, both safeguarding the rights of school boards, are repealed.

All local authorities except county councils and county borough councils are abolished. The rights conferred by section 6 of the bill on urban authorities fall far short of the rights they enjoyed under the previous acts.

The schools for science and art act, 1891, is not repealed, but it is hard to see how, when the local authority mentioned in that act is abolished, the power given to managers to transfer their schools can subsist in reference to the absolutely new and different authority created by the present bill.

It will be noticed that by the bill, clause 1 (7) and clause 3 (1), the power to raise a rate is reserved to the council, and not delegated to the education committee. Thus while the council, by refusing to raise a rate, may cripple the operations of its committee, it is apparently intended that it shall be unable to control the application of the rate when made. This is an obscure point, coupled with the other question whether the education committee is or is not subject to section 83, subsection 2, of the local government act, 1888. Certainly county councils will not like to be ousted from the decision of such questions as to how much of the money voted by them shall be allotted to scholarships, and what the number, tenure, value, etc., of these scholarships shall be; how much money shall be spent on technical as opposed to secondary education; how much to technological and trade classes as distinct from general science and art instruction.

It may be noticed, further, that whereas school boards are subject to the greatest publicity in respect to their work, so much so that by section 87 of the act of 1870 every rate payer is entitled at reasonable times to inspect and take copies of all books and documents belonging to or under the control of a school board, there is no such power or any similar power for a rate payer to know what this new education committee may be doing. Indeed, in the largest technical education committee in England it is contended that, being a committee of the county council, all its reports and documents are confidential, and no one has a legal right to see even its minutes or inspect its accounts. As the sittings of this new body will in most cases be private, some power for the rate payer of seeing their accounts and reports is surely a matter of great importance. It is of importance to insist on this even with the present powers proposed by the bill, but in view of the avowed intention of making these bodies the elementary local authorities of the future, into which, as Sir John Gorst said, the school boards will be absorbed, the point is of the utmost importance.

As to the efficiency of the proposed committee, even for the purposes at present included in the bill:

There is no obligation on the council to find any funds. There is no obligation to provide sufficient means of education; there is no machinery, as there was in the case of elementary education under the act of 1870, to ascertain what education is needed. There is no security that the local authority shall have regard to the suitability of existing school provision, either as to premises, fee, staff, or denominational character.

It is clear that if we are to have local municipal authorities for secondary as well as for technical education we should not make an attack on municipal liberty by forcing these bodies to form composite committees on which "interests" must be represented, nor can we safely trust the discretion or fairness of the present board of education so far as to make them masters of the situation. If Parliament desires a committee of composite character it should lay down some limits within which the discretion of the council should be fettered. But it is submitted that at the present day we shall be safest if we frankly recognize the elective authorities, assuming them to be fit to be trusted, and abandon this purpose of packing a popular body with nominated associates forced on it from without for the purpose of defending interests, not of advancing education. Above all, let us not make nugatory the power of the purse which bodies imposing a rate ought to possess—the power of voting their estimates in detail and by an appropriation bill securing that the money they vote shall go to the purposes for which they vote it.

The dangerous power of subsidizing schools under private management, the obvious intention that these subsidies shall be used for elementary schools, and the consequence which may follow—that the parents, especially in rural districts, may be deprived of the power of managing the schools to which they are by law forced to send their children—make it the more essential that we should not replace the school board by a body in which the partisans and advocates of clericalism and irresponsible management shall be put in a position of vantage to scheme for the control and administration of money levied from the ratepayers without giving the ratepayers who find the money the fullest voice in its application, and securing that they have the fullest management of the schools so supported. If this bill becomes law the people, both in towns and in rural districts, but especially in the latter, must give up all hope of further progress in the schools available for the mass of the community. They will see them stunted and crippled through the jealousy of feeble schools, nominally secondary, but often inferior in all but the fee charged to the best board schools, and they will see the combination of this jealousy with clericalism and sectarianism carry out a successful conspiracy against the aspirations of those who look for brighter days for the people of England, which never needed more than now, in these days of keen international competition, the best, the broadest, the most popular, and the most expansive system of public schools for the whole community.

Public schools under public management for all, an aim which would slowly have come round but for the opposition of powerful interests, will have to be the rallying cry of the progressive section of the English people if once the existing compromise of our national system is torn up in the interest of ecclesiastical supremacy.

E. LYULPH STANLEY.

A NATIONAL SYSTEM OF EDUCATION.

[From the Fortnightly Review, May, 1901.]

Is a coordinated system of national education impossible in England—that is, a system that takes in the whole “populus” and is not concerned with the “plebs” alone? Or, leaving out the universities,¹ which can always come in later, can not some scheme be devised whereby nationally and territorially, at the center and in the localities, all our secondary, technical, higher grade, board, voluntary, and even private schools for both sexes may be brought into a real if elastic organization, and help us thereby to present an undivided front to the steady, phalanx-like pressure that better organized nations are already exercising on us, so much so, that in the world of trade, which is often the first in which the international struggle for existence makes itself manifest, we everywhere see our outposts being driven in and our lines of communication threatened, while the general effects of this growing competition are beginning to make themselves felt in the United Kingdom itself?

Our war office is often held up to ridicule as a model of inefficiency. But what should we think of it were the various branches of the service under the control “of no fewer than ten separate cabinet ministers,” whose “several departments usually scorn to consult together?”² Yet that is precisely the actual condition of our educational army. It is true that in 1899 an attempt was made to lay the foundations of a central authority, but, as will be shown hereafter, much of the work has yet to be done if order is to be evolved out of chaos. But locally the jumble of authorities and schools is far greater. Here the various educational agencies are either isolated from one another or else under authorities which are often at loggerheads. School boards wage an unremitting warfare with the voluntary schools and attempt to establish a permanent foothold in the area of secondary education. Secondary schools squabble with technical, and the committees at the head of the latter attempt to oust the school boards from their higher work, whether in day or evening schools. As for the private schools, no effort is made to encourage the efficient or suppress the incapable. Educationally in England, as far as unity and organization are concerned, we are about on a par with the heptarchy. In a good many places there are friction and overlapping, but in many more this is fully compensated for by a woeful lack of even a bare minimum of educational supply. In this hurly-burly of wrangling authorities and competing schools few have time to raise themselves above the din of party and sectarian strife, and, looking at education from the national point of view, realize that it is one of the chief duties of the State to provide adequate types of instruction for future citizens, according to the condition of life to which they are called; while the democratic ideal of an educational ladder from the gutter to the university naturally suffers from the want of cooperation among authorities and coordination in schools. The matter is not a mere question of money. We spend no less than twenty millions a year out of rates, taxes, and endowments to maintain this “hotchpotch” of educational service. To go on spending further sums to patch up the existing defects can do but little good. What we want is a system, in which nothing shall be crushed out and everything have a chance of development, or, in other words, some sort of organization in which there shall be a place for every type of education, and every type shall be kept in its place.

The Cockerton judgment of last December has brought the present confusion to a maximum. If it is upheld by the House of Lords, school boards will be altogether debarred from the province of secondary education. For the nonce, however, the Government have decided to do nothing as regards the school boards, but they have expressed their determination to proceed with their plan of creating local authorities for secondary education. If the measure is to be carried out on national lines—that is, if it is to unify and consolidate the education of the country, it is clear the Government will have to decide against any idea of a condominium, and plump for one paramount authority, whether school board, county council,³ or some new body. For the same reasons the body on which they decide will subsequently have to be made the authority for all grades of education.⁴

¹ The universities are in some cases already in the pay of the State, and therefore subject to its control; while the others—probably with the increasing need of expenditure on research—will in the long run be obliged to come to Parliament. But in the present article subordinate questions and details must necessarily be sacrificed.

² See Fabian Tract No. 109, “The educational muddle and the way out,” a masterly contribution to the present imbroglio which all should read.

³ The term county council includes, of course, also county borough council.

⁴ Cf. the resolution “in favor of one local authority for education within a given area,” carried unanimously at the recent conference of the N. O. T.

Otherwise, the jumble described above will only be intensified and perpetuated. In this article, then, we shall consider the problem in its complete form—that is, the creation of a single local authority for not only secondary, but all other kinds of education below the universities.

At first sight it might seem expedient, in order to create a really comprehensive set of local authorities, to disfranchise the county councils of their educational rights, disband the school boards, and hand over their educational duties to an entirely brand-new authority. But this suggestion, though possessing all the specious value of symmetry and completeness, would arouse the most prodigious opposition. The two authorities already in the field would fight it tooth and nail. Localities would be up in arms, and members of Parliament would voice their opposition in Parliament. All “placeholders” and officials concerned in the change, on seeing their occupation in danger of being taken from them under the bill, would join in the agitation against it. But there is another yet more formidable obstacle. Such a body being elected solely for education, would introduce into those sections of education which have hitherto been free from it all the miserable religious wrangling which has been such a marked feature of the school-board régime and has proved such a sore let and hindrance to the cause of education. But the most fatal objection of all is that such a body would be an *ad hoc* one. Now, the chief cause of the fearful tangle into which our local government had got before the reform of 1885 was the indiscriminate creation of *ad hoc* bodies whenever some fresh function of county or municipal service made itself felt. Those who believe that local politics can only be made real to the ordinary citizen when they are simple enough to be “understood” of the people at large, would strongly oppose the erection of yet another obstacle in the path of a reform which has already made considerable progress.

A brand new body is, therefore, neither desirable nor possible; but when we come to choose between the two existing bodies, we see that the school board, as one of the principal *ad hoc* bodies, falls under the condemnation of the preceding argument. And even if this reason were inadequate—and the practical man will always be ready to support an anomaly which has proved its inherent usefulness—there are further facts which effectively preclude school boards from being chosen as the local authority. To put the case in a nutshell, there are still some large towns in which the system has not been set up, more than one-third of the population of England are not in school-board areas at all, and more than half the children are in voluntary schools, which are more or less avowedly maintained to keep outschool boards. On the practical grounds of imperfect jurisdiction and of the undesirability of perpetrating, and even intensifying, religious squabbles, it would seem impossible to make school boards the educational authority.

There remains then only the county councils to act as the new authority. And here it is not merely a case of Hobson's choice. The councils themselves have much to commend them. They cover the entire country; their areas are sufficiently large to exclude the faddist, and secure a certain degree of ability and large mindedness in their representatives. They have already acquired administrative experience in dealing with secondary and especially technical education, and after a certain amount of wastefulness inseparable from the winning of their experience, they are now expending the funds at their disposal with good results.

But if the county councils are to be the universal authority, it is probable that the school boards will have to have taken from them even that which they have. This question is best dealt with by regarding the cases of the counties and county boroughs apart. As regards the counties, there would be little opposition to disestablishing the small local boards, whose confined areas have generally been against successful administration. The disestablished boards should not, however, be dissolved. Evicted as autonomous directors they might be reinstated as managers under the county council, with power to co-opt future members from the parish council or outside. The valuable experience of the members would therefore be retained and fortified at the same time by the light from above of the county council, or rather its educational committee. The latter would probably be modeled on the same lines as the present statutory technical committee, which would form its nucleus. To render it really representative of all educational interests, while remaining fully under popular control, a minority of experts from the various grades of education should either be co-opted or nominated by the school groups themselves; in the latter case the nomination should rather be made by managers or governors than by the teachers themselves. In any case no committee would be complete without representatives from the secondary, technical, board, and voluntary schools, and even representatives of the private schools, to take a leaf out of French experience, might be allowed to be present when matters affecting their interest were discussed. Women, of course, should be among the co-opted members.

The work to be done is so extensive the county council would necessarily have to delegate large powers to any important noncounty borough within its area. The apparent difficulty between these two sets of bodies, which is largely one of devolution, will probably right itself once the province of the county council has been clearly understood. In the same way, though in a less degree, powers should be delegated to the district councils; these in their turn would allow a certain liberty of action and initiative to the bodies of governors or managers of the schools within their area and under their control. But the delegation of powers must not stop here, for it is only under such a system that freedom and its correlative responsibility can exist, and freedom rightly understood is quite as vital to good teaching as to good administration. Too much red tape in the school is sure to produce mechanicalness and routine. To strictly define the duties of all is to split up the school into water-tight compartments. Such a measure ruins the unity of the school, which can only be secured when the authority in educational matters is vested in the head master. This has been deeply felt in the French secondary schools, and one of the chief proposals of M. Ribot's commission is to give more authority to the heads of the lycées and colleges. In our secondary schools we have recognized this, and have given our head masters at least a commanding voice in the selection of the staff. The same privilege ought to be extended to the head teachers in our primary schools. They ought to be the best judges of what type of assistant is best for their schools. This does not imply putting the assistant teacher more under the thumb of authority. On the contrary, his position in matters of tenure must be safeguarded, his right to a pension—whether engaged in primary or secondary teaching—recognized and secured, and, above all, he must be accorded a large liberty in his teaching methods. Unless he, too, has his sphere of liberty to turn round in, his teaching will become mechanical. There must be "play" and elasticity in the educational machine from the top to the bottom. Otherwise we shall be merely creating a hierarchy of taskmasters.

The county council would naturally possess in the counties all the rights of the school boards to levy rates, or rather the whole area should be rendered liable to the education rate, and the latter be merged in the county rate. Being the authority for all forms of education, they would naturally, with the possible exception of the private schools, have the right to inspect not only the board schools, but also those of the voluntary schools who desired to come under their régime in order to qualify as efficient. This idea of subsidizing the voluntary schools seems a bitter pill to some people. But assuming that, as they allege, the voluntary schools are inefficient, have we a moral right, from the national point of view, to allow more than half our children to suffer under permanent educational disadvantages until the voluntary schools are starved out in the distant future? Besides, are not the rights of conscience of the sectarian equally respectable as those of the secularist in the eyes of the State? We have spent thirty years in trying to ignore the religious question. The effect has been far from a success. We have not yet attracted half the children of the country into the State primary schools. Let us see if we can do better by recognizing it and making allowance for it. Those voluntary schools which accept the aid of the country will naturally submit to the county council regulations in so far as they do not touch on the teaching of religion, which can be relegated to the first hour of the day.

They will also accept the principle of public control by admitting to their board of managers representatives of the county council. Such a proceeding will greatly add to the security of teachers' tenure at these schools, and likewise effectually protect any small minority in the district from persecution. If the special-aid grant were further paid through the county council committee, the mere threat of the withdrawal of this and other aids would bring the most recalcitrant body of managers to their senses. The same grants might be withheld from those sectarian schools which, while declining to come under the jurisdiction of the county council, an action which would be quite within their rights, were also proved by Government inspectors to be below the normal standard of efficiency. In this case the central authority might close the offending school, or at least allow the county council to open an efficient one alongside. As regards the secondary schools, they could participate as usual in the distribution of the whisky money, and the technical rate (henceforth called secondary and technical), would be raised at least to 2 pence. And lastly, as regards the private schools, our supply of secondary education is still so insufficient it would probably pay the county councils to allow their scholarships to be held in such private schools as pass the test of efficiency, if they did not go further in giving aid to such schools and taking into account

¹ See Memorial of the College of Preceptors to the Duke of Devonshire in the Educational Times for March, 1901.

their presence in questions relating to the adequacy of local supply of secondary education. Apart from any claim that "private venture" may have on the community, it is a very moot point whether the State itself does not suffer a grievous loss by crushing out private enterprise and substituting everywhere its own schools. These schools are essentially centers of experiment, and by their competition they form a safeguard against routine and lethargy in public schools. It is noteworthy that the Ribot Commission on secondary education in France strongly advocated their establishment and encouragement in districts where the State supply was inadequate.

The advantages attached to the adoption of the county council as the paramount educational authority are well-nigh incalculable. It would abate the religious difficulty, if it did not eliminate it. It would abolish the petty tyranny that sometimes disfigures small school boards and voluntary managers, protect teachers, and safeguard the rights of minorities; for the county council, being composed of men of a certain caliber and attainment, would never tolerate such excesses. Above all, it would improve the financial condition of the voluntary schools, and, by subjecting their managers to public control, induce them to take a wider view of things, while by merging the education rate in the general county or district rate, it would render the expenditure on education less unpopular. Again, in taking secondary education under its control, it would at once bring home to people the truth that secondary education is quite as much a matter of national and local concern as elementary. This unification of local authorities would lead directly to the local unification of our school supply.

The county council, as patron of all schools within its area, would not be tempted to allow its attention to be monopolized by any special type. It would frame its budget with a view to the lawful exigencies of all. It would quickly discover and correct overlapping, and where there was a lack in the supply it would do its best to supplement it, and thus in the long run we should have an educational system as intelligible as that of France and Switzerland, though by no means identical. And this is an all-important matter. Democracy, if it is to succeed, must take a deeper interest in its schools. And to enable it to take such an interest, we must make the aims of the different types so intelligible that the very man in the street may comprehend what they stand for and their value to the service of the State. Nor is the man in the street the only person affected in the matter. Much of the Philistine attitude of the middle classes toward learning is derived at bottom from their very natural inability to comprehend what the school really stands for. People will be far more ready to make sacrifices for education when they understand what it really means and aims at. And, finally, the ladder from the gutter to the university, by which we alone can hope to organize the selection of talent and thereby reorganize and recruit society, can never be really complete as long as there are rival authorities in the field, each with a rival set of ascenseurs.

In the towns the propriety of transferring the school boards to the municipal authorities may seem at first sight a more debatable step. They have done, on the whole, excellent work; they have acquired an experience which can not be gained in a day, and built up an administration that represents the expenditure of much care and thought. On the other hand, it is precisely in the towns that the overlapping is at its worst, and a determined attempt has been made to crush out not only private enterprise, but also the lower secondary schools. Thus in London during the last ten years the number of boys in the secondary schools has decreased one-half per cent, though the population shows a rise of 8 per cent. It seems that the fault of this is to be attributed to the aggressive policy of the school board. According to evidence¹ collected on the subjects the clever pupils are either retained in the primary schools beyond the age at which their transfer to the secondary is profitable, or they are unduly "hustled through" the lower standards, to the detriment of their writing and arithmetic, in order to enter the higher grade, toward which they are directed, to the detriment of the secondary schools. One does not know what the reply of the school board is to this serious charge of exercising pressure to prevent clever children from following the normal course of being passed on to the secondary schools in due season, and thereby impairing the utility of the educational ladder.² If the secondary schools are not doing their work as they ought, let the new authority be created as soon as possible to make them. But the rate payer has a right to protest against the rates being used

¹ Cf. "Notes on evidence of the effect on London secondary schools of the attempt to develop secondary teaching in higher elementary schools." By Rev. E. S. de C. Laffan.

² Of course the higher grade school, in as far as it acts as the crown of primary education, as in France, is a natural and necessary outgrowth of the elementary school, possessing, as such, unimpeachable claims on the community, and, if illegal, should be recognized as soon as possible by statute.

to found new schools to compete with existing institutions which, if they do not do their duty, ought to be made to do so, and it is quite probable that they do; otherwise the technical education board would not allow its scholarships to be held at these schools.

The plain question, therefore, is this: Are we then going to permanently allow two sorts of secondary education to grow up, both more or less professing to do the same work, but one financed if not run by the county council, and the other promoted by the school boards? From the national point of view is there any gain whatever from such a clumsy and expensive duplication? Does it not mean the perpetuation of friction and overlapping, an educational schism—in fact, the scission of the nation itself into two parties? Whereas, with one authority at the head, the problem would at once be simplified. Given a certain area, what is the supply of education on the ground? If there is redundancy, correct it; if there is scarcity, supplement it. Is the question one of popular control? Can the school board, elected on a cumulative franchise, be called a really democratic body? Does not the low percentage of votes polled at its elections—a bare one-fifth at the last London election—show, by the rough test of experience, that however much it may profess to be democratic, it only interests a fraction of democracy, whereas the county councils are, both in theory and practice, democratic and popular? We shall never have order, coordination, or popular interest in education till we have a single authority which is really representative of the people. There is, then, only one remedy. The school boards must be taken over by the borough councils, but it would be probably wise to give a term during which they might be taken over. There should, in fact, be no forced liquidation, but they should be acquired as going concerns by the borough councils, who would thus have time to look round and see how they could be gradually taken over with the least amount of educational and administrative disturbance. The best members of the school board would at once be co-opted onto the municipal education committees, in order that the loss of experience and administrative ability might be reduced to a minimum.

London itself would form a problem apart. The school-board system as a whole would be placed under the technical, or, as it would then be called, the education board. But the work in this case would be too gigantic for a single committee, even with subcommittees to aid it. While the education committee would exercise a general oversight and see that a minimum standard was everywhere observed, large powers would be delegated to the new municipal bodies, who would exercise a limited control over their own schools, and thus be able to take an interest in them. The voluntary schools would naturally be allowed, as above, to submit themselves to the inspection of the board and participate in its grants, and what has been said under the headings of co-optation, finance, etc., as regards the country, would, *mutatis mutandis*, apply to the big towns and London.

As regards the central authority, a preliminary effort has been made under the board of education act to unify the chief departments concerned with education. The education department and the science and art department have been united, and certain powers have been taken over from the charity commission—to an insufficient extent according to the headmasters' conference. The office has been divided up into elementary and secondary, with technological. The exigencies of official administration will probably make the division between secondary and technological as distinct as between it and elementary. But, apart from internal reorganization, what the office wants at the present time is a knowledge of the facts with which it has to deal.¹ Hitherto, owing to the system of payment by results, it has been overwhelmed by questions of detail and audit. Perhaps the establishment of the Block grant may set it free to study the admirable collection of reports which have been amassed by its special-inquiries section. It must utilize this knowledge to formulate principles which it should be ready to apply if necessary. To assist in this delicate task it should make full use of the consultative committee, who are the natural "go-between" between the schools and the universities. A capable secondary inspectorate is also a *sine qua non*, not only as the mouthpiece of the department, but as its eyes and ears, for a department without an adequate inspectorate is like those lay figures of whom it has been said "they have eyes and see not, ears have they and hear not."

And, lastly, there must be a wide measure of devolution to the local authorities. The ideal education office is not a clearing house through which every scrap of the education of the country should pass, but a central office for giving unity and direction to the work of the authorities beneath it. All that has been said about

¹ See R. P. Scott: "Secondary education. Legislation with special reference to problems awaiting solution," in *Education in the Nineteenth Century*. Edited by R. D. Roberts. Cambridge, University Press, 1901.

the advantage of unity and clearly defined organization applies with added force to the central authority. In many cases the localities will require the assistance of Parliament to help them to render their supply of education adequate. Their demands, clearly formulated, will enable the office, through its spokesman, the minister, to insist not only on these local needs, but to show how they are only part and parcel of the larger question of improving our third line of defense, which education represents, and for preparing for the new Armageddon—not that dreamt of by theologians—which awaits us in the near future.

The education question is really only an outcrop of the fundamental problem of national life and welfare. It is from the national, or rather international, standpoint alone that we can realize the supreme need of unification and consolidation at the present juncture. During the last fifty years the political policy of the States that make up the civilized world have profoundly changed. It seems hardly likely that we, who form an integral part of that world, can remain unaffected by these alterations, although, from a false sense of security, we may for the moment prefer to ignore them and refuse to shape our policy to suit the new outlook. Speaking broadly, however, it will probably not be contested by thoughtful men that we have been passing through and are now passing out of a period of *laissez faire*, and are willy-nilly, being forced once more into a cycle of state control. It seems strange that in many ways the old-fashioned Liberal and Radical party, who represented the *laissez faire* doctrine at home, should have been the chief means of precipitating this change abroad. By their deep loyal and unwavering sympathy for oppressed peoples, whom they regarded rather as mere aggregates of individuals, they have given an enormous impetus to the growth of nationalities. While they thought they were helping to emancipate downtrodden sections of humanity, they were really assisting in the birth or development of states and empires which must henceforth be reckoned with in the struggle for our own national existence. To take only a few instances. Had Great Britain withheld her aid from Greece, her sympathy from Italy, thrown herself on the side of the Southern States against the Northern, backed France in 1870 and retarded thereby the consolidation of the German Empire, it is very probable that the period of *laissez faire* might have been prolonged in this country. More organized than many of our neighbors, though loosely organized, we should not have felt so shrewdly the need of further organization.

But when Germany, in 1870, suddenly stepped into the front rank of nations, *laissez faire* was doomed. The power which had largely built up its unity through its commercial policy of the Zollverein was little likely to rest content with this internal victory. Having set its house in order, it had every right to dream of a *Weltpolitik*, and this it has henceforth pursued with that sheer, dogged, determined diplomacy which only retires in order to advance in better order, and which surmounts or circumvents the most formidable obstacles by its unflinching consistency. It was not long before the new force began to make itself felt in neutral markets. And since commerce represents one of the main items in our national livelihood, this new form of competition caused much ado in England. The United States have pursued a similar policy. Its great capitalists have forced on the country a protective tariff, and what is more serious, believing that Providence is on the side of the big battalions, have combined among themselves instead of practicing the cut-throat competition à outrance dreamed of by the old economists, whose morality is summed up by the phrase *homo homini lupus*. The battles of commerce are often decided by the last "sou," for it will pay any trading corporation to run a thing for a time at a loss if it implies the ultimate ruin or squeezing out of their competitors. How are the richest firms and companies in England to stand up for long against trusts which, in some cases, represent an entire industry in America, financed by syndicates with illimitable wealth, drawing enormous profits from the home markets that they can afford to employ in underselling abroad, and backed up as well, as they probably will be in the near future, by State bounties or subsidies for American shipping lines?

But it must not be for a moment supposed that the commercial warfare that neither slumbers nor sleeps is a mere matter of protective tariffs or subsidies. The nation which merely goes as far as this resembles the rich man who thinks he has done all that is necessary to do for charity by sitting down and writing out a handsome check. A tariff is only a fortification for those who, like the Americans or Germans, know how to fight behind it. A subsidy is only a grant-in-aid to those who know how to use it. And so the State which succeeds is not that which hedges itself round with a Chinese wall of tariffs and fancies it can then go to sleep. No Chinese or Roman wall ever kept the invader out by itself: but the nation which, behind the wall, taking for its motto Wentworth's "Thorough, thorough, thorough," both individually and nationally, does its best in attempting

to build up, reconstruct, or improve its internal organization, to help it, as it were, to make the core yet harder than the rind. Hence, to confine ourselves to Germany, the appearance of State activity in every quarter. First and foremost in education, then in questions of hygiene, State insurance and old-age pensions. Call it paternal if you will, but it is never grandmotherly, for it is the result of the experience of a civil service which for trained intelligence is the ripest in the world.

• We could not, if we would, servilely copy German methods. As Sir John Gorst put it the other day, we can not wear each other's clothes. They will always be a startling misfit for the other party. But we can make a suit for ourselves. The political reforms of the century in this country have been mainly directed toward placing the tools of power in the hands of the democracy. It has been a great and a bloodless revolution. But the millennium that early reformers dreamed of has not been the necessary corollary. The ruling class, and rightly, is still the ruling class. But it must learn to march with the times. We want, in these days of international competition, something more than a strong army or navy to make the nation strong. Such things are essential, but they are only a means of insurance against loss. They represent the nation's "land and water" police, but those who hold that the State should not only be the protector but the promoter of public welfare can not be content with this alone. If evolution has one lesson for us, it is that by taking thought we may improve the race. The cry for improvement is growing. On all sides and in all quarters we hear more and more imperative demands for reforms, whether for better commercial or secondary education, housing, licensing reform, or old-age pensions. All these and many more are symptoms of the national malaise. What the nation wants is coordinating and leveling up all round. Here is the statesman's chance, not to propose an unwieldy Newcastle programme of isolated reforms, much less to attempt to stave off the crisis by niggling measures of concession; but, seeing the question as a whole in all its diverse manifestations, to bring in a series of measures that interlock and are inter-related, that represent, so to say, a veritable code, for all these problems are closely, at bottom, akin to one another, and their correct solution depends on these relations being rightly understood in reference to each other and in reference to our attitude toward the attitude of other nations. Otherwise we shall go on being beaten "in detail" till the end of the chapter.

But the belated protest may be made that we, as a nation, are refractory to the notion of State control. Such a statement is made by people with little historical knowledge. It was the State control of the Conqueror that made England, of Edward I that consolidated it, while that of Elizabeth not only resettled the country but laid the foundations of Greater Britain and gave her children the chance of going out to seek their fortune beyond the narrow seas. The last reign is particularly to the point. Beginning in difficulties and weakness, it ended in glory and power. And why? Because the statesmen of the day, finding the country weak, poor, disunited, first inquired into the many evils under which it was suffering, and then, by no piece-work and patchwork measures, but by a comprehensive system of legislation, whose success was largely due to the fact that they clearly saw how the solution of one social problem depended on that of another, they set the country once more on its feet; and this social legislation was only destroyed by the revolution of 1648, which was the true beginning of *laissez faire*.

Yet none the less we must not forget that this *laissez faire* was historically necessary. It insisted upon the emancipation of the individual, it upheld his claim to think for himself, it vindicated his rights of conscience. For these hard-won rights we can never be sufficiently grateful. The society of the Middle Ages, except for the church, was a static one; the principle of *laissez faire* introduced, or rather embodied, the "dynamic" element in society. Through this door came the idea of progress for the race and the career open to talent for the individual. The bad side of *laissez faire* has been its neglect of, and contempt for, the State, of which the weak have even more need than the strong, for without its protection the stronger soon weary of fighting among themselves and combine against the weak, so that the latter, who in mediæval times had always a place in society, have now sometimes no definite place at all.

But all progress largely depends on taking and combining the best in two rival systems, and so if we are to have State control in this country we must attempt to preserve at the same time all that is best in the *laissez faire* doctrine. And the same is true of educational reform. Unification of education must come, but State control should not be established at the expense of losing all our freedom, elasticity, and variety, otherwise the solution will not even be a temporary *modus vivendi*, but rather a cause of national decay.

CLOUDESLEY BRERETON.

CHAPTER XX.

THE PUBLIC SCHOOL PROBLEM IN THE SOUTH.¹

By CHARLES W. DABNEY, Ph. D.,

President, University of Tennessee.

The South waiting for education.—Everything in the South waits upon the general education of the people. Industrial development waits for more captains of industry, superintendents of factories, and skilled workmen. The natural resources of the Southern States are great and varied; capital in abundance is ready for investment in them; only men are wanted who can plan, organize, and direct. This is true of all our industries, even of our agriculture. A director of an Agricultural Experiment Station says: "We can do little more to improve the agricultural methods of the farmers until a new generation is educated, who can read our bulletins, apply scientific methods, and keep simple farm accounts."

The colleges for liberal, and institutions for scientific and technical education as well, wait for preparatory schools and high schools. With the same population there were during 1899 in all collegiate and graduate courses in liberal arts only 16,351 students in the Southern States against 30,741 in the North Central States, where they have public high schools. A system of public education is a pyramid; the primary schools are the foundation; the secondary schools and high schools, the normal schools, the technical schools, and the colleges carry up the structure step by step, and the university is the capstone. Our old system of education in the South, so far as we had any, was a Greek column; the university was a beautiful carved capital of classic design, supported by a slender column of literary colleges and academies, which stood upon a narrow and unsubstantial base of private schools.

The effects of war and reconstruction.—Good government in town and State and intelligent action in national affairs are impossible without educated voters. Pettifogging politicians, selfish demagogues, and corrupt lobbyists will continue to control our legislative and county governments until a majority of the voters can read and think for themselves. The Republic must have an educated citizenship or go down. The question of educating all the people is more critically important to the South than it is to the remainder of the nation. We must educate all our people, blacks as well as whites, or the South will become a dependent

¹Address delivered at the Fourth Conference for Education in the South, held at Winston-Salem, N. C., April 13-20, 1901.

Appended to this address is a statement, by Hamilton W. Mabie, showing the character and aims of the Southern Conference, and giving some general idea of the great educational movement it has inaugurated in the South; also brief accounts, by Robert C. Ogden and Walter H. Page, of the two boards which have been formed by the conference and are the outgrowth of it, as it were; namely, (1) the Southern Education Board, an investigating and "preaching" board for carrying on a propaganda of education, and (2) the Board of the General Education Fund, composed of business men, to provide funds and to follow up and give effect to the work of the propagandists. A bill is before Congress to incorporate the latter organization under the name of the General Education Board.

province instead of a coordinate portion of the nation. What, for example, is the cause of the present complete isolation, of the almost entire exclusion from the councils of the nation, of a dozen States which for a long time supplied a majority of the statesmen who directed the affairs of this country, unless it is the political ignorance of their successors, illustrated persistently by the pursuit of absurd financial theories and antiquated political hobbies? The only remedy for the political situation in the South is to be found in public education.

Even religion waits upon general education. How else can we interpret the action of our enlightened and progressive churches, many of which are now actively at work raising their twentieth century educational funds? Evidently they think that the further extension, purification, and strengthening of religion in the South depends also on general education.

This study was undertaken out of a desire to get a true conception of the condition of the public schools in the South, which might be the starting point for efforts at improving them. The writer sincerely hopes that no one will think, because he has tried to tell the truth as he sees it, that he takes a pessimistic or despairing view of the situation. In most aspects the situation of the public schools in the South is indeed a sad one. It is not proposed to discuss at length here the origin or the causes of this state of things, for everyone who knows our history understands them already. The South emerged from the civil war thirty-six years ago, having lost one-tenth of all her white males and three billions of property, which was nearly all her accumulated capital. Reconstruction was even more desolating than war. The spoiler not only stole everything that war had left, but, as Judge Jeremiah S. Black has said, "by their devilish ingenuity they succeeded in running their felonious fingers into the pockets of posterity." They not only looted the treasuries, squandered the school funds, and raised the taxes so high that a general system of confiscation ensued, but in their insatiable lust placed bonded debts upon the Southern States aggregating over \$300,000,000. A debt was piled upon the State of North Carolina, for example, of about \$38,000,000, which was nearly one-third as much as the total valuation of all its property; upon Alabama they put a debt amounting to over \$18,000,000; upon Tennessee one of over \$14,000,000. They squandered \$140,000,000 for Louisiana and increased her debt \$40,000,000!

But why do I recount these awful things? Simply to explain once for all at the opening of this paper why Southern people have not actually done more for public schools, and especially why they hate all taxgatherers and distrust all schemes for the "public welfare," which they understand to mean for the private gain of the schemers. This experience explains our present narrow constitutions, which render it almost impossible to have efficient schools. It explains the intense devotion of Southerners to the laissez faire theory of politics, and their radical applications of the principle of local self-government. It throws light as well upon much of the opposition in early times to our public schools, which seemed to the Southern settlers to be somewhat inconsistent with their theory of individualism.

But the Southern people are too brave and energetic a race to live forever in the shadow of a great sorrow and under the burden of a great wrong. The restoration and recuperation have been rapid; there never was anything like it. The census of 1880 showed that the South had gained nearly \$5,000,000,000 in the assessment of property; in the next ten years she gained 50 per cent more, against 22 per cent in New England and in the Middle States. Since 1880 the production of cotton has doubled and the manufactures of all kinds have been more than quadrupled. The capital invested in cotton manufacturing has increased twelvefold in ten years. Thirty thousand miles of railroads have been built in fifteen years and over \$1,000,000,000 expended upon them. The coal products have increased fivefold and the production of pig iron in this section has increased from 400,000 tons to over 2,000,000 tons. These figures are only pointers; the progress has

been equally great along all other lines. The people of the entire South are now able to have better schools.

Believing that the Southern people have at last overcome most of the financial and political results of war and reconstruction, I hold that the time has come when we must begin seriously upon the work of reconstructing Southern society in all its departments, and that the first thing to do is to establish schools for all the people. God knows we remember the past, even those of us who were nothing but children remember it, and we would not forget or have our children forget any of the lessons of those days, and least of all the inspiring examples of their heroic grandfathers; but our faces are toward the future, and in preparation for the work of rebuilding our institutions it is our duty to study the facts as they are, blinking nothing of the truth, however unpleasant. Some politicians find it desirable to flatter the people and try to make them feel as comfortable as possible in their present position, but all thinking Southerners know that our public schools are a disgrace and such persons demand the truth, and will be glad to learn how to make them better.

The country schools.—The South is an agricultural section. Its people live in the country and work in the country; they must, therefore, be educated in the country. In most respects this is a happy condition, but in order to realize all the blessings of rural life we must have good schools in the country. My investigation and discussion will therefore be chiefly confined to the country schools, the free schools for the masses of the people.

In the old South the better country neighborhoods had many excellent private schools, which educated the children of the wealthier families in classics and literature and trained a race of men and women who have not been surpassed in any age or land. But these schools, which were never general, have now disappeared almost entirely, and at present in the country districts of the South we have just enough public schools to destroy completely the private schools.

Let us seek first to get a general view of these country schools and to learn what progress, if any, has been made in the last quarter of a century. Table I contains a statement, compiled from data supplied by the Commissioner of Education, showing the condition of the public schools in the former slave States, from Delaware to Texas, and including Missouri and Arkansas, in the years 1875, 1885, 1895, and 1900. Between 1875 and 1900 the population increased from 16,000,000 to 27,000,000. Teachers are twice as numerous as in 1875, females having increased far more rapidly than males. There are also nearly twice as many schoolhouses in 1900 as there were in 1875. The value of school property has been nearly quadrupled. The average value of property per school has been nearly doubled. Here is some progress, but we should remember that it is progress from a condition in 1875 of almost nothing. The average number of days the schools are kept has increased but little—from 93 to 109.6. The average annual pay of teachers has decreased from \$175 in 1875 to \$158.75 in 1900. The total expenditures have been doubled, but the amount expended per capita, which was 81 cents in 1875, is only \$1.34 in 1900, and the amount expended per pupil enrolled has increased only 12 per cent in twenty-five years—\$8.56 to \$9.72.

We find thus that while the schools and the school-teachers have multiplied, it has not been in proportion to the enrollment. Much money has been invested in school property, but the compensation of teachers has diminished, and the amount expended per capita is still pitifully low. Worst of all, the schools are still open, upon the average, only five months in the year. Should not the people of the South ask themselves seriously whether they have made the same progress with the schools that they have in other respects? Have they done all they could for the schools?

Compared with North Central States.—Compare with this the situation in the North Central States (Ohio to Kansas, Nebraska, and South and North Dakota)

in 1900. These States contain a million fewer people, but had the same number of children enrolled in the schools. The percentage of the school population in average daily attendance is 52.50 in the North Central States as against 40.32 in the Southern States; the total number of teachers is 181,916 against 127,577; the number of schoolhouses is 105,118 to 96,849; but the value of school property is \$230,391,589 to \$67,473,853. The average number of days schools are taught is 155.6 in the North Central States to 109.6 in the Southern States; the average salary of teachers per month is \$43 to \$31.75; the total expenditures in the North Central States are \$84,802,319 to \$36,280,166 in the Southern States, which is \$3.23 per capita of the population, or \$20.85 per pupil in attendance in the North Central States against \$1.34 per capita of population and \$9.72 per pupil in attendance in the Southern States. We should remember that the Southern States include a population of over 7,000,000 negroes, and were devastated thirty-six years ago by a terrible war. The comparison is not perfectly fair—few comparisons are—but it shows what this population can do and what the results in wealth productions are, and sets a standard toward which the Southern States should strive to build.

Conditions in typical States.—Table I does not, however, give us a correct view of the situation in that portion of the South in which we are particularly interested, namely, the Central Southern and Gulf States. In this table are included statistics for the border States of Delaware, the District of Columbia, Maryland, Virginia, Kentucky, and Missouri, in which the conditions are much better than in the other Southern States. These States bring up the averages very much. For this reason I have prepared, after the same plan, a second table, based upon the latest information obtainable from the State superintendents' reports of North Carolina, Georgia, Alabama, and Tennessee, which are typical Southern States. The reader is invited to examine it very carefully. From the standpoint of the schoolman the situation is sad beyond expression. In North Carolina only 30 per cent of the children are in daily attendance upon the schools; less than 60 per cent are enrolled in them, and the annual school term is less than seventy-one days. There are in North Carolina on the average 65 enrolled pupils to each school and 54 to each teacher. The schoolhouse which is supposed to shelter the children is valued at \$179.60, and the teacher who has charge of them receives \$23.36 a month for seventy and eight-tenths days, or about \$77 for the term. The amount expended per year per pupil in attendance is but \$4.34, which is only 51 cents per capita. In Tennessee less than half of the children between 5 and 18 years of age are in daily attendance; only 70 per cent are enrolled in the schools; the school term is only ninety-six days, and the enrolled pupils attend an average of only sixty-three days in the year. In Tennessee they are taught in a schoolhouse which cost \$426, by teachers who receive an annual salary of \$134. The total expense per pupil is \$5.17 a year, which is only 87 cents per capita.

Tennessee and Iowa compared.—In Table II, by the side of the figures for Tennessee, I have placed the figures for Iowa in 1899. The comparison is not perfectly fair, but it will be well to see what another younger State of about the same population is doing for its schools. This State contains a slightly larger population than Tennessee, but somewhat fewer children. The enrollment in the schools in Iowa is 87.5 per cent of the school population, against 70.1 per cent in Tennessee. In Iowa 57.3 per cent of the school population are in daily attendance, against 49 per cent in Tennessee. Teachers number 28,694 in Iowa to 9,195 in Tennessee; the schoolhouses are 13,836 to 7,185; the value of school property is \$16,908,076 to \$3,063,568. The average value of school property is \$1,222 in Iowa to \$426 in Tennessee. The average number of days the schools are kept is one hundred and fifty-eight in Iowa to ninety-six in Tennessee. The average teacher's salary is \$45 in Iowa to \$31 in Tennessee, and there are three times as many teachers in Iowa. The total expenditures are \$7,978,060 in Iowa and \$1,751,047 in Tennessee. This is \$3.80 per capita of population or \$21.89 per pupil in attendance in

Iowa, against 87 cents per capita of population or \$5.17 per pupil in Tennessee. The total real and personal property per capita, according to the census of 1890, was \$1,196 in Iowa and \$502 in Tennessee. Can we not quite fairly say that this is due in great part to the difference in the public schools?

The penalty of poverty.—The stranger is astounded at this statement of facts. Why is it that a good, brave people tolerate such a condition of things? The explanation is found in the figures at the bottom of the table. The Southern States are only sparsely settled after all; in 1900, North Carolina had only 39, Georgia 37.5, Alabama 25.4, and Tennessee about 48.4 persons to the square mile. The roads are poor, with the result that in many sections the children can not get to schools. But this is not the true explanation; the poverty of the people is the immediate cause why the schools are so poor. The total real and personal property per capita returned to the census of 1890 was \$361 in North Carolina, \$464 in Georgia, \$412 in Alabama, and \$502 in Tennessee; and this is far in excess of the taxable values. In Tennessee, for example, the taxable values in 1900 amounted to only \$266.66 per capita. Tennessee is properly considered one of the richest Southern States, but the total valuation of all her real and personal property for the purposes of taxation in 1900 was only \$472,000,000, or, deducting railroads, telegraphs, telephones, and such property, only \$260,000,000. The total State tax on real property yielded in 1900, net of expenses, only \$1,000,000; the total receipts from all sources were only \$3,120,000. The total indebtedness of Tennessee is nearly \$17,000,000, and the interest about \$700,000 per annum. No wonder that its total expenditures for public schools were only \$1,751,047.

Education and crime.—Our Southern States have still to learn that education is the highest concern of a people, and that the first duty of the State is to provide schools for all its children. The business man on scanning the ledgers of these States would, however, be bound to declare that their chief concern is not education but criminal prosecutions. In the year 1895, for example, the county of Knox, in Tennessee, paid \$37,000 to prosecute 2,668 mostly petty criminal cases; and in addition to this the State paid \$17,000 toward the same prosecutions, making a total of \$54,000, or \$20.35 a case. This was simply the cost of prosecution; it did not include the cost of supporting the convicted criminals in prisons. There were 2,668 prosecutions in a population of 74,000, or about 1 in 24! Among the people in our jails are 8 illiterates to 1 who can read and write. In our penitentiaries there are 6 illiterates to 1 who can read and write. Now, one-half of the people prosecuted in Knox County were of school age. One-half the cost of prosecuting these cases would have sent nearly 10,000 children to school for the full annual Tennessee term. Can we doubt that if this money had been expended for the education of the people we would not have had to send them to jails and penitentiaries? Since certain reforms in the methods of criminal prosecutions and the establishment of an industrial school matters are much better in this county.

The wastes of ignorance.—The Southern people are poor, many of them extremely poor. Their schools are poor because they are poor; but the converse is equally true—the people are poor because the schools are poor. The relations between the opportunities for education and the production of wealth are now so well understood that we can measure the wealth-earning power of a people by the school privileges which they enjoy. Statistics show that the power of a people to earn money is in direct proportion to the length of the period the average citizen has attended school. To paraphrase Dr. Curry, the secretary of the Peabody board, a people's poverty is the most unanswerable argument for the expenditure of any amount of money necessary to give them good schools, for the right kind of schools are the only remedy for poverty as well as crime. The Southern people are too poor to afford the wastes of ignorance. If they spent more money for education, they would not only save much in criminal prosecutions, but would increase enormously their earning power.

What the schools are now doing.—So far we have considered only the general conditions of the Southern schools. Figures expressing totals and averages can not, however, tell the whole story. They are like the numbers standing for the pulse beat, the respiration, and the proportion of red corpuscles in the patient's blood; they give only a general idea of the condition of the sick man. Before we can diagnose the disease we must study his nature carefully and observe his symptoms closely. Let us therefore seek next to ascertain what the public schools of the South actually are and what they are really accomplishing. I will use the schools in Tennessee to illustrate the results of their work.

In 1900 there were in Tennessee 7,185 public schools, with 9,195 teachers and 485,354 pupils enrolled. The total enrollment in the different grades was as follows: First grade, 119,000; second grade, 78,000; third grade, 70,000; fourth grade, 67,000; fifth grade, 49,000; sixth grade, 17,000; seventh grade, 11,000, and eighth grade, 7,000. The large dropping off after the fifth grade is due to the fact that the ordinary primary schools have only five grades, and the three additional ones have to be provided by special local taxation, which is optional. As a result only 1 school in 10 has the three additional grades. There appears to be no way of finding out how many pupils complete the course. Engraved certificates are issued to pupils who complete the fifth and to those who complete the eighth grades. These are sent out from the State superintendent's office gratis upon request, but his records show that during the year 1900 only 1,959 diplomas were issued for the fifth grade and 679 for the eighth grade. More pupils doubtless completed these grades, but there is no record of it. In any case we know that only one-tenth of the enrolled pupils ever reach the beginning of the fifth grade, and only 1 in 70 reaches the eighth grade.

How we are educating a citizen.—Enrollments are also reported by subjects. Taking elementary algebra as a test subject, we find that only 16,000 were enrolled in that; in "higher English," a sixth to eighth grade study, only 11,400 were enrolled. The facts all go to show that the children do not stay in the schools. An easy calculation leads us to the conclusion that the average citizen of Tennessee gets less than three years of this kind of schooling in his entire life. In a similar manner it may be shown that the average citizen of North Carolina gets only about two and six-tenth years, and of Alabama two and four-tenth years of public training. This is the way we are educating the citizens of the Republic—the voters who are to help to determine the destinies, not only of this people, but of millions of others beyond the seas. Have we not missionary work enough to do here at our own doors without going to Cuba, Porto Rico, or the Philippines to find it?

Compulsory attendance.—According to the latest Report of the Commissioner of Education, 32 States and Territories, containing 64 per cent of the population of the country, have laws requiring school attendance for from eight weeks to the full term for an average period of eight years. England, Scotland, Canada, and nearly all the British colonies; France, Austria-Hungary, Switzerland, Italy, and Germany all require from four to ten months each year for a like period. So far no Southern States except Kentucky and West Virginia have compulsory attendance laws. Some interest is, however, arising in the question in other States. The subject is being discussed in North Carolina and in Tennessee, and the general assemblies of three States have been requested to enact compulsory attendance laws. In North Carolina, out of 700 farmers, manufacturers, and laborers who replied to an inquiry sent out by the Commissioner of Labor, 564 favored such a law. One thing is certain, ninety days' school with an average attendance of only 30 to 40 per cent of the school population will never educate the people.

The laws designed to disfranchise illiterate whites and blacks are likely to have a beneficent influence upon the educational situation in the South. Such laws, if impartially drawn and fairly carried out, will do almost as much good in promoting the elementary education, of males at least, as compulsory laws. The unedu-

cated people of the Southern States; both whites and blacks, esteem their ballot to a degree that is almost ridiculous. In States like North Carolina, where the educational qualification has been applied, the colored people are already showing an earnest desire to get the little education required to qualify as voters. But these laws, even at best, touch only one-half the population. The only perfect solution of the problem is a compulsory attendance law carefully designed to reach every healthy child. We must put all the children in school, but before we do this we must have the schools and the teachers.

The secondary schools.—Many of the cities and towns have good high schools, but there are no public secondary schools, properly speaking, in the country districts of the South. Two years ago in Tennessee a law was passed allowing counties to levy a special tax for high schools. So far as I know, however, not a single one has been organized. Mississippi is more fortunate. As the result of an act passed in 1899 one high school has been organized in Jefferson and funds amounting to \$3,000 have been provided, in part by the State and in part by county taxation. There are eight teachers: the principal's salary is \$1,200; the other teachers average \$450. At the beginning of the second year there were 170 pupils. The school prepares its students for the State university. Here is a successful experiment worthy of imitation by all rural communities in which there is population and wealth sufficient to support a high school.

Teachers and their pay.—There is, of course, small opportunity in the country for the professional teacher or even the habitual teacher. Who is going to prepare himself to teach for the pitiful salary of from \$23 to \$31 a month for five months only in the year; or who that can do anything else is going to continue at this very long? Of what use are normal schools until teachers are paid living salaries? The result is that the country schools have to employ "makeshift" teachers, the majority of them inexperienced young people who have had no training beyond what these schools themselves give and who use the school only as a stepping-stone to something better. The young man wants to earn a little money to pay his way at a business college; the girl to earn something to support her in a seminary for a few months. Too often the teacher is some director's dependent sister-in-law or aunt, or some male ne'er-do-well who must be kept out of the poor-house. The best teachers are the farmers' boys and girls who teach during the fall and winter and work during the spring and summer. There is, of course, no prospect of improving this condition until better salaries are provided.

The courses of study.—Extensive courses of study are proposed for the schools in the laws of all the States. Here is the Tennessee course: "There shall be two classes of district schools, designated respectively primary schools and secondary schools" (the primary schools cover five, the secondary schools three, years). "In every primary school shall be taught orthography, reading, writing, arithmetic, grammar, geography, history of Tennessee, history of the United States, including the Constitution; vocal music and elocution may be taught; and no other branches shall be introduced, except physiology and hygiene with special reference to the effect of alcoholic drinks and narcotics and cigarette smoking. The directors of each school district may establish therein one or more secondary schools, in which shall be taught the following branches: Orthography, reading, writing, arithmetic, grammar, geography, history of Tennessee, history of the United States, including the Constitution, and the elementary sciences of geology and agriculture, and elements of algebra, plane geometry, natural philosophy, bookkeeping, physiology, and hygiene, civil government, and rhetoric. Practice shall be given in elocution. Vocal music may be taught." This is a fair sample of what is undertaken in the country schools of the South. All this is proposed to be done in eight short years of four to five months each, by a teacher who received \$31 a month and at a total annual expenditure of \$5.17 per pupil. Of course, it is not done; it can not be done. As a matter of fact, teachers usually

teach whatever they choose or whatever they fancy themselves best fitted to teach. In the almost total absence of expert supervision they do what they please. Perhaps half do the best they can; the other half "keep school." Thus it is the courses of study are chaos.

The schools are very imperfectly graded, if they are graded at all, and the most antiquated methods are in general use. The traditions throughout this section are those of the old-fashioned literary teacher, with the result that the idolatry of books is the bane of all the schools. Twenty millions of people engaged chiefly in rearing plants and animals, and almost nothing taught in our rural schools in regard to plant and animal life! Several of the States require that "scientific agriculture" shall be taught, but for the want of competent teachers very little is done with either nature study or science.

One hears a great deal in the South about its natural resources and their development. Shall we not realize that our great resources—our soils, minerals, and timbers—are useless in the hands of an untrained people? We should recognize that our children are our greatest resource and that the first thing to do is to train them in natural science and the industrial arts, so that they may utilize these resources. Nearly all the arts and industries were represented upon the old-time Southern plantation. The tannery and the shoe shop, the corn and flour mills, the spinning and weaving houses, the cooper and the blacksmith shops, were the technical schools of the people in those days. In these home factories both the white and the colored youth learned many of the arts. Now the manufactures are all concentrated in the cities, with the result that the young grow up ignorant of all industrial arts except the cruder processes of carpentering and agriculture. We must make money before we can even have schools, and the very first thing is to train our people to produce. The book education we give them leads too many away from the industries in which they must make their living into professions already crowded. Moreover, if we do not educate our own people to use these resources intelligently, the skilled men of other States will come in and do so, and make our native population the "hewers of wood and drawers of water" in their industries. We shall then be reduced to an industrial dependency even worse than our present political and commercial dependency.

The improvement of the public schools of the South will come through industrial development. Of all peoples in the world, therefore, we need industrial education; but before we can have it there must be a complete revolution in methods. Book teaching must be replaced in large part by nature study, and simple industrial arts must be introduced in all public schools. It will be exceedingly difficult, however, to do this. The people are by nature very conservative. The normal schools, colleges, and universities are still devoted chiefly to literary work, and turn out few teachers of science and none of manual training. The revolution must begin, therefore, in the higher institutions—in the normal schools and colleges. They must be largely remodeled before we can even begin to educate the kind of public-school teachers we need to make the new schools.

Expert supervision needed for the country districts.—Expert supervision is almost wholly wanting in the country districts; and this trouble seems, unfortunately, to be inherent in our system of government. In the Southern States either the county or the district is a unit of school government. The county is the unit in North Carolina. The district is the unit in Tennessee. The trouble is the same in both cases: The intelligent, educated people are rarely permitted to direct the schools. The school directors are elected either by the people or by the county commissioners. In very few of the States have the State boards or State or county superintendents any adequate authority over the school directors or county supervisors. Elected usually for the purpose of securing the appointment of certain persons to be teachers, to award a contract to build a schoolhouse, or for some other selfish purpose, the school directors are rarely the best men for these posi-

tions. The laws make no requirements as to their qualifications beyond reading and writing, and frequently they are entirely incompetent. Too often they are elected for political reasons and seek to use their positions to further the interest of some county clique. To illustrate: A certain school director closed a school suddenly in the middle of a term to punish an assistant teacher for voting against his faction. The teachers sued the directors personally for the balance of their salaries and won their case in the courts, but all the directors proved insolvent and the recoveries had to be made out of the school fund. A serious abuse is the division of the districts and the multiplication of small schools. The motive for this is to meet the convenience of influential people, to make new salaries, or sometimes to sell a lot and build a new schoolhouse. In some States the investments in school property are out of proportion to the funds expended for the other purposes of the schools. In Tennessee, for example, there are 3,084 school districts with 7,813 schools, or an average of $2\frac{1}{2}$ schools to each district. In these 7,813 schools there are only 9,195 teachers, or 34 enrolled pupils to each teacher. This division of money and forces where so little is provided is worse than folly. It is a crime. In the more intelligent communities a reaction has already begun, with the result that the people are asking to have the schools consolidated. With the establishment of good roads it will be possible to convey children to school at public expense and to consolidate them still further.

The county superintendent.—The county superintendent is elected either by the people of the county, the county supervisors (in North Carolina), or the county court (in Tennessee). The county court, made up of magistrates elected from the different districts, is a miniature legislature, and is usually made up of local politicians. This court divides the county into school districts and levies and distributes the local tax, and is thus responsible for the success or failure of the schools. They are generally treated as of minor interest, the most important things being the court-house offices, the "pickings" in the magistrates' courts, and the jobs in public works—bridges, roads, etc.

The trouble about the county superintendent is threefold. The first trouble is the method of his election. The Tennessee law says he must be a "person of literary and scientific attainments, and when practicable of skill and experience in the art of teaching," and provides for his examination by a committee of citizens; but as the county court elects him no way has been found to enforce even these limited requirements, with the result that the place usually goes to some political striker, briefless young lawyer, broken-down preacher, or other person incompetent to earn in any other way the average Tennessee superintendent's salary of \$296 a year. There are, of course, exceptions. A few counties pay better salaries and command the services of better men.

The second trouble is that the tenure of office is short and uncertain. If we once get a capable and faithful officer it is almost certain that just when he begins to develop some efficiency he is compelled to abandon the management to one to whom the whole business is entirely new. The rule "he has served his two terms" usually applies here as to other county offices. If the superintendent is an honest and independent man and insists on weeding out the incompetent teachers, he is almost certain to make himself unpopular and to lose his position to a more complacent competitor.

The third difficulty is the small salary. In South Carolina the average superintendent's salary is \$423; in Tennessee it is \$296. One thousand dollars is about the largest salary paid in any county not containing a large town. These are the men who hold examinations and issue certificates to teachers. One may judge how people regard their schools when salaries like these are paid to the men who should be responsible for them.

State superintendent of public instruction.—The State superintendent of public instruction is elected by the people or the legislature or appointed by the gov-

error. In nearly all cases he is more or less involved in politics. A few States have State boards of education, but they can do very little under this system of local government. A State superintendent appointed by the governor is apt to be a politician, and his chief energies to be devoted to advancing the interests of his party. Election by the people has given us some of our best superintendents, and is the plan to be preferred until we have properly constituted State boards of education to elect them.

The people of the South have still to reach a just conception of the importance of this office. It is usually treated as if it were one of the least important offices in the State and has attached to it one of the smallest salaries. A State educational system is or should be a great business, and the State superintendency calls for a skillful business man as well as a learned educator. The man who fills this office should be competent to direct county superintendents, principals of city schools, local boards of education, and school directors; advise the legislature about school taxation and legislation, and secure and distribute adequate appropriations; he should, in short, be to the State system what a president is to a great university or a bishop to a diocese of the church.

The curse of politics.—The great curse of our public educational system, as of most things in our States, is politics. From the school directors up to the State superintendent politics is the blight of our school administration. Listen to these words from a former superintendent of public instruction of North Carolina. Speaking of the county superintendents, he says: "Why have not the men best qualified to fill these positions been elected in every county in North Carolina? I am sorry to tell you why, should you not already know, but I will do it. Politics was the cause and is the cause to-day." He continues: "The public schools have been in the galling grasp of the court-house politicians for twenty years. The county supervisor owes his election both directly and indirectly to the county officers. They are the men he is supposed to serve; they are the men to whom he must render an account of his stewardship. Away with such! Let us break away from this court-house ring business." Brave man! Would there were more like him.

At the bottom of it all is the want of serious interest in the public schools among the body of the voters. When the people realize their value they will be ready to give money to support them and to see to it that they are administered by competent and faithful men.

Signs of an awakening.—Are there no signs of an awakening? I am glad to say that there are many. Some of the States still seem dead in politics and ignorance, but in others the people are awakening to a realization of the inadequacy of existing schools for the work that belongs to them. The private schools and the city schools have taught the people what might be done. Ministers and professional men, and especially the teachers educated in the colleges and the normal schools, are preaching the gospel of public education, with the result that there is a pervading sense of discontent with the present conditions. It is true that this discontent is still vague; that the discussions of this subject are often unintelligent, and the efforts at improvement crude and ineffective. But the hopeful sign is that the interest of the people has been aroused. Even where they are still under the dark cloud of ignorance we hear subdued mutterings which indicate an early breaking away from the old ways. Some of our State superintendents are striving faithfully to awaken the legislatures to their duty. The reports of Supt. C. H. Mebane, of North Carolina (1896 to 1898), and those of Commissioner G. R. Glenn, of Georgia, and also that of Supt. John J. McMahan, of South Carolina (1899 and 1900), contain forcible statements of facts and eloquent pleas for better schools. Some of our public men are taking up the school question as the chief issue. Hear, for example, these brave words from the inaugural address of the governor

of North Carolina. Speaking of his promise to the people in the campaign, Governor Aycock said:

"I promised the illiterate poor man, bound to a life of toil and struggle and poverty, that life should be brighter for his boy and girl than it had been for him and the partner of his sorrows and joys. I pledged the wealth of the State to the education of his children. Men of wealth, representatives of great corporations, applauded eagerly my declaration. I have found no man who is unwilling to make the State stronger and better by liberal aid to the cause of education. Gentlemen of the general assembly, you will not have aught to fear when you make ample provision for the education of the whole people. Rich and poor alike are bound by promise and necessity to approve your utmost efforts in this direction. The platforms of all the parties declare in favor of a liberal policy toward the education of the masses." And concluding, he says: "The problems before us are of the gravest nature, but among them all there is none that can approach in importance the necessity for making ample provision for the education of the whole people."

The difficulties in the way of improvement.—The difficulties in the way of the improvement of the public schools are that deadening indifference which grows out of ignorance and that pitiful poverty which always accompanies it. The Southern people who commenced thirty years ago by opposing, or at least doubting free public schools, have generally come to recognize their necessity, but they do not yet know how to organize them, nor have they the means to support them. They still need to be educated about the benefits, especially the economic and moral results, of public education.

There are many constitutional and legal difficulties in the way of the organization of anything like a thorough system of public schools in most of the Southern States. As pointed out above, the government and direction of the schools is left in the majority of our States entirely to either the school directors, the county superintendent, or the county supervisors, without any efficient supervision whatever and very little assistance of any kind. Better supervision is absolutely necessary, but unfortunately can not be provided under the constitution of many of the States. For example, it has been decided by the courts in Tennessee that the county superintendent must be elected either by the people of the county or by the magistrates without let or hindrance from any State authority.

In the second place, we leave it to the people of the rural districts and counties to raise nearly all of the school money. In a majority of the States the counties are required to levy a certain per cent upon real and personal property; but where they have very little property the fund produced is exceedingly small. In some cases the people are allowed to make an additional levy if they choose to do so, the total taxes not to exceed a fixed amount. In South Carolina, for example, the constitution authorizes a 3-mill tax on property. But what good does this do where the people have no property? In one district of Aiken County the superintendent tells us the 3-mill tax raised only \$18, and in a district in Dorchester County it produced only \$32, while in a district in Denmark County, a fairly wealthy one, the same tax produced \$1,195. A majority of the States levy no general State tax, or a very small one, for public schools. In Tennessee, for example, the total State fund distributed to the counties for public schools amounted last year to only \$129,000. Such governments excuse themselves from making adequate State levies for the schools on the ground that if the people want the schools they can provide them by local taxation. So it is that we leave ignorance to direct the schools and poverty to tax itself to support them. The States supply neither adequate funds nor direction for the schools. Where education is most needed is just where the people do not appreciate it and will not exert themselves to provide it. It can not be expected that a poor people will tax themselves for schools or that an ignorant people will know how to organize and direct them. We have

yet to learn in the South that the State is the unit of education and must provide for its weakest members. The wealth of the country must educate its poor; the intelligence of the State must direct the schools.

The way to improvement.—Our system of school legislation and management and our methods of school taxation must be completely turned round before we can have anything like a system of efficient public schools. The school money must be raised to a larger extent from the State as a whole and be distributed more in accordance with the needs of the people. School management and supervision must be centralized to a considerable degree in the hands of representative and skilled experts. There should be a State board of education composed of the ablest educational authorities to be found, who should be responsible for all the public schools and should elect a State superintendent who should in turn have the fullest authority with regard to the organization of schools, examination of teachers, courses of study, and the distribution of funds, and have the general direction of county and city superintendents. The schools of the counties and the towns should be in the hands of boards of like powers working under the general direction of the State board and its superintendent. Who would think of carrying on any great business reaching every part of the State by the worthless methods, or no methods, which prevail in the South in regard to our schools? We must have a thoroughgoing reform in these things before we can even begin to build good schools.

What the leaders can do to help.—The immediate need of our people is information and guidance. They need leaders to show them the way. We need a central propaganda or agency which shall conduct a campaign of education for free public education and which, while it edifies the people on this subject, shall use every opportunity to instruct them as to the best forms of legislation for their conditions and the best methods of organization for their schools. This is, then, the definite proposal that I would make to this conference: Shall we not at this meeting take steps to establish such a propaganda for free public schools in the South?

The negro in the schools.—The end of this paper has been reached and I have said nothing about the negro in the schools. We should consider the negro as a man to be educated for work, independence, and citizenship like other men. Everything I have said applies to him, therefore, just as it does to the white man. The negro is in the South to stay—he is a necessity for Southern industries—and the Southern people must educate and so elevate him or he will drag them down. The human race is an organism, all its members being bound together by natural affinities and ministering to each other by natural law. If history, philosophy, and revelation teach us anything it is the solidarity of all mankind, that “no man liveth to himself” and “no man dieth to himself,” but that we are each “his brother’s keeper.”

I plead for justice and common sense in the education of the negro. The most encouraging thing about public education in the South is the noble, self-sacrificing way in which the Southern people have given of their limited resources for the education of their recent slaves. That they will continue to do for the black man all that their means will permit, I firmly believe. These attacks upon the negro school fund, these proposals to give him for his schools only what he pays in himself, come from short-sighted people who fail to recognize the basal principle underlying all public education, namely, the duty of all the people to educate all the people. They do not represent the opinion of the best people of the South and their proposals will not prevail. The people of the South realize already that this proposal is not primarily an assault upon the black man, but a movement to undermine the foundation of the country’s prosperity, progress, and peace. We can not longer take the risks of multitudes of ignorant voters controlled by a few wicked demagogues.

But we must use common sense in the education of the negro. We must recog-

nize in all its relations that momentous fact that the negro is a child race, at least two thousand years behind the Anglo-Saxon in its development, and that like all other races it must work out its own salvation by practicing the industrial arts, and becoming independent and self-supporting. Nothing is more ridiculous than the programme of the good religious people from the North who insist upon teaching Latin, Greek, and philosophy to the negro boys who come to their schools. Many of our Southern States make a similar mistake in trying to enforce in the schools of the black districts courses of study laid down for whites. A Philadelphia lady at work in the South entered her protest recently against requiring the negro children of the sea islands of South Carolina, one of the most backward populations in the South, to study Coleridge and Shakespeare, physiology and hygiene, when they scarcely knew how to read. She reports that in this county, where efficient negro teachers can not be found to teach reading, arithmetic, elementary history, and geography, willing persons are denied license because they can not pass the State examination in "technical grammar" and the "history of South Carolina." She is right. Let us adapt our instruction to the needs of the people, and, above all things, let us give them that industrial training which will prepare them to be self-supporting citizens. General Armstrong, of Hampton, and Principal Washington, of Tuskegee, have worked out a sensible plan for the education of the negro. Our State schools for this race should be modeled after their plan. The only solution of the Southern problem is free public schools for all the people, blacks and whites alike, and compulsory-attendance laws.

APPENDIX.

THE CONFERENCE FOR EDUCATION IN THE SOUTH.

Fifth meeting (1902), at Athens, Ga.

[The following statement, showing the character and aims of the Southern Conference, is taken from an editorial account of the fifth conference by Hamilton W. Mabie, in *The Outlook* for May 3, 1902.]

The attendance of the delegates was much the largest in the history of the conference, every Southern State being represented, and almost every Southern institution of note and prominence; from the oldest university to the most recently organized public schools.

It was impossible to look into the faces of the delegates, to talk with them, and to hear their addresses, without being impressed by the fact that there has been born in the South a great new movement for education along democratic lines, a propaganda for the uplifting of the masses by the diffusion of educational opportunity in all parts of the country.

The conference was organized only four years ago at Capon Springs in West Virginia, where a number of gentlemen from the North and the South met for informal discussion of Southern educational needs and conditions. The time was auspicious, for scattered throughout the South were able and aspiring men in the colleges, normal schools, and public schools, who felt that the hour had come for a new educational movement, a fresh definition of educational aims, and the union of educational effort for an educational advance along the whole line.

These men were * * * drawn together by a common purpose, and they felt the need of companionship for definiteness of aim, for the encouragement which comes from the consciousness that one is working, not in isolation, but with the sympathy and fellowship of a multitude. It would be impossible to collect a more robust, wholesome, attractive group of men than the Southern teachers who sat in the conference at Athens; men who showed not only the impress of

their training, but, in their responsiveness and the grasp of their hands, that high capacity for enthusiasm which is essential to all great popular movements.

Many of them had come out of great tribulation. They had been working for years in communities in which, by reason of adverse conditions, there was small knowledge of educational matters and still smaller interest in them. They had fought their way alone, slowly explaining their aim and convincing the people with whom they had to deal of the need of new facilities and of a broader idea of the place of the school in a democratic community. In that struggle many of them have become leaders; men like Dr. Alderman; Dr. Dabney, of the University of Tennessee; Dr. McIver, of the Normal College at Greensboro, N. C.; Mr. E. C. Branson, principal of the State Normal School at Athens—to select a little group of representative names from many which ought to be enumerated. These men are not only experts in modern educational methods, but they are familiar with local conditions, with the needs of their communities, and with the measures that must be taken to meet those needs. They have not only been teachers of pupils, but they have been teachers of parents, of legislatures, of officials of the State, and they will become the teachers of the whole section, with a message to the nation at large.

Many topics were discussed at the several sessions of the conference, but every topic was vitally related to the two great objects of the Southern board and of the conference—the awakening of the public interest throughout the South, and the advancement and extension of public-school opportunities, until education is within reach of every boy and girl in the South, without reference to color. The Hon. Hoke Smith struck one of the keynotes of the conference in the title of his address, "Popular education as the primary policy of the South." Governor Aycock, of North Carolina, one of the most interesting men in the public life of the country, and one of the leaders of the New South, struck another keynote in his very effective plea for a generous support of popular education by the taxpayers; Dr. McIver, of the North Carolina State Normal and Industrial College, one of the leaders of the new movement; Dr. Alderman, President Dabney, the Hon. H. St. G. Tucker, of Virginia; Dr. Albert Shaw, of New York; Professor Farnam, of Yale; Dr. Felix Adler, Mr. William H. Baldwin, jr., of New York; the Hon. H. Hugh Hanna, of Indianapolis, and Mr. Hamilton W. Mabie, were heard at different sessions on different aspects of the single problem of the education of Americans as a national need for the sake of higher citizenship.

It was significant that not a single note of retrogression was heard in any speech, and that all the notes of progress were emphatically applauded. Every Southern speaker dwelt on the necessity of the broadest educational opportunities for both races, and this sentiment never failed to meet with instant response. * * *

The movement which found expression in the sessions of the Southern Educational Conference is national in its character. It has taken hold of the South as nothing has taken hold of it since the war; it is destined, in the judgment of those who have watched it most closely, to become a movement of tidal breadth and depth. It is a movement not only for the betterment of a great section, but for the knitting of closer ties between all sections.

THE SOUTHERN CONFERENCE AND THE BOARDS ASSOCIATED WITH IT.

[Robert C. Ogden, in the *Educational Review*, May, 1902.]

It came about that, by the suggestion of Rev. Dr. Abbott of your city, a conference was formed for the discussion of education in the South. It met for three years at Capon Springs. It was by the kindly invitation of the proprietor of the hotel at Capon Springs that the conference came into existence. But that organization took on a larger life, and last spring met at Winston-Salem, N. C., a place that was better suited for a large assembly. The meetings, lasting through three days, were well attended and enthusiastic. Much was said and done, and in the papers that were presented there was a great deal of valuable information. At that conference I chanced to be the presiding officer, and was directed to form a board for a propaganda of education. That board was formed last winter, and, most happily, there has come together in it a splendid group of men. There is Dr. Alderman, president of Tulane University, at New Orleans. He is a man whom it is fortunate to know, and the portions of the country that do not know him will yet know him, and the country will be richer just in proportion as he is widely known. There are Dr. McIver, who has led the crusade for the education of women in North Carolina, and Dr. Frissell, president of Hampton Institute. These three men are field directors. It is their business to carry on a campaign of education. Our Southern friends say that their people will not read very much, but they will listen to any amount of talk. So we are taking for our motto the exact words of Jefferson in which he says, "Preach a crusade for education." Dr. Dickerman, of New Haven, Dr. Booker Washington, of Alabama, Harry St. George Tucker, of Washington and Lee University, Dr. Frazier, of Richmond, have come into this work, and these men are simply carrying on the propaganda. They will talk by the wayside or will address legislatures. It is said, and I think I am correctly informed, that an address of Dr. Alderman to the legislature of Mississippi—and Mississippi is the most progressive State in Southern education—has resulted in an addition to the appropriation of half a million dollars for the next year. In addition to these men who are in the field comes Dr. Charles W. Dabney, president of the University of Tennessee, who has a liberal appropriation at his command and has, in association with Dr. Claxton and Dr. Eggleston, formed a strong organization for collecting and publishing information of every sort concerning all educational questions between the Potomac and the Rio Grande. That bureau is going on vigorously. The maps that have been prepared, with little signs upon them indicating literacy and illiteracy of both races, are wonderful, where you see at a glance, as an object lesson, just the conditions in each State and each county of each State. And then, too, as consulting engineer or supervising director, there is Dr. J. L. M. Curry. Associated with these men are a few Northern men who stand back of them, and there has been gathered together a fund of \$40,000 a year for two years—\$80,000—which is simply to carry on this campaign of education for education.

Now parallel to this board of the propaganda is a board for money that is composed simply of business men, and perhaps you may have noticed in your papers this morning the first public announcement of that board. It has been formed with an alumnus from Harvard at its head, Mr. W. H. Baldwin, jr., and has already at its beginning something over \$1,000,000 in its hands to expend in following up the work that the preachers of the Southern Education Board may do.

The idea is this: Go into a locality, just as the Slater board, and the Peabody board have done, and get the people to tax themselves. If there is not money enough to build a proper schoolhouse, costing say \$1,000, put \$500 with what the people will raise and build it; then supplement what they will pay for teachers, get better teachers by paying more. Give the people of a locality these facilities

for three years or four years, and when they have had educational advantages for that period then you may withdraw your support; they will take care of it themselves after that. But a million dollars for that purpose! Why, it is a mere trifle. A hundred millions could be used, and a hundred millions will be used before the work is thoroughly done.

It is planned, with the association of these two boards, for the promotion of the idea of education and for the handling of money, to create a community of interest, a clearing house—the work of the Peabody board, the work of the Slater board, the work of the Southern Education Board, and the work of the last board, which is called the board of the General Education Fund—and thus to concentrate the highest intelligence, the result of the best experience, and all economies in such a way as to prevent duplication of this work and to insure the best application of money.

[Walter H. Page,¹ in *The Independent*, May 15, 1902.]

The Athens conference showed two or three facts that are of revolutionary importance.

(1) Northern men who are earnestly engaged in furthering popular education and Southern men who are also actively engaged, as soon as they meet in a friendly earnestness of purpose discover that they agree absolutely, both with regard to aim and with regard to method. They stand on identically the same platform as to the education of the races, and the platform is this—that both races should be treated alike. There is a body of Southern opinion—a decreasing body—that still looks askance at negro education. But the Southern men who are engaged in educational work stand squarely for the same training for the blacks as for the whites. The governors of most of the Southern States—but not quite all—stand firmly on the same platform. This battle has been won once for all.

(2) There was a unanimous agreement that only by a public-school system, generously maintained by taxation, can the problem of rural education in the South be solved, and the conference committed itself to schools that train the hand as well as the mind. Several model schools have been established in rural districts in Georgia where such teaching is done and plans have been made for establishing more. They are enthusiastically approved by the people.

(3) Most important of all, perhaps, was the fostering of what may be called a national feeling in education by such a meeting of men from different sections. The Southern people showed even more than their traditional hospitality to visitors from the North. Anywhere they were taken into their homes, and permanent, intimate friendships came from such associations. Brought into such a relation, what were supposed to be differences of opinion and methods turned out to be agreements. The old clash of purposes and the old suspicions utterly disappeared. The well-informed and earnest North now works in perfect accord with the earnest and enlightened South. Those that find differences and provoke controversies are either not informed or they are not representative of the dominant feeling.

The work of the Southern Education Board and these conferences led to the organization a few months ago of another board which is called the General Education Board. As the Southern board is a clearing house for facts about Southern education and a means of propaganda, so the general board is an organization for practical financial help to education anywhere, but for the present in the South, because help is most needed there. The general board has been incorporated by a special act of Congress. It, too, is made up of both Northern and Southern men, and its chairman is Mr. William H. Baldwin, jr., of New York, and its secretary is Dr. Wallace Buttrick. This board has among its members men who are also

¹ Editor of *The World's Work* and member of the Southern Education Board.

members of the Peabody and Slater and Southern boards. These four bodies, therefore, work together, each taking advantage of the knowledge and experience gained by the others.

The General Education Board has a fund of somewhat more than a million dollars, which it is spending thus far chiefly for the building up of rural schools in the South and for the training of teachers for these schools. The distribution of its money is made through the local machinery for educational administration, with proper safeguards and guaranties that it is rightly applied; and it is given for the furthering of education without regard to sex or color. The board has been so organized and is so managed that its help is not suggestive of charity, for it works in hearty cooperation with the enlightened agencies of Southern education. Its aim is simply to help remove the heavy burden that long past events—for which this generation is in no way responsible—placed on Southern life, and this it regards as the foremost patriotic duty of our time.

The General Education Board hopes to be the channel for the wise distribution of many millions of dollars for this patriotic purpose. It is an organization of business men, who do the work on strict business methods.

CHAPTER XXI.

TEMPERANCE INSTRUCTION.

CONTENTS.—(1) "Is there too much temperance matter in the school physiologies?" by Mary H. Hunt.—(2) Report of a committee of the Department of Superintendence.—(3) "Temperance teaching and recent legislation in Connecticut," by Supt. W. B. Ferguson, of Middletown, Conn.—(4) Temperance instruction in Nebraska.—(5) "The modern subjection of science and education to a propaganda," by Prof. Wm. T. Sedgwick, of the Massachusetts Institute of Technology.—(6) "The will of the people, not of an oligarchy," by Mary H. Hunt.—(7) Alcoholic physiology in school.—(8) Enforced temperance among railway employees.—(9) Report of a committee of the New York State Science Teachers' Association.

IS THERE TOO MUCH TEMPERANCE MATTER IN THE SCHOOL PHYSIOLOGIES?¹

By MARY H. HUNT,

*World's and National Superintendent of the Department of Scientific Temperance Instruction of
the Women's Christian Temperance Union.*

The statement is sometimes made that the indorsed school physiologies give too much space to the temperance matter. If this is true, is there any topic under which the temperance matter can be left out; can all temperance matter be massed in one chapter and omitted from the rest of the book; or can the present space devoted to alcohol and narcotics be condensed? Let us consider these three propositions in turn.

SHALL THE TEMPERANCE MATTER BE LEFT OUT OF ANY TOPIC?

THE BONY FRAMEWORK.

Reputable scientific authorities testify that alcohol and tobacco used during the period of growth tend to dwarf the human stature, or, used later in life, to weaken the recuperative powers of the bony system, thus retarding or even preventing the formation of new bony material in cases of broken or shattered bones. Every child desires a well-formed body. Shall we omit these facts from the books and thus leave the child in the midst of temptations to drink and smoke, unwarned of the natural consequences to his future growth?

THE MUSCULAR SYSTEM AND WORKING ABILITY.

Take the muscular system. It has been proved experimentally in scientific laboratories, and on a large scale with armies and companies of laboring men, that tobacco and alcoholic drinks weaken the strength and endurance of the muscles. But these facts are not universally known. Moreover, the opposite erroneous opinion, that alcoholic drinks strengthen one and better enable him to endure hardships, is very prevalent. Only a few years ago a college professor (Lombard)

¹From the *School Physiology Journal*, December, 1901.

who was making some experiments on the strength and endurance of the muscles, was greatly surprised to find a remarkable decrease of ability after he began to smoke a cigar. He had previously supposed that he could work better while smoking.¹ Shall we erase these facts from the pages of our school text-books and confine them to the archives of medical libraries, where the people would never find them? It has been stated recently by the dean of one of our industrial colleges, who has been studying the industrial problem both at home and abroad, that one factor in the present commercial supremacy of this country is "the American tendency to apply knowledge as soon as acquired." The indorsed school physiologies are now carrying to millions of children all over this country the facts concerning the effects of alcoholic drinks and tobacco on muscular working ability which have been wrought out by scientific experiment, largely within the past decade, and which, but for this practical application, would be reposing in dust-covered volumes on the shelves of medical libraries. Furthermore, it is the testimony of expert students of the causes of our present industrial leadership that the greater sobriety of the American workman is a very large factor in his greater efficiency over the European workman. The reason for this is seen in the dissemination through the schools, and the immediate application in the industries of the knowledge of the effects of narcotics upon working ability.

Shall we now reverse the policy which has brought such telling results, eliminate these truths from our physiologies, and let the coming American generation grow up uninformed, or misinformed, as chance may decide?

FOOD.

One of the most important chapters in the school physiologies is that devoted to food, which is the source of energy for mental and muscular work. The most perfect engine placed in the hands of an engineer who knew nothing of the nature of fuels would be as little likely to attain the limit of its possibility as the best human machine subjected to an ignorant caterer. The indorsed physiologies teach with the greatest possible exactness the true nature of the materials which men commonly use as foods, and point out definitely and in accordance with the most decisive proofs of exact modern science the qualities that are lacking in certain other substances which have been supposed to be foods, but are not.

"One of the most fatal errors of science," says Professor Kassowitz, of the University of Vienna, "is the idea that alcohol is a food." That idea is common among the people. Step by step for nearly half a century science has slowly but surely divested alcohol of every last claim and every shadow of a claim to a food value.

Recently some who have not kept fully acquainted with this literature have charged falsely that the question is not yet settled, and that therefore the subject should be kept out of the school physiologies. But meanwhile the disproved errors of the earlier experimenters are being promulgated through the newspapers and popular magazines. Shall the evidence which corrects these errors be allowed to lie on the shelves of the medical libraries, or shall it be given to the children, with full references to the authorities, which anyone who doubts may go and consult? As long as human belief influences human action and knowledge decides belief, whoever advocates the withholding of the established facts in this matter from the young is as much a traitor to his country as was Benedict Arnold.

DIGESTION.

Next to the subject of food comes digestion. It has long been held and is still taught by some belated or prejudiced physicians that alcoholic drinks are an aid to digestion. This notion has been disproved by the most careful exact experi-

¹ Journal of Physiology, vol. 13, 1892.

mentation. Shall we leave this evidence out of our physiologies and allow our future generations to become easy victims to the alcohol habit through the popular erroneous notion that it aids digestion?

Following the digestion of food comes its conversion into blood and the transportation of the blood to every part of the organism. The heart is the propelling engine. Medical literature contains constantly accumulating evidence of the injurious influence of tobacco and alcoholic drinks upon the heart. "Tobacco heart" rules many applicants out of the naval and military service of their country and unfits them for many other promising careers. Shall we omit these facts from the school literature and leave our youth to learn from the school of experience, when too late, what they might have been?

RESPIRATORY ORGANS.

Energy for warmth and work is derived from the oxidation or burning of food materials in the tissues. The oxygen necessary for this burning is carried into the body by the respiratory organs. Careful study of tuberculosis of the lungs during the last few years has revealed such a close connection between consumption and alcoholic habits that "alcoholism" and "tuberculosis" frequently stand together in the title of articles in medical literature. Only a few years ago alcohol was advocated by superficial observers in the medical profession as a cure for consumption. It is now a common lay prescription for a cold. Shall the evidence that alcohol predisposes the membranes of the respiratory organs to attacks of cold, makes them more susceptible to the germs of consumption, and weakens the powers of resistance against the disease be withheld from the children who study the school physiologies?

ORGANS OF EXCRETION.

However well the engineer may feed his engine with fuel, if he allows it to become clogged with ashes its power will diminish accordingly. The human body affords a parallel. Alcohol often causes diseases of the kidneys or of other organs concerned in the elimination of waste which quickly derange the human engine. Shall we leave out of our physiologies the evidence science has accumulated in this subject?

THE NERVOUS SYSTEM.

The human nervous system differentiates man from the brute creation, covers the surface of the earth with the products of his constructive power, harnesses the forces of nature to the car of his audacious purposes, and even aspires to think God's thoughts after Him. This, the almost divine part of the human system, the last attainment in the millenniums of evolution, is the most susceptible to the influence of alcoholic drinks and narcotics. Here the evidence of their action in small amounts is first detected by the weakening of that self-control through which man becomes the master of circumstances. Here lies the secret of that power gained by the alcoholic appetite which has caused the fall of some of the noblest specimens of the human race.

The injurious effects of large quantities have long been recognized. They have furnished the text for exhortations to moderation since the days of Noah. But evidence of injurious effects of small quantities, beyond the fact that they tended to the formation of the alcoholic appetite, has been obtained almost entirely during the last ten years. It has been secured through the most exhaustive, exact, and careful observation of the effects of alcohol on the higher mental operations, conducted by trained specialists in the psychological laboratories of renowned universities. Shall the results of these investigations be withheld from the young whose tastes, opinions, and habits are now in process of formation? Shall this knowledge be erased from our school physiologies?

THE ORGANS OF SPECIAL SENSE.

A part of the effects of narcotics upon the nervous system is their effects on the organs of special sense, the media through which the mind is made acquainted with its environment. Shall we withhold knowledge of the fact that these organs may be made less efficient by the use of alcohol and other narcotics?

But there is still another line of truths needed to correct popular misconceptions which encourage the formation of the drink habit.

FERMENTATION.

Fruits are healthful, a necessary part of man's diet. He has a natural appetite for them which has natural limits. Why is not the juice of these fruits when extracted and allowed to ferment equally healthful? To answer this question correctly one must understand the changes that take place during the process of alcoholic fermentation, the natural causes producing them, the nature of the resulting substances—the popular alcoholic drinks. One must know also the nature of the alcohol which makes these liquors injurious to the human system when used as beverages. This knowledge exists in the archives of science. Shall we not, according to our American tendency, continue to give in our school physiologies practical application of this knowledge to one of the most vital questions of individual and social welfare, rather than meekly to forsake our evident duty because some who have given little or no constructive thought to this great problem meet us with the vague objection that we are giving too much space to the temperance matter?

Science, logic, and experience all unite in demonstrating that established facts concerning the nature of alcoholic drinks and other narcotics, together with their effects upon the human system, have a rightful place in all physiologies to be studied by the young, and that, too, in connection with each phase of the subject. To omit such facts from a single topic is by so much to rob the child of knowledge which is his due and which might prove his stay in time of temptation.

SHALL THE TEMPERANCE MATTER BE MASSED IN ONE CHAPTER?

The plea is made that all temperance matter should be massed in one chapter. If we yield to this suggestion we sacrifice logical sequence and often the temperance matter itself. When the child is studying the structure and function of his muscles and his interest and enthusiasm are already kindled at the thought of what he can do with these organs, then is the time to study the hygiene of the same, to learn how the muscles are to be cared for and trained, and what may impair their usefulness. The influence of alcohol and tobacco is thus a logical part of hygiene. There is no sound reason for divorcing them and putting the temperance matter into a separate chapter, where it can be conveniently omitted; but, on the contrary, there is every reason for retaining it in connection with each topic.

Furthermore, if all temperance matter is massed in a single chapter at the end of the book there is every probability that it will be hurried over perfunctorily or neglected altogether. In any case, the golden moment of the child's interest has passed, and it has passed unimproved.

SHALL LESS SPACE BE GIVEN TO THE TEMPERANCE MATTER.

But can not all necessary temperance matter be given in less comparative space? To answer this question one must first compute the amount of physiology that is needed in each successive grade of the school course, and then compute the proportion required for clear statement of the facts of the temperance matter that are

appropriate to the same respective grades. The best efforts of experience, trained skill, and conscientious scruple concerning the omission of necessary truths have found that about one-fifth of the text of the systematically arranged and carefully graded school physiology is required for such a presentation of this topic.

Greater condensation would sacrifice the illustrations and development that are necessary to clear understanding and forcible impression. In such case the teaching becomes dogmatic assertion instead of the logical presentation of reasons for the truth asserted. Such a systematic arrangement as is followed in the indorsed books avoids the wearisome and unwarranted repetition of a few truths and the omission of others which result from unsystematic, haphazard teaching, the kind of teaching which necessarily brings the subject into disrepute wherever it is practiced.

The conservative study of the sociological side of the alcohol question has found the beverage use of alcoholic drinks a first cause in the 31 per cent of the crime represented in prisons and reformatories, excluding all minor penal institutions and criminal courts; a direct cause of 37 per cent of the poverty found in almshouses, excluding the incalculable amount of poverty which escapes these institutions, and a direct cause of 46 per cent of the deserted children. Such facts speak for themselves and show that, in view of the far-reaching effects of the use of alcoholic drinks and other narcotics, one-fifth of the space in our school physiologies is not too much to devote to the subject.

In the face of these facts we dare not lower our standard by omitting or further condensing the temperance matter in the text-books. To do so would be to pave the way for many a child to join the ranks of drink victims and to shut out the strength of his young manhood from the support of his country and her institutions.

REPORT OF A COMMITTEE OF THE DEPARTMENT OF SUPERINTENDENCE.

[At the meeting of the department of superintendence of the National Educational Association held at Chicago February 28, 1901, District Superintendent A. G. Lane, Chicago, chairman of the committee on physiology in schools appointed at the meeting of the department in 1900, presented the following report.]

The undersigned committee of the department of superintendence was appointed under the following resolution:

Resolved, That the chair appoint a committee of seven, whose duty it shall be to report upon the teaching of physiology in the schools, especially with regard to the condition and progress of scientific inquiry as to the action of alcohol upon the human system, and to recommend what action, if any, by this department is justified by the results of these inquiries.

Your committee recommends the adoption of the following report:

The department of superintendence agrees cordially with the special advocates of the temperance cause in holding that everything which public instruction can do in the battle against intemperance ought to be done, and that both physiology and hygiene should be so taught as to leave in the minds of children and youth an adequate and proper knowledge of the effects of alcoholic drinks and stimulants and of narcotics on the human system.

Since the last meeting of this department there has been considerable discussion of the question as to whether alcohol under any conditions is properly to be defined as an article of food. Medical authorities are quoted in support of both sides of this question; but no authority has been found to maintain that alcohol is a food in the ordinary sense of that term. The question of the supposed food value of alcohol is a technical one for medical experts to determine, and not one which

need concern the men and women who are engaged in the work of public instruction of children and youth. For them it is enough to know that its use as a beverage is injurious, and that all authorities agree in deprecating the formation of the drinking habit and in commending all practicable efforts, through public instruction, to promote the cause of temperance.

The questions of highest importance for teachers and superintendents of schools to consider are those which relate to the methods by which temperance instruction shall be imparted, the extent to which it shall be carried, and the subject-matter to be presented.

The educational side of this subject is vitally important and demands thorough and systematic study.

We therefore recommend that a body of educational doctrine be formulated which may guide temperance instruction in the schools throughout the country, and we further recommend that the scope of the investigation be so enlarged as to cover not only the topics already suggested, but also the whole field of personal hygiene, so far as this is a practicable matter for school instruction.

We also recommend that this investigation be conducted under the direction of the National Council of Education, in accordance with the regulations of the National Educational Association.

Upon motion of Mr. Lane, seconded by Henry Sabin, of Iowa, the report was adopted without debate.

TEMPERANCE TEACHING AND RECENT LEGISLATION IN CONNECTICUT.¹

BY W. B. FERGUSON,

Superintendent of Schools, Middletown, Conn.

The act of the Connecticut legislature, at its last session, in radically modifying the temperance education law of the State, at the request of the teachers and temperance leaders, probably marked the beginning of a reaction in legislation affecting one of the most remarkable temperance movements of modern times.

The Connecticut statute of 1893 resembled, in its general features, the statutes of several other States. It was less stringent than the law of New York, Illinois, or New Jersey, but more exacting than that of Massachusetts or Pennsylvania. It was as follows:

SECTION 1. The nature of alcoholic drinks and narcotics, and special instruction as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the common or public schools, and shall be studied and taught as other like required branches, by the use of graded text-books in the hands of pupils where other branches are thus studied, and orally in the case of pupils unable to read, and by all pupils in all schools supported wholly or in part by public money.

SEC. 2. The text-books used for the instruction required by the preceding section for intermediate and primary pupils shall give at least one-fifth of their space

¹ Reprinted from the Educational Review, March, 1902.

to the consideration of the nature and effects of alcoholic drinks and narcotics, and the books used in the highest grade of graded schools shall contain at least twenty pages of matter relating to this subject; but when this subject is massed wholly or in part in a chapter or chapters at the end of a book, such book shall not be considered as meeting the requirements of this law.

SEC. 3. It shall be the duty of all school visitors to report to the comptroller if the provisions of this act have not been complied with, as specified in the preceding sections; and any failure thus reported, or otherwise satisfactorily proven, shall be deemed sufficient cause for withholding the amount of school dividend which such district or districts are otherwise entitled to receive.

SEC. 4. No certificate shall hereafter be granted to any person to teach in the public schools of Connecticut who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects and nature of alcoholic drinks and other narcotics upon the human system.

This statute had been in force eight years. In some schools an honest and earnest effort had been made to obey both its letter and spirit. In other schools temperance teaching had doubtless been slighted, but everywhere throughout the State superintendents, principals, and teachers were, at the beginning of the present year, practically unanimous in condemning certain provisions of the law and in demanding their repeal.

Before entering upon a discussion of the recent legislation in Connecticut, let us trace briefly this remarkable temperance movement from its beginning. What were its cause and origin? What are its aims, methods, and results? * * *

Alexander von Humboldt declared in the last century that whatever virtue men would have appear in society must be taught in the schools. An organization of women was to apply that philosophy to the temperance problem. The Woman's Christian Temperance Union was organized in 1874. Its plan was to form State, county, and local branches throughout the country, and its membership soon extended into every State and Territory of the Union. In 1879 a prominent member of that organization submitted to it a proposition, which she called "my concern." It provided for "a thorough, systematic study of scientific or physiological temperance for all pupils in the public schools of the United States." In 1880 a department of scientific temperance instruction was organized to put that plan into execution, and a superintendent was appointed "to originate, devise, and direct plans of work for the accomplishment of the objects of the department." This superintendent had, she herself says, "an earnest, enthusiastic clientele of active, loyal Christian women in every part of the country, ready quickly and intelligently to carry out the plans transmitted to them, a great army of battalions in every State and Territory, regiments and companies with pickets at every outpost, and all under the guidance of one head."

The hope entertained by the members of this organization of effecting a thorough temperance reform in society by teaching the children the effects of alcohol on the human body rests upon the old Socratic philosophy that knowledge of evil insures the avoidance of evil; that people do wrong from ignorance only. It was said,¹ "The cause of temperance will ever be a fluctuating reform until it is based upon the education of the people as to the proven facts about the nature and consequent effects of alcoholic drinks. When these facts become a part of public knowledge, dating from early childhood, the saloon problem will be solved."

This instruction was to be given in connection with physiology and hygiene, but temperance was to be made the "chief topic." It was proclaimed, "This is not a physiological but a temperance movement."¹ This teaching was also to be required by law, not only in the schools of every State, but in all schools and colleges under the control of the National Government.

Many things contributed to make legislation to this end possible. The object was a noble one, and history has repeatedly shown that the nobility of the object

¹An Epoch of the Nineteenth Century, by Mary H. Hunt.

often blinds good people to the futility, if not to the immorality, of the means. Again, all attempts to reform adult society had failed, and the only hope of redeeming the world from the curse of strong drink seemed to be in saving the children from intemperance by a process of education. Still again, the Woman's Christian Temperance Union, with its loyal branches in every city, town, and village, with its leader of high moral purpose and consecration to a good cause, of consummate ability as a general, and of great eloquence as an advocate, was able to wield a political influence second to few, if any, organizations in the country.

Let us briefly notice the means used by that organization to secure desired legislation. It will be a study of the most astute and successful political methods. Regarding the campaign in New York, in 1884, for a temperance educational law, the leader in that campaign says: "The campaign was systematically planned and executed. Earnest appeals from platform, press, and prayer meeting among the constituencies back of every vote created a sentiment that echoed in the final 'aye,' 'aye,' that enacted the law of 1884. * * * More than a million pages of matter in print and letter form went out during that campaign to the people of that State."¹ According to the same authority similar methods were employed in Pennsylvania in 1885. * * *

The people were appealed to in the name of temperance; their sons and daughters were in danger of suffering; why not fortify them against temptation by pointing out to them the true nature of alcohol and tobacco, and thus enable them to withstand in the evil hour? A strong public sentiment having been thus created in each locality "was gathered up and focalized on each member of the committee to whom the bill would be referred in both branches of Congress" and the legislatures, and, before the vote was taken on the final passage of the bill, Senators and Representatives were deluged with letters and petitions. Presumably, some hesitated to oppose such temperance measures lest they be classed among the friends of the saloon, the enemies of the children and good morals, and be threatened with political annihilation. It is not surprising, therefore, that a temperance education law, usually of a mild nature, was soon passed by nearly every State and by the National Congress.

But, as has been said, temperance was to be taught in connection with physiology and hygiene, and there were no text-books of physiology which devoted much space to alcohol and other narcotics. The next step, therefore, was to induce or compel publishers to revise their physiologies and to incorporate in them chapters on narcotics.

It was just here that these temperance leaders made their first great mistake. Only praise can be bestowed upon their ultimate object. It is a truly noble and patriotic one. Nor can severe criticism be pronounced upon the means employed to secure legislation. They were simply the means often used by the better class of politicians. But, in revising the physiologies, the greatest care should have been exercised not to include in them any statements concerning alcohol and other narcotics which do not square with scientific truth. These books, however, instead of being scientifically accurate, contain statements that contradict both science and the everyday observations of men. True, they are said by those who are styled "eminent scientists," "best scientific authorities," and the "world's experts," to contain "no errors," to be "substantially correct," "completely in accordance with the facts determined through scientific experimentation and observation," "accurate," etc. But let us briefly examine some of these volumes and ascertain whether they are wholly accurate and, therefore, in accord with the highest scientific authority.

In the latest and quite recent editions of these books we find the following state-

¹An Epoch of the Nineteenth Century.

ments, made either by the authors of the books or quoted from those who are called "eminent writers," "gifted authors," and "men of high standing and acknowledged ability."

"The majority of beer drinkers die from dropsy."¹

That the long-continued and excessive use of beer tends to affect injuriously the liver and kidneys—and all organs of the body for that matter—is undoubtedly true, but if it be true that the majority of those who drink beer die from dropsy, it is difficult to understand why American life-insurance companies are so desirous of doing business among such a dropsical people as the Germans must be.

"Alcohol is a virulent poison, and should be classed with arsenic and mercury."²

Druggists do not seem to know this, for they never put the "poison" label on a bottle of alcohol, though they seldom forget to do so in the case of arsenic and mercury. Instead of being a "virulent" or "powerful" poison, alcohol is one of the weakest and slowest of poisons. Moreover, it is a subject of discussion among leading scientists whether alcohol acts at all like a poison when taken in small doses. But whether it should or should not be classed scientifically as a poison, certainly in the sense in which the child understands the word "poison" alcohol is not a poison, and this is sufficient reason why it should not be so called in teaching children.

Another³ of these "indorsed" physiologies conveys the impression that alcohol passes through the different organs of the body unoxidized and merely "mixed with" the blood, thus conveying the impression that it can not in any sense or measure serve the purpose of a food. This is a surprising position for a book published in 1899 to take, in view of the results of scientific research conducted in the laboratories of Europe and America during the last twenty years, but more especially during the last three or four years. Alcohol is certainly not a food in the sense in which children understand that term, and this consideration forbids calling it a food in teaching children, but to affirm specifically or to teach by implication that alcohol is not oxidized in the body, but always passes through it unchanged, is to teach untruth.

Alcohol can not build tissue nor increase muscular strength, but taken in small quantities it is oxidized and yields energy. This fact, however, furnishes no good reason for using alcohol liquor as a beverage, nor does it help to solve any one of the many problems that have their source in the liquor traffic.

The subject of alcohol as a food or poison is a purely academic one, and should have no place in the teaching of the public schools, at least in the lower grades.

"Tobacco has done more to cause insanity than spirituous liquors."⁴

The records of the Connecticut Hospital for the Insane show 1,003 cases of insanity caused by spirituous liquors and only 13 cases caused in part by tobacco.

"Tobacco is doing more harm in the world than rum."⁵

This statement was taken from a newspaper report of an address by Dr. Willard Parker. Those who knew Dr. Parker can best judge as to whether he would be guilty of making such a ridiculous statement. But is that the kind of temperance teaching we want our boys to receive? Would not the inference that it is less harmful to drink beer or whisky than to smoke or chew tobacco be natural to boys who are told that "tobacco is doing more harm in the world than rum?"

Dr. J. W. Seaver, of Yale University, is made to say, "No young man can use tobacco without injuring himself *seriously*."⁶ (The italics are mine.) In reply to a letter from me Dr. Seaver says: "I would never think of making such a state-

⁵ Pathfinder, No. 2, p. 60.

⁶ Stowell's Essentials of Health, p. 233.

ment; the facts are all against such a statement. * * * It is a bugaboo." And yet Dr. Seaver is one of the strongest advocates of total abstinence from tobacco. The author of the book is said to have recently acknowledged that he took the statement from a newspaper.

"None are more likely to deceive unscrupulously than those who use the weed. Tobacco demoralizes; it makes a man careless about his hair; he lets his nails go unclean; his clothes or soiled, and he is generally untidy."¹

These are merely illustrations of the kind of temperance instruction which too many of these books offer to the boys and girls in our public schools.

Of course these books were not satisfactory to teachers, who knew that such statements were in direct conflict with the results of their own observations and who soon learned from scientists that such teaching was also in direct conflict with the consensus of scientific opinion. Indeed, nothing in the education of our time has met with so general and so earnest disapproval from the most intelligent teachers as have these "indorsed" physiologies. This has been due, however, not so much to specific statements of a misleading nature as to the spirit of exaggeration that pervades the books, to the large amount and unwise distribution of the temperance matter, to the emphasis placed upon facts—or assumed facts—that appeal to fear and to the disregard of facts that appeal to manliness and the moral nature, to negative teaching chiefly, and to the omission of much that should be given to emphasize the beauty, nobility, and strength of a temperate life.

Let us briefly notice the proportion of space which these "indorsed" books give to narcotics. One of them,² which contains approximately 90 pages (not including preface, contents, index, or space occupied by cuts and questions on the text), devotes 38 pages to anatomy and physiology, about 35 pages to narcotics, and only 17 pages to all other topics of hygiene. It devotes 1 page to the "Care of the brain and nerves," but 4 pages to the effects of narcotics on the nervous system; 4 pages to the important subject of "Foods," but 16 pages to the sources and nature of alcohol; 7 lines to show why people who are not growing need food, but an indefinite number of pages to show why these same people do not need alcohol. Five lines are thought sufficient for a thorough discussion of the important subject of "Exercise," but nearly three pages are devoted to a consideration of "Cider." Another volume of this series³ devotes approximately 75 pages, or two-fifths of the entire space (not including space occupied by cuts and questions), to narcotics. These books, I think, represent about the proportion of space given by other "indorsed" physiologies of the same grade to narcotics.

This proportion is much too great. Too much of even the best food soon cloy the appetite, causes indigestion and nausea, and does physical harm. So too large or too frequent doses of temperance instruction are sure to kill all interest in the subject, cause disgust, and do moral injury. Moreover, all the facts that are presented in the 35 pages of the one book or the 75 pages of the other could be adequately and impressively presented in 10 pages or even less.

As has already been shown, these books appeal chiefly to fear. The trembling hand, the thick speech, the dull senses, the poisoned blood, the overwrought heart, the disordered liver and stomach, the weakened nerves, the confused brain, the foul mouth, the offensive breath, the poverty, crime, and misery of the drunkard are hysterically held up to the gaze of the children; but the steady hand, the distinct speech, the quick senses, the healthy body, the clear brain, the success, and happiness of the temperate man are scarcely mentioned.

Says Prof. S. T. Dutton, of Columbia University: "We do not teach hygiene by the study of disease, cleanliness by the observation of filth, nor purity by the contemplation of vice."

We teach truth, kindness, generosity by pointing to men and women who

¹ Stowell's Essentials of Health, p. 245.

² Pathfinder, No. 1.

³ Pathfinder, No. 2.

exemplify those virtues. "It is by studying the Christ-life that we become Christ-like," says a Connecticut school superintendent, a member of the Women's Christian Temperance Union. "Too often we try to lead the children into temperate lives by holding up intemperance only, into lives of all self-control by careful observation of those who are only examples of self-indulgence. We believe that these lessons can be most effectively taught by persistently placing before the child, in every way and at every opportunity, the virtues we would have him incorporate into his own life."

"Education," says Superintendent Soldan, "is that process by which the germs of good that lie as possibilities in every child are drawn forth and developed." How can that object be better accomplished than by keeping the thoughts and affections on the good, the pure, the beautiful, and away from the evil, the impure, and the ugly? Froebel's injunction was so "to fill the mind with the beautiful that there will be no room for the ugly." Our ministers learned long ago that Christian character can be more easily cultivated by helping people to catch glimpses of heaven than by holding up to their gaze the torments of hell. If this be true in the case of older people, it is doubly true in the case of children.

We do not contend that the evil effects of alcohol and tobacco should never be pointed out to children. They should be, but chiefly in order that by contrast the nobility, strength, and success of the temperate life may be made more impressive.

The distribution of the temperance matter in these books is very objectionable. Instead of concentrating it into three or four chapters, it is distributed in many places, and, in too many cases, the trend of the chapter is toward a climax in the discussion of narcotics; that is, the instruction in physiology and hygiene seems to be intended merely as a preparation for the temperance teaching that frequently closes the chapter. In this way temperance is made the "chief topic," and the proclamation that "This is not a physiological, but a temperance movement" is enforced.

But to return to the history of this temperance movement. After physiologies of the nature just described had been secured, a demand was made for more stringent laws—laws which required the use of text-books that devote at least one-fifth of their space to narcotics, and which specified that temperance instruction should be given to all children, from the lowest primary classes to the young men and women in the high school.

It is not generally understood, I think, with what consummate shrewdness and skill the political influence of the Woman's Christian Temperance Union on legislators and the personal influence of officers and members of that organization on publishers and school committees have been made to contribute to the accomplishment of the one purpose, viz, the adoption and use of the "indorsed" physiologies. By plans carefully laid and skillfully executed, this object was, in some States, quickly secured. Through the personal influence of branches of the Woman's Christian Temperance Union in each locality public sentiment was first aroused in favor of temperance instruction. This sentiment was then brought to bear upon legislators in favor of temperance education laws, at first of a liberal character. Publishers were then compelled to revise their books and to incorporate in them chapters on narcotics in order to secure sales, for the influence of the local Woman's Christian Temperance Union forced school committees to demand temperance books. It was, then, not a difficult matter to secure such modifications in the law as practically to require the use of the "indorsed" books or of books made with a view of securing indorsement, and therefore differing little from the "approved" books.

No claim is here made that, in the steps taken to secure this legislation, methods of a dishonest character were employed. There is admiration rather for the perfect organization of forces, for the marshaling of "companies, battalions, pickets, and outposts," for the carefully laid and skillfully executed plans, for the facility

with which legislators were made as clay in the hands of the potter, and for the triumphant success that crowned the efforts of those who fought without a ballot. I am simply endeavoring to show how it has happened that laws which do violence to modern pedagogy, which force upon the schools "devitalized and machine-like methods," and a kind of teaching which is a "travesty on modern education," have been secured by the Woman's Christian Temperance Union in spite of the opposition of teachers and school superintendents, in spite of State officers of education, college professors, and college presidents, in spite of prominent physicians, clergymen, the public press, and even the legislators themselves.

In demanding these more stringent laws, however, the temperance people made their second great mistake. Had school superintendents, principals, or teachers been consulted and their advice followed, such laws would not have been demanded. There are many reasons, well understood by practical school people, why the smallest children should not receive instruction concerning the effects of narcotics on the human body. Moreover, that stringent laws do not insure effective teaching, but that liberal laws are more likely to accomplish that object, is clearly shown by the results in different States. The experience in Pennsylvania is to the point. The teaching in that State is said by temperance leaders to be especially satisfactory, and yet the law of that State specifies nothing as to what, how much, or how temperance shall be taught, nor is it specified that text-books shall be used in any grade.

Let us now return to the situation in Connecticut.

What had been the results of temperance teaching under the exacting statute of 1893? The following replies of the ten teachers in one of the grammar schools of the State undoubtedly represent the opinions of teachers throughout the Commonwealth. The questions were submitted before the movement to secure modifications in the law was begun, and only one teacher knew the superintendent's opinion of the text-books in use or of the results of temperance teaching in his schools.

"Do your children understand what the text-book states about the physiological effects of alcohol on the liver, kidneys, heart, and other organs of the body?" All answer "No."

"Do you accept as true all the statements of your text-book of physiology?" All answer "No."

"Do you think that temperance instruction, as presented in your book, will save some of your boys from the use of intoxicating liquors and other narcotics?" Four answer "Possibly;" six answer "No."

"Do you think that temperance instruction should relate chiefly to the effects of alcohol and other narcotics on the human body, or to their effects on character, happiness, and success in life?" All answer "The latter."

All of these ten teachers had earnestly endeavored to obey both the letter and the spirit of the law. Can it be reasonably doubted that similar replies would be made to these questions by the teachers of New York, Illinois, and other States, upon whose schools a kind of temperance instruction is forced which is baneful to both teacher and pupil?

And so this temperance education law had been tried in Connecticut eight years with results that were unsatisfactory to both teachers and temperance leaders, when, suddenly, the widespread opposition to the law that had been gathering force among the educators became manifest and made itself felt in favor of radical modifications.

At a meeting of the Connecticut council of education, held in New Haven early in the present year, the subject of "Temperance Teaching in Public Schools" was discussed by Prof. W. O. Atwater, members of the council, and officers of temperance organizations of the State, who had been invited to be present and to take part in the discussion. So great was the opposition manifested by the school superintendents and principals to the law that the Rev. J. H. James, secretary of

the Connecticut Temperance Union, suggested that the school people and temperance people get together and see if they could not agree upon modifications of the statutes if modifications should seem desirable. The suggestion was acted upon, and a committee was appointed to confer with the officers of the temperance organizations of the State. A conference was held; a bill was at length agreed upon and accepted by the school people and temperance people. Superintendents and principals, representing a majority of the teachers and pupils of the State, signed a petition to the legislature urging its passage. Every superintendent, principal, and teacher in the State, so far as I know, favored the bill. It was indorsed by President Hadley, of Yale; President Raymond, of Wesleyan, and other prominent citizens of the State. It was strongly opposed by the national superintendent of scientific temperance instruction and members of her advisory board, but it passed both house and senate without a word of opposition. * * *

Great honor is due the temperance people of Connecticut, especially the Woman's Christian Temperance Union, for manifesting a broad-mindedness and a spirit of conciliation which made agreement with the teachers possible. They placed duty before policy, good teaching before any desire for a "perfect" law, and the interests of the children before the fear or pleasure of anybody. The future will show, we believe, that in winning the respect and confidence of the teachers by uniting with them in support of a more reasonable temperance education law they "built better than they knew."

The provisions of the new law are as follows:

SECTION 1. The effects of alcohol and narcotics on health, and especially on character, shall be taught in connection with hygiene as a regular branch of study to all pupils above the third grade in all graded public schools except public high schools.

SEC. 2. Suitable text-books of physiology and hygiene, which explain the effects of alcohol and narcotics on the human system, shall be used in grades above the fifth in all graded public schools except public high schools.

SEC. 3. The provisions of sections 1 and 2 of this act shall apply, in ungraded public schools, to classes corresponding to the grades designated in said sections.

SEC. 4. All normal schools and teachers' training schools shall give instruction in the subjects prescribed in sections 1 and 2 of this act and in the best methods of teaching such subjects.

SEC. 5. No certificate to teach in grades above the third shall be granted to any person who has not passed a satisfactory examination in the subjects prescribed in section 1 of this act.

SEC. 6. If it shall be satisfactorily proven to the comptroller that any town or district, having pupils above the third grade, has failed to meet the requirements of this act, such failure shall be deemed sufficient cause for withholding, in whole or in part, school dividends which such town or district would otherwise be entitled to receive.

If this statute be compared with that of 1893, the following chief differences will appear: The present law does not require temperance instruction below the fourth grade nor in the high school; it does not require the use of text-books below the sixth grade nor the use in any grade of books that devote any definite portion of space to narcotics. Neither does it require the use of text-books by pupils. All these requirements were definitely specified in the statute of 1893. The increased demand on the normal schools is more apparent than real, for the old statute required those schools to provide temperance instruction by its general provisions relating to the teaching of temperance "in all schools supported wholly or in part by public money."

The present statute was a compromise in the strictest sense of the word. It was not entirely satisfactory to either party, but it was more satisfactory to the teachers than the old law, and to the temperance people than no law at all. A fight between the teachers and the temperance people might have resulted in the passage of the bill which had been introduced early in the session, and which provided for the repeal of the then existing statute, but neither party desired to enter upon such a fierce contest as would surely follow.

The teachers of Connecticut are in favor of giving to their pupils a reasonable amount of temperance instruction, but they wish to practice temperance in their temperance teaching. They believe, with the National Association of Superintendence, that "the question of highest interest for teachers and superintendents of schools to consider is the methods by which temperance instruction shall be imparted, the extent to which it shall be carried, and the subject-matter to be presented." They believe that all these matters should be determined by practical educators and not by visionary enthusiasts. They know that many a course of study, conceived in the fertile brain of one of no experience in teaching, has found its Waterloo in the practical test of the school-room.

But what is to be the outcome of this temperance movement?

The answer to that question depends largely upon the wisdom shown by educators and temperance leaders. If they act as becomes those who seek the same ultimate object, some good should result; but these temperance people are doomed to certain disappointment in the amount of good which they hope will be accomplished. Their theory and hopes rest upon an assumption that is not founded on the truth. Knowledge of evil does not insure the avoidance of evil. People do not do wrong from ignorance only.

Educators and temperance leaders should cooperate, and cooperation will be promoted if good sense, consideration, and forbearance are shown by both parties.

Educators should remember that they are public servants and are not in a position to dictate in matters of public policy; that more can be gained by patience and discussion than by impatience and unkind remarks; that the temperance people who have been instrumental in securing existing legislation are honest, high-minded, true to their convictions of duty, desiring only to subserve the highest interests of the children, of society, and their country; that they can not be driven from their course, but that the great majority of them can be led from it by showing them a better way; and that, when aroused by a sense of duty, they can wield a political influence which educators would find difficult to overcome.

On the other hand, temperance leaders should remember that most teachers are also temperance people by precept and example; that they are honest, high-minded, and conscientious; that they are second only to parents in the interest they feel in the moral welfare of their pupils; that they have had professional training and know best what subjects are suited to the different stages of mental and moral development; that teachers can not be forced to teach what they believe to be false; that the most intelligent teachers will rely for their scientific facts upon men of science and not upon the compiler, the tyro, or the partisan; that no temperance education law, however "perfect," can accomplish much unless it has the support of educators; that their support can not be secured by abuse, by charging them with being in sympathy with the liquor interests and always opposed to progress; that no temperance education law or course of temperance instruction which is conceived in the brain of anyone, however brilliant, who has had no educational training or experience in the modern schoolroom will probably be sufficiently sane and sensible to deserve the support of anybody. And, furthermore, temperance leaders will do well to understand that the people are beginning to know the facts about this temperance movement, to question its efficacy as at present conducted, and that, in a contest between teachers and the promulgators of this movement, the people will support the teachers as they have never done before.

Liberty to teach the truth, as the teacher understands it, and to teach it in the way in which he can make it most effective, must be maintained at all cost. For educators to yield this right would be to sacrifice self-respect and the highest interests of the children. All who are interested in sound education and good morals should see to it that this right is preserved to the teachers of American youth.

TEMPERANCE INSTRUCTION IN NEBRASKA.

The instruction in this subject is often unwisely distributed throughout the course, and any change of sentiment or opinion against the use of alcohol seems entirely disproportionate to the outlay of time and effort that has been made. There is frequent and unnecessary repetition, and diminished interest and dislike of the subject are prevalent. Text-book instruction could, with profit to the cause and to the school, be limited to the higher grammar grades. The use of charts in common schools showing morbid physiological conditions is generally condemned.—*Official decisions of the State superintendent of Nebraska (1881-1902)*, p. 46.

 THE MODERN SUBJECTION OF SCIENCE AND EDUCATION TO PROPAGANDA.¹

When, in 1842, Horace Mann published his still excellent essay on *The Study of Physiology in Schools*, he seems, judged by recent school statutes of the several United States, to have made one serious omission, for he nowhere mentions or even foreshadows that remarkable creation of our own times, "temperance physiology," and very likely, with some old-fashioned people of to-day, he regarded "temperance" as chiefly a moral question.

The movement is variously called "scientific temperance instruction," "temperance physiology" or "physiological temperance," and it has now grown to such proportions and has gained such power as to dominate, almost absolutely, all instruction in elementary physiology and hygiene in America. It is of course right and proper that pupils in all grades of the public schools should be taught the dangers of alcoholic beverages as fully and as earnestly as other dangers lurking in food or drink. We may even grant that more stress should be laid upon this subject than upon some others. But an examination of the present status of elementary education in physiology and hygiene in the United States shows that in many cases the instruction demanded by this propaganda, and given according to law, in reference to alcohol goes much further. It even appears that all instruction in physiology and hygiene in the public schools has passed to a great and unjustifiable extent into the virtual control and under the subjection of the "temperance physiology" propaganda.

Authoritative sources of information for testing these statements are easily accessible to all. They consist of the statutes of the several States requiring instruction, often of prescribed and peculiar kinds, regarding alcohol; of the text-books on elementary physiology and hygiene actually in the hands of the pupils; of the teachers—many of whom groan in spirit even when they do not dare to complain openly; and last, but not least, of the histories of the propaganda published, one in 1891 (or earlier) and the other in 1897.²

From these latter it appears that statutes now exist in nearly every one of the United States requiring instruction in physiology and hygiene with special refer-

¹ Abridgment of an address delivered at the Chicago meeting of the American Society of Naturalists, December 30, 1901, by Prof. Wm. T. Sedgwick, of the Massachusetts Institute of Technology, president of the society.

2. *An Epoch of the Nineteenth Century. An Outline of the Work for Scientific Temperance Education in the Public Schools of the United States*. By Mary H. Hunt, national and international superintendent of the department of scientific temperance instruction, and life director of the National Educational Association. Boston, 1897.

ence to the nature and effects of alcoholic drinks; that in some States a penalty clause is attached for nonenforcement; that in some the amount of space to be given in text-books is prescribed, and in the same or in others the time to be devoted to the subject. In some States it is also required that the subject shall not be treated in an appendix or in a separate chapter at the end of the book.

The Illinois law requires that all pupils "below the second year of the high school and above the third year of school work," counting from the lowest primary, "shall be taught and shall study this subject every year, from suitable text-books in the hands of all pupils, for not less than four lessons a week, for ten or more weeks of each year." For students below the high school "such text-books shall give at least one-fifth their space," and for high-school students "not less than twenty pages, to the nature and effects of alcoholic drinks and other narcotics. The pages on this subject in a separate chapter at the end of the book shall not be counted in determining the minimum." The New York law of 1896 is very lengthy and likewise contains an important provision that "this subject must be treated in the text-books in connection with the various divisions of physiology and hygiene, and pages on this subject in a separate chapter at the end of the book shall not be counted in determining the minimum."

The effect of these peculiar laws closely defining instruction in physiology and hygiene has been to create a correspondingly peculiar class of text-books. Some of these have been prepared by competent writers, but most of them are inferior and some are distinctly bad. One chapter in Mrs. Hunt's history is entitled *The Text-Book War*. It is not agreeable reading, either for scientific men or for educators. In a so-called *Great Petition to Publishers*, which reads more like a threat than a petition, it is stated: "This is not a physiological, but a temperance, movement. In all grades below the high school this instruction should contain only physiology enough to make the hygiene of temperance and other laws of health intelligible. Temperance should be the chief and not the subordinate topic, and should occupy at least one-fourth the space in text-books for these grades." In the same *Great Petition to Publishers* we find it also stated that "Those text-books that are largely physiology with a minimum of temperance matter * * * do not meet the requirements of the law, and do not satisfy those who secured its enactment and are determined to secure its enforcement." Further on, publishers are told exactly what is wanted in great detail and in no uncertain tones.

Text-books conforming with these requirements of the propaganda may be officially "indorsed" by a "committee of the advisory board" sitting in council for the purpose. In another chapter, entitled *The Text-Book War Over*, it is stated that "in response to the *Great Petition* most of the publishers have expressed the desire to have their books revised, on condition that the national superintendent of the scientific department of the *Woman's Christian Temperance Union* would revise them or supervise their proposed revision." That is to say, many publishers were naturally eager to have their books "indorsed," doubtless hoping thereby to increase their sale.

No wise educator who has given any attention to the subject can deny that the influence of this powerful propaganda has been in most respects injurious to the proper teaching of physiology and hygiene in the lower schools. Teachers, principals, superintendents, and even school committees, are seldom able to speak with perfect frankness on the subject, from fear of the influences which may be brought to bear against them or of the intemperate criticism to which they may be exposed; and in my opinion it is time for a body of scientific men like the *American Society of Naturalists* or the *American Association for the Advancement of Science* to put on record its opinion that the subjection under which science and education are to-day suffering from the "temperance physiology" propaganda has become intolerable.

I lately examined with some care a good text-book of elementary physiology and

was shocked on opening it to find at the very beginning, and in a most prominent place, an entire page devoted to an "indorsement" of the book by the self-constituted oligarchy which has the assurance to "approve" or not, as it sees fit, text-books on physiology and hygiene for use in secondary and lower schools. In the case I mention, this committee did not even confine their "approval" to the alcoholic and narcotic portions of the book but "indorsed" also its "amount of matter on general hygiene," as well as the "presentation of matter with regard to its adaptability to the class of students for which it is designed;" or, in other words, passed upon its scientific and pedagogical merit, as well as upon its alcoholic value. If, as would sometimes seem to be the case, it has actually come to pass, at the beginning of this twentieth century, that a writer who desires to publish an elementary text-book on physiology and hygiene, before he can obtain a publisher or a market, may have to secure the "indorsement" of the world's and national superintendent of scientific temperance instruction of the Woman's Christian Temperance Union, of the vice-president of the Massachusetts Total Abstinence Society, and the rest of this self-constituted committee, it is high time that cognizance should be taken of the fact by scientific men and educators and a protest entered.

On further examining the book to which I have just referred, I was even more disturbed to find that this author, like some other recent writers on elementary physiology and hygiene, doubtless with the New York law before his eyes (which requires that "this subject must be treated in the text-books in connection with the various divisions of physiology and hygiene, and pages on this subject in a separate chapter at the end of the book shall not be counted") had actually felt bound to weave in a lesson on alcohol with his discussion of the physiology of muscle, of nerve, of digestion, of vision, and each of several other sections of the subject, so that all his work seemed literally tainted with alcohol.

What I have said thus far of this subject applies mainly to elementary education; but those who have witnessed the virulent attacks upon a conscientious chemist and physiologist, who has recently made important physiological experiments upon the oxidation of alcohol within the human body, because his experiments have seemed to confirm the earlier statements that alcohol in minute quantities is more like a food than a poison, do not need to be told that this same propaganda is quite as eager to bring science, as it has already brought education, under its powerful dominion. Signs are not wanting, however, which indicate that its control has already reached its climax, and even begun to decline.

An attempt in 1899 to make the Massachusetts law conform more closely to the ideas of those interested in "scientific temperance" was stoutly resisted by the Massachusetts Medical Society, as well as by various scientific men and educators, with the result that the statute of 1885 remains unchanged. This prescribes that "physiology and hygiene, which in both divisions of the subject shall include special instruction as to the effect of alcoholic drinks, stimulants, and narcotics on the human system, shall be taught as a regular branch of study to all pupils in all schools supported wholly or in part by public money, except special schools maintained solely for instruction in particular branches, such as drawing, mechanics, art, and like studies." With the exception of the clause "to all pupils" this statute is not unreasonable, for, as I have said above, it is right and proper that the youth of the land should be taught, plainly and thoroughly, the dangers which lurk in alcoholic drinks, in narcotics, etc. What is unnecessary and objectionable is that the exact amount of such teaching should be prescribed by law; and that the method of teaching (by text-books in the hands of the pupils), the space devoted to it, and its treatment, in text-books, should be legally regulated. That, in addition, the particular text-books used should be largely determined by a self-constituted and unofficial oligarchy, leaders of a propaganda, which, in any right use of the terms, is neither educational nor scientific, is both odious and intolerable.

In Connecticut, in 1901, a statute of the objectionable sort referred to above was repealed, and one to which but little exception can be taken was enacted in its place. It is gratifying to note, also, that the department of superintendence of the National Educational Association, at a meeting in Chicago in the early part of the same year, adopted a report containing the following significant, if guarded, paragraphs:

The questions of highest importance for teachers and superintendents of schools to consider [concerning "temperance physiology"] are those which relate to the methods by which temperance instruction shall be imparted, the extent to which it shall be carried and the subject-matter to be presented.

The educational side of this question is vitally important, and demands thorough and systematic study.

This action is timely and welcome in view of the existence of an opinion like the following, expressed in a letter to me by a representative of a prominent publishing house: "I feel that we can not be too emphatic in expressing sympathy with your movement and in denouncing the intimidation of teachers and other educators which has gone on for some years."

THE WILL OF THE PEOPLE, NOT OF AN OLIGARCHY.¹

* * * Professor Sedgwick is now objecting, not to this study, he says, but to the legal specifications which have made it a success. First, he objects to its being taught "to all pupils." He does not tell when or by what class of pupils he would have it omitted. In our country "all pupils" of to-day are destined to be the sovereign people of to-morrow. Hence, looked at from the standpoint of the State, it can not afford that one single pupil should not receive the utmost instruction on this subject needed to fit that pupil for a future sovereignty of intelligent sobriety.

From the standpoint of the individual, we ask, from whose child shall this educational method for the prevention of intemperance be withheld? Shall it be from the children of the poor, the rich, the foreign born, or the home born? We are answered by the command of the greatest of all Teachers that the supreme message for the prevention of evil and the establishment of right should be given "to every creature" in "all the world." That inclusive demand and precedent not only justifies all pupils getting this education, but implies neglect of duty if it is excluded from any.

If Professor Sedgwick's objection is to the requirement of the study through specified grades, as his reference to the Illinois law implies, we answer: The formation of right habits is the object sought. The child's habits are rapidly formed, new ones each year as it proceeds through the first primary to the high school. It is therefore self-evident progressive instruction which will guide in the formation of right habits should be given, especially during the primary, grammar, and first year of the high school, in order to keep pace with and guide the child's development. The boy or girl who leaves school at any point in the school course with as much knowledge as he can comprehend of the laws of health, including those which warn against the use of alcoholic drinks and other narcotics, has thereby a most valuable equipment for the battle of life.

The diffusion of this knowledge in our country is now as universal as the schools. It does not, we grant, add to the value of brewing stocks, but evidence is not lacking that it is proving of great value to the human stock in the increase of health due to better knowledge of sanitary laws, consequent lengthening of life, increased sobriety of the American workman, which sobriety is acknowledged to be one cause of the commercial supremacy of this country in the markets of the world, etc.

¹From a communication in reply to Professor Sedgwick's address, by Mrs. Mary H. Hunt, published in the Journal of the American Medical Association (Chicago), March 22, 1902.

Professor Sedgwick says he was "shocked—much disturbed to find that an author had actually felt bound to weave in a lesson on alcohol with his discussion of the physiology of muscle, of nerve, of digestion, of vision, and each of several other sections of the subject."

Why should not the deleterious effects of alcohol on muscles be taught in connection with the study of the physiology and hygiene of the muscles? Prof. E. Destrée, University of Brussels, by actual experimentation, proved that the "total work product obtained (from the muscles) with the use of alcohol is less than that obtained without it." Our boys and girls need to know that fact. Why should not the fallacy of the idea that alcohol is an aid to digestion be pointed out in connection with the hygiene of digestion, when Professor Chittenden distinctly says of his experiments: "The results obtained suggest a tendency toward prolongation of the period during which the meat remains in the stomach when alcohol fluids are present?" Why is not the treatment of the physiology and hygiene of the nerves the proper place for pointing out the effect of alcohol upon them when H. J. Berkeley, M. D., of Johns Hopkins University, reported as a result of the experiments he performed for the Committee of Fifty that alcohol "possesses the quality of destroying the protoplasm of the nerve cells and annulling its functions." Why not in teaching the care of the eyes mention the danger from the use of alcohol when the senior surgeon of the New York Ophthalmic Hospital says: "The respectable moderate drinker who never takes too much or oversteps the boundary line of decency but goes round half full all the time exposes himself to the risk of losing his eyesight, which in this case is incurable."

To Professor Sedgwick's complaint that some laws require text-books on this subject for pupils' use and specify the amount of temperance matter they shall contain, etc., we reply: The tendency of careless, unsympathetic school boards to fail in providing well-graded text-books on this subject, books that contain the matter the law requires taught as one source of information for pupils sufficiently advanced to use text-books on other subjects, induced the National Congress and many States to legally require that such text-books shall be provided. This requirement has led to the preparation of a valuable school literature by men of acknowledged scientific standing and to the revision of nearly all the imperfect books. Why should Professor Sedgwick complain? No one has proved the books inaccurate, nor that their use in the schools has not contributed to individual and public good. The old, unrevised, ungraded, and therefore unindorsed books contain such teaching as the following for children in primary grades: "The tendon of Achilles is the tendon of the gastrocnemius and soleus muscle," a statement as clear as mud to the primary child. The people want better books for their children and hence have so legislated that better books are produced. * * *

Professor Sedgwick appears to have some fears that a writer who desires to publish an elementary text-book on physiology and hygiene, before he can obtain a publisher or a market, may have to secure the indorsement of Mrs. Mary H. Hunt, etc. Anybody can write a text-book on this subject as far as the scientific department of the Woman's Christian Temperance Union is concerned, but the mothers in any community have a perfect right to oppose their children studying that book, if, in their judgment, it fails to teach the whole truth against the most destructive of human habits. They have a right through organization to secure and protect this form of education for their children and to appoint one of their number to act with them in searching for truth, and, aided by men of science, to refuse indorsement to books that do not contain the truth. I make no apology for its being my fortune to have been thus officially appointed. * * *

As to the publisher's part in this connection, I would say: The publisher is a business man who knows that his success depends upon his supplies meeting the demands of the market. If the condition prevails which Professor Sedgwick describes, it is good evidence that publishers have found that the American peo-

ple do not want their children to study what the publishers themselves call "rum books," and that the indorsement of this department is a guaranty to the public that the books bearing that indorsement are not of that character, but, instead, contain the truths the people want taught their children. Therefore, the writer who wishes to put a "rum book" on the market must find publishers who will ignore the law of supply and demand, or he must persuade the people to allow their children to be sacrificed to the Moloch of intemperance either for his personal gain or to avoid shocking the sensibilities of scientific gentlemen who see no place in physiology and hygiene for warning against that disobedience of hygienic law which causes, as Gladstone said, more havoc to the human race than war, pestilence, and famine. * * *

The superintendent and advisory board of the department of scientific temperance instruction in schools and colleges are elected by the world's and national Woman's Christian Temperance Union to take charge of the work of that society for the study of temperance physiology in schools. Thus this department has for its constituency the largest organization of women in the world, who are banded together to secure as one of their objects the protection of this special education for their children. Hence, to call the work of this department that of a "self-constituted oligarchy," as Professor Sedgwick does, shows utter misapprehension of facts. "A self-constituted oligarchy"—i. e., "power exercised by a few" who are self-appointed, could not write its ideas embodied in law on the Federal statute books and those of all the States of this great Republic. The laws requiring this study and whatever is necessary to its being taught represent the 75,000,000 American people who have decided that their children shall have this special education. It is simply futile to try to belittle this movement by efforts to make it appear as anything less than a national one which is rapidly becoming world-wide.

MARY H. HUNT,

*World and National Superintendent of the Department
of Scientific Temperance Instruction of the
Woman's Christian Temperance Union.*

ALCOHOLIC PHYSIOLOGY IN SCHOOL.¹

Perhaps it is well to teach children something about their little insides, enough to keep them from eating green apples, for example, but it is an easy matter to go too far with infantile instruction in physiology. No doubt it would be sad to find the children of the grammar schools indulging a premature appetite for alcohol and tobacco, but it does not seem to be necessary to teach them what is not true in order to prevent the spectacle of inebriated babes. There is room to suspect that the calling of youthful attention to the real or imaginary effects of alcohol, tobacco, opium, and the like is calculated to arouse an unholy curiosity in their immature minds and lead them to give more interest to the subject than it would naturally receive from them. If the idea be to fortify the children with real or imaginary knowledge as to the appalling effect of alcohol on the stomach, nervous system, liver, kidneys, etc., in order to scare them into refusing drink in later years, it is a mistake. It is not from any ignorance of the effects of alcohol that men drink, whether moderately or excessively. They have had ample warnings as to the breaking down of various organs from the immoderate and long-continued use of liquor, and hardly a day passes but they see somebody in a disgraceful state of helplessness from drink and foresee for him a hideous end unless he shall cease his abuse of alcoholic beverages. It is affirmed by a New England alienist, who is the head of a sanitarium where men of wrecked nervous systems abide, that a fearful percentage of physicians are the incurable victims of

¹ From the Philadelphia Record, January 6, 1902.

the morphia or cocaine habit. Surely no men know better the insidious growth of such habits and the effect on the brain. Clearly, then, a knowledge of the physiological action of stimulants and narcotics does not deter persons from abusing them.

The particular objection which is raised by scientific men against alcoholic physiology in the public schools is that the instruction is false and misleading. Prof. W. N. Rice, of Wesleyan University, recently attacked the instruction in Connecticut as extravagant and in some instances absurd. In one text-book prescribed by law he finds such contradictory statements as that "one-half the commitments to insane asylums are due to overindulgence in alcohol," and that "more persons become insane through the use of tobacco than alcohol." Neither statement is true. The extreme abstainers who construct the text-books seem to think that in the war on whisky and tobacco any degree of misrepresentation is warranted. Most men smoke and a great many use alcoholic liquors in moderation. They naturally object to having their children shocked by the information that their fathers are heading straight for the lunatic asylum. Prof. W. T. Sedgwick, president of the American Association of Naturalists, has just entered his protest against the time which is devoted to the study of the effects of alcohol and tobacco in the public schools, the teaching on which subjects, he maintains, "has passed, to a great and unjustifiable extent, into the hands and under the subjection of the temperance physiology propaganda;" that is to say, into the hands of well-meaning people, who are said by the Rev. Dr. Rainsford, of New York, to be "doing the devil's work." Most scientists agree with the opinion expressed by a prominent Philadelphia physician, that some of the text-books on these subjects "contain senseless and unscientific twaddle."

It is enough to condemn the whole system of instruction in alcoholic physiology that the first and supreme purpose is not to teach what is exactly and undeniably true, but to teach only what is calculated to scare the pupil from the use of alcohol and tobacco. That is not a legitimate function of a scientific text-book.

ENFORCED TEMPERANCE AMONG RAILWAY EMPLOYEES.¹

One of the greatest armies of temperance reformers in the world preaches its doctrine daily in our midst by action, and not by precept or sermon; but few of the thousands who travel up and down the railroads of our country ever stop to consider this silent force which has become stronger in its example and power for good than all the temperance organizations. There are several million men employed in various capacities on the railroads of the United States, and of this considerable army fully 50 per cent occupy responsible positions which render their work of a peculiarly public character. The engineers, firemen, switchmen, and train dispatchers are daily responsible for the lives and property of great numbers, and to prevent mistakes, which might cause great disasters, every possible precaution is taken to eliminate errors.

The discipline of the railroad employees of the country is probably stricter and better enforced than in any other line of work. A number of years ago temperance was not strictly enforced on train men, but the engineers were compelled to report for business in a perfectly sober condition. There were some lax rules in regard to the train men, and it was not uncommon to see many of them drinking at the public houses along the route when their train was waiting for orders. But to-day not only temperance, but almost teetotalism, is enforced on our leading railroads, especially among engineers, firemen, switchmen, and train dispatchers and conductors. The managers of the railroads found that many of the accidents

¹ From Harper's Weekly, January 4, 1902.

were due to drink among the employees, and after considering the problem for a few years the man who could not get along without drinking was gradually forced from the ranks of the railroad employees. To-day these workmen represent the largest and strongest army of upright, sober, industrious men in the world.

Dismissals are common on the railroads to-day for drunkenness, and they must continue so long as human temptations are in existence; but it is becoming more difficult every year for a drinking man to secure any responsible position in the railroad companies. A drinking engineer would no more be tolerated on a railroad than a wild Indian. Such a man might cause more damage and loss to the road than his wages would amount to in a century. The man who has a disposition to drink must be content to seek employment in other lines than on the railroads. The engineers are as a body strictly sober and temperate men. Their calling has made them so. They realize the dangers which they must daily meet, and their responsibilities sober them. It is rarely that an active railroad engineer ever touches liquor on or off duty. Habit makes him dislike to introduce any risk in his work. He knows that liquor might tend to befog his mind some day, and an accident that resulted therefrom would mean his eternal ruin. An engineer discharged for drinking could never hope to find a position on another railroad.

Dismissal for drinking is the worst possible thing that could happen to a railroad man in any position. If he applies to another road he must furnish reference or tell where he was last employed. His record is then looked up, and each road furnishes another with the correct data required. If the dismissal has been for drinking, the applicant is very naturally turned down.

Yet allowances are made for human weakness, and if an otherwise good employee falls once, unless he is an engineer or train dispatcher, he may receive a reprimand and warning. He is then placed on trial, and if he does not repeat his offense he may be retained indefinitely. Indeed, many men have been reformed from drink in this very way. Realizing that their positions depended upon their sobriety, they have steadily refused to touch liquor at all. In this effort to reform they are mightily helped by their associates. These are all railroad men who are placed in the same position; they must live a sober life. Consequently the weak man in the number is encouraged rather than tempted, and his battle is rendered much easier.

Next to the engineers the train dispatchers are probably the most important employees who must observe the strict rule of sobriety. The task of the dispatcher is so difficult that nothing except a perfectly clear, intelligent mind can do the work without endangering the lives and property of others. A train dispatcher who reported for duty with the smell of whisky about him would instantly be reported to the general superintendent. He would receive a warning delivered in no unmistakable words, and a second offense would be followed by instant dismissal. Usually, however, there is little trouble with this class, for the train dispatchers are men of unusual ability and ambition, and they have themselves under perfect control.

The switchmen and yard men have the greatest temptation to drink of any employee, and even when on duty it is easy for them to gratify their thirst. Consequently there are more dismissals of these workmen than of any other grade. This is partly due to the fact that their work is very important and critical, and yet, comparatively speaking, it is not paid well for, and is of a lower grade than that of the train dispatcher or engineer. It does not require talent or a high grade of skill to be a yard man or switchman, but the work does demand clear minds and steady nerves. The switchman who drinks becomes a menace to the whole railroad system.

So many accidents have happened through the negligence of switchmen that the railroads are growing stricter every year with this class of employees. Some roads have promulgated orders which absolutely rule out of their service any man who

drinks at all, and switchmen in particular have to give their pledge that they do not touch liquor in any form. In the opinion of the railroad managers this seems to be the only absolute way of obtaining the services of men who can be depended upon to bring a clear mind to their work daily. Meanwhile the grade and pay of the men are being raised, and better workmen are attracted to the positions.

Railroad managers are pooling their interests in respect to the drink question, so that these great corporations are gradually eliminating the drunkard or the drinking man from the railway service. Every competent railroad man understands this, and he will advise a beginner ambitious to work up in the service to give up absolutely the habit of tipping or drinking at home or in public. No man, however bright, can expect to make a success in railroading who is not willing to yield to this inexorable rule of the road. Thus, from the highest down to the lowest, the railroad men are invariably temperate and sober, and if they ever had the habit of drinking they have bravely overcome it. Consequently the force of example set by this great body of workmen is far more powerful in its effects than any preaching or open advocacy of temperance from a moral point of view. The railroads demand the strictest sobriety, and by rigidly enforcing the rule voluntary teetotalism is spreading throughout the thousands and millions of their employees.

REPORT OF A COMMITTEE OF THE NEW YORK STATE SCIENCE TEACHERS' ASSOCIATION.

In 1898 a committee of five was appointed¹ by the New York State Science Teachers' Association "to ascertain and report what is definitely known regarding the effects of alcohol and narcotics on the human body and to recommend suitable methods for teaching the same in the schools of the State."

Three separate inquiries were conducted in the course of the investigation, and numerous letters of inquiry sent out to teachers in New York State and New England.

In the preliminary report of this committee, which was published in the *Educational Review* (New York) of June, 1902, the committee summed up its conclusions as follows:

1. Physiology is the only subject in the curriculum that is dominated by legislative enactment. The result seems to be that instruction is commonly given in a perfunctory way, or that the provisions of the law regarding temperance instruction are disregarded. It should be remembered that no law, however stringent, can bring about effective teaching when the statements presented to the pupils are questioned or disbelieved by the teacher.

2. The teaching of the effects of stimulants and narcotics under the present system has not produced any marked change of sentiment in the young either for or against their use. If any change exists, it is entirely disproportionate to the outlay of time and effort which has been made.

3. Whether the matter taught is or is not excessive in amount, it is unwisely distributed through the course, and there is frequent and unnecessary repetition.

4. As the result, diminished interest and dislike of the subject prevail.

5. The preponderance of opinion expressed indicates that instruction could profitably be limited to fewer grades; those between the fifth and eighth being preferred.

6. The use of text-books should not be made compulsory earlier than the sixth grade, if at all.

7. Although the text-book may not always be satisfactory, the teachers do not regard this fact as a marked impediment to their work.

8. Charts showing morbid physiological conditions are generally condemned.

9. The evils of alcohol and narcotics can be presented most effectively from the moral and economic point of view.

¹ Membership of the committee: Irving P. Bishop, chairman, State Normal School, Buffalo; Burt G. Wilder, Cornell University; Gaylord P. Clarke, Syracuse University; Eli H. Long, University of Buffalo; James E. Peabody, Peter Cooper High School, New York.

The committee made the following recommendations:

1. The New York State Science Teachers' Association should urge that the present law be modified in such a way that teachers of physiology be given more freedom to decide as to the character and content of their teaching, and writers of text-books more freedom as to the space devoted to the subject and its location in the volume.

2. We are interested in the recent changes effected in the law in the State of Connecticut, and look with favor upon its present provisions. But before recommending similar specific changes in our law we deem it wise to allow a reasonable time to elapse for observation of the working and results of that law.

3. So long as the existing statute remains in force, if truthful instruction is to be given in the subject the possible benefits of alcohol, when prescribed by physicians, should be conceded. The difference in the effects on the human body of fermented beverages (beer and light wines) and distilled liquors should also be noted. Emphasis should be laid, too, on the greater susceptibility of young persons both to direct injury from the use of alcohol in any form and to the danger of forming undesirable habits. Pupils should be allowed also to know that there is wide disagreement among authorities as to the physiological effects of a strictly moderate use of liquors by adults. On the other hand, attention should be called to the fact that the moderate use of alcohol very commonly leads to excess, and the teacher should emphasize the fact that an immoderate use of liquors weakens the tissues, so that they are made more susceptible to disease.

4. Finally, if the teacher wishes to present the strongest arguments in favor of either total abstinence or strict temperance, and thereby fulfill the spirit rather than the letter of the law, your committee recommends that comparatively little time be spent in trying to teach the physiological effects of alcohol and tobacco. Let us frankly admit that we are discussing not so much a question of physiology as one of morals and economics, and let us devote the larger part of the time required by law to a treatment of the question from the moral and economic standpoint.

CHAPTER XXII.

RELATIONS OF THE NATIONAL GOVERNMENT TO HIGHER EDUCATION AND RESEARCH.¹

By CHARLES D. WALCOTT,

Director of the United States Geological Survey.

When one considers the relations of the General Government to higher education and research, probably the first question to arise is, What, within the limitations imposed by the Constitution, can the Government do? Other pertinent inquiries are: What has been done? What is the present policy of the Government? How are its educational resources being utilized? What can be done that is not already being well done by our universities, colleges, and technical institutions?

Many of our wisest and best statesmen and jurists believe that the General Government has no power, under the Constitution, to appropriate money for educational purposes, that important function having been left to the States. A glance backward over the history of colonial and national discussion and legislation is interesting and instructive.

HISTORY OF COLONIAL AND NATIONAL DISCUSSION.

In colonial times Oxford, Cambridge, and Edinburgh were to American youth the centers of learning and higher education. These famous universities furnished all that was needed by the well-to-do student, and local colleges were given little attention and scant support. The founders of our college system were obliged to meet adverse conditions which developed the same qualities that led their compatriots to the conquest of the continent.

Early in the seventeenth century (1619) the Virginia Company granted 10,000 acres of land "for the foundation of a seminary of learning for the English in Virginia." At the suggestion of the King, the bishops of England, in the same year, raised £1,500 to aid in the education of the Indians in connection with the proposed grant of land for the seminary. A portion of the land was occupied and the seminary was started under the direction of George Thorpe, a man of high standing in England. But the institution was short-lived. It, with its inmates and founder, perished in the Indian massacre of 1622.

In 1624 an island in the Susquehanna River was granted for the founding and maintenance of a university, but the undertaking lapsed with the death of its projector and of James I, and the fall of the Virginia Company.

For a time the movement of higher education was delayed, but in 1636 Harvard was founded; then William and Mary, in 1660; Yale, in 1701; the College of New Jersey, in 1746; the University of Pennsylvania, in 1751; Columbia, in 1754; Brown, in 1764; Dartmouth, in 1769; the University of Maryland, in 1784; the University of North Carolina, in 1789-1795; the University of Vermont, in 1791; and Bowdoin, in 1794.

The university spirit was well developed when the Constitutional Convention

¹ Substance of address before the University of Chicago, delivered June 17, 1901. Reprinted from *Science*, N. S. Vol. XIII, No. 329, pp. 1001-1015, June 23, 1901.

met in 1787. Madison, who was a member of the convention, acting in harmony with the known wishes of Washington, proposed to give the National Legislature power—

To establish a university.

To encourage, by premiums and provisions, the advancement of useful knowledge and the discussion of science.

Charles Pinckney also earnestly advocated a plan for the establishment of a national university, and Mr. Wilson supported the motion; but the matter was dropped, on the ground that Congress already had sufficient power to enact laws for the support of national education.

John Adams, who agreed with Washington in believing that "scientific institutions are the best lasting protection of a popular government," was always a strong advocate of the promotion of intelligence among the people. He secured the insertion in the constitution of Massachusetts of a provision recognizing the obligation of a State to pursue a higher and broader policy than the mere protection of the temporal interests and political rights of the individual. This provision read as follows:

It shall be the duty of legislatures and magistrates in all future periods of this Commonwealth, to cherish the interests of literature and the sciences * * * to encourage private societies and public institutions, rewards and immunities for the promotion of agriculture, arts, sciences, commerce, trades, manufactures, and the natural history of the country.¹

Washington sought to impress on Congress and the people his earnest conviction that the Government should establish and support a great national university. To this end he made a bequest in his will, and if Congress had treated it as the Legislature of Virginia treated his bequest for the endowment of Washington College, there would be to-day a fund sufficient to give adequate support to a great institution for investigation and original research in the capital city. In his will Washington expressed the fears he entertained as to the effect of foreign education on the youth of America, and the desirability of having an American university. His language was as follows:

That as it has always been a source of serious regret with me to see the youth of these United States sent to foreign countries for the purpose of education, often before their minds are formed, or they have imbibed any adequate ideas of the happiness of their own, contracting too frequently not only habits of dissipation and extravagance, but principles unfriendly to republican government, and to the true and genuine liberties of mankind, which thereafter are rarely overcome. For these reasons it has been my ardent wish to see a plan devised on a liberal scale which would have a tendency to spread systematic ideas through all parts of this rising empire, thereby to do away with local attachments and State prejudices, as far as the nature of things would, or indeed, ought to admit, from our national councils. Looking anxiously forward to the accomplishment of so desirable an object as this is (in my estimation), my mind has not been able to contemplate any plan more likely to effect the measure than the establishment of a university in a central part of the United States, to which the youth of fortune and talents from all parts thereof might be sent for the completion of their education in all the branches of polite literature, in arts, and sciences, in acquiring knowledge in the principles of politics and good government, and (as a matter of infinite importance, in my judgment), by associating with each other, and forming friendships in juvenile years, be enabled to free themselves in a proper degree from those local prejudices and habitual jealousies which have just been mentioned, and which when carried to excess are never-failing sources of disquietude to the public mind, and pregnant of mischievous consequences to this country.

Madison, though defeated in his effort to secure the approval of the Constitutional Convention in respect to the establishment of a national university, did not fail, when President, to call the attention of Congress to the subject. In his second annual message he said:

I can not presume it to be unreasonable to invite your attention to the advan-

¹ Massachusetts Public Statutes, 1882, p. 34.

tages of superadding to the means of education provided by the several States a seminary of learning instituted by the National Legislature, within the limits of their exclusive jurisdiction, the expense of which might be defrayed or reimbursed out of the vacant grounds which have accrued to the Nation within those limits. (Annals of Congress, 1810, 1811, 1813.)¹

Various other attempts have been made from time to time to establish a national university. Blackmar says:

In 1796 a proposition was before Congress in the form of a memorial praying for the foundation of a university. (Ex. Doc., Fourth Cong., second sess.)

Again, in 1811, a committee was appointed by Congress to report on the question of the establishment of a seminary of learning by the National Legislature. The committee reported unfavorably, deeming it unconstitutional for the Government to found, endow, and control the proposed seminary. (Ex. Doc., Eleventh Cong., third sess.)

In 1816 another committee was appointed to consider the same subject, and again the scheme failed. (Ex. Doc., Fourteenth Cong., second sess.)²

When the disposition of the Smithsonian fund was under consideration (1838-1846), the subject of founding a national university was fully and freely discussed, and the plan was rejected by Congress.

Again, in 1873, the matter was revived by the Hon. J. W. Hoyt, who from that time onward never ceased to labor diligently for a national university. Largely owing to his zeal and activity, a committee of 100 was formed, various bills were introduced in Congress, and a Senate committee was created to establish a national university. But Congress always looked on the scheme with suspicion, and not one of the various bills offered was ever acted upon by the Senate or House of Representatives.

The trend of opinion has been and is that the Government should not found a national university in the sense suggested by Washington and his followers. The Congress has, however, generously aided technical and higher education by grants of land to States and Territories for educational purposes.

The policy was inaugurated under the general authority of the famous ordinance of July 13, 1787. Conformably thereto a contract was entered into between the Ohio Company and the board of treasury of the United States on the 27th of July, 1787, whereby lot 16 in every township was given for the maintenance of public schools, and not more than two complete townships were given perpetually for the purpose of a university, the land to be applied to the purpose by the legislature of the State.³

The most important act, after that of 1787, was that of 1862, granting land for the endowment of colleges for teaching agriculture and the mechanical arts. It is to be noted that by this act the responsibility was thrown entirely upon the States, and that, so far as the administration of the fund was concerned, it was State, not national, education.

The total grants of lands aggregate about 13,000,000 acres, or 20,000 square miles. Of this 2,500,000 acres, or 4,000 square miles, were for the establishment of higher institutions of learning. This land, divided among 30 States and Territories, gives an average of a little more than 80,000 acres, or about 130 square miles. For technical schools, called "colleges for the benefit of agriculture and the mechanical arts," Congress has granted to 45 States 10,500,000 acres, or about 16,000 square miles. This is an average of 230,000 acres, or about 360 square miles. Congress now grants annually to each of the 45 States \$25,000,⁴ a

⁴Act approved August 30, 1890. Statutes at Large, vol. 26, p. 417.

total of more than \$1,000,000, all of which is expended under the direction of State boards.

The Government maintains, and has maintained since 1802, an academy for training its army officers; also, since 1845, an academy for training its naval officers. The Government does not maintain, and never has maintained, any institution for training its civil officers.

The policy of the Government, as gathered from its acts, has been to relegate the direct control of education to the States, aiding them in this work by grants of land and, in the case of technical education, by grants of money also.

PRESENT POLICY OF THE GOVERNMENT.

Turning, now, to the question, What is the present policy of the Government? we have just seen that aid is given by grants of land and, in the case of the experiment stations, by grants of money. As to the use of its literary and scientific collections by students, its policy was defined by a public resolution of Congress, approved April 12, 1892, which reads as follows:

Whereas large collections illustrative of the various arts and sciences and facilitating literary and scientific research have been accumulated by the action of Congress through a series of years at the National Capital; and

Whereas it was the original purpose of the Government thereby to promote research and the diffusion of knowledge, and it is now the settled policy and present practice of those charged with the care of these collections specially to encourage students who devote their time to the investigation and study of any branch of knowledge by allowing to them all proper use thereof; and

Whereas it is represented that the enumeration of these facilities and the formal statement of this policy will encourage the establishment and endowment of institutions of learning at the seat of Government, and promote the work of education by attracting students to avail themselves of the advantages aforesaid under the direction of competent instructors: Therefore,

Resolved, by the Senate and House of Representatives of the United States of America in Congress assembled, That the facilities for research and illustration in the following and any other Governmental collections now existing or hereafter to be established in the city of Washington for the promotion of knowledge shall be accessible, under such rules and restrictions as the officers in charge of each collection may prescribe, subject to such authority as is now or may hereafter be permitted by law, to the scientific investigators and to students of any institution of higher education now incorporated or hereafter to be incorporated under the laws of Congress or the District of Columbia, to wit:

- One. Of the Library of Congress.
- Two. Of the National Museum.
- Three. Of the Patent Office.
- Four. Of the Bureau of Education.
- Five. Of the Bureau of Ethnology.
- Six. Of the Army Medical Museum.
- Seven. Of the Department of Agriculture.
- Eight. Of the Fish Commission.
- Nine. Of the Botanic Gardens.
- Ten. Of the Coast and Geodetic Survey.
- Eleven. Of the Geological Survey.
- Twelve. Of the Naval Observatory.

The privileges of this act, it will be noted, are limited to scientific investigators and students of institutions incorporated under the laws of Congress or the District of Columbia. This limitation was removed by an act approved March 3, 1901, which reads as follows:

JOINT RESOLUTION to facilitate the utilization of the Government Departments for the purposes of research, in extension of the policy enunciated by Congress in the joint resolution approved April 12, 1892.

WHEREAS * * *

Resolved, That facilities for study and research in the Government Departments, the Library of Congress, the National Museum, the Zoological Park, the Bureau of Ethnology, the Fish Commission, the Botanic Gardens, and similar

institutions hereafter established shall be afforded to scientific investigators and to duly qualified individual students and graduates of institutions of learning in the several States and Territories, as well as in the District of Columbia, under such rules and restrictions as the heads of the Departments and Bureaus mentioned may prescribe.

DISCUSSION AND ACTION IN RECENT YEARS.

Mr. Daniel C. Gilman, in 1897, summarized the situation in relation to the establishment of a national university as follows:¹

First. There is a strong desire, not only among the residents of the Federal city, but among the lovers and promoters of learning throughout the country, that the libraries, collections, instruments, and apparatus belonging to the Government should be opened to students, not as a favor, nor by exception, nor as a passing entertainment, but for study and experiment, according to suitable regulations, and especially under the guidance of such able teachers as may be already engaged in the service of the Government or may be enlisted hereafter for the particular offices of education. So far as this there would be a unanimous, or nearly unanimous, assent.

Second. The universities existing in Washington and near to it, including those of New England, would regard with disfavor, and probably with distrust, an effort to establish, by Congressional action, the University of the United States. In some places there would be positive opposition. * * *

Third. Outside of academic circles, as well as inside, there is a great distrust of the principle that Congress should provide for and direct university education. The fears may be foolish. It is easy to laugh at them. Apprehensions may be pronounced groundless. Nevertheless it will be difficult to get rid of them. There will be an ever-present expectation of political interference, first in the governing body, then in the faculty, and finally in the subjects and methods of instruction. It is true that partisan entanglement may be avoided, but it will be difficult indeed to escape the thralldom.

In the same article it is suggested that the Smithsonian Institution take charge, so that—

The literary and scientific institutions of Washington may be associated and correlated so far, and so far only, as relates to the instruction and assistance, under proper restrictions, of qualified students. * * * Such a learned society may be developed more readily around the Smithsonian Institution, with less friction, less expense, less peril, and with the prospect of more permanent and widespread advantages to the country, than by a dozen denominational seminaries or one colossal University of the United States.

In February, 1899, Dr. William H. Dall, of the Geological Survey, outlined very clearly the conditions and possibilities for post-graduate work in Washington and urged that if any organization was attempted it should be free from Government control.²

Little, if any, advantage was taken of the Congressional resolution of 1892, which restricted opportunities for study and research to the educational organizations of the District of Columbia; but with the recent rapid growth of the Department of Agriculture a considerable number of students have been given opportunity for study and practical training. Secretary Wilson has taken the lead in actually bringing qualified students into the laboratories of a Government department and setting them to work. He has inaugurated a new class, called "student assistants," and has demonstrated its practical value. In his report for 1898 he says:³

George Washington, by his will, left property to be devoted to university education in the District of Columbia. There is no university in the land where the young farmer may pursue post-graduate studies in all the sciences relating to production. The scientific divisions of the Department of Agriculture can to some extent provide post-graduate facilities. Our chiefs of division are very proficient in their lines; our apparatus the best obtainable; our libraries the most complete of any in the nation. We can direct the studies of a few bright young people in

¹ Century Magazine, November, 1897.

² American Naturalist, Vol. 33, pp. 97-107.

³ Yearbook of the Department of Agriculture, 1898, pp. 18, 19.

each division, and when the Department requires help, as it often does, these young scientists will be obtainable.

They should be graduates of agricultural colleges and come to the Department of Agriculture through a system of examination that would bring the best and be fair to all applicants. The capacity of the Department is limited, but something can be done that will indicate to Congress the value of the plan. The Department often needs assistants to take the place of those who are tempted to accept higher salaries in State institutions. The opening of our laboratories to post-graduate work would provide an eligible list from which to fill vacancies as they occur, supply temporary agents, and be a source from which State institutions might get assistance in scientific lines.

The Department of Agriculture naturally turns to the professedly agricultural colleges for its student assistants, but if other institutions gave their students such instruction as would qualify them for the work of that Department there seems to be no good reason why they should be discriminated against.

As the development of the work progressed in the scientific bureaus it became impossible to find men qualified for the permanent positions open to them. Graduate students were obtainable, but they were without practical training for the work. The Civil Service Commission was called on, but it had no eligibles on its lists. The only way out of the difficulty seemed to be for the heads of the scientific bureaus to select bright, well-educated young men and train them. This they have been doing for several years. In the Geological Survey graduate students, being the best men available for temporary field assistants in both geologic and topographic work, are given preference. The Survey cooperates with such institutions of learning as are willing to give the advanced instruction necessary to fit students to engage in the several special lines of investigation. This cooperation consists mainly in the employment of graduate students and instructors. A high standard is maintained by the character of the examinations held for selecting temporary employees. For example, in the examination for temporary geologic assistants held April 23 and 24, 1901, the applicants were obliged to meet the following requirements:

First. To write an essay of more than a thousand words, setting forth either the course and results of an original geologic investigation by the applicant or the main features of the geology of some State.

Second. To answer satisfactorily seven questions, so selected as to test the applicant's knowledge of the science of geology in general.

Third. To select one of the five specialties, stratigraphy, petrography, paleontology, physiography, and glaciology, and make clear the possession of an adequate knowledge thereof.

The weight given to the various subjects was as follows:

Geological essay, including composition and drawing	30 per cent.
General geology.....	15 per cent.
Special geology.....	25 per cent.
Education and experience	30 per cent.

Fifty-two persons took this examination, and of these 46 made an average of more than 70 per cent. The successful applicants have received degrees for academic and graduate study from the following institutions of learning:

Harvard University.....	13	Alfred University.....	1
Johns Hopkins University.....	6	Beloit College.....	1
University of Chicago.....	6	Columbia University.....	1
Yale University.....	5	Columbian University.....	1
Cornell University.....	4	Cornell College, Iowa.....	1
University of Wisconsin.....	2	Denison University.....	1
University of California.....	2	Gates College.....	1
University of Kansas.....	2	German Wallace College.....	1
Stanford University.....	2	Hamilton College.....	1
Iowa State College.....	2	Heidelberg College, Ohio.....	1
Amherst College.....	2	Heidelberg, Germany.....	1
Munich.....	2	Indiana State University.....	1

Lafayette College	1	University of Missouri	1
Lawrence Scientific School	1	University of Nebraska	1
Moore's Hill College	1	University of the City of New York	1
Ohio Wesleyan University	1	University of Oregon	1
University of Illinois	1	University of South Carolina	1
University of Minnesota	1	Williams College	1

The total of 46 successful applicants divides by State residence as follows:

Massachusetts	9	Colorado	1
Illinois	7	Kansas	1
New York	7	Kentucky	1
Iowa	3	New Jersey	1
Connecticut	2	Ohio	1
Indiana	2	Oregon	1
Missouri	2	Tennessee	1
Pennsylvania	2	Wisconsin	1
South Carolina	2	Wyoming	1
California	1		

Of those who passed, 40 have received appointments to temporary positions. It is probable that 50 per cent of the number will become permanent members of the Survey; 38 per cent already hold or will obtain positions as instructors in educational institutions, and the others will enter State surveys and private employment.

Of the temporary geologic force of the Survey other than those mentioned, and who receive pay only when actually employed, the majority are connected with institutions of learning, as follows:

Harvard University	4	Johns Hopkins University	1
University of Chicago	4	Ohio State University	1
University of Wisconsin	3	University of Michigan	1
Columbia University	2	University of California	1
Stanford University	2	University of Virginia	1
Yale University	2	University of West Virginia	1
Amherst College	1	University of South Dakota	1
Clark University	1	Vanderbilt University	1
Colby University	1	Williams College	1

The preceding statements illustrate the intimate relation existing between one division of one bureau of one department of the Government and the higher educational interests of the country. A close analysis of the personnel of other bureaus will doubtless show that the Government is thus indirectly doing a great work in fostering higher education and research, and it will at the same time be seen that the educational institutions of the country are training men and women for the highest scientific and technical positions in the Government service.

The Association of Agricultural Colleges and Experiment Stations several years ago realized the importance of giving its students the training which would enable them to meet the conditions prevailing in Washington. A committee of graduate study in Washington was appointed in July, 1897.¹ In the following April this

¹ *Resolved*, That a committee of five be appointed by the President to investigate, consider, and, if practicable, devise a plan whereby graduate students of the land-grant and other colleges may have access to and the use of the Congressional Library and the collections in the Smithsonian Institution, the National Museum, and the scientific bureaus of the various departments at Washington of the United States Government for the purposes of study and research, said plan to include suggestions as to the manner in which such work may be organized, coordinated, and directed to the best advantage; the composition and organization of such a staff as may be necessary to properly coordinate and direct such work, and also an outline of such legislation as may be necessary to effect the general purposes of this resolution. (Proceedings of Twelfth Annual Convention of the Association of American Agricultural Colleges and Experiment Stations, held at Washington, D. C., November 15-17, 1898, being Bulletin 65, Department of Agriculture, p. 53.)

committee met in Washington to study the conditions under which work might be undertaken. In a report made in November, 1898, the committee said in part:

After long deliberation and full discussion your committee are unanimously of the opinion that the time is ripe for expeditious action.

The inquiries and investigations so far made lead the committee to the conclusion that it is entirely practicable to provide for the use of the Library of Congress and the collections of the Smithsonian Institution, the National Museum, and of the various scientific and other bureaus in the several departments of the General Government, by graduate students of the land-grant and other colleges, for study and research, and that it is also practicable to organize, coordinate, and direct such work so as to make it eminently effective.

The committee has been greatly desirous that some existing agency be found to undertake such work of organization, coordination, and direction, and have naturally turned to the Smithsonian Institution as the one best fitted for the purpose.

The committee is unable, at the present time, to present a complete outline of the legislation necessary to effect the general purposes of the resolution. It submits tentatively, however, that Congress might be asked to provide for the establishment of an administrative office in Washington, preferably in the Smithsonian Institution, in which graduate students of the institutions we represent, and others as well, might be enrolled and directed to the appropriate departments (Bull. 65, Dept. Agr., pp. 61, 62).

In a report by the subcommittee of the committee of the National Educational Association on the establishment of a national university, we find that the active cooperation of the Smithsonian Institution is contemplated in the conduct of the proposed school or bureau, but that the committee of the Regents of the Smithsonian Institution feel that the powers of the institution, as at present organized, are insufficient to embrace the work proposed.¹

At a meeting of the Smithsonian Regents held on January 24, 1900, Dr. Alexander Graham Bell introduced a resolution to the effect that Congress be asked to provide for an assistant secretary of the Smithsonian Institution in charge of research in the Government departments, etc. The resolution was referred to a committee, which, on January 23, 1901, reported a modified form of the original resolution. This modified form was adopted by the Board of Regents. It reads as follows:

In order to facilitate the utilization of the Government departments for the purpose of research, in extension of the policy enunciated by Congress in the joint resolution approved April 12, 1892:

Resolved, That it is the sense of the board that it is desirable that Congress extend this resolution so as to afford facilities for study to all properly qualified students or graduates of universities, other than those mentioned in the resolution, and provide for the appointment of an officer whose duty it shall be to ascertain and make known what facilities for research exist in the Government departments, and arrange with the heads of the departments and with the officers in charge of the Government collections, on terms satisfactory to them, rules and regulations under which suitably qualified persons might have access to these collections for the purpose of research with due regard to the needs and requirements of the work of the Government; and that it should also be his duty to direct, in a manner satisfactory to the heads of such departments and officers in charge, the researches of such persons into lines which will promote the interests of the Government and the development of the natural resources, agriculture, manufactures, and commerce of the country, and (generally) promote the progress of science and the useful arts, and the increase and diffusion of knowledge among men.

This resolution referred the matter to Congress. Many members of both Houses doubt whether Congress has power under the Constitution to appropriate money raised by taxation for purposes of education, and nothing was done by Congress, as the resolution was not officially brought before it.

¹Science, N. S., Vol. XI, March 16, 1900, pp. 410-414.

ORGANIZATION OF THE WASHINGTON MEMORIAL INSTITUTION.

At this point the Washington Academy of Sciences undertook to give the proposition to utilize the resources of the Government for higher education and research a practical form, independent of direct Government support or control. For several months the academy had been conferring with the George Washington Memorial Association relative to erecting in Washington a memorial building to be dedicated to science, literature, and the liberal arts. The president of the academy suggested to the memorial association that it should so amend its act of incorporation that it could cooperate with the academy in carrying out the objects common to both organizations. The suggested amendments were made, and an agreement was entered into substantially as follows:

The objects of the George Washington Memorial Association are, first, as implied in its name, the creation of a memorial to George Washington; and second, as stated in its amended act of incorporation, the increase in the city of Washington of opportunities and facilities for higher education, as recommended by George Washington in his various annual messages to Congress, notably the first—i. e., "the promotion of science and literature," substantially as set forth in his last will, and by and through such other plans and methods as may be necessary or suitable. The object of the Washington Academy of Sciences, the federated head of the scientific societies of Washington, is the promotion of science, the term "science" being used in its general sense—"knowledge, comprehension of facts and principles."

The two organizations agreed, first, that, although American universities have so developed since George Washington's time that they fulfill many of the objects of the national university outlined by him as desirable for the youth of the United States, there is still need of an organization in the city of Washington which shall facilitate the utilization of the various scientific and other resources of the Government for purposes of research, thus cooperating with all universities, colleges, and individuals in giving to men and women the practical post-graduate training which can not be obtained elsewhere in the United States and which is now available only to a limited degree in the city of Washington; and, second, that the best method of securing the objects for which both organizations stand is the establishment, within the district selected by Washington as a site for the permanent seat of Government of the United States, of an institution whose object shall be the realization of Washington's repeatedly expressed wish and recommendation that provision be made for the promotion of science and literature.

The membership of the academy includes most of the leading scientific men of Washington and the country at large. The academy, familiar with conditions in Washington and with the efforts of the committees of the Association of Agricultural Colleges and Experiment Stations and the National Educational Association, and knowing that the Smithsonian Institution would not, under its limitations, take an active part, realized that the time was opportune for a new organization. Its committee drafted and secured the passage of the act of Congress approved March 3, 1901. The committee next drafted a plan of organization, which was accepted by the academy and memorial association. The plan was, in brief, as follows:

1. Organization.—A private foundation independent of Government support or control.

2. Objects.—(a) To facilitate the use of the scientific or other resources of the Government for research.

(b) To cooperate with universities, colleges, and individuals in securing to properly qualified persons opportunities for advanced study and research.

3. Government.—The policy, control, and management to vest in a board of fifteen trustees, and in addition there shall be an advisory board composed chiefly of heads of Executive Departments, Bureaus, etc.

Articles of incorporation were then drawn up and executed, and were filed on May 20, 1901. They read as follows:

Articles of incorporation, Washington Memorial Institution.

We, the undersigned, persons of full age and citizens of the United States, and a majority of whom are citizens of the District of Columbia, being desirous to establish and maintain, in the city of Washington, an institution in memory of George Washington, for promoting science and literature, do hereby associate ourselves as a body corporate, for said purpose, under the general incorporation acts of the Congress of the United States enacted for the District of Columbia; and we do hereby certify in pursuance of said act as follows:

First. The name or title by which such institution shall be known in law is the Washington Memorial Institution.

Second. The term for which said institution is organized is nine hundred and ninety-nine years.

Third. The particular business and objects of the institution are to create a memorial to George Washington, to promote science and literature, to provide opportunities and facilities for higher learning, and to facilitate the utilization of the scientific and other resources of the Government for purposes of research and higher education.

Fourth. The number of its trustees for the first year of its existence shall be fifteen.

In testimony whereof we have hereto set our names and affixed our seals, at the city of Washington, in the District of Columbia, on the 16th day of May, 1901:

DANIEL C. GILMAN.	[SEAL.]
CHARLOTTE EVERETT HOPKINS.	[SEAL.]
C. HART MERRIAM.	[SEAL.]
GEORGE M. STERNBERG.	[SEAL.]
CHAS. D. WALCOTT.	[SEAL.]
CARROLL D. WRIGHT.	[SEAL.]

DISTRICT OF COLUMBIA, ss:

Be it remembered that on this 16th day of May, A. D. 1901, before the subscriber personally appeared the above-named Daniel C. Gilman, Charlotte Everett Hopkins, C. Hart Merriam, George M. Sternberg, Charles D. Walcott, and Carroll D. Wright, to me personally known and known to me to be the persons whose names are subscribed to the foregoing instrument of writing, and severally and personally acknowledged the same to be their act and deed for the uses and purposes therein set forth.

Given under my hand and official seal the day and year above written.

[SEAL.]

HERBERT W. GILL, *Notary Public.*

On May 27 fifteen trustees were elected, and on June 3 the officers for the first year were chosen. Lists of these are given herewith:

Board of trustees, Washington Memorial Institution.

1, Dr. Edwin A. Alderman, president Tulane University; 2, Dr. A. Graham Bell, regent Smithsonian Institution; 3, Dr. Nicholas Murray Butler, professor of philosophy and education, Columbia University; 4, Dr. C. W. Dabney, president University of Tennessee; 5, Dr. D. C. Gilman, president Johns Hopkins University; 6, Dr. A. T. Hadley, president Yale University; 7, Dr. William R. Harper, president University of Chicago; 8, Mrs. Phoebe A. Hearst, regent University of California; 9, Mrs. Archibald Hopkins, president George Washington Memorial Association; 10, Dr. C. Hart Merriam, chief United States Biological Survey; 11, Dr. Cyrus Northrup, president University of Minnesota; 12, Dr. H. S. Pritchett, president Massachusetts Institute of Technology; 13, Dr. George M. Sternberg, Surgeon-General United States Army; 14, Hon. Charles D. Walcott, president Washington Academy of Sciences and Director United States Geological Survey; 15, Hon. Carroll D. Wright, Commissioner of Labor.

Officers of Washington Memorial Institution.

Daniel C. Gilman, director; Charles D. Walcott, president board of trustees; Nicholas Murray Butler, secretary board of trustees; C. J. Bell, treasurer.

An advisory board also was selected, as follows:

President of the United States, Chief Justice of the United States, Secretary of State, Secretary of the Treasury, Secretary of War, Secretary of the Navy, Secretary of the Interior, Secretary of Agriculture, Postmaster-General, Attorney-General, Secretary of the Smithsonian Institution, Commissioner of Education, Librarian of Congress, Commissioner of Labor, Commissioner of Fish and Fisheries, president of the Civil Service Commission, president of the National Academy of Sciences, president of the National Educational Association, president of the Association of American Universities, president of the Association of Agricultural Colleges and Experiment Stations, and Dr. Charles W. Eliot.

The duties of the director, as defined in the by-laws, are as follows:

The director shall be the chief executive of the institution, and, under the guidance and control of the executive committee, shall conduct its affairs. He shall make all arrangements for cooperation between the institution on the one hand and the Government, universities, colleges, learned societies, and individuals on the other, subject to the approval of the executive committee.

EXISTING FACILITIES FOR STUDY AND RESEARCH.

The policy of the Government as expressed is to aid in higher education and research by granting the use of such facilities as are at its command in the District of Columbia. The direct control of higher education has been relegated to the States, the Government aiding by grants of land, and in the case of technical education at agricultural experiment stations by grants of money.

The Government has carried on original research for its own purposes in the District of Columbia through grants of money to its various scientific and technical bureaus, notably those of the Department of Agriculture, the Coast and Geodetic Survey, the Geological Survey, the National Museum, the Bureau of Ethnology, the Fish Commission, the Bureau of Education, the Library of Congress, etc.

Of the total sum appropriated for the fiscal year 1901, at least 25 per cent, or \$2,020,000, may be regarded as expendable for scientific and research work and in the interest of higher education. The appropriations for the year are as follows:

Department of Agriculture:			
Weather Bureau	\$1,168,320.00		
Bureau of Animal Industry	1,154,030.00		
Bureau of Plant Industry	204,680.00		
Bureau of Forestry	185,440.00		
Bureau of Chemistry	35,800.00		
Bureau of Soils	100,140.00		
Division of Entomology	36,200.00		
Division of Biological Survey	32,800.00		
Agricultural experiment stations	789,000.00		
Miscellaneous	222,000.00		
			\$3,937,410.00
War Department, Army Medical Museum and Library			25,000.00
Navy Department:			
Hydrographic Office	136,518.00		
Naval Observatory	226,461.08		
Nautical Almanac	15,900.00		
			378,879.08
Interior Department:			
Geological Survey	1,023,423.11		
Bureau of Education	59,370.00		
			1,082,793.11
Treasury Department:			
Coast and Geodetic Survey	830,345.00		
Bureau of Standards	167,140.00		
Marine Hospital	71,100.00		
			1,068,585.00
Smithsonian Institution:			
National Museum	289,400.00		
Bureau of American Ethnology	50,000.00		
National Zoological Park	80,000.00		
Astrophysical Observatory	12,000.00		
International exchanges	24,000.00		
			455,400.00
Commission of Fish and Fisheries			543,120.00
Botanic Gardens			24,393.75
Library of Congress			565,345.00
Total			8,080,925.94

This is about 10 cents per capita for the entire population.

Great collections of books, specimens, statuary, paintings, instruments, apparatus, etc., have been assembled in Washington.

Libraries.—Statistics of the principal libraries reveal the presence of a large number of books, maps, and pamphlets, many collections of which are exceptionally complete in special lines of research, notably those of the Departments of State and Agriculture, the Geological Survey, the Naval Observatory, the Surgeon-General's Office, the Bureau of Education, the Museum of Hygiene, the Patent Office, the National Museum, and special collections in the Library of Congress. The principal libraries are here listed:

Library of—	Books.	Pamphlets.	Maps.
Congress.....	¹ 1,000,000	55,760
Smithsonian Institution.....	² 250,000
United States Supreme Court.....	280,000
Army Medical Museum.....	135,058	229,546
Department of Agriculture.....	68,000
Bureau of Education.....	81,872	140,004
Patent Office.....	74,140
Department of State.....	63,000	2,500
Geological Survey.....	47,600	77,027	29,185
National Museum.....	25,000	30,000
Coast and Geodetic Survey.....	16,405	6,178	25,000
Weather Bureau.....	18,000	5,000
Museum of Hygiene.....	11,969
Hydrographic Office.....	8,000
Bureau of Ethnology.....	12,000	4,000
Bureau of Statistics.....	6,000	5,000

Department of Labor.....	7,051	4,454
Corcoran Gallery of Art.....	2,500
Treasury Department.....	22,000	3,000
War Department.....	49,000	2,000
Navy Department.....	33,635
Interior Department.....	15,000
Post-Office Department.....	12,000
Light-House Board.....	5,000
War Records Office.....	2,000
Naval Observatory.....	20,000	4,600
Nautical Almanac Office.....	2,200	2,500
Total.....	2,092,430	515,209	109,885

¹ Books and pamphlets.

² These figures are included in the 1,000,000 assigned to the Library of Congress.

Other libraries in the District bring the grand total to more than 2,500,000 volumes, 570,000 pamphlets, and 110,000 maps, assembled in large part by specialists in every field. All the libraries are accessible, and are maintained at a high standard of efficiency.

Collections.—The collections of the National Museum, though inadequately housed, and with insufficient laboratories for the work of the regular museum force, are nevertheless of such character and are so arranged for exhibition and study that they will be of great service to all who may wish to use them. Under the present organization of the Museum there are three departments—anthropology, biology, and geology. All the exhibits are systematically classified and placed in immediate charge of specialists acquainted with the results of man's activity in almost every form in which such results admit of study and representative exhibition. As provided by statute, the collections made by the Geological and other surveys are deposited in the National Museum after they have been used by the organization which collected them. This has resulted in an immense accumulation of material, much of which has not yet been fully studied, and upon which, when sufficient laboratory space is provided, students can be employed under the oversight of the specialists in charge.

The collections of the Army Medical Museum have a world-wide reputation and contain a great quantity of unique and valuable material. There are large

collections of living animals at the Zoological Park, and there is a fine series, illustrating fish culture, at the Fish Commission building. The museum of the Agricultural Department contains valuable material, especially the working collections of the different divisions, and the Botanic Gardens are capable of great development under scientific direction. To the student interested in the development of American inventive genius and the industries represented by patents, the collection of models and drawings in the Patent Office offers exceptional opportunities. Mention should also be made of the collections of apparatus of various kinds in Government laboratories, and of the illustrations of the evolution of apparatus in the National Museum and Smithsonian Institution.

In art, while the collections are not so large as in other lines, yet there is a collection of excellent quality in the Corcoran Gallery of Art, which maintains a free school. In this school day and night classes are taught the arts of drawing and painting, free of tuition fees or charge of any kind. Up to the close of 1899, 844 pupils had received instruction in the day school and 1,483 in the night school.

The Naval Observatory has a good equipment, including a chart and a chronometer depot, an extensive collection of instruments used in taking astronomic photographs, a fine telescope and transit instruments, used in carrying on its routine work.

The newly created National Bureau of Standards is to have buildings and a fine equipment of all necessary apparatus. When fully developed it will be second to none in the character and value of its scientific and practical work. The functions of this bureau are defined in the organic act as follows:

The functions of the bureau shall consist in the custody of the standards; the comparison of the standards used in scientific investigations, engineering, manufacturing, commerce, and educational institutions with the standards adopted or recognized by the Government; the construction, when necessary, of standards, their multiples and subdivisions; the testing and calibration of standard measuring apparatus; the solutions of problems which arise in connection with standards; the determination of physical constants and the properties of materials, when such data are of great importance to scientific or manufacturing interests and are not to be obtained of sufficient accuracy elsewhere.

Law and diplomacy.—The State Department has accumulated a valuable library relating to international law. The law library of Congress contains more than 50,000 volumes exclusively legal in character, and accommodations are provided for students who wish to use it. The school of diplomacy of Columbian University is one of the unique features of the educational organizations of Washington. The Supreme Court of the United States and the Court of Claims bring together the foremost American lawyers. There is also the supreme court of the District of Columbia, which has the common-law, equity, and probate jurisdiction of State courts, besides that of the circuit and district courts of the United States.

There are, of course, unequalled opportunities for studying the development of legislation and for meeting the leading statesmen and public men of the country.

Medicine.—The Army Medical Museum has one of the finest collections in existence of recent pathologic specimens. These, taken with the library of the Surgeon-General's Office, in the same building, afford a rare opportunity for the medical student. In the adjoining National Museum there is a most complete collection illustrating the materia medica of the United States and of foreign countries. There are also several hospitals, at each of which clinical instruction is given.

Congress has enacted that these vast collections and resources shall be available for higher education and research, but it has not provided the machinery for making them practically available. As in the case of the grants of land to colleges, Congress provides facilities and indirectly the means, but it leaves to other agencies the task of devising ways and means to make them practically useful.

The Government is obliged to train most of its specialists. Opportunities for post-graduate study and research exist at a few of the strongest universities, colleges, and technical schools of the country, but at best the training given, except in a few branches, is of a preparatory character. Most American youth who are ambitious to pursue higher study and research have little opportunity, owing largely to the fact that the instructor's duties leave him scarcely any time for research and practical work with the student. Post-graduate students seek instructors distinguished for research, even to the extent of undergoing many privations and leaving their country. In the city of Washington the Government has assembled the largest body of original investigators to be found in any one place in the world. Most of these investigators are willing to train suitably qualified students, because of the assistance the students can give them in the work they have in charge, the method being to have the students do actual, practical work, and not to instruct them in the ordinary sense of the word. An unofficial inquiry indicates the following as a possible number of instructors and students in the various departments and bureaus at Washington:

	Instruct- ors.	Stu- dents.
History and diplomacy	1	5
Historical research	5	10
Library administration and methods	5	15
Statistics	2	5
Magnetism	1	2
Meteorology	5	15
Tides	1	2
National Standards, Bureau of		
Astronomy	3	8
Physics	2	3
Hydrography	5	10
Cartography, etc	2	5
Topography	10	20
Chemistry	6	10
Mineral resources	1	5
Geology	10	17
Paleontology	5	7
Animal industry	10	25
Anthropology and ethnology	4	13
Zoology	34	50
Botany	11	25
Forestry	10	20
Total	133	272

With the development of a well-considered plan, just alike to the student and to the officers of the Government, the number of students—or, more strictly speaking, student assistants—would increase from year to year. Most of the students would naturally come from institutions of learning; in all such cases the student should be certified to the director of the Washington Memorial Institution, and finally certified back to the parent institution after completing his work, such certificate to be based on the work done and the proficiency made. In the case of individual students not connected with any institution, let each prove his capacity to profit by the opportunities, and then accredit him to the special officer who has charge of the field of work in which he may wish to study. On satisfactory completion of the work undertaken, the certificate of the Washington Memorial Institution might be addressed "To whomsoever it may concern." Students working in Government laboratories, museums, and libraries would be subject to the rules obtaining therein.

It is the belief of many acquainted with the educational system of the country that the policy above outlined will result in a body of trained students, ready for expert work, many of whom will undoubtedly enter the Government service, while others will become instructors in institutions of learning or be engaged as

experts in private capacity. This will avoid competition with other institutions, will give most valuable training and practical experience to students, and will be especially helpful to instructors in educational institutions, who might wisely be sent for six months or a year to Washington, as at present some are sent abroad. There should be no thought of providing a general or liberal course of education. Coming as student assistants, there should be opportunities and encouragement only on clearly defined lines of study and investigation. There are many large and small problems to be worked out by the officers of the Washington Memorial Institution, but with the skilled educator and organizer now at its head as director their successful solution is only a matter of time. It is anticipated that the Washington Memorial Institution will, under the direction of Dr. Gilman, begin its work by November 1, 1901.

The Government's part in the work, when once under successful headway, will be to enlarge the quarters of the various bureaus concerned. This will be necessary eventually even if no student assistants are provided for. The Government has done its part nobly so far. It is now for the educational institutions of the country to come forward and assist by setting a high standard of scholarship for admission to the privilege of becoming a student assistant in the Government bureaus. Only students of the type of those who win fellowships or excel in ability should be certified or accepted.

The Washington Memorial Institution should, and I believe will, maintain a standard that will meet the approval of our colleges and universities. It should occupy a most important place in the great educational work of the country. With the hearty cooperation of our collegiate institutions and of the officers of the Government there is little question that it will ultimately become the federated head and clearing house of all the higher educational interests of the country.

The relations of the National Government to higher education and research are intimate and complex; but the complexities are already partially resolved, the present is auspicious, and the future outlook is most promising. Long ago the nation recognized its obligation "to promote a higher and more extended policy than is embraced in the protection of the temporal interests and political rights of the individual." The action of Congress in the present year in opening the Government bureaus at Washington for study and research is a long stride forward, and if carried out in good faith must result in another and higher standard for American endeavor.

CHAPTER XXIII.

THE CARNEGIE INSTITUTION OF WASHINGTON, D. C.,

WITH AN APPENDED LIST OF THE PRINCIPAL EDUCATIONAL BENEFICATIONS OF ANDREW CARNEGIE IN THE UNITED STATES AND A STATEMENT OF HIS GIFT IN AID OF HIGHER EDUCATION IN SCOTLAND.

Surplus wealth is a sacred trust to be administered during life by its possessor for the best good of his fellow-men, and I have ventured to predict the coming of the day—the dawn of which, indeed, we already begin to see—when the man who dies possessed of available millions which were free, and in his hands to distribute, will die disgraced.—*Andrew Carnegie.*

[The foundation of the Carnegie Institution marks a notable step forward in the development of the instrumentalities of higher education in the United States. Being designed more particularly to promote and afford substantial aid to study and original research, it promises to become an active agency in effecting the solution of many of the problems which are engaging the attention of students and others, thereby enlarging the bounds of human knowledge.

The following documents and statements relating to the foundation and organization of the institution are reprinted here to show its general character, objects, and the methods to be employed, so far as they have yet been given definite shape.]

ARTICLES OF INCORPORATION (JANUARY 4, 1903).

We, the undersigned, persons of full age, and citizens of the United States, and a majority of whom are citizens of the District of Columbia, being desirous to establish and maintain in the city of Washington, in the spirit of Washington, an institution for promoting original research in science, literature, and art, do hereby associate ourselves in a body corporate for said purpose, under an act to establish a code of law for the District of Columbia approved March third, nineteen hundred and one, sections 599 to 604, inclusive; and we do hereby certify in pursuance of said act as follows:

First, the name or title by which such institution shall be known in law is Carnegie Institution; second, the term for which said institution is organized is perpetual; third, the particular business and objects of the institution are the promotion of study and research, with power (*a*) to acquire, hold, and convey real estate and other property necessary for the purposes of the institution as herein stated, and to establish general and special funds; (*b*) to conduct, endow, and assist investigation in any department of science, literature, or art, and to this end to cooperate with governments, universities, colleges, technical schools, learned societies, and individuals; (*c*) to appoint committees of experts to direct special lines of research; (*d*) to publish and distribute documents; (*e*) to conduct lectures; (*f*) to hold meetings; (*g*) to acquire and maintain a library; (*h*) and, in general, to do and perform all things necessary to promote the objects of said institution; fourth, that the affairs, funds, and property of the corporation shall be in general charge of a board of trustees, the number of whose members for the

first year shall be twenty-seven (27), and shall not thereafter exceed thirty except by a three-fourths vote of said board.

In testimony whereof we have hereto set our names and affixed our seals, at the city of Washington, in the District of Columbia, on the fourth day of January, 1902.

JOHN HAY.	[SEAL.]
EDWARD D. WHITE.	[SEAL.]
JOHN S. BILLINGS.	[SEAL.]
DANIEL C. GILMAN.	[SEAL.]
CHARLES D. WALCOTT.	[SEAL.]
CARROLL D. WRIGHT.	[SEAL.]

DISTRICT OF COLUMBIA, ss:

Be it remembered that on this 4th day of January, A. D. 1902, before the subscriber personally appeared the above-named John Hay, Edward D. White, John S. Billings, Daniel C. Gilman, Charles D. Walcott, and Carroll D. Wright, to me personally known and known to me to be the persons whose names are subscribed to the foregoing instrument of writing, and severally and personally acknowledged the same to be their act and deed for the uses and purposes therein set forth.

Given under my hand and official seal the day and year above written.

[SEAL.]

WILLIAM MCNEIR, *Notary Public*.

Received for record Jan. 4, A. D. 1902, 11 a. m., and recorded in Liber No. 9, fol. 420 *et seq.*, one of the incorporation records of the District of Columbia.

GEO. F. SCHAYER, *Deputy Recorder*.

BOARD OF TRUSTEES (ORGANIZED JANUARY 29, 1902).¹

Ex officio.—The President of the United States, the President of the Senate, the Speaker of the House of Representatives, the Secretary of the Smithsonian Institution, the President of the National Academy of Sciences.

John S. Billings, New York; William E. Dodge, New York; William N. Frew, Pennsylvania; Lyman J. Gage, Illinois; Daniel C. Gilman, Maryland; John Hay, District of Columbia; Abram S. Hewitt, New Jersey; Henry L. Higginson, Massachusetts; Henry Hitchcock, Missouri; Charles L. Hutchinson, Illinois; William Lindsay, Kentucky; Seth Low, New York; Wayne MacVeagh, Pennsylvania; D. O. Mills, New York; S. Weir Mitchell, Pennsylvania; William W. Morrow, California; Elihu Root, New York; John C. Spooner, Wisconsin; Andrew D. White, New York; Edward D. White, Louisiana; Charles D. Walcott, District of Columbia; Carroll D. Wright, District of Columbia.

TRUST DEED BY ANDREW CARNEGIE CREATING A TRUST FOR THE BENEFIT OF THE CARNEGIE INSTITUTION OF WASHINGTON, D. C.

I, Andrew Carnegie, of New York, having retired from active business, and deeming it to be my duty and one of my highest privileges to administer the wealth which has come to me as a trustee in behalf of others; and entertaining the confident belief that one of the best means of discharging that trust is by providing funds for improving and extending the opportunities for study and research in our country; and having full confidence in the gentlemen after named, who have at my request signified their willingness to carry out the trust which I have confided to them, therefore I have transferred to these, the trustees of the Carnegie Institution of Washington, ten millions of registered five per cent bonds of the United States Steel Corporation, the names of said trustees being as follows:

[Here follow the names of the trustees as given above.]

¹Grover Cleveland, former President of the United States, was chosen one of the original trustees, but was not able to accept the appointment.

The said gift is to be held in trust for the purposes hereinafter named or referred to; that is to say, for the purpose of applying the interest or annual income to be obtained from the said bonds, or from any other securities which may be substituted for the same, for paying all the expenses which may be incurred in the administration of the trust by the trustees, including in said expenses the personal expenses which the trustees may incur in attending meetings or otherwise in carrying out the business of the trust; and, second, for paying the sums required by the said trustees to enable them to carry out the purposes hereafter expressed. I hereby confer on the trustees all the powers and immunities conferred upon trustees under the law, and without prejudice to this generality the following powers and immunities, viz: Power to receive and realize the said bonds and the principal sums therein contained and the interest thereof; to grant discharges or receipts therefor; to sell the said bonds, either by public sale or private bargain, at such prices and on such terms as they may deem reasonable; to assign or transfer the same; to sue for payment of the principal sums or interest; to invest the sums which from time to time may be received from the said bonds on such securities as trustees are authorized by the laws of the States of New York, Pennsylvania, or Massachusetts, to invest trust funds; and also on such other securities as they in the exercise of their own discretion may select, and to alter or vary the investments from time to time as they may think proper.

And I hereby expressly provide and declare that the trustees shall to no extent and in no way be responsible for the safety of the said bonds, or for the sums therein contained, or for the securities upon which the proceeds of the said bonds may be invested, or for any depreciation in the value of the said bonds or securities, or for the honesty or solvency of those to whom the same may be entrusted, relying, as I do, solely on the belief that the trustees herein appointed, and their successors, shall act honorably.

And I further hereby empower the trustees to administer any other funds or property which may be donated or bequeathed to them for the purposes of the trust; and I also empower them to appoint such officers as they may consider necessary for carrying on the business of the trust, at such salaries or for such remuneration as they may consider proper, and to make such arrangements and lay down from time to time such rules as to the signature of deeds, transfers, agreements, cheques, receipts, and other writings as may secure the safe and convenient transaction of the financial business of the trust. The committee shall have the fullest power and discretion in dealing with the income of the trust, and expending it in such manner as they think best fitted to promote the objects set forth in the following clauses.

The purposes of the trust are as follows, and the revenues therefrom are to be devoted thereto:

It is proposed to found in the city of Washington an institution which, with the cooperation of institutions now or hereafter established there or elsewhere, shall, in the broadest and most liberal manner, encourage investigation, research, and discovery; show the application of knowledge to the improvement of mankind; provide such buildings, laboratories, books, and apparatus as may be needed, and afford instruction of an advanced character to students properly qualified to profit thereby.

Among its aims are these:

1. To promote original research, paying great attention thereto as one of the most important of all departments.
2. To discover the exceptional man in every department of study whenever and wherever found, inside or outside of schools, and enable him to make the work for which he seems specially designed his life work.
3. To increase facilities for higher education.

4. To increase the efficiency of the universities and other institutions of learning throughout the country by utilizing and adding to their existing facilities and aiding teachers in the various institutions for experimental and other work in these institutions as far as advisable.

5. To enable such students as may find Washington the best point for their special studies to enjoy the advantages of the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools, and kindred institutions of the several departments of the Government.

6. To ensure the prompt publication and distribution of the results of scientific investigation, a field considered highly important.

If in any year the full income of the trust can not be usefully expended or devoted to the purposes herein enumerated, the committee may pay such sums as they think fit into a reserve fund, to be ultimately applied to those purposes or to the construction of such buildings as it may be found necessary to erect in Washington.

The specific objects named are considered most important in our day, but the trustees shall have full power, by a majority of two-thirds of their number, to modify the conditions and regulations under which the funds may be dispensed, so as to secure that these shall always be applied in the manner best adapted to the changed conditions of the time; provided always that any modifications shall be in accordance with the purposes of the donor, as expressed in the trust, and that the revenues be applied to objects kindred to those named, the chief purpose of the founder being to secure, if possible, for the United States of America leadership in the domain of discovery and the utilization of new forces for the benefit of man.

In witness whereof I have subscribed these presents, consisting of what is printed or typewritten on this and the preceding seven pages, on [twenty-eighth] day of [January], nineteen hundred and two, before these witnesses.

ANDREW CARNEGIE.

JANUARY 28, 1902.

ESTELLE WHITFIELD.

REMARKS OF MR. CARNEGIE ON PRESENTING HIS TRUST DEED.

Mr. Chairman and members of the board of trustees:

I beg first to thank you for so promptly and so cordially coming forward to aid me in this work by the acceptance of trusteeship. The President of the United States writes me in a note of congratulation, "I congratulate you especially upon the character, the extraordinarily high character, of the trustees." These are his words. I believe that that estimate has been generally approved throughout the wide boundaries of our country.

May I say to you that my first idea while I dwelt upon the subject during the summer in Scotland was that it might be reserved for me to fulfill one of Washington's dearest wishes—to establish a university in Washington. I gave it careful study when I returned and was forced to the conclusion that if he were with us here to-day his finely balanced judgment would decide that such, under present conditions, would not be the best use of wealth. It was a tempting point suggested to me by the president of the Women's George Washington Memorial Association, that the George Washington Memorial University, founded by Andrew Carnegie, would link my name with Washington. Well, perhaps that might justify such association with Washington, and perhaps it is reserved for some other man in the future to win that unique place, because if we continue to increase in population as we have done it is not an improbability that it may

become a wise step to fulfill Washington's wish. But while that may justify the association of any other name with his, which is a matter of doubt, still I am very certain nothing else would. A suggestion that this gift of mine, which has its own field, which has nothing to do with the university except as an aid to one, if it is established, which has a field of its own, that is entitled to the great name of Washington, is one which I never for a moment could consider. If the coming university under the control of the nation—as Washington suggested a national institution—is to be established, as it may be in the future, I think the name of Washington should be reserved for that and for that alone. Be it our opportunity in our day and generation to do what we can to extend the boundaries of human knowledge by utilizing existing institutions.

This is intended to cooperate with all existing institutions, because one of the objections—the most serious one which I could not overcome when I was desirous to establish a university here to carry out Washington's idea—was this: That it might tend to weaken existing institutions, while my desire was to cooperate with all kindred institutions and to establish what would be a source of strength to all of them and not of weakness, and therefore I abandoned the idea of a Washington university or anything of a memorial character.

Gentlemen, a university worthy of Washington, or a memorial worthy of Washington, is not one costing \$1,000,000, or \$10,000,000, or \$20,000,000, but of more. When I contemplated a university in Washington in fulfillment of Washington's great wish, I set aside a larger amount than the largest of these. I take it for granted that no one or no association would think of using the revered name of Washington except for a university of first-class rank, something greater and better, if I may be allowed to say so, than we have in our land to-day—and you all know the sums which are now used for our universities.

Gentlemen, your work now begins; your aims are high, you seek to expand known forces, to discover and utilize unknown forces for the benefit of man. Than this there can scarcely be a greater work. I wish you abundant success, and I venture to prophesy that through your efforts, in cooperation with kindred societies, our country's contributions through research and in the domain of the higher sciences in which we are now so woefully deficient, will compare in the near future not unfavorably with those of any other land.

Again, gentlemen, from my heart, I thank you, and I will now, with your permission, read the deed of trust which has been prepared. I may say that the intended officers of this institution have a letter from my cashier, stating that the transferred bonds will be sent you early in February. They can not be transferred until the first of the month. They begin to bear interest on the 1st day of February. Here is the deed of trust. (Printed on pages 1068–1070.)

There is nothing so important, I think, as the last clause. This clause follows the deed given to the Scotch universities, in the main. When I proposed it in committee the chairman said he did not know about assuming so much responsibility as a trustee, and several gentlemen also suggested that it was too liberal, and threw too much responsibility upon them. Mr. Arthur Balfour was one of these, and I replied to him that my experience was that it is not without the greatest difficulty we can find men who can legislate for their own generation, and sometimes we are not quite successful even in doing that; but, I asked, "Have you ever seen or heard of a body of men wise enough to be able to legislate for the next generation?" He said, "No, I never have; and you are quite right, and that is the wisest provision I have ever heard of in a trust deed."

I have nothing more to say to you, gentlemen, having already expressed my thanks; but as I began with doing this I feel that I should also like to end doing so, and, therefore, I thank you again.

OFFICERS.

President of the Carnegie Institution: Daniel C. Gilman.

Chairman of the board of trustees: Abram S. Hewitt.

Vice-chairman of the board of trustees: John S. Billings.

Secretary of the board of trustees: Charles D. Walcott.

Executive committee: John S. Billings, Daniel C. Gilman, Abram S. Hewitt, S. Weir Mitchell, Elihu Root, Charles D. Walcott, Carroll D. Wright.

The office of the Carnegie Institution is in Washington, D. C., at No. 1439 K street, where an assistant secretary, Mr. Marcus Baker, is in charge.

CARNEGIE INSTITUTION,
1439 K Street, Washington, D. C.

A LETTER TO THE HEADS OF AMERICAN INSTITUTIONS AND TO OTHERS INTERESTED
IN THE WORK OF INVESTIGATION.

The Carnegie Institution sends to you herewith a copy of Mr. Carnegie's deed of gift and other information in respect to the organization of the new foundation.

Some of the ablest thinkers and investigators in the country have already called attention to important lines of inquiry. Their communications will be referred to special committees in different departments of knowledge—astronomical, physical, chemical, biological, geological, archaeological, philological, historical, bibliographical, economical, etc., and the referees will be requested to add their own suggestions and to report to the Carnegie Institution such methods of procedure and the names of such investigators as they deem likely to advance with wisdom the great purpose of the foundation.

No large appropriations can be made at present, as there will be no income from the fund before August. The summer will be chiefly devoted to a careful study of the problems of scientific investigation at home and abroad, and in the autumn definite plans of procedure will be formulated.

Any member of the executive committee will be glad to receive from you at any time suggestions, opinions, and advice as to fields that the Carnegie Institution ought to occupy and the best methods for carrying forward its work in those fields; but in order that important papers, designed for official consideration, may be properly recorded and filed, they should be addressed to the president of the Carnegie Institution, 1439 K street, Washington, D. C.

DANIEL C. GILMAN, *Chairman.*
CHARLES D. WALCOTT, *Secretary.*

ABRAM S. HEWITT,
S. WEIR MITCHELL,
ELIHU ROOT,
CARROLL D. WRIGHT,
Executive Committee.

THE CARNEGIE INSTITUTION.

AN AUTHORITATIVE STATEMENT BY PRESIDENT GILMAN.¹

Not many months ago Mr. Andrew Carnegie surprised the universities of Scotland by a gift of \$10,000,000 for the encouragement of deserving students. He has now surprised the learned institutions of America by a gift of the same

¹ Reprinted from the Century Magazine, March, 1902.

amount for the advancement of knowledge. As this open letter is written, he has not formally made his deed of gift, and the trustees whom he selected have not developed their plans; but enough is definitely known to awaken the highest expectations of good, and to call for the enthusiastic reception of his great project. His general purpose has been clearly stated in a single sentence. He purposes to found, in the city of Washington, in the spirit of Washington, an institution which, with the cooperation of institutions now or hereafter established, there or elsewhere, shall, in the broadest and most liberal manner, encourage investigation, research, and discovery; show the application of knowledge to the improvement of mankind; provide such buildings, books, and instruments as may be needed, and afford instruction of an advanced character to students whenever and wherever found, qualified to profit thereby.

A more complete announcement of Mr. Carnegie's plan is given in this informal statement:

Among its aims are these:

To increase the efficiency of the universities and other institutions of learning throughout the country by seeking to utilize and add to their existing facilities, and to aid teachers in the various institutions for experimental and other work in these institutions as far as practicable.

To discover the invaluable and exceptional man in every department of study, whenever and wherever found, inside or outside of the schools, and enable him by financial aid to make the work for which he seems specially designed his life work.

To promote original research, paying great attention thereto, as being one of the chief purposes of this institution.

To increase facilities for higher education.

To make more useful, to such students as may find Washington the best point for their special studies, the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools, and kindred institutions of the several departments of the Government.

To insure the prompt publication and distribution of the results of scientific investigation, a field considered to be highly important.

These and kindred objects are to be attained by the employment of able teachers in the various institutions in Washington or at other points, and by enabling men fitted for special work to devote themselves to it, through salaried fellowships or scholarships, or through salaries carrying pensions in old age, or through aid in other forms to such men as continue their special work at seats of learning or who may be discovered outside the schools.

The present moment is favorable for casting the eye backward over the growth of an idea, and for tracing the various influences which have contributed to its evolution. A small amount of that "original research," which is the dominant note of the scientific world, will show the relation of George Washington to this new movement.

The possible establishment of a national university was brought up in the Constitutional Convention, and was seriously discussed; but the project was dropped, and no mention of it is found in the fundamental law of the Union. When Washington became President he used this language in his first message to Congress, January 8, 1790:

There is nothing which can better deserve your patronage than the promotion of science and literature. * * * Whether this desirable object will be best promoted by affording aids to seminaries of learning already established, by the institution of a national university, or by any other expedients, will be well worthy of a place in the deliberations of the legislature.

From that time onward until he drew up his last will, a few months before he died, Washington frequently recurs to his wishes. "The University of the Federal City" is repeatedly spoken of. At the beginning of the year 1795 he points out the advantages of the "Federal City" as a site for a university, and says if the plan is adopted he will give to it 50 shares of the Potomac River Company.

He adds, however, that the design has assumed no form, and that he does not know who is promoting it. A little later he addresses Mr. Jefferson on the same subject, and gives these reasons for preferring the Federal City for his proposed gift: It will be the seat of government; it is central; half the District of Columbia is in Virginia; there will be an advantage in governmental supervision, and certain studies in law and politics can be favorably pursued in the neighborhood of Congress. He speaks also of his own gift as a part of the endowment. In 1796 a memorial was presented to Congress for the foundation of a national university, but nothing came of it. Finally, in the will of Washington we have the following paragraph, which, like the famous paragraphs that constitute the Monroe doctrine, is very short, and has been the basis of much discussion in later years:

* * * as it has always been a source of serious regret with me to see the youth of these United States sent to foreign countries for the purpose of education, often before their minds were formed, or they had imbibed any adequate ideas of the happiness of their own; contracting too frequently not only habits of dissipation and extravagance, but principles unfriendly to republican government, and to the true and genuine liberties of mankind, which thereafter are rarely overcome; for these reasons it has been my ardent wish to see a plan devised on a liberal scale, which would have a tendency to spread systematic ideas through all parts of this rising empire, thereby to do away local attachments and State prejudices, as far as the nature of things would, or, indeed, ought to admit, from our national councils. Looking anxiously forward to the accomplishment of so desirable an object as this is (in my estimation), my mind has not been able to contemplate any plan more likely to effect the measure than the establishment of a university in a central part of the United States, to which the youths of fortune and talents from all parts thereof might be sent for the completion of their education, in all the branches of polite literature, in arts and sciences, in acquiring knowledge in the principles of politics and good government, and as a matter of infinite importance, in my judgment, by associating with each other, and forming friendships in juvenile years, be enabled to free themselves in a proper degree from those local prejudices and habitual jealousies which have just been mentioned, and which, when carried to excess, are never-failing sources of disquietude to the public mind, and pregnant of mischievous consequences to this country.

Whatever may have been the source of Washington's idea, it was not a passing thought, for his recorded commendations of it cover nearly ten years. But there was little public discussion of the subject for nearly three quarters of a century, although it was repeatedly mentioned in Presidential messages. At length, in 1873, a member of Congress, the Hon. John W. Hoyt, of Wisconsin, afterwards governor of Wyoming, brought the subject forward, and from that time to this he has been the unselfish, undaunted, and persistent advocate of a national university to be organized and endowed by Congress. In spite of the opposition and coldness which the project has encountered, he has lost no opportunity to urge its importance; he has never lost his zeal and confidence. Eminent members of the National Legislature have introduced the appropriate bills, and yet no final action has been taken by Congress: The support of distinguished men in every part of the country has been secured, and yet, at the same time, strong objections have been raised in various quarters. Many wise and patriotic persons have been apprehensive that Congress would not be, as years roll by, the best supporter of advanced education, and others have thought that the country already had more than enough institutions exercising the university functions.

Recently other influences have been at work. Many persons who admire the management of the Smithsonian Institution have thought it desirable that the work of that establishment should be so enlarged as to exercise, in part at least, the functions of a university; but the authorities of the Smithsonian have not seen the way clear to any such expansion. Many of those who are connected with the scientific bureaus of the Government became aware of the great resources of Washington which might be opened to students properly qualified to profit by them, and probably at their suggestion Congress consented to the

opening of these resources to those who might be enrolled in the institutions of the District of Columbia. Five institutions in the District are called universities—the Georgetown University, under the Jesuit fathers; the Columbian University, controlled by the Baptists; the Howard University, for the instruction of Africans; the Catholic University, chartered by the Pope and fostered by the Roman Catholic prelaty; and the American University, projected by the Methodists. This simple enumeration shows how divergent have been the wishes and aims of those citizens who have agreed with Washington that the Federal City offered exceptional advantages for advanced instruction.

Another factor has entered into this complex problem. Many influential and patriotic ladies in different parts of the country have formed the George Washington Memorial Association, and, among other objects, have undertaken to collect a fund which might be applied to the erection in Washington of a memorial building in honor of Washington, to be used as a central, administrative building for the national university, if such an institution should come into existence.

Just before adjournment, in the summer of 1901, Congress authorized the opening of the scientific bureaus and libraries of Washington to students from any part of the country. This was an opportunity which was immediately seized by the Washington Academy of Sciences and by the George Washington Memorial Association, just referred to, and they united their forces in the establishment of an independent body to be known as the Washington Memorial Institution. This movement received the support of a large number of the presidents of colleges throughout the land, and in the autumn of 1901 everything looked favorable for the beginning of its work, except the lack of funds. In a private way some efforts were made to secure, if not an endowment, a sufficient income to carry on the work of the new organization.

Then came a great surprise. Mr. Carnegie announced his desire to found an institution in the city of Washington upon the plan already indicated at the beginning of this letter, and those whom he has selected for this work are about to proceed to the unfolding of his purposes.

The form of organization is very simple. Under the general law of the District of Columbia six persons, namely, Messrs. John Hay, Edward D. White, John S. Billings, Charles D. Walcott, Carroll D. Wright, and Daniel C. Gilman, formed an incorporation at Mr. Carnegie's request, and subsequently, on his nomination, selected twenty-seven persons to be the trustees, namely: The President of the United States, the President of the United States Senate, the Speaker of the House of Representatives, the Secretary of the Smithsonian Institution, the president of the National Academy of Sciences, *ex officio*; Grover Cleveland, John S. Billings, William N. Frew, Lyman J. Gage, Daniel C. Gilman, John Hay, Abram S. Hewitt, Henry L. Higginson, Henry Hitchcock, Charles L. Hutchinson, William Lindsay, Seth Low, Wayne MacVeagh, D. O. Mills, S. Weir Mitchell, W. W. Morrow, Elihu Root, John C. Spooner, Andrew D. White, Edward D. White, Charles D. Walcott, and Carroll D. Wright.

It is obvious that a body like this, which is made up of men whose homes are in widely scattered parts of the country, and who are evidently selected because of the interest they have shown in the welfare of the country, can not manage the details of scientific investigation. They will doubtless select certain executive officers, but even these will not be qualified, without a great deal of expert advice, to determine the value of the various methods of procedure which will quickly be presented for their consideration. Accordingly, the next step forward will be to appoint a number of counselors or experts, to whom will be referred important questions of a scientific character, the selection of competent helpers, and the best methods of publishing results. It is proposed, in other words, to select, in different departments of knowledge, men who by their ability and experience have

shown themselves worthy of confidence. They will constitute the scientific corps of the institution, and will be chosen because they are qualified and willing to cooperate in advancing the purposes of the institution.

It is noteworthy that Mr. Carnegie's gift does not supersede any action on the part of Congress to establish a university, in the ordinary sense of that word, where a faculty shall be assembled, laboratories provided, and post-graduate students admitted. All the plans thus far projected for a national university have looked toward post-graduate work, extending the opportunities now provided in colleges and other institutions throughout the land. This form of activity is foreign to Mr. Carnegie's purposes, and his purposes can be carried out with or without the establishment of a national university by Congress. That question stands now, as heretofore, on its own merits.

The friends of scientific research will await the further development of the Carnegie Institution with profound interest. Even those who would prefer the organization of a national university supported by Congress must perceive upon reflection, if they do not at the outset, that Mr. Carnegie's plans are as broad as the field of knowledge, that the amount of his gift surpasses any other endowment in the world for the specific purpose of extending science, and that the spirit of cooperation which he enjoins upon his trustees must bring the new institution into close affiliation with all that is best in the country. He will deserve not only the applause but also the gratitude of mankind.

DANIEL C. GILMAN.

OBJECT AND PURPOSE OF THE INSTITUTION.

STATEMENT BY PRESIDENT GILMAN IN THE INDEPENDENT, MARCH, 20, 1902.

A brief definition of the object and purpose of the Carnegie Institution is the advancement of knowledge. This is its chief aim, and the efforts of those who have been selected to frame its policy will be directed accordingly. It will occupy a distinct position in the field of education, interfering in no way with the plans of other organizations. We trust that it will prove a new and powerful agency for the promotion of science in this country.

Those who have been appointed to formulate plans will devote ample time to a careful consideration of all the possibilities. If it is deemed advisable to erect a building or series of buildings, they will be constructed, but the procedure is not likely to be immediate. The question of aiding students who are deserving of such assistance will be thoroughly discussed, but if any decision is reached in the affirmative our plans will in no way conflict with those of the Washington Memorial Institution, which has this as one of its principal purposes. Our activity may include cooperation with the highest universities or with schools comparatively obscure. Not only are the suggestions of eminent educators invited, but we look for assistance from all persons who have ideas of value. Diligent inquiry is to be made respecting existing agencies of research. We know where valuable data exist, but may discover new sources as the inquiry progresses.

As a preliminary study I expect to visit various institutions in this country so as to confer personally as far as possible with those who may be in a position to aid us. Later I shall spend some time abroad with the same object in view. In short, we intend to draw upon the world at large for counsel and suggestions which may be of assistance in formulating a plan.

For the present, the affairs of the Carnegie Institution are in the hands of an executive committee, appointed by the board of trustees, consisting of Abram S. Hewitt; Carroll D. Wright; Dr. John S. Billings; Charles D. Walcott; Elihu Root, Secretary of War; Dr. S. Weir Mitchell, and the President. We have rented a

dwelling in Washington for temporary headquarters. While the board of trustees are given authority by the founder to complete the organization and formulate the policy to be pursued, I have no doubt that if we should call upon him for advice or other assistance it would be gladly given. * * *

EDUCATIONAL BENEFACTIONS OF ANDREW CARNEGIE.

The following is a list (compiled from Appleton's Annual Cyclopedias) of the most notable gifts of money by Andrew Carnegie for libraries and other educational purposes in the United States:

Object or institution.	Location.	Amount.
1885.		
Public library and art gallery	Pittsburg, Pa	\$1,000,000
1898.		
Library, music hall, and clubhouse (for employees of Carnegie Steel Co.).	300,000
Virginia Mechanics' Institute (to complete Ginter Memorial Building).	Richmond, Va	10,000
Total for 1898	310,000
1899.		
Carnegie Institute (for enlarging building)	Pittsburg, Pa	1,750,000
Cooper Union (for mechanics' day art school)	New York, N. Y	300,000
Public library	Washington, D. C	350,000
Do	Atlanta, Ga	125,000
Do	Lincoln, Nebr	75,000
Do	McKeesport, Pa	50,000
Do	Connellsville, Pa	50,000
Do	Steubenville, Ohio	50,000
Do	East Liverpool, Ohio	50,000
Do	Fort Worth, Tex	50,000
Do	Emporia, Kans	30,000
Do	Davenport, Iowa	50,000
Do	Cheyenne, Wyo	50,000
Do	Austin, Tex	50,000
Do	San Diego, Cal	50,000
Do	Duluth, Minn	50,000
Pennsylvania State College (for library building)	State College, Pennsylvania.	100,000
Stevens Institute of Technology (for laboratory building).	Hoboken, N. J	50,000
Mechanics' Institute	New York, N. Y	25,000
Public library	Newport, Ky	20,000
Do	Tucson, Ariz.	25,000
Virginia Mechanics' Institute (for new building)	Richmond, Va	10,000
New York Zoological Society (for building fund)	5,000
Public library	Erie, Pa	5,000
Total for 1899	3,870,000
1900.		
Carnegie Library and Institute (additional)	Pittsburg, Pa	1,850,000
Polytechnic Institute	do	3,000,000
Public library	East Orange, N. J	50,000
Do	York, Pa	50,000
Library	Fort Dodge, Iowa	30,000
Do	Leavenworth, Kans	25,000
Do	Chillicothe, Mo	25,000
Tuskegee Normal and Industrial Institute	Tuskegee, Ala	20,000
Stevens Institute of Technology (additional)	Hoboken, N. J	15,000
Total for 1900	5,065,000
1901.		
Technical School ¹	Pittsburg, Pa	2,000,000
Carnegie Institution	Washington, D. C	10,000,000
Sixty-five branch libraries	Greater New York, N. Y	5,200,000
Annuity fund for laborers	Homestead, Pa	4,000,000
Libraries	Braddock, Homestead, and Duquesne, Pa.	21,000,000
Carnegie Institute	Pittsburg, Pa	1,000,000
Library and branches	Detroit, Mich	750,000
Do	San Francisco, Cal	750,000
Cooper Union	New York, N. Y	500,000
Syracuse library	Syracuse, N. Y	200,000

SUMMARY.

Year.	Amount.	Year.*	Amount.
1895	\$1,000,000	1901	39,243,500
1898	310,000		
1899	3,370,000	Total	39,983,500
1900	5,065,000		

*The total value of the n. notable gifts and bequests for public purposes of \$5,000 and upward made during the year 1901, as given in Appleton's Annual Encyclopedia, and including the above amount given by Mr. Carnegie, was \$114,549,789. This sum excludes ordinary denominational contributions for education and benevolent purposes, State and municipal appropriations to public and sectarian institutions, and the grants of Congress.

THE CARNEGIE GIFT TO THE UNIVERSITIES OF SCOTLAND.

The following statement shows in detail the character and purpose of the recent gift of Mr. Carnegie to promote higher education in Scotland:

The executive committee of the newly constituted Carnegie trust for university education in Scotland held its first meeting in Edinburgh on Monday, Lord Elgin presiding. The following letter from Mr. Carnegie was read:

“LONDON, June 7, 1901.

“MY DEAR LORD ELGIN: It is with the greatest satisfaction I can now announce that I have signed the deed of trust placing \$10,000,000 under the charge of your

lordship and other noblemen and gentlemen who have so kindly consented to act as trustees in the administration of the money for the benefit of the universities of Scotland and the youth of that country who desire the benefits of a university education. I must express my warmest thanks to your lordship and the other friends who have, during these past few days, shown so much anxiety to adjust the deed and the relative constitution, so as to secure that the funds shall be administered in the most advantageous manner. I believe that these labors have been completely successful, and I anticipate that most excellent results will follow. I am especially obliged to your lordship for agreeing to accept the onerous post of chairman, both of the trustees and of the executive committee, and I shall trust to your proceeding to put the trust deed into execution. The services of Mr. Ross, my solicitor, are at your disposal as interim secretary, until you have an opportunity of appointing permanent officials. I shall make arrangements whereby the fees of the students to be advantaged may be paid for the ensuing session, beginning in October next. As your lordship is aware, my desire throughout has been that no capable student should be debarred from attending the university on account of the payment of fees. I believe that the conditions of applications insure the sufficient standard of merit, and I hope that the honest pride for which my countrymen are distinguished will prevent claims from those who do not require assistance, and that the invidious task of inquiring into the circumstances of each candidate need not be imposed upon the trustees. But, to further mark my personal belief and hope in this matter, I have made provision in the trust deed that the trustees may receive funds from others to be administered along with the funds placed by me. I consider this a valuable clause, believing from my own experience with young men, that some students in after life may value the privilege of repaying advances received from the trustees. Although these are free gifts, I hope the trustees will gladly welcome such repayments if offered, as this will enable such students as prefer to do so to consider the payments made on their account merely as advances which they resolve to repay, if ever in a position to do so, and that this will protect and foster the spirit of manly independence so dear to the Scot.

“Very truly, yours,

“ANDREW CARNEGIE.”

Mr. Ross, solicitor, of Dunfermline, was appointed treasurer to the trust and interim secretary. It was intimated that the transfer of the bonds constituting the income of the trust had been made, and that the first dividend would be received in the autumn. Arrangements were made by the executive committee for carrying out Mr. Carnegie's wishes regarding the payment without delay of students' fees.—[School Board Chronicle, July 20, 1901, p. 84.]

The Washington Post of May 4, 1902, published a complete list of the gifts of Andrew Carnegie, as revised and approved by Mr. Carnegie himself; in this list were included gifts for other than library or educational purposes. The summary of all the gifts, according to locality, was as follows:

Canada	\$876,500
Cuba	252,000
England.....	420,000
Ireland.....	65,500
Scotland	13,078,750
United States.....	52,270,173
Miscellaneous gifts, Great Britain.....	250,000
Grand total	67,212,923

CHAPTER XXIV.

EDUCATION IN FRANCE.

France, Republic: Area, 204,992 square miles; population, 33,517,975 (1896). Civil divisions having special functions in educational administrations, departments (90 in number, including 3 in Algiers); communes, cities or villages.

⁷ State appropriation required for 1901.

The statistics tabulated above, present the salient particulars of education in France in a form convenient for reference and for comparison with corresponding particulars in other countries. What they signify as to progress in France can be understood only by comparison with an earlier date. As regards primary education such comparison is set forth in a series of retrospective tables, pp. 1038-1093, covering a period of sixty years. Here are noted only the more striking particulars of the progress in the public system since the establishment of the Republic. The policy of the Republic with respect to primary education may be said to have begun in 1878 by the passage of a law imposing upon the communes (cities and rural districts) the obligation to own their schoolhouses. To aid in the work the Government appropriated 120,000,000 francs (\$24,000,000), to be allowed one-half in appropriations, one-half as loans to the communes. Between that date and 1897, there were expended for buildings and sites 639,000,000 francs (\$137,800,000), of which \$52,000,000 were for normal schools. The expenditures of Paris and other large towns not included in the above would raise the grand total to 850,000,000

francs. In 1878 the communes owned 41,401 school buildings; in 1897, 52,879. The difference (11,478) scarcely expresses the actual increase as 8,024 of the new buildings are school groups, of which, in 1878 there were very few.

In 1877 there were 110,709 teachers in the primary schools (excluding infant schools); in 1897 the number was 153,505, an increase of 38.6 per cent (for men teachers 30.2 per cent, for women teachers 44 per cent).

In 1897 there were 818,190 more pupils enrolled in primary schools than in 1877, and during the same time the enrollment in infant schools had increased by 197,571. The great increase in school teachers and enrollment has necessitated corresponding increase in current expenditure, which rose from 94,997,554 francs (\$18,879,510) in 1887 to 214,915,259 francs (\$42,803,050) in 1897, or two and one-third-times the earlier total.

This progress in essential conditions has been accompanied by a striking extension in the scope and influence of the schools as shown by the development of higher primary schools and of evening continuation classes for youths and adults, and by a variety of social efforts (educational, recreative, and philanthropic) of which the school is the inspiring source. These developments, which belong to the later years of the Republic, will be considered presently in detail.

The higher teaching agencies, the classical schools and universities, have also been liberally fostered by the Republic. In the last twenty years the State has spent about 67,000,000 francs (\$13,400,000) in the construction and restoration of the lycées (State classical schools), and to this amount the cities have added 20,000,000 francs (\$4,000,000).

The public lycées and colleges for boys, which had 66,931 pupils in 1876, enrolled 85,591 in 1898. Since 1880, the entire work of public secondary education for girls has been created.

For the buildings alone devoted to this latter purpose, the State has advanced above 33,000,000 francs (\$6,680,000), and bears annually about 70 per cent of the current expenses, which, in 1898, amounted to 3,764,354 francs (\$752,870).

The development of university education under the Republic can be but faintly indicated by figures. The university administration has been entirely reorganized, the material resources of the universities greatly enriched, and the scheme of studies extended.

As regards students, the statistics show an increase from 17,605 in the State universities in 1878 to 28,254 in 1898, and as regards current expenditure an increase from 10,400,000 francs (\$2,080,000) to 13,860,000 francs (\$2,772,000). Since 1875 above \$2,000,000 have been expended by the State and cities in the construction of new university buildings. The total State appropriation for education (ministry of public instruction) rose in 1901 to 266,966,483 francs (\$51,393,296), of which \$31,426,215 was for primary education.

For a closer view of the work of this comprehensive system of education the three divisions (primary, secondary, and superior) must be considered separately. These are centralized under the control of the minister of public instruction (at present M. Leygues), but separately administered.

To the department of primary education (director in the ministry, M. Bayet) belong the infant schools, primary schools, elementary and higher, and primary normal schools. As shown in Table I, the State shares this work with private agencies (chiefly clerical). The relation of these two systems to each other gives peculiar interest to the educational history of France and explains the most important recent events of that history. The Republic has been forced to build itself in and through the public schools, and hence the progress outlined above can be fully comprehended only by considering the measures which have developed the national as opposed to the church system.

As a public service primary education dates from Guizot's law of 1833, passed in the brief calm of Louis Philippe's reign. The principles of public obligation and necessity which the law embodied had indeed been set forth with more passionate ardor and much wider scope by the early leaders of the French revolution; but whereas these doctrinaire projects failed of effect, save perhaps that they hastened the suppression of existing institutions, Guizot's law was practically realized. It struck to the root of the matter by localizing responsibility. Every commune was required to maintain a primary school and every department a normal school for men. The requirement was enforced by the imposition of a local school tax.

An ordinance of 1835 strengthened the work by creating a special inspectorate for primary schools, and a second ordinance (1836) made provision for the primary instruction of girls.

Under Guizot's law a communal school might be denominational, and the influence of the church was increased by giving the clergy excessive representation in the local school committees. Like the English school law of 1870, this earlier French law indicated a serious intention of overcoming gross illiteracy. At the time of its passage it was estimated that seven or eight thousand communes (about one-fourth of the whole number) were totally destitute of schools and that as many more had schools unworthy of recognition. The effects of the law were soon apparent. By reference to the retrospective table (II) it will be seen that school enrollment increased by nearly a third (31 per cent) between 1837 and 1850—two years after the fall of the restored monarchy. Schools under the charge of the religious orders multiplied even more than public secular schools. Among the former were held in special repute the schools of the Christian Brothers, which had been favored by Napoleon. The Emperor was indeed content to leave the instruction of the masses as it had been left before the revolution—to the efforts of priests and brotherhoods. Although the *petites écoles*,¹ as primary schools were designated, were nominally included under the Imperial University, they were disregarded in its practical administration.

The work that Guizot began and fostered while minister of education, a position which he held at intervals from 1832 to 1840, continued with varying fortune after the fall of the monarchy. Carnot, first minister of public instruction in the Republic of 1848, framed a law on broad lines, making primary education obligatory and free. Though practically a dead letter, it revived the ideals of the first Revolution. Under the ministry of M. de Falloux was proposed the celebrated law which bears his name, although passed under his successor March 15, 1850. It has been called the law establishing the liberty of teaching. According to M. Rambaud, it established "the monopoly of the religious orders."²

From the passage of that law up to 1875, the enrollment in secular primary schools, as will be seen by reference to Table II, increased by only 24 per cent, while the enrollment in schools of the religious orders increased by 99 per cent. Moreover, the secular schools were imbued with the church spirit, as their teachers were largely recruited from the religious orders. They differed from the independent schools simply in deriving support from public funds and being under the supervision of local committees.

The event of chief importance to education during the reign of Napoleon III was the ministry of M. Duruy. Although his efforts were chiefly directed to secondary and higher education, he secured the passage of a law (1867) which strengthened public primary education. This law made the maintenance of a separate public school for girls obligatory upon every commune having 500 or more inhabitants, improved the teachers' salaries, created continuation classes for

¹ These schools had been the subject of royal decrees in 1695 and again in 1724.

² See article "France," in Buisson's Dictionary of Pedagogics and Primary Instruction, Vol. I, Part I.

adults, and provided for the support of hamlet schools and for special aid to necessitous schools.

In the twelve years between the passage of that law and the year in which the Republic entered vigorously upon its school policy above 2,000 new schools were opened—nearly 200 a year—and of the whole number 1,580 were schools for girls. The increase in the same time in the enrollment of girls is particularly marked (Table II); for all pupils the increase was 7 per cent; for girls, 10 per cent. It is worthy also of note that a law of 1854 (the third year of the second Empire) transferred to the prefects of departments the power in respect to schools hitherto exercised by the rectors of academies. This measure, which Jules Simon denounced as a sacrifice of educational to political interests, laid the foundations for the departmental administration of primary schools, which is one of the most important features of the present system.

The French Republic was proclaimed September 3, 1870, the day after the defeat of the French army at Sedan, and on the 4th of September a cabinet was formed with Jules Simon as minister of public instruction.

The siege of Paris, the disorders of the commune, the humiliation and distractions of the country, precluded for a time any serious efforts in respect to education. Moreover, and perhaps because of the excesses of the commune, there was a temporary strengthening of ecclesiastical influences. This was shown by the laws of March 19, 1873, reorganizing the superior council of education, and by the law of July 12, 1875, upon the liberty of higher education.

The former law restored the elective principle in the formation of the council, but gave excessive representation to the clericals, while the law of 1875 operated wholly in favor of "church faculties." It was not until after the elections of 1877, which gave a Republican majority to both chambers, that education became the absorbing interest of the Government.

The course of the Government with respect to primary education was fore-had-dowed by the law of June 1, 1873, which, as noted already, created a fund of \$24,000,000 for building schoolhouses.

The year following began the memorable ministry of Jules Ferry, who is justly called the founder of the national system. His views respecting education were already well known. In 1870, after his election by a Paris district to the Chamber of Deputies, he had publicly vowed to give himself to this cause. "When this honor fell to me," he said, "I made this vow: That among all the questions, all the problems, all the necessities of the hour, I would choose one to which I would consecrate all my abilities, all my mind and heart, all my physical and moral power—this is the problem of the education of the people."

It must interest us to know that he found inspiration for his efforts in the work of our own country. He had studied this work carefully in the report of M. Hippéau, and drew from it pointed illustrations for the positions advanced in his address upon "Equality in education."¹ This address set forth very clearly the principles so effectively applied during his administration.

The first measure carried by Jules Ferry was the law of August 9, 1879, which imposed upon each department the creation of a normal school for women teachers under the same guaranties as those required by the law of 1833 for the normal schools for men. This law, with the foundation of three higher normal schools—Sèvres, Pontenay-aux-Roses, and Saint-Cloud—(the first intended for professors of girls' lycées, the last two for professors in the primary normals) completed the measures necessary to assure a teaching force thoroughly equipped and imbued with patriotic sentiment.

The law of February 14, 1880, reorganizing the superior and academic councils

¹ See *Discours sur l'égalité d'éducation; Discours et opinions de Jules Ferry, Vol. I, pp. 234-305.*

of public instruction, made a radical change in the administrative service. These councils were a survival from the university or State teaching monopoly created by Napoleon. Under his system the councils were formed by appointment, and reflected simply his arbitrary will. Their constitution had been modified in the years between the fall of the first Empire and the establishment of the second Republic, but never to the extent of making them essentially professional councils for the fostering of public education.

In his exposé of motives accompanying the measure of 1830 the minister declared that heretofore the representatives of the public interest had been excluded as far as possible from the superior council, while its doors had been opened wide to the representatives of rival interests. Independent schools could be multiplied without limit, but the State could not open a school, found a college, or create a university professorship without the sanction of the superior council, a majority of whose members had "no connection with education and were hostile to the State system." Briefly summarized, the changes that he proposed were: (1) Exclusion of ecclesiastics and of so-called representatives of social interests; (2) admission to the council of elected representatives of secondary and primary education; (3) predominance of the elective element above the appointed or administrative.

Professional competence was the only qualification demanded in those eligible for membership. "We admit," said the minister in the discussion of the bill, "and we have proposed to admit to this council educators and only educators." Of the 69 members that made up the council, 13 were to be appointed—viz, 9 representing the State teaching system and 4 the independent agencies. Thus the State authority was made supreme. The same principles of professional qualification and election were applied in the reconstitution of the academy councils, but with modifications required by their local relations.

This measure was followed March 18, 1880, by the passage of a law relative to the liberty of higher education. Its most important provisions were: (1) That restoring to the State the sole right to confer degrees; (2) forbidding the use of the name university by any independent body; (3) requiring special sanction upon proof of public utility for the opening of any private establishment for higher education. This law, like those of December 21, 1880, establishing public colleges (*lycées*) for girls, and July 21, 1881, creating the normal school for professors of these colleges, had no direct relation to primary education, but they deserve mention here as indicating the principles and completeness of the system which Jules Ferry had in mind. He is distinguished as the founder of French primary education, but he had no thought of isolating primary education from the higher grades.

The essential principles of administration being settled, the minister gave himself up to the great work of primary education. There followed in rapid succession the laws which created a national system. These were: (1) The law of June 16, 1881, requiring all teachers, public and private, to be provided with State diplomas and doing away with the clerical letters of authorization, which had been heretofore accepted as sufficient proof of capacity for the work [teachers possessed of these letters were obliged to submit to a State examination, excepting those who had reached the age of 35 years and had been five years in the service. Even these could not be promoted until they had conformed to the law]; (2) the law of the same date making public primary schools free schools; (3) the law of March 28, 1882, secularizing the public primary schools and making it compulsory upon all parents to secure the instruction of their children [the choice of means, that is of public or private schools or home instruction, was left to the parents]; (4) the law of October 30, 1886, "the organic law of the system," which prescribed minutely all the details of the administration, inspection, and classification of primary schools, the requirements and gradation of the teaching force, the

school programmes, etc. The law also completed the secularization of the schools by a clause providing that all teachers of public schools should belong to the laity.

Five years were allowed for the application of this provision to schools for boys, but no limit was specified in respect to schools for girls. Naturally, however, a limit was assured, as no more appointments of members of religious orders were permitted. From the intense excitement aroused by this clause, it overshadowed at the time all other features of the law. Its mention naturally carries the mind forward to the recent law respecting the religious associations, which is regarded as the culmination of the policy inaugurated by M. Ferry.

To the American student of the French system the more important provisions of the law of 1886 relate to the scholastic policy and ideals which it embodied.

It secured to Republican France a uniform school administration, equally forceful in the humblest communes and the chief city; assured even to the smallest hamlet the service of an approved teacher, guided and inspired by professional superiors, secured to every child the elements of knowledge, and by a judicious flexibility of programmes opened to all a wide range of specialized instruction.

At the outset the school work derived its impetus from a few leading men—from M. Buisson, for many years the director of primary education, and from the professors of the chief normal schools, St. Cloud and Fontenay; but as the years passed the centers of influence multiplied, and to-day every departmental normal school is a power, while the inspectorate has become the propelling force of primary schools. This diffusion or multiplication of forces is the natural result of the thorough organization provided by the law of 1886. The inspectorate, which is the distinctive feature of the organization, will be considered more fully hereafter. We proceed here with the record of progress.

DETAILED STATISTICS OF PRIMARY EDUCATION.

The sources of the following statistics are: Report on primary education in the principal countries, comparative and retrospective (*la statistique de l'enseignement primaire*), presented by M. E. Levasseur to the International Institute of Statistics, 1891; the official reports of the minister of public instruction for 1891-92, 1896-97, and the reports of the chairman of the financial committee of the Chamber of Deputies for the successive years from 1897 to 1901, inclusive.

Distribution of schools.—Practically every commune in France has complied with the law as regards the establishment of public schools, and a very large proportion (97 per cent) of those having 500 inhabitants, or more, have met the requirement of a separate school for girls. The situation in 1897 in respect to these requirements was as follows:

Total number of communes.....	36,530
Number having one or more public schools.....	35,618
Number having only private schools.....	39
Number maintaining a public school with another commune.....	815
Number having no school.....	48
Communes of 500 inhabitants or more.....	18,539
Number having a public school for girls.....	17,185
Number having only private schools for girls.....	708
Number having no separate school for girls.....	646
Communes of less than 500 inhabitants having a separate school for girls..	3,601

SCHOOL ENROLLMENT.

TABLE II.—*Retrospective view of pupils in the primary schools.*

Year.	Total number of pupils. ¹	Boys.	Girls.	Pupils in schools.

¹ Infant schools not included. Algiers not included prior to 1886-87.

TABLE III.—*Proportion of total enrollment in different classes of primary schools at dates specified.*

Year.	Public.	Private.	Secular.	Schools of religious orders.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1837	76	24		
1840	76.5	23.5		
1850	78.3	21.7	71.2	28.8
1863	78.3	21.7	62.4	37.6
1877	81	19	56	44
1881-82	81.6	18.4	66.8	33.2
1887-88	79.9	20.1	69.5	30.5
1891-92	77.1	22.9	70.1	29.9
1896-97	75.7	24.3	70.7	29.3
1898-99	75.3	24.7	71	29

From Table II it will be seen that there was a steady increase in school enrollment from 1837, when Guizot's law had borne fruit, up to 1888-89, in which year the maximum enrollment was reached. The decline in enrollment between that year and 1896-97, which for France, excluding Algiers, was a decline from 5,545,400 pupils to 5,427,211, or 2.1 per cent, is attributed to the following causes: (1) Decrease in the school population of France (ages 6 to 13), which, as shown in Table IV, amounted to 3,145, or 0.07 per cent, between the census years 1891 and 1896; (2) rapid advance of pupils in the primary schools, with the result that the leaving certificate (*certificat d'études primaires*) is obtained at an earlier age than formerly; (3) less vigorous enforcement of the obligatory school law.¹

¹ Statistique de l'enseignement primaire (1893-97), pp. ciii, cv.

A slight advance in enrollment above that reported in 1896-97 is shown by the statistics for 1898-99 (a gain of 3,283 pupils for France, excluding Algiers).

Table III shows the relative enrollment in public as compared with private schools and in secular schools as compared with those belonging to religious orders, especially since the passage of the law of 1836. This law, as already stated, forbade the employment in public schools of teachers belonging to religious orders.

The decline in public-school enrollment became somewhat marked after 1889-90, or toward the end of the period assigned for the full secularization of the schools for boys.

A transfer of pupils has been going on from public and secular to private church schools, as appears from the following analysis of the enrollment at the beginning and end of the half decade covered by the last official report:

Classification of schools.	Enrollment.		Per cent of increase (+) or decrease (-).
	1891-92.	1893-97.	
SECULAR.			
Public:			
Boys	2,318,349	2,292,639	- 1.1
Girls	1,434,901	1,487,766	+ 3.7
Private:			
Boys	53,955	48,199	-10.7
Girls	97,772	83,202	-11.3
CLERICAL (UNDER RELIGIOUS ORDERS).			
Public:			
Boys	36,969	25,766	-30.3
Girls	490,964	384,149	-21.8
Private:			
Boys	396,576	415,943	+ 4.9
Girls	739,984	793,754	+ 8.6

The greatest falling off, it will be seen, was in public schools for boys conducted by members of religious orders. Virtually this class of schools has now disappeared. At the same time there has been a very marked decline in the corresponding class of schools for girls. The schools that have gained by the change are chiefly private schools belonging to the religious orders, though a slight gain is also noticeable in public schools for girls.

By reference to Table II, it will be seen that although there was a slight decline in the enrollment in primary schools in the decade 1893 to 1899, if the comparison be carried back to 1876 a decided increase is disclosed.

TABLE IV.—*Retrospective view of population, as shown at census dates, and ratio of enrollment in primary schools to total population.*

Year.	Total population.	Increase (+) or decrease (-).	Children between 6 and 13, inclusive.	Increase (+) or decrease (-).	Ratio to total population.	Ratio of enrollment in primary schools to total population.
		<i>Per cent.</i>		<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1876	36,905,788		4,562,566		12.2	12.78
1881	37,672,048	+2.1	4,586,349	+1.85	12.17	13.97
1886 ¹	38,218,963	+3.55	4,729,144	+5.03	12.4	14.46

1896	38,517,975	+ .79	4,636,381	+0.07	12.03	14.37

¹Algiers included for this and subsequent years.

In connection with the general subject of school enrollment the growing enrollment in infant schools (*écoles maternelles*), which it is optional with the communes to establish, deserves attention.

In the half decade 1891-92 to 1896-97 the number of pupils in these schools rose from 706,579 to 729,648, an increase of 1.3 per cent, while at the same time the population 2 to 6 years of age (period for attendance upon infant schools) declined by 1.6 per cent.

Enrollment in mixed schools.—The instruction of boys and girls in the same school is permitted only in communes having less than 500 inhabitants, all communes above that limit being obliged to provide a separate school for girls. In a letter on this subject, addressed to the Commissioner of Education, M. Levasseur says: "From 1892 to 1897 the number of mixed schools has increased but slightly. This is because the population of a number of small communes has diminished.

"Before 1886 many small communes possessed maternal schools (in which boys and girls are both admitted) and received State appropriations for the supply of the same.

"The law of 1886 suppressed the appropriation for all communes having less than 1,200 inhabitants. As a consequence, a number of communes of this class have transformed their maternal schools into an infant class annexed to their mixed schools, which has the advantage of a State appropriation. Hence it happens that many mixed schools have two classes—an infant class and a primary class—in both of which boys and girls are instructed together.

"The causes of private mixed schools are different. Among these are included many small schools in which little boys and girls (up to 12 years of age and even beyond this age) receive their instruction in common. The schools of this kind are generally found in the large cities. In Paris, for example, there are at least a dozen, perhaps more. Boys are admitted only to the lower classes."

The following statistics appended to the foregoing statement pertain solely to the mixed schools for the year 1896-97:

	Mixed schools.	
	Public.	Private.
Total number	19,961	155
Number directed by a lay master	15,534	28
Number directed by a lay mistress	5,974	415
Number directed by a religious order	483	512
Total number of classes	20,688	1,507
Total number of pupils	652,548	34,988
Boys	377,797	12,652
Girls	314,751	22,336

TABLE V.—*Distribution of pupils in separate and mixed schools.*

Class of schools.	Total enrollment.				Per cent enrolled.			
	1887.		1897.		1887.		1897.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
Public:								
Separate	2,098,458	1,661,298	1,940,608	1,557,164	83.98	82.79	83.7	83.13
Mixed	400,222	345,151	377,797	314,751	16.02	17.21	16.3	16.82
Private:								
Separate	318,302	742,302	451,490	854,620	96.31	97.47	97.27	97.45
Mixed	12,165	19,041	12,652	22,336	3.69	2.53	2.73	2.55

STATISTICAL INDICATIONS OF THE EFFICIENCY OF SCHOOLS.

Average attendance.—One of the most important indications of the actual efficiency of schools is furnished by the item of average daily attendance. Although this item is not included in the French statistics, an approximate idea of the relation of attendance to enrollment can be formed by a comparison between the

enrollment in the months of December and June, the months respectively of highest and lowest school attendance, and the number present on a selected day in each of the months named. The following tabulation presents these particulars for the latest year reported:

	Number enrolled for every 1,000 pupils belonging.	
	Public schools.	Private schools.
Month of December, 1896.....	875	911
Present December 5.....	786	851
Month of June, 1897.....	846	911
Present June 5.....	732	841

It appears from the above that the enrollment in public schools in December was 87.5 per cent of the annual enrollment, and the attendance on the day selected 89.8 per cent of the month's enrollment; the enrollment in private schools for the same month was 91.1 per cent of the annual enrollment, and the attendance 93.4 of the month's enrollment. The corresponding ratios for June were: In public schools 84.6 per cent and 83.5; in private schools 91.1 and 92.3.

Number and proportion of classes.—The increase of classes as compared with the number of schools is an index of improvement in the schools themselves, since each class has its own teacher. The situation in this respect at successive dates was as follows:

	Number of schools.	Increase in a half decade.	Number of classes.	Increase in a half decade.
1886-87.....	81,130	<i>Per cent.</i>	132,309	<i>Per cent.</i>
1891-92.....	82,533	1.7	140,656	6.8
1896-97.....	83,654	1.4	145,955	3.8

In the following tabulations comparison is made (1) between public and private schools; (2) between secular schools and schools belonging to the religious orders.

Average number of classes for every 100 schools, 1895-96.

Public schools for boys.....	175
Private schools for boys.....	301
Public schools for girls.....	173
Private schools for girls.....	258

Number of schools of each category, 1896-97.

Schools of—	Secular.	Belonging to religious orders.	Proportion upon 100 schools.	
			Secular.	Belonging to religious orders.
			<i>Per cent</i>	<i>Per cent.</i>
1 class.....	46,525	6,202	71.5	33.3
2 classes.....	11,033	6,243	17.0	33.5
3 classes.....	3,771	2,845	5.8	15.3
4 classes.....	1,524	1,344	2.3	7.2
5 classes.....	791	760	1.2	4.1
6 classes.....	614	470	.9	2.5
7 classes.....	301	327	.5	1.8
8 classes.....	483	418	.8	2.3
Total.....	65,042	18,612	100	100

The relatively higher ratio of classes in the private schools, which are chiefly schools belonging to religious orders, is due in part to location. Schools of this class are most numerous in the large cities and towns; furthermore, for every such school there is always more than one "brother" or "sister," as the case may be. There are about 30,000 nuns and 9,000 members of brotherhoods engaged in the schools, and their number can be almost indefinitely increased. They live with their respective orders, and receive not a penny of salary for their work, to which they are passionately devoted.

The higher primary schools and classes.—The total enrollment in primary schools includes the pupils in the higher primary schools and classes, in 1897, 64,658, distributed as follows:

	Public.	Private.
Classes:		
Boys.....	11,946	2,676
Girls.....	6,219	9,398
Schools:		
Boys.....	23,425	564
Girls.....	9,816	614
Total.....	51,466	13,252

For admission to the higher primary schools candidates must have attained the age of 12 years and have secured the certificate of primary studies, or must pass an examination to which none under 13 years of age are admitted. Attendance upon these schools is stimulated by a system of public scholarships (bourses). These are of three classes: "Bourses d'internat" (not to exceed \$100 per annum), which cover the cost of living in the boarding department, if the school has one; "bourses familiales" (\$100), which are in the form of an allowance for expenses at home, and bourses of support (\$20 to \$30). In 1897 the number of scholarships allowed was 1,006—viz, 626 to boys and 380 to girls.

An investigation into the subsequent career of students after leaving the higher primary schools was made in 1896, as had been done for the previous official reports of 1887 and 1892, with the following results:

	1887.	1892.	1897.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Entered into normal or technical schools.....	11.3	17.2	17.6
Entered into lycées or colleges.....	5.3	5.6	3.3
Entered as instructors in other schools.....	1.5	.1	.4
Entered into the civil service.....	3.8	3.9	3.7
Entered into military or naval service.....	2.4	1.4	1.4
Employed in railroad service.....	1.6	1.5	1.5
Employed in commercial or technical careers.....	55.8	60.0	60.0
Employed in banks, notaries public, etc.....	6.3	1.7	2.4
Scholarships secured for study in foreign countries.....6	.8
Unknown or dead.....	11.0	8.0	8.7

Teachers.—The number of teachers employed in the public and private primary schools in 1896-97 was 161,691, of whom 9,414 were in infant schools and 152,277 in the elementary and higher primary schools.

Table VI shows the number and classification of the primary-school teachers (infant schools omitted) for specified years during a period of six decades. Table VII shows the relative proportion of secular teachers and those belonging to religious orders at the dates of the last three official reports.

RETROSPECTIVE TABLE VI.—Number and classification of teachers of primary schools at specified dates.

Year.	Total number teachers.	Men.	Women.	Men and women.

Of the teachers employed in the public schools, 97 per cent on a total of 105,774 were possessed of diplomas and 43 per cent of the highest diploma (certificat d'aptitude pédagogique). The proportion of certificated teachers in the private schools was 87 per cent on a total of 46,503.

The remarkable progress made by France in securing trained teachers for its public schools is due in great measure to the liberal provision of normal schools and the high standard at which these are maintained. Every department has complied with the law requiring the establishment of two normal schools, one for men and the other for women, or has been authorized to combine with another department for this purpose. The State shows its solicitude in this matter by the maintenance of two superior normal schools, one for men at St. Cloud, the other for women at Fontenay-aux-Roses, in which professors are trained for the primary normals. These two superior schools are really post-graduate institutions, requiring for admission either the higher diploma of pedagogy or a bachelor's degree.

The following statistics show the relative status of the primary normal schools at the beginning and end of the last half decade reported:

	Number of schools.	Number of students.	Number of officers and teachers.
1891-92.			
Normal schools for men	87	3,878	890
Normal schools for women	85	3,707	711
1896-97.			
Normal schools for men	87	3,865	897
Normal schools for women	85	3,871	852

The total number of graduates during the half decade 1893 to 1897 was, from the schools for men, 7,189; from the schools for women, 5,615. The corresponding numbers for the half decade 1893 to 1897 were, men, 6,199; women, 6,189. Total for the decade, 25,142, or an average of 2,514 annually.

Expenditure.—The total expenditure for primary education in 1896-97 amounted to 214,015,250 francs (\$42,803,050). This sum includes expenditure for primary normal schools and for infant schools, the current expenditure for the primary schools proper (elementary and superior) not being separately presented. On the basis of this total the expenditure per capita of enrollment in public primary schools (viz, 4,642,609, infant schools included), says M. Levasseur, is found to be 46 francs (\$9.20). It is difficult to institute comparisons on this basis, because of changes in the financial administration since 1890, but this the statistician has attempted with results that are shown in the following table. These results, he explains, are not exactly comparable, but they establish beyond doubt the fact of steady increase in the per capita expenditure for the public primary education.

These estimates do not include the payment of interest on the moneys advanced for school buildings. If this item were included in the estimate for 1896-97, it would raise the per capita expenditure to 56 francs (\$11.20).

The expenditure for private primary schools¹ is not known, but on the supposition that it is relatively the same as for the public schools, the total annual expenditure for primary education is estimated by M. Levasseur as 293,000,000

¹According to a recent estimate, 60,000,000 francs (\$12,000,000) are annually raised for the church schools. All Catholics, even the humblest and poorest, cooperate in the work. The money "is chiefly raised by what is called 'The Sou of Christian Schools,' a widespread inter-diocesan guild whose headquarters are in Paris. This guild enrolls most of the devout Catholics of France and binds them to a share in the good work. Some undertake to give a sou a week, some a sou a day, some more."

francs (\$58,600,000), not including rentals, and including rentals, 350,000,000 francs (\$70,000,000).

MOVEMENT FOR PROLONGING THE EDUCATION OF THE PEOPLE.

The obligatory period of primary instruction extends from the sixth to the thirteenth year, but a child who passes the examination for the certificate of primary studies is exempt from the obligation to attend school. Candidates may be admitted to this examination at 11 years of age, and in fact a large proportion of those who seek the certificate do so at that early age. Hence the very means taken to increase the interest of pupils tends to shorten their school term. The majority of the children leave school at an earlier age than 13, and even for those who pass the whole obligatory period in school the wholesome restraints of instruction and constant supervision are too soon removed. It is also true in France, as in other countries, that elementary instruction, by its natural limitations, does not leave the same lasting effect upon the character or furnish the same intellectual resources as higher education.

The condition of the young people of the laboring classes thrown upon the world with meager attainments and without preparation for any particular industry has long excited the serious attention of the Government and of public-spirited, earnest men and women throughout the country. The recent vigorous movement for extending the provision for adult education is the outcome of this solicitude. The Government has given substantial aid to the cause, and in 1895 ordered a special investigation, with a view to obtaining complete information as to the status of the work and to determining the means for extending and improving it. This commission was intrusted to M. Édouard Petit, a professor in one of the Paris lycées and an indefatigable promoter of the cause of adult education. He found teachers and professors everywhere alive to the importance of the effort and ready to give their aid in establishing and maintaining classes. Numerous private societies entered into the work with great spirit, and in 1895 the Havre "Society for Instruction by Objects" (enseignement par l'aspect) celebrated its fifteenth anniversary by calling a congress of all the societies engaged in promoting popular

education to consider the subject of the systematic instruction of adults and adolescents. The minister of public instruction presided over the congress, and the resolutions of this body have shaped in a measure the subsequent official regulations. These schools and classes, which are held generally in the evening, sometimes on Sunday, offer courses of instruction for illiterates, review courses, and continuation courses. The last named have usually a technical or industrial character and prepare the student, especially in the rural communities, for agriculture and other pursuits. The local adaptation of the courses is carefully studied, and also their relation to the age and economic condition of the students. Civic instruction has a large place in the programmes, and the subject is much more thoroughly treated than is possible in the primary schools. The students in general show deep and earnest appreciation of the opportunities thus afforded. The growth of the work is shown by the following statistics:

Year.	Number of courses of lectures.			Number of attendants registered.	Number of regular attendants.		
	For men.	For women.	Total.		Men.	Women.	Total.
1895-96.....	13,920	1,808	15,728	400,000	270,560
1896-97.....	20,039	4,429	24,528	709,000	340,926	68,555	403,481
1897-98.....	22,939	7,429	30,368	850,000	378,196	104,711	482,907
1900.....	38,291	540,000

Various efforts for promoting the social well-being of young people have grown out of this movement for their continued education. Among these are the formation of mutual aid associations and of friendly societies (*petits amis*). The former increased from 10 associations in 1896 to 1,600 in 1900. They included 12,000 schools and 450,000 young members.

The friendly associations increased from 56 in 1889 to 4,784 in 1900, having 234,958 members and disposing of funds to the amount of 900,000 francs (\$180,000).

THE ORGANIZATION OF THE STATE-TEACHING SYSTEM (UNIVERSITY OF FRANCE) AND THE INSPECTORATE FOR PRIMARY SCHOOLS.

Public education in France forms a department of public affairs, under the direction of a cabinet officer, the minister of public instruction and fine arts (present incumbent, M. Georges Leygues).

The control of the minister is exercised through a graded series of appointed officials belonging to the central administration or to the academies (17 in number, including 1 in Algiers), which are the local subdivisions of the system. Public instruction is a State service, professors and teachers constituting a professional order whose qualifications, duties, privileges, honors, emoluments, and penalties are as rigidly fixed by law as those of other branches of the civil or those of the military service.

To the central administration belong the superior council of public instruction, the chiefs or directors of the three scholastic departments (superior, secondary, primary), the corps of general inspectors, and a large body of clerks or assistants.

The functions of the superior council (council of the Imperial University, 1808, transformed and liberalized) are advisory and in some cases disciplinary and judicial. This council consists of 60 members, one-fourth appointed by the President of the Republic and the remainder elected by their colleagues (professors and teachers), the term of service being four years. General inspectors—10 for secondary and a large number for primary instruction—are sent annually from Paris to investigate and report upon the condition of colleges and schools in their respective jurisdictions (service dating from 1808, extended to primary instruction, 1846).

The centralized power is reinforced by the peculiar organization of the system. It consists of 17 academies or scholastic subdivisions, each comprising a university and classical college and its quota of primary schools (after the general plan of the Imperial University created in 1808). At the head of each academy is a rector, an official of great dignity, appointed by the President of the Republic. He is assisted by a council of university professors, of whom four are his own nominees. The control of the rector extends nominally to all three grades of education, but here we consider exclusively his relation to primary education. In this province he is virtually represented by the academy inspector, excepting as regards the departmental normal schools. On the scholastic side the normal schools are under the rector's mediate direction. The financial affairs of the normal schools pertain exclusively to the academic inspector. This official is appointed by the minister of public instruction, generally from the corps of secondary professors

or of primary inspectors; in any case he must have had extended experience in teaching or have secured a university degree. The importance of the service was emphasized in the educational exhibit of the Paris Exposition (1900) by a special monograph on the subject, prepared by the director of primary instruction, M. Bayet. In summing up the duties and the influence of the academy inspectors, M. Bayet says:

Upon them falls the task of applying the laws, decrees, and regulations which have made primary education compulsory, gratuitous, and strictly secular, reformed the programmes, and assigned the principal place to moral and civic instruction. It is their duty to explain the spirit of these regulations to the teachers under their charge, to guide them by their counsels, to sustain their courage, to save them from failures. They must also see to it that the schools are properly installed: they must excite the local ambition, keep in touch with the local authorities, with the elected councils, and the principal citizens in order to draw to the schools the current of sympathies necessary for their support and development. * * * The academic inspectors have fulfilled their obligations with remarkable success. They have put their minds and their hearts into the work. This is the unanimous testimony of the rectors, of the inspector general, and of all who are in a position to observe its progress.

But the academy inspector has a wider province than elementary education; his supervision extends also, though in a subordinate sense, to secondary institutions.

This double action offers, says M. Bayet, the great advantage of unifying the direction of institutions which, although engaged in imparting instruction differing in degree and in the sanctions which are attached to them, have as their common purpose national education. The academy inspector is thus the bond of union between functionaries who, without him, would remain isolated from each other.

The true unit of primary-school administration in France is the department—a civil district which for educational purposes is treated as a subdivision of an academy. France (including Algiers) comprises 90 departments, which are unequally distributed among the 17 academies. Chambéry, the smallest academy, comprises 2 departments; Paris, the largest academy, 9. The departments also vary in extent and in population. The smallest has 88,000 inhabitants; the largest (Seine), three and a half millions; but, large or small, their adoption as units of administration has saved France from the ills of petty, autonomous school districts.

The departmental administration includes two normal schools (one for men and one for women) and the several classes of primary schools.

The civil head of every department and the head also of its school affairs is the prefect, appointed by the President of the Republic, and the only political official in the long series of those who pertain to the State teaching service. Around his prerogatives—especially the most important prerogative of appointing teachers—is waged a perpetual conflict, but so far only with the result of limiting his power by the advisory functions of the academy inspector and of a professional council. This departmental council of public instruction, which must be distinguished from the general council of the department, comprises 14 members (the department of the Seine has more), including 4 members from the civil council elected by their colleagues, 2 primary inspectors designated by the minister, the directors of the two normal schools, and 4 teachers (2 men and 2 women) elected by their colleagues, and when matters are under discussion affecting private schools, 2 members representing the same, one clerical, the other, lay. Of this council the prefect is president and the academy inspector vice-president. The term of service is three years, and the members receive no salary, but are allowed traveling expenses.

The council meets four times a year, and special sessions may be called by the prefect.

The functions of the council are educational, administrative, and judicial.

It supervises the carrying out of courses of study and general regulations prescribed by the superior council, including the arrangements for the medical super-

vision of schools; deliberates on all propositions touching reforms, new departures, the financial needs of the schools, the distribution and location of schools, authorization of private schools, the authorization of foreigners to teach; in short, upon all questions touching the scholastic or business interests of primary education.

Its disciplinary powers over teachers are very great, extending to a complete prohibition to teach in any school. The teacher has, however, the right of appeal to the superior council of public instruction.

The academy inspector submits most of the propositions upon which the decisions of the council and the executive orders of the prefect are based.

It will readily be understood that the academy inspector, both from the prestige of his position and his wide experience, is in general the controlling spirit in the administration. Besides his routine duties, the inspector must also be watchful as to the carrying out of the essential principles of the school laws—the principle of compulsion, of free tuition, of exclusively secular instruction, of an exclusively lay personnel in the public schools. Obviously he has no time to look into the work of individual schools. This is the duty of primary inspectors, who are chosen from the élite of the teachers by a rigid examination, appointed by the minister of public instruction in the proportion of one to a hundred and fifty schools (the ideal proportion is assumed as one to a hundred schools), and who receive instructions only from the academy inspector, the rector, the general inspectors, or the minister.

The duties of these inspectors are distinctly defined. They must approve the sites selected and the buildings erected for schools, attend to the carrying out of orders relative to the opening of private schools, auxiliary public schools and classes (for adults, manual apprenticeship, etc.), authorize the transfer of pupils from one grade of school to another, approve time tables, receive the reports as to delinquent pupils, participate in the proceedings of all local school committees, conduct the examinations of pupils for the "certificat d'études," take part in the examination of candidates for the departmental normal schools and for teachers' diplomas, and convene the teachers of their respective districts for instruction and conference (meetings corresponding to teachers' institutes in our own country).

This service, like that of the academy inspectorate, was made the subject of a special monograph prepared for the Paris Exposition by M. Bayet.

After tracing briefly the development of the service and stating the conditions imposed upon candidates by the law of 1886, he leaves the incumbents to speak for themselves by copious extracts from their own reports. These reveal complete familiarity with the work of the schools and great power of discriminating criticism. As to the general efficiency of this branch of the inspection, M. Bayet contents himself with heartily reaffirming the following opinion expressed by Jules Ferry in 1881:

During the half century that this institution has existed with us it has proved its value, and the services it has rendered are such that one can say it has no longer any adversaries. Organized at first very feebly as a sort of benevolent and temporary committee of the *arrondissement* councils, long condemned to feel its way slowly and to recruit its ranks with volunteers who were more remarkable for their good will than their competence, the primary inspectorate has won for itself by the force of circumstances, or rather by its own merit, the important place it occupies in our school organization.

Other countries have been able to surpass us in the perfection of their equipment and methods, but none, perhaps, has so speedily and resolutely linked the destinies of its national education to the homogeneous composition and incessant activity of an official body of professional inspectors.

To-day, when the primary inspector is necessarily recruited from among the élite of the teaching body and appointed on the results of competition in professional knowledge, the standard of which has recently been once more raised, he is one of the functionaries of State whose authority in its modest limits is the best established and the readiest accepted.

The examination for primary inspectors.—Candidates for admission to the examination for the certificate of fitness for the primary inspectorate must be at least

25 years of age, must have diplomas showing satisfactory attainments, and must have taught at least five years in public schools.

The examination, which is the same also for directors of normal schools, is both written and oral, including a practical test. The written part is conducted simultaneously in the chief places of the several departments, the subjects being the same for all. Those who pass this division repair to Paris for the oral part, which is conducted by a special board. This oral division includes pedagogy, school law, and school management. Each candidate is asked to explain orally a passage from some one of the prescribed authors. The following is the list of subjects for the composition in pedagogics for 1900:

First session. What is the meaning, as regards primary education, of the phrase *préparer sa classe* (prepare the lessons beforehand)? How will you impress upon teachers who have had several years' experience of teaching that it is necessary to prepare the work for one's class all one's life long?

The following is the subject set for the composition in school administration for the same period:

First session. The higher primary schools: their general organization and staff. [Candidates should avoid discussing details in the programme.]

For 1898-1900 the authors set included, among others, Fénelon, J. J. Rousseau, Condorcet, Émile Boutroux, F. Buisson, and Horace Mann. For 1901-1903 the extracts are taken from the works of Montaigne, Rousseau, Channing, Michelet, Bain, Pécaut, and Jules Ferry. It is worth noting the large use made of English and American writers on education and the absence of any German books on the subject.

The following are a few specimens of the questions in pedagogy:

1. In a pedagogical conference, set forth the principal reasons why the school attendance has been defective, and indicate to the teachers what they can do, without having recourse to the school commission (local committees), to improve it.
2. Discipline. How do you understand its application to the pupils of all ages in your primary schools?
3. How, in your opinion, can a teacher in his commune extend his educational influence outside of and beyond the school?
4. How would you regulate the use of monitors in the elementary school?

Specimens of questions on school law and administration:

1. The functions and rôle of the inspector of primary education in the matter of examinations.
2. Right of opposition to the opening of private schools. Closing of the schools.
3. Class books, prizes, and supply of school material.

The primary inspectors are divided into five classes. For promotion from a lower to a higher class, an inspector must have served three years in the former and be on the list of eligibles prepared by the academy inspector.

The annual salaries are 3,000 francs in the lowest class, with an increase of 500 francs for each class up to the maximum of 5,000. These salaries are paid by the State. The inspectors are also allotted so many traveling days' expenses at the rate of 10 francs a day, according to the size of their respective circonscriptions, and finally the department allows them a minimum indemnity of 300 francs. [In Seine the inspectors are paid on a higher scale.]

The inspection of infant schools (*écoles maternelles*) is confided to departmental inspectresses, who are also selected by rigid examination.

The medical inspection of primary schools is intrusted to physicians designated by the municipal councils.

Communal supervision.—The mayor and civil councilors of every commune (city or rural) have the right to inspect the local schools in respect to the condition of school buildings, furniture, and supplies, the health and conduct of pupils; but they have no authority to touch on the course of study or the methods of instruction.

There is also a school committee (commission scolaire) in each commune, which supervises and encourages school attendance. In Paris and Lyons there is a local committee for each municipal arrondissement.

The academy inspector and the municipal or communal council have the appointment of the members of the committee, the mayor being always president and the primary inspector one of the members.

SECONDARY EDUCATION.

To the department of secondary instruction (director, M. Rabier) belong the lycées, or state classical colleges, for boys, the state lycées for girls, and the communal colleges, established by the communal or local authorities and aided by the State. In 1899 the lycées for boys numbered 109 and enrolled 52,708 pupils. The communal colleges numbered 227, with an enrollment of 32,891. This gives a total of 85,599 boys in the public secondary schools. The church secondary schools for boys enrolled the same year 91,825 pupils (of these, 23,000 in the petits séminaires for students intending to enter the priesthood), and private secular secondary establishments for boys 10,182.

The public lycées and colleges for girls had an enrollment the same year of 11,402 students, and there were also 3,909 girls pursuing courses of secondary instruction in classes under public auspices. The attendance upon convent and private secondary schools for girls is not known.

The professors of secondary instruction (public) are appointed by the minister of public instruction. Their salaries, like those of the professors of superior instruction, are paid by the State, and they are also borne on the pension list.

The public secondary schools of France (lycées and communal colleges) provide a complete course of education distinct from that given in the primary schools. The latter prepare the children of the working classes for citizenship and for the intelligent pursuit of their humble avocations; the former impart that liberal education leading to the bachelor's degree, which is necessary for admission to the specialized courses of the universities and professional schools and also for entrance upon the public service.

The lycée is the typical secondary school; the local colleges have the same curriculum, so far as circumstances permit; often students pass from a college to a lycée for the completion of their studies.

The following statistics present a comparative view of the enrollment and distribution of secondary students for a period of twelve years.

Enrollment in secondary schools for boys.

The classification of students in the lycées and colleges in 1899 was as follows:¹

	Total enrollment.	Classical course.	Modern course.	Special mathematics.	Preparatory division.
Lycées	51,997	20,032	14,489	4,783	12,688
Communal colleges	32,784	9,242	13,541	749	9,292

Proportion of total students in each division.

	Classical course.	Modern course, including special mathematics.	Preparatory course.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Lycées	45	31	24
Communal colleges	28	44	28

From the foregoing table it will be seen that the independent or non-State schools, including the "petits séminaires," enroll the larger proportion of the students in secondary education. The Government has long viewed with alarm the growing influence of the church schools in this important field, and this solicitude, together with a widespread demand for a reform in the curriculum and organization of the State schools, has brought on what is called in France "the crisis of secondary education." The serious intention of the Government in respect to this matter has been shown by legislative action looking first to the reform of the public secondary schools, and second to the repression of anti-Republican tendencies in the independent schools.

In pursuance of the former purpose a commission was appointed in 1898 by the Chamber of Deputies to investigate the whole subject of secondary education and to suggest needed reforms.²

The conclusions of this committee have formed the basis of a measure elaborated by the minister of public instruction in advice with the superior council of public instruction, and the project now awaits legislative action.

The proposal³ deals with both sides of the secondary establishments—the domestic (internat) and the educational. The domestic régime has long been unsatisfactory from every point of view. One of the chief reasons for the falling off in the patronage of the State schools is alleged to be the scanty comforts enjoyed by the boarding pupils of the lycées, who are in the great majority. The food and lodging are poor, and the inmates have less freedom than soldiers in a barrack. The professors do not reside in the establishment, are present only during class time, and have no influence in forming the habits and character of the students. The latter are under the espionage of the répétiteurs (house tutors), who are generally despised because of their disciplinary functions, and are thus prevented from exercising any wholesome influence over the young men whose studies they partially direct.

In all these respects the lycées are inferior to the independent schools, church and private, which not only provide for their boarding pupils better living conditions, but also the certainty of constant intercourse with devoted, high-minded teachers. Under these circumstances many eminent men have urged that the State should withdraw from the direct administration of the lycées, retaining only control over the scholastic work and the teaching staff. This suggestion is evidently not practicable at present, but the conditions which have caused it explain

¹ Enrollment here given excludes day pupils.

² See Commissioner's Report, vol. 1, chap. 21, pp. 1107-1138.

³ See Bulletin Administratif, February 1, 1902, pp. 97-109.

the tenor of the new provisions touching the "internat" or domestic régime of the schools. The broad lines of reform in this respect as laid down by the minister are: Financial separation of the educational and domestic sides of the lycée, the latter to be self-supporting; increase of the dignities, qualifications, and responsibilities of the principals (provisseurs); professors to be brought into closer relation with the life of the students; the position of répétiteurs to be improved, their work as teachers elevated, and their disciplinary functions transferred to other officials; hygienic requirements to be strictly enforced; physical education to be seriously organized, with recognition either in the leaving examination or in the regulations for military service; recreation rooms and libraries for masters and pupils to be established in all lycées. All these provisions so far as they are applicable are extended also to the local (communal) colleges.

Important as are the changes contemplated in the domestic régime of the lycées, they are of less general interest than those relative to the curriculum and to the diploma, which is the goal of secondary studies. As regards the studies it is proposed that they be grouped in two cycles, one comprising four years, the other three years. This plan, the minister admits, is not well suited to Greek and Latin, which branches, in particular the latter, have heretofore been chiefly considered. The mere suggestion of the change indicates the importance which other branches have recently assumed. "By this division into cycles," says the minister, "it will be possible for the pupil who leaves the lycée at the close of the fourth class (troisième) to acquire more than mere beginnings and to carry with him a fund of knowledge which, though limited, may be complete and useful. For a certain proportion of the students this is greatly to be desired. A standard will thus be set for those who are pressed by the necessities of life, and for those who have no taste for study, who follow the course against their will and are a dead weight upon their classes." In the first cycle choice may be made between a classical and a nonclassical course. The classical programme will include morals, civics, French, Latin, one modern language, history, geography, the elements of mathematics, and drawing. Latin is to be taught in three graduated courses of a year each, and as far as possible without change of teachers during the three years. Greek, which is optional, is to begin the third year. The nonclassical programme includes for the first cycle morals and civics, French, one modern language, history, geography, the elements of science and drawing. To these subjects will be added optional courses, commercial, industrial, or agricultural, according to local demands.

At the end of the first cycle a certificate of studies will be conferred upon those who, by their daily records and the testimony of the professors, are found to deserve it. For those who leave the lycée at this stage the certificate will be valuable, and for those who remain it will have weight in their candidacy for the bachelor's degree which is the goal of the complete programme. From the choice of studies allowed in the first cycle, it will follow that three classes of students will present themselves for the second or three years' cycle—those who have studied both Latin and Greek, those who have studied Latin but no Greek, and those who have studied neither Latin nor Greek. The first class will naturally push their classical studies as far as possible. The second class will give their attention chiefly to the sciences and the modern languages, in which subjects the third class will be united with them. The duration of studies will be the same for all three classes, and all will lead alike to the bachelor's degree. The diploma will have the same value in all classes, but will mention the course which the candidate has pursued. It is evident, however, that this single diploma will not represent identical possibilities in all cases. For example, the student who has not taken Greek can not become a candidate for the licence-ès-lettres.

The new measure eliminates the modern course of the lyc e, which is shorter by two years than the classical course, but leads like that to a bachelor's degree. Provision is made, however, for a new section, based upon the nonclassical division of the lower cycle. Like that division, the new division is intended particularly for students who seek a preparation for active business. It will comprise a short specialized course in the living languages and in the sciences considered in respect to their practical applications. This course will be established only where it is demanded and with special adjustments to local industries. Students who finish this course will be tested by final examination, which will entitle them to a certificate, having nothing, however, in common with the baccalaureate.

The above summary shows in brief the solution which the educational officials present of the complex problem of secondary education.

Outside the university circle the project is seriously criticised, especially because of the reduction of the lyc e course from eight to seven years and the endeavor to burden the lyc e with specialties which are, even in the project, stamped as foreign to the purpose and spirit of liberal education.

For a clear understanding of the changes proposed, the new scheme sketched above should be compared with the existing scheme of the lyc e courses, as presented in the tabular view appended to this article.

The purpose of the Government to suppress adverse influences in the domain of secondary education is shown by the passage of a law (the Law of Associations, July 1, 1901) determining the conditions under which associations may acquire the legal right to exist and to work in France.

Although the law deals with all associations, secular and religious, its avowed intent was to bring the religious orders into subordination to the civil authority, of which they had been hitherto entirely independent. It would be out of place here to consider either the general scope of the law, the political and social conditions which have led to its passage, or the agitations which it has excited. It must suffice to state simply the conditions which are imposed upon the religious orders and the probable effect upon their educational work. The law requires that every association shall publish, through its founders, its title and object, the place of its establishment, and the names, professions, and domicile of those who are in any way concerned with its administration or management. These declarations must be made at the prefecture of a department or the subprefecture of a district. Any changes in the administration or modification in the statutes must also be reported within three months.

Three months was the limit of time allowed for associations to comply with all the conditions. At the expiration of the time those associations that had not sought authorization were to be declared illegal and dissolved. In such cases the property belonging to members of an association before its formation, or since acquired by them by succession, should be restored. The property acquired gratuitously and not specially assigned by a deed of gift to a work of charity may be reclaimed by the donor, his heirs or assigns. After a delay of six months all property that has not been claimed or devoted to some work of charity shall be liquidated, and the sum realized set apart to be used by the public liquidator according to the regulation of public administration of the law.

Later regulations defining the methods by which the law should be enforced placed the responsibility of the authorization and subsequent surveillance of the religious orders upon the respective diocesan bishops, thus subordinating to the ordinary church authorities those bodies which had hitherto claimed canonical exemption. The number of orders affected by the law is estimated at 1,663, of which 152 are for men and 1,511 for women. They comprise about 16,500 establishments; of these a little above 5,000 have applied for authorization. The members of the remaining 11,327 establishments have been dispersed, the greater part

having gone into other countries to prosecute their work. A very large proportion of these establishments maintain schools, but some are wholly devoted to missionary propaganda and works of charity. In some cases the educational work has been transferred to other hands and will be continued without violation of the law, but a large proportion of teaching establishments are closed.

Until an official inquiry has been made the actual effect upon education can only be conjectured. By reference to statistics already given it appears that nearly one-half the secondary classical instruction of the country and above one-third of the primary instruction was in charge of brotherhoods and sisterhoods when the law was passed.

Organization of the lycée classical course.

¹ From Lycées and Colleges for Young Women, by M. Camille Sée (author of the law of 1880), edition for the Exposition of 1900.

The teaching staff of the lycées and colleges in 1899 comprised 687 professors and assistants. The financial review presented by M. Camille Sée, in his history of the measure providing higher education for women, shows that the State advanced the sum of 33,409,437 francs (\$6,681,887) from 1891 to 1898 for building purposes. These advances are to be met by the cities and towns in which the lycées are situated.

The total receipts of the lycées and colleges, exclusive of the boarding departments, amounted in 1898 to 3,764,354 francs, of which the State furnished 70 per cent, tuition fees 27 per cent, and local authorities the balance.

HIGHER EDUCATION.

To the department of higher education (Director M. Liard) belong the universities and the special schools of university rank which are under the minister of education.¹ Paris is the seat of these special schools, and also of the principal university. Under the law of 1896, 15 of the former faculty groups have been organized into independent universities. They registered 29,377 students in 1900, an increase of 11,772, 68 per cent above the number enrolled in the faculties in 1888.

The professors of the State universities are appointed by the President of the Republic in advice with the minister of public instruction. The choice is made from two lists, one furnished by the university council, the other by the superior council of public instruction. The salaries of professors are paid by the State, and they have a right to a pension.

Statistics of State universities.

Medicine:				
Doctor				1,099
Health officer				67
Dental surgery				35
Certificate of midwifery				242
Pharmacy:				
Diploma				611
Herbalist				247

The total of 13,731 diplomas conferred in 1897-98, as shown in the above table, includes 72 conferred upon women. These were distributed as follows: Law, licentiate, 1; sciences, bachelor, 1, licentiate, 15; letters, bachelor, 26, licentiate, 3; medicine, doctorates, 16, certificates, 8; pharmacy, certificates, 2.

The recent history of higher education in France is concerned mainly with the outcome of the measures reorganizing the universities.

While preserving the organic unity of the State system, technically called the University of France, these measures have restored in part the independence which belonged to the old universities of France. After the decree of suppression issued by the convention in 1793, higher education was relegated to isolated special schools. In the Imperial University, created in 1808, letters and science and the learned professions were represented by faculties which were scarcely more than examining bodies. "Napoleon," says M. Bréal, "whose conceptions assumed inevitably a hierarchical and administrative form, would probably never have created faculties of letters and of science, but that it was necessary to have some one to confer diplomas."

The policy proved disastrous to the interests of higher education. Even the Sorbonne, which alone preserved in some measure the unity and philosophic spirit of university work, could not resist the paralyzing influence.

After the fall of Napoleon the spirit of culture revived, but the harassed and impoverished condition of the country prevented practical reforms. As late as 1875 the condition of higher education was still deplorable. In a speech made in the Senate that year Paul Bert dwelt upon the miserable equipment and inefficient organization of the faculties:

We have in France [he says] 43 faculties of diverse orders; they are distributed in 15 or 16 cities and they comprise each four or five professors charged to cover the whole domain of the sciences and of letters. In the science courses there is scarcely a single student and few in those of letters. The professional faculties alone have followers and are inspired by the presence of interested hearers. The other faculties have no hold upon the students; they have scarcely any relation with them; they have no interest in the increase of their number, and therefore in encouraging their attendance. The faculties are isolated. No common purposes can be developed among the professors of the faculties of letters and of the sciences.

In France, save at Paris, in France, in the country of Burnouf, there is not a chair of philology; in the country of Champollion there is not a chair of epigraphy or of archaeology; in the country of Cuvier there is not a chair of paleontology.

If we consider not the organization only, but the spirit of the instruction, we find even a worse state. As a consequence of the incessant surveillance of officials every new doctrine, every original idea is prescribed.

From this barren state the faculties have been raised to organized and vigorous life. The work was begun by increasing the State appropriations, which were until recently the only dependence of higher education. Within two decades their

amount was doubled, rising from \$1,157,773 in 1870 to \$2,797,071 in 1889, to \$3,000,000 in 1900. Buildings have been erected on which the States and cities have spent about \$3,000,000. In 1885 two important decrees were issued. The one authorized the faculties to hold property, receive gifts, and manage their own estates; the other began the work of internal organization by the constitution of a general council in each group of faculties having control of their common interests, and a council of each individual faculty charged with special interests. These measures culminated in the law of 1890, which gave legal sanction and permanency to the changes already accomplished.

Article I of the law declares that "the universities are public establishments of higher education, whose purpose is instruction and culture by all the sciences (*l'ensemble des sciences*)." "They are civil personalities." They are named from the cities in which they are located. Article II defines the scope of a university: "A university must comprise at least the four faculties of law, medicine, sciences, and letters; other establishments of superior instruction may also be incorporated with it at the instance of the minister." Under this law fifteen of the faculty groups have already been transformed into universities having the measure of independence that is compatible with the unity of the State system. The rulings of the university council are subject to the approval of the minister of public instruction. The intermediary between the minister and the university is the rector, whom the former appoints.

The present sources of income for the universities are gifts and bequests of private individuals, societies, and local administrators, fees, and state appropriations. The control of gifts and legacies is vested in the council of the universities. The receipts from tuition fees and the state appropriations are managed as heretofore—by special agents appointed by the minister of finance. The report of these operations must be submitted each year as a part of the report of the expenditures of the department of public instruction.

It should be noted also that every organization whose contributions to the support of the university are accepted may be represented in the sessions of the university councils in which the financial affairs and the annual reports upon the state of instruction are discussed. Cities may be represented by their mayors, departments by the presidents of their councils, etc. Thus the sense of a common interest and responsibility is stimulated.

The following details relative to the development of the reorganized universities are drawn from the report of the chairman of the financial committee of the chamber of deputies (M. Perreau), 1901:

The faculties of medicine have been provided with physical, chemical, and bacteriological laboratories. In the faculties of law the introduction of studies relating to historic, political, and economic sciences has greatly enlarged the views of students, who were formerly too much absorbed in the mere mastery of prescribed texts. The faculties of science have had still greater development as regards both curriculum and laboratory equipments.

Thus (says M. Perreau) has been realized the saying of Virchow, that "the end of higher education is the acquisition of general culture with the addition of a particular specialty." The growth has not been at the expense of practical education. This has simply become more scientific. The faculties of all orders have not ceased to be professional schools while becoming, in the true sense of the word, scientific schools. Indeed, since the organization of local (regional) universities, it seems that the relation between science and practice in the domain of higher education has become more intimate and constant. Everywhere, beside theoretic instruction of the most elevated order, has been established instruction in the applications of science.

Invested with civil personality and endowed with financial autonomy, the universities have created institutes, courses, and laboratories for instruction in industrial and agricultural chemistry, applied mechanics, electricity, bacteriology, and for analysis, experiments, and research under the direction of distinguished mas-

ters. They have attracted a new clientèle which does not disdain either the special certificates (certificats d'études) nor the technical diplomas which are much appreciated in industry.

The following are cited by M. Perreau as notable examples of this development:

At Lyon, where there is already a flourishing school of industrial chemistry, the university is about to found a school of tannery.

"The foundation of this school," writes the secretary, "marks a forward step in the university. It has not been taken solely with reference to the interests of the immediate neighborhood, but with reference also to the general interests of the tannery industry in France. The creation of the school was determined and in a measure supported by the general syndicate of the industry of hides and leathers in France.

"The founders have had in view not simply a technical school, but an institute of higher education of a special order intended to form directors of tannery works able to conduct and to perfect the fabrication of leather. Besides instruction in general chemistry, which they share in common with the students in the school of industrial chemistry, the students of the tannery school follow during their two years' attendance a special course directed to the end which they have in view. This course includes chemistry as applied to tannery, natural history, the technology of hides and leathers, and the approved methods of analysis applied to the materials and the products of this particular industry.

"As it is organized this school will soon rival, it is believed, the old and prosperous schools at Freiburg, Saxony, and Leeds, England."

In another order of ideas (continues M. Perreau) the University of Lyon has just opened a school for notaries, in which civil and commercial law are studied in their special relations to the functions of a notary, acts of registration, and stamp duties. To this instruction are added practical lectures upon particular cases, legal documents, etc.

In 1889 the University of Nancy, by the aid of local appropriations, founded a chemical institute for instruction in the theory and applications of the different branches of chemistry. The number of students, which at the opening of the school was only 11, had risen to 29 in 1895 and to 94 in 1900. All these students have either entered into industry or are intending to do so. In 1892 the same university added to the technical institute a laboratory of brewery, which soon developed into a veritable school. Its purpose is to impart the scientific knowledge necessary for conducting a brewery either as a technical expert, chief, or foreman. Besides the theoretic instruction, practical studies of the processes of the manufacture have a large place in the programme of the school. Each year the school receives about 30 students—sons of brewers, or foremen in breweries—and it renders invaluable service to this branch of French industry. Before the school was founded, young Frenchmen of the eastern departments were obliged to go to Germany for their scientific and technical training, and it was to Germany also that the brewers looked for the directions and processes applicable to their industry. Now they look to Nancy, and the opposition which the school at first encountered has given way to the most absolute confidence.

The University of Nancy also founded in 1899 new laboratories of physical chemistry, of electrical chemistry, of dyeing, of printing, and of electricity. Through the successful efforts of two learned professors, M. Bichat, dean of the faculty of science, and M. Haller, director of the chemical institute, funds to the amount of 300,000 francs (\$60,000) for the construction and equipment of certain of these laboratories were obtained from the neighboring manufacturers.

The University of Dijon contemplates the creation of an institute of wine making and grape culture, as well as a complete commercial course, including scientific and legal branches. * * * In giving their instruction a more scientific tendency (says M. Perreau) the faculties have not ceased to be truly professional bodies. They do not, however, rest content with being sources of science; they have become, in addition, sources of wealth, and the efforts which the public authorities have made in their interests have resulted in increasing the renown of France and the prosperity of the national industry.

M. Perreau closes this survey with a list of institutes, laboratories, and other technical or industrial establishments attached to the faculties and universities, which is here reproduced:

University of Paris.—(Faculty of sciences) School of applied chemistry (rue Michelst). Three laboratories of maritime zoology, viz: Laboratory Arago at Banyuls-sur-Mer (Pyrénées Orientales); laboratory at Roscoff (Finistère); laboratory of maritime zoology at Wimereux (Pas-de-Calais) pertaining to the chair of the evo-

lution of organized beings, founded by the city of Paris, auxiliary to the faculty of sciences; archaeological museum of the University of Paris (at the Sorbonne, faculty of letters); colonial and geographic museum.

University of Aix-Marseille.—Laboratory of maritime zoology at Endoume (near Marseille), attached to the faculty of sciences. Colonial Institute at Marseille, faculty of sciences.

University of Besançon.—Experimental station, faculty of sciences.

University of Bordeaux.—Faculty of sciences, two laboratories, viz: Laboratory of agricultural and of industrial chemistry; laboratory of industrial electricity; archaeological museum (faculty of letters).

University of Caen.—Laboratory of maritime zoology, Luc-sur-mer (faculty of sciences).

University of Clermont.—Laboratory recently established at Besse (Puy-de-Dôme) for the study of the flora and fauna of the mountains and lakes of Auvergne. Laboratory of industrial electricity.

University of Dijon.—Faculty of sciences: Laboratory of industrial physics, laboratory of chemical analysis, and laboratory of bacteriology. (The two latter laboratories, though attached to the faculty of sciences, are entirely supported by the city of Dijon.)

University of Grenoble.—Electro-technic institute, faculty of sciences.

University of Lille.—Institute of applied chemistry; institute of industrial physics; laboratory of maritime zoology at Portel (Pas-de-Calais), the foregoing pertaining to the university; laboratory of agricultural chemistry (faculty of sciences); archaeological museum of the university (at the faculty of letters).

University of Lyon.—Institute of chemistry with school of industrial chemistry; laboratory of maritime physiology; Institute Michel Pacha at Tamaris (Var), dependent upon the university; archaeological museum of the university (at the faculty of letters); school of tannery; school for notaries (faculty of law).

University of Montpellier.—Institute of chemistry; of physics; of zoology; of botany; botanical garden (all annexes of the university); station of maritime zoology (at Cette); archaeological museum of the university (at the faculty of letters).

University of Nancy.—Institute of chemistry; of technical electricity; of serum therapy (all annexes of the university); brewery school (faculty of sciences).

University of Poitiers.—Laboratory of agricultural analyses (faculty of sciences).

University of Toulouse.—Laboratory of agricultural and industrial chemistry.

ADMISSION OF FOREIGN STUDENTS TO FRENCH UNIVERSITIES.

The recent efforts that have facilitated the admission of foreign students to the French universities have been set forth in full in previous Reports.¹ It will suffice to note here that a committee was formed in Paris in 1895 (Comité Franco-Américain), with an advisory branch in Washington, whose purpose it was to familiarize American students with the facilities for advanced study offered by the French universities and with the conditions for admission to the same.

Few foreign students, and especially few American students, were attracted to the French universities because of the difficulty in securing a degree. The German doctorate, on the contrary, could be gained with comparative ease. As pointed out by Professor Furber, of Chicago, to whose efforts the new arrangements are chiefly due:

There was an organic difference in the nature of the German and the French degrees. In Germany the doctorate carried with it no professional prerogatives. Not without further qualifications and severe examinations could the student obtain from the State the license permitting him to practice a profession. In France, on the contrary, the degrees were given, not by the university, but by the State, and clothed the recipient with special immunities and rights. The licencié en droit could enter on his legal duties. The doctor of medicine was already a physician, while the license of the other faculties opened public careers in various directions. To render degrees more accessible to foreigners was, therefore, to subject the native youth to sharper competition in acquiring a livelihood, a competition in which, because of his military duties, the Frenchman was at a disadvantage on his own soil. It was due, in fact, to this consideration that at the very

¹ See in particular Report for 1894-95, vol. 2, p. 305; Report for 1896-97, vol. 1, p. 33 et seq.; Report for 1897-98, vol. 1, pp. 749-759; Report for 1898-99, vol. 1, pp. 1091-1095.

time the friends of a more liberal hospitality were endeavoring to secure the foreign student greater privileges, a counter agitation was developed which aimed at curtailing those that he already had.

The arrangements ultimately proposed by the Comité Franco-American harmonized all these interests. It was, in fact, the creation of a new university doctorate, which was sanctioned by a ministerial decree of July 21, 1897, in the following terms:

Besides the degrees established by the State, the universities are empowered to institute titles of a nature purely scientific.

These titles shall confer none of the rights and privileges attached by law and regulations to the (State) degrees and in no case shall be declared a substitute. The studies and examinations which shall determine their distribution shall be subject to regulations formulated by the council of the university and approved by the standing committee of the superior council of public instruction. The diploma shall be delivered, in the name of the university, by the president of the council in forms different from the forms of those delivered by the Government.

The doctorates and diplomas created under this decree and available for foreigners are as follows:

University of Paris: Doctorate of letters, sciences, medicine, pharmacy, Protestant theology. (The university doctorate has not yet been adopted for law.) Also diploma of pharmacy and certificate of French language and literature.

University of Besançon: Doctorate of letters and of sciences; also diploma of agriculture.

University of Bordeaux: Doctorate of sciences, medicine, pharmacy, letters; also diploma of pharmacy.

University of Caen: Doctorate of law (also diploma of and certificate of higher literary studies; act November 19, 1886).

University of Dijon: Licentiate in law: doctorate of laws.

University of Grenoble: Doctorate of letters, law, sciences; also diploma for electro-technical subjects and diploma of French language and literature.

University of Lille: Doctorate of medicine; also diploma of French language and literature.

University of Lyon: Doctorate of medicine, pharmacy, sciences, letters; also diploma of pharmacy; of electro-technical studies; of agriculture; of oratory; of pedagogy; French letters.

University of Montpellier: Doctorate of pharmacy; of medicine; of law; also diploma of legal studies.

University of Nancy: Doctorate of law, sciences, pharmacy.

The following statement of the expenses to be met by candidates for the doctorate of the University of Paris is furnished by M. Henri Bréal, corresponding secretary of the Franco-American committee:

Faculty of Protestant theology:	Francs. ¹
4 inscriptions quarterly of 30 francs each.....	120
4 quarterly fees of 2.50 francs.....	10
Examination fees.....	110
Total.....	<u>240</u>
Faculty of sciences:	
Annual matriculation.....	20
Annual fees for library.....	10
4 quarterly fees for laboratory from 50 to 200 francs.....	200 or 800
Examination fees.....	140

¹A franc is ordinarily reckoned at 20 cents, or 5 francs to \$1, but the exact rate of exchange is at present 19.3 cents per franc.

The total depends on the fees for laboratories and on the number of years of study.

	Francs.
Faculty of letters:	
2 annual matriculations of 20 francs	40
2 annual fees for library of 10 francs	20
Examination fees	140
Total if the doctorate is taken in one year	200
Faculty of medicine:	
16 quarterly subscriptions of 30 francs	480
16 fees for library of 2.50 francs	40
16 fees for practical exercises of 15 francs	240
3 examination fees of 80 francs	240
Total	1,400
Faculty of pharmacy:	
Annual matriculation	20
Annual fees for library	10
4 quarterly fees for laboratories of 150 francs	600
Examination fees	100
Total if the doctorate is taken in one year	730

CONSPECTUS OF COURSES OF STUDY IN THE UNIVERSITY OF PARIS.¹

The University of Paris includes five faculties, viz. letters, sciences, law, Protestant theology, and medicine, and a higher school of pharmacy, equivalent to a faculty.

The faculty of letters (Sorbonne) comprises at present the following professorships, complementary courses, and lectureships:

Professorships.—Philosophy, history of ancient philosophy, history of modern philosophy, Greek eloquence, Greek poetry, Latin eloquence, Latin poetry, French literature in the Middle Ages and history of the French language, French eloquence, French poetry, foreign literature, literatures of southern Europe, ancient history, history of the Middle Ages, modern history, modern and contemporary history, history of the French Revolution, geography, colonial geography, archeology, Sanscrit and comparative grammar of the Indo-European languages, science of education, French literature, English tongue and literature, history, Greek language and literature.

Complementary courses.—Philosophy, history of social economy, history of political doctrines, romance philology, French literature, sciences auxiliary to history, history of French art, ancient history of eastern peoples, Latin language and literature, paleographic classic Latin, English language and literature, experimental psychology.

Lectures.—Philosophy, Greek language and literature, Latin language and literature, Latin language, grammar and philology, French literature, German language and literature, English language and literature, geography, classical paleography, pedagogy (historic.)

The faculty of sciences comprises professorships, annexed courses, and lectureships as follows:

Professorships.—Higher geometry, higher analysis and higher algebra, differential and integral calculus, mathematical astronomy and celestial mechanics,

¹ Statistique de l'enseignement supérieur, 1900, pp. 3-8.

rational mechanics, physical astronomy, calculus of probabilities and mathematical physics, physical and experimental mechanics, physics (two chairs), general chemistry (two chairs), organic chemistry, biological chemistry, comparative zoology, anatomy and physiology, evolution of organized being, zoology, botany, physical geography, mineralogy, geology, physiology.

Annexed courses.—Elements of analysis and mechanics, mathematical astronomy and celestial mechanics, physics (three courses), physical chemistry, analytical chemistry, animal histology; also 16 courses of lectures.

The faculty of law comprises:

Professorships.—Civil law (6 chairs), Roman law (3 chairs), criminal legislation and procedure, criminal law and penal legislation (comparative), civil procedure, commercial law, commercial maritime law and commercial legislation (comparative), history of law, history of Roman and of French law, common law, pandects, general public law, international law, constitutional law, administrative law (2 chairs), political economy, financial science, statistics, international law, public and private, Mussulman law.

The faculty of Protestant theology comprises:

Professorships.—Lutheran dogma, Reformed dogma, Evangelical ethics, Exegesis and criticism of the New Testament, ecclesiastical history, practical theology.

Free courses.—Complementary course, exegesis and criticism of the Old Testament.

Lectures.—Patristics, history of philosophy, German theological language and literature, ecclesiastical history.

The faculty of medicine, Rue et Place de l'École de Médecine, comprises 34 chairs or professorships and 4 complementary courses. The lectures of the professors are supplemented by the specialized instruction of 38 agrégés—a class of highly trained specialists.

There are also 16 directors of clinics, which are held in the hospitals for which the city is famous, and 37 directors of laboratory work with a large body of assistants.

The Superior School of Pharmacy (Avenue de l'Observatoire, 4) comprises 12 professorships. In addition to the general courses for which these provide, there are 7 agrégés or special professors, 4 directors of laboratory work, and a large corps of laboratory assistants.

The university doctorate authorized by law and open alike to natives and to foreigners has been created by the University of Paris in all the faculties excepting that of law. The conditions on which the degree may be obtained in the several faculties are as follows:¹

Faculty of letters, university doctorate.—At the faculty of letters the candidates for the university doctorate of Paris must, if they are French, have the diploma of licencié-ès-lettres. The faculty can, however, accord a dispensation in consideration of other titles they may possess. If the candidates are foreigners, this diploma may be dispensed with on the presentation of credentials of which the faculty remains judge.

The time given to preparation must extend over at least four half yearly terms.

The studies may be carried on partly in one of the great scientific establishments of Paris, in a French university, or even in a foreign university. Their duration may be abridged by decision of the faculty.

The tests include: First degree, maintenance of thesis, written either in French or in Latin; second degree, interrogations on questions chosen by the candidates and accepted by the faculty (regulation of the 28th of March, 1898).

¹The Universities of France, published by the Franco-American Committee, pp. 45-56.

Faculty of sciences.—To obtain the doctorate at the faculty of science the candidates must produce two of the following certificates of higher studies:¹

1, differential and integral calculus; 2, rational mechanics; 3, astronomy; 4, higher analysis; 6, celestial mechanics; 7, mathematical physics; 8, physical and experimental mechanics; 9, general physics; 10, general chemistry; 11, mineralogy; 12, biological chemistry; 13, zoology; 14, botany; 15, geology; 16, general physiology; 17, physical geography.

The faculty reserves the right of accepting equivalents.

The length of time devoted to study is a year. The studies may be pursued either at the faculty or in one of the scientific establishments of Paris.

The tests include the public discussion of a thesis setting forth the candidate's personal investigations and interrogations on different questions proposed by the faculty.

Faculty of Protestant theology.—Duration of studies: To be determined by the faculty (minimum, one year).

Conditions of education: A proof to be given during the time of study of knowledge which is equivalent to the licence en théologie, and credentials of previous secondary and higher studies by certificates from foreign universities, or equivalent proof by the student's own works. The licence requires a sufficient knowledge of the following subjects: Dogma and history of dogmas; evangelical ethics; exegesis and criticism of the Old and New Testaments; ecclesiastical history and practical theology. A knowledge of German enters into the licence programme. The doctorate examination is composed, beside the colloquium doctrine, in which the candidate will give proof of necessary knowledge, of the public discussion of a thesis, printed in French or in Latin, on a subject which should previously have received the approbation of the faculty.

Faculty of medicine.—At the Paris faculty of medicine, the diploma of "doctor of the University of Paris" is delivered to foreign students who are, in virtue of a dispensation, allowed to pursue their studies and undergo their examinations without passing by the bachelor's degree. This title confers none of the rights or privileges attached to a degree and can not in any case be accepted as an equivalent to the degree of doctor of medicine. The diploma is delivered under the seal and in the name of the University of Paris by the president of the university council. (Regulations of March 28, and April 1, 1898.)

The requirements are four years of resident study (the duration may be reduced according to the candidate's ability), five examinations, and a written thesis on a subject chosen by the candidate.

School of pharmacy.—"At the higher school of pharmacy the candidates for the doctorate of the University of Paris, must, if they are French, produce the diploma of first-class pharmaceutical chemist; if they are foreigners, two study certificates, the first of studies in chemical pharmacy and toxicology, the second of studies in galenic pharmacy and materia medica.

"The school reserves the right of accepting equivalents.

¹ Certificates of higher studies. The examination seasons are held twice a year, in July and at the beginning of the scholastic year.

No unsuccessful candidate can present himself before another faculty during the same session for the same certificate.

The examinations for each certificate include three tests: A written test, a viva voce test, a practical test.

The two first tests are eliminatory. The jury is composed of at least three members. The marks obtained by the candidates in the viva voce examination and practical exercises are communicated to the jury, who take them into account in their appreciation. The admissibility, admission, and postponement are pronounced by the jury after deliberations.

According to the terms of article 3 of the decree of January 22, 1896, three of the certificates mentioned above confer the diploma of licencié-ès-sciences.

"The period of study extends over a year at least and takes place at the school.

"The test consists in discussion of a thesis embodying personal researches."
(Regulation of March 28, 1898.)

INTERNATIONAL CORRESPONDENCE OF STUDENTS.

The idea of organizing on a large scale a system of international correspondence between students was started in 1896 by M. Mieille, who had previously had wide experience as a professor in a normal school, Draguignan, France. For several years M. Mieille, with the help of English friends, had maintained an exchange of letters between his own pupils and some English students, which had proved a great help to both in the acquisition of the foreign tongue. His plan for the work on the larger scale, based upon this successful experiment, immediately gained the cooperation of Mr. Stead, in England, and of the editor of the *Revue Universitaire*, France, who agreed to collect names in their respective countries. Professor Hartmann, of Germany, was similarly enlisted for that country.

The following statement by the English secretary for international correspondence shows the extent of the work during the four years from its announcement in January, 1897, to Easter, 1901:

The statistics presented may not be quite accurate. I have been more engrossed by the care of putting my friends into communication with one another than by counting them. Including Danes, Dutch, Italians, etc., with English-speaking peoples, French, and Germans put into correspondence, the totals for the four years are, roughly—

English boys	2,887
English girls	1,613
Total number of scholars	9,000
Largest list in any one month	480

During the same time the adults of all countries put into correspondence have numbered 4,400.

RULES FOR THE MANAGEMENT OF THE SCHOLARS' INTERNATIONAL CORRESPONDENCE.

I. The exchange of letters is always and everywhere under the supervision of the foreign language teacher. All foreign letters and other postal communications

are under his control. If possible, the scholar, from the beginning of the correspondence, should enter copies of the letters he writes in a book, and thus be able to show or refer to them when necessary.

II. Teachers should only send in the names of those among their scholars who are trustworthy and whose parents have sent either oral or written permission. They must also be able to write their own language correctly and have some knowledge of the foreign tongue. It should be explained to the scholars that they should not write anything which may dishonor themselves, their school, or their country, and therefore political and religious questions are better avoided.

III. The names of scholars, with age of each, must be sent by their teachers or parents, and letters will be addressed to the school. In the case of French correspondents names of boys are printed in the *Revue Universitaire*, and the French boy writes first. Lists are sent over the 1st of each school month, and the foreign introductory letter should be received about the 20th. If no such letter come, teachers are asked to send a post card to Mowbray House before the 30th. Girls' names are not printed, but lists are filled up from time to time, and names are selected as age and circumstances correspond with the names sent from France.

As regards German correspondents, the occupation of parent must be given and a 2d. stamp sent with each name.

If by mischance a scholar receives two letters, the teacher is asked to arrange that some other suitable scholar respond, or else to send the letter on to Mowbray House. Should the teacher consider a rearrangement of letters necessary, he is quite free so to do, and, if needful, a scholar's name may be sent in again and again, provided that due notice is given and that the foreign partner's interests are considered.

IV. The German bureau asks that younger correspondents should write chiefly or only in their mother tongue.

V. The rule is that the scholar should write alternately in his own and the foreign language, but the first letter should always be in his own tongue and written with great care, as a satisfactory development depends largely upon the first impression received.

VI. As the letters in the mother tongue are intended as models for the partner, they must be written with care and must be grammatically correct. The scholar should endeavor to find something of interest to tell his friend. Questions should be asked and answered, and a helpful bond of union thus be formed. Courtesy and sympathy are imperative.

VII. The teacher or parent is asked to help in finding materials for letters. In some cases teachers have planned a series of letters, and have written suggestions each month on the blackboard.

VIII. It is advisable that letters received in the foreign tongue should be entered in a note book; at any rate, all unknown or idiomatic expressions should be thus noted.

Foreign letters are often useful in class teaching.

IX. Teachers are asked to tell us about any which are of unusual interest, and we hope we may be permitted to see copies of such.

X. The mistakes in English of the foreign writers must be carefully corrected by the partner, in English, and returned with his answer. Younger scholars need help in doing this, for the more the correction can be made to illustrate idioms and peculiarities the better for both partners.

XI. The time for the exchange of letters is subject to arrangement, but as regularity and frequency are imperative, letters must be exchanged once a month at least and a bimonthly arrangement is the rule. Every letter should be dated, and the date of receipt of letter which is being answered should be given.

XII. To avoid delay, care should be taken in addressing the letters in plain handwriting. The address of sender should also be clearly written and the full name given. Fancy handwriting has been the cause of many an undelivered letter. Scholars should carefully keep the address of partner as it is given in the first letter; it may not be repeated. Remember also that only one-half an ounce can be sent for 2½ pence.

XIII. If for any reason a scholar who has sent in his name no longer wishes to correspond, he must at once let us know, sending the name and address of his correspondent; simple politeness demands this. If he receives a letter and does not wish to reply, the letter itself should at once be sent to Mowbray House. To leave the partner to wait in uncertainty is a rudeness of which we hope no one will be guilty.

XIV. If for any reason the foreign partner discontinues writing, the scholar's name will again be placed on our lists. One from another part of the country will then be selected. A change of this kind is sometimes desired by both partners, and teachers are asked to inform us when this is the case.

XV. Illustrated post cards may be exchanged on condition that the sender describes the picture fully in his own language, but such exchanges are not to take the place of letters. Comic post cards and newspapers with caricatures give rise to misunderstandings, and therefore should not be sent. But in this, as in all things, the teacher is the judge.

All English letters should be addressed to the office of the Review of Reviews and indorsed "Secretary for international correspondence."

The addresses for the remaining countries enlisted in the work are as follows:

France.—Le Directeur de la Revue Universitaire, 5, rue de Mezières, Paris
M. Mouchet, 203, rue de Becon, Courbevoix.

Germany.—Prof. Martin Hartmann, Deutsche Centralstelle für international Briefwechsel, Fechnerstrasse, 2 Leipzig.

Canada.—Mr. W. McLay, Macmaster University, Toronto, Canada.

United States.—Mr. E. Magill, Swarthmore College, Swarthmore, Pa.

INSTRUCTION IN MORALS (LA MORALE) IN THE PRIMARY SCHOOLS OF FRANCE.

The most significant movement in the recent history of primary education in France is the impulse given to instruction in morals or practical ethics.

The subject is not new; it is found in school programmes that antedate the Republic, but always in relation with religion. By the law of 1882 the State schools were made strictly secular, but at the same time morals and civics were placed at the head of the prescribed studies. For a long time, however, these branches were taught in a formal memoriter manner and with meager results, as was shown by a report on the subject prepared for the Exposition of 1889.¹ The report itself undoubtedly conduced to the improvement of this instruction, but the change is more directly traceable to external pressure. The secular public school has encountered the bitter hostility of the church or the powerful teaching orders. It has been represented as godless and immoral, and as the active cause of an alleged increase in juvenile crime. These charges have put the Government upon the defensive; the spirit and methods of the school have been freely discussed, and the whole body of public school officials, inspectors, and teachers alike have been fired with patriotic zeal to vindicate the character of their work. Meanwhile another influence had been gradually leading to the same end. Jules Ferry, who has been called the father of the secular school in France, reiterated again and again in his speeches before the chambers his purpose of making the secular school moral. The sincerity of these declarations was proved by his appointment to positions of highest influence three men peculiarly fitted to accomplish this purpose. Called to the ministry of public instruction in 1879, one of his first acts was the appointment of M. Buisson as director of primary education. Before the year closed the minister had established the normal school at Fontenay-aux-Roses to prepare teachers for the primary normal schools for women, and placed it in charge of M. Pécaut; shortly after the minister laid the foundations of the chair of pedagogy at the Sorbonne, and appointed to the same M. Marion.

These three men, distinguished masters of ethical teaching,² have profoundly impressed the whole body of French teachers, and from their high positions an influence has gone forth which has penetrated to every hamlet of France. As a

² In this connection see, in particular Buisson's *La Religion, la morale, et la science—leur conflit dans l'éducation contemporaine*. Pécaut's *Études au jour le jour sur l'éducation nationale*. Marion's *De la Solidarité morale*.

result of these influences, the one excited by external opposition, the other working harmoniously within the system, the primary school of France has undergone a subtle transformation within the past decade. The scientific spirit by which for a time its instruction was dominated has given way to the ethical spirit. The teaching of practical morals has become living and effective. It turns the child's thoughts inward and excites him to reflect upon his conscious experiences, his moral duties and destinies, and thus relieves, by an excitation of the sensibilities and the will, the extreme formality of the intellectual and industrial training. This ethical expansion of the school was emphasized in many ways by the Exposition of 1900 and received special recognition from the jury of awards, who unanimously voted a grand prize for the system of moral instruction. The radical change which it implies was aptly characterized by the English member of the jury, who had made personal observation of its application in schools of an extended portion of France:

Probably the world has never witnessed [he says] a more astonishing revolution than the apparently successful effort to raise, lift, and shift the entire national education from a Catholic to a merely ethical foundation, and that, apparently, with no net loss to the education of the country, but with even a considerable gain. Such an astonishing feat can be paralleled only by the engineering exploits you sometimes attempt in America when you raise a huge hotel upon rollers and transfer it to a new basis. Now, this ethical instruction is merely an attempt to "underpin" the old structure on its new foundation, and, as such, should have the sympathy of all.¹

The endeavor on the part of the French Government to develop a system of moral training entirely separated from religious faith and dogma will naturally be followed with great interest by educators in other countries.

It is obvious, however, that a system which works well with the French, and especially under the pressure of a conflict between church and state, can not be successfully copied by any other people. It is conditions peculiar to the French that have infused life into the instruction.

The most ardent advocates of moral instruction in the primary schools of France do not, however, delude themselves with the notion that this alone will suffice to make the people moral. The limitations of the school in this respect are ably set forth by M. F. Buisson in an article² from which the following is quoted:

The part of the school is rigidly limited for two reasons: On the one hand its duration is too brief; it covers only the earliest years. The impressions which it makes are, it is true, vivid and often ineffaceable, but they are only the impressions of childhood, and other impressions—the stronger impressions of youth and of adolescence—soon come to obscure them. A moral influence which ceases to operate the day after the child's confirmation may perhaps affect the child, but it can not form the man.

The influence ceases on the very day when should begin and when, in fact, for the children of the more favored classes, does begin that decisive culture whose impress will remain throughout life. On the other hand, the school is only one agent in the moral education of the young. If only this agent were assured of the cooperation of all the others! Generally it may expect their opposition. Is the school always seconded by the family? Is it ordinarily seconded by the church? Later will not other masters seek and perhaps easily obtain a greater influence over the youth than ever the teacher exercised over the child? The press (and often what a press!), the theater (but not the French theater), the street, the workshop, the saloon, the public ball or the concert café, the temptations of comrades, of example, of fashion, of juvenile bravado, the brutal impulse of passions, and, still later, that of selfish interests, at all ages the force of appetites which one after the other arise and drown the voice of reason; these are, indeed, other impulses than those of the school.

¹ Cloudesley Brereton, esq., vice-president of the international jury on primary education, Paris Exposition, in an address before the national council, Detroit, 1901.

² "L'école primaire en France et sa part de responsabilité dans l'éducation morale du pays." Jost's annuaire de l'enseignement primaire, 1898.

Poor school, how soon its effect is lost in the fading light of childhood! Later, indeed, it will be one of the dear remembrances of old age. There will come a time when memory will recall the old schoolroom, with its white walls, its black-board, its maps, the old seats; everything, even to the humblest details of the school life, will come back.

But this is not an influence; it will simply be a late and melancholy remembrance. Let us not exaggerate, then, the power which the school exercises. Leave to the enemies of the secular teacher, who for a long time contemptuously limited him to reading, writing, and arithmetic, leave to them the noisy pretension that he is accountable for the whole destiny of the nation, solely responsible for what the pupil may become when he is a man, although as a child he may have passed only a few months within the school walls. * * *

If there are, indeed, some men who sincerely believe in this stroke of a magical wand they ought to find out their error. They know now, and they have needed this lesson to teach them that a people can not be reformed in twelve or fourteen years nor by the primary school alone; they know that in order to modify traditions centuries old, supported by the authority of the church, of the state, of the family, infused into the very blood of the people through the innumerable currents of physical and moral heredity, something more is needed than two lines of a law voted by Parliament and two pages of programme signed by a minister.

For ourselves, we did not need this experience to convince us that the school could not accomplish more in fifteen years than the church did in fifteen centuries. We are not of those who, hardly arrived at the edge of the field that they are directed to sow, turn impatiently, expecting to see the grain already springing up behind them.

Does it follow, then, that the work once commenced there is nothing to hope for; that no encouraging results are yet to be seen? It is not to partisan journalists that we should look for evidence on this point, but rather to the testimony of the people. Consult them in the cities and in the villages and see if everywhere they do not tell you that the pupils leave our schools with a perceptible moral improvement.

The good sense of the common people estimates justly those paradoxes relative to the instruction which so delight certain circles. To-day, as formerly, the first service that the school renders and which is not questioned in the homes is that of imparting to the children habits of mind and of body, ways of acting and of speaking, ideas and sentiments which enable one to distinguish them at a glance from the untrained child. To deny this, is to deny what is evident.

In the same article in which this limitation of the primary school is set forth, M. Buisson explains also the present attitude of the State secular school toward moral instruction. This is a particular in respect to which the State school has been greatly misjudged; hence this exposition by one who has had an important part in determining its moral standpoint is essential to a just estimate of its social and historic value. M. Buisson approaches this division of his subject by a consideration of the origin of the notion of morality in the human mind. On this point he says, in part:

No morals without religion. This is the fundamental axiom so thoroughly accepted by the church that even those who have rejected its tutelage have unconsciously retained the axiom in the modified form—no morals without philosophy.

The truth is that religion and philosophy, instead of engendering the notion of morality, are derived from it. It is not because it teaches any doctrine as to the nature and attributes of God, or as to rewards and punishments beyond the tomb, or as to the origin of the universe, that man yields to the moral law and feels in his conscience the irresistible obligation to conform to it. It is, on the contrary, because the sense of this obligation proves to him the existence of a moral law that he is forced to admit that there is a lawgiver, that there is an absolute authority, that the universe is governed by infinite wisdom. These metaphysical consequences of the moral law once admitted, man, in obedience to the innate demand for unity and logic, coordinates them into a system which, under the form either of religion or of philosophy, sums them all up for him, enables him to represent to himself the universal order, responds to his questionings, justifies his hopes. How natural, then, for him to attribute great virtue to this system, to confound it with the moral law itself, and to regard it as the supreme instrument of moral instruction. In all times the moment a science is constituted the first movement of educators has been to give it ready-made to pupils, instead of showing them how it has been formed by obliging them to grope their way along by the slow and tedious process of experience.

Human morality is the fruit of prolonged human effort. It is not due either to a miracle or to an artifice. It springs, or rather, slowly emerges, from the very depths of our nature; it is evolved by long and painful efforts. * * * Morality is not achieved by one stroke; it is the result of all the little victories which man has gained over the brute within him. The history of the human conscience is the history of the conquests of the spirit over animality, of reason over passion, of will over appetite. Throughout the ages, in proportion as society passes from the savage to the civilized state, the moral conscience grows. To respect for force is opposed the respect for justice; two grand ideas essentially human, that of duty and that of right, illumine the darkness of the animal world. The distinction of good and of evil marks the advent of the human empire.

The written law expresses often only a minimum of the mutual obligations upon which men are agreed. Each holds himself bound by the unwritten but not less imperative law within his conscience; the feeling of moral obligation becomes ever more and more intense, precise, severe, scrupulous, and delicate, until there bursts upon the soul the full splendor of the ideal of moral perfection, which, though it despair of attaining, it must evermore pursue. * * *

Those who, like Kant, realize the majesty of the moral law, like him, also, feel the necessity of attaching the moral order to the universal order, and each, according to his intelligence, will endeavor also to find for himself a solution of the problem which has agitated so many great minds. What is there that can weaken these moral convictions? And in them one finds the joy of the spirit—a support and new encouragement in the path of virtue. A philosophic or religious theory is not the foundation of morality, but why should it not be its crown?

This is exactly the position of the French secular school on the question of moral education. What does the school really do? Its work is neither religious nor philosophic—its work is moral in the true and full sense of the word. Those who accuse it as destitute of faith utter nonsense; on the contrary, the very thing which causes this reproach is itself an act of faith—faith in human nature; faith in conscience (which certain people call the voice of God, and then reproach us for wishing to listen to it always and to respect it in preference to any other voice); faith in the absolute value of the moral law; faith in the good and the true; faith in duty even without punishment or reward, even without any other sanction than that of our own conscience.

Starting from this faith, not from this or that system or dogma, but from that which is the common source and the underlying reason of every system and every dogma, that is to say, starting from faith in the human soul and in its laws, the school takes the child just as he comes to it from contemporaneous society. It does not endeavor to make him reason about morality, but to fill him with the spirit and inspire him to the practice of morality. Aristotle long ago said: "Virtue is not a science, it is an art, it is a practice, it is an ensemble of habits." The secular school teaches morals not as something to be learned, but as something to be lived. For this it is not necessary to create a new theory, it is necessary only to gather up and to fix the ideas, the sentiments, the opinions, the principles, the moral postulates which are diffused as it were in the air we breathe, in the language we speak, in everything that expresses the public thought or conscience.

THE OFFICIAL PROGRAMME OF MORAL INSTRUCTION IN THE PRIMARY SCHOOLS OF FRANCE.

[Abridged from the original.]

(1) *General instructions and explanations—aims and characteristics.*—Moral instruction is intended to complete, to elevate, and to ennoble all the other instruction of the school. While each of the other branches tends to develop a special order of aptitudes or of useful knowledge, this study tends to develop the man himself; that is to say, his heart, his intelligence, his conscience; hence moral education moves on a different plane from the other subjects. Its force depends less upon the precision and logical relation of the truths taught than upon intensity of feeling, vividness of impressions, and the contagious ardor of conviction.

The aim of moral education is to cause one to will rather than to know; it arouses rather than demonstrates; it proceeds more from the feelings than from reasoning; it does not attempt to analyze all the reasons for a moral act, it seeks before all to produce it, to repeat it, to make of it a habit which will govern the life. In the elementary school it is not a science, but an art—the art of inclining the will toward the good.

The rôle of the teacher.—In respect to this subject as to the other branches of education, the teacher is regarded as the representative of society. It is of the highest importance to a democratic secular society that all its members should be initiated early, and by lessons which can not be effaced, into a feeling of their

dignity, and into a feeling not less deep of their duty and of their personal responsibility. To attain this end the teacher is not to proceed as if he were addressing children destitute of all previous knowledge of good and of evil; he will remember that the great majority of them have received or are receiving a religious instruction which familiarizes them with the idea of a God of the universe and a Father of men, with the traditions, the beliefs, the practices of a worship, either Christian or Jewish; that they have already received the fundamental ideas of a morality, eternal and universal; but these ideas are still with them in the germ. They await ripening and developing by appropriate culture and this culture it is for the teacher to give. His mission is, then, limited. He is to strengthen, to root into the minds of his pupils, for all their lives through daily practice, those essential notions of a morality common to all civilized men. He can do this without making personal reference to any of the religious beliefs with which his pupils associate and blend the general principles of morals. He takes the children as they come to him with their ideas and their language, with the beliefs which they have derived from their parents, and his only care is to teach them to draw from these that which is most precious from the social standpoint, namely, the precepts of a high morality.

Proper objects and limits of this instruction.—The moral teaching of the school is, then, distinguished from religious instruction without contradicting it. The teacher is neither a priest nor the father of a family; he joins his efforts to theirs to make each child an honest man. He should insist upon the duties which bring men together, and not upon the dogmas which separate them. He should aim to make all the children serve an effective apprenticeship to a moral life. Later in life they will perhaps become separated by dogmatic opinion, but they will be in accord in having the aim of life as high as possible; in having the same horror for what is base and vile, the same delicacy in the appreciation of duty, in aspiring to moral perfection, whatever effort it may cost, in feeling united in that fealty to the good, the beautiful, and the true, which is also a form, and not the least pure, of the religious sentiment.

Methods.—By his character, his conduct, his example, the teacher should be the most persuasive of examples. In moral instruction what does not come from the heart does not go to the heart. A master who recites precepts, who speaks of duty without convictions, without warmth, does much worse than waste his efforts. He is altogether wrong. A course of morals which is regular, but cold, commonplace, dry, does not teach morals, because it does not develop a love for the subject. The simplest recital in which the child can catch an accent of gravity, a single sincere word, is worth more than a long succession of mechanical lessons.

On the other hand, it is hardly necessary to say, the teacher should carefully avoid any reflection either by language or expression upon the religious beliefs of the children confided to his care, anything that might betray on his part any lack of respect or regard for the opinions of others.

The only obligation imposed upon the teacher, and this is compatible with a respect for all convictions, is to watch in a practical and paternal manner the moral development of his pupils with the same solicitude with which he follows their progress in scholarship. He should not believe himself free from responsibilities toward any of them if he has not done as much for the education of character as for that of the intellect. At this price alone will the teacher have merited the title of educator and elementary instruction the name of liberal education.

THE PROGRAMME.

Infant section: Ages 5 to 7 years.—Very simple talks mingled with all the exercises of the class and of recreation. Simple poems explained and learned by heart; stories; songs. Special care by the teacher in regard to children showing any defect in character or any vicious tendency.

Primary section: Ages 7 to 9 years.—Familiar conversations, readings (examples, precepts, parables). Practical exercises tending to moral activity in the class itself: 1. By observation of individual character, the gentle correction of faults, and the development of good qualities. 2. By the intelligent appreciation of school discipline as a means of education. 3. By appeal to the feelings and moral judgment of the child himself. 4. By the correction of vulgar notions, of prejudices, and of superstitions. 5. By instruction drawn from facts observed by the pupils themselves.

Intermediate section: Ages 9 to 11 years.—Familiar talks, reading illustrative examples with comments, practical exercises as in the elementary section, but with a little more method and precision.

1. (a) The child in the family: Duties toward parents and grandparents: Obedience, respect, love, recognition; aiding parents in their work, tending them in sickness, caring for them in their old age.

Duties of brothers and sisters: Loving each other; watchful care of the elder over the younger; effect of example.

Duties toward servants: To treat them with politeness and with kindness.

(b) The child in the school: Earnestness, docility, industry, civility. Duties toward the teacher. Duties toward comrades.

(c) The country: Grandeur and misfortunes of France. Duties toward the country and society.

II. Duties toward one's self: Care of the body; cleanliness, sobriety, and temperance; dangers of drunkenness; gymnastics.

Use and care of property: Economy; avoiding debts; effects of gambling, prodigality, avarice, etc.

The soul: Veracity and sincerity; personal dignity and self-respect; modesty; recognition of one's own faults; evils of pride, vanity, coquetry, frivolity; shame of ignorance and idleness; courage in peril and misfortune; patience; personal initiative; evils of anger.

Regard for animals: Kindness toward; society their natural protector.

Duties toward other men: Justice and charity; the Golden Rule; kindness, fraternity, tolerance, and respect for the beliefs of others.

(NOTE.—In all these considerations the teacher should assume the existence of conscience, of the moral law, and moral obligation. He should appeal to the feeling and the idea of duty and of responsibility. He should not attempt to demonstrate these by theoretic statements.)

III. Duties toward God: The teacher is not required to give a course upon the nature and attributes of God. The instruction which he is to give to all without distinction is limited to two points: First, he teaches his pupil not to speak the name of God lightly. He clearly associates in their minds with the idea of the First Cause and of the Perfect Being a sentiment of respect and of veneration, the same as is associated with these ideas under the different aspects of their religious training.

Then, and without concerning himself with the prescriptions special to the different religious beliefs, the teacher will strive to have the child comprehend and feel that the first duty he owes to divinity is obedience to the laws of God, as revealed to him in his conscience and his reason.

Higher section: Ages 11 to 13 years.—Exercises on ideas of previous years continued and expounded; special development of social morality: 1. The family; 2. Society, justice, the conditions of all society; solidarity, fraternity (alcoholism; its destruction little by little of the social sentiments by destroying the power of the will and the feeling of personal responsibility); development of the idea of the native land; the duties of the citizen (obedience to the laws, the military service, discipline, devotion, fidelity to the flag); imposts (condemnation of fraud toward the State); the ballot (it is a moral obligation; it ought to be free, conscientious, disinterested, enlightened); rights corresponding to these duties: Personal liberty, liberty of conscience, liberty in respect to work, in respect to association: general security of life and property: the national sovereignty; explanation of the republican motto, "Liberty, equality, fraternity."

"Under each head of the course in social morals the teacher should explain clearly, but without entering into metaphysical discussions: (1) The difference between duty and interest, even when they seem to be confounded with each other; that is to say, the imperative and disinterested nature of duty; (2) the distinction between the written and the moral law; the one fixes a minimum of prescriptions that society imposes upon all its members under definite penalties for violations of the same; the other imposes upon each one in his secret conscience a duty which no one obliges him to fulfill, but which he can not neglect without the sense of a wrong to himself and to God."

JUVENILE CRIME.

The recent efforts to make moral instruction prominent and forceful in the primary schools are due in a measure to alarming reports of the increase in juvenile crime. These reports were based chiefly upon criminal statistics relating to the period 1880 to 1886, which showed an increase in crime over the period 1876 to 1880. Thus, according to M. Levasseur, the mean annual number of persons convicted of crime in the period 1876 to 1880 was 4,374. In the period 1881-1885 the mean rose to 4,351.¹ The increase in the number accused of minor offenses was still more marked, rising from a mean annual of 140,167 in the decade 1871 to

¹See *La Population française*, vol. 2, p. 447.

1880 to 180,806 in the half decade 1881-1885 and to the mean annual of 189,655 in the succeeding three years, 1886-1888.¹ "The number of young delinquents," says M. Levasseur, "also augments and this precocity in crime is a cause of anxiety."² He notes further that the proportion of illiterate criminals had declined. This fact was not, however, misinterpreted by M. Levasseur. "It was," he observed, "a necessary consequence of the general diffusion of instruction."³

The statistics, however, were seized upon by the enemies of the State schools and by others either seriously alarmed at the revelations or eager for sensations, and the cry became general that secular education was undermining good morals. In fact, the State secular schools were not thoroughly organized until 1886, and were hardly to be counted as a national force before 1892. Later statistics indicate that the annual number of criminals is decreasing. Meanwhile serious investigations of the moral and criminal status of the French population have put the whole problem of juvenile crime in a new light. We present here citations from recent reports and discussions which summarize the results of these investigations.

The report of the minister of justice for the year 1896, published in 1899, presents the following statistics, showing the number of minors tried in the criminal courts at the dates specified:

	1866.	1876.	1886.	1892.	1893.	1894.	1895.	1896.
Number of accused under 16 years of age:

DECREASE IN NUMBER OF ACCUSED FROM 1876 TO 1896.

	Under 16 years of age.	Between 16 and 21 years of age.
Boys.....	<i>Per cent.</i> 43.3	<i>Per cent.</i> 30.4
Girls.....	62.5	41.2
Total.....	59	32.6

The same report showed also that the number of minors brought before the "correctional tribunals" (corresponding to our police courts) charged with minor offenses had been gradually decreasing. Under this head the following statistics are given:

	1892.	1893.	1894.	1895.	1896.
Number presented under 16 years of age:					
Boys.....	6,118	5,719	5,967	5,680	5,635
Girls.....	1,030	981	934	960	938
Total.....	7,148	6,700	6,901	6,640	6,573
Number presented between 16 and 21 years of age:					
Boys.....	27,744	28,350	28,701	27,261	27,044
Girls.....	3,479	3,532	3,616	3,502	3,336
Total.....	31,223	31,882	32,317	30,763	30,430

³ *Ibid*, p. 465.

With respect to the literacy of criminals, the report presents detailed statistics showing the degree of instruction of persons convicted of homicides (including under this head assassination, murder, parricide, poisoning), rape of minors, and thefts and breaches of trust. Summarized, the facts are as follows:

Date.	Total number convicted.	Per cent unable to read or write.	Per cent able to read and write.	Per cent having higher attainments.
1872	3,967	36.45	70.28	2.27
1873	3,802	36.29	61.88	1.83
1874	3,596	37.01	60.70	2.29
1875	3,210	33.05	63.92	3.03
1876	3,236	31.70	64.77	3.53
Total for half decade	17,811	35.07	62.40	2.53
1892	2,775	19.38	76.72	.04
1893	2,891	17.15	80.35	2.50
1894	2,642	15.93	81.41	2.66
1895	2,582	16.54	80.68	2.78
1896	2,464	15.17	82.06	2.77
Total for half decade	13,154	16.89	80.80	2.86

The foregoing statistics bring into comparison the half decade preceding the establishment of the State secular schools with the half decade succeeding their complete organization. Considering the entire period, 1876 to 1896, it is seen that the number of convictions for the crimes specified decreased from 3,236 in 1876 to 2,464 in 1896, a decrease of 24 per cent.

By reference to the statistics relative to minors it will be seen that the decrease in the number of criminal minors during the same period (1876 to 1896) was relatively much greater, viz, for young men between 16 and 21 years of age, 30.4 per cent; for young women between 16 and 21 years, 44.2 per cent; for all between those ages, 32.6 per cent. For lads under 16 years of age there was a decrease of 43.3 per cent; for girls under 16, a decrease of 62.5 per cent; for all under 16, a decrease of 50 per cent. This is a very significant showing, because it relates to persons young enough to have received the full influence of the schools. The minister, in discussing these several tables, emphasizes their educational bearing:

The long-continued participation of minors in certain crimes, often the most atrocious crimes [he says], offers a serious consideration for the reformers of the prison system and the educators of the young. * * * But considering the annual total number of young people tried, the excitement that the question has raised in some quarters appears to be groundless.

With respect to the statistics of minors brought before the lower courts the minister notes:

Since 1894, when the maximum was reached, there has been a marked decrease in the number of prosecutions. It is true, however, that an analysis of the details shows a slight increase from 1895 to 1896 in the number of graver offenses. Thus the number accused of stealing, notably those from 16 to 21 years of age, increased from 9,589 in 1895 to 10,777 in 1896. But in 1892 the corresponding number was 11,027. There is also a somewhat marked increase in the number of youths between 16 and 21 years of age accused of murderous assaults, while on the other hand the number accused of indecent assaults varied but slightly throughout the decade 1886-1896. On the whole, there is a decline in juvenile crime, which, although slight, must be regarded as a favorable sign.

In discussing the detailed statistics of the literacy of criminals (all ages included) the minister observes "that the participation of persons completely illiterate in homicidal crimes has greatly decreased, as regards proportion, by one-half, or from 36 to 18 per cent, and in absolute numbers from 812 to 461." Nevertheless, this decrease has not kept pace with the decrease in the number of illiterates. Thus in 1874, out of a total of 283,768 conscripts, 18 per cent could neither read nor write; in 1894, of a total of 337,109 conscripts, only 5.34 per cent were illiterate.

On the other hand, of the conscripts in 1874, less than 1 per cent (0.69 per cent) had obtained a bachelor's degree; in 1894 the proportion was 1.89 per cent, or more than double the former proportion. During the same time the proportion of convicts who were well educated had but very slightly increased, as appears from the foregoing table showing the proportion of illiterates to total criminals. M. Levasseur has pointed out that the proportion of illiterate criminals must necessarily decline as education becomes universal.

It is, however, evident [he observes] that criminality diminishes as the term of instruction is prolonged. It may, then, be expected that as instruction is developed its moral influence will become more marked. Even now that influence is much more decided than appeared from former statistics.

The effect of public instruction in diminishing illiteracy is shown by the decreasing ratio of illiterates. The following table shows the number of illiterates in every hundred persons of the classes specified:

Year.	Conscripts.	Newly married—	
		Men.	Women.
1870 ^a	26.8	39.4
1880 ^a	14.4	16.1	24.5
1887 ^a	10.2	10.7	17
1892 ^a	6.9	8.1	12.2
1895 ^a	5.4	6.3	9.4
1896 ^a	5.3	8.8
1897 ^b	5.1

^a Report of M. Maurice-Faure, 1899, p. 251.

^b Report of M. Levasseur, 1896-97, pp. clxvi-vii.

The investigation of the criminal statistics of France has brought to light many other conditions bearing indirectly upon the question of public education. Two of these conditions deserve attention here. The tendency to the formation of a criminal class is indicated by the very large percentage of old offenders who reappear annually in the courts. In France in 1898 the proportion of old offenders to the number of prisoners serving sentence on the 31st of December was for men, 80 per cent; for women, 75 per cent.¹ M. Levasseur, in his work previously cited, shows that the proportion of old offenders to the total average number condemned in the courts rose steadily during the period 1856-1860 to 1888, viz, from 27 to 46 per cent. "Society," he says, "hides in its bosom a hideous sore; instead of healing, it perpetuates and aggravates the evil. Vice nourishes and develops vice. Moralists, jurists, and politicians are agitated by the spectacle and alarmed at the danger."²

It is further evident that the criminal impulse tends to become a fixed habit before the individual reaches mature years.

According to the statistics [says M. Fouillée], the curve of crime in France reaches its highest point between the ages of 21 and 30. It falls a little between the ages of 30 and 40, and falls rapidly between 40 and 50. Youth is then the critical age, and everything depends upon a right direction at the start. It rarely happens after the age of maturity is reached that offenders pass the bound that separates occasional crime from professional crime. On the contrary, it is during childhood and youth that this step is taken; that one adopts the criminal profession. Now it is the professional criminal that recruits the ranks of old offenders. What, then, is the principal means of putting an end to this class—that is, of accomplishing the proper object of penal law, regarded as a system essentially preventive, rather than expiatory? It is the prevention of juvenile crime.³

This necessity is fully recognized by those in charge of the State schools, and, as we have seen, they are making strenuous efforts to increase the moral influence

¹ Statistique pénitentiaire, 1894, pp. xlvi, li.

² La Population française, p. 469.

³ Fouillée: La France au point de vue moral, p. 147.

of the schools and to extend the time during which young people shall be kept under instruction. But the school alone can never overcome the evil impulses inherent in man, nor can it alone combat the social influences that make for evil.

It would be out of place here to discuss these influences. We may, however, note two that are peculiar to France, and which because of their coincidence in time with the school laws have given color to the charge that the schools foster crime. In 1880 a law was passed permitting the opening of saloons without previous authorization by local authorities; the year following was passed the law establishing full liberty of the press.

Since the passage of the first-named law, according to M. Fouillée, the consumption of alcoholic liquors in France, and, moreover, of all bad liquors, has tripled, and in the consumption of intoxicants per capita of the population France has passed from the seventh to the first rank among nations. In 1887 the annual number of prosecutions for assaults upon persons had increased by one-third, and the statistics attribute this increase to the spread of alcoholism, and not to the progress of instruction.¹

With respect to the freedom of the press in France, M. Fouillée complains that it is liberty without responsibility. No attempt is made to control the circulation of immoral journals, and their sale among young people is pushed by all the devices of commercial greed.

In 1882 a cabinet minister declared before the Chamber of Deputies that there were distributed every day in Paris, at the very doors of the schools, more than 30,000 immoral papers.

In the Senate, in 1897, during the discussion of a proposal to restrict circulation through the mails, M. Berenger stated that there was not a village in France to which these journals did not penetrate. "They are distributed," he said, "by twenty and thirty thousand at a time." A journalist declared that he had no need to read the recitals in papers, as he could learn of the crimes of the day from the children in the streets. These examples, which might be multiplied, show the extent to which the liberty of the press has been abused in France.

"Our laws relating to the press," says M. Fouillée, "are in a crude and chaotic state, the interests of the press as well as its dignity require that it should stand for justice, which consists only in the maintenance of the greatest liberty for all with a responsibility equal in extent to that liberty." He cites in this connection the effect of public opinion in our own country and in England in repressing the circulation of immoral publications.

In New York [he says] and throughout the United States there are, for example, "associations for the prevention of vice," which see to it that scandalous journals do not circulate, and which, moreover, have the power to bring cases before the courts and to institute suits against offenders. * * * The National Vigilant Society, of England, works also to secure the enforcement of the very vigorous laws for the repression of vile literature. With us, also, there exist some societies of the same nature, such as the League of Public Morality. * * * But our judicial régime renders these societies powerless. Societies can do nothing in a country if the law itself is insufficient and if the Government, failing through fear of the press to enforce even the crude laws that exist, suffers the filthy stream to spread, engulfing everything.

M. Fouillée writes as a philosopher and a careful student of social conditions. It is of interest to note that in his comprehensive survey of the causes of criminality he lays special stress upon the same conditions that M. Buisson, the distinguished chief of primary education, has also emphasized.

Whatever [says M. Buisson] be the nature of the facts that are regarded as indications of a relaxation of morals, they impress everybody with their twofold character. On one side, they are phenomena that have not developed suddenly since the enactment of recent school laws but during preceding decades, phenomena

¹ Fouillée, *La France au point de vue moral*, p. 156.

whose movements statisticians have traced repeatedly since the beginning of the century. Progression in crime and vice is a social fact depending upon causes very complex; more profound, more general, than the primary school. On the other hand, these lamentable phenomena are not peculiar to France. They are found in all countries almost without exception. Quite recently the German press deplored an increase in the number of crimes and misdemeanors, notably in those imputed to youth, although religious instruction and ecclesiastical supervision were never more strictly organized.

Whatever is the case, no one, outside of that special public which reads *La Croix* or *La Gazette de France*, will be so foolish as to maintain that the school, laic or not, is the direct cause of all the disorders of society, crimes, misdemeanors, suicides, etc. If we must find some recent laws upon which to lay a part of the responsibility, it would suffice to cite two laws which have given free scope and entire impunity, the one to the manufacture and sale of alcoholic drinks, the other to the cheap pornographic press with or without illustrations.

THE SIMPLIFICATION OF FRENCH SYNTAX,¹

INCLUDING DECREE OF THE FRENCH MINISTER FOR PUBLIC INSTRUCTION,
FEBRUARY 26, 1901.

I.—INTRODUCTORY NOTE.

A few words will suffice to explain the circumstances in which the decree of February 26, 1901, relating to the simplification of French syntax, was issued by the minister for public instruction.

In January, 1900, the superior council of public instruction adopted a resolution that a committee should be appointed to consider what simplifications might be effected in French grammar for the purposes of school instruction and of examinations controlled by the ministry for public instruction. The committee was composed of MM. Gaston Paris (president), Henri Bernès, Comte, Croiset, Devinat, O. Gréard, Paul Meyer, and Henri Clairin (secretary). Their report, signed by M. Clairin, was delivered in June, 1900. In it they stated that from the way in which grammar was now being taught, elementary education was losing the simplicity which should always be its distinguishing characteristic; that pupils were perplexed and education hampered by undue insistence both by teachers and examiners on totally unimportant grammatical and orthographical rules. They therefore recommended that such rules should in future be omitted from school grammars, and that ignorance of them should not be counted as mistakes against candidates in examinations controlled by the ministry for public instruction, and they drew up a list of cases in which tolerance should be exercised. They repudiated any intention of altering the French language or injuring its best traditions, but they professed that the object of the reforms they proposed was to introduce into examinations a generous and intelligent toleration of alternative usages. It was urged that the benefits of the reform would be reaped in the first place by French children, for their work would become less wearisome and more intelligent. They would be enabled to acquire a wider and more thorough knowledge of French literature, instead of burdening their memories with useless rules, which were forgotten as soon as learned. In the second place, if French grammar were made more clear and simple, the study of the French language would be encouraged among foreigners.

A decree, accompanied by this report and the list of grammatical difficulties in which latitude was to be allowed, was issued by the minister for public instruction

¹ Republished from pamphlet issued by the special inquiries branch of the board of education, England. The circular letter and decree were translated by Mr. W. G. Lipscomb, M. A., assistant master at University College School, London, and honorable secretary of the Modern Language Association.

on July 31, 1900, but its execution was suspended pending the approval of the *Académie française*. The *Académie* at once expressed its sympathy with the principle of the reform and accepted the majority of the concessions, but made certain reservations, notably in the case of certain rules concerning the agreement of the past participle. Accordingly, a joint committee was appointed, composed of members of the *Académie française* and of the superior council of public instruction, to consider the points on which the two bodies were not in accord and any other points on which fresh proposals, acceptable to both, might be made.

On February 26, 1901, a revised decree was issued rendering compulsory the observance of the recommendations of the joint committee, which were appended as a schedule. This decree and the schedule, together with the circular of the minister of public instruction to the rectors of educational districts (*recteurs d'Académie*) are translated below.

W. G. L.

II.—CIRCULAR LETTER RELATING TO THE SIMPLIFICATION OF SYNTAX ADDRESSED BY THE MINISTER FOR PUBLIC INSTRUCTION AND FINE ARTS TO THE RECTORS OF EDUCATIONAL DISTRICTS.

PARIS, February 28, 1901.

SIR: On the 31st July last I issued a decree relating to the simplification of French syntax. I felt it my duty, however, before making its provisions obligatory to await the opinion that I had requested from the *Académie française*, for I felt that any reform in a matter of such delicacy should be supported not only by the authority of the superior council of public instruction, which determines the curricula and regulates the examinations of the different grades of education, but also of the *Académie française*, whose "prescriptive office it is to labor for the preservation and purity of the language, for the maintenance of its distinguishing characteristics and principles, and the explanation of its difficulties."

The *Académie française* has been kind enough to communicate to me the observations of the special committee appointed by its members to consider the proposed reforms to which I had directed their attention in the decree of July 31, and the schedule attached to it. I learn that the principle of the reform met with no opposition, and that although the proposals of the superior council of public instruction might not in every case be in accordance with the feeling of the *Académie française*, there was perfect agreement in a great number of cases in which grammatical difficulties can be simplified.

In these circumstances I have decided to give effect to the reforms on which the superior council of public instruction and the *Académie* are in accord. This is the object of the new decree which I issued on February 26, and of which I send you herewith a number of copies.

I think it will be useful to direct your attention particularly to the character of the reform which is hereby sanctioned. It is in fact of importance that teachers and members of examining committees who will be affected by these regulations should understand that there is no question of suppressing any fundamental rules of our syntax. The reform simply aims at rendering elementary instruction in French syntax simpler and easier for children and foreigners, and freeing it from useless complexities.

As early as 1891 one of my honorable predecessors protested against the abuse of grammatical tests and deplored the time spent even in primary schools on the study of rules often disputed by the most famous writers of dictionaries, and affecting neither the character nor the essential principles of the language. I may mention in this connection the use which is still made in some schools of dictations which are, as a rule, nothing but a succession of meaningless sentences in which oddities and catches in spelling are piled up at will. These exercises are of no use, and you

will be good enough to request teachers to discontinue them. Dictations should not be artificially manufactured. They should be taken from our best authors, in order that the pupils may have at the same time a lesson in grammar and in literary taste.

The committee of the superior council has alluded to subtle and sometimes false rules which hamper elementary education and serve no purpose either in reading or in the cultivation of intelligence and the development of thought. They have drawn up a sort of catalogue indicating the licenses that may properly be allowed. This list, supported by the approbation of the *Académie française*, is appended as a schedule to the present decree.

Henceforth the members of examining committees will no longer have to act upon merely general instructions; they will be in possession of a definite guide which will relieve them of all doubt and render their task easier. On the other hand, masters will know exactly what to retain and what to discard in the books that are used in the lower and middle forms of schools.

The reform in syntax that we are carrying out does not in the least imply that less time and care is to be devoted to the study of French—quite the contrary. The genius of a language, its flexibility, elegance, and clearness do not lie in peculiarities of spelling. They are learned by studying the words of the great orators and writers. The time gained by the simplification of the grammar will be usefully employed in the study and explanation of selected books and in French essay writing—the only kind of work which is capable of teaching the resources and manipulation of the language.

I request you, sir, to take the necessary steps to have the accompanying decree put in force. You will be good enough to bring it to the notice of the district inspectors under your direction, the heads of secondary schools and the presidents of the various examining committees, and to see that it is published in the primary education gazettes.

I remain, sir, etc.,

The Minister of Public Instruction and Fine Arts.,

GEORGES LEYGUES.

III.—TRANSLATION OF THE DECREE AND OF THE SCHEDULE.

1. By virtue of article 5 of the law of the 27th February, 1880. 2. *In re* the decree of the 31st July, 1900. The minister of public instruction and fine arts, after consultation with the superior council of public instruction, decrees:

1. In all competitive or other examinations controlled by the ministry for public instruction involving special tests in orthography, the use by candidates of the concession notified in the present decree shall not be reckoned as mistakes.

The same provision applies to the marking of the various French compositions in the competitive or other examinations controlled by the ministry for public instruction which do not involve special orthographical tests.

2. The decree of the 31st July, 1900, is revoked.

Given in Paris, the 26th February, 1901.

GEORGES LEYGUES.

Schedule to the decree of February 26, 1901.

SUBSTANTIVES.

Plural or singular.—In all constructions where the sense permits the noun complement to be understood either in the singular or the plural the use of either number will be allowed; *e. g.*, *des habits de femme* or *de femmes*; *des confitures de groseille* or *groseilles*; *des prêtres en bonnet carré* or *en bonnets carrés*; *ils ont ôté leur chapeau* or *leurs chapeaux*.

SUBSTANTIVES OF TWO GENDERS.

1. *Aigle*.—According to present usage this noun is masculine, except when it means standards; *e. g.*, *les aigles romaines*.

2. *Amour, Orgue*.—Present usage makes these two words masculine in the singular. In the plural the masculine or feminine will be allowed without distinction; *e. g.*, *les grandes orgues, un des plus beaux orgues; de folles amours, des amours tardifs*.

3. *Délice and Délices* are, in reality, two different words. The former is rare and rather affected. It is of no use to pay any attention to it in elementary education and school exercises.

4. *Automne, Enfant*.—These two words being of both genders, it is useless to pay any special attention to them. The same applies to all substantives which are without distinction, either masculine or feminine.

5. *Gens, Orge*.—In all cases the adjective qualifying *gens* may be made feminine; *e. g.*, *Instruits or instruites par l'expérience les vieilles gens sont soupçonneux or soupçonneuses*.

Orge may be feminine in all cases; *e. g.*, *orge carrée, orge mondée, orge perlée*.

6. *Hymne*.—There is no sufficient reason for giving this word two different meanings, according to whether it is used masculine or feminine. Either gender will be admitted, whether it means national anthems or religious hymns; *e. g.*, *un bel hymne or une belle hymne*.

7. *Pâques*.—This word may be feminine whether it denotes a date or a religious festival; *e. g.*, *A Pâques prochain, or à Pâques prochaines*.

PLURAL OF SUBSTANTIVES.

Plural of proper names.—Since there is the greatest obscurity in the rules and exceptions taught in the grammars, proper names preceded by the plural article may in all cases take the sign of the plural; *e. g.*, *Les Corneilles* and *les Gracques; des Virgiles* (copies) and *des Virgiles* (editions). And so with the names of persons denoting their works; *e. g.*, *des Meissonniers*.

Plural of nouns borrowed from other languages.—When these words have thoroughly become part of the French language the plural may be formed according to the general rule; *e. g.*, *des exéats; des déficits*.

COMPOUND NOUNS.

Compound nouns.—The same compound nouns are nowadays met with sometimes with and sometimes without a hyphen. It is useless to weary children by teaching unjustifiable inconsistencies. The absence of a hyphen in the expression *pomme de terre* does not prevent it from being a real compound word just as much as *chef-d'œuvre*, for example. These words may always be written without the hyphen.

THE ARTICLE.

Article before proper names of persons.—It is the custom to use the article before certain Italian family names; *e. g.*, *Le Tasse, le Corrège*, and sometimes incorrectly before Christian names (*le*) *Dante, (le) Guide*. Ignorance of this usage will not be counted as a mistake.

Great uncertainty exists also as to the way in which the article which forms part of certain French names should be written: *la Fontaine, la Fayette* or *Lafayette*. When such names occur in dictations, it is best to say whether the article ought to be separated from the noun.

Omission of the article.—When two adjectives joined by *et* relate to the same substantive in such a way as to denote in reality two different things, the article

may be omitted before the second adjective; *e. g.*, *L'histoire ancienne et moderne* or *l'histoire ancienne et la moderne*.

Partitive article.—*Du, de la, des*, instead of the partitive *de*, will be allowed before a substantive preceded by an adjective; *e. g.*, *de or du bon pain, de bonne viande or de la bonne viande, de or des bons fruits*.

Article before plus, moins, etc.—The rule which exacts that *le plus, le moins, le mieux* shall be invariable before an adjective denoting the highest degree of the quality in the substantive which it qualifies, without comparison with other things, is very subtle and of little practical use. It is unnecessary to pay any attention to it in elementary education or in school exercises. *Le plus, la plus, les plus, les moins, les mieux* may all be used in such constructions as *on a abattu les arbres le plus or les plus exposés à la tempête*.

ADJECTIVES.

Agreement of the adjective.—In the expression *se faire fort de* the adjective may be made to agree; *e. g.*, *se faire fort, forte, forts, fortes de*. . . .

Adjective qualifying several substantives.—When a qualifying adjective follows several substantives of different gender, the adjective may always be put in the masculine plural, whatever the gender of the nearest substantive; *e. g.*, *appartements et chambres meublés*.

Nu, demi, feu.—These adjectives may agree with the substantive which they precede; *e. g.*, *nu or nus pieds; une demi or demie heure* (without a hyphen between the words); *feu or feu la reine*.

Compound adjectives.—The two component words may be united into one word, which shall form its feminine and plural according to the general rule; *e. g.*, *nouveauné, nouveaunée, nouveaunés, nouveaunées; courtvêtu, courtvêtue, courtvêtus, courtvêtues*, etc. But compound adjectives which denote shades of color having become, by an ellipsis, really invariable substantives, will be treated as invariable words; *e. g.*, *des robes bleu clair, vert d'eau*, etc., just like *des habits marron*.

Invariable past participles.—At present the participles *approuvé, attendu, ci-inclus, ci-joint, excepté, non compris, y compris, ôté, passé, supposé, vu*, when placed before the substantive to which they are joined, are invariable. And indeed *excepté* is already classed among the prepositions. The agreement of these participles will be made optional, and the application of different rules—according to whether they are placed at the beginning or in the middle of the clause, and whether they define the substantive or not—will not be insisted upon; *e. g.*, *ci joint or ci jointes les pièces demandées* (without hyphen between *ci* and the participle); *je vous envoie ci joint or ci jointe copie de la pièce*.

The same freedom will be allowed in the case of the adjective *franc*; *e. g.*, *envoyer franc de port or franche de port une lettre*.

Avoir l'air.—*Elle a l'air doux or douce, spirituel or spirituelle* may be written indifferently. No knowledge will be demanded of any subtle difference of meaning arising from the agreement of the adjective with the word *air* or with the person described.

Numeral adjectives. Vingt, cent.—The existing rule by which these two words are put in the plural when they are multiplied by another number is justified in certain cases by the pronunciation. The plural of *vingt* and *cent* will be allowed even when these words are followed by another numeral adjective; *e. g.*, *quatre vingt or quatre vingts dix hommes; quatre cent or quatre cents trente hommes*.

The hyphen between the word denoting the units and that denoting the tens will not be insisted on; *e. g.*, *dix sept*.

In dates of the Christian era *mille* will be accepted instead of *mil*, as in ordinary numbers; *e. g.*, *L'an mil huit cent quatre vingt dix or l'an mille huit cents quatre vingts dix*.

DEMONSTRATIVE AND INDEFINITE ADJECTIVES AND PRONOUNS.

Ce.—The particles *ci* and *là* may be added to the preceding pronoun without making any distinction between *qu'est ceci*, *qu'est cela*, and *qu'est ce ci*, *qu'est ce là*. In these expressions the hyphen may be omitted.

Même.—*Même* following a plural substantive or a pronoun may be made to agree, and no hyphen between *même* and the pronoun is necessary; e. g., *nous mêmes*, *les dieux mêmes*.

Tout.—*Tout* may be made to agree with the name of a town which it precedes, and no attempt will be made to establish a somewhat subtle distinction between such constructions as *toute Rome* and *tout Rome*.

It will not be counted as a mistake to write without any difference of meaning, when it is a woman who is speaking, *je suis tout à vous* or *je suis toute à vous*. When *tout* is used with the indefinite sense of *chaque* it may, with its accompanying substantive, be written either singular or plural without altering the meaning; e. g., *des marchandises de toute sorte* or *de toutes sortes*; *la sottise est de tout (tous) temps et de tout (tous) pays*.

Aucun.—This word may be used with a negative either singular or plural; e. g., *ne faire aucun projet* or *aucuns projets*.

Chacun.—When this pronoun follows the verb and refers to a plural subject or object either of the possessive adjectives, viz, *son*, *sa*, *ses*, or *leur*, *leurs*, shall be allowed after *chacun*; e. g., *Ils sont sortis chacun de son côté* or *de leur côté*; *remettre des livres chacun à sa place* or *à leur place*.

VERBS.

Compound verbs.—The omission of the apostrophe and of the hyphen will be allowed in compound verbs; e. g., *entrouvrir*, *entrecroiser*.

Hyphen.—The omission of the hyphen between the verb and the pronoun-subject following the verb will be allowed; e. g., *est il*.

Distinction between the apparent subject and the real subject; e. g., *sa maladie sont des vapeurs.*—There is no occasion to teach rules for such constructions as this, for their study can only be profitable when they occur in the text which is being read and explained. It is not a question of grammar but of style, and should find no place in elementary school work or in examinations.

Concord of the verb preceded by several subjects not joined by the conjunction et.—If the subjects are not summed up in an indefinite word such as *tout*, *rien*, *chacun*, the verb may always be put in the plural; e. g., *sa bonté, sa douceur le font admirer*.

Concord of the verb preceded by several subjects in the singular joined by ni, comme, ainsi que, and other similar expressions.—The verb will always be allowed in the plural; e. g., *Ni la douceur ni la force n'y peuvent rien* or *n'y peut rien*; *La santé comme la fortune demandent à être ménagées* or *demande à être ménagée*. *Le général avec quelques officiers sont sortis* or *est sorti du camp*; *Le chat ainsi que le tigre sont des carnivores* or *est un carnivore*.

Concord of the verb when the subject is a collective noun.—Whenever the collective is accompanied by a plural complement the verb may agree with the complement; e. g., *Un peu de connaissances suffit* or *suffisent*.

Concord of the verb when the subject is plus d'un.—Since the existing practice is to make the verb singular to agree with its subject *plus d'un*, it will be permissible to do so even when *plus d'un* is followed by a plural complement; e. g., *Plus d'un de ces hommes était* or *étaient à plaindre*.

Concord of the verb preceded by un de ceux (une de celles) qui.—When should the verb in the relative clause be plural and when singular? This is a nicety of language, and no attempt will be made to introduce it into school work or examinations.

C'est, ce sont.—As great diversity of custom exists as to the exact use of *c'est* and *ce sont*, and as the best authors have used *c'est* to introduce a plural subject or a pronoun in the third person plural, the use of *c'est* instead of *ce sont* shall always be permitted; e. g., *c'est* or *ce sont des montagnes et des précipices*.

Sequence of tenses.—The present subjunctive will be allowed instead of the imperfect in subordinate clauses dependent upon clauses in which the verb is in the conditional present; e. g., *Il faudrait qu'il vienne* or *qu'il vint*.

PARTICIPLES.

Present participle and verbal adjective.—The general rule should be observed, by which the participle is distinguished from the adjective, in that the former denotes *action* and the latter *state*. It is sufficient for pupils and candidates to give evidence of common sense in doubtful cases. Subtleties must be carefully avoided in setting exercises; e. g., *Des sauvages vivent errant* or *errants dans les bois*.

Past participle.—No change is to be made in the rule by which the past participle must agree with the word it qualifies when it is used as an epithet, and with the subject when it is a complement to the verb *être* or when it is an intransitive verb conjugated with *être*; e. g., *Des fruits gâtés; ils sont tombés; elles sont tombées*.

As for the past participle with the auxiliary verb *avoir*, when it is followed either by an infinitive or by a present participle or another past participle, it may remain invariable, whatever the gender and number of the objects which precede: e. g., *Les fruits que je me suis laissé* or *laissés prendre; les sauvages que l'on a trouvé* or *trouvés errant dans les bois*. When the past participle is preceded by a collective noun it may be made at choice to agree with the collective or the noun dependent on it; e. g., *La foule d'hommes que j'ai vue* or *vus*.

ADVERBS.

Ne in subordinate clauses.—The use of this negative in a great number of subordinate clauses gives rise to complicated, difficult, and incorrect rules, often at variance with the usage of the most classical writers.

Regardless of whether the clauses on which they depend are affirmative, negative, or interrogative, the omission of *ne* will be permitted in subordinate clauses dependent on such verbs or phrases as: *Empêcher, défendre, éviter que, &c.*; e. g., *Défendre qu'on vienne* or *qu'on ne vienne; Craindre, désespérer, avoir peur, de peur que, &c.*; e. g., *De peur qu'il aille* or *qu'il n'aille. Douter, contester, nier que, &c.*; e. g., *Je ne doute pas que la chose soit vraie* or *ne soit vraie. Il tient à peu, il ne tient pas à, il s'en faut que, &c.*; e. g., *Il ne tient pas à moi que cela se fasse* or *ne se fasse*.

In like manner the omission of *ne* after comparatives or words implying comparison will be permitted: *Autre, autrement que, &c.*; e. g., *L'année a été meilleure qu'on l'espérait* or *qu'on ne l'espérait; les résultats sont autres qu'on le croyait* or *qu'on ne le croyait*.

Likewise after the phrases *à moins que, avant que*; e. g., *à moins qu'on accorde le pardon* or *qu'on n'accorde le pardon*.

NOTE.

In examinations, mistakes which prove no want of intelligence or real knowledge on the part of candidates, but only show ignorance of some nice point or grammatical subtlety, must not be counted as serious.

Approved as a schedule to the decree of February 26th, 1901.

The minister for public instruction and fine arts.

GEORGES LEYGUES.

CHAPTER XXV.

HIGHER COMMERCIAL EDUCATION.¹

The movement for the institution of courses of study for the purpose of affording an opportunity for the higher education of young men who desire to enter upon business careers or branches of the public service, like the consular, is making considerable progress. For more than fifty years commercial or business colleges have flourished in this country and have furnished instruction to large numbers of students. The subjects of study included in the courses of these institutions were arithmetic, bookkeeping, accounting, stenography, typewriting, English, penmanship, business forms, correspondence, etc., designed to prepare young men and women for clerical positions, such as bookkeepers, stenographers, typewriters, etc., but did not include a study of the sciences related to commercial and industrial pursuits. The work of the commercial or business colleges is thus described by Dr. Edmund J. James:

As to the so-called commercial or business colleges, I would not willingly deem them an injustice. I believe that they are a great and permanent constituent of our educational system. They have done and are doing and are destined to continue doing a great and useful work. But the training which they, with few exceptions, furnish can scarcely be called a higher training at all. It has to do with facilities—indeed, chiefly with manual facilities—writing, reckoning, etc., those things that go to make up a good clerk, things of great value in themselves, things which every business man would be the better for having, and yet things which after all are only facilities; they do not touch the essence of successful business management or tend to develop the higher sides of business activity; they bear little or no relation to those broader views characteristic of the business manager as distinct from the business clerk and are of course next to useless as a means of liberal education. The knowledge which they impart, however valuable in itself, does not suffice to fit a young man for the struggle of commercial life, for wise management of a private estate or for efficient public service.²

The Wharton School of Finance and Economy of the University of Pennsylvania is generally conceded as having been the first institution that offered special courses of study for the higher education of business men. It was established on an endowment of \$100,000, given to the University of Pennsylvania in 1881 by Mr. Joseph Wharton, of Philadelphia, Pa. In 1889 Mr. Wharton gave an additional sum of \$25,000 to establish a library fund for the school.

The considerations that determined Mr. Wharton to establish the school are thus stated by Dr. James, formerly a professor in the school:

First, the belief that the business classes of our country need a higher training as much or more than any other classes; second, the view that the commercial or

² Education of Business Men, I and II, American Bankers' Association, 1892.

business college, however valuable its curriculum, is by its very nature unable to give this higher training; third, the fact that the American college, however real and valuable its higher training, does not in its present form furnish a kind of higher training which appeals to the business sentiment of the community, as is shown by the fact of the small number of youths looking to business careers who enter college.

The object of the Wharton School, as stated by Mr. Wharton in the "project" submitted to the trustees of the University of Pennsylvania, is "to provide for young men special means of training and of correct instruction in the knowledge and in the arts of modern finance and economy, both public and private, in order that, being well informed and free from delusions upon these important subjects, they may either serve the community skillfully as well as faithfully in offices of trust, or, remaining in private life, may prudently manage their own affairs and aid in maintaining sound financial morality; in short, to establish means for imparting a liberal education in all matters concerning finance and economy."

While the instruction to be given in the school was not strictly defined nor limited by Mr. Wharton, he suggested in the "project" that the school should be conducted by one principal or dean, one professor or instructor of accounting or book-keeping, one professor or instructor upon money and currency, one professor or instructor upon industry, commerce, and transportation, and one professor or instructor upon elementary and mercantile law.¹

The Wharton School was opened for instruction in the fall of 1881, but in its first years did not attract any large numbers of students. The number in 1881-82 was 13; in 1890-91, 59; and in 1900-1901 the number had increased to 139.

In 1889 education for business began to receive the attention of the American Bankers' Association. On October 16 of that year the following resolution was unanimously adopted by the executive council of that association:

Resolved, That a committee of not less than three or more than five be appointed by the chairman, to whom shall be submitted the subject of the preparation or procurement of a paper to be read at the next convention of the association upon the establishment of schools in connection with the universities and colleges of the country, of general scope and character like that of the Wharton School of Finance and Economy, connected with the University of Pennsylvania, and the best means by which the establishment and endowment of such schools may be promoted and fostered by the association.

The committee appointed under the above resolution secured Prof. Edmund J. James, Ph. D., of the Wharton School to prepare and read a paper on schools of finance and economy, which he did at the convention held at Saratoga on September 3, 1890. In his address Dr. James emphasized the need of schools for the education of business men, and gave a somewhat detailed account of the work and aims of the Wharton School. Recognizing the limitations of that institution as then organized, Dr. James gave some idea as to what, in his opinion, a school of finance and economy should include. He said:

The ideal of the faculty, it may be said, is a great institution, comprising many different courses—one looking to business, another to journalism, still another to politics, another to the university—all composed alike of two elements—a common one, consisting of such studies as political economy, constitutional law, politics, history, etc., and a professional one, embracing such special instruction as may be of aid to preparing the students for their particular careers. The business course itself should be subdivided according to the intention of the student, and should comprise not merely the fundamental branches we now have, but many others, such as railroading, commerce, insurance, etc.

An institution like this, with a curriculum based upon a thorough knowledge of our own vernacular, its use, literature, history, etc., with such other languages, ancient or modern, as the student might choose to take, and all based on a thorough elementary training in languages, mathematics, and natural science, would be an addition to our educational system comparable in importance and influence

¹ For the course of study and detailed description of instruction now offered by the Wharton School, see p. 1173.

only to the great system of technical schools which in a different field are revolutionizing our American education. It would give us also the best system of training for business, journalism, teaching—in a word, for citizenship—which the world has yet seen.

On September 5, 1890, the following resolution was adopted by the American Bankers' Association:

Resolved, That the American Bankers' Association most earnestly commends, not only to the bankers, but to all intelligent and progressive citizens throughout the country, the founding of schools of finance and economy for the business training of youth, to be established in connection with the universities and colleges of the land, upon a general plan like that of the Wharton School of Finance and Economy of the University of Pennsylvania, so ably set forth by Professor James in his most admirable address before this convention.

Resolved, That the executive council is hereby directed to carefully consider and, if possible, devise some feasible plan whereby this association may encourage or promote the organization of a school or schools of finance and economy among our institutions of learning, and report upon the same at the next convention.

The address of Dr. James and the action of the association on the subject of schools of finance and economy were printed by the association and distributed among bankers, educators, and universities and colleges throughout the country, and awakened great interest in the subject. In 1892 Dr. James was commissioned by the association to make an examination into European institutions for the education of business men, and his report on the subject was published by the American Bankers' Association and was reprinted in full in the Report of the Commissioner of Education for 1895-96, pages 721-837. This report gives an historical survey, as well as the courses of study offered in the commercial schools of Europe, particularly in Austria, France, and Germany, and was received by business men and educators as a valuable contribution in aid of commercial education.

As a result of the agitation of this subject, schools, colleges, or courses of study of various designations, but all designed for the education of persons desiring to enter upon business careers, the public service, or other callings in which a knowledge of business is essential, have been established in a number of the universities and colleges of the country. The majority of such courses extend through a period of four years and lead to the baccalaureate degree. The Amos Tuck School of Dartmouth College is essentially a graduate school and is intended primarily for persons who have already taken a baccalaureate degree.

While special courses in commerce and finance are announced by a comparatively small number of the universities and colleges of the country, instruction in many of the branches of study included in such courses has been for some time and is now offered in the departments of economics or political economy of a considerable number of the leading institutions. Thus we find included in such departments courses on money, banking, transportation, corporations, trusts, commercial geography, commercial history, economic organization, trade statistics, accounting, speculative market, etc. New courses are being added constantly to these departments, and under the elective system in vogue in our institutions students are enabled to select the subjects offered that are suited to their future careers.

In the following pages are given the courses of study in commerce, finance, and administration maintained by a number of the institutions of the country, with detailed statements concerning the instruction offered in the commercial branches so far as given in the annual catalogues of the institutions.

UNIVERSITY OF CALIFORNIA, BERKELEY, CAL.

The college of commerce was opened for instruction in the fall of 1898, and "the curriculum is intended to afford an opportunity for the scientific study of commerce in all its relations and for the higher education of business men and of the higher officers of the civil service." The undergraduate course of four years

leads to the degree of Bachelor of Science, and "is devoted almost wholly to those studies of an elementary or a technical nature which are deemed most appropriate as a broad preparation for commercial life. The small number of electives are to consist of such special studies as shall most directly aid the student in his preparation for the career that he intends to follow after graduation." Opportunity for further specialization is offered in the graduate department.

One hundred and twenty-five units are required for graduation, and are grouped as follows:

(1) *Elementary studies*.—English, 6 units; modern languages, 18 units; mathematics, 8 units; history (mediæval and modern), 12 units; economics (theoretical), 6 units; geography (including 7 units in the study of the materials of commerce with the assistance of the Pacific Commercial Museum), 15 units; military science, 5 units.

(2) *Technical studies*: (a) *In practical economics*.—History and theory of international commerce, 6 units; money, banking, and credit, 3 units; manufacturing processes, 3 units; public finance, 3 units; statistics, 3 units; accounting, 3 units; transportation, 3 units; commercial practice, 2 units; social policy, 3 units. (b) *Jurisprudence*.—Elementary law, 3 units; international law, 3 units; industrial and commercial law, 6 units.

(3) *Electives*.—To be devoted to a special field, 14 units.

In a report to the board of regents made by President Benjamin Ide Wheeler in December, 1900, he says:

The work of the College of Commerce, as outlined in the curriculum adopted by the faculty, does not include a sufficient amount of work characteristic of commercial activities. The faculty has intended a thorough revision of its curriculum, but until the funds of the university or the special equipment of this school make it possible to add a number of chairs for the teaching of practical commercial subjects, it is feared that the college will not fulfill its highest opportunity.

The work in geography, conducted by Professor Davidson, has given very particular attention to the subjects of currents and climatology of the Pacific. It is necessary that this work be very much enlarged by a study of the products and climates of the other regions involved in the trade connections of this country. It is highly important that there should be offered to students in the College of Commerce instruction in the Russian language, and to a fuller extent than our possibilities now allow, in the Spanish language. Provision has already been made for instruction in Chinese and Japanese. Added instruction is needed in banking, insurance, statistics, and in various fields of practical business procedure. The founding of the Pacific Commercial Museum promises to provide for this school an invaluable laboratory.

COLORADO AGRICULTURAL COLLEGE, BOULDER, COLO.

The commercial course was established in 1896, extends through two years, and is as follows:

Junior year.—Commercial arithmetic, geometry, general history, spelling, book-keeping, penmanship, rhetoric and composition, accounting, business correspondence, business practice and banking.

Senior year.—Constitution of the United States, stenography, typewriting, literature, business geography, business law, physiological psychology, sociology, political economy, and office practice.

UNIVERSITY OF CHICAGO, CHICAGO, ILL.

The College of Commerce and Administration was inaugurated in 1898 "in response to the growing demand for a course of university instruction that should be adapted to the needs of students who desire to make university work more directly introductory to careers in business, law, diplomacy, administration, journalism, etc." The course of study extends through four years, and leads to the degree of Bachelor of Philosophy. It is partly prescribed and partly elective.

In the junior college (freshman and sophomore years) the work includes 18 majors,¹ besides a specified amount of public speaking and physical culture. In the senior college (junior and senior years) the work includes 18 majors, besides physical culture for four quarters.

The prescribed work of the junior college is as follows:

Economic and social history.—The development of the economic organization of society down to the time of the so-called industrial revolution in the latter part of the eighteenth century.

Commercial geography.—A study of the various countries and their chief products; the effect of soil, climate, and geographical situation in determining the character of national industries and of international trade, commercial routes, seaports; the location of commercial and industrial centers; exports and imports; the character, importance, and chief sources of the principal articles of foreign trade.

Civil government in the United States.—This course includes an analysis of the structure and working of government in the United States—local, State, and national.

History.—(1) The mediæval period; (2) the modern period; (3) the United States. *An introduction to the study of society.*—A descriptive account of the organization and processes of modern society.

Modern languages.—The three required courses in modern languages may be selected with the advice of the dean from any of the junior college courses offered in those departments.

English.—In English two courses in English composition and rhetoric will be followed by one affording an introduction to English literature.

Mathematics.—Plane trigonometry and college algebra are required.

Science.—The two required courses in science may be elected, with the advice of the dean, from any of the junior college courses in physics, chemistry, the biological group, or geology.

The work of the senior college consists of 18 majors; of these 7 are prescribed and 11 are elective. The prescribed courses are: Principles of political economy, 2 majors; elements of jurisprudence, 1 major; Federal constitutional law, 1 major; history of Europe in the nineteenth century, 1 major; recent American history, 1 major; psychology, 1 major.

The prescribed work of the senior college is as follows:

Principles of political economy.—Exposition of the laws of modern political economy.

The course is designed to give the students an acquaintance with the working principles of modern political economy.

Elements of jurisprudence.—A study of fundamental legal ideas and principles, illustrated by cases and statutes.

Federal constitutional law of the United States.—An elementary course based on a selected text-book.

Europe in the nineteenth century.

Recent American history (1861–1900).

Psychology.

The remaining 11 majors of the senior college will be selected, with the advice of the dean, from among the following groups of courses. In special circumstances technical scientific work may be more beneficial than the courses listed here. These or other courses outside the following list may be taken only with the consent of the dean.

ECONOMICS, COMMERCE, AND FINANCE.

Economic theory.—Value. The aim is to trace the development of the theory of value down to the writings of the present day, and to take up other controverted topics of economic theory.

Unsettled problems of economic theory.—Questions of exchange and distribution. Critical examination of selections from leading writers.

History of political economy.—This course on the development of economic doctrine treats both of the history of topics and that of schools and leading writers; the mercantile system, the physiocratic school, the English writers from Adam Smith to J. S. Mill, and recent American and European economists.

Scope and method of political economy.—The province, postulates, and character of political economy, its method, the nature of economic truth, methods of proof,

¹ A major is a subject pursued daily for one quarter (twelve weeks).

and the relation of political economy to ethics, political science, and sociology are discussed.

Training course in statistics.—The object of this course is to train students in the practical use of the statistical method of investigation. Stress will be laid upon methods of collecting, tabulating, and interpreting statistics of different orders, and constructive work will be required in order to obtain practical efficiency in the treatment of such data.

Economic factors in civilization.—Study is given of the origin of some phases of present forms of industry, and the effect of economic motives and exigencies on cultural development.

Problems of American agriculture.—Special attention will be given to the extension and changes of the cultivated area of the United States; the methods of farming; the influence of railways and population, and of cheapened transportation; movements of prices of agricultural products; European markets; competition of other countries; intensive farming; diminishing returns; farm mortgages; and the comparison of American with European systems of culture.

Industrial development of the United States.—A study is made of the distribution of population among the important industries at different periods of our development, and a comparison is made of the wages and profits secured by the different groups. The effects of changing from extractive industries to manufactures are traced. The influence of legislation in shaping the industrial development of the nation is sought. The forces which determine the location and prosperity of industries are studied, and the effect upon our exports and imports of changes in our industries is dwelt upon.

Recent industrial development in Europe.—The competition of industries in Great Britain, Germany, and other countries with our own producers; the elements lying behind the industrial growth of Germany; the changed relation of different countries in the scale of industrial importance during recent decades; the influence of tariffs on European development; and the existing tariff systems in the principal countries of Europe.

Modern industries.—This elementary course, requiring no previous study of economics, gives an exposition of the present organization of productive industries; the processes of leading industries, such as iron and steel, cotton, wool, etc.; the effects of modern invention; internal business methods, etc. Visits will be made to a number of large industrial establishments.

Economics of workingmen.—The purpose is to treat of efforts made to improve the condition of workingmen, and the effects of cooperation, profit sharing, building associations, manual training, trades unions, and the like.

The group of industrials.—The labor movement from the point of view of sociology. The influence of habitat, race, inheritance, migration, division of labor, towns, institutions, and conventions on the differentiation and opportunities of the so-called operative class, the actual condition of this group, and their participation in the goods of civilization; the essentials of a truly human existence; the modes by which improved ideas of welfare originated and are diffused; the social system of economic, political, and cultural organization through which the group must enjoy the social inheritance; description, criticism, programme of amelioration.

Socialism.—This course treats historically and critically socialistic theories, recent socialistic developments; the writings of Marx, Rodbertus, and Lassalle; and gives a review of recent popular writers, platforms, and programmes of socialistic organizations.

Technique of trade and commerce.—A study of the actual forms of modern business; market quotations; investment securities; operations on the stock and produce exchange; foreign and domestic exchange; insurance; the construction and use of exchange, bond, and annuity tables.

Commercial treaties.—A study is made of the text of the most important commercial treaties, supplemented by an examination into their economic causes and effects. This course is suitable for students who have already given considerable attention to history and political science.

Colonial economics.—This course will discuss the trade and financial relations of modern colonies to the mother country; their gains or losses; the economic development of colonies to the present time; their productions, their monetary systems, their labor conditions, and the influence of racial characteristics on their industrial growth.

The history of commerce during the middle ages.

Trusts.—Main emphasis at present will be put upon industrial combinations or trusts as a type of industrial organization, while outlining also the general province of government in regard to industry.

American shipping.

Railway transportation.—The course opens with a brief historical survey of the development of the transportation system of the United States; then takes up a discussion of theories of rates, competition, combination, speculation, discrimination, legislation, and the position of the State, the public, the investors, the managers, and the employees.

Comparative railway legislation.—This course studies the development and present status of the railway systems of Great Britain, France, Germany, Austria-Hungary, Russia, Italy, Brazil, and Australia. A comparative study will show what light the experience of other countries throws on our own railway problems.

Accounting.—A study of the underlying principles. Some practice work under the guidance of an expert auditor of accounts will be given, but only with a view to illustrating the principles discussed in the lectures. Emphasis will be placed on the interpretation of balance sheets and the problems implied therein.

Money.—An examination is made first of the principles of money, whether metallic or paper; next the subjects of metallic and paper money are taken up, and attention is given to the experiences of the United States and modern countries.

Banking.—A study is made of the banking systems of leading nations; the relations of the banks to the public; their influence on speculation; and the relative advantages of national banks, State banks, trust companies, and savings banks.

Financial history of the United States.—After a rapid survey has been made of the financial experiences of the colonies and the confederation, a detailed study is undertaken of fiscal administration and the course of legislation upon currency, debts, and banking in the United States. The study will be based upon first-hand examination of the sources.

Finance.—In these courses it is intended to make a comprehensive survey of the whole field of public finance. The treatment is both theoretical and practical, and the method of presentation historical as well as systematic. Most emphasis is placed upon the study of taxation, although public expenditures, public debts, and financial administration are carefully studied.

LAW AND GOVERNMENT.

History of political theory.—American theory. The development of political theory since the French revolution. First term devoted to the European movement; second term to American political ideas. Lectures, reports, and discussions.

Comparative national government.—A comparative study of the constitutions and constitutional law of leading nations, as France, Germany, Switzerland, Great Britain, and the United States. The texts of constitutions are read in the light of commentaries, like those of Burgess, Laband, Dicey, Lebon, and others, with lectures by the professor.

Federal government.—The principal federations of history are studied—the United States of America, Germany, and Switzerland receiving special attention.

The government of Great Britain.—A somewhat detailed study, historical and descriptive, of the British system.

The government of France.—A somewhat detailed study of the French system, as it has developed since the revolution.

The government of Germany.—A study of the German Empire.

The government of colonies.—A study of the political development of the colonial system in recent times.

Federal constitutional law of the United States.—This course will examine the leading principles established by the decisions of the Supreme Court of the United States. Selected cases are studied in detail.

State constitutional law: I. Principles of organization.—Making and amendment of constitutions; suffrage and elections; the separation of powers; legislative and administrative organization; local self-government.

State constitutional law: II. Principles of legislation.—Constitutional limitations regarding process and substance of legislation, with special reference to the police power.

Comparative politics; State governments in the United States.—A study in the constitutions and constitutional history of the American Commonwealths.

The law of municipal corporations.—Organization and power of municipal corporations. Corporate rights and liabilities.

Municipal government.—A comparative study of the modern municipality, American and European, in its legal, constitutional, and administrative aspects.

The elements of international law.

Diplomatic history of Europe.—The principal European treaties of the last century are examined, with an especial view to ascertain the main principles of existing international agreements.

Diplomatic history of the United States.—The treaty relations of the United States with foreign powers are studied in detail, including an analysis of documents and an examination of methods.

Roman general administration.—A historical view with constant reference to the sources, of the methods of election, powers, limitations, privileges, insignia, etc., of the various Roman magistrates, and to the organization, functions, and order of business of the senate and the *comitia*. The work of the class room will consist of lectures and the discussion of papers prepared by the members of the class.

Institutes of Roman law.—A brief outline of the history of the Roman law. Study of the text of Justinian's Institutes.

History and elements of the law of property.—Principally the development of the Law of real property. Instruction will be based on the second book of Blackstone's Commentaries.

The law of persons.—Status; legal and acting capacity; absolute personal rights; domestic relations.

HISTORY.

American history.—(1) The early period under the Constitution (1789-1820). (2) The middle period (1829-1860).

The history of American political parties.—Their organization and action to 1840.

The age of the renaissance, 1250 A. D. to 1500 A. D.

The history of Europe in the seventeenth and eighteenth centuries.

The French revolution and the era of Napoleon.

The rise of Prussia.

SOCIOLOGY.

Contemporary society in the United States.—A concrete study of natural conditions, the population and its distribution, institutions, economics, political, educational, and ecclesiastical, together with an examination of conventional ideas as to national characteristics.

American cities.—A study of the location, growth, population, groupings, arrangements, architecture, and typical institutions of American cities.

Development and organization of the press.—A brief historical survey, followed by a study of the technical side of a modern newspaper, its organization as a business unit, its relation to organized news collecting, to news and other syndicates, to advertising, to distributing agencies.

The family.—The development of the domestic institutions in lower and higher civilizations; social ethics of the family; legal, industrial, educational, and religious problems of the family.

Rural communities.—Conditions of social existence in the country; organization for improvement.

Contemporary charities.—Studies of the nature and origin of depressed and defective classes; principles and methods of relief; organization of benevolence.

Social treatment of crime.—Causes of crime; principles of criminal anthropology; prison systems; legal factors; juvenile offenders; preventive methods.

The structure of English society.—A study of the economic, physiological, social, aesthetic, intellectual, and ethical elements in a typical society.

Philanthropy in its historical development.

The elements and structure of society.—A study of the economic, physiological, social, aesthetic, intellectual, and moral elements in American society; the interrelation of the individual and the group; the problem of social progress in a democratic society.

Municipal sociology.—An examination of the means of satisfying communal wants through public activity, with special reference to British and American cities.

The sociological conception of the State and of government.

The sociological conception of the problems of modern democracy.

SCIENCE.

Electricity and magnetism.—A course of advanced work in theoretical electricity and magnetism.

Physiography.—The earth's features, treated with special reference to their origin and significance; agencies affecting changes in geographic features; physiographic changes in progress; genetic geography.

Economic geology.—A discussion of the nature and distribution of ore deposits and of nonmetallic materials of economic value.

Introduction to mineralogy; physical and geometrical crystallography.—Physical characteristics of crystals; general principles of crystallography; projection and construction of figures of crystals. Groth, *Physikalische Krystallographie*, etc.

Elementary mineralogy and petrology.—This course will include the study of a few of the common rock-forming minerals and of the common rocks.

Descriptive mineralogy and determinative mineralogy.—Essential characteristics of minerals; laboratory work in testing minerals by chemical and blowpipe methods.

The chemistry of ore deposits.—A discussion of the origin of ore deposits and the chemical processes involved in their formation; lectures and laboratory work.

Geographic botany.—This course presents regional and world problems.

Public hygiene.—The application of bacteriology to municipal hygiene; water supply, food supply, sewage disposal, etc.

Sanitary aspects of water and food.—Special study will be given to the physiological and chemical principles of water and foods, including food analysis, food adulteration, money values, and dietaries.

Mechanical drawing.—A course designed to acquaint the student with the principles of mechanical drawing and projection, the preparation of working sketches and drawings, and elementary curve tracing.

The following suggestions on the grouping of courses are added for the guidance of students who are seeking preparation for any of the following activities:

Banking.—Money, banking, financial history of the United States, accounting, trusts, technique of commerce, law of property.

Railroads.—Railway transportation, comparative railway legislation, technique of commerce, American shipping, accounting, training course in statistics.

General industries.—Modern industries, technique of commerce, accounting, banking, money, trusts, economics of workmen, the group of industrials, industrial development of the United States.

Foreign commerce.—History of commerce, commercial treaties, American shipping, industrial development of Europe, industrial development of the United States, colonial economics.

Consular service.—International law, diplomatic history of Europe, diplomatic history of the United States, history of commerce, American shipping, training course in statistics, technique of commerce, American agriculture, commercial treaties.

Journalism.—Development and organization of the press, money, banking, trusts, American shipping, financial history of the United States, American city life, municipal sociology, economics of workmen, comparative government, international law, oral debates, argumentation.

In addition to the courses of study offered by the College of Commerce and Administration, the following course of open lectures was given during the year 1901-1902: The New Education, by Prof. J. Laurence Laughlin, Ph. D., of the University of Chicago; Railroad Management and Operation, by A. W. Sullivan, assistant second vice-president of the Illinois Central Railroad Company; Railways as Factors in Industrial Development, by Louis Jackson, industrial commissioner of the Chicago, Milwaukee and St. Paul Railway; Some Railway Problems, by Paul Morton, second vice-president of the Atchison, Topeka and Santa Fe Railway; Railway Consolidation, by E. D. Kenna, vice-president of the Atchison, Topeka and Santa Fe Railway; Railway Finance (three lectures), by Edwin H. Abbot, A. B., LL. B., formerly president of Wisconsin Central Railroad; The Railway Mail Service, by George G. Tunell, Ph. D., secretary to the president of the Chicago and Northwestern Railway; The Steel Industry, by Franklin H. Head, LL. D.; At Wholesale, by Adolphus C. Bartlett, vice-president of Hibbard, Spencer, Bartlett & Co.; Development of the Forging Industry and Modern Methods of Making Steel Forgings (two illustrated lectures), by H. F. J. Porter, M. E., sales agent of the Bethlehem Steel Company; The Credit Department of Modern Business, by Dorr A. Kimball, credit man of Marshall Field & Co.; The Commercial Value of Advertising, by John Lee Mahin, president of the Mahin Advertising Company; The Textile Industries (three illustrated lectures), by S. N. D. North, A. M., secretary of the National Association of Wool Manufacturers; The Methods of Banking (two lectures), by J. H. Eckels, LL. B., president of the Commercial National Bank, Chicago; The Stock Exchange; Investments, by D. R. Forgan,

vice-president of First National Bank, Chicago; The Board of Trade (two lectures), by George F. Stone, secretary of the Chicago Board of Trade; Fire Insurance, by A. F. Dean, assistant manager of the western department of the Springfield Fire and Marine Insurance Company; Life Insurance, by Willard Merrill, A. B., vice-president of the Northwestern Mutual Life Insurance Company; Foreign Exchange, by H. K. Brooks, manager of the financial department of the American Express Company.

The officers of instruction of the College of Commerce and Administration, as given in a circular of information of August 31, 1901, are as follows: William R. Harper, Ph. D., D.D., LL.D., president of the university, professor and head of the department of Semitic languages and literatures; Harry P. Judson, A. M., LL. D., professor of comparative constitutional law and diplomacy and head of the department of political science; Charles R. Henderson, A. M., D. D., professor of sociology; J. Laurence Laughlin, Ph. D., professor and head of the department of political economy; Albion W. Small, Ph. D., LL. D., professor and head of the department of sociology; Edmund J. James,¹ A. M., Ph. D., professor of public administration; Benjamin Terry, Ph. D., professor of mediæval and English history; J. Franklin Jameson, Ph. D., professor and head of the department of history; George S. Goodspeed, Ph. D., professor of ancient history; Starr W. Cutting, Ph. D., professor of German literature; Adolph C. Miller,² A. M., professor of finance; Oliver J. Thatcher, Ph. D., associate professor of mediæval and English history; Karl Pietsch, Ph. D., associate professor of Romance languages and literatures; Ernst Freund, J. U. D., Ph. D., associate professor of jurisprudence and public law; William I. Thomas, Ph. D., associate professor of sociology; Edwin E. Sparks, Ph. D., associate professor of American history; George E. Vincent, Ph. D., associate professor of sociology; Alex. Smith, Ph. D., associate professor of general chemistry; Charles Zueblin, Ph. B., D. B., associate professor of sociology; Thorstein B. Veblen, Ph. D., assistant professor of political economy; Maxime Ingres, B. ès Lettres, assistant professor of Romance languages and literatures; Francis W. Shepardson, Ph. D., assistant professor of American history; Herbert E. Slaughter, Ph. D., assistant professor of mathematics; George C. Howland, A. M., assistant professor of Romance languages and literatures; Camillo von Klenze, Ph. D., assistant professor of German literature; Jacob W. A. Young, Ph. D., assistant professor of mathematical pedagogy; Ferdinand Schwill, Ph. D., assistant professor of modern history; William Hill, A. M., assistant professor of political economy; Paul O. Kern, Ph. D., instructor in Germanic philology; Theodore L. Neff, A. M., Ph. D., instructor in Romance languages; David J. Lingle, Ph. D., instructor in physiology; James H. Boyd, Sc. D., instructor in mathematics; Charles M. Child, Ph. D., instructor in zoology; Ralph C. H. Catterall, A. B., instructor in modern history; Robert A. Millikan, Ph. D., instructor in physics; Henry R. Hatfield, Ph. D., instructor in commerce; James W. Thompson, Ph. D., instructor in European history; Philip S. Allen, Ph. D., associate in German; Wesley C. Mitchell, Ph. D., associate in political economy; Charles G. Merriam, Ph. D., docent in political science.

In his quarterly statement, made at the spring convocation of the University of Chicago, held on March 18, 1903, President Harper said:

By the action of the senate of the university, approved by the trustees, a separate faculty has been established for the conduct of the College of Commerce and Administration. This faculty consists of those instructors, from various departments, selected to give instruction in accordance with the curriculum of the college, and of five members of the university at large, appointed by the trustees. Mr. Henry Rand Hatfield (assistant professor of political economy) has been appointed dean of this college. It is expected that the work of this division will assume a more definite form and take on a more technical character.

¹ Since elected president of Northwestern University, Evanston, Ill.

² Elected professor of political economy and commerce at the University of California.

This institution announces courses of instruction for students desiring special training for commerce, industry, and the public service. Attention is called to the fact that under the liberal system of election a student preparing for business or for the public service may find courses bearing directly on his future life work sufficient to occupy his time for three years, which may be counted toward a regular college degree. The courses especially recommended for such students are those in psychology, modern languages, history, administration, economic theory and economic history, finance, banking, transportation, commerce (with commercial geography), and sociology. The instruction offered in some of the above-mentioned branches is as follows:

Economic theory.—An introductory and elementary course. Recitations, lectures, and frequent written tests. First semester, three hours per week.

Transportation.—An elementary course in the theory and history of transportation. The modern era of turnpikes and canals. The development of the railroad, including the organization, management, and consolidation of corporations; the question of rates and of public control, State and Federal. The railroad as a prime factor in the development of commerce and industry. Hadley's Railroad Transportation and the reports of the Interstate Commerce Commission are used as guides. Second semester, three hours per week.

Administration.—A course in administrative law and the comparative theory and history of administration of the leading modern nations. The course treats of the general field of administrative study and the nature of administrative law, the comparative central administration of the leading countries, together with a study of the legal relations existing between the different organs of administration. Special attention is paid to the organization of the diplomatic and consular services of the different countries. The questions of local administration, with special reference to the organization and administration of cities in the chief modern countries. The separation of local and central functions and the possibility of exercising an administrative rather than a legislative control over the local governments. Two hours per week through the year.

Industrial and commercial history.—The industrial and commercial history of Western Europe and America since the middle of the eighteenth century. The effects of modern inventions and political changes on trade and industry. The economic effects of the formation of the Zollverein; the adoption of free trade by England; the discovery of gold in California and Australia; the American civil war, and the rapid extension of the means of transportation. The effects of political changes in establishing new lines of trade and new centers of industry. The resulting tendency toward concentration and combination of capital and labor. Three hours per week through the year.

Public finance.—Modern systems of taxation; objects and methods of public expenditure; equilibrium of the budget; public loans; the relation of public financing to private economy. In taxation a comparative study is made of the various systems in leading modern countries; and in the United States the relation between existing methods of taxation and the present industrial organization is given special attention. First semester, two hours per week.

Money and banking.—The evolution of money; the standards of various countries, together with an historical survey of the different kinds of money used in the United States; banking functions in the modern business world; clearing houses and systems of credit and their relation to the trade and industry of the country. Second semester, two hours per week.

Commercial geography and international trade.—A general survey of modern commerce. The mechanism, organization, and instruments of international trade; the factors determining the values of commodities; the points of origin and methods of producing and preparing for the market and transporting the more important articles entering into the commerce between nations; the relation of the Government and of centers of production to national commercial supremacy. One hour per week through the year.

Labor question in Europe and the United States.—Economic condition of the working classes in Europe and the United States during the past century; relation of labor organizations to capital in the production and distribution of wealth; rise and growth of labor organizations; the development of the labor contract; methods of industrial remuneration; the shorter working-day; workingmen's insurance, and employers' liability. Three hours per week through the year.

Tariff and financial history of the United States.—Three hours per week through the year.

UNIVERSITY OF ILLINOIS, URBANA, ILL.

Beginning with the scholastic year 1902-1903 this institution offers "courses of training for business." The courses consist of work regularly organized in the college of literature and arts leading to the degree of Bachelor of Arts. The requirements for admission are the same as those for entrance to the university in the course in literature and arts. Students in the college of science and college of agriculture, as well as engineering students, can so arrange their courses that they may take a considerable amount of work in business administration.

In order to graduate from the university in the courses of training for business, the student must do the work prescribed for all students in the college of literature and arts, that prescribed for all students in industry and commerce, and that required for the particular line that he elects to follow. He must also in his senior year write a thesis on some topic directly connected with the line of business he is planning to enter, and secure, in all, 130 hours' credit. Students are urged to take one or two years of graduate work in their special lines after completing the undergraduate course of four years.

The subjects required of all students in the college of literature and arts, irrespective of their future course of study, are as follows: Advanced algebra, 2 or 3 hours; English literature, 4 hours; French or German, 8 hours; geometry, solid and spherical, 3 hours; history, 6 hours; logic, 3 hours; military, 5 hours; physical training, 2 hours; natural science, 8 to 10 hours; rhetoric, 6 to 10 hours; trigonometry, 3 or 2 hours. This work amounts to from 50 to 56 semester hours,¹ and must be taken in the first two years of the course. It does not take up all of the student's time through the two years, and he may fill up his schedule of studies by elections of certain of the subjects offered especially for business training.

In addition to the above general requirements, the following subjects are required of all students, whichever one of the courses in business training they wish to pursue: Principles of economics, commercial geography; English economic history; economic history of the United States; French two years, or German three years, beyond the freshman year; elements of commercial law; courses in business correspondence, or, for students preparing for journalism, English composition.

The subjects offered for business training are so grouped as to furnish specific training for (1) trade; (2) banking; (3) transportation, especially railroad transportation; (4) journalism; (5) insurance. Students who enter the several courses should take from the following subjects, among others, in addition to the general requirements mentioned above, sufficient to secure, in all, 130 hours' credit:

General course in business training.—Labor problems; corporation management and finance; industrial consolidations; commercial politics; commercial policy of the United States; materials of commerce; generation and transmission of power.

Course in banking.—Money; financial history of the United States; public finance; money market; statistics; history of commerce; banking; elements of corporation law.

Course in transportation.—Statistics; industrial consolidations; labor problem; railway management; railway systems; elements of corporation law; materials of commerce; elements of drafting; maintenance of way; machinery and manufacturing; locomotive and steam railways; electric railways; generation and transmission of power.

Course for journalism.—American history; colonial policy; charities and correction; commercial policy of the United States; constitutional law; elements of commercial law; English literature; financial history of the United States; indus-

¹A semester hour is one class period per week, presupposing two hours of preparation, for one half-year; or an equivalent amount of time spent in laboratory or shop practice.

trial consolidations; international law; labor problem; municipal corporations; political ethics; political institutions; public finance; socialism and social reform; taxation; money market.

Course in insurance.—Corporation management and finance; economics of insurance; public finance; money market; statistics.

The instruction offered in some of the subjects is as follows:

ECONOMICS, COMMERCE, AND INDUSTRY.

Principles of economics.—This course is introductory to the more advanced courses. Attention is confined to the underlying principles of the science. Three hours.

Principles of economics.—This is a course in general economics offered primarily to junior and senior students of high standing in the colleges of agriculture, engineering, science, and law. Emphasis is laid on the practical side of economic questions. Two hours.

Principles of economics.—This is the same as the preceding with the addition of one lecture per week on practical economic questions by Professor Kinley. Three hours.

Money.—This course is devoted to an elementary study of the history and theory of money and the monetary history of the United States. Three hours.

Financial history of the United States.—This course deals with the growth and management of the national debt, national taxation, and monetary policy. Three hours.

Public finance.—This course consists of a critical comparative study of financial theories and methods. Special attention to American conditions. Three hours.

Taxation.—A detailed study of State and local taxation in the United States. Two hours.

English economic history.—Special attention is directed to the evolution of modern industrial institutions. Two hours.

The money market.—This is an advanced course dealing with rates of exchange, functions of bill broker and banker, causes of fluctuations in rates of discount, the concentration of financial dealings at such centers as New York and London, international payments, and the determination of rates of foreign exchange, the effect of different monetary standards on international payments, monetary panics and crises, and the financial aspects of dealings on the stock and produce exchanges. Three hours.

Banking.—This course consists of a study of the history and theory of banking with special reference to the banking experience of the United States, and of a study of the existing banking systems and practices of various countries, particularly the United States, England, Germany, France, and the Orient. Three hours.

History of economic thought.—This course takes up the history of the development of economic theory since the sixteenth century. Two hours.

Industrial consolidations.—This course will treat of the development of industrial consolidations, the causes at work producing them and their forms in Europe and America; the promotion, financiering, incorporation, and capitalization of corporate consolidations; monopoly prices and monopoly methods; the ability of trusts to affect prices, wages, interest, and profits; and the proposed plans for controlling trusts, such as publicity, taxation of profits, and public ownership. Three hours.

The labor problem.—This course is a study of the labor movement and its social significance. The progress of the laboring classes, the legal relations of employers and employed, wages, strikes, arbitration, labor organizations, and similar topics are studied and serve to show the general character of the course. Three hours.

Railway management.—A study of the theoretical and practical aspects of railway transportation, with especial reference to American conditions. Some of the topics are the historical development of railroads, principles of construction, operation and traffic management, organization and finance, methods of control. Two hours.

Railway systems.—A comparative study of the railway systems of the United States, England, Germany, France, Australia, etc., with special reference to methods of management, control, and economic effects. Two hours.

Charities and corrections.—This course begins with the history of poor relief in Europe and the United States. As full a discussion of the various methods of reform and prevention is given as the time will permit. Two hours.

Sociology.—This course comprises an elementary presentation of social principles and phenomena and a brief discussion of some of the recent theories advanced to explain the growth and structure of society. Two hours.

Economic seminary.—Advanced students are formed into a seminary for investigation and for the study of current economic literature. Students who write their theses in economics must do so in connection with the seminary work. Four hours.

The industrial organization of modern Europe.—A study of the industrial conditions, methods, and organization of the leading European countries, with special reference to international competition and the foreign policy of the various Governments. Three hours.

Corporation management and finance.—The growth of corporations; their organization and securities, position and relations of stockholders and directors, analysis of reports, stock speculation, relation of industrial corporations to international competition, receiverships and reorganizations, social and political effects. Three hours.

Socialism and social reform.—This course is a study of the nature of socialism and of its strength and weakness as a scheme for the production and distribution of wealth, with a historical and critical examination of socialistic theories and propositions for social reform put forward during the nineteenth century. Three hours.

Economic history of the United States.—This course is an inquiry into the trend of our development and into the physical, economic, and political forces which have directed and controlled it. The physical conditions under which our people have worked, the movement and character of our population, the interaction of our political and economic life, our position in the world's industry and commerce, the problem of territorial expansion in its relation to our industrial and commercial growth, are some of the topics discussed. Attention is given to the history of some specific great industries, such as the iron and steel industry, cotton manufacture, shipping question, etc. Three hours.

Statistics.—This is a course in descriptive statistics, intended to familiarize students with the statistical literature of economics. One hour.

Statistics.—This course is the same as mathematics where the description is given. Students of economics should take this course and the preceding together. Those who do not wish the mathematical theory of probability may drop out of the class when that part of the subject is reached. For them the mathematical requirements for entrance will not be enforced, and both courses will count for four hours' credit. All who take the course must take both parts of it, as described under mathematics, which see.

Public control of trade and industry.—This course is an economic and financial study of the practical results of the public regulation of private business enterprises, and the public control, ownership, and operation of public service corporations such as street railways, waterworks, gas and electric light plants, docks, and markets. Three hours.

Commercial geography.—This course comprises a study of the natural and artificial conditions of the various countries and the effects of these conditions upon their industrial development and international commerce. Two hours.

History of commerce.—This course comprises a historical survey of commerce from ancient times, with special stress on the growth of commerce since the discovery of America. Two hours.

Institutes of commerce.—This course comprises a discussion of such subjects as kinds of commerce, the importance and organization of commerce and the management of commercial transactions. Two hours.

Institutes of commercial politics.—(1) Domestic commercial politics, comprising a discussion of trade restrictions, of protection against unlimited competition and against the misuses of credit, etc. (2) Foreign commercial politics, including, among other subjects, a discussion of the aims of foreign commercial policy, of the different kinds of tariffs, commercial treaties, bounties, subsidies, etc. Two hours.

History of the commercial policy of the United States.—This course includes a historical study of all those measures, such as tariff legislation, commercial treaties, laws regulating coastwise navigation, tonnage duties, reciprocity arrangements, bounties, subsidies, consular matters, etc., which have an important bearing on the commercial side of the foreign relations of the United States. Four hours.

History of the commercial relations between the United States and Germany.—This is to be followed in later years by the history of the commercial relations of the United States with other powers. One hour.

Economics of insurance.—The course consists of a brief study of the historical development of insurance, followed by a more extended discussion of its economic aspects. The various forms of insurance—fire, accident, employment, and life—are

considered from the standpoint of internal organization and from that of social service. Special attention is given to the theories and practices relating to rates, policies, investments, corporate management, accounting, public supervision, and insurance law. Three hours.

The theory of value.—This is a historical and critical study of theories of value. (Graduate work.)

The distribution of wealth.—This course deals with the problem of distribution, both in theory and practice. The facts of distribution of wealth and of income are first discussed, and attention is then turned to a comparison of theories of wages, interest, and profits. An attempt is made to show the relation of the existing distributive process to social prosperity and progress. (Graduate work.)

Seminary in commerce.—A seminary for graduate students, devoted to a study of present international commercial relations, with special reference to the trade conditions of the United States and the extension of her trade to foreign markets. The basis of this work will be a study of the statistical and commercial reports of the American and foreign Governments, as well as a study of board of trade and other journals devoted to the interest of foreign and domestic commerce. The primary aim will be to familiarize the student with the principal sources of information on commercial subjects. (Graduate work.)

Research courses in selected subjects. (Graduate work.)

GOVERNMENT. (SCIENCE OF).

Political institutions.—This is an elementary course in historical and practical politics. After a brief preliminary survey of some of the fundamental principles of politics, a comparative study of the political systems of the United States and the leading countries of Europe is made, with special reference to their historical development and practical operation. Six hours.

HISTORY.

Medieval and modern European history.—Elementary introductory course. Three hours.

Historical introduction to contemporary politics.—The political history of the nineteenth century. Three hours.

American history.—The origin and growth of the nation from the beginning of English colonization in America to the close of the reconstruction period. Five hours.

English constitutional history.—Three hours.

The colonial interests and colonial policies of the European powers.—Special attention is given to the nineteenth century. Three hours.

English history.—A general course in the history of England from the migrations until 1815. Four hours.

LAW.

Elements of jurisprudence.—The origin, development, and classification of law, followed by an introduction to the fundamental principles of the common law. Text-books: Blackstone's Commentaries, Robinson's American Jurisprudence. Four hours.

Elements of commercial law.—A course dealing with those branches of substantive law most commonly employed in mercantile pursuits. The work of the first semester covers the main principles underlying the law of contracts. The leading English and American cases are referred to, but the instruction is based upon lectures and collateral reading in the best text-books. In the second semester the fundamental doctrines of contracts are studied in their application to the law of negotiable securities, railroads and other common carriers, pledges and chattel mortgages, insurance and bankruptcy. Four hours.

Elements of corporation law.—Legal relations. A study of the legal principles involved in the organization and operation of the modern corporation, the constitutional and statutory limitations, both State and Federal, and questions arising under interstate comity. Lectures and assigned readings in cases and texts. Two hours.

Civil law of the Spanish-American colonies.—This course is intended especially for those who intend to be connected with business houses having to do with commerce between the United States and the Spanish-American countries. Two hours.

Contracts.—Text-book, Keener's Cases on Contracts. Three hours.

Roman law.—Text-book, Sohm's Institutes of Roman Law. Four hours.

Insurance.—Text-book, Wambaugh's Cases on Insurance. Two hours.

MATHEMATICS.

Statistical adjustments.—This course is given in two parts, of which the first may be taken alone.

(a) Theory of statistical adjustments: This part of the course includes a discussion of the general method of statistical investigation, the arithmetical and geometrical average, application of averages to tabulation, graphic methods of deducing the law of error, interpolation, and the application of the theory of probability to statistics. Two hours.

(b) Applications: A problem course in which the applications of the principles developed in (a) are made to specific problems in economics, biological science, insurance, etc. Two hours.

MATERIALS OF COMMERCE.

Agricultural.—A study of the animals, grains, fruits, vegetables, and forage crops entering the channels of trade, together with a sketch of their manufactured products and by-products. This would embrace the following:

Horses and mules and their market classes; hogs, beef cattle, and mutton sheep, together with fresh, refrigerator, and canned meats, and the by-products of slaughterhouses, such as leather, hair, gelatine, medicinal extracts, horn, bone, fertilizers, etc.; poultry—meat, feathers, and eggs; milk and its manufactured products—cream, butter, cheese, kumiss, etc.; wool, cotton, felt, shoddy; grain for human consumption, as wheat, rye, etc.; grains and forage for animal consumption, as corn, oats, barley, hay, straw, stover; grains and vegetables worked for sugar, starch, oil or spirits, as corn, barley, rye, potatoes, sugar beets, and their by-products used for stock feeding; fruits. Two hours.

Chemical.—Classification and review of the chemical industries, including related lines which depend for their success upon chemical processes. A further study in detail of typical industries, as for example, paints and painting, theory of paint composition, materials, substitutes, adulterants, methods of manufacture, future lines of probable development, etc. Two hours.

Geological (economic geology).—This course is devoted to a study of the uses man may make of geologic materials, the conditions under which these materials occur, and the qualities which render them valuable. A series of laboratory exercises on ores, soils, and structural materials runs parallel with the lecture course. Five hours.

Vegetable (economic botany).—Commercial plants and plant products. This is a study of the plants themselves from which are derived important commercial products, the conditions under which the latter are developed, and the methods by which they are obtained and utilized. Substitutions and falsifications and their detection are studied. Two hours.

Zoological.—This is a study of the origin and economic uses of economic products derived from the animal kingdom, aside from those ordinarily classed as agricultural. It will include the fisheries (marine and fresh water), products of fur-bearing animals, bees, the silk worm, etc. Injuries by insects to stored merchandise and other manufactured property will be discussed with reference to measures of prevention and remedy. Two hours.

MECHANICAL TECHNOLOGY.

Elements of drafting.—Geometrical constructions; orthographic, isometric, and cabinet projections. Tracy's Mechanical Drawing. Three hours.

Shop practice.—Students in transportation will be given training either in the machine shop, wood shop, foundry, or the forge shop, according to the circumstances of the case. Three hours.

Maintenance of way.—Development of maintenance of way; general relations to transportation problems and railway development. Character of permanent way as related to financial conditions. Signal systems. Two hours.

Machinery and manufacturing.—Classification, construction, operation, and erection of "form-changing machines." A study of machinery that transforms raw material into a finished product. Manufacture *v.* building; hand labor *v.* automatic machinery; the American system of interchangeable machine parts. Three hours.

Locomotives and steam railways, electric railways.—General treatment, giving peculiar adaptations and limitations of steam and electric roads; their adoption as determined by character of country or service and distance. Probable future changes in the latter; essential differences in operation. Two hours.

Generation and transmission of power.—Elementary principles of generation and transmission of power. Applications of power for purposes of agriculture, manufacturing, mining, and transportation on land and water. Two hours.

PHILOSOPHY.

Political ethics, historical and applied.—A study of various phases of thought concerning the ethics of social organizations; theories of the nature of the state, including views of the state of nature, of natural law, and natural right. A discussion of rights and duties in relation to social institutions; international rights and duties; the ethics of diplomacy. Two hours.

RHETORIC AND ORATORY.

Business writing.—English composition for students preparing for business careers. Business correspondence, the making of summaries and abstracts, advertising, proof reading, and the preparation of manuscript for the press. Four hours.

OTHER COURSES.

Accounting.—This course furnishes opportunity to study the general principles of accounting and auditing adapted to modern business. Public accounts of railroads, banks, and other corporations are studied with a view to teaching students how to interpret them and how to devise systems of accounting suitable to particular business enterprises. The work is done in the main in the courses on banking, railroads, etc., but is supplemented with special lectures.

Commercial grading of grains.

The instructors who give courses prescribed for students in business administration are as follows: David Kinley, Ph. D., professor of economics; George M. Fisk, Ph. D., professor of commerce; Maurice H. Robinson, A. M., professor of industry and transportation; Matthew B. Hammond, Ph. D., assistant professor of economics; Nathan C. Weston, Ph. D., instructor in economics; Evarts B. Greene, Ph. D., professor of history; James B. Scott, J. U. D., Charles C. Pickett, LL. B., and Charles W. Tooke, LL. B., professors of law; Thomas A. Clark, B. L., professor of rhetoric; Lewis A. Rhoades, Ph. D., professor of German language and literature; George D. Fairfield, A. M., professor of Romanic languages; Thomas J. Burrill, Ph. D., professor of botany and horticulture; Charles W. Rolfe, M. S., professor of geology; Samuel W. Parr, M. S., professor of applied chemistry; Frank Smith, A. M., assistant professor of zoology; James D. Phillips, B. S., assistant professor of general engineering drawing; Edward C. Schmidt, M. E., assistant professor of railroad engineering; Gerdt A. Gerdtzen, M. E., assistant professor of machine design.

INDIANA UNIVERSITY, BLOOMINGTON, IND.

A commercial course will be inaugurated at the opening of the university year, October 1, 1902, and will cover the last two years of the regular university course. The first two years at the university are to be devoted to the regular course of studies, and all required subjects should be finished during that time. In addition, the student will be required to take, as a preparation for the commercial course, three terms' work in the department of history, and also elements of political economy and the principles of commerce.

The following is a provisional curriculum of the two years' work in the commercial course:

First year (third year of university course).—Economic history of England, two hours; economic history of the United States, four hours; business and commercial law, three hours; business organization and management, three hours; transportation, three hours; American history, nine hours; American politics, six hours; modern language (French, German, Spanish), fifteen hours; or modern language nine hours and physiography six hours.

Second year (fourth year of university course).—Money and banking, four hours; public finance, three hours; financial history of the United States, three hours; commercial geography, three hours; theory of distribution, two hours; international law, six hours; modern European history, three hours; American history, six hours; political institutions, six hours; modern language, nine hours.

LOUISIANA STATE UNIVERSITY, BATON ROUGE, LA.

This institution offers a commercial course extending through four years and leading to the degree of Bachelor of Science, as follows:

UNIVERSITY OF MICHIGAN, ANN ARBOR, MICH.

To meet the wants of students who wish to pursue the study of history, economics, and subjects allied thereto for purposes of specialization and with reference to the careers they have in view, provision has been made for the extension and the systematic grouping of all the courses of study offered in those departments in such a way as to enable a student to plan his work in an orderly manner.

Two special courses have been organized, one in higher commercial education and the other in public administration. In the former the aim is to give a scientific training in the structure and organization of modern industry and commerce, and thus enable the student quickly to master the technique of any business career. In the latter the aim is to give a knowledge of the fundamental principles of political organization and of the methods and practice of public administration.

The course in higher commercial education covers three years of systematic instruction, and in the case of candidates for a degree, should be elected at the beginning of the third year of university residence. If all graduation require-

ments are met, the degree of Bachelor of Arts is conferred at the close of the second year of the special course and the degree of Master of Arts at the close of the third year. The first two years of residence should be devoted to collegiate studies and to studies preparatory to the special course. The courses in mediæval and modern history, English history, history of the development of industrial society, and the course in the elements of political economy should be completed during the first two years of residence.

The following programme is suggested to students:

THIRD YEAR IN THE UNIVERSITY.

First semester.—Social and industrial reforms, 4 hours;¹ commercial geography of the extractive industries, 3 hours; theory and history of money, 2 hours; general electives, 7 hours.

Second semester.—Science of finance, 3 hours; commercial geography of the manufacturing industries, 3 hours; theory and history of banking, 2 hours; statistics, 1 hour; general electives, 7 hours.

FOURTH YEAR IN THE UNIVERSITY.

First semester.—Problems in political economy, 4 hours; resources and extractive industries of the United States, 3 hours; commercial law, 3 hours; science of accounts, 2 hours; general electives, 4 hours.

Second semester.—Administration of corporate and public industries, 2 hours; manufactures of the United States, 3 hours; commercial law, 3 hours; history of industrial chemistry, 2 hours; general electives, 6 hours.

FIFTH YEAR IN THE UNIVERSITY.

First semester.—The distributive and regulative industries of the United States, 3 hours; technique of foreign trade, 3 hours; money market, 2 hours; labor laws of the United States and Europe, 2 hours; thesis seminary, 2 hours.

Second semester.—Transportation problems, 3 hours; European commercial geography, 2 hours; American trade with China, Japan, and the Philippines, 2 hours; history of industrial physics, 2 hours; business organization, 2 hours; thesis seminary, 2 hours.

The instruction offered in some of the branches is as follows:

INDUSTRY AND COMMERCE.

Commercial geography of the extractive industries.—Lectures and topical reports. The design of this course is to present the technical and trade conditions which determine the success or failure of the chief extractive industries, such as agriculture, horticulture, forestry, fisheries, and mining.

Commercial geography of the manufacturing industries.—Lectures and topical reports. This is a continuation of the above course, and presents the chief technical processes and trade relations of the manufacturing industries.

The resources and extractive industries of the United States.—Lectures and assigned readings. A study of the natural and social resources of the United States and of the chief extractive industries to determine their location, present condition, and relations to each other.

The manufactures of the United States.—Lectures and assigned readings. The evolution, present location, and condition of our chief manufacturing industries will be presented, and the relations of these industries to one another, to sources of raw materials, transportation, and market facilities, and foreign trade.

The distributive and regulative industries of the United States.—Lectures and assigned readings. This course will include a description of the various methods of marking goods, of the classifications, grades, brands, and trade-marks employed, and of wholesale and retail trade, jobbing, etc. Attention will also be given to those private organizations, not connected with money and banking, which guide

¹Per week.

and control the industrial process, such as trade associations and trade papers, boards of trade and chambers of commerce, stock and produce exchanges, national and export associations, museums and expositions.

Technique of foreign trade.—This course treats of the supply and demand areas of the world, with special reference to the chief articles of international trade. It comprises a study of the documents, regulations, and customary procedure of foreign trade, including methods of selling goods in foreign countries, shipping routes, customary packages, weights and measures, tariffs, export bounties, commercial treaties, and foreign industrial legislation.

European commercial geography.—Lectures and assigned readings. A presentation of the resources and industries of the chief European states, particular emphasis being laid upon openings for American trade.

American trade with China, Japan, and the Philippines.—This course will include a statement of the resources and industries of the countries mentioned, and a consideration of the present and probable future trade of the United States with them.

Science of accounts.—This course is designed to give the student an insight into that phase of administrative management which has been styled "the vital element of business." It assumes that the student is familiar with the simpler forms of bookkeeping. A study will be made of the methods used by auditors in conducting investigations, illustrations from the business world forming the basis of this part of the work. Considerable time will be devoted to a consideration of the essential data concerning the various lines of commercial enterprises, which must be furnished to the financier by the accountant in order that correct deductions may be made with regard to the needs of the business under discussion and the means which must be taken to increase its efficiency.

History of industrial chemistry.—The purpose of this course and of the course in general chemistry which is required for its election is to familiarize students with the significance of chemistry in the process of manufacture and to enable the factory manager to understand the reports of laboratory experts. He learns chemical nomenclature, chemical laws and principles, and something of the purpose of chemical tests and investigations in the general course given by the chemical department as introductory to further study. In the present course he learns of the manner in which chemical principles have been applied in the development of chemical technique, and prepares himself to judge intelligently proposals for the further application of such principles.

History of industrial physics.—The purpose of this course is, in general, the same as that of history of industrial chemistry.

Thesis seminary.—This seminary is confined to students in the course in higher commercial education. Its chief purpose is to hear reports from such students as are required to present a thesis for graduation. It will also be made the occasion of lectures from men not regularly connected with the academic staff of the university, in which case all students enrolled in the course in higher commercial education will be expected to attend.

GENERAL AND COMMERCIAL LAW.

Commercial law.—It is the design of this course to instruct students in the fundamental principles of law, so far as these principles pertain to the ordinary activities of business life. It is a three-hour course throughout the year, comprising two lectures and one quiz upon lectures and assigned readings each week. The topics covered by this course are as follows:

First semester.—Elementary law (six lectures); contracts (twelve lectures); agency (eight lectures); sales (ten lectures).

Second semester.—Bailments and carriers (eight lectures); bills of exchange and promissory notes (eight lectures); partnership (eight lectures); corporations (twelve lectures).

Public corporations.—Two hours a week. Second semester. Lectures.

The science of jurisprudence.—One hour a week. Second semester. Text-book, accompanied by oral exposition.

Taxation.—One hour a week. Second semester.

Public officers.—One hour a week. First semester.

Private international law.—Two hours a week. First semester.

In addition to the regular course noted above, the lectures on the following topics are open to students in the course in higher commercial education: Insurance (Dr. M. M. Bigelow); mining law (Mr. Clayberg); patent law (Mr. Walker); copyright law and trade-marks (Mr. Reed); railway law (Professor Knowlton).

POLITICAL ECONOMY AND FINANCE.

Elements of political economy.—This course is introductory to all other courses in political economy. The weekly quiz covers both the lectures and some standard text announced at the beginning of the semester. The ground covered in the lectures includes the usual topics—production, exchange, and distribution.

History of the development of industrial society.—A study of the history of English industrial society from the twelfth century to the present time, designed to show how modern industrial customs and rights came into existence.

Principles of the science of finance.—Finance as here used is not concerned with money or banking, but treats of public expenditure, public revenue, and public credit.

Public finance.—A comparative study of financial legislation and administration among the leading nations.

Problems in political economy.—The problems studied are as follows: The immigration problem, industrial crises, free trade and protection, the railway problem, the municipal or trust problem, and taxation.

Social and industrial reforms.—The special problems studied are the following: Cooperation, profit sharing, communism, socialism, factory legislation, workingmen's insurance, trades unions, and industrial federation.

Transportation problems.—The social and industrial significance of modern transportation, the development of railway transportation in this country and in the more important European countries, the administrative and legislative organization of railway systems, the history of the railway problems of the United States, and the control of railways through commissions.

Administration of corporate and public industries.—An analysis of industrial organization primarily from the administrative point of view. It considers the history and social significance of rapid transit in cities and other quasi public industries, both public and private. It studies railway administration under public as well as private ownership, and makes a special investigation into the history, organization, and administration of the post-office department of this and other countries.

Theory and history of money.—The first half of the semester will be occupied with a fuller study of special topics. Among these will be the value of money, the theory of the standard, and regulation of the paper money. The second half of the semester will be given to the history of money, particularly in the United States.

Theory and history of banking.—Among the topics considered will be the nature and social functions of banking, the natural laws of banking phenomena, systems of regulation, etc.

Economic theory.—Ingram's History of Political Economy will serve as a basis for this course, but much of the time will be given to the study of masterpieces.

Economic theory.—History of opinion on leading problems. The work will be conducted somewhat after the fashion of a seminary. Open only to advanced students.

The theory and practice of statistics.—This course treats statistics as a method of social research, an instrument important not only to economists and statisticians, but also to all who wish to qualify themselves to understand or criticize current social and political discussion. The class read Mayo-Smith's Statistics and Sociology, and, in addition, each member is assigned an exercise intended to afford some practice in collating statistical material and presenting it in tabular and graphical form. Advanced students only are allowed to elect the course.

Seminary in economics.—Two hours.

Seminary in finance.—Two hours.

The course in public administration covers three years, and, like the course in higher commercial education, should be elected at the beginning of the third year of university residence. The following programme is presented as suggesting an appropriate order of elections:

THIRD YEAR IN THE UNIVERSITY.

First semester.—History of Europe from the peace of Westphalia to the close of the French revolution, 3 hours; political and constitutional history of the United States, 3 hours; constitutional law and political institutions of the United States, 3 hours; American administrative law, 3 hours; public officers, 1 hour; general electives, 3 hours.

Second semester.—History of Europe since the French revolution, 3 hours; political and constitutional history of the United States, 3 hours; administrative law in European countries, 3 hours; taxation, 1 hour; general electives, 6 hours.

FOURTH YEAR IN THE UNIVERSITY.

First semester.—Present problems of European politics, 3 hours; English political institutions, 2 hours; municipal administration, 3 hours; private international law, 2 hours; general electives, 6 hours.

Second semester.—Comparative study of the political institutions of France, Germany, Switzerland, and other continental states, 3 hours; municipal administration, 3 hours; the government of Michigan, 2 hours; public corporations, 2 hours; general electives, 6 hours.

FIFTH YEAR IN THE UNIVERSITY.

First semester.—Seminary in administration, 2 hours; research course for the study of present problems of European politics, 2 hours; seminary in American history, 2 hours.

Second semester.—Seminary in administration, 2 hours; research course for the study of present problems of European politics, 2 hours; seminary in American history, 2 hours.

The instructors whose principal work lies in history and political science are as follows: James B. Angell, LL. D., president, lecturer on international law; Henry C. Adams, LL. D., professor of political economy and finance; Richard Hudson, LL. D., professor of history; Andrew C. McLaughlin, A. M., LL. B., professor of American history; Fred M. Taylor, Ph. D., junior professor of political economy; Earle W. Dow, A. B., assistant professor of history; Charles H. Cooley, Ph. D., assistant professor of sociology; John A. Fairlie, Ph. D., assistant professor of administrative law; Edward D. Jones, Ph. D., assistant professor of commerce and industry; Arthur L. Cross, Ph. D., instructor in history; Duran W. Springer, B. S., lecturer on the science of accounts; Harlow S. Person, A. M., instructing fellow in economics; Andrew H. Wood, assistant in history; Theo. J. Zimmerman, fellow in American history.

In his report for the year ending September 30, 1901, President Angell says:

The courses which were established last year for giving instruction in higher commercial education and administrative law have attracted much attention. They have been highly commended in the public press, and have deeply interested some of our most earnest students. The organization of the work was necessarily tentative and experimental. A number of eminent specialists assisted us by brief courses of lectures. We have now added to our faculty Dr. E. D. Jones, formerly of the University of Wisconsin, as assistant professor of commerce and industry. We shall also have again the aid of some special lecturers. The almost simultaneous establishment of similar courses of work in several of the leading colleges and universities shows that there is a widespread demand for them. Fortunately for us, we had in our various departments a large force of teachers whose work properly coordinated was easily made tributary to the ends sought by the establishment of these new courses. In our special announcement the names of no less than twenty-five teachers appear.

NEVADA STATE UNIVERSITY, RENO, NEV.

The School of Commerce offers a course of study extending through four years and leading to the degree of Bachelor of Science. The requirements for admission are the same as for the other university schools. The course is as follows:

Freshman year.—English literature and composition, German, algebra, solid geometry, trigonometry, general history, stenography or accounting.

Sophomore year.—German, general chemistry, mediæval history industrial economics, geography of commerce, stenography or accounting.

Junior year.—German, French, organic and industrial chemistry, history of England, municipal and international law.

Senior year.—French, Spanish, principles of economics, political economy, finance and trade, political history of the United States.

In addition to the subjects named in the junior and senior years, considerable reading and investigation in geography, history of commerce, and the political and economic conditions of the chief trading nations are required.

DARTMOUTH COLLEGE, HANOVER, N. H.

The Amos Tuck School of Administration and Finance was established in 1900 on an endowment of \$300,000, granted to Dartmouth College by Mr. Edward Tuck, a graduate of the college in the class of 1863. By a second gift of \$100,000 Mr. Tuck has made provision for the erection and maintenance of a building for the use of the school.

The object of the school is to train college graduates who desire to engage in affairs rather than to enter the professions. The instruction offered is intended to prepare men to enter upon private banking, brokerage and investments, insurance, railroad service and water transportation, foreign trade, general mercantile or manufacturing businesses, journalism, consular service, or for active participation in municipal and civic affairs.

The course of study extends through two years and is intended as a graduate course. The first-year courses of the school may be elected by seniors in Dartmouth College. The work of the first year is largely required, consisting mainly of courses in modern languages, advanced history, advanced economics, American constitutional and international law, sociology, money and banking, and the history and theory of transportation. From these courses the student must choose eighteen hours each semester.

The work of the second year permits of wider choice within the range of the following subjects: Modern languages continued, modern history and diplomacy, municipal administration, accounting and auditing, theory and technique of statistics, business organization and procedure, commercial law, commerce, rail and water transportation, insurance, practical banking, investments, and public finance.

The scope of the courses of instruction offered is shown in the following outline:

MODERN LANGUAGES.

A. *French.*—Composition and conversation.

B. *German.*—Composition and conversation.

C. *Spanish.*—Composition and conversation.

During the first year, two of the three languages are to be elected, and one of these during the second year. Students will enter upon the grade of language work which their previous preparation permits. Those whose equipment in one or more of these languages is considered adequate, will be permitted to substitute electives therefor.

D. *English.*—See Business Organization and Procedure, H.

ADVANCED HISTORY.

A. *The history of England to the sixteenth century.*—This course will consist primarily of the political history of the English nation, with such reference as is necessary to constitutional, economic, and intellectual development.

B. *The history of England and the British Empire from the sixteenth century.*—This is a continuation of Course A, and will include, in addition to the history of Great Britain, the development of the British Empire and the history of its colonies and dependencies.

C. *American colonial history to 1783.*—This course is intended to trace the beginnings of the American nation rather than the details of the history of the individual colonies. Emphasis is therefore laid on the European inheritance brought to this country by the colonists, their development of American institutions in the new environment, the expansion of population, the struggle between French and English for North America, the underlying causes of the Revolution, the growth of independence and union.

D. *European political history, 1789-1878.*—This course will open with a review of the geography of Europe and lectures on the various nationalities, the state of the leading countries on the eve of the French revolution and the early stages of that movement. It will continue with text-book work, supplemented with lectures on the part of the instructor and varied exercises on the part of the students.

E. *United States political history, 1783-1877.*—This course will be conducted in substantially the same way as the work of the previous course.

F. *Modern history.*—This course will consist of lectures on the political history of Canada, Mexico, and the South American States, Asia and Africa, with special emphasis on recent developments and particular reference to the phases of their history which might bear on their relations with this country. Under the direction of the instructor the students will do constructive work in the political history of Europe since 1878, each student covering a given period and profiting from the results of the work of other students.

ADVANCED ECONOMICS.

A. *American industrial development.*—Brief treatment of the earlier period of national development, followed by a more careful study of the history since the civil war. This will include the consideration of agricultural conditions and problems both North and South; special study of some of the more important products, such as iron, coal, wheat, and cotton; the development of the great manufacturing industries: the growth of corporations, trusts, and monopolies, and a consideration of the relations of labor and capital as influencing industrial progress.

B. *Advanced theory.*—A study of the development of economic theory. Assigned readings in the works of the classical school, especially Smith, Ricardo, and Mill, and in the writings of the representatives of modern development—Marshall, Boehm-Bawerk, Patten, Clark, and others.

LAW AND DIPLOMACY.

A. *American constitutional law.*—This course is designed to give students a knowledge of the general principles of the constitutional law of the United States, both Federal and State. Particular attention is given to the origin and development of American political institutions, to the formation of State governments, and to the immediate causes of the adoption of the Federal Constitution, and to its text.

B. *Politics and administration.*—A study of American political parties since 1873; their organization and increasingly centralized control; their policies and methods chosen for executing them; existing electoral machinery, its practical workings and defects; some proposed remedies.

C. *International law.*—This course is historical and explanatory of present international relations. It treats of the origin and development of the rules that generally govern the intercourse of modern civilized States, and their recent modifications by treaty.

D. *Diplomacy.*—The subject of this course will be the business of international negotiation, and while necessarily parallel to international law, it will deal with that subject only as it must and in an incidental way. Lectures will be given on the origin and evolution of modern diplomacy; the qualifications and methods of typical modern diplomats; the course of certain specially noteworthy negotiations from the Congress of Vienna to the Venezuela case, including the evolution and history of the Monroe Doctrine; the organization of American and foreign diplomatic and consular services; principles of diplomatic procedure, and the duties laid down by the United States Government for its agents in foreign countries. Constructive work in the history of Europe since 1878 will be done by the students.

SOCIOLOGY AND STATISTICS.

A. *Anthropological geography.*—This considers man in relation to his physical environment, as determining his dispersal over the face of the earth, his mode of

life, and the density of population. It traces the bearings of the natural surroundings upon man's physical and mental characteristics, and follows this fundamental and necessary adjustment through the history of the family and the State and in the evolution of the forms of economic life.

B. Social statistics and applied sociology.—This course has for its foundation an inquiry into the chief results of vital statistics, such as birth and death rates, the mortality from different diseases and under varying social and climatic conditions. These data are then brought into connection with crime, pauperism, and social reform. It is the biological side of social life.

C. History, theory, and technique of statistics.—A course in statistical methods and results, with practical work in investigation and tabulation. An attempt to determine the laws that govern group actions of men. Sources and reliability of statistical data. The methods of distinguishing true and false inferences.

D. Studies in American statistics.—Critical study of the contributions of statistics to our knowledge of production, banking, coinage, prices, wages, and particularly domestic and foreign commerce.

ADMINISTRATION.

A. Municipal administration.—A series of lectures in which the development of municipal policy will be traced with regard both to the forms and the aims of municipal government. The principles determining State control and municipal home rule; the place in the municipal system of the council, the mayor and the heads of departments; comparison of the chief points in typical municipal charters, Continental, English, and American; the development of metropolitan administration in London, New York, and other great cities. The proper sphere of the municipality, first, in its traditional function as protector of person and property; secondly, in the extension of its functions to include the control of public utilities, the education of the electorate, and the care of the dependent classes; the practical workings of municipal departments in the cities of Europe and the United States with a comparison of results for different cities; the peculiar conditions which affect American municipal progress; the causes of municipal corruption, especially as found in economic conditions, and the relation between municipal reform and social reform in general.

B. Business administration. See Business Organization and Procedure, E and F.

ACCOUNTING AND AUDITING.

A. A series of lectures including a consideration of accounting as a profession.

B. Theory and practice of accounts and audit.

(a) General books, viz: Cashbook, journals, ledgers, and subsidiary books and forms.

(b) Opening, conducting and closing accounts of manufacturers, merchants, clubs, electric-light companies, street railways, dealers in investment securities.

(c) Trial balance, balance sheet, cost, depreciation, good will, profit and loss.

(d) Examinations of accounts for purposes of (1) extending credit, (2) ascertaining causes of insolvency, (3) ascertaining earnings for a series of years as a basis for capitalization and change from partnership to corporation.

(e) Various systems of accounting compared and analyzed.

(f) Auditing and arrangement of accounts with a view of facilitating an audit. This is a practice course as distinct from a lecture course.

C. Theory and practice of railroad accounting.

(a) Revenue and expenses, why railroads are operated, how organized and administered, and the relation of accounting, auditing, and statistics to operation. General plan and technique of railroad accounting.

(b) Revenue accounting, freight and ticket; how the money is collected and covered into the treasury; the safeguards provided.

(c) Disbursement accounting, stages and methods of authorization, checks provided, significance of the different certifications, possibilities of fraud.

(d) Stores and car accounting, various systems, watching balances, use of the car record in car distribution, car mileage, clearing houses, the home record, the foreign record, the interchange record.

(e) Statistics of operation, revenue disbursement, motive power, transportation, and maintenance of way. Use of statistics in handling a property.

(f) General books, ledger, side ledgers, journal, journal entries, accounts current, general balance sheet, organization and methods of the accounting office, the division and general office, the shops, the storehouse, the station agency.

BUSINESS ORGANIZATION AND PROCEDURE.

A. *Commercial law*.—An outline of the law of real property, including deeds, mortgages, and wills; of the law of contracts; of negotiable instruments; of personal property, including sales and bailments; of agency, carriers, insurance, and trustees.

B. *Industrial and commercial corporations*.—A course of lectures treating of the distinctions between natural persons, partnerships, and corporations; modes of forming corporations; inviolability of charters; powers of corporations, and their officers and agents; fiduciary relations of their officers and agents; ultra vires acts; State control over corporations; rights of stockholders; relation of stockholders to each other; issue of stocks and bonds; sales and dealing in stocks; rights of creditors; quasi-public corporations, industrial trusts.

C. *Business organization*.—A study of the methods of business organization devised for the conduct of industrial undertakings. See also Course B (a) under Transportation and Course B (b) under Money and Banking for typical instances of the organization of great undertakings.

D. *Materials and facilities*.—Detailed study of the raw products that enter into manufactures, with their sources, costs, transportation facilities, and markets. Study of the costs and processes in the stages of manufacture from the raw material to the completed product. Investigation of the times, places, and opportunities for the sale of the manufactured product.

E. *Procedure*.—A series of lectures, contrasting business conditions before and after the formation of combinations, treated under the following topics: Former business conditions, suggestions as to the causes of failure in business, unintelligent competition, industrial consolidations, economic gains and losses of consolidations, the competition of the future, commercial integrity.

F. *Relation of the employer to labor*.—This course deals with the present relations of capital and labor in the United States. It investigates the statistics, organization and methods of trades unions, their temper and tendencies, together with strikes and lockouts. It considers attempts to improve the conditions of labor, and the relations of employer and employed, such as various methods of shop management, the model factory village, profit-sharing, and cooperation. The course is based on the belief that an understanding of the workingman's point of view is essential to the successful conduct of business.

G. *Materials of construction and motors*.—(a) Materials, source, use, preparation, testing and cost of wood, lime, cement, mortar, steel, steel-concrete construction, brick and building stones. (b) Motors, characteristics, adaptation and general construction of windmills, heat, steam, and electric engines, water wheels.

H. *Commercial correspondence*.—Training in business forms, and in the problems of correspondence which involve the correct use of terms and care in construction and expression.

COMMERCE.

A. *Descriptive and commercial geography*.—This course is designed to acquaint the student with so much of geographical knowledge as is needed in modern business relations. It involves a careful study of the geographical data at the basis of commercial and economic geography, with special reference to the number and quality of the various populations. Atlases and maps are studied in detail on the practical rather than the mathematical or scientific side.

B. *International trade*.—A study of international trade routes and the facilities employed, tariff laws of the more important trading countries, commercial treaties, and a consideration of America's competitive position in the markets of the world.

C. *International commercial law*.—The course comprises such general topics in private international law as are of practical importance to persons engaging in business in or with jurisdictions other than their own, together with more specialized instruction in the commercial codes of the principal European and Asiatic nations, including the organization of companies abroad, the provisions relative to American securities on the exchanges of Paris and Berlin, trade-marks, and the method of collecting debts from foreign debtors.

D. *Materials of commerce*. (a) *Economic chemistry*.—This will treat of the place of the chemist in the world's work, the source and history of the materials in the chemical industries, the struggle for existence, the utilization of by-products, the economic value of exact knowledge.

(b) *Economic botany*.—This will aim to cover some of the most important aspects of those economic botanical problems which have a large part in practical affairs and to demonstrate the place of the botanist in the commercial world.

Sugar, coffee, wheat, forestry, and allied topics will form the basis for a consideration of the botanical and agricultural questions involved, both in this country and abroad. Some attention will also be given to the conditions, natural and artificial, necessary for the successful establishment of these industries.

(c) *Economic mineralogy*.—This will treat of the origin, distribution, identification, mining, and reduction of ores, annual output, and practical application to arts and industries. The products treated will include quarry products, carbon minerals, such as coal and petroleum, the precious metals, the useful metals, ores of the alkaline earths, and alkalis, together with glass and sand.

E. *Consular service*.—For organization and duties of the consular service, see Law and Diplomacy, D.

F. *Statistics*.—For statistics of foreign and domestic commerce, see Sociology and Statistics, D.

TRANSPORTATION.

A. *History and theory of transportation*.—The history of railroad development in the United States and foreign countries, with a study of the great railroad systems of the world. Theories of rates, combination, consolidation, community of ownership, and government ownership and control, both here and abroad, including a study of the Interstate Commerce Commission and State commissions. Water transportation, lake, river, canal, and ocean, its history and present condition, and its position as an aid to and competitor of railroads.

B. *Railroad service*. (a) *Organization*.—The organization of a railroad for business, with a discussion of the duties of officers and employees.

(b) *Operation*.—Practical methods of operation, including a careful study of the regulations governing all forms of railroad service. A study of the traffic department, including systems of car accounting. Theories of rates and methods of forming classifications and rate schedules. Fast freight lines, joint rates, and various forms of railroad associations.

(c) *Accounting and auditing*.—See Course C, under Accounting and Auditing.

(d) *Mechanics*.—Study of the elements of railroad construction and maintenance and their costs. Details of locomotives and cars, their use, construction, and repair. Modern mechanical and safety devices, including brakes, couplers, signaling systems, and the like. Purchasing department, with consideration of properties of materials and railroad supplies.

(e) *Management*.—Competition, discrimination, pooling, combination, consolidation, state ownership or control.

C. *Water transportation (inland)*. (a) *Lakes and rivers*.—The service as a competitor of railroads. Character of lake and river traffic, its organization, facilities, rates, and influences upon industry. Projects for its development.

(b) *Canals*.—Their economic value, practical use and development within the country. Careful study of the isthmian canal problem.

MONEY AND BANKING.

A. *History and theory of money and banking*.—Special attention will be devoted to the financial legislation of the United States. The practical problems before the country will be briefly considered. Modern currency standards in operation in foreign countries.

B. *Practical banking*. (a) *Law*.—Detailed study of the bank laws of the United States, and of typical States, and of generally accepted banking practice.

(b) *Organization*.—The organization of a bank for business, with the duties and liabilities of its officers and employees. Comparative study of national, State, private, and savings banks, loan and trust companies. Clearing houses, their functions and administration.

(c) *Operation*.—Practical methods of operation. Forms of credit transactions, note issues, domestic exchange. Comparative study of English and continental banks.

C. *Modern banking practice*.—A study of the question from the banker's standpoint. See Corporation Finance and Securities, C.

PUBLIC FINANCE.

A. *Public finance*.—Methods of public administration. Public expenditure and revenue. Relation of the Treasury Department to the money market in the issuance of bonds and the placing of deposits. National, State, and municipal debt and taxation. Typical States and municipalities will be carefully studied.

CORPORATION FINANCE AND SECURITIES.

A. *Corporation finance.*—Forms of investment securities, methods of corporation "financiering," consolidation, bankruptcy, receivership, reorganization, general principles of investment.

B. *Money markets and speculation.*—Movements of money and rates of domestic exchange. New York as a financial center, and the influences affecting interest rates. Note and bill brokers. Theory of foreign exchange and the causes that determine rates. Methods of international payment, movements of capital, monetary standards of foreign countries as they influence international settlements. A study of the English money market. Panics, signs of their approach, and the methods of meeting them. Detailed study of stock and produce exchanges, including a comparison of the exchanges of England and the continental countries with those of the United States.

C. *Practical study of the market.*—This subject is considered from the banker's standpoint.

(a) The money market, including interest rates, exchange, modern banking methods and practice, crises and panics.

(b) The stock market, including investments, speculation, and financial humbug.

INSURANCE.

A series of lectures designed to illustrate the practical workings of insurance as conducted to-day in all its important forms, with special reference to the United States. After a brief discussion of the economic conception of insurance, its history, development, problems, and social service, attention will be given to fire and casualty insurance, to employer's liability and corporate suretyship, but special study will be devoted to its most highly developed form in life insurance. This will involve consideration of fundamental assumptions, rate making, policy construction, varied benefits, field management, advertisements, compensation, solicitation, medical selection, practical accounting, investments, office work, corporate management, State supervision, insurance law, insurance by the State. A critical estimate will be presented of the leading theories and different practices related to these questions, the object being to give a just estimate of the business and a comprehensive knowledge of its present-day workings.

THESIS.

A thesis embodying original research and representing study in the line of work which the student is especially pursuing will be required of every candidate for the certification of the school.

The members of the faculty of the Amos Tuck School and the subjects taught by them are as follows: Rev. William J. Tucker, D. D., LL. D., president; James F. Colby, A. M., LL. B., constitutional and international law; Justin H. Smith, A. M., modern history and diplomacy; David C. Wells, A. B., geography and labor problems; Warren A. Adams, Ph. D., German composition and conversation; George R. Wicker, Ph. D., finance and statistics; Frank H. Dixon, Ph. D., transportation, finance, and business organization; Wilbur C. Abbott, B. Litt., English history; John E. Allen, A. B., LL. B., commercial and corporation law; Prescott O. Skinner, A. M., French and Spanish composition and conversation; Homer E. Keyes, B. L., commercial correspondence.

The following lecturers and instructors were appointed for the year 1901-1902: Edwin J. Bartlett, A. M., M. D., Dartmouth College, economic chemistry; Charles H. Richardson, Ph. D., Dartmouth College, economic mineralogy; Charles A. Holden, C. E., Thayer School of Civil Engineering, materials of construction and motors; George T. Moore, United States Department of Agriculture, economic botany; Robert A. Woods, A. B., head of the South End House, Boston, Mass., municipal administration; Joseph A. De Boer, A. M., actuary of the National Life Insurance Company, theory and practice of life insurance; Marshall P. Thompson, A. B., LL. B., lawyer, Boston, Mass., international commercial law; J. Shirley Eaton, A. M., statistician of the Lehigh Valley Railroad Company, theory and practice of railroad accounting; Alfred L. Ripley, A. M., vice-president of the National Hide and Leather Bank, Boston, Mass., stock and money markets;

James Logan, general manager of the United States Envelope Company, Worcester, Mass., business methods; Gerald Wyman, A. M., professional accountant, Boston, Mass., accounts and accounting; Edward P. Comins, public accountant, Boston, Mass., accounting and auditing.

NEW YORK UNIVERSITY, NEW YORK CITY.

The School of Commerce, Accounts, and Finance was established in October, 1900, "to train men for the higher duties of commercial life." The course of study extends through two years, and leads to the degree of Bachelor of Commercial Science. The following outline of the subjects embraced in the curriculum is announced, subject to changes:

A. ACCOUNTING.

1. *Theory of accounts.*—Principles of accounting, purpose of accounts; single and double entry; the different books of accounts.

2. *Practice in accounting.*—Description and illustration of accounts of individuals; accounts of partners; accounts of corporations—commercial, financial, manufacturing, transportation, etc.; municipal accounts; State accounts; Federal accounts; receivership; trusteeship; executorship; liquidation, etc.; statement of affairs.

3. *Auditing.*—Methods of procedure in examination of accounts of individuals, partners, corporations, municipalities, etc.; verification of balance sheets and statements of profit and loss; special reports.

B. COMMERCE.

1. *Foreign commercial relations.*—Theory of international trade; history and development of commerce during the last two centuries; trade policies of foreign governments toward one another and toward colonial dependencies; foreign commerce of the United States; commercial treaties of United States with the countries of Europe; economic aspects of colonial development; foreign trade of America as affected by recent acquisitions of territory; commercial possibilities of the Orient and South America; consular service and regulations as affecting commerce; economic and commercial geography.

2. *Domestic commerce and transportation.*—History of transportation and of railway policies; economic and social bearings of present transportation problems; railway construction, speculative management, stocks and bonds; railway failures, receiverships, reorganizations, negotiations, profits; theories of rates, classification, discrimination, competition, combination-railway; employers' liabilities, labor relief, insurance, State ownership and management; comparative study of interests of inventors, of employees, of public, of State.

C. FINANCE.

1. *Money.*—Theory and history of money; functions of money as a medium of exchange and denominator of value; relation of prices to prosperity; Government paper money and fiat money; bimetallism *v.* monometallism; monetary experiences and legislation of the United States; the law of March 14, 1900.

2. *Credit and banking.*—Theory of credit and its relation to prices; history and theory of banking; development and functions of deposit banks; nature and services of the bank note; banking systems of Europe; national banking system and proposed reforms.

3. *Money market.*—Influences governing the rate of interest and prices of securities; relation of the money market to the United States Treasury; rules and practices of the New York Stock Exchange; produce exchanges and deals in futures; panics and commercial crises; theory of foreign exchange; payment between countries having different standards; international movements of gold and securities; arbitrage operations.

4. *Public finance.*—Revenues and expenditures of the various political units in America (local, State, national); chief features of public financial administration; history of financial development (Federal, State, and municipal); recent problems of State taxation.

D. COMMERCIAL LAW.

First year.—Elementary law (one hour per week); contracts (one hour per week).

Second year.—Commercial paper (one hour per week); corporations.

E. ADMINISTRATION.

1. General principles of business organization and management.
2. Administration of public business.
3. Ethics.

The faculty of the school consists of the following members: Henry M. MacCracken, D. D., LL. D., chancellor; Charles Waldo Haskins, C. P. A., dean and professor of auditing and of the history of accounting; Joseph French Johnson, A. B., secretary and professor of political economy; Charles E. Sprague, A. M., Ph. D., C. P. A., professor of the theory of accounts; Anson O. Kittredge, C. P. A., professor of theory of accounts and practical auditing; Ferdinand William Lafrentz, C. P. A., professor of auditing; Joseph Hardcastle, C. P. A., lecturer on accounts of trustees and executors; J. Shirley Eaton, A. M., lecturer on domestic commerce and transportation; William Clarence Webster, Ph. D., lecturer on theory, history, and geography of commerce; Cleveland F. Bacon, A. B., LL. B., lecturer on law (elementary law and contracts); William F. Walsh, A. B., LL. B., lecturer on law (commercial paper and corporations); Leslie J. Tompkins, M. S., LL. M., registrar; Clarence N. Jones, A. M., lecturer on life insurance; Morris Putnam Stevens, LL. B., lecturer on law.

OHIO STATE UNIVERSITY, COLUMBUS, OHIO.

The course in commerce and administration extends through four years and leads to the degree of Bachelor of Philosophy. The studies included in the course are as follows:

First year.—French, German, European history, algebra, trigonometry, analytics, calculus, rhetoric.

Second year.—French or German, United States history, elementary economics, history of England, rhetoric, English literature, and one of the following: Botany, general chemistry, physics, zoology.

Third year.—Elementary law (or commercial law and private and municipal corporations), philosophy, contracts, or any two of the following: Private corporations, insurance, agency, sales, and mortgages. Electives: Economics, German, history, political science, rhetoric, romance languages. Four hours per week are devoted to the major subject elected by the student.

Fourth year.—Five hours per week are devoted to the major subject and ten hours to studies chosen from the electives enumerated under third year.

CENTRAL HIGH SCHOOL, PHILADELPHIA, PA.

The department of commerce was inaugurated in September, 1898. It has a four years' course of study leading to the degree of Bachelor of Science, as follows:

FRESHMAN YEAR.

English.—Composition writing, with a study of classical literature in translation and of American literature, 4 hours.

Latin.—Elements of Latin and easy readings, 4 hours.

Mathematics.—Algebra, 5 hours.

History.—Greek and Roman history and European history to 800 A. D., 3 hours.

Science.—Raw materials of commerce (animal, vegetable, and mineral products), 4 hours.

Economics.—Philadelphia history, government, and business interests (lectures and quizzes), 2 hours.

Business technique.—Business forms, with penmanship. Practice, 2 hours.

SOPHOMORE YEAR.

English.—History of English literature, with composition writing, 3 hours.
German.—Grammar, reading, and conversation, 5 hours.
Mathematics.—Advanced commercial arithmetic, including mensuration and the metric system, 2 hours. Elements of geometry and trigonometry, 3 hours.
History.—English and modern European history, 3 hours.
Science and economics.—Commercial geography, 2 hours. Trade centers of the world—lectures in connection with the course on commercial geography, 1 hour.
Business technique.—Bookkeeping, 3 hours. Stenography, 2 hours. Typewriting (optional).

JUNIOR YEAR.

English.—Readings from English literature, with essay writing, 2 hours.
German.—Reading, composition, and conversation, 3 hours.
Romance languages.—Spanish or French, 4 hours.
History.—American history, 2 hours.
Science.—Physics and chemistry, 4 hours.
Economics.—Political economy, 2 hours.
Business technique.—Mechanical drawing, 2 hours. Observation of and report on office practice, business methods, etc., 3 hours. Stenography, 2 hours. Typewriting (optional).

SENIOR YEAR.

English.—Readings from literature and thesis writing, 3 hours.
German.—Advanced reading, conversation, and correspondence, 3 hours.
Romance languages.—Spanish or French, 3 hours.
History.—Modern industrial and commercial history (of the United States and England), 3 hours.
Science.—Industrial chemistry, 2 hours.
Economics and political science.—Transportation, banking and finance, 4 hours. Statistics (in connection with thesis writing), 1 hour. Study of government (chiefly of cities), 3 hours.
Business technique.—Ethics of business and commercial law, 2 hours.

DREXEL INSTITUTE, PHILADELPHIA, PA.

The department of commerce and finance offers a liberal and thoroughly practical course of study, including two years' training in a knowledge of the world's industries and markets, the laws of trade and finance, and the mechanism and customs of business. Besides the systematic course of two years, there are three distinct office courses, each occupying one year and leading to a specific line of employment. A course is offered for teachers who wish to fit themselves for commercial high-school work.

Applicants for admission to any of the courses, except the commercial course for teachers, must pass satisfactory examinations in English grammar and composition, geography, arithmetic, and United States history, and must be at least 16 years of age. The diploma of high schools of approved standing is accepted in place of an examination.

I. COURSE IN COMMERCE AND FINANCE.

The aim of the course in commerce and finance is to give young men and young women thorough fundamental training for the activities of business, which include: (1) The production, manufacture, sale, and transportation of articles of commerce; (2) the management of stock companies and corporations; (3) the buying and selling of securities; (4) the importing and exporting of merchandise; (5) the borrowing and lending of money and credit; (6) the advertising of commercial concerns; (7) the keeping of business records; (8) a knowledge of the Spanish language.

The work of the course is divided into two years, as follows:

JUNIOR YEAR.

First term.

English language.—Composition; letter-writing. American classics.
Commercial arithmetic.—Weights and measures; metric system; trade standards and prices; wages and pay rolls; commercial interest and discount; speed practice.

Business customs.—Invoices; commercial paper; bills of lading and manifests; vouchers.

Bookkeeping.—Principles and practice of single and double entry; simple transactions; business forms.

Penmanship.—A plain, rapid business hand.

Typewriting.—Word exercises; study of mechanism of machine; transcribing from rough draft.

Correspondence.—Mechanical arrangement and style of business letter; exercises in condensing and expanding.

Commercial geography.—Physical and mathematical geography in their relations to commerce. Commercial geography of the United States.

Spanish language.—Elementary grammar, oral and written exercises; vocabulary.

Second term.

English language.—Grammatical principles; diction. Selected classics.

Industrial arithmetic.—Measurements; builders' and contractors' bids and estimates; scientific measurements; manufacturers' and mechanics' estimates; metric system.

Business customs.—Securities; collections; discounts.

Bookkeeping.—Principles and practice of single and double entry in more complicated transactions. Shipments, consignments, and business forms.

Commercial calculations.—Practical exercises for acquiring rapidity and accuracy of work.

Commercial geography.—Industrial and economic geography of the United States, special attention being given to the new dependencies. Study of the world's commercial staples, raw and manufactured.

Spanish language.—Grammar, oral and written exercises, vocabulary, reading; business letters and business forms.

Penmanship.—Continued.

Typewriting.—Continued.

Correspondence.—Letters relating to contracts, purchases and sales, recommendations, introduction, credit; circulars, telegrams.

Public speaking.—One hour a week throughout the year.

Physical training in the gymnasium twice a week throughout the year.

SENIOR YEAR.

First term.

English language.—Rhetorical principles; synonyms; essay writing.

Advanced bookkeeping.—Importing and jobbing; wholesale and retail; manufacturing, real estate, joint stock companies, corporations, banking, etc. Introducing order book, cashbook, invoice and sales register, special column journal, bill book.

Banking and finance.—Outlines of the history of banking and of the national banking system, State banks, savings banks, trust and financial companies; foreign banking; banking in its relations to foreign trade.

Commercial arithmetic.—Financial problems involving partial payments; buying and selling exchanges; stocks and bonds; equating of accounts; adjusting of partnership, joint stock company, and corporation accounts.

Commercial geography.—A comparative study of the commerce and industry of the great commercial nations of the world.

History of commerce.—Outlines of the history of ancient, mediæval, and modern commerce, with special reference to the history of American commerce.

Civics.—Principles and practical operation of government in the United States.

Spanish language.—Grammar, conversation, reading, correspondence.

Typewriting.—Arrangement of papers.

Second term.

English language.—Paragraph—its sum and structure. Study of selected plays of Shakespeare.

Advanced bookkeeping.—Continued.

Commercial arithmetic.—Continued.

Banking and finance.—Bank management, mechanism and practice of banking; the clearing house; currency reform.

Commercial geography.—Continued. Special studies requiring independent research.

Mechanism of commerce.—Boards of trade; stock and produce exchanges; trans-

portation; interstate commerce; warehousing; importing and exporting; duties; exchange; mercantile agencies.

Commercial law.—Elementary principles of contracts and negotiable paper, and the leading principles which regulate the relations of the business man—principal and agent; carriers; commission merchants; partnerships; joint stock companies; corporations.

Civics.—Principles and practical operation of government in the United States; history, principles, and organization of political parties; civil service; ballot systems; representation systems; municipal government.

Business printing and advertising.—Type and paper; printers' estimates; proof-reading; business cards, circulars, and catalogues. Modern advertising, including mediums, rates, agencies.

Spanish language.—Reading, conversation, correspondence.

Public speaking.—One hour a week throughout the year.

Physical training in the gymnasium twice a week throughout the year.

There are evening classes in the Spanish, French, and German languages, to which students of the department may be admitted on the payment of a fee of \$6 for each language.

Students may elect to do special work in chemistry at the discretion of the director in charge.

The stereopticon is freely used in the class room as an aid in teaching the history and mechanism of commerce, commercial geography, and other subjects.

During the senior year visits are made to some of the leading industrial and commercial establishments of Philadelphia, and systematic use is made of the Philadelphia commercial museums in the study of commercial geography.

The diploma of the institute is granted to students who complete the course in commerce and finance and pass the prescribed examinations.

II. COMMERCIAL COURSE FOR TEACHERS.

In order to meet the growing demand for specially trained commercial teachers, the institute offers instruction to men and women who wish to equip themselves for entrance upon the new and widening field of commercial work in high schools and academies.

For admission to this course, the applicant must have had at least two years' experience in general teaching, or must have been graduated from a State normal school of approved standing.

Students who enter this course are given special consideration by the professors and instructors of the department, generous assistance being given in methods of teaching, the preparation of outlines and courses, and the bibliography of the several subjects.

The course occupies one year, divided into two terms, and includes the following subjects:

English language.—Rhetorical principles; essay writing; selected plays of Shakespeare.

Bookkeeping.—Principles and practice of single and double entry; business forms; importing and jobbing; wholesale and retail; manufacturing, real estate, joint stock companies; corporations; banking, etc. Introducing order book, cash book, invoice, and sales register, special column journal, bill book.

Commercial arithmetic.—Financial problems involving partial payments; buying and selling exchanges; stocks and bonds; equating of accounts; adjusting of partnership, joint stock company, and corporation accounts.

Banking and finance.—Outlines of the history of banking and of the national banking system; State banks, savings banks, trust and financial companies; foreign banking; banking in its relations to foreign trade; bank management, mechanism, and practice of banking; the clearing house; currency reform.

Commercial geography.—Physical and mathematical geography in their relations to commerce; industrial, commercial, and economic geography of the United States; comparative study of the commerce and industry of the great commercial nations of the world; special studies requiring independent research.

History of commerce.—Outlines of the history of ancient, mediæval, and modern commerce, with special reference to the history of American commerce.

Commercial law.—Elementary principles of contracts and negotiable paper, and the leading principles which regulate the relations of the business man—principal and agent; carriers; commission merchants; partnerships; joint stock companies; corporations.

Mechanism of commerce.—Boards of trade; stock and produce exchanges; transportation; interstate commerce; warehousing; importing and exporting; duties; exchange; mercantile agencies.

Civics.—Principles and practical operation of government in the United States; history, principles, and organization of political parties; civil service; ballot systems; representation system; municipal government.

Stenography.—Theory of Pitman system; special emphasis upon methods of teaching the subject.

Typewriting.—Word exercises; study of leading typewriters; transcribing from rough draft; arrangement of papers; instruction in duplicating processes; letter press; office practice.

Penmanship.—A plain, rapid business hand.

Should the student's time admit, the Spanish language may be added to the course.

The diploma of the institute is granted to students who complete the commercial course for teachers and prepare an acceptable thesis upon an assigned commercial topic.

III. OFFICE COURSES.

Three distinct office courses are offered. These are thoroughly practical in character, and are adapted to prepare young men and young women for entering immediately upon the respective lines of employment to which the training leads.

Private secretary course.—This course has been organized to respond to applications that are made to the institute for clerks fitted to do work of a more general character and of a higher grade than that required in a purely business office. Applicants for admission must show by examination, or otherwise, that they are prepared to profit by the training given in this course.

The course occupies one year, divided into two terms, and includes the following subjects:

Stenography.—First term: Theory of Pitman System; daily drill in phonetics. Second term: Practice of the art by means of carefully graded dictation exercises, and daily transcript of notes.

Typewriting.—Word exercises; study of leading typewriters; transcribing from rough draft; arrangement of papers; instruction in duplicating processes; letter press; office practice.

English language.—Rhetorical principles; essay writing; collection and arrangement of material; criticism of manuscript; English classics.

Spanish language.—Grammar, oral and written exercises; reading, correspondence, business letters and business forms.

Business printing.—Type and paper; printers' estimates; proof-reading.

Accounts, business forms and customs.—Elements of single and double entry bookkeeping; invoices, commercial paper, vouchers, etc.

Correspondence.—Arrangement and style of business letters; letters of recommendation, introduction, etc.; circulars, telegrams.

Penmanship.

Public speaking.—One hour a week, for young men.

Physical training in the gymnasium, twice a week.

¹ Part of second term.

Bookkeeping course.—The object of this course is to prepare young men and young women for positions as bookkeepers. It occupies one year, divided into two terms, and includes the following subjects:

Bookkeeping.—Single and double entry; use of auxiliary books; order books, cashbooks, invoice and sales register, bill book, special-column journal, etc.

Commercial arithmetic.—Weights, measures; metric system; builders', manufacturers', mechanics' estimates; partial payments; exchanges, stocks, bonds, partnerships; joint-stock companies and corporations; speed practice.

Business forms and customs.—Invoices, commercial paper, bills of lading, and manifests; vouchers.

English language.—Composition; letter writing; grammatical principles. American classics.

Correspondence.—Arrangement and style of business letters; letters of recommendation, introduction, etc.; circulars, telegrams.

Penmanship.—A plain, rapid business hand.

Typewriting.—Word exercise; mechanism of machine; transcribing from rough drafts; arrangement of papers.

Public speaking.—One hour a week, for young men.

Physical training.—In the gymnasium, twice a week.

Stenography course.—The aim of this course is to train young men and young women for positions as stenographers. There is a growing demand among business men for stenographers who can not only take down and typewrite correspondence, but who have a serviceable knowledge of good English and who are intelligently trained along general educational lines.

The course occupies one year, divided into two terms, and includes the following subjects:

Stenography.—First term: Theory of Pitman System; daily drill in phonetics. Second term: Practice of the art by means of carefully graded dictation exercises and daily transcript of notes.

Typewriting.—Word exercises; study of leading typewriters; transcribing from rough draft; arrangement of papers. Instruction in duplicating processes; letter-press; office practice.

English language.—Composition; letter-writing; grammatical principles. Selected American or English poets.

Accounts, business forms, and customs.—Elements of single and double entry bookkeeping; invoices, commercial paper, vouchers, etc.

Correspondence.—Practice in writing business letters, orders, and telegrams.

Penmanship.

Public speaking.—One hour a week, for young men.

Physical training.—In the gymnasium, twice a week.

Total	21

Certificates are granted to students who complete any one of the office courses and pass the prescribed examinations.

COMMERCIAL MUSEUM.

A beginning was made in 1895 toward the formation of a permanent commercial museum, and a large collection of raw and manufactured products has already been secured. The collection represents quite fully the following industrial products: Flour, wool, petroleum, teas and coffees, sugar, cotton, copper, iron and steel, glass, tobacco, leather, rubber, paper, wood, carpet, linen, spices, aluminum, building stone, brick and terra cotta. Additions are constantly being made, and the student who is looking forward to devoting his life to trade, shipping, or manufacturing, has opportunity, in connection with his academic work, to make a special study, from both a geographic and an economic standpoint, of the particular industry in which he is interested.

The instructors in the department of commerce and finance are as follows: Parke Schoch, A. M., director, professor of the history and mechanism of commerce, and stenography; Jonathan J. Sparling, professor of the theory and practice of accounts; Carl L. Altmaier, professor of commercial law and instructor in correspondence and typewriting; John T. Holdsworth, professor of commercial geography and banking; Harriet L. Mason, professor of English language and literature; Calixto Guitéras, C. E., professor of Spanish; Carolyn H. Locke, instructor in stenography; Alice E. Chase, A. B., instructor in English; Lillian M. Dalton, instructor in English.

UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PA.

The Wharton School of Finance and Economy was founded in 1881 by Joseph Wharton, esq., of Philadelphia, who expressed the desire that it should offer facilities for obtaining (1) "An adequate education in the principles underlying successful civil government." (2) "A training suitable for those who intend to engage in business or to undertake the management of property." The regular course of study extends through four years, leads to the degree of Bachelor of Science, and is as follows:

¹From which each student must choose sixteen hours in each term.

The instruction offered in some of the technical subjects is as follows:

GEOGRAPHY AND COMMERCE.

American commerce and commercial relations.—The history of American commerce. An analytical study of the present trade of the United States with different sections of the world, and an investigation of the commercial treaties in force between the United States and the leading foreign nations. The latter part of the course deals with commercial policy. Lectures, assigned readings, and reports. Elective for juniors and seniors in finance and economy. Two hours.

European commerce and commercial relations.—A history of European commerce. An analytical study of the present commerce of Great Britain, France, Germany, and Russia. A study of the commercial policy and commercial relations of European countries with special reference to their relation to American commerce. Elective for seniors in finance and economy. Two hours.

Transportation.—A study of the American railway system, the several branches of the railway service, and the questions of public aid and public control. A study of inland navigation and ocean shipping, with special reference to the United States. Lectures, assigned readings, and reports. Elective for seniors in finance and economy. Two hours.

Geography of commerce.—A study of the economic and commercial geography of the United States, and of the organization and routes of our international trade. The leading industries of the different sections of the country are considered, and a study is made of the foreign trade to which those industries give rise. Lectures, assigned readings, and reports. Elective for sophomores in finance and economy, and required of second-year specials in banking. Two hours.

Physiography.—(a) *Land sculpture:* A treatment of the forces and laws of land sculpture, with special application of the United States. (b) *The principles of*

meteorology: The charting of weather elements and interpretation of weather maps. Lectures, readings, and map construction. Freshmen in finance and economy, and first-year specials in banking. Two hours.

Economic geography of America.—The geologic structure of America, with results in topography and soils. The distribution of heat and moisture resulting in forests, farms, and grazing lands. Distribution of minerals and of soils, and of plant and animal life, determining the settlement and industrial development of the country. Facilities for transportation and communication; harbors, common roads, railways, and canals. The location of great trade centers. Action and reaction between man and his environment. Elective for juniors and seniors in finance and economy, and second-year specials in banking. Two hours.

BUSINESS PRACTICE.

Bookkeeping and office methods.—Theoretical and practical bookkeeping; practice employed in different forms of business, mercantile, manufacturing, and banking. Lectures and bookkeeping practice. Three hours (first term).

Corporation accounting.—Lectures on the elements of corporation accounting, supplemented by the examination of the accounts of railway and industrial corporations. Three hours (second term).

Industrial management.—The organization and management of industry and trade. A study of the practice of business. Lectures, assigned readings, and reports. Elective for juniors and seniors in finance and economy, and required for second-year specials in banking. Two hours.

Business law and contracts.—Post seniors in civil and mechanical engineering, seniors in the four-year engineering courses, and in chemistry. Sophomores in finance and economy, and second-year specials in banking. One hour.

Banking practice.—The practice of banking in the United States; forms and methods; duties of officers and employees; organization of banks, functions and machinery of the clearing house, etc. Bolles's Practical Banking. First-year specials in banking. Two hours (first term).

FINANCE.

Public finance.—A course on public revenue and public expenditures, with special reference to the financial systems of the United States, of Pennsylvania, and of Philadelphia. Adams's Public Debts. Seniors in finance and economy, and in arts and science in the economics, social science, and law group, and second-year specials in banking. Two hours.

Money, credit, and foreign exchange.—The phenomena of the money market in their relation to trade, industry, and speculation. The principles regulating the flow of gold and currency in domestic and international settlement. The machinery of the domestic and foreign exchanges. Goschen's Foreign Exchange. Clare's A B C of Foreign Exchange. Sophomores in finance and economy, and second-year specials in banking. Two hours.

Principles of private finance.—The acquisition and expenditure of private funds. What forms of money and credit may be used as funds; the instruments used in procuring funds; the institutions and agents employed in funding operations; settlements made between funding agents. Lectures, special assignments, and class discussion. Seniors in finance and economy and second-year specials in banking (first term).

The financiering of trusts and industrial corporations.—A study of the financial methods peculiar to the industrial corporation and of the special advantages of the several financial methods that may be properly employed. Special attention is given to the methods employed in the financiering of trusts. Lectures, assignments, and class discussion. Elective for seniors in finance and economy and second-year specials in banking. Two hours.

History of banking in Europe.—After a general survey of the money and credit systems among the ancients and in the middle ages the course takes up the great European systems. Beginning with the history of banking in Italy, this is followed by that of the Bank of Amsterdam, banking in England, France, Austria-Hungary, Germany, Russia, and the Scotch system; Conant's History of Modern Banks of Issue; lectures and assignments; juniors in finance and economy, and second-year specials in banking. (First term.)

History of banking in the United States.—This course first takes up the banking experience during colonial days. In the subsequent development special stress is thrown on the history of "The first and second Banks of the United States," "The New England banking system," "The safety-fund system," the "Free-

banking system," the "National banking system." and present tendencies in banking. Knox's History of Banking; Report of Monetary Commission; lectures and assignments. Juniors in finance and economy, and second-year bankers. (Second term.)

Investment and speculation.—The nature, methods, and law of investment, and of the relation of speculation to investment. The relative merits of railway stocks, bonds, farm mortgages, street railways, gas and water securities, municipal and county bonds, etc., as investments receive special attention. Lectures, assignments, and class discussion. First-year specials in banking, and elective for sophomores in finance and economy. Two hours (second term.)

Railway finance.—A study of the financial operations in promotion, construction, operation, and consolidation of railway companies, including bankruptcy, receiverships, and reorganization. Lectures. Poor's Manual and Commercial and Financial Chronicle. Elective for sophomores in finance and economy and for first-year specials in banking. Two hours (first term)

The faculty of the Wharton School is as follows: Charles C. Harrison, LL. D., provost; Edgar F. Smith, Ph. D., Sc. D., vice-provost; Josiah H. Penniman, Ph. D., dean; Simon N. Patten, Ph. D., professor of political economy; John Bach McMaster, A. M., Litt. D., professor of American history; Edward P. Cheyney, A. M., professor of European history; Emory R. Johnson, Ph. D., assistant professor of transportation and commerce; Samuel M. Lindsay,¹ Ph. D., assistant professor of sociology; Leo S. Rowe, Ph. D., assistant professor of political science; Henry R. Seager, Ph. D., assistant professor of political economy; James T. Young, Ph. D., instructor in administration; Albert S. Bolles, Ph. D., LL. D., lecturer on banking law and practice; William E. Lingelbach, Ph. D., instructor in European history; Frederick A. Cleveland, Ph. D., instructor in finance; Edward S. Meade, Ph. D., instructor in business practice; J. Paul Goode, Ph. D., instructor in geography; George W. Scott, A. B., assistant in public law.

UNIVERSITY OF SOUTH DAKOTA, VERMILION, S. DAK.

The College of Commerce offers a course of study extending through two years and leading to the degree of Bachelor of Commerce. Admission to the course is granted to persons who have completed the preparatory course, substituting shorthand, bookkeeping, and typewriting for foreign languages.

The course of study is as follows:

Junior year.—Commercial law and legislation; commercial arithmetic; English; political economy; commercial geography; transportation.

Senior year.—Banking; insurance; economic history; finance; corporations; parliamentary law; one elective.

The instruction offered in some of the commercial branches is as follows:

Commercial and industrial geography.—Natural products of the world, by countries; methods for preparing these products for the market; manufactured articles, where and how made; where raw materials are obtained; what are or may be markets for these products or materials; comparative study of great commercial centers and nations; business methods in foreign countries; prices, tariffs, means of communication, etc.

Transportation.—Development and present status of railroads, canals, steamboats, and steamship lines; their relation to individual shippers and to industry and commerce.

Commercial law.—Elements of law, the feudal system and customs of ancient traders; contracts, negotiable papers, agency, partnership, guaranty, lien, usury, etc.

Commercial legislation.—Commercial legislation passed by Congress and other legislative bodies; commercial treaties; State legislation, Western States, especially South Dakota.

¹ Appointed commissioner of education of Porto Rico.

Banking.—History of banking; national, State, savings, and private banks; trust, investment, and mortgage companies; foreign banking systems; bank papers and records; clearing houses; analysis of proposed banking reforms.

Insurance.—Life, fire, and marine insurance; nature of policies issued under each system; examination of insurance contracts and of insurance companies' reports.

Corporations.—Purpose and organization of corporations, trusts, and monopolies; charters, powers, rights, and duties of each; effect on commerce, benefits and injuries; proposed legislation; method of keeping records and distributing funds.

UNIVERSITY OF THE SOUTH, SEWANEE, TENN.

The course in finance and economy is designed to cover a period of two years. Instruction is given in the following branches: Bookkeeping, banking, commercial law, finance, political economy, history, English, commercial arithmetic, typewriting, stenography, and telegraphy.

AGRICULTURAL COLLEGE OF UTAH, LOGAN, UTAH.

This institution offers two commercial courses; a four-year course leading to the degree of Bachelor of Science, and a short course of two years.

The subjects included in the four-year course are as follows:

Freshman.—Grammar, rhetoric, literature, algebra, geometry, history, physics, drawing, shopwork.

Sophomore.—Chemistry, rhetoric, solid geometry and higher algebra, trigonometry, analytical geometry, civil government and constitutional law, anatomy and physiology, surveying.

Junior.—Heat and electricity, or stenography, agricultural chemistry or stenography, German, calculus, botany, psychology, zoology, history of commerce, science of accounts, physics, bookkeeping.

Senior.—Physiological botany, commercial law, German, geology, literature, commercial calculations, political economy, stenography or business practice, stenography or business customs, stenography or auditing and experting of accounts, typewriting.

The short course of two years includes all of the commercial branches assigned to the four-year course, but contains much less of general culture studies.

The instruction given in some of the commercial branches is as follows:

Business customs.—The fundamental principles of bookkeeping are applied according to modern ideas of business. The subjects of banking, securities, exporting and importing, railroading, business correspondence, and everyday business transactions are carefully examined from a practical standpoint.

History of commerce.—Careful study of the principal countries of the world from which such staple articles of commerce as food, textile and mineral substances, metals and manufactured products are obtained. The student notes the kinds and amount of such products from those countries, and the dependence of each upon every other for the necessaries and luxuries of life; he learns how markets are created and controlled; how waterways and railways afford a ready means of transportation and influence; and how the improved mail, postal, telephone, and telegraph services facilitate the interchange of thought and also influence trade. Statistics are gathered showing the magnitude of the world's production. Practical commercial problems of the day are discussed.

Political economy.—The economic laws of trade, the general principles of political economy technically applied to commerce, and general business methods are carefully examined.

Commercial law.—Customs and the law of the nature, formation, operation, interpretation, and discharge of contracts, including agency, partnership, corpo-

ration, bills, notes and checks, purchase and sale of personal property, guaranty or suretyship, limitation of the time to sue, commission merchants and brokers, agreements for personal services, bailments, insurance, telegraphic communication, patents, copyright, trade marks, real-estate conveyances, and the business and legal forms that are used to carry on trade.

UNIVERSITY OF VERMONT, BURLINGTON, VT

The course of study in commerce and economics extends through four years and leads to a baccalaureate degree. The freshman and sophomore years are the same as those of the general culture courses of the university. The junior and senior years are as follows, the students being expected to take sixteen hours per week:

Junior year.—Required: Economics, 3; modern languages, 3; English, 1; American civil institutions, 3; accounting, 3. Elective: History, 3; logic, 3; mathematics, 3; physics, 4; sociology, 3.

Senior year.—Required: Economics, 3; constitutional law and comparative politics, 2; international law, 2; money, banking, and international trade, 3. Elective: History, 3; sociology, 3; commercial law, 2; modern languages, 3; English, 2.

UNIVERSITY OF VIRGINIA, CHARLOTTESVILLE, VA.

This institution offers a course of study extending through three years for young men who desire to be prepared to enter the consular service of the United States. The course does not lead to a degree, but a certificate of proficiency is given on the completion thereof. The course is as follows:

1. French, German, Spanish, Italian.
2. Modern history, economics, general and industrial chemistry.
3. Constitutional and international law, contracts, criminal law, persons and wills, conflict of laws.

Under the general subject of economics are studied the general principles of economic science (Walker), money and banking (White), public finance (Plehn), protective tariffs (Sherman), monopolies and trusts (Ely).

WASHINGTON AGRICULTURAL COLLEGE, PULLMAN, WASH.

The course of study of the School of Business extends through two years and includes the subjects of penmanship, commercial geography, banking, commercial arithmetic, grammar and composition, rhetoric, typewriting, stenography, algebra, general history, commercial law, economics and industrial history, orthography and punctuation, and French, German, or Spanish.

WEST VIRGINIA UNIVERSITY, MORGANTOWN, W. VA.

The commercial school was established in 1895. The course of study extends through two years and includes instruction in chemistry, English, commercial geography, economics, botany, freehand drawing, bookkeeping, commercial law, bank accounting, shorthand, typewriting, history of commerce, physics, and geology.

The instruction in commercial law, commercial geography, and history of commerce is as follows:

Commercial law.—Contracts, negotiable paper, bailments and suretyships, agency.

Commercial geography.—A description of the surface of the earth, with special reference to the production, manufacture, transportation, and exchange of articles of trade. A general outline of the countries of the world, soil, climate, agricultural products, forests, manufactories, quarries, mines, centers of industry, foreign relations, ways of communication, social relations and conditions, imports, exports, and markets. Special attention is given to the study of the United States, area, climate, position, population, natural resources, raw products, man-

ufactures, waterways, railways, seaports, exports, imports, reason for rapid growth of Western cities, industrial possibilities.

History of commerce.—History of commerce; methods of exchange in ancient times; shipping of the ancients; fairs and markets; results of maritime discoveries, changing the commercial routes; international treaties affecting commerce; scientific and industrial discoveries affecting commerce; trade restrictions; consuls and modern commerce; boards of trade; stock and produce exchanges; modern transportation; freight express companies; insurance; modern modes of preparing and shipping articles of merchandise; circulation of commodities between cities and countries; trade statistics; dependence of manufactures upon producers of raw material; nomenclature of commerce.

UNIVERSITY OF WISCONSIN, MADISON, WIS.

The School of Commerce was established in 1900 for the purpose of supplying "facilities for the training of young men who desire to enter business careers, especially in such fields as domestic and foreign commerce and banking, or branches of the public service, like the consular, in which a knowledge of business is essential."

The course of study extends through four years and leads to the degree of Bachelor of Commercial Science. The studies of the school are grouped in three classes: (1) Those required of all students, no matter what business they desire to enter. (2) Specially arranged and correlated electives leading to the particular business which the student intends to enter. (3) Free electives chosen for the purpose of general culture.

I. REQUIRED STUDIES.

The courses belonging to this group are of three sorts:

(a) Those needed as a foundation or preparation for more technical courses which are to follow. Under this head fall the courses in trigonometry, chemistry, physics, mediæval, modern, and American history, and economic geography. Trigonometry is needed in the study of physics; chemistry is essential to the study of the materials of commerce and their adulterations, and physics lays the foundation for the study of the generation and transmission of power, materials of construction, etc. The courses in history and economic geography are essential to the successful study of the subjects enumerated under (b), and they are also of direct practical advantage in extending the student's horizon and in giving him such an acquaintance with national habits and characteristics and such skill in the interpretation of men and events as are essential to the highest success in business.

(b) This group includes a number of courses designed to acquaint the student with the structure of the business and commercial world, and with the methods of conducting modern business enterprises. Under this head fall the courses in the industrial history of England, the history of commerce, business forms and accounts, transportation, banking and the mechanism of exchange, business organization and management, commercial law and economics.

(c) The studies belonging to this group are as essential to the general equipment of the business man, no matter what particular branch of business he pursues, as those mentioned under (a) and (b). It includes German, French, and Spanish. In one of these languages, at least, he must acquire such facility in reading, speaking, and writing as will enable him successfully to conduct business in the countries in which the language he has learned is spoken. An opportunity to elect a second language is open to students after the freshman year. For the coming year, besides the above-named languages, Italian and Russian are available for such election. This group also includes a series of graded courses in the study of English, designed to enable the student to use his mother tongue fluently and correctly. It includes also a course in the generation and transmission of power, designed to give the business men who graduate from this school a knowledge of the natural sources and limitations of water, steam, and electric power, and of the important place which these physical agencies occupy in the successful conduct of business enterprises.

A careful, technical study of some group of products is also required of all students. So far as possible, each one will be allowed to select the group in which he is most interested and which will best fit him for the business he expects to

follow. As an indispensable aid to studies of this sort a commercial museum is being accumulated. The university already possesses a collection of about 5,000 economic plants with samples of the products into which they enter and materials for the illustration of the processes of their manufacture, and the beginnings of a valuable chemical collection which will be made the basis of a technical study of the most important chemical industries. Two courses are available for election based upon these two collections respectively. Other courses along this line will be offered as the commercial museum grows.

II. TECHNICAL ELECTIVES.

In addition to the studies enumerated above and required of all students, groups of courses have been arranged extending throughout the junior and senior years and designed to furnish special preparation for particular lines of business. Each student is required to elect one of these groups. Two such groups are available, one preparatory to the business of banking and the other to the consular service.

The first mentioned group consists of the following courses: (a) The elements of money and banking; (b) the history of the currencies of the chief modern nations; (c) corporation finance and securities; and (d) commercial crises with especial reference to their influence upon the banking business.

The consular group consists of the following courses: (a) international law; (b) commercial geography of Europe; (c) history of diplomacy; (d) history and characteristic features of the consular services of the chief foreign countries; (e) the consular service of the United States.

The school also expects to offer one or more courses of lectures by specialists on various phases of South American and West Indian commerce designed to be of especial value to young men who may desire to engage in commerce in those parts of the world.

III. FREE ELECTIVES.

From three to five hours per week, beginning with the second semester of the sophomore year and extending throughout the junior and senior years, will be available to the students of this school for free electives. A large number of courses in the various departments of the university will be open to them, and they will be urged to make such selections as will contribute most to the increase of their general culture and to the extension of their knowledge along lines not represented in the required work of the school.

ARRANGEMENT OF STUDIES.

The arrangement of studies for the academic year 1901-2 is as follows (the figures indicate number of hours per week):

Freshman year.—First semester: Economic geography, 4, or American history, 4; German, French, or Spanish, 4; English, 3; trigonometry, 2; chemistry, 3; drill and gymnastics, 2. Second semester: Economic geography, 4, or American history, 4; economic history of England, 2; language (continued), 4; English, 3; chemistry, 3; drill and gymnastics, 2.

Sophomore year.—First semester: History of commerce, 2; mediæval history, 3; business methods and accounts, 2; language (continued), 2; English, 2; physics, 5; drill and gymnastics, 2. Second semester: Business organization and management, 2; elementary economics, 3; modern history, 3; language (continued), 2; physics, 5; elective, 2; drill and gymnastics, 2.

Junior year.—First semester: Money and banking, 3; transportation, 2; generation and transmission of power, 3; language (continued), 2; technical elective, 3; free electives, 5. Second semester: Commercial law, 3; transportation, 2; nineteenth century history, 3; language (continued), 2; technical elective, 3; free electives, 5.

Senior year.—First semester: Commercial law, 2; materials of commerce, 3; language (continued), 2; thesis, 2; technical elective, 3; free electives, 6. Second semester: Commercial law, 2; materials of commerce, 3; language (continued), 2; thesis, 2; technical elective, 3; free electives, 6.

OUTLINE OF COURSES IN ECONOMIC HISTORY, GEOGRAPHY, AND COMMERCE.

Economic history of England.—Begins with a study of the economic life of England as depicted in the doomsday survey, and, with this as a basis, traces the most important changes in the agricultural, manufacturing, and commercial life

¹ Students who take economic geography the first semester will take American history the second, and vice versa.

of the country from that time to the present. Scott's Syllabus of Lectures and Gibbon's Industry in England. Repeated each semester. Lectures twice a week; quiz once a week.

The history of commerce: (a) The development of the world's commerce from ancient times to the Napoleonic era.—Special attention is given to the materials and the machinery of commerce, to trade routes, and to the relations between commercial development and other branches of the history of civilization. Lectures and assigned readings, first semester, twice a week.

(b) Commercial policies.—Study of commercial treaties and tariff history since the Napoleonic era. A sketch of the histories of the commercial policies pursued by the chief modern nations previous to the present century will be given by way of introduction. Lectures, assigned readings, and topics, second semester, three times a week.

Currency history.—Systematic presentation of the currency history of England, France, Germany, and the United States. Second semester, three times a week.

Commercial geography: (a) Introductory course.—A study of the technique of productive industry. Topical reports and lectures. Repeated each semester, four times a week.

(b) Extractive industries of the United States.—A study of the natural and social resources of the United States and of the chief extractive industries for the purposes of determining their location, condition, and relations to each other. Lectures and required readings. First semester, three times a week.

(c) Manufacturing industries of the United States.—The evolution, present location, and condition of the chief manufacturing industries, their relations to one another, to the extractive industries, to transportation, credit, and market agencies, and foreign trade. Lectures and required readings. Second semester, three times a week.

(d) Commercial geography of Europe.—Natural resources and industries of the chief European countries, with special emphasis on their location, their present state of development, and their relations to the commercial interests of the United States. Second semester, twice a week.

Business forms and accounts.—Various methods of accounting and auditing actually employed by and suitable to great corporations. Also a study of business forms, such as invoices, sales, accounts, custom-house documents, ships' reports and papers, bills of lading, warehouse receipts, charters, insurance policies, etc. First semester, twice a week.

Transportation: (a) Railroad transportation.—History of its development in the chief modern nations, with a discussion of its economic and legal aspects. Lectures and assigned readings. First semester, twice a week.

(b) Water transportation.—Brief historical survey of the growth of inland and ocean navigation, followed by a description of the leading water routes of the world and the industrial forces and geographical and political conditions determining them. Lectures and assigned readings. Second semester, twice a week.

Materials of commerce—(a) Vegetable.—Throughout the year two lectures per week and two hours per week of laboratory work.

(b) Chemical.—One lecture per week and two laboratory periods.

Economic crises.—Organization of the market, causes and characteristics of economic crises from the point of view of the business manager and the banker, history of crises, concrete study of the more important crises. First semester, three hours a week.

Corporation finance and securities.—Methods of financing employed in great corporations, with especial reference to the various sorts of negotiable securities which they issue and the circumstances which affect their value. A technical study of stock and produce exchanges and of their relations to the business of banking. Lectures and assigned reading. Second semester, twice a week.

Business organization and management.—Lectures, assigned readings, and topical reports. Second semester, twice a week.

Consular service—(a) Foreign consular service.—Brief outline of the growth of foreign relations, history of the consular services of the chief countries of the world, methods and work of the consular officers of the chief foreign countries. First semester, three times a week.

(b) Consular service of the United States.—Detailed study of the work and duties of the consular officers of the United States, combined with practical work in the investigation of existing industrial conditions and the making of such reports as are required of consuls. Second semester, three times a week.

South American and West Indian commerce.—Courses of lectures by specialists on commercial geography of the chief South American States, their systems of banking, exchange, currency, credits, transportation, tariff, commercial law, etc.

Seminaries.

The members of the faculty of the School of Commerce, with the subjects taught by them, are as follows: William A. Scott, Ph. D., director, economic history, elements of money and banking, currency history; Andrew A. Bruce, A. B., LL. B., law of agency and carriers; Edwin E. Bryant, law of corporations, bankruptcy, negotiable paper, and insurance; Storm Bull, M. E., generation and transmission of power; Lellen S. Cheney, M. S., materials of commerce; Victor Coffin, Ph. D., modern European, nineteenth century, and diplomatic history; William F. Giese, A. M., French and Spanish; Charles N. Gregory, A. M., LL. B., law of patents; Charles H. Haskins, Ph. D., mediæval history; Edward D. Jones, Ph. D.,¹ commercial geography and commercial crises; Edward Kremers, Ph. G., Ph. D., materials of commerce; Victor Lenher, Ph. D., chemistry; Balthaser H. Meyer, Ph. D., transportation, history of commerce, corporation finance and securities; James C. Monaghan, A. B., consular service, commercial geography, business forms and accounts; George R. Noyes, Ph. D., Russian; Paul S. Reinsch, Ph. D., LL. B., law of real and personal property, contracts, sales, and procedure; Ernest B. Skinner, Ph. D., trigonometry; Howard L. Smith, A. B., LL. B., law of partnership; Benjamin W. Snow, Ph. D., physics; William G. Bleyer, M. L., English; R. E. Neil Dodge, A. M., English; Carl R. Fish, Ph. D., American history; Edward L. Hancock, B. S., trigonometry; Gustavus A. Kleene, Ph. D., elementary economics; Otto Patzer, B. L., French; Edwin C. L. C. Roedder, Ph. D., German; Samuel E. Sparling, Ph. D., business organization and management; Edward A. Thurber, A. M., English.

UNIVERSITY OF WYOMING, LARAMIE, WYO.

The school of commerce offers a course of study that may be completed in three years. The course is divided into two parts—the department of bookkeeping and practice and the department of shorthand—each extending through two years, but both of which may be completed by a student in three years.

The course in the department of bookkeeping and business practice is as follows:

First year.—English history, bookkeeping, commercial arithmetic, raw materials of commerce, commercial geography, spelling and penmanship, business forms, business correspondence.

Second year.—English, history, civil government, bookkeeping, drawing, commercial arithmetic, penmanship and spelling, business law, history of commerce and transportation.

The course in the department of shorthand is similar to the above, stenography and typewriting being substituted for some of the commercial branches.

STATISTICS.

The number of students in the colleges or courses of commerce and finance during the year 1900-1901, so far as reported, was as follows:

University of California, Berkeley, Cal.	41
Colorado Agricultural College, Fort Collins, Colo.	83
University of Chicago, Chicago, Ill.	88
Louisiana State University, Baton Rouge, La.	33
Nevada State University, Reno, Nev.	1
Dartmouth College, Hanover, N. H.	15
New York University, New York, N. Y.	67
Central High School, Philadelphia, Pa.	362
University of Pennsylvania, Philadelphia, Pa.	139
University of South Dakota, Vermillion, S. Dak.	82
Utah Agricultural College, Logan, Utah.	44
University of Vermont, Burlington, Vt.	1
Washington Agricultural College, Pullman, Wash.	50
West Virginia University, Morgantown, W. Va.	52
University of Wisconsin, Madison, Wis.	81
University of Wyoming, Laramie, Wyo.	45

¹ Elected assistant professor of commerce and industry in the University of Michigan.
