REPORT OF THE COMMISSIONER OF EDUCATION.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., October 1, 1901.

SIR: I have the honor to submit herewith the Annual Report of this Office for the year ending June 30, 1901.

There were enrolled in schools and colleges, public and private, during the year 1900-1901, 17,299,230 pupils, the same being an increase of 278,520 pupils over the previous year.

Of this number the enrollment in public institutions—that is to say, institutions supported by taxation and funds belonging to States and municipalities—was 15,710,394, as against 15,443,462, the number reported for the previous year.

Besides the enrollment in schools and colleges of the prevailing type, as given above, there were pupils enrolled in special institutions of varying degrees of educational character, from the city evening schools, business schools, and schools for Indians, all of which approach nearly the type of the common schools, to schools for cookery, reform schools, schools for special trades and vocations, which depart more widely from the common type of school, as follows:

Enrollment in special schools, 1900-1901.

City evening schools	203,000
Business schools	110,031
Schools for defectives	27,159
Reform schools	25,337
Government Indian schools	23,077
Indian schools (Five Civilized Tribes)	11,590
Schools in Alaska supported by the Government	1,963
Schools in Alaska supported by incorporated municipalities (partly estimated)	1,393
Orphan asylums and other benevolent institutions	15,000
Private kindergartens	95,000
Miscellaneous (including schools of music, oratory, elocution, cookery, and various special arts)	50,000
Total	563,550

Adding the enrollment in these special schools to the total of schools giving general education we have a total of 17,862,780.

The general items of statistics for the country as a whole and for the five census divisions may be seen in the following three tables.

In Table I is given a comparative summary of items of attendance of pupils, teaching force, and receipts and expenditures, showing the increase from decade to decade for thirty years and more in what are called "common schools," that is to say, schools of elementary and secondary grades supported from public funds.

It will be seen that the average length of school term in days has increased from 132.2 days in 1870 to 144.2 the past year. But there is a slight decrease from the previous year (1900) in this respect, amounting to three-tenths of a day.

The number of women teachers has reached 306,063, from 122,986 thirty-one years ago. The number of male teachers was 77,529 in 1870 and reached 132,257 in 1898, from which it has declined in three years to 123,941. The ratio of male to female teachers has declined from 42.8 in 1880 to 28.8 per cent in 1901. This preponderance of women teachers is due largely to the fact that three-fourths of all the pupils are in the first four years' work of the elementary schools, and to the fact that women are to be preferred over men for instruction of children under ten years of age.

It will be seen that the aggregate of school property is nearly \$577,000,000, having increased to that amount from \$130,000,000 reported in 1870.

The income from local taxes has increased to \$161,245,764 the past year, from \$97,222,426 in 1890.

TABLE II.—Number of pupils and students of all grades in both public and private schools and colleges, 1900-1901.

NOTE.—The classification of States made use of in the following table is the same as that adopted by the United States census, and is as follows: *North Atlantic Division*: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania. *South Atlantic Division*: Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. *South Central Division*: Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, Oklahoma, and Indian Territory. *North Central Division*: Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. *Western Division*: Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, and California.

Division.	Pupils receiving elementary instruction (primary and grammar grades).		Pupils receiving secondary instruction (high school grades). ^a		Students receiving higher instruction.										Total higher.
	Private (largely estimated).		Public.		In universities and colleges. ^c		In schools of medicine, law, and theology. ^e				In normal schools. ^g				
	Public.	Private	Public. ^b	Private (in preparatory schools, academies, normals, etc.).	Public.	Private.	Public. ^f	Private.	Total.	Public.	Private.	Total.	Public.	Private.

^aIncluding pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3. ^bA classification of public and of private secondary students, according to the character of the institutions in which they are found, is given in Chap. XXIV, vol. 2.

^cThis is made up from the returns of individual high schools to the Bureau, and is somewhat too small, as there are many secondary pupils outside the completely organized high schools whom there is no means of enumerating.

^dIncluded are colleges of commerce, agriculture and mechanical (hand-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

^eMainly State universities and departments of agriculture and mechanical colleges.

^fIncluding schools of dentistry, pharmacy, and veterinary medicine.

^gMainly in schools or departments of medicine and law attached to State universities.

^hNonprofessional pupils in normal schools are included in columns 4 and 5.

ⁱThere are, in addition to this number, 30,755 students taking normal courses in universities, colleges, and public and private high schools. (See Chap. XXXVIII, vol. 2.)

TABLE II.—Number of pupils and students of all grades in both public and private schools and colleges, 1900-1901—Continued.

In the following table (Table IIIa) I have shown the variation of increase of the school system in the United States for the past twelve years. The entire increase in eleven years has been 2,786,452, the same being an average of 253,314 per annum. I have shown in the fourth column the per cent of increase over the previous year in order to indicate the irregularities from year to year. Some of these irregularities are doubtless due to carelessness in the preparation of returns made to this Office. These irregularities are of such a nature as to be corrected in some cases in the following year, and in some cases in the third or fourth year afterwards, so that the average for four years will eliminate irregularities that arise from error in the collection and tabulation of the details of the statistical aggregate. In one year the annual increase may be a little too large, in another too small; but after making allowance for errors of this description the evidence remains that there exists an actual variation of considerable importance in school attendance from one year to another, and in some cases it is easy to assign a cause.

Up to 1893 there had been a great increase of productive industry in the way of manufacture and transportation. The increase had begun as early as in 1880, and with the development of new and higher fields of manufacture and transportation there had been a call upon the laborers in the general trades for alert and skillful workmen for the new positions created. The most skillful blacksmiths were invited to step up higher into the new situations opened for a higher order of metal work. In the same way the vast army of carpenters had been drawn upon for their most skillful laborers to fill places in establishments doing cabinetwork and the higher orders of wood manufacture.

This same change had taken place in transportation. The larger combination the more places for intelligent skill and productive power. The farms had been drawn upon for their most intelligent youth to leave the plow and take up manufactures in wood, in metal, in leather, or in textiles. When business is very good it is apt to be the case that the older youth leave the school and take their places in the ranks of productive industry. This is what happened in the years directly preceding 1893. On the first check to productive industry the less skillful laborers are likely to be thrown out of employment. A manager prefers to keep his most skillful laborers. A parent also prefers to send his youngest sons back to school, if he has been obliged for lack of help to withdraw them prematurely, and his stress is now relieved. This explains how it is that there was a sudden annual increase of nearly 400,000 pupils enrolled in the year ending June, 1893. It is probable that the excess that was enrolled was chiefly in the spring and summer, but it seems to have continued the whole of the next year, because the increase of the next year is nearly half a million. But with the long continuation of hard times the parent

begins to withdraw again his older youth from school in order that they may assist in the support of the family, although it be by means of poorly remunerated industries.

In columns 5, 6, and 7 the specialist on State systems in this Office has prepared a careful estimate of the increase of the population of the United States from year to year for purposes of comparison. And it would seem that the average annual increase of 1.61 per cent in the enrollment of pupils over that for the previous year is surpassed in the general population, which amounts to 1.93 per cent. The attendance on schools in the decade 1890-1900 has not quite equaled in its ratio of increase that of the entire population. This ten years' change of rate, however, corresponds to a decrease of only 0.67 of 1 per cent in the proportion of the population receiving education (see Table III*b*), and in my opinion this is due chiefly to a gradual improvement in the methods of collecting and tabulating statistics of the rural portions of the country, many of which were formerly in the habit of adding the children of the summer session of school without deduction; said summer school being taught by a separate teacher; counting it with the enrollment of the winter term without making any allowance for duplicate registration, which in some cases may have amounted to one-sixth of the entire enrollment. In the rapid-moving populations of cities and villages in the far West there is very much duplicate registration at the present time, and it happens often that the methods of excluding this error are far from efficient. The falling off in the proportion of the population enrolled is something less than seven one-hundredths of 1 per cent on the quota from year to year.

But the statistics of schools in other nations where a complete compulsory system is in efficient operation show that 20 per cent of the entire population enrolled in schools is too large to expect under normal conditions. And yet in Table III*b* it is shown that the per cent enrolled in 1889-90 amounted to 23.17 of the entire population, while in 1899-1900 it amounted to 22.50. The increase of population enrolled in secondary and higher schools proves conclusively that the amount of schooling for each person as a whole is increasing in the United States, and that the schools are reaching more persons from year to year. The system of higher education in 1890 enrolled only one five-hundredth of the population, while it enrolled nearly one three-hundredth in 1900 (i. e., it increased from 2,181 to 3,139 in the million). The increase in secondary education also was approximately from 1 in 200 to 1 in 100 (i. e., from 5,872 in the million of population to 9,449 in the million).

TABLE IIIa.—Increase in eleven years of the total number of persons receiving education and the total population.

THE AVERAGE AMOUNT OF SCHOOLING PER INHABITANT.

It will be seen from Table IVa that the average schooling in years of 200 days each in public and private schools for the whole United States was 5.14. The different divisions of the United States, however, varied much, as will be seen by reference to the table. One also sees in what manner the total amount of schooling per individual has increased during the past thirty years.

In Table IVb the same items are given with reference to the public elementary and secondary schools, the private schools and higher institutions being left out of consideration. It will be seen that the common schools, including the elementary and high schools, give an average to the entire population of nearly six years in the North Atlantic Division.

I repeat here certain interesting estimates upon the amount of schooling given to each inhabitant on an average at different selected dates in the past century. While there were many sections of the country, in cities and wealthy towns, that extended the blessings of

education practically to the entire population early in the century, yet, on the whole, no State or Territory had any compulsory laws or attempted to provide in an effective way for the education of all the children of the people. A careful estimate of the entire amount of schooling obtained by the average person in 1800 shows that it did not exceed 82 days of school instruction during his life. The vast majority of the people within the limits of the United States did not receive any school instruction at that time. In 1840, the year in which the United States census began to enumerate the number of persons that had attended school the previous year, the total amount of schooling for each inhabitant had risen to 208 days; and according to the census of 1850 the average amount of schooling had increased to 420 days, for this decade was a period of agitation on the part of Horace Mann and his disciples. A great revival in common-school interest extending through the thickly populated sections of the country had produced this great change in the ten years, 1840-1850. In 1860 the average amount of schooling had risen to 434 days, only 14 days more than it had been in 1850. But in 1870 the number had reached 672 days; in 1880, 792 days; in 1890, 892 days, and in 1900, 1,026 days.

TABLE IV a.—Average number of years of schooling (of 200 days each) that each individual of the population received at the different dates specified in the table, taking into account all public and private schooling of whatever grade.

Education in central Europe.—Chapter I presents, among other items, a view of recent educational movements in Germany, and gives some idea of the conflict existing there between classical and modern tendencies in secondary schools. The most interesting point is per-

haps that found in the Emperor's order which assigns great importance to instruction in the English language. He says: "I desire * * * that English be introduced as an optional study of equal rank with Greek in classical schools throughout the Kingdom of Prussia. Where local needs suggest, English may replace French as a regular study and French be taught as an optional study." That this is the result of modern commercial and industrial conditions is plainly seen from the equanimity with which the people view this step. The *Journal des Débats* (Paris) says "that the Emperor morally gives to English that increased importance which naturally belongs to it." The *Gaulois* (Paris) is of like opinion when it says: "Friendly competition between England and Germany is the reason why the young men of the German middle classes, who are not intended to become gentlemen of leisure nor men of the world, but business men and industrialists, are advised by their Emperor to learn English rather than French." In order to further show the powerful influence modern industrialism has upon education in Germany, some extracts from an address of Prof. A. Riedler, of Berlin, on "The necessity of technological education" are given. Professor Riedler argues that the teaching of science for its own sake, as is done in the old established universities, will not suffice in the present age. Knowledge is valuable only when it can be applied in life. He urges that the polytechnica of Germany should direct their main attention to adaptations and applications. A creative agency, he says, is not an end in itself, but is a means toward definite economic purposes. Every engineer who wishes to be a creative agent must realize that he is a link in the chain of productive industry. All instruction, especially that in the higher seats of learning, must conform to this tendency. The time has passed when pure scientific education meets all demands. It is said that this professor, a very frank and outspoken advocate of the polytechnicum as against the classical university, succeeded in convincing the Emperor that by giving the polytechnica the right to grant degrees (Doctor of Engineering), the institutions would rise in the estimation of the people, and subsequent events have proved this opinion correct. Students from other lands visit the German polytechnical schools. There are now more than 2,000 foreign students among a total of 12,000. But this does not, as might be expected, diminish the number of foreigners in the old-established universities.

Art education in Germany.—W. von Seidlitz, in the *Deutsche Revue*, like other philosophic writers on aesthetics, uses the term art not in any restricted but in the widest sense, as embracing poetry, or rather good literature, painting, sculpture, the drama, and music; he includes even industrial art. He gives an account of the efforts of the Hamburg teachers to sift out what is undesirable in juvenile reading matter and to decorate the school houses and rooms. The numerous advocates of schoolroom decoration in the United States will read

with some interest what he says on this topic. One will be surprised at what he says against juvenile literature. He contends, namely, that a juvenile book of poetic form should be a masterpiece; but literary masterpieces, he says, belong to general literature, and hence a specific juvenile literature has no right to exist.

Commercial schools and commercial universities in Germany.—In a historical review of the gradual growth of commercial educational institutions, the fact is brought out that as early as 1715 a petition was presented to the Government of the Kingdom of Saxony to open a commercial academy, the plan of which resembled that of a university. The recent opening of a higher commercial institution affiliated with the Leipzig University, of a similar institution connected with the polytechnicum at Aix-la-Chapelle, and of independent commercial universities at Hamburg and Cologne are indications of the intense earnestness with which the Germans are preparing themselves for competition in the world's markets.

School supervision in Germany.—An account is given of the conditions of school supervision existing in the German Empire, and especially in Saxony. It sketches the legal provisions for the three grades—local, county, and State supervision—showing that neither local nor State supervision exerts much influence upon the schools, but that county supervision, being professional supervision, exerts a very beneficial influence. Comparing the number of school supervisors with that in American cities, it becomes at once apparent that German schools seem to get along and produce good results without much supervision, for rarely do the members of a local board visit the schools, the county supervisor or inspector scarcely more than once or twice a year, and the minister of education, as State supervisor, never. This is explained by the fact that no person can be employed as an elementary teacher in central Europe unless he have a certificate acquired in a State examination after four years' (in some German States six years') attendance at a normal school, and no one can be appointed to a position in a secondary school who is not a university graduate or has university and normal-school training combined. This naturally does away with the necessity of constantly directing the teachers in their daily work, and hence the small number of supervising officers.

Institutions for the defective in Germany.—A statistical review of institutions for the blind, the deaf, idiots or the intellectually weak, and the morally depraved is offered, which proves that the 26 States of the Empire are eager to save the unfortunates, to enable them to make a living, and to change them from social debits to social credits.

A new law concerning reformatory education of children in Prussia.—This law affords a characteristic example of German thrift and parental government, containing, as it does, provisions for placing depraved children, duly convicted, not in institutions where they

might be further contaminated with crime, but in well-reputed families, where they are kept as apprentices under strict supervision and seclusion from the evil influence of the streets. Such commitments, however, are made only by the proper judicial authorities, and the expense of such children is defrayed at first by the local government, but the government may reimburse itself by collecting the costs from the families from whom they are taken, except in cases of poverty. This law has now been in force a year and a half, and has proved so well devised and of such beneficial effect that other States of the Empire are beginning to copy it. The cause of this new departure in the treatment of juvenile criminals is the adoption of the imperial criminal code in 1871, which fixes the age limit of criminal responsibility at 12 or in some cases at 14 years of age. Children under 12 who commit crimes and neglected children over 12 and under 16 or 18 are now, through the operation of this law, not subject to punishment. Two years' margin (12 to 14) is the period allowed at the discretion of the judge, who in each individual case may decide whether the child is intellectually mature enough to realize the consequences of its evil acts, and the margin from 16 to 18 years is the period allowed at the same discretion in cases where the moral deficiency of the individual is in question.

Child labor outside of factories.—This gives the results of an official inquiry set afoot by the German imperial chancellor, Prince Hohenlohe. The purpose and nature of the inquiry is revealed in a circular letter, which sets forth that the census returns, which give a total of 54,375 wage-earning children, offer but inadequate information on child labor, since the enumerators register only those children who are laboring for wages after having left school, though not yet 14 years of age. The figures, it is said, apply only to the most important occupations of wage-earning children, and even then are far from being accurate statements, since the number of school children employed in partly remunerative labor was not ascertained by the census. The different State and local governments conducted the investigations from January till April, 1898. In a few States the police authorities acted as agents, but in by far the most States the teachers of elementary schools were instructed to ascertain the facts. The results of the inquiry are startling. There were reported to have been employed for wages outside of factories (where child labor is prohibited by law) 532,283 children of school age (6 to 14), or about 1 per cent of the population of the Empire. If one adds to that an equal number who are employed for wages in agricultural pursuits, there may be said to be about 1,000,000 school children employed in earning wages, or about 10 per cent of the school population. This is a very great number, and accounts for the many complaints of teachers who find school children listless, sleepy, fatigued, and generally incapacitated for vigorous mental action. The report goes into details as

to the kinds of occupation, the age of wage-earning children, the daily work hours, the arrangement of work rooms, the amount of pay, and the police regulations concerning child labor in Germany and other countries. The Berlin *Tägliche Rundschau* discusses the report and adds some instructive details. The official character of the inquiry secured for this report the attention of legislators in Germany, and measures are being prepared to counteract the dangers arising from excessive child labor, but it is generally understood in that country that a limited amount of responsibility may safely be laid upon children, in order to accustom them to regular habits and thrift, and to lay the foundation for an active, useful life. Hence it is not to be expected that all wage-earning child labor will be prohibited, but that excessive demands and overburdening will be checked.

Higher education of women in Austria.—This is a brief account of the efforts made in behalf of women in that Empire. They indicate a considerable degree of progress if viewed from the Austrian standpoint, for the educational efforts of any country should be viewed only in the light of its own development. It is apparent, however, that in Austria and other European countries the problem of how to make woman's intellectual talents an available resource in the social wealth of the nation is being solved.

Agricultural schools in Austria.—The account which was prepared for the late exposition in Paris by the chief of the educational section of the department of agriculture in Austria is of unusual interest, inasmuch as it shows not only what is done for agriculture and forestry in Austria, but how it is done. It will challenge comparison with the noteworthy operations carried on in recent years in our own Department of Agriculture. In view of the rigid centralization of the government of the Empire, it is worthy of notice how great an amount of liberty is granted in establishing educational facilities where necessity or special demands suggest them. Especially in regard to forestry Austria's example is worthy of imitation.

Noiré's logos theory.—In an extract from Noiré's book, "Loges, Ursprung und Wesen der Begriffe," is offered the classic passage in which the author elucidates the theory of apperception in so instructive a manner that it is worthy of a place even in an annual report like the present. Herbart has become the counterpart of Pestalozzi. While Pestalozzi has based all education on sense perception (*Anschauung*), Herbart has based all on the explanation or interpretation of what is perceived, and this he called apperception. Pestalozzi would say, fit your children to see for themselves the objects which they wish to learn; Herbart would say, have the children understand what they see, have them think out the relations of every new item of knowledge to the accumulated experiences regarding the object. It is easy to see that Herbart is more important than Pestalozzi as far as his theory of the faculties of the mind is concerned. Anyone who

wishes to get the clearest idea of this doctrine of apperception will study carefully Noire's illustration on page 106, of the apperception that is involved in perceiving so simple an object as a piece of bread. The apperceiving mind in looking at the piece of bread thinks of the steps of its production, as, for instance, dough, flour, grain, and of the processes by which each of these have originated; also, of the uses of bread as food in restoring the waste of the organism and of the activities of life that are made possible by this food. Apperception reinforces the senses by adding all that is stored up in the mind as an aggregate of experience, and thus produces what we call an understanding of the object, or a comprehension of it. It is the insight into causality that explains what exists in the present by what has existed in the past, and it looks forward and predicts the future as results of causal activities that it sees now in operation. Schopenhauer wrote a book on the fourfold root of the principle of efficient causality. Noire discusses the conclusions arrived at in that treatise and explains by it his views of apperception and the elements of causality which it involves. He who deals successfully with German pedagogy need not be told that it is necessary to master the German systems of philosophy. American students who bring home from Germany mere fragments or dead results of German systems, without their life-giving principles, usually end in producing what are called "fads." They try to adopt German methods in circumstances where they are in no wise appropriate. The life-giving principle of the German, if seized by an American, will prove a lasting source of inspiration and of profounder insight into practical problems. It is of course slow work to master a theorem in German philosophy, but no one who has done this will say that he has not been recompensed for his time.

Goethe and the great thinkers.—An address of Prof. Rudolf Eucken in Jena is translated for this report. There has hardly been another mind of such comprehensive grasp in modern times as Goethe's. Hence it is interesting and instructive to see how the great thinkers of all ages, especially of antiquity, have influenced the great German thinker.

State appropriations for education in Europe.—A brief statement from a German authority is given of what the Russian Empire, Switzerland, Prussia, and Italy expended in 1900-1901 for popular education, and also a discussion of the cost of professional preparation of teachers in certain of the German States.

The Ohio school system.—In Chapter II, Miss Mary L. Hinsdale has traced the evolution of the Ohio public school system, basing her work upon a study of the session laws of the State. Although the usual clause enjoining upon the legislature the perpetual encouragement of schools and the means of instruction was incorporated into the first constitution of Ohio (1802), yet for twenty years it seems that "the

State did absolutely nothing to carry out the provision," relying entirely upon private initiative. The gradual formation of a sentiment in favor of public schools is shown by the appearance upon the statute book, first, of a permissive law (1821), then of a mandatory one (1825). The latter measure, though crude, weak, and tentative, marked the true beginning of public education in Ohio. The further development of the system, the successive introduction of features then untried but now familiar, the mistakes made and rectified, the steps taken forward and backward as the progressive or conservative elements of the population alternately gained the upper hand, are typical of what occurred in many other States and form an instructive chapter in our educational history.

Consolidation of rural schools.—A compendium of information regarding the consolidation of rural schools, and the transportation of pupils at the public expense, is given in Chapter III. It contains a report by Superintendent O. J. Kern of a visit to the centralized schools of Ohio, in which are given many useful particulars of the practical workings of consolidation in that State; also detailed accounts, reprinted from the reports of the State superintendents of Massachusetts, Indiana, New Hampshire, and Nebraska, of the attempts that have been made in the direction of consolidation in those States, as ascertained by those superintendents in each case through a special inquiry made of the local officials who have had to put the system into actual operation. The statements by these local officials of the steps that were taken, the modes of procedure, the saving in cost, and the advantages and disadvantages resulting from consolidation in widely separated localities, and under a great diversity of social, climatic, and topographical conditions, furnish a considerable body of first-hand information on this subject. Upon the success of this movement rests the chief hope for the improvement of the rural school. It is fortunate that a device which changes the ungraded school into a graded school involves a saving of expense. The improvement is well worth trial, even were it to double the cost of the rural school, but as will be seen by the statistics given in this chapter it is secured with an actual saving of expenditure. Better teachers, more sanitary buildings, less personal exposure on the part of pupils, better classification, and many lesser advantages are commending this reform to county superintendents over the country. It was first tried in certain rural towns of Massachusetts, notably Quincy and Concord.

Industrial education (Chapter IV).—At a meeting of the Society for the Promotion of Engineering Education, held at New York July 2 and 3, 1900, a committee specially appointed for the purpose made a preliminary report upon "the educational means and methods which they are prepared to recommend as best adapted to advance the general cause of industrial education in this country." The committee

in their report consider in turn the various schools and other agencies designed to furnish the necessary training for those young people who, having had a common school education, desire to prepare themselves for employment in manufacturing industries, in commercial houses, or with the great transportation companies. The functions and office of each class of these schools are characterized by the committee, and an opinion is expressed as to the degree of usefulness of each, considering the particular end it has in view.

Chapter V contains an account of various efforts made in this country to apply self-government in education. This account refers chiefly to those attempts which direct their attention to the unfortunate, weak, neglected, or depraved children, and try to save these members of the social body for a life of usefulness. These efforts have a double purpose—first, to give proper treatment to children who are apt to sink under neglect into confirmed criminals, and second, to free the schools from a contingent that tends to retard the progress of normal pupils. Many noble men and women are devoting their energy to raising the lowly to a higher degree of usefulness, and their methods, though varying to suit the existing circumstances, are all successful. Among the most noteworthy of these efforts in the line of what has been called educational pathology the one which aims at the establishment of special children's courts in several of the large cities of this country—deserves particular mention. Lawyers of repute in New York and Chicago have taken interest in the establishment of children's courts, and much is said in praise of those which have been in operation in Massachusetts. Another method is the application of self-government in education, as is seen in settlements organized on the model of the "George Junior Republic," all of which are intended to aid in raising the social standard among youth and to prepare useful citizens for the State. Several years of experience have proved the desirability of such measures, but all prove indisputably that the vital force in such an experiment is, and needs must remain, the teacher. Where his sympathy and wise suggestions are lacking the attempts at managing a school by methods of local self-government will result in failure. While the efforts sketched in this chapter are mostly such as deal with the weaklings of society, there are advocates who propose to introduce self-government into schools of normally endowed and properly behaved children.

International Association for the Advancement of Science, Arts, and Education.—In Chapter VI an account is given of the International Association for the Advancement of Science, Arts, and Education, by Prof. Patrick Geddes, F. R. S. E., secretary of the British and American groups. Considerable space is devoted by Professor Geddes to an account of the origin of this association. The idea, as he shows, was several times broached in conferences of scientific societies, and in 1899 the occasion was offered for active measures in furtherance of

the project by the simultaneous meetings of the "British Association" at Dover and the "French Association" at Boulogne. The first international assembly of the association was held at Paris during the exposition of 1900. The purposes of the association and the method of its practical operations are set forth in a report of this assembly, which comprises the greater part of the chapter. "The first task of the association and its assembly," says Professor Geddes, "was to cooperate with the various international congresses to be held during the exposition, and wherever necessary or desirable to aid the existing agencies in recruiting suitable members for these. To the many specialists of all kinds who attended the exposition without being able to be present at the exact time of the particular congress most interesting to them, the congress information bureau of the association and the special rendezvous which it arranged proved of great service. Thus each member of the association on reaching Paris was enabled rapidly to avail himself of its resources and to meet his fellow-workers, French and foreign alike. The international assembly was included in the official list of congresses as the permanent *École Internationale de l'Exposition*. Besides keeping record of the congresses in the usual way, it was attempted, in some measure, to indicate their main problems and to summarize their main results by a full use of graphic methods."

The assembly also furnished interpretation and skilled guidance to all the departments of the exposition, programmes of lectures and of visits to the collections having been carefully prepared beforehand. The special literature of the exposition was carefully collected and classified by the assembly and a beginning was made in respect to securing typical exhibits for circulation. Thus a duplicate of the admirable nature-study exhibit of the Philadelphia Normal College, supplied by the kindness of Professor Wilson and her pupils, was circulated among Scottish and English schools for some months, and the "tenement house exhibition organized in New York and exhibited in Chicago and Boston" was secured for exhibition in Great Britain, where the question of the housing of the poor is urgent.

As a result of the Paris assembly several standing committees were formed, of which the most important was a committee on museums. This committee purposes in particular to work for the coordination and perfection of museum plans in different countries and cities, and to conserve so far as possible certain parts of international or world expositions which have a permanent educative value. In general the aim of the International Association for Science, as unfolded by Professor Geddes, is to correlate the work of individual organizations of various but kindred characters. The association is still in a tentative stage, but the experience at Paris helped materially toward defining its scope and methods.

In summing up the work of the Paris assembly, M. Bourgeois

reports that 800 lectures were given in 120 days, being an average of 6 lectures daily. The auditors ordinarily ranged in number between 40 and 50, but sometimes reached over 300. The total number of professors who took part in these lectures was 100, and 8 secretaries were employed.

Professor Geddes has included in his paper an account of the preliminary arrangements made for the second assembly of the association, which was held in connection with the Glasgow Exposition of 1901.

Training for railroad service.—Chapter VII, on educational training for railroad service, gives an account of those technological schools in this country which recognize this branch of activity in their courses of study. My Annual Report of 1898-99 contained an article on this subject, and this chapter may be regarded as a supplement to it. Courses of study in civil and railway engineering are given with much detail. The question of specific preparation for railroad service is frequently discussed by railroad men, and it is often urged that much waste of time and energy could be avoided by such a preparation. In calling attention to the very great extent of the railroad interests as a factor of the present industrial life in this country, the necessity of special preparation for railroad engineering is brought out in a forcible manner.

Biological contributions to educational theory.—I have printed in Chapter VIII an abstract of an interesting article in the Pedagogical Seminary (edited and published by Dr. G. Stanley Hall, president of Clark University in Worcester, Mass.) relating to the development of the nerves and motor systems in children, the title of the article being "From fundamental to accessory in the development of the nervous system and of movements" (by Frederick Burk, October, 1898). An attempt is made to fix the relation in the order of development of the different structures of the nervous system. These are divided into fundamental and accessory by Dr. Ross, and by later writers on the same subject. The fundamental system includes such portions of the nervous system as man possesses in common with lower animals and which are well developed in the human embryo at birth. The accessory part of the nervous system includes those portions that differentiate the nervous system of man from that of the highest animals and which are absent in the human embryo. The accessory movements are those which man has acquired since he adopted the erect posture—that is to say, most of the movements of the hand in the grasping and holding of objects, and in using tools of various kinds. All his movements of the organs of articulation concerned in speech and most of the movements of facial expression are accessory. That the fundamental structures develop before the accessory would seem to be a matter of course, inasmuch as these terms are adopted to express this very fact. The main point to be ascertained for the bene-

fit of educational theory is, at what period of life the latter begin to develop and how long their period of development lasts. This period of development is called, technically, the "nascent period." During the nascent period the muscle or nerve system may be educated. Fundamental muscles correspond to fundamental nerves; accessory muscles to accessory nerves. The observations on the development of those parts of the brain and nervous system which relate to the fundamental nervous system can not in the nature of things furnish original data for the determining this question as to time of development. For it is only by comparing brain development, ascertained by post-mortem dissection, with the external development of power in the use of the two different kinds of muscles that the conjecture is reached that there are certain portions of the brain which furnish motive power to one set of muscles and certain other portions which furnish power to another set of muscles. One could never tell in advance, for instance, that the existence of brain matter at certain centers near the so-called fissure of Rolando would imply that the individual possessed the power of performing deft processes with his fingers, unless a great mass of observations had shown that the one invariably accompanied the other. The record of the actual possession of the different kinds of manual dexterity could be made only by a study on the living individual, the record of the differences in development of portions of the brain would naturally have to be made after death. Obviously the education of the individual can not be directed by a knowledge of brain development ascertained only after his death. Nor, on the other hand, can a body of knowledge relating to post-mortem dissection determine in advance the education of the individual case. For the diagnosis of the condition of the individual, and it is the same with the multitude, must proceed by observation of the external manifestations of power, the actual use, for instance, of the fingers of the hand or of the muscles of the vocal organs. The external observations must be organized into a consistent whole before they can be used to interpret the observations on brain development. Hence education would be bound to draw its conclusions from direct observations of external manifestation of power, and not from the more remote and less certain indications of brain development ascertainable in comparatively rare cases, and only after death.

It would not settle the question of the introduction of the art of writing into the work of the primary school to inquire whether those parts of the brain which have to deal with the coordination of the writing muscles are yet developed at the age of 7, 8, or 9 years. But it, educational theory, would appeal to the more primary scientific data which concern the fact of the actual capacity of the child at those ages to learn to write, and it would study the actual effects or influence of such training on the subsequent development of the child. It would notice whether evil effects followed, and by such inquiries

determine the best time when a special training should begin, all things considered. It would be taken for granted if the child could learn to write at 7 years, that his brain development must be already advanced sufficiently. Nor can the supposed anthropological origin—the origin of man in the lower animals—be of any value here for the determining of questions of education. Mr. Burk says, it is true, “The child traverses before he is 6 or 7 years old, not only the long, deep worn road of racial ancestry, reaching back perhaps as far as arboreal, or even aquatic life, but I think we may say he takes a few paces in certain few coordinations that are his own, blazes a few trees and leaves his mark.” If the inferences from the anatomy of the brain as a result of post-mortem dissection are far less reliable than inferences based on the direct data of observation and of experiments made with the living child in the special functions which are in question, it must be admitted that those inferences that are based on a possible or conjectured heredity in lower animal life are in the nature of idle speculations. Whether man's ancestry was arboreal or aquatic or vermiform, or even some phase of plant life, does not contain even a hint as to the epochs of his present life. Only a study of present conditions and a comparison of these with the conditions of life in lower animals can establish such a relation if any exists, and the data of this class of direct observations contain the only bases on which valid inferences for education may rest. To find these bases in conjectured anthropological principles, giving them an air of scientific demonstration, is an unwarranted procedure, for the anthropological principles in this case are unscientific conjectures. No one has shown what the line of descent (or ascent) of man was, or whether it is the same for all men, still less has any one adduced scientific proof of the correspondence of any of the ages of man's life to the life of his ancestry. It would be unwarranted, therefore, to make out a course of study for the schools on any conjectures relative to these things. Even were the conjectures to be established as scientifically probable, it would remain to be determined whether the “road of racial ancestry” should be taken positively or negatively in human education; whether it should cause education to eliminate all traits and life habits of such racial ancestry, or whether education should encourage the human being to endeavor to repeat them in his own life.

Ethics and human conventions determine this matter in all nations, and education follows their behests as an actual fact. However lacking in valid basis such conclusions as those of Mr. Burk are in regard to the age of teaching accuracy in hand and finger movements such as are involved in writing or in the kindergarten occupations, yet the question is an important one to be considered by the director of schools. Mr. Burk infers that the ninth or tenth year should be reached before the school should make efforts “to compel accuracy,”

but, as we have seen, an inference that is based on anatomical investigation is of no value unless it rests likewise on a previous investigation of the external manifestations of power. In the present case the inference from nerve development must presuppose a body of knowledge obtained from investigation of the child's efforts to learn to write or to manipulate the kindergarten gifts. The efforts of the child to obtain skill in these matters are, as an actual fact, crowned with some success at three years of age, more success at four years and subsequently. The child's effort develops the brain, presumably. The child, as a fact, does not, if left alone till ten years, learn to write with more elegance. The actual facts are ignored or slighted by reason of the anatomical delusion that an inspection of the brain settles in advance this question of the time to begin to teach writing. The child, as shown by Preyer, puts himself to school in learning manipulation from the time when he begins to grasp objects in the seventeenth week. Before the age of six years he has arrived at the time when he may begin by easy lessons to learn the use of the pen and pencil. How fast he is to learn, and how much time he is to give per day, how long he should write at a time, these are important matters, to be ascertained by wise attention to fatigue and to the bodily reaction which manifests itself on occasion of the occupation of special muscles by the will, and by carefully noting that the elasticity is preserved, these being matters of practical investigation in the school room and the home rather than in the anatomical laboratory.

Biological theory of inhibition.—In Chapter IX the word "inhibition" is not used in its ordinary sense as a restraining act on the part of the conscious will, but rather as the equivalent of the Herbartian expression "Hemmung," which may be otherwise translated arrest, or suppression, referring to the suppression or submerging of an idea that has already come into consciousness by an idea exciting greater immediate interest. One idea thus eclipses or obscures another idea, and this eclipsing or obscuring is called "inhibition" in this chapter (which is an abstract of an interesting article by Mr. H. S. Curtis, in the Pedagogical Seminary for October, 1898). Inhibition as an act of conscious will is perhaps one of the most important factors in the self-education of mind. Everything that is ethical, everything that is rational, is accompanied by inhibition. And the most plausible suggestion that has been made in physiological psychology is that the function of the gray matter of the brain, the so-called cortex, is wholly devoted to inhibiting and coordinating the impulses that arise in the lower centers of sensation and motion. If this conjecture has a basis in fact it furnishes a very luminous explanation of the relation of the mind to the brain; it makes the will the prime mover in building the body and in using the body as its instrument; it makes the brain the instrument of the soul. But Herbart has no place in his system for the will as the governing principle, for he substitutes

desire for will in his theory. There is no individual sovereignty, but only a conflict between ideas within the mind and ideas that are seeking to enter the mind. The result of the struggle is the triumph of the stronger concept, according to his method of looking at mental operations. The ordinary view is that the will is supreme whether it permits a struggle between fancies that arise, or whether it suppresses them altogether by an inhibitive act. Attention is to be called to that part of this article which relates to fatigue and the encroachment of one set of activities upon another, and to the robbery of the muscles by the waste of brain tissue through worry or close intellectual application; and likewise the robbery of the digestive organs through the same causes; the effects of the deprivation of sleep. The author says well, "Just as the heart and brain will starve the rest of the body and still be undiminished themselves, so it seems to be nature's law that active parts shall be fed at the expense of inactive ones, if necessary, or even at the expense of parts active in a lower degree." Professor Sargent, of Harvard, is quoted as saying, "porters, draymen, heavy iron workers, and a certain class of athletes often illustrate the effects of an excessive use of the muscular system. Where the body's nutriment is expended in this direction the impairment of the heart and lung tissue is likely to follow." The action of the will produces fatigue in the bodily organs, whether the same be muscle or brain, and the exertion of the will in persons of nervous temperament is prone to rob the vital organs, such as the stomach or the heart, of the nervous energy required for their normal action. This deserves the most careful consideration on the part of the directors of physical training in our schools and colleges.

History of public education in the South.—In Chapter X, Rev. A. D. Mayo has given an historical account of the movements that were made toward the establishment of common-school systems, previous to the civil war, in the States of Louisiana, Missouri, Arkansas, Texas. In Missouri such a system had been put into fairly successful operation by 1860. In the other States of the group some sort of beginning had been made.

In Chapter XI the same writer treats of education in the South—principally of the freedmen—during the civil war and the period of reconstruction. The first considerable attempt to provide schools for the refugee slaves was made in the city of Washington, whither these unfortunate people had fled in large numbers at the outbreak of the war. The same work was entered upon in southeast Virginia at an early period of the conflict. The educational labors of Gen. Rufus Saxton among the freedmen of the Department of the South, of Gen. John Eaton among those of the Mississippi Valley, and of Gen. N. P. Banks in Louisiana, are narrated at considerable length by Dr. Mayo. An account is also given of the Freedmen's Bureau, the Peabody Education Fund, the mission schools established by

funds from the North, and the Hampton Normal and Agricultural Institute.

An historical document.—In August, 1864, during the civil war, Prof. Edward S. Joynes, of William and Mary College, Virginia, addressed a letter to the trustees and faculty of Hollins Institute at Botetourt Springs in the same State, where he was temporarily employed, in which he made an elaborate argument in behalf of a plan which he had devised for the normal instruction of women at that institute, in order to provide a corps of trained teachers for the schools of Virginia. His discussion of the subject forms an instructive chapter in the history of normal schools. The many side-lights which this letter throws upon educational and social affairs in Virginia at this period render it of peculiar interest and value, and I have included it in the present Report (Chapter XII).

Industrial education in the South.—A number of addresses delivered at the tenth annual meeting of the Southern Educational Association, held at Richmond in December, 1900, are printed here (Chapter XIII). In one, President George T. Winston, of the North Carolina College of Agriculture, emphasizes the need of industrial education for the development of the new South; he urges that the whole scheme of negro education, from elementary to higher, should be industrial. President Charles W. Dabney, of the University of Tennessee, also lays stress on the necessity of industrial and technical education, but maintains that a more thorough public-school education must precede and form the foundation; he shows by statistics that the education of the masses of a people increases their wealth-producing power, and that this power in any people may be measured by the school privileges that they have enjoyed. A discussion of the social phases of negro education by Dr. Paul B. Barringer, chairman of the faculty of the University of Virginia; by President Julius D. Dreher, of Roanoke College, and by Principal H. B. Frissell, of Hampton Institute, follows.

German instruction in American schools (Chapter XIV) is an especially interesting contribution as throwing light on the function of the American public school in rendering homogeneous the composite elements of the population. It has been prepared by Prof. L. Viereck, formerly a member of the German Reichstag, who came to this country for the express purpose of studying the extent of German influence upon American civilization.

All school education at public expense demands for its justification the existence of some political necessity which it provides for, or the existence of a general want in society for the supply of which the system of education serves a useful purpose. Thus our common schools are generally supposed to provide voters who can not only read the ballots which they cast, but also read the political discussions in the newspapers and form an intelligent opinion on the polit-

ical issues which their ballots shall decide. Without such ability to read on the part of its citizens the right of suffrage is a mockery. The citizen is supposed not only to cast an intelligent vote for the election of his lawmakers, but also to be able to read the laws made to govern him. The ancient and necessary ceremony of publishing laws by the mouth of the herald, who read them in public places to the people, is abolished, and yet people are held responsible for a knowledge of all laws enacted, it being assumed that every person can and will read the laws. There is a still further assumption that ordinary citizens shall be able to serve their turn as legislators, and make laws, as well as elect others to make them.

Unless the State does injustice to the poor class it will give all its children a chance to learn how to make laws as well as how to obey them. No class of citizens can claim as a right to have any other language than the language of the government taught in the schools at public expense, yet the fact that they have a right to retain the use of a foreign language and to educate their children in private schools to use that language alone, and the further fact that a class of citizens do in fact exercise this right, may make it expedient and desirable that such language be taught in the schools at public expense, provided that by this means great social and political advantages result to the community as a whole; the community has the right to teach any modern language in its schools if it finds it expedient to do so.

The expediency of introducing German-English instruction into public schools is the question to be decided, and not the question of the legal right to do so, nor the question of the right of a class to demand it. It is generally recognized by the people of the United States that immigration into our territory is a good and desirable thing. Inducements have been and are held out to foreigners to settle in America. The territory at first a wilderness becomes a populous and civilized State through the agency of foreign immigration. The conversion of natural possibilities into actual wealth is accelerated. The immigrant is bettered in circumstances by coming here, and still more is the native citizen benefited by the creation of wealth where there was no wealth before, for the native acquires wealth through the rise in the price of land and its sale to the immigrant, and secondly, through the profits of traffic with him, and thirdly, through a share in the increased production which the immigrant contributes.

But this direct benefit may be counterbalanced to a greater or less degree by the fact that the immigrant is a citizen not only with social rights, but also with civil and political rights. He can choose lawmakers for the natives; more than this, he can be elected to make the laws. If he has not absorbed the spirit of our institutions and

come into sympathy with it, if he has not learned how to perpetuate our institutions as a lawgiver, he will foist upon us parts of foreign laws and institutions. If he is ignorant even of the institutions of his native country, he will be a still worse element in our politics and will seek narrow, selfish advantages under the banner of the demagogue whom he will aid to corrupt our politics and rob our public treasury.

It is all important, therefore, that the immigrant shall be educated in our best institutions and "Americanized" in the spirit of our free intelligence. Otherwise he certainly will be "Americanized" by the worst forms of our political corruption. This is not a matter of choice between two different courses of action. If we do not "Americanize" our immigrants by luring them to participate in our best civilization and to adopt an enlightened social intercourse with us, they will contribute to the degeneration of our political body, and thus de-Americanize and destroy our national life. If we allow them to grow up in ignorance, they will lower the standard of political honor and intelligence. If they establish schools of their own and even achieve a high culture in them, as Germans have done when they have refused to enter our public schools, still they may lack training in the spirit of our special forms of government, and being educated into foreign ways of viewing and acting, they are all the more incapable of rightly judging public exigencies, of understanding the motives of, and sympathizing with, the native population.

The more highly cultured and civilized the immigrants that come to our country, the more stubbornly will they hold to their own manners and customs. Hence the very qualities which should make them desirable from the economical point of view may make them dangerous politically. Under all circumstances it is desirable that the immigrant shall be educated in the same schools with the native population if he is to have and exercise political power. Acting upon this principle, most of our cities east and west having large proportions of German population, have adopted at one time or another the study of German into their public schools. The immediate effects justified expectations. Large numbers formerly taught by foreign teachers and in private schools came into public schools, and while learning some German have learned much English, to their great future benefit and to the great benefit of the native population. Every year has witnessed the breaking down of barriers of caste in those cities.

The public school is the instrumentality designed to preserve democratic principles. It protects one class against another by giving an opportunity to the children of all classes for free competition in the struggle to become intelligent and virtuous. An aristocracy built on the accident of birth, wealth, or position, can not resist the counter-influence of a system of free schools wherein all are given the same

chances. To eradicate caste distinctions in the community is the most important function of the public school. Homogeneity of population is the great desideratum for free institutions, but it should be homogeneity on the basis of educated intelligence, and not of illiteracy.

No public institution is established on a firm foundation so long as it is beneficial only to a small class of the community. The introduction of German into the schools makes them useful to a greater number, and hence more stable. The thorough mingling of the populations has produced a very rapid assimilation. The German children in the public schools are as thoroughly American in sympathies, views, and aspirations as the Anglo-Americans. The influence of the schools largely reacts upon the parents through the children, and where formerly German was spoken altogether by parents and children within the family, now both speak English to gratify the strong preference of the children.

For a long time after immigration the immigrants keep a relation with their kindred in the mother country. Our population in the Northwestern States keeps up correspondence and recognizes the family ties that exist with the people in Great Britain and Ireland, Germany, and the Atlantic States. No difficulty is experienced by the Anglo-American settler among us in this matter. But the German-American is obliged to learn two languages. For if his children learn English only there must be a too sudden and abrupt breaking off of the continuity of race, and a consequent great evil wrought upon the character. The consciousness of the history of one's ancestry, and the influences derived from communication with the oldest members of one's family, are very potent in giving tone to the individuality of youth and ripening age. This continuity of history is a kind of solid, substantial ground for the individual, and from its soil spring up his self-respect and aspiration. A class of immigrants who had no desire to preserve a relation with their family stock would bring calamity upon the community into which they came.

Child study.—In Chapter XV, I print a translation from the German giving an account of the first extensive attempts at child study, which were made in Berlin in 1869. The object of the effort in Berlin was to ascertain the contents of children's minds at the age of 6, when entering school. The teachers of that city had been induced by the study of psychology to make the inquiry very thorough. Circular letters were sent out instructing the teachers to ascertain how many of the young children entering school possessed some knowledge of the familiar objects named in a long list. The answers to 75 questions can not be obtained in a few minutes, and hence the examination was prolonged for weeks and months, thereby, as one would suppose, causing the influence of school to become an important factor in the equation. However, such as it is, it is of great value owing to its influence on subsequent inquiries made in this country. The teachers

in Berlin were desirous to find whether children coming from kindergartens were better prepared for school work than those coming from home; and again, whether children from infant asylums (crèches) showed less information than those coming from kindergartens. It must be noted that the date of the report is 1869, when kindergartens were still in their infancy in Germany. The tabulated results seem to show that kindergarten children have a greater wealth of ideas, both regarding facts in their immediate environment and regarding ideas involving some action of the imagination.

The education of the negro.—I print in Chapter XVI the results of an investigation of the present condition of negro education, especially as affected by the geographical distribution of negroes, by their moral, social, and economic status, by race prejudice, and other influences. The author (Prof. Kelly Miller, of Howard University) has made free use of any published statistics that would throw light upon the subject of his inquiry, and has been at some pains to interpret their results. Apart from a current of migration of negroes to cities, where the women find employment as domestic servants and the men as day laborers, the main tendency of the race is to mass itself in the fertile plains and river bottoms of the extreme Southern States, forming the so-called "black belt." The reasons for this segregation of the black population are fully considered in this article. Its effects upon the border States may be shown in some degree by the circumstance that throughout those States the race increased only 26 per cent in the thirty years preceding 1890, while as a whole the negro population of the country increased about 70 per cent in the same period. In Kentucky the negro element declined in thirty years from 20 to 14 per cent of the total population, and in Missouri from 10 to less than 6 per cent. On the other hand, there were, in 1870, 79 counties, mostly in the Gulf States and South Carolina, in which the negroes exceeded the whites by a ratio of nearly 3 to 1, the average being 276 negroes to 100 whites; while in 1890 there were 103 such counties, and in them an average of 319 negroes to 100 whites, or more than 3 to 1. This increasing concentration of the negro population in certain localities tends to intensify in a two-fold way the difficulties connected with the education of these people. In the border States, where the negro element is in many sections disappearing and where separate schools for the races are rigidly prescribed, the sparseness of the colored population forms an obstacle to an efficient school system; in fact, there are not enough colored pupils in some of the counties to supply children for a single school, and consequently a school organization of the ordinary form is impracticable. At the other extreme, those communities in which the colored people largely predominate suffer from a lack of means. Of even more interest to the general race question is the study made of the occupations of negroes and of the amount of property they

have acquired, including their status as owners and tenants of farms and homes. One-sixth of the negro families owned their own homes in 1890. There were nearly 30,000 negro owners in Virginia alone, though the absolute value of holdings was not large. Of the negroes employed in gainful occupations, 57 per cent were engaged in agriculture and 31 per cent in personal service, leaving only a little more than 10 per cent for all other occupations.

A separate section is devoted to the higher education of the negro, in which are considered the intellectual capacity of the negro, his need of the higher education, the relative claims of industrial and higher education, the higher education of colored women, negro colleges, the negro in Northern colleges, colored men in the professions, and negroes who have achieved distinction along lines demanding intellectual ability.

Early English writers on education (Chapter XVII).—It is important to the historian of education to read the notices of some early English writers on education, with descriptions, extracts, and notes, prepared for this report by Prof. Foster Watson of University College, Wales. The writers taken up are La Tour Landry, Juliana Bernes, Erasmus, Sir Thomas Elyot, and John Baret, and the extracts from their works afford considerable insight into the educational ideals and methods of the fifteenth and sixteenth centuries.

The Association of Catholic Colleges.—In Chapter XVIII are reprinted a number of papers and discussions from the proceedings of the third annual conference of the Association of Catholic Colleges, held in Chicago, April 10–13, 1901.

Right Rev. Mgr. Conaty, rector of the Catholic University of America at Washington, D. C., and president of the association, in his opening address on "The Catholic College of the twentieth century," enlarges upon the need of unification and coordination in the Catholic system of schools and higher institutions; in particular, he is of the opinion that the colleges should not undertake graduate work, but should encourage that class of students who seek advanced education along graduate lines to resort to the University at Washington, where the best facilities are offered for this kind of instruction. Rev. James A. Burns, in a paper on Catholic secondary schools, states that this class of schools is the weakest point in the Catholic educational system; according to his statistics and classification of pupils, Catholic secondary schools for boys have only one-third of the pupils they should have, or 13 to each 10,000 of the Catholic population; whereas in all secondary schools for boys in the country combined there are 39 pupils to each 10,000 of the total population. He concludes that efforts for the improvement of Catholic education can be best applied in building up a system of secondary schools, as nearly as may be parallel to the public high school system. The papers read at the conference on the teaching of science, history, English, and Greek,

respectively, form together a contribution to the literature of pedagogics of peculiar interest, considering, as they do, from the Catholic point of view, the aims, subjects, and methods of instruction in these branches.

Education in Great Britain and Ireland.—Chapter XIX treats of education in Great Britain and Ireland, with special reference to the organized systems of elementary education. The record of current events is brought into proper historical continuity by brief conspectuses of the different systems in the three great divisions of the United Kingdom. The elementary system of England, based on the law of 1870, and that of Scotland (law of 1872), are substantially alike in respect to the application of the Government grant for schools and the mode of Government inspection. Scotland, however, has been saved from the complications that beset the English system by the continuance of principles which had struck deep root in the country under the Scotch parish-school system, dating from a law of 1696. This system prepared the way for universal public schools under elected local boards, and thus avoided the friction of a dual system of public and parochial schools like that existing in England. The statistics show that of the 5,705,675 pupils enrolled in the elementary schools of England in 1900, a little more than half (53.3 per cent) were in “voluntary,” chiefly parochial, schools, and 46.7 per cent in board schools under municipal control. The central Government bears the greater part of the expenditure for both classes of schools, viz, for the parochial schools, 78 per cent; for the board schools, 53 per cent. The balance of expense for the parochial schools, which are under private (chiefly clerical) management, is met by endowments, subscriptions, and fees. The board schools, that is schools under public control, claim the balance of their support from the local taxes (“rates”). From these unequal policies, financial and administrative, have grown unfortunate differences in resources and in purposes. In the thirty years since the passage of the Forster law of 1870 the increase of school provision and school attendance in England has been noteworthy. At that date it was estimated that the school provision was adequate for $8\frac{1}{2}$ per cent of the population, and that the number of pupils enrolled was equal to 7.6 per cent of the population; in 1900 the school provision was sufficient for $20\frac{1}{2}$ per cent of the population and the number of enrolled pupils equalled 17.7 per cent of the population (retrospective Table XVII). Both classes of schools, denominational and board, have contributed to this result, but the multiplication of board schools is the most impressive fact in the record. Three years after the passage of the school law board schools enrolled about 5 per cent of the elementary pupils; this proportion now reaches 47 per cent (Table IV). The accommodation in board schools, sufficient for 2,788,129 children, has occasioned an outlay of about \$209,000,000, or an estimated cost per child of £14 18s. 7d. (\$73).

This sum has been advanced by loans to the school boards and is secured by local taxes. During the same period of thirty years the denominational schools have raised by subscription for building purposes above \$55,000,000 (Table IX). Board schools have made their chief progress in the cities (as is shown in detail in Table II), comprising London and 65 county boroughs. In these communities the enrollment in board schools is 60 per cent of all pupils, as against 37½ per cent for the remainder of the country outside of these boroughs. In the more populous centers the board schools have developed great power of adaptation to the varying needs of children of different ages and conditions in life. This is shown by the successful conduct of infant departments, of special schools for the blind, the deaf mute, and the feeble-minded, and by the remedial influences brought to bear upon neglected and even vicious children. This adaptability of the board school is illustrated by detailed accounts of the work in London and five other typical cities (Table III and context).

These efforts in behalf of special classes of children are not more important than the progress in respect to the general conditions of school efficiency. The improvement in the teaching force of England is indicated by the steady increase in the proportion of adult as compared with pupil teachers, the increase being for all schools from 48 per cent of the total force in 1870 to 84 per cent in 1900. The board schools have had the larger share in this increase, and they have also been most favored in respect to efforts for raising the standard and prolonging the period of instruction. The rural parishes have in general only parochial schools. Even if there be a school board in a rural parish its jurisdiction is so restricted and the property assessment so low that the local tax yields but little for school expenditure, so that in any case the rural school has a poor outlook. The current income of parochial schools is estimated to be 10s. 6d. (\$2.50) less than the income of board schools for the children per capita. This difference, as is shown in the address quoted from Dr. MacNamara, M. P., falls most heavily upon the rural districts. It is reflected in the comparatively poor teaching staff of rural schools, and is emphasized by unsuitable school buildings and generally meager appurtenances. The city school boards have also been able to command liberal support from local taxes for advanced classes, and have in many instances developed what are known as higher grade schools (see Table III). The upper classes of these schools are on a par with the scientific departments of our own high schools, but the English higher grade school comprises also lower grades, to which children who are likely to continue in school up to the age of 15 or 16 years are admitted at about 10 years of age. Thus in 1900 the 44 higher grade schools of London enrolled 23,968 pupils 10 years of age and upwards, of whom 910 were above 15 years of age. The higher grade schools

act as a stimulus. Although access to them is not limited to board-school pupils, nor are they in every case created by the school boards, nevertheless it is to what may be called the sphere of school-board influence that the higher grade schools pertain. Thus it appears that the combination of public and parochial schools recognized by the English school law has really operated to bring about an urban school system of peculiar efficiency and promise and a rural system hopelessly hampered.

The problem of equalizing the school provision of England is involved with another problem apparently not less urgent, namely, that of an adequate supply of secondary schools accessible to the artisan and working classes. This need was recognized as far back as 1868 by the British schools inquiry commission and has been reiterated by subsequent commissions. Meanwhile the stress of business and commercial conditions has intensified the need. The upper grade board schools have indeed risen in response to this need, but they have come into conflict and sometimes into wasteful competition with the county councils and with other authorities in control of technical or of secondary education. The Government, which formerly favored the school board efforts in respect to higher grade schools, has recently shown the disposition to restrict their activity to a very limited range of elementary instruction. This action is in striking contrast to the policy in Scotland. The Scotch law of 1872 expressly authorized school boards to maintain secondary schools, and subsequent laws allowed them to levy local taxes for the support of such schools; but in Scotland, as already stated, school boards are universal, so that the unity of the system operates in favor of both elementary and secondary education.

The prolonged and bitter conflict which resulted in the defeat of the Government education bills of 1896 and 1901, and the controversy over the pending measure, are made intelligible by the discussion of these two items—rural education and secondary education. This last measure aims at a radical change in the local administration of schools and includes in its provisions both elementary and secondary education. While the proposals threaten the school boards with extinction, they seem, at least to the American student of the facts, designed to strengthen the parochial schools. The comparative Table XVIII, showing the progress under the Scotch law of 1872, illustrates the advantages of universal public schools. The school accommodation in this division of the kingdom, which even under the traditional influences of the parish system was only adequate for 8 per cent of the population in 1872, is now sufficient for 20 per cent (Table XVIII).

The statistics relating to higher education (Table XIX) show for the decade 1889 to 1900, considerable increase in the attendance at the universities and university colleges of England, but a decline in those of both Scotland and Ireland. The most decided step forward in Eng-

land is found in the university colleges, whose rise in the great centers of industry—Manchester, Leeds, Birmingham, and elsewhere—is an important event in the recent history of higher education in Great Britain. The decline of university students in Scotland is attributed chiefly to the lack of adequate equipments for meeting modern demands, especially in respect to science instruction and research. It is confidently expected that the Carnegie trust will do something to supply the necessary equipments in these respects, as one-half the income is to be devoted to “improvement and expansion,” in the widest sense, “in the faculties of science and medicine,” and in the “modern part of the arts faculty.” By the terms of this gift, which are given in Chapter XXIII of this Report, the other half of the annual income is to be spent in the payment of the fees of students of Scottish birth and extraction, according to the terms laid down in the deed of foundation of the Carnegie trust and the regulations of the trustees. The amount of the trust fund is £2,000,000 and the estimated annual income \$500,000. The first report of the administration of the trust shows that for the winter session 1901–2 the sum of £22,941 16s. 6d. was paid by it up to December 31, 1901, in behalf of 2,441 students, representing the fees of 7,610 classes. This comes to a little over £9 (\$45) per capita. The circumstances that caused the appointment of a Government commission to report on the state of university affairs in Ireland are set forth in Chapter XIX in a paper by Judge William O'Connor Morris, republished from the *Fortnightly Review*. The paper reviews incidentally and briefly the history of university education in Ireland, and discusses the present situation dispassionately from the Catholic standpoint.

Temperance instruction.—Various papers relating to temperance instruction in the public schools have been brought together in Chapter XXI, showing the trend of opinion on this subject. A report of a special committee of the department of superintendence of the National Educational Association sums up tersely the functions of teachers and superintendents in regard to temperance instruction, and points out the questions of importance for them to consider. A paper by W. B. Ferguson, superintendent of the schools of Middletown, Conn., treats of temperance teaching in Connecticut, and of the new and less radical law which has been recently enacted by the legislature of that State; the law as modified does not require temperance instruction below the fourth grade nor in the high school; the use of text-books is not required below the sixth grade, nor must any definite space in any grade of books be devoted to narcotics. Among the other topics discussed in this chapter, the conclusions and recommendations which appear in a report of a committee of the New York State Science Teachers' Association are worthy of notice, as a further indication of some reaction against the extreme views which have hitherto prevailed.

The State of Georgia has recently adopted the law requiring temperance instruction in its public schools. This legislation has completed the list of States requiring, by statute, text-book instruction on the effects of intemperance.

All persons with a knowledge of the situation will admit that it is very difficult to teach temperance in schools, and all will equally admit that such teaching is of the highest importance. Moreover, it must be total abstinence that is taught and not a compromise which admits moderate drinking as the ideal to be reached. It is customary for teachers and superintendents of schools to criticize whatever instruction is attempted in the schools that has not yet been reduced to "pedagogical form." Many things thought necessary to be taught in the schools, such as manual training, cookery, temperance, and natural science, for example, have not been as yet reduced to the form of "progressive lessons." Arithmetic, geography, history, and grammar have been long since reduced to a "pedagogic form," and the first lesson or the first five lessons are good and valuable if no more lessons are given. The earlier lessons prepare the pupil step by step for the later lessons. In the new branches above mentioned the necessary steps to connect one point with the next are lacking and the instruction can not be made so thorough as it is made in the course of lessons in reading, writing, and arithmetic.

Admitting this, I think it explains the disparagements written regarding temperance instruction which we find in some of the reports of the superintendents of schools. On the other hand, I think that it will be admitted that instruction in what is called "scientific temperance," conducted as it is under the laws of all the States, in the public elementary schools, furnishes a permanent and active means for the dissemination of correct views regarding the effect of intoxicating drinks upon the human body. The pupils will have their attention called to the subject every year and the intelligent ones will understand with some degree of clearness the results of scientific investigations in this matter. Even the dull pupils who fail to seize the scientific points will carry away an impression in their minds that intoxicating drinks are very dangerous and should not be used even in moderate quantities. It is an undoubted fact that a moderate use of intoxicating liquors is liable to lead, especially in predisposed organisms, to "alcoholism." Total abstinence is the only safe course with such persons, and no one can tell in advance what person can safely become a moderate drinker of alcoholic beverages in any form.

Dull pupils, and I may say all pupils, if taught by incompetent teachers, will fail to master the scientific evidence on which these conclusions are based. The examination papers of such pupils will provoke ridicule if made public. This is true not only in regard to temperance instruction, but in regard to instruction in all branches of natural science, manual training, history, religion, and whatever

other branches of useful information are taught in schools without having first been carefully reduced to pedagogic form. But very useful results are attained in these subjects notwithstanding. The scientific temperance instruction required in the several States of this nation is certainly a permanent and efficient source for the promulgation throughout the community of correct opinion regarding the effects of intoxicating beverages upon the body. Such instruction, too, is sure to furnish the greater number of the intelligent pupils in schools with a tolerably correct notion with regard to the scientific investigations which have furnished the evidence for these conclusions. The utter destruction to the body and mind which comes from habitual intemperance and the danger of moderate drinking in arousing an abnormal appetite for intoxicating liquors will certainly be seen and understood by the great mass of pupils that attend the public schools. It may be said that this movement is the most effective one ever devised by the friends of temperance to abate a great evil, one of the greatest evils abroad in the land.

Relations of the National Government to higher education and research.—The substance of an address on this subject before the University of Chicago by Director Charles D. Walcott, of the United States Geological Survey, forms Chapter XXII. The different ways in which the Federal Government has aided higher education are reviewed in some detail. This assistance until recent years usually took the form of grants of land, though some grants of money were made in the case of technical education. In 1892 a further step was taken by the Government in the direction of promoting higher education and research; by a resolution of Congress approved April 12 of that year, and amended in 1901, the literary and scientific collections of the Government departments were made available for study and research to duly qualified students. Mr. Walcott gives in the course of his address a summary account of the situation in relation to the founding of a national university, and of the Washington Memorial Institution.

The Carnegie Institution.—Chapter XXIII contains various documents and authoritative statements relating to the Carnegie Institution of Washington, D. C., its organization, objects, methods, etc. A list of the principal educational benefactions of Mr. Andrew Carnegie is appended, together with some notice of his gift in aid of university education in Scotland.

Education in France.—Chapter XXIV presents an historical and descriptive survey of the comprehensive system of public education in France and of the complementary system maintained by church authorities. The history is an integral part of the history of the Republic, which has fostered education as an essential condition of its existence. Hence the progress of the public or State system affords an index of the growing stability of the existing government. The

traditional distinctions between primary or popular education and the liberal education of the higher classes are preserved in the organization of the present system, which comprises three departments: primary, secondary, and higher. The distinction between the two last-named divisions is merely nominal—secondary education comprising the colleges for general education preparatory to the specialized higher or university education. The efforts of the Republic in respect both to the colleges (*lycées*) and the universities have been directed to the increase of their resources and the revival of the free and powerful activities which were repressed under the Napoleonic or Imperial University. The primary system is essentially the creation of the Republic and therefore most deeply involved in its life. The principles upon which it is based are the outcome of the revolution of 1789. Their embodiment in law was a gradual process, extending through a century of effort, as shown in the chapter under consideration. As a public service primary education dates from Guizot's law of 1833, passed in the brief calm of Louis Philippe's reign. This law recognized church schools, providing for public schools simply as a means of supplementing the deficiency of the former. Like the later English law of 1870, it indicated a serious intention of preventing gross illiteracy among the common people. It was estimated at the time of its passage that 7,000 or 8,000 communes (about one-fourth of the whole number) were destitute of schools and that as many more had only worthless schools. The effects of the law were apparent in a rapid increase of school enrollment, which continued with varying fluctuations until the coup d'état of 1851.

The permanent contribution of Guizot's law to the cause of popular education was the clause obliging communes to maintain a primary school; the principle of local responsibility thus legally sanctioned has never since been ignored. Scarcely less important was the requirement that every department should maintain a normal school. Not only was the principle of professional training for teachers thus established, but the machinery was devised for its uniform application throughout the country. The principle of local obligation was extended by a law of 1867, passed during the reign of Napoleon III at the instance of Minister Duruy. This law made the maintenance of a separate public school for girls obligatory upon every commune having 500 or more inhabitants. The response with which it met indicated the growth of local interest in education. Within twelve years above 2,000 new schools were opened, of which 1,580 were for girls. The present Republic was proclaimed September 3, 1870; but the siege of Paris and the humiliations and distractions of the country precluded for a time attention to education. The serious purpose of the Government in this respect was first manifested by the law of June 1, 1878, creating a fund of 120,000,000 francs for the erection of school-houses. The year following began the memorable ministry of Jules

Ferry, who consecrated all his abilities to the cause of popular education. His first efforts were directed to administrative reform; there followed in rapid succession the laws which have given an exclusively civic or national character to public primary schools, namely, the law reaffirming the obligation of every commune to maintain a school which should be free and secular; requiring all teachers, public and private, to be provided with State diplomas; and making it compulsory upon parents to secure the education of their children either in public schools or by private means. In the State schools nothing was left to chance or caprice; the law of October 30, 1886, prescribed minutely all particulars respecting the conduct of schools, their classification, inspection, studies, etc. In virtue of these regulations and the efficient supervision of the State, the humblest commune in France is assured of an efficient school. From the detailed statistics given in Chapter XXIV it appears that out of the total of 36,520 communes only 87 are now destitute of a public school, and that 92 per cent of the communes having 500 or more inhabitants have a separate school for girls. The enrollment in primary schools increased steadily up to 1889-90, reaching in that year a total of 5,623,401, or 14.7 per cent of the population, as against 5,539,299 in 1898-99, or 14.3 per cent of the population. The slight decline which has taken place in the intervening decade is attributed to the actual decrease in the school population, to the rapid advance of pupils in the primary schools, with the result that the leaving certificate is obtained at an earlier age than formerly, and to the less vigorous enforcement of the obligatory school law. The relative enrollment in public and in private schools for successive years (Table III) shows between 1887-88 and 1898-99 a slight decline in the proportion of public school enrollment, i. e., from 79.9 per cent of the total to 75.3, and a corresponding increase in the proportion of private school enrollment, i. e., from 20.1 per cent to 24.7. This change appears to be due to the law of 1886 forbidding the employment in public schools of teachers belonging to religious orders. As regards the schools for boys, the law was to take effect by 1891, and consequently public schools for boys are now completely secularized. Considering the prejudices which the law had to encounter the effect upon public school attendance appears to have been slight. This may be taken as an indication of increasing confidence in the public schools. One of the most important evidences of the actual efficiency of schools is furnished by the item of average daily attendance. This item is approximately indicated in the official statistics of France by a comparison between the enrollment in the months of December and June, the months, respectively, of highest and lowest school attendance, and the number present on a selected day in each of the months named.

On this showing the attendance upon public schools was in December 89.8 per cent of the enrollment and in June 84.6 per cent. The

corresponding rates for private schools were 93.4 per cent and 92.3. Both in this respect and in respect to the number of classes and the number of pupils to a teacher the advantage appears to be with the private or church schools. This is explained in part by the fact that the latter are most numerous in the large cities and towns. Furthermore, for every such school there is always more than one "brother" or "sister," as the case may be. There are about 30,000 nuns and 9,000 members of brotherhoods engaged in the schools, and their number can be almost indefinitely increased. They live, it is stated, with their respective orders and receive not a penny of salary for their work, to which they are passionately devoted. On the other hand, the public schools are better organized than the private and have a larger proportion of teachers who have obtained professional diplomas (Tables VII and VIII). The remarkable progress made by France in securing trained teachers for its public schools is due in great measure to the liberal provision for normal schools and the high standard at which these are maintained. In continuance of the policy begun by Guizot, every department (civil divisions, now numbering 90) maintains two normal schools, either of itself or in union with another department, one for men and one for women. The professors for these local normal schools are carefully trained in two higher State normal schools. The State also assures to every public school teacher a minimum salary, ranging from 1,000 to 2,000 francs (\$200 to \$400) for men and for women 1,000 to 1,600 francs (\$200 to \$320). This amount is generally increased by the communes, which must at least furnish a house or its money equivalent to the teacher. Primary teachers are also borne on the State pension list. Thus, the position of a primary teacher is one of security and of assured though modest income.

The total current expenditure for primary education more than doubled in the two decades, 1877 to 1897, increasing from 94,397,554 francs (\$18,879,510) to 214,015,250 francs (\$42,803,050), or from \$4.69 per capita of enrollment in public primary schools to \$9.20 per capita. The part of the State in this expenditure rose during the period from 25 per cent to about 67 per cent, and that of the local authorities declined proportionately. It is estimated by M. Levasseur that the current expenditure for private primary schools (not State aided) would raise the total for 1897 to 293,000,000 francs (\$58,600,000), or, including cost of buildings hired and interest on the amount invested in school property, to 350,000,000 francs (\$70,000,000).

The solicitude of the State for the education of the masses does not stop with the elementary primary school, as is shown by the development of higher primary schools and the adaptation of their individual or technical departments to local demands. The movement for the continued moral and intellectual training of the masses beyond the brief period of school life, recognized in Duruy's law of 1867, but long

left almost entirely to private efforts, has received substantial aid from the Government since 1895, both in the form of an annual appropriation and by the loan of illustrative material. In 1900 not less than 38,291 courses of lectures were given in various parts of France, with a total of 540,000 regular attendants. Both through these popular conferences and the societies for promoting the industrial welfare of the youthful pupils and providing them with innocent amusements, the schools have become centers of a remarkable movement for the social uplifting of the masses. This movement has been in part inspired by hostile arraignments of the moral influence of secular schools. The endeavor to fasten upon them the responsibility for an alleged increase in juvenile crime has, however, signally failed—(1) by the accumulation of statistics showing their opposite tendency, and (2) by evidence that the increase in youthful depravity is among the vicious and vagabond classes, who escape the influence of the schools to fall under that of a pernicious press and of intemperate habits. A summary of the facts bearing upon this important problem is presented, supplemented by a detailed account of the system of moral training, which is rapidly infusing an ethical spirit into primary instruction.

As regards secondary education, two recent events of great significance are discussed. The first of these relates to a legislative measure for the reform of the public secondary schools (State lycées and local colleges); the second to efforts for the repression of antirepublican tendencies in the independent or clerical schools. The most important feature of the reform measure noted above is that for the recognition of three distinct but equivalent courses in the lycées, i. e., a course including both Latin and Greek, a course with Latin, and a course in which modern languages replace the classics. The grounds on which the proposition is supported are cited in this chapter. Outside government circles the project is seriously criticised as an endeavor to burden the lycées "with specialties which even in the law are stamped as foreign to the purpose and spirit of liberal education." The law of July 1, 1901, defining the conditions under which associations may legally exist and work in France, was professedly intended to subordinate the religious orders to the civil authority. As these orders control a large proportion of the secondary schools of France, the law is really an educational measure of deep import. The terms which it imposes and its effects in dispersing the members of the orders are briefly stated.

As regards higher education, statistics are given and citations from official reports showing the continued development of the universities under the law of 1890, which restored to them in large measure the independence which was lost by their absorption into the State university or teaching system. Fifteen universities have been organized under the law and all give signs of renewed life and vigor. The

increase of laboratory facilities and the multiplication of endowed professorships are noticeable features of the record. The number of university students rose from 17,605 in 1887 to 29,377 in 1900. The provincial universities have gained relatively much more than the Paris University, the total increase for the former in the period being 8,720 students, a little more than 100 per cent, and for the Paris University 8,460 students, about 33 per cent. The recent arrangements facilitating the admission of foreign students to the French universities, including admission requirements, fees, and diplomas attainable, are given in full.

Higher commercial education.—The movement for the establishment of courses of study designed particularly for the higher education of business men, especially in the lines of commerce and finance, is making considerable progress. The first institution to offer such special courses was the Wharton School of Finance and Economy of the University of Pennsylvania, which was established in 1881 on an endowment of \$100,000, given by Mr. Joseph Wharton, of Philadelphia, Pa., who afterwards gave an additional sum of \$25,000 to establish a library fund for the school.

In 1889 the education of business men was made the subject of a special inquiry by the American Bankers' Association. As a result of the inquiry the association requested the universities and colleges of the country to establish schools of finance and economy on the plan of the Wharton School of Finance and Economy. During the past few years colleges and courses under various designations, but having for their object the higher education of persons who desire to enter upon business careers, have been established by a number of universities and colleges. Descriptions of such courses with detailed statements concerning the instruction offered, so far as they could be obtained, are given in Chapter XXV.

Coeducation of the sexes in the schools and in the colleges and universities of the United States.—In Chapter XXVIII I have brought together old and new matter relative to the coeducation of the sexes in the schools and in the colleges and universities of the United States. While the policy is not entirely peculiar to this country it has here so much wider an extension than elsewhere, that whenever it becomes a subject of discussion or experiment the school records of the United States are consulted for precedent and for arguments. It is the purpose of this chapter not only to bring together the facts relative to the present status of coeducation in our schools and higher institutions, but also the strongest arguments (pro and con) pertaining to this policy and the widest experience in respect to its application. As regards the public schools, it is shown that the education of boys and girls in the same classes is a very general practice in the grades below the high school, the only exceptions being isolated cases of schools and city school systems which for some cause, historical or

local, can not be adjusted to the prevailing condition. The same is true of the vast majority (at least 98 per cent) of the high schools of the country. In a few cities, situated for the most part on the eastern border of the country, separate high schools for boys and girls are maintained and advocated. The causes of these exceptional conditions are shown in this chapter by statements of city school superintendents thoroughly conversant with the situation. As the public schools enroll 15,840,000 children and youth, or 91 per cent of all pupils in elementary and secondary schools, it is readily seen that their policy in a matter like this must profoundly affect public opinion and the solution of many social and industrial problems. That the minority who would prefer separate instruction for boys and girls is very small is further indicated by the fact that more than half of the secondary private schools of the country are coeducational. This association of boys and girls in the school undoubtedly explains in a measure the freedom that women enjoy in respect to the pursuit of intellectual careers. In the public secondary schools women form 50 per cent of the teaching force. The extent to which women share in the directive service of public education will be seen by reference to the tabulated statement of the supervisory school offices which they may hold or for whose incumbents they may vote. The adoption of coeducation in the colleges and universities of the country is related to the general movement for the higher education of women. This movement, beginning in the earlier years of the nineteenth century, assumed national extent and importance through the cooperation of several causes, of which the most potent was the passage of the Government land grant act of 1862 for the endowment of colleges making special provision for the branches of learning that are related to "agriculture and the mechanic arts." The history of this general movement as related to the policy of coeducation is briefly reviewed in the chapter under consideration. In the western division of the country all influences promoted the admission of women to the highest institutions on the same terms as men. In the more conservative East the movement was toward separate endowments for women, such as Vassar, Wellesley, Smith, and others. From these extremes two modifications have arisen, namely, that of "annexes" for women, such as Radcliffe and Barnard, and that of coordinate colleges, as at Western Reserve and Brown universities.

These different policies show a wise regard for local conditions, and this spirit gives significance to the fact that the number of coeducational colleges and universities is steadily increasing. Starting with Oberlin College, Ohio, in 1833, the policy of coeducation had spread by 1880 to 51.3 per cent of the colleges and universities of the country. In 1900 the proportion had risen to 71.6 per cent. In this number are included 30 State universities and 14 private universities of high order.

The dearth of scholarship and fellowship funds available for women students is in somewhat striking contrast to the generally liberal provision for men students in this country. The particulars set forth under this head indicate a growing interest in this matter.

Under the head of the "Literature of coeducation" will be found citations from reports and other publications of officials in charge of public school systems, presidents of universities, specialists, and other representative men, treating of the policy in question. The purpose in this selection has been to bring together for ready reference the strongest arguments, affirmative and negative, and the widest experience pertaining to this important feature of our educational policy.

The Philippines.—Mr. F. W. Atkinson, superintendent of public instruction in the Philippines, has forwarded to the Bureau a full account of the present educational movement in the islands, and from this important document, which appears as Chapter XXIX, I take the following account of the situation of the public school system there:

Before the arrival of the Americans in the archipelago the Spanish system of public instruction, which in its modern form was inaugurated in 1863 by royal decree, consisted of a normal school in Manila for training teachers and separate primary schools for males and females in the various towns of the islands, besides a number of special schools. The criticisms of the methods of instruction in these schools, noted in the Report of the Bureau for 1899-1900 (Chapter XXIX), Mr. Atkinson repeats, and adds some comments upon the text-books formerly used. Soon after the Americans took possession the military government interested itself in the subject of schools, introduced some American text-books, and detailed soldiers as teachers, especially of English. General Otis took particular interest in the matter, and desired the army officers to open as many schools as possible. The district commanders appointed officers to act as superintendents, among whom were many chaplains. About 1,000 schools were in operation under military rule. Their equipment was inadequate, and the old Spanish text-books were used. The commanding officers were unanimous in urging that English be taught in the schools on account of the assistance the knowledge of English on the part of the people of the Philippines would be to them. Capt. Albert Todd, in charge of public instruction under the military government, recommended that all the schools under Government control be conducted in the English language as far as practicable and that Spanish and the dialects be eventually dispensed with, and, further, that the Government schools be absolutely divorced from the church. This period marks the transition from the Spanish management of the schools to the American, which may be regarded as beginning with the appointment of Mr. Atkinson as general superintendent of education. On September 1, 1900, Mr. Atkinson introduced a new organization

of the public schools which was modeled on the American system, but different from that in certain features which the conditions in the islands required. He mentions as especially necessary a centralized control of the school system, with careful supervision through provincial and district superintendents. Upon his recommendation the Philippine Commission passed an act establishing the present system of education in the islands. This is the law published in the Report of this Bureau for 1899-1900.

The chief characteristic of the present organization is centralization. The education staff comprises the secretary of public instruction (who is a member of the Philippine Commission); the general superintendent of public instruction for the Philippine Islands; 18 division superintendents; 45 deputy division superintendents; 1,000 primary and 200 higher teachers of English, and about 3,400 native teachers, together with a superior advisory school board and local boards. The superior advisory board consists at present of the general superintendent of public instruction (Mr. Atkinson) and 4 Filipinos. Interesting biographical sketches of these latter members are given, from which it appears that they are educated and competent men. The school boards in the municipalities, consisting of from 5 to 7 members, one of whom is the presidente of the municipality, are composed of responsible and influential landowners when possible. One-half the members are elected by the municipal council, and the other half are appointed by the division superintendent. It may be difficult to get these local boards to show much enthusiasm for the primary schools, because they are drawn from the wealthy and educated classes of the municipalities who have the hereditary feeling of their caste of indifference toward the common people. "They are no more interested than is necessary," says the report. The common people themselves generally, however, desire education and opportunity.

The work done so far under the American organization is summed up as follows: An education bill has been enacted; the archipelago has been divided into 17 divisions and an American school superintendent placed in charge of each, with deputies in each province; 1,000 American teachers for primary work have been appointed and distributed to their stations, and 200 for secondary work are being appointed. About 200 soldiers had been detailed as teachers until recently, while 3,400 Filipino teachers have been appointed. More than three-quarters of a million American schoolbooks have been purchased, together with a very great quantity of school supplies, including 20,000 modern school desks. Instruction in the English language has been provided for in about 1,500 schools, in which over 200,000 children are enrolled. Night schools for adults and those unable to attend during the day have been opened throughout the archipelago, and are working successfully with an enrollment of about 25,000.

The salaries of the Filipino teachers have been increased, and a definite announcement made to them that the American teachers are not introduced to displace them but to prepare them to take charge of their own schools. They receive daily instruction in English, and when sufficiently advanced they are taught the common branches and the methods of teaching them. Vacation normal courses have been organized in the various school divisions, and permanent normal schools, tributary to the Manila normal school, have been established in the provinces. Industrial and trade schools are established and will be increased in number, and agricultural schools are in process of organization. In pursuance of the idea of gradation from the primary schools to the university, "grammar high schools" have become a part of the school system, recommendations have been made for the establishment of schools of painting, sculpture, drawing, and music, and the plans of a technical school and also of a university, to be established in Manila, have been discussed.

The reports from the superintendents of schools in the different provinces are very instructive. They present, as far as schools are concerned, a good idea of the different intellectual conditions prevailing in the various provinces, some of the inhabitants being highly civilized while others are very backward, a state of things which is not surprising when one remembers that there are a great many tribes and peoples in the Philippines, ranging in the scale of civilization from "head-hunting" barbarians to cultivated people with European tastes and education. The reports represent the generally unsatisfactory condition of the schools for the common people, and point out the educational needs of the latter. It is noticeable that the wealthy families, even in the remote provinces, send their children to Manila and Hongkong to be educated. The intellectual quickness of the Filipino children is frequently remarked. The desire to learn English seems to be general. In many places the time of the American teachers could be fully taken up in teaching English alone to adults.

Many extracts from letters of governors of provinces are given in Superintendent Atkinson's report, all going to show the beneficial influence of the new schools and of the American teachers. From the answers to a list of questions sent to the teachers relating to the intellectual qualities of the Filipino children the following interesting points are obtained: The Filipino boys "were found to take by far the greatest interest in arithmetic, next preferring English, drawing, writing and reading, in the order named. The girls show the greatest interest in English, reading, spelling, drawing, writing, music; their interest in English (their favorite subject) is not so marked over the other subjects as the interest of the boys in arithmetic. Among the native games the boys take great interest in kites, pitching pennies, native football, and leapfrog, introducing the element of gambling

wherever practicable." They take kindly also to new games, such as football, baseball, prisoners' base, catch, duff, and hopscotch. The girls do not as a rule take as much interest in games as the boys, but many play a kind of marbles, native hopscotch, running games, song-and-dance games, and jackstraws. The teachers have also introduced other games which they appear to enjoy. A very large majority of the teachers remark upon the superiority of the Filipino child in imitation, memory, and courtesy. On the other hand, he is described as falling short in reasoning, in activity, in morality, and in ambition. The insular treasury pays the salaries of the American supervisors and teachers, their traveling expenses, office rent of superintendents, the cost of text-books and supplies, and their transportation to the various towns. The salaries of Filipino teachers, together with the cost of local school buildings and their equipment, are paid by the municipalities. The expenditure for education from July 1, 1901, to February 1, 1902, was \$777,585.42. The average monthly pay roll of the American supervisors and teachers is approximately \$100,000. The estimated monthly pay of Filipino teachers is \$37,756.

Education in Alaska (Chapter XXXI).—The report of the general agent shows that there were 28 public schools under the immediate supervision of this Bureau maintained in Alaska during the school year 1900-1901; these schools were taught by 37 teachers, and had a total enrollment of 1,963 pupils. On account of the prevalence of small-pox in southeastern Alaska during the spring of 1901 several of the schools in that section were temporarily closed. The cost of conducting the schools per capita of enrollment was \$17.78. The appropriation for education in Alaska, which had been made annually since 1886, was discontinued by the last Congress. The "act making further provisions for a civil government for Alaska," approved March 3, 1901, prescribes that 50 per cent of all license moneys for carrying on business outside the incorporated towns of Alaska be set aside and expended in the discretion of the Secretary of the Interior for school purposes outside the incorporated towns.

The statements of the teachers of the different districts which the general agent has incorporated in his report give in considerable detail the results of their labors the past year; the peculiar difficulties encountered in maintaining an efficient system of public schools in that remote and thinly settled region, with its rigorous climate, are made very manifest by a perusal of these statements. The information contained in them is supplemented by reports of the educational work in Alaska of the different church missionary associations.

Introduction of reindeer into Alaska (Chapter XXXII).—Since 1891, when the first reindeer were purchased, up to the present time, 1,320 reindeer have been brought into Alaska from Siberia. From these, 4,462 fawns have been born. Deducting those which had been killed

for food or had died from accident or disease, there remained 4,164 in the herds October 1, 1901, against 3,323 in 1900. The native Eskimo herders, in the estimation of competent judges, have been found to possess sufficient intelligence and aptitude for their work and have proved themselves competent after having been properly trained; several instances are given in which natives acquitted themselves with credit in managing reindeer in emergencies demanding skill, judgment, and endurance. A number of reindeer of unusual stature were obtained in the summer of 1901 in the region back of Ola, in Siberia, west of the Sea of Kamchatka, and brought to Alaska for breeding purposes, 254 in all having been landed. It is hoped with these to further improve our present stock and provide for Alaska a breed of reindeer superior to that of any other country. Use is being made of reindeer in Siberia, both by the Government and by private enterprise, in the transportation of merchandise; the important part these animals are playing there is suggestive of what may be accomplished through their aid in the development of Alaska. Already reindeer teams are employed in the latter Territory to a considerable extent in transporting men and supplies to mining camps and outlying stations; as their number increases they will more and more take the place of dogs for these purposes. During the past winter a detachment of United States troops engaged in constructing a Government telegraph line became snow-bound near Kaltag on the Yukon River; their mules were unable to make any progress even after the soldiers had shoveled a trail for them in the deep snow. In this emergency, at the request of General Randall, in command of the Department of Alaska, deer teams were sent to their relief from the Eaton reindeer station and brought the troops and their camp equipment through the snow to a place of safety. Deer teams were also employed during the winter in drawing telegraph poles from the woods. By Executive order of March 30, 1901, two specified tracts of land were set apart and reserved for reindeer stations.

City school systems (Chapter XXXIV).—By the steady increase in population of the cities and villages of the country the list of cities of over 8,000 inhabitants receives constant additions. From year to year new cities are added to the list when their populations are estimated to have passed the 8,000 mark, these estimates being based on the data of the last census, the growth of the city during the ten years preceding, and the reported present school enrollment. Thus the list of city school systems in cities of over 8,000 inhabitants numbered in 1900-1901 582, a gain of 14 over 1899-1900. This change in the list should be considered in making comparisons with the statistics of previous years. The entire enrollment in the city schools of the United States for 1900-1901 was 4,090,819, an increase of 141,258, or 3.58 per cent, over the previous year. The rate of increase in enrollment varies

greatly in the several divisions, being notably greatest in the South Atlantic division, where it is nearly 10 per cent, and falling to less than 2 per cent in the North Central division. The enrollment in primary schools shows a decrease in every division except the Western, the decrease for the United States being 32,238, or 3.47 per cent. In regard to supervision, a movement, temporary in its character, is noticed tending toward the reduction of the number of supervising officers. The city of New York furnishes a noteworthy instance of this, for the number of supervisors reported for 1900-1901 shows a loss of 76 from the number reported in 1899-1900, while at the same time 908 places were added to the list of teachers. For the United States the whole number of supervising officers is 4,733, less by one than the total of the previous year, while the number of teachers, 87,561, shows a gain of 4,068. All of the five divisions share in the relative reduction of the list of supervisors, which reduction is greatest in the North Atlantic and South Atlantic divisions. It will also be noted that women supervisors were the principal sufferers in the cutting down of the force. In the case of New York City, cited above, 74 of the 76 positions lost were held by women, and for the United States the number of female supervising officers is less by 59 than in 1899-1900, against a gain of 58 in the number of male supervisors. This is in decided contrast to the marked tendency of several years past. The per cent of increase of male teachers, also, is slightly greater than that of women. A significant fact disclosed by the statistics is the relatively large increase in the amounts expended for tuition or for the teaching force, the rate of increase being greater than that of any other item. The expenditure for tuition was \$63,433,167, a gain of \$4,249,601, or 7.18 per cent. This raises the average annual salary of the city teacher from \$670.81 in 1899-1900 to \$687.29 in 1900-1901. The total expenditure was increased by \$8,206,551, or 8.25 per cent.

Recently there has been much discussion of the municipal expenditures, with a view to arrive at the normal ratio which the cost of one department should bear to another. Of course it is admitted that conditions differ in different cities and that local causes peculiar to one city may make it reasonable or necessary to devote a larger ratio of its taxes to the police, or to street cleaning, to sewer building, or to sanitation, than another city may find to be necessary. But comparative tables throw light on the parts of the budget that vary from the average, and thus draw attention to the items that need explanation and are suspicious.

I give here the comparative statistics of 20 cities, showing expenditures for schools and for police—first, a table showing the educational statistics, with the cost for permanent improvements (grounds and buildings) included, and secondly, a table with this item omitted.

Total expenditure (including construction and capital outlay) by the 20 largest cities for public schools and for police departments.

[Data relating to police from Bulletin of the Department of Labor, No. 42, September 1902; that relating to schools from reports for corresponding dates made to the Bureau of Education; calculations made in the Bureau of Education.]

City.	Total spent for schools.	Spent for police.	Ratio.
New York	\$22,845,359	\$10,474,019	\$2.18 for schools to \$1 for police.
Chicago	8,577,622	3,890,741	\$2.21 for schools to \$1 for police.
Philadelphia	4,223,278	3,119,981	\$1.35 for schools to \$1 for police.
St. Louis	2,123,020	1,627,235	\$1.30 for schools to \$1 for police.
Boston	4,007,264	1,778,353	\$2.25 for schools to \$1 for police.
Baltimore	1,426,031	967,823	\$1.47 for schools to \$1 for police.
Cleveland	2,413,548	483,015	\$5.00 for schools to \$1 for police.
Buffalo	1,440,714	793,294	\$1.82 for schools to \$1 for police.
San Francisco	1,169,845	789,251	\$1.48 for schools to \$1 for police.
Cincinnati	1,154,301	563,268	\$2.05 for schools to \$1 for police.
Pittsburg	1,407,003	490,287	\$2.87 for schools to \$1 for police.
New Orleans	589,480	231,374	\$2.55 for schools to \$1 for police.
Detroit	1,251,826	570,207	\$2.20 for schools to \$1 for police.
Milwaukee	852,572	342,508	\$2.49 for schools to \$1 for police.
Washington	1,485,695	703,819	\$2.11 for schools to \$1 for police.
Newark	931,387	428,495	\$2.17 for schools to \$1 for police.
Jersey City	634,154	430,241	\$1.47 for schools to \$1 for police.
Louisville	555,812	273,615	\$2.03 for schools to \$1 for police.
Minneapolis	839,090	216,698	\$3.87 for schools to \$1 for police.
Providence	799,767	371,875	\$2.15 for schools to \$1 for police.

Expenditure by the 20 largest cities for maintenance and operation of public schools and of police departments.

[Data from Bulletin of the Department of Labor, No. 42, September, 1902; calculations made in the Bureau of Education.]

City.	Spent for schools, building omitted.	Spent for police department.	Ratio.
New York	\$19,731,629	\$10,199,206	\$1.93 for schools to \$1 for police.
Chicago	8,203,493	3,685,982	\$2.23 for schools to \$1 for police.
Philadelphia	3,319,604	3,036,264	\$1.09 for schools to \$1 for police.
St. Louis	1,526,140	1,602,182	\$0.95 for schools to \$1 for police.
Boston	3,043,640	1,754,151	\$1.73 for schools to \$1 for police.
Baltimore	1,417,392	967,823	\$1.46 for schools to \$1 for police.
Cleveland	1,257,345	417,932	\$3.01 for schools to \$1 for police.
Buffalo	1,161,834	793,294	\$1.46 for schools to \$1 for police.
San Francisco	1,166,763	789,251	\$1.48 for schools to \$1 for police.
Cincinnati	1,126,631	555,185	\$2.03 for schools to \$1 for police.
Pittsburg	843,648	490,287	\$1.72 for schools to \$1 for police.
New Orleans	478,025	231,374	\$2.07 for schools to \$1 for police.
Detroit	869,713	542,049	\$1.60 for schools to \$1 for police.
Milwaukee	764,968	342,508	\$2.24 for schools to \$1 for police.
Washington	1,182,916	687,922	\$1.72 for schools to \$1 for police.
Newark	830,081	428,495	\$1.94 for schools to \$1 for police.
Jersey City	500,332	421,616	\$1.16 for schools to \$1 for police.
Louisville	512,947	273,615	\$1.87 for schools to \$1 for police.
Minneapolis	736,981	216,698	\$3.40 for schools to \$1 for police.
Providence	739,695	371,875	\$1.99 for schools to \$1 for police.

Higher education.—Chapter XXXV contains the usual statistics concerning institutions for higher education, with an additional table giving the number of students in the various courses of study in each institution so far as reported. The number of undergraduate and resident graduate students in universities and colleges for men and for both sexes, colleges for women (Division A), and in schools of technology, for the year 1900-1901, is reported as 103,351, an increase

of 4,428 students over the number for the preceding year. The number of students for each year from 1889-90 to 1900-1901 is as follows:

Year.	Universities and colleges for men and for both sexes.		Colleges for women, Division A.	Schools of technology.		Total number.	
	Men.	Women.	Women.	Men.	Women.	Men.	Women.
1889-90.....	38,056	8,075	1,979	6,870	707	44,926	10,761
1890-91.....	40,689	9,459	2,265	6,131	481	49,220	12,185
1891-92.....	45,082	10,580	2,636	6,151	843	51,769	15,507
1892-93.....	46,689	11,459	3,158	6,616	843	55,305	15,530
1893-94.....	50,297	13,144	3,578	9,517	1,376	59,814	18,088
1894-95.....	52,589	14,288	3,657	9,467	1,106	62,053	19,071
1895-96.....	55,558	16,746	3,910	8,587	1,065	65,143	21,721
1896-97.....	55,755	16,536	3,913	8,907	1,094	65,662	21,543
1897-98.....	58,407	17,765	4,416	8,611	1,239	67,018	23,470
1898-99.....	58,467	18,943	4,593	9,038	1,330	67,505	24,880
1899-1900.....	61,812	20,452	4,872	10,347	1,449	72,159	26,764
1900-1901.....	65,069	21,468	5,260	10,493	1,151	75,472	27,879

Of 91,288 students whose classification according to the courses of study pursued was reported, 63,843 are reported in classical and other general culture courses, 9,081 in general science courses, 3,843 in agriculture, 391 in architecture, and 14,130 in the various branches of engineering. The first school of mines in the United States was established at Columbia College (now Columbia University), in the City of New York, and was opened to students in 1864. At the present time the institutions offering courses of study in mining engineering number 37, having more than doubled during the past ten years. This does not include institutions in which a limited amount of instruction in mining engineering is included in civil engineering courses. Short statements concerning the mining engineering courses, with a description of the special mining equipment and the field work required during the course of study, are given in Chapter XLV. The degree of bachelor of arts is now the only degree conferred by 137 universities and colleges for the completion of a liberal course of study. The degrees of bachelor of philosophy, bachelor of literature, and bachelor of science (except for technical courses) are no longer used in a considerable number of institutions, and the degree of bachelor of arts is conferred in their stead. Table 28 of this chapter shows the institutions conferring the several degrees. The total number of degrees conferred for work done (excluding degrees in law, medicine, and theology) was 16,513, of which number 11,463 were conferred on men and 5,050 on women. The degree of doctor of philosophy was conferred by 42 institutions on 312 men and 31 women on examination, and by 14 institutions on 35 persons as an honorary degree. The total value of all property held by institutions for higher education amounts to \$391,230,784, a gain of \$30,636,189 over the amount for the preceding year. The endowment funds amount to \$177,127,965, and the remainder represents the material equipment of the institutions. The total income was \$33,259,612, and the

benefactions received by the several institutions during the year amounted to \$18,040,413.

Professional schools (Chapter XXXVI).—The number of students in theology in 1900-1901 was 7,567, a decrease of 442 from the previous year, and of 804 from the number in 1898. This continued decrease in the number of theological students is in marked contrast with the rapid growth in the numbers studying law, medicine, and dentistry. The value of grounds and buildings of theological schools is reported at \$15,217,164, and the endowment funds aggregate over \$21,000,000. Law students numbered 13,642, an increase of more than 1,000 in one year. The growth in the number of law students can be appreciated more fully by contrasting the number in 1891 with the number in 1901, namely, 5,252 with 13,642, an increase of 160 per cent in ten years. Medical students numbered 26,757, an increase over the previous year of 1,544. The year 1901 was unusually favorable to medical education, in view of the gift to Harvard Medical School of over \$1,000,000 by Mr. J. P. Morgan, and the subsequent announcement of the gift, on certain conditions, of a like sum to the same institution by Mr. John D. Rockefeller. Students in dentistry now number 7,308; in pharmacy 4,429.

Agricultural and mechanical colleges.—In Chapter XXXVII are given in considerable detail the statistics concerning the institutions making special provision for instruction in agriculture and the mechanic arts, endowed by the acts of Congress approved July 2, 1862, and August 30, 1890. According to the reports of the presidents of the several institutions the various States received from the General Government under the act of July 2, 1862, an aggregate amount of 10,320,843 acres of land, of which 1,030,572 acres remain unsold. The invested funds realized from the sale of these lands amount to \$10,806,780, yielding an income of 6.3 per cent. The total income of these institutions for the year ended June 30, 1901, excluding appropriations for experiment stations, was \$7,325,604. Of this amount the States and Territories granted \$3,073,736, the income from Federal sources was \$1,937,136, from students' fees \$960,621, from endowment other than Federal or State sources \$553,503, and from miscellaneous sources \$800,608. The value of all property held for the benefit and use of the institutions amounts to \$68,084,925, the value of additions to the equipment during the year having been \$1,932,058. The total number of students in the agricultural and mechanical departments was 29,950. The establishment of short practical courses, especially in the line of agriculture, has continued during the year and is doing much toward bringing these institutions into closer touch with the people in the agricultural districts of the several States. The number of students in the technical courses shows a decided increase during the past few years. Mention is made in this chapter of the changes in the courses or methods of instruction, and a description of new

buildings erected during the year is given so far as reported. A considerable amount of aid is granted to students in the way of paid labor. Ten States made specific appropriations for this purpose, amounting to \$27,500, during the year. The total amount expended for student labor was \$160,477. The average amount earned by 4,868 students was \$32 per annum. The highest average paid by any institution was \$200 and the lowest was \$1 per student. In addition to the work at the institutions a large amount of time is given to outside work, especially at farmers' institutes. Twenty-three States are reported as making special appropriations for farmers' institutes, amounting to \$103,112. The amount of time given to this work during the year by officers of agricultural colleges and experiment stations was about 2,613 days. The number of institutes held was 1,497, with an estimated attendance of 445,144.

The organization of the institutions endowed by the acts of July 2, 1862, and August 30, 1890, differs very greatly. In some States, as in California, Minnesota, Nebraska, etc., instruction is offered in a wide range of subjects, comprising the studies included in general culture, technical, and graduate courses, as well as in the professional courses of law, medicine, dentistry, etc., while in other States, as in Massachusetts, Michigan, etc., the instruction is limited to technical subjects. In order to give an idea as to the scope of the several institutions a brief statement of the courses of study offered is included in this chapter. There is given also the announcement of the first session of the Graduate School of Agriculture, to be held for four weeks from July 7 to August 1, 1902, at the Ohio State University, under the auspices of that institution and with the cooperation of the United States Department of Agriculture and the Association of American Agricultural Colleges and Experiment Stations. Instruction will be given in agronomy, zootechny and dairying, and in plant and animal breeding. The faculty consists of 24 instructors and officers from 16 of the agricultural colleges and experiment stations and 6 officers from the Department of Agriculture, with Director A. C. True of the Office of Experiment Stations as dean.

Statistics of normal schools (Chapter XXXVIII).—It is estimated that at least half a million persons are engaged in teaching in the schools of the United States. This does not include private teachers and tutors. To furnish recruits for this vast army of teachers the normal schools and other institutions offering professional training for teachers are sending out nearly 15,000 teacher graduates a year. For the scholastic year 1900-1901 there were enrolled in public and private normal schools, public and private high schools and academies, and universities and colleges, 94,157 students pursuing training courses for teachers, in all public institutions there having been 57,689 such students, and in all private institutions 36,468. The 170 public normal schools had 43,372 of these students, the 118 private normal

schools 20,030; in 23 public universities and colleges there were 3,019 normal students, and 7,453 in 188 private universities and colleges; 494 public high schools had 11,298 such students, while 326 private high schools and academies had 8,985. Nothing will better illustrate the growth of normal schools in this country than the following table, which shows the amount of public appropriations for public normal schools each year since 1890:

Public appropriations for public normal schools for twelve years.

Year.	For support.	For build-ings.	Year.	For support.	For build-ings.
1889-90.....	\$1,312,419	\$500,533	1895-96.....	\$2,187,875	\$1,124,834
1890-91.....	1,285,700	409,916	1896-97.....	2,426,185	743,333
1891-92.....	1,567,082	394,635	1897-98.....	2,566,132	417,866
1892-93.....	1,452,914	816,826	1898-99.....	2,510,934	560,896
1893-94.....	1,996,271	1,583,399	1899-1900.....	2,769,003	718,507
1894-95.....	1,917,375	1,003,933	1900-1901.....	3,068,485	709,217

Statistics of secondary schools.—Chapter XXXIX is devoted to the statistics of public and private high schools and academies, with an introduction showing the number of secondary students in other institutions. The total number of secondary students reported to this office for the year 1900-1901 was 736,000, distributed among eight classes of institutions, as follows:

Secondary pupils in the United States.

Institutions.	Male.	Female.	Total.
Public high schools.....	224,584	317,146	541,730
Public normal schools.....	2,749	4,404	7,153
Public universities and colleges.....	7,287	2,570	9,857
Private high schools.....	53,813	54,408	108,221
Private normal schools.....	4,408	2,809	7,217
Private universities and colleges.....	30,016	14,785	44,801
Private colleges for women.....	5,614	5,614
Manual training schools.....	6,818	4,589	11,407
Total.....	329,675	406,325	736,000

The 736,000 secondary students comprised 4.25 per cent of the entire school enrollment of the country, which was 17,299,230. Almost 1 per cent of the whole population was receiving secondary instruction. In the last ten years the rate of increase of secondary students has been more rapid than the rate of increase in population. The number of secondary students in private institutions has very nearly kept pace with the growth of population from year to year, while the number of such students in public institutions has increased from about 3,500 to the million in 1891 to about 7,200 to the million in 1901. In 1891 the total number of public and private secondary students was about 5,800 to the million, while the number in 1901 was about 9,500 to the million.

Leaving out of consideration the secondary students in preparatory departments of colleges and in other institutions, the following table

will illustrate the growth of public and private high schools proper since 1890:

Public and private high schools since 1889-90.

Year reported.	Public.			Private.			Total.		
	Schools.	Teachers.	Students.	Schools.	Teachers.	Students.	Schools.	Teachers.	Students.
1889-90.....	2,526	9,120	202,963	1,632	7,209	94,931	4,158	16,329	297,894
1890-91.....	2,771	8,279	211,596	1,714	6,231	98,400	4,485	14,501	309,996
1891-92.....	3,035	9,564	239,556	1,559	7,093	100,739	4,585	16,657	340,295
1892-93.....	3,218	10,141	254,023	1,575	7,199	102,375	4,793	17,340	356,398

1894-95.....	4,712	14,122	350,069	2,180	8,559	118,347	6,892	22,681	468,446
1895-96.....	4,974	15,700	380,493	2,106	8,752	136,654	7,080	24,452	487,147
1896-97.....	5,109	16,809	409,433	2,109	9,574	107,633	7,209	26,383	517,066
1897-98.....	5,315	17,941	449,600	1,990	9,357	105,225	7,305	27,298	554,825
1898-99.....	5,495	18,718	473,227	1,957	9,410	103,838	7,452	28,128	580,065
1899-1900.....	6,005	20,372	519,251	1,978	10,117	110,797	7,983	30,489	630,048
1900-1901.....	6,318	21,778	541,730	1,892	9,775	108,221	8,210	31,553	649,951

In the last dozen years there has been a steady increase in the proportion of high-school students in certain leading secondary studies. In 1890 less than 34 per cent of the students were studying Latin, while in 1901 the per cent was about 50. The per cent studying algebra increased from nearly 43 in 1890 to nearly 56 in 1901. The following synopsis exhibits these percentages for each of the twelve years in certain studies:

Per cent of the total number of secondary students in public and private high schools and academies in certain courses and studies, etc.

^a Per cent of total number of graduates.

A recent inquiry sent to the school superintendents in 160 of the largest cities, those having over 25,000 population, asking for the date of first opening of a public high school, brought 142 responses. Of the 142 cities reporting, it appears that 28 had public high schools before the end of the year 1850; in 41 cities such schools were established in the period from 1851 to 1860, inclusive; in 32 cities public high schools were established from 1861 to 1870, inclusive; and subsequent to 1870 such schools have been established in the 41 remaining cities.

Education in Porto Rico.—The report of the commissioner of education for Porto Rico to the Secretary of the Interior is naturally largely taken up with the public elementary schools of the island as reorganized since the American occupancy. The year 1901 found about 34,000 children in school, and the commissioner estimates that next year 50,000 will be enrolled. For these pupils the number of teachers will need to be increased to 1,000. The summer normal school at San Juan was attended by over 800 teachers in 1901. A large building for the normal school was under construction at Rio Piedras, and was to have been opened about November 21, 1901. There were 39 new school buildings completed and in use; the teaching corps has been reorganized; a system of agricultural schools gives practical instruction to about 1,000 students; and a high school is in operation at San Juan. The annual budget has been increased from \$400,000 to \$500,000, and the schools are now equipped with all necessary books and supplies, while the school term extends to nine months in the year. There are 100 American teachers now in the island. Free transportation for teachers between New York and San Juan was discontinued in June, 1901. The salary of American teachers is fixed at \$40 per month for nine months in cities of less than 5,000 population. In larger cities it is \$50 per month for the same time.

Teachers' institutes were held in 15 places in the island during the summer of 1900, and summer schools were open in 16 districts.

In January, 1901, the sum of \$200,000 was transmitted to the treasurer of Porto Rico from the United States Treasury, by direction of the President, to be used for school buildings, and suitable buildings are in course of construction in all parts of the island. The school maintenance fund of \$501,000 allotted under the civil government is 25 per cent of the entire insular budget. It is independent of \$235,000 destined for school extension.

The free public library in San Juan has 7,400 volumes. Provision has been made by the legislature of the island to send a limited number of young men and women to complete their education in the United States.

The following is a statistical summary of the public-school system of Porto Rico from October, 1900, to June, 1901, inclusive:

Total population of the island.....	953, 243
Total school population	323, 393
Number of schools open at end of year (boys, 132; girls, 71; mixed, 528; night, 2)	733
Average number of schools open each month	698
Number of buildings in use for schools (town, 120; rural, 387).....	507
Number of teachers employed at end of year (white male, 461; white female, 235; colored male, 41; colored female, 31; total males, 502; total females, 266)	768
Total number of American teachers employed during year	104
Number of pupils enrolled at end of year.....	33, 802

(Of these 15,542 were white boys and 5,695 colored boys, and 8,763 were white girls and 3,802 colored girls. The total number of boys was 21,237, and of girls 12,565.)

Average daily attendance during the year	23, 453
Per cent of total population enrolled in schools.....	3.5
Estimated value of all school property.....	\$213, 465.97

Hawaii.—The Bureau is indebted to Mr. Alatau T. Atkinson, superintendent of public instruction of Hawaii, for the following figures and information relating to the schools of Hawaii:

For the year ending July 1, 1901, the enrollment was as follows: Enrolled in public and private schools, males 9,551, females 7,967, total 17,518; enrolled in public schools, males 7,233, females 5,956, total 13,189.

Average daily attendance in the public schools, 10,737.

Average number of days the public schools were kept, 186.

Number of buildings used as schoolhouses, 184.

Teachers' cottages supplied by the board of education, 64.

Estimated value of all public school property, \$500,000.

Number of pupils enrolled in public high schools or studying high school branches, 160.

Number of pupils enrolled in private and parochial schools giving primary or secondary instruction (including academies and preparatory schools), 4,329.

Whole number of different teachers employed in the public schools: Males, 104; females, 276; total, 380.

Average monthly salary of teachers (there is no distinction for sex, color, or race), \$62.

The appropriation for public schools from state taxes for two years ending June 30, 1903, was \$855,387.50.

Expenditure for the same for the year ending June 30, 1902, \$377,553.59.

There is no distinction on account of color or race in the public schools. American, British, German, Norwegian, Hawaiian, Hawaiian

mixed blood, Chinese, Japanese, Porto Rican, and South Sea Island children all attend the same schools.

From the last printed report of the superintendent for the year ending December 31, 1900, it appears that the number enrolled in the public schools was 11,501, showing an increase of enrollment in 1901 of 1,688.

The nationalities of the pupils are interesting. Thus there were, in 1900, 6,015 pupils of Hawaiian and Hawaiian mixed blood, 421 American, 136 British, 171 German, 2,625 Portuguese, 92 Scandinavian, 1,207 Japanese, 739 Chinese, 27 South Sea Islanders, and 68 of other unspecified nationalities in the public schools.

Cuba.—Volume II of the first annual report of the commissioner of public schools of Cuba has an especial value from an historical standpoint, on account of the reports of the provincial superintendents and investigating committees, which present a candid picture, in some respects quite curious, of the earliest workings of the school system which was inaugurated under the American administration. The commissioner remarks that "the school law is the most democratic order that has been published during the military occupation of the island of Cuba. It places the control of the public schools of the island almost entirely in the hands of the different local boards of education, only leaving to the higher offices the supervision of the work that is done by the lower, and such other authority and control as is rendered necessary by the facts that all expenditures of the public schools are paid from the island treasury, and that the grading and instruction throughout the island should be uniform." These boards are elected by the electors of the municipalities. They were supposed to appoint teachers without regard to politics or interest, but in some cases were found to be corrupt or negligent and the teachers were appointed from political motives or through favoritism. Such cases were investigated promptly and the offending members of the board removed, after a full examination of witnesses and report by a board of commissioners appointed for this purpose. These proceedings must have been an object lesson in administration to the voting public.

The progress during the year 1900-1901 is given in the following summary. At the beginning of this period there were a few more than 3,000 teachers employed in the public schools. The school accommodations were poor, as were also the equipment and supplies. The boards of education neglected their duties of supervision. The attendance was poor in many places, the methods of instruction were often defective, and many of the teachers had had but little experience. This state of things has been changed. Supervision and inspection have corrected many of the defects. Over 264,000 different children were enrolled in the schools during nine months, the enrollment for one month reaching nearly 180,000, of whom an average of 132,688 were in attendance daily. The population of the island being

about 1,500,000, an average of nearly one-eleventh of the population was in the public schools the entire school year, and one-sixth of the population attended school some portion of the year. By the census of 1899 the number of illiterate Cubans over 10 years was 690,565, out of a total population over 10 years of age of 1,215,810, or 57 per cent. This proportion can not long remain if one-sixth of the entire population is enrolled in school.

The number of schools has been increased by several hundreds, and the boards of education are becoming better acquainted with their duties, powers, and limitations, so that the school administration has improved greatly in the various districts. The schoolhouses and equipments have been greatly improved and supplies of text-books and other material have been abundant. All public school teachers hereafter will be required to possess a regular teacher's certificate. During the summer vacation summer normal schools were organized, which were attended by 4,000 teachers. One hundred teachers were sent to the summer normal school of Harvard University at Cambridge, Mass., and 60 young women are attending the State normal school at New Paltz, N. Y. A table is given of the number of private schools in the island, with their attendance and enrollment. From this it appears that there are in all 610 private schools, with an enrollment of 24,333 and an average attendance of 20,592. The commissioner remarks, however, that he believes these figures to be very incorrect.

Considerable space is given to manual training and to the "school city."

There were 2,413 different women and 1,708 different men employed during the year as teachers, of which numbers 1,911 women and 1,207 men, or 79 per cent of the women and 70 per cent of the men, taught the entire year.

The total enrollment was 264,742, or 47 per cent of the population of school age. The average monthly enrollment in the public schools was 168,303, and 24,333 in the private schools. The average daily attendance was 132,688, or 50 per cent of the total enrollment. This was made up of 86,456 whites and 46,232 colored, of whom 69,101 were boys and 63,587 were girls.

The expenditures for public schools for 1900-1901 were:

Boards of education.....	\$2,848,866.01
Office of commissioner of public schools	510,705.07
Office of the island superintendent of public schools.....	55,913.85
Office of the provincial superintendents of public schools.....	22,438.76
School buildings.....	125,908.11
Total.....	3,563,831.80

The following schedule, showing the annual expenditure for all grades of public instruction in Cuba, was received from the United States minister to Cuba:

Annual cost of public instruction.

Higher education:

Office of secretary	\$14, 440. 00
Habana University	274, 750. 00
High schools [institutes?], one for each province	228, 025. 86
School of painting and sculpture	11, 720. 00
School of arts and trades	25, 960. 00
National library	4, 500. 00
	559, 395. 86

Primary schools:

Boards of education, school-teachers, school rents, etc	2, 917, 742. 11
Furniture and school supplies, text-books, expenses of the students at New Paltz, expenses of the offices of school superintendents, construction and repair of schools, etc	419, 433. 56
Normal Kindergarten School	8, 840. 00
	3, 346, 015. 67

Grand total

	3, 905, 411. 03
--	-----------------

The department of public instruction is informed that there is an estimate, amounting to some \$260,000, which should be in the department of public works. The expense of freights and furniture for the schools is also not included, which is forwarded on bills of lading, nor is the expense of public journeys, for which transportation requests are issued, these expenses being paid directly by the General Treasury.

Higher education in Cuba.—The Bureau is indebted to the courtesy of the secretary of public instruction of Cuba for the annual report of the University of Habana for the scholastic year 1900-1901. From the historical introduction to this report it appears that the university was opened in 1734. The course of study then embraced grammar, arts, theology and the Holy Scriptures, mathematics, philosophy, civil and canon law, and medicine. This plan of studies was followed until 1842, when the "university," including the three grades of primary, secondary, and higher education, was secularized. The law of 1880 made the plan of studies and regulations of the university district uniform with those in Spain. The rector of the university was ex officio the head of education in Cuba. Various changes in the plan of studies in the different faculties from time to time were introduced by royal decrees, the dates whereof are recorded in the sketch under consideration. The present plan includes the faculties of letters and sciences, of medicine and pharmacy, and of law.

These faculties comprise "schools" with different titles, and the course or plan of studies is classified and distributed among these schools. An idea of the modernness of the programme may be derived from

the "schools" under the faculty of letters and sciences. This faculty includes the school of letters and philosophy, in which ancient and modern languages, history, psychology, moral philosophy, and sociology are taught; the school of pedagogy, the school of sciences (physical and biological, including anthropology) with laboratories and museums; the engineering school (including electrical engineering), the school of architecture, with laboratory and mechanical and electrical workshops, and the school of agronomy. The separate subjects of study, forming a list too long to give here, appear to be calculated to meet modern requirements. The photographs accompanying the report give views of the various laboratories with students at work in them. The great extension of laboratory work is an innovation which marks a radical change in the method of study, even of purely objective or laboratory subjects proper. In 1900-1901 there were 638 students in the university, of whom 158 were enrolled in the faculty of letters and sciences, 315 in the faculty of medicine and pharmacy, and 165 in the law faculty.

At the same time there were 126 students enumerated in the "institutes" of secondary instruction, of whom 61 were enrolled in the institute of Habana, 11 in that of the province of Pinar del Rio, 18 in that of Matanzas, 11 in that of Santa Clara, 5 in that of Puerto Principe, and 2 in the Institute of Santiago de Cuba.

All of which is respectfully submitted.

WM. T. HARRIS, *Commissioner*.

The SECRETARY OF THE INTERIOR.

a Inclusive.

b Not fixed by State law.

c School census law repealed; funds now apportioned on basis of total days' attendance.

d With certain exceptions in the case of children over 13.

e No compulsory attendance law.

f Law of 1902; applies only to Baltimore city and Allegany County. Children 15 to 16 years lawfully employed and able to read are exempt.

g No State school census.

h Including 1,852 Croton Indians.

i May be extended.

TABLE 4.—Number of pupils enrolled in the common schools at different dates, and the relation of the enrollment to the school population.

State or Territory.	Number of different pupils of all ages enrolled during the school year (excluding duplicate enrollments).					Per cent of school population (i. e., of children 5 to 18 years of age) enrolled.

a Approximately.

b In 1899-1900.

c In 1898-99.

Method of ascertaining average attendance.—The average daily attendance during a year (which is the average number of pupils actually present each day the schools were in session) may be computed as follows:

First, for a single school: Add together the number of pupils present each school day during the year, and divide the sum (which is the "aggregate attendance in days") by the number of such school days.

Second, for a group of schools having the same number of school days in the year (as the schools of most cities have): Divide the combined aggregate attendance in days of all the schools by the number of school days in the year.

Third, for a system of schools having different lengths of school year (as, for instance, those of a county): Add together the average attendance of the component schools and groups of the system, as ascertained by the foregoing rule. For larger systems, as those of a State or of the United States, the summing-up process is continued in the same way.

In a system of schools such as is specified under the heading "Third," the average number of days in the school year for the whole system is found by dividing the combined aggregate attendance in days of all the schools of the system by the average attendance as ascertained by the method given. See observations on Table 8.

Observations on ascertaining the average school term (Table 8).—The "aggregate number of days' schooling given" to all pupils (see column 7), which is the same thing as the aggregate number of days attended by all the pupils, has been computed for those States which do not make an explicit report of this item by multiplying the average daily attendance of pupils by the average length of school term in days.

Conversely, the average length of school term (column 6) for the United States as a whole and for each of its geographical divisions has been obtained by dividing the aggregate number of days attended by the average daily attendance.

By this method the school term of each State, in computing the average term for a number of States, is in fact given a weight proportioned to the school attendance of the State, as should be done under a correct interpretation of the expression "Average length of school term." The result might more properly be called "Average length of attendance," which is essentially what it is desired to know.

A method which has been in use in some States for finding the average school term of a county, for instance, is to weight the different school terms of the towns or districts the county is composed of by the number of schools in each. In other words, the total number of days (or months) all the schools of a county were kept is divided by the total number of schools to get the average time each one was kept. So, in finding the average term for the State, the school is taken as the unit instead of the pupil. When the schools differ much in size (number of pupils), as they do in all mixed urban and rural systems, varying from some half a dozen to 500 or more pupils each, the average term obtained by this method varies considerably from that obtained by the Bureau's method. The long terms of the large city schools not being given their proper weight, the resulting average is too small. The same objection applies still more forcibly to weighting the school terms of the different counties or towns by the number of school districts in each.

Another method is to divide the total number of months or days taught by the number of teachers. This is better than the preceding method, as it takes some account of the size of the schools—that is, an eight-grade school with eight teachers has eight times the weight, in determining the average term, than a district school with one teacher has. This is manifestly as it should be. If every

teacher taught the same number of pupils the result would be the same as by the Bureau's method. Care must be taken in working by this method to use the number of teachers' places (or number of teachers necessary to supply the schools) for the divisor; for if a teacher teaches a school or grade part of the term, and is replaced by another for the rest of the term, the two should obviously count as one teacher for the combined period of service. The liability to overlook this distinction in practice, as well as the inequality in the number of pupils to a teacher, makes this method generally objectionable.

Still another and most faulty method is to add together the school terms of the different counties or towns and divide by the number of such counties or towns; i. e., the simple arithmetical mean is taken. An example of this occurs in a school report, where it is stated that 14,193 pupils in one district attended 185 days and 856 pupils in another district attended 160 days, while the average time the whole 15,049 pupils attended is computed at $172\frac{1}{2}$ days, although nearly all (16 out of every 17) attended 185 days. This method, if it can be so called, gives altogether too short an average term, and nothing can be said in defense of it. It is as if, wishing to get the population per square mile of Minnesota and Dakota combined, we said, population per square mile of Minnesota, 9.86; of Dakota, 0.92; average number of persons per square mile in the combined territory $(0.92 + 9.86) \div 2 = 5.39$, instead of dividing the total population of the two States by the combined area in square miles.

The "aggregate number of days' attendance" is a statistical item of the utmost simplicity and of great value, about the meaning of which there can be little or no difference of opinion. Every teacher's register that records the number of pupils present each day in school, as they all presumably do, contains the data for ascertaining it for that school for the school year by the simple process of addition or summing up.

There are a few States that do not ascertain at all how long their schools were taught, and others that use methods so faulty that they also are totally in the dark in the matter. Yet this is one of the most necessary and fundamental items of information in determining the amount of school instruction given.

TABLE 8.—(1) Average length of school term at various periods; (2) aggregate number of days' schooling given to all pupils; (3) the same compared with the school population and the enrollment (columns 8 and 9).

State or Territory.	Average number of days the schools were kept during the year. ^a					Aggregate number of days' schooling given in 1900-1901.	Average number of days' schooling given for every child 5 to 18 years of age in 1900-1901.	Average number of days attended by each pupil enrolled in 1900-1901.
	1870-71.	1879-80.	1889-90.	1899-1900.	1900-1901.

^aIncluding buildings rented.

^bThe reports of private schools are more or less incomplete, and the number of pupils as given may be taken to represent the minimum number of private pupils in the States furnishing this item. In forming the totals the States not reporting are estimated.

c Average for those States reporting salaries.

d In 1897-98.

e In 1899-1900.

f Number of schools.

g In 1889-90.

h Approximately

i Estimated.

j In 1895-96.

k In 1893-94.

l In 1891-92.

m Does not include furniture and apparatus.

n In 1892-93.

o In 1898-99.

p In 1896-97.

q In 1894-95.

Average salaries.—In computing (for Table 10) the average monthly wages of all the male (or female) teachers in the several groups of States, the average wages of each of the States in question is multiplied by the corresponding number of teachers. The sum of the resulting products is then divided by the sum of the teachers, and the quotient is the average wages of all. Each rate of wages thus receives its due weight.

To illustrate the principle: If 48 teachers receive an average of \$72.20 per month, they all receive in a month \$3,466; if 473 other teachers receive an average of \$48.60 per month, these together receive in a month \$22,988; the 521 teachers combined, therefore, receive per month \$26,454, or an average of \$50.77.

Attention is called to this subject for the reason that the practice of taking the arithmetical mean of a number of rates of wages (the mean is \$30.40 in the above case) in order to get the average of all is so common as to vitiate, to a considerable extent, the published statistics of average wages.

TABLE 11.—(1) *Length of school term.* (2) *The aggregate number of days' schooling given compared with the school population.*

Year.	Average length of school term, in days.						Average number of days' schooling given for every child 5 to 18 years of age.

a Includes bond payments.

b Cities not included.

c Includes expenditure for sites, buildings, etc., in cities.

d Not reported.

e Includes some unclassified items.

f Includes some miscellaneous expenditure.

g Expended from "schoolhouse fund."

h Interest on bonded debt not included.

i Included in column 4.

TABLE 16.—(1) Expenditure per pupil (based on average attendance); (2) average daily expenditure per pupil; (3) percentage analysis of school expenditure.

State or Territory.	Average expenditure per pupil (for the whole school year).				Average daily expenditure per pupil.		Per cent of total expenditure devoted to—		
	For sites, buildings, etc.	For salaries.	For all other purposes.	Total per pupil.	For salaries only.	Total.	Sites, buildings, etc.	Salaries.	All other purposes.

a From 1871 to 1887 this Bureau did not ask principals of private high schools and academies to report the number of students pursuing each secondary study. Prior to 1890 the number of students reported by a large number of these private schools included the total number in attendance, the elementary pupils as well as the secondary students. For the past nine years the two classes of students have been reported separately. Taking the reports from 1890 to 1895 as a basis, the number of secondary students in private high schools from 1871 to 1889 has been carefully estimated for each year.

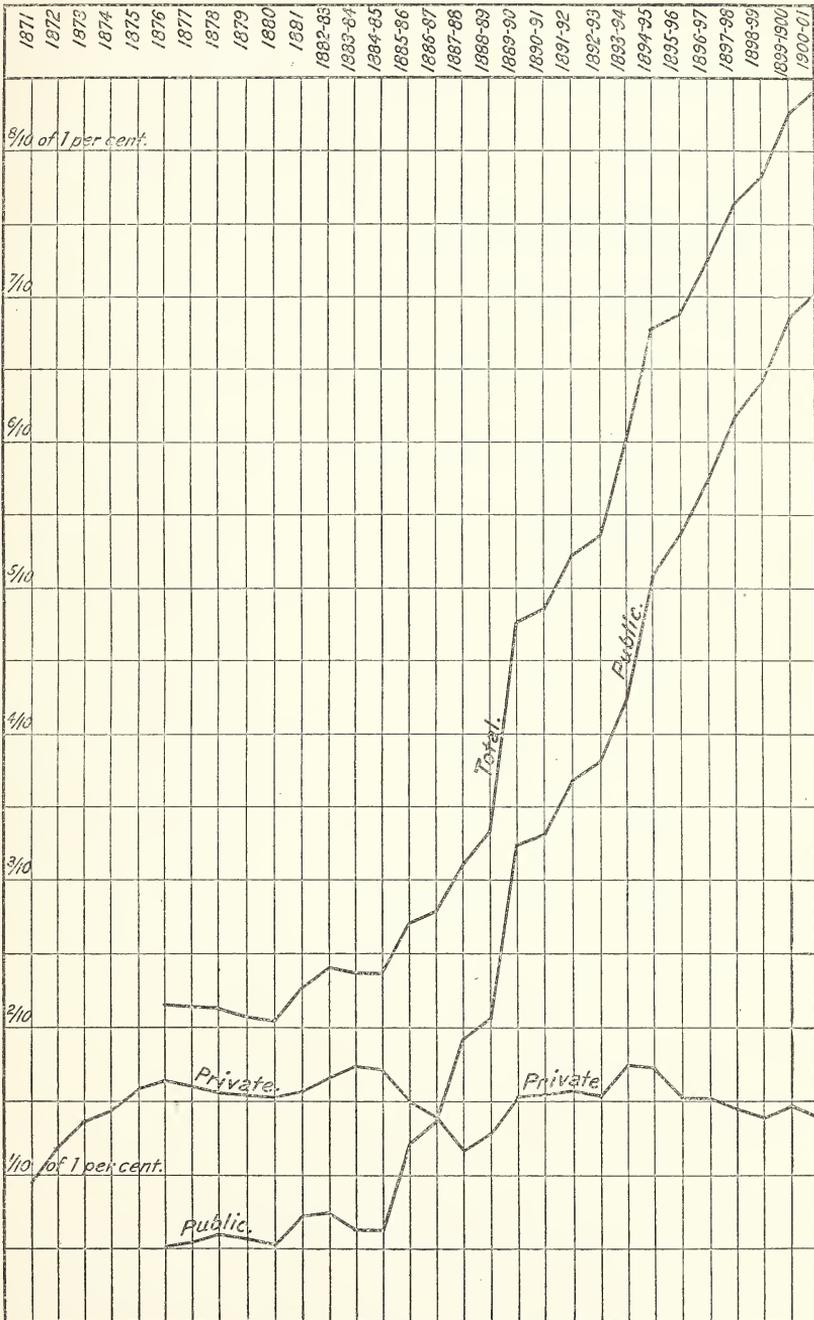

b Previous to 1890 only the pupils in public city high schools are given. From 1890 onward all public high schools are included.

DIAGRAM 5.—Number of secondary students in public and private secondary schools.

NOTE.—In connection with this diagram, see the accompanying table and explanation, p. xcv.

DIAGRAM 6.—Percentage of the population enrolled as secondary students in public and private secondary schools.

NOTE.—See explanation to Diagram 5.

II.—TABLES OF SCHOOL EXPENDITURE IN THE SOUTHERN STATES, CLASSIFIED BY RACE.

Table A gives the school expenditure, classified by race, in each Southern State that reports the expenditure so classified, as far back as the record goes in each. In Maryland the expenditure for negro schools for the first three or four years is mainly in the city of Baltimore. The totals include only the States tabulated.

Table B gives the white and colored school population (children 5 to 18 years of age) in each case where the school expenditure is given in Table A.

Table C gives the expenditure for white schools per capita of white school population, and the corresponding per capita for the negro schools. The averages include only the States recorded each year.

In making an estimate of the white and colored school expenditure of the remaining Southern States the most obvious assumption to make in the absence of any positive information is to consider that their white and colored school per capita expenditures bear the same ratio to each other each year as that of the average per capita given in Table C. It is upon this basis that the classifications by race have been made that are given in Table D, except for the years 1870-71 and 1871-72, in which the ratio of white to colored per capita was taken at about 6.

TABLE A.—Expenditure for white and colored schools.

Year.	District of Columbia.		Florida.		Kentucky.		Maryland.		North Carolina. ^a		South Carolina.		Texas. ^b		Total.

Totals.....	650,623,877	528,842,209	121,184,568				

^a United States Census.^b Approximately.

It will be observed that according to the foregoing table the estimated expenditure for colored schools at times varies abruptly; there was a large increase in 1891-92, and a falling off equally as large in 1894-95. This irregularity did not of necessity actually exist, but results from the way in which the estimates were made, as explained on page xcviii. In 1891-92 Texas, which had a large per capita expenditure for colored schools, entered into the average, and in 1894-95 South Carolina, with its correspondingly small expenditure. The estimate for 1899-1900 is based upon the classified race expenditure of six States, and probably gives a sufficiently close approximation.

III.—PUBLICATIONS OF THE UNITED STATES BUREAU OF EDUCATION.

[From 1867 to 1902.]

1. Annual Report of the Commissioner of Education, 1867-68. Barnard. 8°. pp. xl+853. Out of print.

I. EDUCATIONAL MOVEMENTS IN GERMANY.

The problems of the age, varied and intricate as they are, are all, more or less, educational problems. They certainly are reflected in popular education. School, like a vessel in harbor, is safe from the storm that rages on the social and political ocean, but it feels its effect in the slight commotion of the waves, and is rocked by the ripples in which the huge waves of the ocean terminate. This is found to be so

in every country where school education has become a concern of the State. Everywhere the schools are benefited or disturbed by changes in movement, new ideas, conflicting tendencies, or counter-currents.

In Germany, particularly, the demands of the time for educational reform¹ have become loud and urgent. The desired and partly effected changes in the elementary schools were clearly set forth in the last Annual Report. (See chapter entitled "Education in Central Europe.") Recently the secondary and higher institutions have become the subject of discussion, partly through the initiative of the Emperor, chiefly, however, in consequence of the enormous expansion of industry and commerce. A Berlin correspondent of the *New York Evening Post* sketches the commotion going on in school affairs in Germany by pointing out the irrepressible conflict between classical and technological schools. The article, signed W. v. S., is here inserted, with some omissions and verbal changes:

In the German conception of public school and higher education, and in the efforts to bring the concrete facts more closely in harmony with this conception, there has recently been remarkable progress, or at least change. And if one accepts the theory held by many educators the world over, i. e., that the needed and thorough reform of the present system of education must come in Germany and through German pedagogues, it may be truthfully said that the present time is rife with problems and bright prospects for their solution. After the truce which came on the heels of the Emperor's brief effort to effect a radical reform of the gymnasium (classical high school) curriculum and of the methods employed by the teachers there, the battle is now on once more, and the arena is already filled with the noise of the belligerents; the advocates of both technical and classical education are up in arms in behalf of their contentions.

One of the matters which Emperor Wilhelm, shortly after ascending the throne, first tried to arrange and reshape was this one of the old-fashioned German gymnasium education. That this was a step in the right direction was admitted then by the majority of educated men, but that the manner in making the attempt was not very successful also admits of small doubt. The result of the conference held in 1891 was to "ease up" the school task of the student, especially in Latin and Greek, to such an extent as to seriously interfere with the young student's proficiency in both classical languages, in introducing a spirit of unrest into the minds of both teachers and pupils, and in setting an agitation going which has never since stopped. This last achievement was, perhaps, good in itself. One other thing accomplished, and also to be commended, was the taking up of manly sports by the "gymnasiasts" and university students as a body, of rowing, football, lawn tennis, etc. The radical reform, however, that had been intended, has not been brought about.

Since then nearly ten years have elapsed. During that time technical and applied science has achieved triumph after triumph, and one important new invention after another has been introduced here and elsewhere. It is also well known what a strong interest the Emperor has taken in some of these; how, for instance, he received men like Roentgen, Marconi, Slaby, etc., and witnessed their demonstrations, and how he did everything in his power to further the standing and the interests of technologists. All this, of course, with the hearty disapprobation of the men of the old school in Germany, who continued to look upon chemists, engineers, electricians, etc., as a higher sort of mechanics, but not as men of science—certainly not as belonging to the "Ritter vom Geist"—not as their fellows in the aristocracy of intellect. That the average German "Gelehrter" has gone a good deal too far in this respect can hardly be doubted. Even such a prince of applied science as the late Siemens was, though he had attained wealth and recognition, suffered all his life from the thinly veiled disdain of the German university savant. And it must be remembered that in Germany the university-bred man thus far is the only one for whom the public service of the country is open; that he is the paramount power in German literature, journalism, almost every form of public opinion, and that, therefore, nonrecognition from that quarter has meant all along the shutting up of all the avenues through which men attain to glory, emoluments, popular esteem, orders, decorations, preferment, influence.

The battle cry was "Technical against classical education" throughout Germany for years, and the practical men with the technical education had generally

¹ See also notes under the head of Miscellaneous Items at the close of this chapter.

the worst of it, as they do not belong, as a rule, to the writers, and were too busy to reply to much that was said. One of the main objects the men of technics fought for all along was the title of "doctor," as conferred by the universities on their highest and ablest graduates. In a country like Germany, where the desire for titles and visible decorations is strong, and where not to bear a title of some kind or other seems to the average man one of the most serious misfortunes, and where people in their judgment of others are very largely governed by such titles, it meant, of course, a great deal more than in other countries that the young engineer, analytical chemist, architect, etc., no matter how thoroughly educated and how efficient and well-deserving, was under all circumstances debarred from the enjoyment of a title denoting academic degree and conferring social distinction as well.

It was here where the Emperor in his capacity as King of Prussia again interfered in behalf of the technical men. To the displeasure of the whole Prussian official world and of the vast and influential body of university-bred men outside of it, he conferred on the three Prussian institutions of technology in Berlin, Aix-la-Chapelle, and Hanover the right of conferring academic degrees, the only difference being that the "doctor-ingenieur" must be written and printed in German letters instead of Roman ones, so as to avoid misleading the public.¹ The Emperor did this, too, in a way to make this gift doubly valuable, and a large part of the German press has since been bemoaning the fact and expressing the direst fears for the future of the country. Nearly every university-bred editor or writer has flung Goethe's bitter sarcasm about the uses to which science is put, viz., "To the one she is the exalted, divine goddess; to another she is merely a good cow that provides him with butter," into the faces of these men of applied science, now his actual competitors in the race for honors, and the abuse heaped on the heads of the latter is still flowing undiminished.

New fuel was added to the flame when Professor Riedel, the rector of the Technological Institute of Berlin, delivered an address (see translation of portions of this address following this article) wherein he used the substance of a talk the Emperor had had with him and the other two rectors, and in which the present educational system of Germany, so far as it prepares for the universities, was severely taken to task, and the opinion expressed that a large share of what the pupils of the higher and secondary schools learns is, as a rule, useless, and that not enough regard is paid by the teachers and professors to the practical needs of life. The address went, of course, into details and furnished illustrations, but it was so powerful and well-reasoned as to produce a strong and lasting effect, all the more so when, in answer to the unceasing abuse showered on him, Professor Riedel publicly stated, probably with the Emperor's permission, that the phrases most found fault with had been used by the Emperor himself in the course of the conversation referred to.

In one of the leading German periodicals, the *Deutsche Revue*, Professor Kaibel makes a strong argument from the point of view of the university man against the Emperor's attempt to put the graduates of the universities on a par with those of the technical institutions, arguing that this will aid greatly in destroying the last fragment of that idealism in the German character which has made the German people great in science, poetry, the arts, and which has already been sadly curtailed by a growing desire for merely material good. He, too, furnishes illustrations and examples, and there is undoubtedly a kernel of truth in what he says. But Kaibel commits the mistake of simply ignoring the undeniable shortcomings of the present German educational system, and of joining in the vulgar abuse of his opponents. Nevertheless, his article has caused a sensation, and all the conservative papers of Germany are reprinting it, many of them because in doing so they can take issue with the reform movement.

Even such a strong Government paper as the *Kreuzzeitung* takes delight in thus intimating to the monarch that he had better retrace his steps again, as he did once before. But there does not seem to be any prospect of his doing so this time. * * * The Emperor has gone in earnest at the task of carrying through this reform. He met with strong and determined opposition, the strength of which can be measured by the virulence of the press campaign against the technological institutions. * * * Meanwhile the sovereigns of Saxony, Wurttemberg, Hesse, and Baden have imitated him in conferring similar rights on the technological institutions of Carlsruhe, Dresden, Stuttgart, and Darmstadt.

That, however, the movement within the nation itself for a thorough modification of Germany's secondary and higher school system is gathering strong momentum despite the enormous opposition on the part of the conservative leaders of public

¹ See next article on "Necessity of technological education."

opinion here, there are many proofs. One is, that among the German pedagogues themselves the number of those insisting on a change is rapidly growing.

The idea among them finds more and more favor that it would strengthen German educational school methods materially if some of the English and American educational features were to be adopted, with a view particularly of arousing in the German boy and youth more of that indomitable energy, that self-reliance, and that practical sense in meeting and overcoming difficulties which have ever distinguished those two nations, and which are in large measure due to early inculcation at school, where the "try, try again" is taught even to the youngest. * * * No less a paper than the Cologne Volkszeitung, the leading Catholic organ in Germany, published a well-reasoned article by a German bishop wherein this was set forth at length and with irresistible logic. It is certainly strange to see such an article appear in the main organ of the Ultramontane party, but the fact does not detract from its significance. It is quite certain that the Emperor's programme will also make toward this same end, and there is, whether one may regret it or rejoice at it, a strong current within the German people of to-day trying to rid it of the national failings that have told against political and financial success in the past, such failings as indecision, procrastination, lack of practical sense and ruthless energy in the battle of life, and there is a growing conviction that these old failings are due in large measure to the dreamy, impractical German schoolmaster of yore.

W. v. S.

A conference of distinguished Prussian school men, called together by the minister of public instruction, resulted in the rejection of the plan submitted to it, namely, of arranging for a common course of study for all secondary schools up to the fifth grade, and a trifurcation into classical, technological, and commercial courses from the fifth to the tenth grade. The conference also rejected the plan of making English a compulsory branch, except in the two highest grades. The "technologists" throughout the Kingdom deplore the result of this second educational conference as not in line with modern thought.

Since then the Emperor, perhaps impatient with the slowness with which the teachers and other school authorities moved in the matter so dear to his heart, has issued a new order, which is so significant that a translation is deemed desirable. The order reads:

After examining the report concerning the reforms instigated by me in 1892 in the secondary schools of the Kingdom, I desire to see the efforts continued along the following lines:

1. With reference to the privilege of students of abridging their military service to one year, the three kinds of schools—the Gymnasia (classical high schools), Realschulen of the first order (realistic schools), and Realgymnasia (schools representing both tendencies)—shall be considered of equal value in general education, and only with reference to the fact that some higher professions require special preparatory education, which not all three kinds of schools can give equally well, shall a distinction be maintained in favor of Gymnasia. The extension of the privilege mentioned to the realistic institutions is intended to raise their importance among the people and to extend the amount of realistic and scientific knowledge.

2. The recognition of the principle of equality of the various kinds of secondary schools will enable each to develop its own characteristics better. In pursuance of this principle I do not object to an adequate increase in the number of hours per week devoted to Latin in Gymnasia and Realgymnasia, but I lay especial weight upon the importance which knowledge of the English language has gained of late, and desire, therefore, that English be introduced as an optional study everywhere of equal rank with Greek. Where local needs would suggest, English may replace French as a regular study and French be taught as an optional study. It seems to me, also, very desirable to pay more attention in Realschulen to the study of geography.

3. Since 1892 the secondary schools have made unmistakable progress in various directions, but more must be done. I therefore urge upon the principals to remember "multum, non multa," and see to it that in the course of study not all branches be treated alike in importance, but that the essential be treated with due consideration and be taught more thoroughly. For the study of Greek it would seem desirable to abandon useless philological forms and pay more attention, besides the esthetic conception, to the causal nexus between the antique world and modern culture. In teaching modern languages especial stress should be laid on

facility to speak them, and securing comprehension of their classic writers. In the study of history there are still observable two faults: (a) The neglect with which important sections of ancient history are treated, and (b) the want of adequate lessons in German history of the nineteenth century, with its elevating accounts of great achievements for the fatherland. With reference to geography it seems best to intrust this branch to the hands of specially well-qualified teachers. In the study of natural sciences object teaching and experiments should claim more space and attention, and excursions should be resorted to to enliven the instruction; in physics and chemistry application and technique in daily life is to be more emphasized. With regard to drawing I desire that the ability of sketching objects rapidly be valued higher than heretofore, and in classical high schools it is urged that students who intend to devote themselves to technology, natural sciences, mathematics, or medicine make diligent use of facilities offered in drawing lessons. Aside from gymnastic exercises, the arrangement of the time-table should consider more than heretofore the health of students, especially by giving longer intermissions between lessons.

4. Since the institution known as "Abschlussprüfung" [an examination conducted after six years' attendance to enable students to abridge their military service.—Tr.] has not proved a relief, and especially has not relieved the throng to the universities, on the contrary, has rather increased the number of candidates for higher seats of learning, it is desirable to abandon the examination.

5. The establishment of secondary schools according to the plans adopted in Altona and Frankfurt has generally proved a success. [These schools begin with modern instead of with ancient languages.—Tr.] Their common foundation, which embraces the Realschulen, forms a social advantage not to be underestimated. I therefore desire that such attempts be not only continued where they have been tried, but that they be made in other localities also.

I entertain the hope that the measures instituted to realize the ideas expressed in the foregoing will find no obstacles among the teachers, in whose ever acute sense of duty and faithful devotion I trust, so that our secondary schools may benefit thereby, and the contrasts between representatives of the humanistic and realistic tendencies be lessened and terminate in a conciliatory spirit.

The educational press of Germany has not published much with reference to the Emperor's utterance, but the foreign press considers it as a very important state action and treats it accordingly. Inasmuch as French alone among the modern languages has been obligatory in former days in the classical schools of Germany, some journals in France have seen in the Emperor's advice a thrust at France.

The *Journal des Débats* (Paris) nevertheless says that the Emperor merely gives to English that increased importance which naturally belongs to it. This is also the opinion of the *Gaulois* (Paris), from which the *Literary Digest* takes the following:

At one time French was predominant as the language of diplomacy, of literature, of society. Perhaps it still holds its own in these respects. It is still the best medium for lively, graceful conversation; still the best means to express clearly all international agreements. But that only proves the value of French as an international means of communication in the aristocratic world. As long as the study of languages was the privilege of exclusive circles, nothing could disturb the supremacy of French. To-day the French language only shares in the depreciation of everything aristocratic. The business man rules the world, and the business man cares but little about the beauty of a language. It is the young merchant who tours the world nowadays, instead of the young gentleman who used to frequent courts and universities; and the merchant prefers the language of the people to whom he would sell his goods. We are not the most prominent nation in trade and colonization, hence the study of our language is less important than that of others. The crisis of the French language is not due to our social or literary decadence, but to our economic inferiority.

At present the business impulse is undoubtedly strongest in Germany. But the German has encountered the Englishman everywhere as a competitor. Germany finds England as England found Holland. The English learned the secret of trade from the Dutch, the Germans have learned it from the English. In this kind of struggle the nations at first combat each other, but they soon come to terms, especially if they are similar in race and language. The period of violent competition and enmity between Germany and England has been but short, nor has it been very critical. Its most prominent feature is the English regulation to

stamp German manufactures as "made in Germany," a measure which has not hurt the Germans, and is not nearly so full of animosity as Cromwell's navigation act. To-day the English and Germans have settled down to friendly competition. That, then, is the reason why the young men of the German middle classes, who are not intended to become cavaliers nor men of the world, but business men and industrials, are advised by their Emperor to learn English rather than French.

II. THE NECESSITY OF TECHNOLOGICAL EDUCATION.

[Extracts from an address of Prof. A. Riedler, rector of the Polytechnic Institute of Berlin.¹]

The demands made by present conditions of life upon education are different from those of former times, and they are determinative. Powerful forces and influences have changed conditions of life, and education, to be correct, must be in harmony with these conditions. Public education is not meant only to serve certain classes of society, but must promote national and political interests by stimulating productive activity. The causes, phenomena, and characteristics of recent demands upon modern education, in so far as they proceed from changed conditions of life, must be taken into consideration. They make the conclusion a natural consequence.

Present conditions of existence in connection with the great educational questions are, in the first place, characterized by an endless diversity in the growth of the sciences, which are, nevertheless, only at the beginning of an incalculable development. Whoever sees nothing more in this uninterrupted progress than an increase of scientific matter can demand nothing more than that every new scientific branch receive a new professor and new classes of students. Man will hardly live long enough, however, to be able to acquire all scientific knowledge; that is out of the question. As it is improper to develop specialism in school, so inconceivable is the thought of learning all that science offers.

There is but one way of meeting the constant development of science, using the term in its broadest sense, namely, by division of labor and an education calculated to effect self-reliance, utmost simplicity, comprehension of essentials, and a final absorption in or devotion to one branch of science. But that way is impossible unless the command of scientific principles is combined with their application. The thought of accomplishing anything at all by mere theoretical speculation is undeserving of the least attention.

As a further result of recent conditions of existence, I may say that the means of education at our command are much more varied than those of former times. Formerly, all known wisdom was contained in a book of written notes, and could be taught only from the teacher's chair. This point of view, though long since overruled, is still adopted in instruction and for educational means. About four hundred years ago Melancthon taught theology, philosophy, natural sciences, and mathematics. In his time, however, theology and philosophy were identical; natural sciences meant a translation of Aristotle, and mathematics that of Euclid. Whoever had a knowledge of the dead languages was able to teach these studies.

In our own day much is proclaimed from the professor's chair as wisdom which is nothing beyond a knowledge of methods and scientific expedients, and neglects any consideration of modern educational means or the present status of science, i. e., the matter of education.

Modern educational matter and means² have become infinitely more varied than would be supposed from the scholastic method still in use. It is astonishing how ancient and antiquated forms are preserved and continue in vogue, as

¹ This is the paper referred to in the foregoing correspondence.

² It must be borne in mind that the author refers to secondary and higher institutions of learning. Whenever he uses the word school it is always in that sense.

though printing had never been invented, and wisdom emanated only from certain restra.

An immense overvaluation of erudition at present predominates in place of applied knowledge, to which no special significance seems to attach. The mania still prevails to treat all subjects historically, though history is often only a history of errors, and the young are tortured by these errors instead of being trained to clear judgments.

Technological methods in all departments of study are still too much underrated. These methods aim to give every branch of knowledge the simplest and most easily applied form of expression, together with the greatest clearness and most distinct arrangement. I beg leave to mention that university men are just beginning to reap laurels by applying technological methods which are familiar to us, but have until recently been ignored by the learned profession.

Another characteristic of altered conditions of life is the demand upon education for a different content (Inhalt). In former times efforts toward the highest education tended in one direction alone; they aimed at discovering an all-comprehending discipline (branch of study) for thought. This led to the most startling errors, especially in philosophical speculation.

To-day representatives of the natural sciences occupy the same chairs from which the infallibility of speculation was once preached. In juxtaposition to this there is the fact that true education must at the present day be inseparably connected with the consciousness that so called general education, as well as individual or special education, is defective (Stückwerk). He who fails to hold this view can not have an extended intellectual horizon. True education at present does not consist in the knowledge of many things, or in knowing what has been transmitted by learned authority, but in understanding the connection between different branches of knowledge and in a certain veracity of thought that appreciates the confines of cognition and judgment. By no means does it consist in a presumptuous belief in the infallibility of any single branch of knowledge.

For true education there is no other foundation than that of reality. The obstacle in the way of development of a correct mode of thought is the prevailing false training, mostly supported by dogmas which admit of nothing except blind acceptance. Take these dogmas away and the whole educational structure will fall. I merely refer, as an example, to the enormous overvaluation of language, or, more properly speaking, grammatical instruction.

A false professional preparation of the teachers for secondary schools also needs mention. Every candidate is trained in only one special branch. Instruction is but a reiteration of information, and a dead weight of facts instead of the recognition of truth is implanted in the minds of students—a school philosophy which it is well to forget as soon as possible.

Another great obstacle is the study for qualification,¹ in view of which many school plans are formed, as well as the acquisition of certificates of qualification, in the belief that their possession implies qualification and competency to govern and criticise, a belief that is fast gaining ground with modern youth. Study for qualification, remunerative support, or salaried position are cynosures for many.

Greater obstacles still are living examples; they exercise a stronger influence than words spoken or written. The worst example is the power of those who have no practical education and not the least notion of productive energy, and who exert their power to the greatest detriment of the ambition and love for work of those who really labor. In this respect a comparison with foreign countries, especially the United States, forces itself into notice.

¹ The author here refers to the examination which entitles the student to an abbreviation of his term of service in the army, and to other examinations which open the door to promotion and State service.

So far as the national spirit is concerned, Germany need not dread a comparison with America on many points. The Germans, the nation of visionaries, as they were called, were, in fact, an agricultural people until very recent times. With the development of technology they awoke to the consciousness of their latent power. The German nation has had reason to rejoice in a Christmas gift not granted by many centuries—the Thoughts and Reminiscences of Prince Bismarck. In this work a giant mind speaks to his nation, and his words contain an instructive force that will be felt in centuries to come. In these reminiscences we read that the progress of a nation is inseparable from a certain healthy egotism, to be controlled by necessity and never to degenerate into a spirit of domination or power. It is deplorable that we have no other word for egotism. It is a law of nature, like the struggle for existence, and has other than a derogatory significance. In the life of nations there is a necessary and commendable selfishness upon which their greatness is dependent.

All effort indispensable to the growth of a nation and to creative energy must proceed from a healthy egotism. It is necessary for national interests, as self-reliance and self-help can thrive on no other soil. God helps those who help themselves, and first in order come governments. At times demands are made upon governments which they can not meet, even with the best will and greatest resources at command. A healthy development is possible only through self-reliance and self-help.

The most significant part is played by the power of adaptability. Individuals as well as nations grow old and decrepit as soon as they cease to fit themselves to changed relations and conditions. No State can desire that. Every effort must be made to cultivate this most important faculty. The power of adaptability, connected with right knowledge, meets the probabilities of life. In life there is very little absolutely certain. Mere probability is a general rule, and it is self-evident that certain conditions can not be recognized at all, or only at improper times. In all practical problems the multiplicity of conditions acts as a restraint. The difficulty of the problems consists in managing the complexity of given conditions, together with their contradictions and opposing forces, that must be overcome and can be set aside by a corresponding power of adaptability.

Considering whom I am addressing, I need place no special stress on the fact that engineers find their chief difficulty and greatest problem in the aforementioned peculiarity. In no deed of engineering can calculations be made as exactly as in a mathematical problem. Every such act deals with a multiplicity of conditions, a whole series of probabilities. A proper consideration of probabilities and their valuation in the face of definite conditions is generally called speculation. This does not concern industry alone, but all creative activities, and most of all those that intend to govern, whether at the top or modestly in the ranks. To govern means to anticipate, not to decree. Whoever wants to foresee must know how to deal with the whole sum of probabilities that entangle practical life in intricate perplexity.

The further division of labor progresses, the greater the dependence of separate branches of knowledge one upon the other. That is an unavoidable consequence. One obstacle in the way of a correct comprehension of given conditions is the overestimation of knowledge, even technical.

Every creative agency has not its own end in view, but is a means toward definite economic purposes. Technical activity is only a part of all creative agency. Whoever understands building or other construction to be its own end makes a mistake. Professional narrow-mindedness that ignores the dependence of one branch upon others leads to wrong results.

The education of engineers of the future must therefore not be one partially false, but it must be an economic technological training. Every engineer who

wishes to be a creative agent must realize that he is a link in the chain of creative labor. The whole future, as a matter of course, depends upon this connection between technological creative agency and economic development. All instruction, especially that in universities, must conform to this tendency. The time has passed when purely scientific education meets all demands.

The present situation is still very unsatisfactory. All preparatory education excludes technological views and fails to meet demands. In the universities, even, the opinion prevails that purely abstract scientific qualification is all that is necessary. There are numbers of scientific specialists teaching in universities who have never gained any experience on their own responsibility, who have never themselves worked, and have no insight into the relations of present community life. Equipped with superficial (*oberflächlich*) knowledge, they are capable only to exercise criticism, and, in turn, only educate critics. I maintain that all school organization upon which men of technological education have no influence is very unsatisfactory. Even in technological institutions representatives of abstract or alien studies have the deciding voice, instead of professors in the appropriate line.

Another characteristic of the present is the decadence of authority. The influence of authority in every direction is weakening fast; not only the authority of the past, together with everything based upon it, but also that of the present, especially in social and political affairs. What was formerly solved in the simplest way by belief in authority is at present impossible. The result is irrepressible. It is the progressing democratization of all educational institutions, and this is accelerated by modern technical institutions. What was formerly exclusive has become common property. In education this fact is perceptible in the comparison of present public instruction with that of the old monastic or convent schools. Despite modernism and its numerous educational agencies, many efforts are still made to preserve untenable, outgrown institutions. There is much historical tradition in education, especially in classical schools, and generally in linguistic education. The contention concerning the course of study in secondary or preparatory schools is frequently based on false grounds.

If only the superiority of one or the other educational plan were to be proved, discussion on many points would long since have been decided; but the case is different. The old institution (the classical school or gymnasium) of verbal transmission of classic lore is defended, not in the interests of the subject, but for the sake of prerogatives or privileges connected with it. Other institutions would be considered equally good if they could only be imbued with the flavor of aristocracy; if they could grant privileges of qualification and were not within reach of all, and if they assured an exclusiveness favoring a growth of separate interests. Therefore I do not believe that the discussion which so often provokes heated argument will ever cease so long as it is based on the subject-matter. It is the struggle for privileges (private rights) that is carried on with such bitterness.

The ruling system of education favors language instruction, merely the forms of thought, too much; contents seem to be of secondary importance. This leads to verballity, shallow interpretation, and fruitless criticism. A consequence of the present educational code is that young men are not conscious of the importance of correctness of thought above mere form. He who masters the forms passes the examinations in school; he who fails in that is considered incompetent.

Unfortunately, instruction in mathematics is not much different from that of language. It is too independent of application. The unavoidable consequence is that young men attempt to solve all problems like mathematical tasks at school, and whatever can not be solved in this manner is simply neglected. Thus a belief is developed that everything can be solved with exactness. Mathematical formulas are applied, and real difficulties not to be dealt with mathematically, are evaded. The belief is strengthened that all scientific questions can be solved by

mathematics, and that everything we desire can be determined like the value of x in an equation. If conditions are to improve, the whole educational system must be permeated with a right technological view and mind, which is the spirit of responsibility and proper application. Teachers must not only possess more than a purely abstract education, but must be able to apply their knowledge; they must themselves have a mind for the treatment of probabilities and of errors; they must awaken the consciousness of errors. That will result in the consciousness of creative activity and the multiplicity of practical conditions; that mere power of criticism will lose in the game may be a great gain.

Furthermore, an instruction and a method are required that will develop qualities which a nation does not possess, and not those alone which are inborn in the people. That is our vulnerable point. Subtlety of thought and speculation are encouraged with us, while that which distinguishes other nations plays a very insignificant part in our education. Finally, as a matter of course, the fulfillment of these claims must make it possible to train pupils to a greater self-reliance in their work.

On account of privileges and prejudices, reforms always lead a fierce strife. History furnishes many examples to prove that institutions on the decline have been defended to the bitterest end. The struggle is always one in defense of privileges. Whoever attempts to inaugurate reforms for the development of suitable education by changing existing systems will always meet the strongest opposition, and especially the resistance of intellectual inertia. It is a law of nature like the passiveness of the masses; the resistance of the narrow-minded and the privileged leads to a hard struggle. This should not be fought for its own ends; it must have a well-defined purpose, which should be the right education necessary for national progress. I may here add that school reform is not the only thing to be accomplished.

Presupposing, however, the most far-reaching success, that purpose can only be attained by the cooperation of all factors, and engineers and other men of technological education must make every exertion to obtain recognition for their work and through their work. I regret to admit that this factor stands in need of much reform. The technical professional spirit leaves much to be desired when compared with that of law and medicine. Professional ambition is still too prevalent. Criticism is exercised on engineering feats by those who are not engineers. There has developed in recent years a mode of expert criticism in form of commissions, the members of which are anything but experts. It would do much good if we had such representatives as chambers of engineering, as merchants and financiers have in their chambers of commerce, physicians in their medical boards, etc. Engineers have no similar institutions; a mere association will not do.

There should also be an institution of the highest order and authority for technology. Universities do not answer the purpose; only an "Academy of technological sciences" would satisfy the want. The Prussian Academy of Architecture is no such institution, being only an auxiliary board, consulted by the minister of public works when it suits his purpose.

The defense of the profession of engineering also deserves mention here. Efforts toward that end are most significant, but have not always been well directed. The title "engineer" has been brought into such discredit that I do not think it can be generally raised at once; some time will be required for this end.

The drawback is that State secondary schools educate "engineers." The secondary, like all other, schools in Germany are managed by State governments, and I do not think all will relinquish the title without opposition. The Prussian ministry of public works has done much to bring the title of engineer into disrepute by granting it to those who have no academic higher education.

I believe, therefore, that the only practical means of defense for the profession is the degree of doctor. This degree has social value, is distinguished by tradition, and is an important and powerful weapon for equalization of the professions. At one time theologians alone held the degree, lawyers relieved them, and their successors in turn, down to chemists, encountered the distrust and opposition of the old holders of the privilege. I see no reason for engineers to follow a different course. They should conform to tradition, for in this case tradition bears the valuable testimony of a definite course of education, and attests the value of any new as well as the old accustomed courses. If the degree of doctor is granted to engineers, I consider the safety of the engineer's title guaranteed. It is hardly possible in any other way.

Confronted by the unavoidable contest, our question is, What practical and strategical means can be employed in the struggle? One way is to begin at the bottom and end at the top; to begin with schools and preparatory education, with the training of teachers, and subsequently give attention to the highest seats of learning. This way will arouse much opposition from people who have no comprehension for technological work, and it requires many decades of painful labor.

I am of the opinion that the right way is to begin the reform at the very top. We who possess a technological education must exert ourselves to make influential men understand our work and the necessity of promoting technological education. It is our duty to lead them to this conviction.

The greatest hindrance is found in the want of sympathy among our prominent colleagues, who, in the midst of their professional success, do not care to take the time or the trouble to interrupt their own great efforts in order to consider the difficulties of professional movements or to interest themselves in the mental grasp of the young.

Technological pursuits are already beginning to receive earnest attention. Technological universities are gaining recognition where they were formerly unknown. Even the old universities that made no effort to hide their contempt are beginning to grow thoughtful. Several of the erstwhile nonbelieving are, in fact, ranged on our side. One instance of great success is the establishment of laboratories on a large scale. One and a half million marks (\$357,000) have been appropriated for the department of machine construction in the Polytechnicum of Berlin. The South German States have followed this example. Wurtemberg has appropriated 1,000,000, Baden almost as many, marks for machine construction and electro-technological shops alone. The beginning has thus been made. Other institutions of technology will follow the example given. That the instruction is thereby based upon an entirely different foundation from that of former times is self-evident.

Another instance of success is the establishment of new technological institutions in different cities, as, for instance, Dantzic. The establishment of that school has been officially announced at the last session of the House of Deputies, and all political parties in the House voted for the necessary appropriation; the vote was virtually unanimous. The conditions in Dantzic present many difficulties. Education does not rank in the eastern provinces as it does in the western. The Government knows perfectly well that attendance in Dantzic will at first be poor; nevertheless, the institution will be established on a large scale as a full-fledged technological university. About the same number of teachers will be employed as at the polytechnic in Vienna; but there will be four professors alone for shipbuilding, and for machine construction there will be three more than in Vienna.¹

The establishment of a technological university in Breslau (Province of Silesia,

¹This comparison with Vienna, Austria, is made by the author because he delivered this address to a congress of technologists in Vienna.—TRANSLATOR.

Prussia,) has been much discussed, but as yet there is no prospect of its becoming a reality, though conditions are favorable. Despite its necessity for the Province of Silesia, the representatives of technological institutions were called upon to oppose its foundation because of the movement to affiliate different technological departments with the old-established university. Such an action would be detrimental rather than encouraging to the development of technological sciences. Our professional studies would decline within the confines of a university. The necessity for technological institutions is so great that some more must be called into existence independent of universities.

Every German engineer will think of the Emperor with a feeling of intense gratification and sincere gratitude. He has shown the most astonishing interest in technology and has supported the interests of technologists with surprising sympathy. This has not manifested itself only toward marine engineering, but is also combined with a true understanding of technological sciences and a judgment truly remarkable. On different occasions technological institutions have been honored by visits from the Emperor. I do not know that any other higher institution has been similarly favored. The personal initiative of the Emperor in inviting three Prussian representatives of technological institutions to the Imperial palace is well known.

I also remind you of a powerful, though unsuccessful, initiative taken by the Emperor toward reform in the preparatory schools. The thoughts expressed at that time alone have the characteristic of truth. I refer to the fundamental idea of beginning with the study of the present time and its conditions and ending with the past. That idea should have been carried into effect in the schools. The first measures toward the foundation of a polytechnic in Dantzig is likewise attributable to the Emperor's initiative.

It is too late for us to enter into further details. I shall only acknowledge, with great satisfaction, that a strong, refreshing current is felt at present. He who maintains that the world has been divided, and that engineers, like poets, have fallen short, is unjust to us. The reverse is true. Engineers are indispensable to a new world and its new conditions, and I am convinced that engineers of the twentieth century will hold a more important position than lawyers of the nineteenth.

I shall close with Hutten's¹ familiar words: "Century and science! It is a pleasure to live, though we must not grow weary. Sciences and talents are flourishing now. Ancient barbarism, take the warning and seek another place of refuge." Barbarism, however, continues to exist. It is recognized in ancient formalities that must be overcome. Struggle there must be, but its issue will be a glorious future.

III. ART EDUCATION IN GERMANY.

[On the subject of education in art, Mr. W. von Seidlitz publishes in the *Deutsche Revue* of November, 1900, an article which deserves attention owing to its compact review of recent efforts in this direction in Germany. He uses the term art not in any restricted, but in the widest, sense, as embracing poetry, or rather literature, painting, and sculpture, the drama and music; he includes even industrial art. The essay is here reproduced in English, because it contains some valuable suggestions of what the German teachers do to foster art education.]

It is one of the signs of a new era when we hear of art education in contradistinction to general intellectual education and special professional training. Georg Hirsch, of Munich, may be said to be the first who brought this distinction promi-

¹ Ulrich von Hutten, 1488-1523.

nently before the German nation. In his *Ideas Concerning the Teaching of Drawing and Professional Art Education* (1887) he enlisted the attention of his readers chiefly to the education of artists. But in the same year Prof. A. Lichtwark read an excellent paper on "Art in school" before the Society for the Advancement of Pedagogical Science in Hamburg. In 1893 Konrad Lange, formerly professor in the University of Königsberg, now in Tübingen, published his book on *Art Education for German Youth*, which book served its purpose well, owing to its valuable suggestions. From that time on energetic efforts in behalf of education in art in German schools were made under the leadership of the teachers of Hamburg.

The question of art education does not, as a matter of course, refer alone to the education of children, but to that of adults as well. It concerns the great uncultured mass as well as educated people. The general object is to train the artistic sense, chiefly the eyes, of the whole nation, and this object is quite as important as the development of the power of thinking, which has been so exclusively emphasized heretofore. But though in the end the whole nation is to be benefited, it follows that a beginning has to be made in training the young. This latter, however, is possible only when the teachers are prepared for the purpose. Only through a proper training of teachers in art can the necessary conditions for successful art work among children be met. And this has been the German policy all along: For whatever new branch was introduced into the schools the teachers were prepared a long way ahead.

The movement in behalf of art education in schools did not originate in Germany, but may be traced to France and England, two countries which most energetically promoted art education of all kinds. In France, as early as 1880, the minister of public instruction appointed a commission to prepare the necessary measures for the purpose of introducing art into the schools. In England, several years earlier, the Manchester Art Museum had undertaken to provide elementary schools with good pictures, and since 1883 the Art for School Association is active for the same purpose. Now that Germany has joined the movement, it is confidently hoped that a strong impulse for the acceleration of the movement will be the result, for however much a so-called practical education is advocated during the last two decades, Germany is ever ready to stand in the front rank where the solution of ideal questions is sought. And such a question is under discussion.

Several points come under consideration: (1) The selection of juvenile literature; (2) the artistic preparation of picture books; (3) the artistic decoration of schoolrooms; (4) the reform of drawing instruction; (5) manual training; (6) the utilization of art museums for the education of the young; (7) theater performances, and (8) concerts for children. The teachers of the city of Hamburg so far have been the most active in all these directions, hence the results of their work and their publications deserve to be mentioned first of all, as pioneer work, so to speak.

Since the year 1893 the teachers' committee for the examination of juvenile literature has published a monthly, edited by Heinrich Wolgast, which paper has become a guide and adviser for German authors who are engaged in writing for children. The paper appears as a supplement to many educational journals of national reputation. Annually, in November, this periodical (*Jugendschriften-Warte*) publishes a list of books for Christmas presents which can be recommended by the committee, a body that has secured the utmost confidence through its thoroughly impartial work. In 1899 this list contained 168 titles, grouped for five different ages. The standpoint from which new juvenile literature is judged has been minutely explained by the editor in a book entitled "The Misery of Our Juvenile Literature" (second edition, 1899). He says, among other very pertinent

things, that books specially prepared for youth are of comparatively recent origin. Generally speaking, they made their appearance at about the middle of the nineteenth century. Books which are intended to express and represent an outspoken ethical, or at least an instructive tendency, promote hypocrisy and artificiality. Books which offer amusement in form of poetry and fiction without genuinely poetic contents destroy the sense of poetry and foster coarse "reading hunger." Among parents such juvenile literature is treated with indifference and utter want of judgment, and, moreover, such literature receives authoritative promotion through the existence of school libraries. Such consequences can be counteracted by the teachers only by energetically rejecting unfit books and by careful selection of what children read privately at home. The new school editions of selected works of the great poets; the works of such classic authors of juvenile books as Schmid, Horn, Nieritz, Hoffmann, and others; translations of American Indian stories and the numerous books of women writers who write for girls are carefully reviewed, and the latter with especial severity. Of Klementine Helm's *Backfisch's Leiden und Freuden* the editor says: "That which is the moral curse of middle-class people, the ever-recurring consideration of 'what will people say of it?' has been raised to a principle of life in this book." And of Emmy von Rhoden's *Trotzkopf* he says: "There is in the whole book not one full tone coming from the depth of conviction or emotion; all is shallow twaddle and superficial action." Of all recent German maiden writers the severe critics of the committee find only two who pass muster: Elise Averdieck and Johanna Spyri, except that at times even they indulge in moralizing and obtrusive piety.

It is claimed that youth should be trained in the enjoyment of literature, hence books must be given them which will be read for the enjoyment they offer. Such books are stories of life, fairy tales, sagas, poetry; in short, books of poetic form and contents. Therefore Wolgast's review bears the motto of the poet Storm: "If you would write for the young, you must not attempt to write for the young." A juvenile book of poetic form and contents must be a masterpiece; but literary masterpieces belong to general literature, and hence specific juvenile literature has no right to exist. Prof. A. Lichtwark says: "Adults should be able to read juvenile books with the same, nay, even greater, interest than children." Education is deeply concerned in a common literary source for both adults and children. Though a poetic masterpiece may not be intended to instruct, yet it will always add to the capacity of understanding.

That the efforts to thus prune the literature offered to children do not find universal approval is plain, if we consider the unscrupulous manner in which such vital questions are still viewed by many careless parents and the thoughtlessness with which the science of pedagogy used to view them. As long as the majority of adults, educated people not excepted, are satisfied with the tasteless menu dished up by daily newspapers and family journals, they can not possibly evince either interest or comprehension of the efforts of the Hamburg teachers and will be satisfied when their children are brought up on a diet of Indian stories and "daughter albums and anthologies." Children who are thus fed intellectually will, of course, when grown up sink back into mere newspaper twaddle and read fiction indiscriminately. Thus the chain of cause and effect is made complete. Writers of juvenile books and contributors to superficial family magazines, spurred by a common interest, work into each other's hands.

The principle that juvenile literature should be selections from real literature deserves hearty approval. Did not Goethe, who for us is the representative of the entire culture of the past, collect his reading matter in that way? He plainly states that in his *Wahrheit und Dichtung*. Although the circumference of the literature from which juvenile reading matter can be chosen is small, owing to considerations of the field of children's interest, and morality as well as religious

feelings, yet it is beyond doubt that in time a long list of books, or parts of books, will be selected which have been overlooked heretofore, because the adult's interest alone was consulted. Various Hamburg family chronicles, printed for the Hamburg amateur library by Professor Lichtwark, offer distinct proof of the foregoing assertion. A particular difficulty for the commission appointed to examine juvenile literature arises from the adoption of the principle that all books having a purpose in view are to be rejected, let their object be patriotism or religion, however well they may be meant. Such severity easily awakens the suspicion that the efforts of the commission are directed against government and church. To awaken and justify confidence in this respect will require much patience and fine tact, but the ultimate success is sure to come. Things objectionably sectarian occur very seldom and must be rejected, but, on the other hand, the demand of the clergy to reject all expressions of liberal views, whether they refer to politics, religion, or ethics, can not well be granted without subjecting juvenile books, for adults as well as for children, to the Procrustean bed of religious dogmata.

That the efforts thus sketched, namely, the conscientious regulation of a definite field of education, meets certain dangers; that it must avoid extremes and narrow-mindedness is plainly seen from allusions in Wolgast's book. Thus it is of doubtful effect when art education is placed too prominently in the foreground as a specific part of instruction, while it should be the free growth of a natural but varied innate power, for which all that is required is proper opportunities, just as physical education is best fostered by offering opportunities for healthful exercise. Any specific influence for a purpose must be limited to a small number of occasions. Another Utopian idea is attempting to solve the problem of uniform people's education. It is admitted that "the kind of social struggle and the tempo of the development of civilization" depend to a large extent upon the literary education of the struggling parties, but any endeavor "to make the masses uniformly capable of consuming literature" will find its limits in the varied needs of the separate layers of society and in their differing modes and conditions of life. Among intellectually advanced families and groups, which will never cease to exist, a literary culture will develop that will reach far above the average.

By causing the publication of cheap editions of Storm's *Pole Poppenspäler* and Liliencron's *War Novels*, the Hamburg committee has performed a most meritorious service.

Professor Wolgast, in 1894, published another work in pamphlet form entitled "Concerning Picture Books and Illustrations." In it he points to the fundamental importance for intellectual development of impressions made upon the eye and mind during the first six years of life. He shows in examples of English and French artists, such as Walter Crane, Caldecot, Kate Greenaway, Boutet de Monval, that the simple and clear principles of the Japanese color print may be safely adopted. In Germany the classic illustrations of juvenile books by Ludwig Richter and by Pietsch, also the illustrations of Thumann in *Mother and Child*, deserve mention. But in this second work of Wolgast a few principal considerations seem to be doubtful. While he claims it to be the task of education "to introduce the child into the realm of thought and emotion of adults, i. e., of cultured people," we think it sufficient if for the healthy development of the child's own world of thought and emotion the necessary conditions are supplied. While he claims that the child is to be "systematically educated in the enjoyment of art," it would seem fully sufficient to restrict the teacher to causing enjoyment and suggestion by means of the mere contemplation of pictures.

In May, 1896, a historical exhibition of picture books and illustrated juvenile books was arranged in the art hall at Hamburg as a supplement to the meeting of the national teachers' association, for which a catalogue with preface was

printed. With this exhibition another was connected, that of pictures for the decoration of schoolrooms. Mr. M. Spanier published for this occasion a work entitled "Artistic Picture Decorations for the Schoolroom" (second edition appeared in 1900). In this work some historical allusions are made, from which we see that the first who advocated the æsthetic appearance of schoolrooms was Comenius, who said, in 1630: "The room should be bright and clean, and decorated with paintings." Though the exhibition was chiefly filled with charts, it may be of interest to quote a few opinions advanced by artists and collected in the second edition of the work mentioned:

Hans Thoma says, among other things: "Above all, I think it more important to suspend pictures in the schoolrooms than to be much concerned as to the selection of the pictures." He then goes on to say that he regrets "the disappearance of the coarse, but honestly good and original, mural paintings of former times and the substitution of common wood graining, stencil frescoing, or 'dead wallpaper.'" He argues "that it would be good for children if free-hand original colored frescoes would appear on the walls. Perhaps it might be well to oblige every artist who enjoys a State or other public stipend to furnish some work of his genius to be hung up for the benefit of the public. And what place could be better fitted for it than the schoolrooms of the people? However," he adds, "no jury of art professors should be allowed to spoil his joy in creating. * * * The subjects need not be sentimental ones, nor any that are intended to moralize or influence the mind. I should prefer simple presentation, 'painting as such,' for schools. Let us never forget that the paintings are to be merely wall decorations." It is obvious that the same principle that was followed in judging literature for children is here applied and advocated.

Max Liebermann writes: "Merely suspending reproductions of artistic paintings on the walls does not seem to me to solve the question. First, because a person who constantly sees the same reproduction for a whole or a half a year does not look at them any more; second, reproductions rarely ever produce a pleasing impression. But a pleasing impression should be given to the schoolroom, so that the pupils are unconsciously accustomed to require pleasing surroundings in their own houses in after life. Such a schoolroom might be made pleasing, aside from good, bright, cheerful light, by giving the walls a coat of paint of decided color. A simple straight line enlivens the whole wall; below it should be a deeper color (for reasons of cleanliness this may be of oil color); above it a brighter, but still decided tone, of color." The Hamburg teachers' association had the satisfaction, when this opinion was received from the artist, of referring to its own petition to the city building commission, some years previous, in which they had asked that the schoolrooms be painted with harmonious colors, in order that the æsthetic sense of the children be fostered. In that petition the sentence occurred: "The presentation of the beautiful demands no greater outlay than the presentation of the ugly."

Hans Christiansen (formerly of Paris, now of Darmstadt) writes: "It would seem advisable to arrange for a competition among German artists to furnish simple colored pictures for the walls of schoolrooms. I believe many good artists would enter such a competition, if for nothing else than for the good cause."

As was said before, France and England preceded Germany in the laudable movement of decorating schoolrooms. The Art for School Association, of London, founded in 1883, publishes annually several pictures, grouped in (1) historical pictures, (2) nature-study pictures, and (3) reproductions of master works. In 1897 the number of its published works had reached 460. This association annually lends or presents some of its pictures to schools unable to buy them. Many of the subscribers place their share of pictures for that purpose at the disposal of the executive board. The Manchester Art Museum possesses 240 collections of 12

pictures each (some of which are framed), which are loaned to schools. Well known are the colored Fitzroy pictures (the best of which are prepared by Heywood Sumner), which are used for decorating not only schools, but mission houses, hospitals, and similar institutions. .

In France the normal schools are provided with paintings or reproductions for wall decoration. Among them are found German masterpieces, such as Dürer's *Melancholy*, Holbein's *Madonna*. Among the German pictures selected for French lycées three are engravings of Schongauer, four of Dürer, some paintings of Von Memling, Lucas van Leyden, six of Holbein. The artist Spanier may be right when he says: "I believe that there are still German normal schools which lack the funds to convince young candidates of the profession, by appeal to the senses, of the grandeur and splendor of our old German masterpieces."

In Antwerp, Belgium, a member of the city council moved an annual appropriation of from 3,000 to 5,000 francs from the city treasury to intrust talented young artists who have finished their studies at the art academy to decorate each artistically one or two rooms of the city schools, and thus make architect and painter work hand in hand to produce a harmonious whole. In Austria the large, effectful advertisement pictures of the various State railroads, illustrating the picturesque scenery of the Empire, are distributed among the schools for school-room decoration.

The Society of Hamburg Art Friends, which issues a yearbook (since 1895) and numerous reproductions, has recently undertaken a new issue of Holbein's paintings at 20 pfennigs (5 cents) each, and of Dürer's paintings at 1 mark (25 cents) each, for use in schools. At the aforementioned exhibition in Hamburg the large colored representations of English and French schools were highly appreciated; likewise Thoma's lithographies and Seemann's reproductions of mural paintings (at present more than 100). Attention was also called to the pictures of *The Nineteenth Century in Painting*, Spemann's *Museum Collection*, and the *Copperplate Cabinet*. A list of suitable reproductions for school decoration prepared by Mr. Spanier for the exhibition contains no less than 210 numbers. This list is very serviceable for schools. At Easter, 1898, a second exhibition of that kind was opened in Bremen.

From all this it is obvious that the subject of artistic decoration of schools is a field which opens opportunities for action, both for the parental care of the state and communal efforts. It is quite right what Spanier says: "When industrial people lack art education, i. e., taste for high art, the trades will suffer." Equally important is the point of view that "art should be introduced into the schools, but not the history of art." Here the influence of Lichtwark, who gave the first impulse to the movement in Hamburg and has since guided it, is plainly noticeable; in his *Exercises in Contemplating Masterpieces* (1897, 2d ed. in 1898) he gave the practical example for the method in which the sense for art may be awakened. When in some of the books on the subject such pedantic ideas are reiterated as "Every one has to be educated for the enjoyment of art," it is well to take them "cum grano salis," since nature has provided for it that the trees will not grow into the sky.

An especially weighty question is raised by a book by C. Götze, entitled "The Reform of Instruction in Drawing," which was published through the aid of the Hamburg City Teachers' Association in 1897. In this book it is set forth that drawing is a kind of play from which, if conducted well, the child derives a particular enjoyment; that the development of the power of observation is the main object and that technical skill is of secondary importance; that observation is the firmest and broadest bridge between nature and man; hence that instruction in drawing should be based upon observation of objects and their reproduction. Hitherto geometrical and ornamental forms have been drawn for years, and the

pupil did not reach the stage of reproducing natural objects until almost at the close of his school course, if at all. Now he advocates that the child should begin with it; for he claims that lessons in drawing and geometry aiding and supplementing each other are dangerous for the development of the æsthetic sense. It was Konrad Lange who recognized that the excessive emphasis given to the mathematical side of the work implied a pressing into the background of the artistic side, and that this was of great danger for instruction in drawing. Hence he concluded that the ornament resting upon geometrical forms should be banished as an object of drawing in the lower grades; likewise, all printed models for copying. Experience tells us that the geometrical and ornamental schemes are never found in original drawings of young children, say, under 10 years, while man and animal form the chief objects of their reproduction in drawing. The Englishman F. L. Burk quite agrees with this, saying that drawing is for the child a language for the expression of his ideas; the form, though simple and clear, enlisted only a small part of his interest. And H. T. Lukens says, "We may assume that it is easier for a child to draw with a few lines a characteristic sketch from memory than to draw after a visible object. Perhaps by requiring the child to draw from objects we make it difficult for him to produce the preliminary end, which is simplicity in outline." To judge from the foregoing it may be assumed that lessons in drawing should not begin before the tenth year of age. An apparently contradictory observation is that the pleasure in drawing diminishes between the tenth and twelfth years of life, but that may be owing to the rapid growth of the imagination at that age.

If, concerning the decadence of the power of observation, experiences of men who have a warm heart for æsthetic education are considered, the foregoing reasoning is deserving approval. Richard Schöne said (1878) in a lecture published in the Prussian Yearbooks: "When we see what it is that most persons among the well-educated class observe of objects, it must be acknowledged that this observation is restricted, as a rule, to that which is necessary to recognize things as such, or, in other words, to name them." And Alfred Lichtwark remarked in 1887: "The power of observation seems to be lost entirely. The main point in education with us lies in knowing. That lack is the breach through which alien things enter victoriously. Lowest of all is the state of education in the fine arts. For every hundred children chained to the piano at the age of 7, not one receives private lessons in drawing." In so far as instruction in drawing is considered an effective means for art education, Götze's dictum may be accepted, namely, that there need not be an essential difference between the work in drawing in elementary and in secondary schools. Drawing from nature, which was even advocated by Rousseau, will have the desired effect. In the course of study of the Hamburg schools the aim of drawing is expressed in these words: "The pupil is to be enabled to reproduce simple natural objects without coarse errors." This seems fully to meet the demands at the beginning, if we agree with Herbert Spencer that it is not a question whether the child furnishes good drawings, but whether it develops its inborn powers. How instruction in drawing is to be arranged only experience can teach us; the teacher's individuality will have to play its part, as heretofore. Whether the systematic study of child nature will lead to essential results in regard to the study of drawing is hard to tell, for from the samples of juvenile work exhibited in Hamburg nothing new could be learned.

A new field of activity was opened by the Teachers' Association of Hamburg in 1898, when it undertook to take about 8,000 pupils of the elementary schools to see theatrical performances. A pamphlet entitled "Our Elementary Pupils in the Theater," containing a number of contributions (one especially instructive from the pen of the indefatigable Wolgast), reports upon the manner in which admission to performances was managed and how the pupils were selected. At the begin-

ning of 1899 four concerts were arranged for school children of Hamburg, which were attended by 2,222 children. A pamphlet issued by the association reports upon these occasions, which have been duplicated since, in 1900.

The foregoing review shows in how many directions the promotion of art education in school is possible. Most important of all seems to be the decoration of schoolrooms. Since a beginning in this matter will naturally be made in large cities, the question may be taken into consideration how the treasures of art museums might be utilized for such purposes. At present the teachers of classical high schools take their students on vacation trips to renowned collections of sculpture. Why should not the students be taken to art galleries as well, to awaken the sense for the enjoyment of art, though not knowledge of the history of art? Above all, it is necessary to create a comprehension of the great importance of the question at issue, so that it may spread and be transformed into active and energetic enthusiasm, as is done in Hamburg, the pioneer city of this beneficial movement in Germany.

IV.—COMMERCIAL SCHOOLS AND COMMERCIAL UNIVERSITIES IN GERMANY.

[A review of recent movements in commercial education.¹ By Wilhelm Stieda.]

A period of most active competition has made success in mercantile business more difficult than ever before. It is therefore easily understood that merchants desire to acquire all the knowledge relating to their occupation. Twenty years ago an expert as well posted as Gustav Cohn could write: "Affairs will be as they were in the times of the Fuggers and Rothschilds; we can make money and be shining lights in the world of wealth with no other learning than reading, writing, and arithmetic."² These words can not be truthfully applied to the present. Since the systems of correspondence and transportation have so rapidly developed and economics are beyond their infancy, and advancing day by day, the conditions that govern trade are not so simple as they used to be. Many more possibilities and probabilities must be taken into account and judgment pronounced on many more suppositions. If the science of economics has afforded a clearer insight into economic movements difficult to understand, and if it can illustrate them more plainly, it becomes a necessity for anyone who stands in the midst of economic factors to learn their doctrines and test their application in business. In his address at the opening of the commercial university in Leipzig, Privy Councillor Carl Roscher said that the spirit of enterprise in mercantile business rests upon a peculiar combination of caution and venture, of comprehension of the whole and observation of detail, of versatility and perseverance, of adaptability to strange conditions and preservation of individuality. These conspicuous qualities, however, are not acquired exclusively by the practical teaching of business methods, but must be attained through scientific study.

When Prince Henry left for China, December 26, 1897, the Emperor emphatically declared that under the protection of the German flag German merchants and German science were to receive the recognition which Germany has a right to claim among the nations. In consequence, however, merchants must be prepared to cope with the puzzling questions of their calling and to maintain the prestige of German reputation and German education. The mercantile class itself is evidently most benefited by a thorough systematic education, including both theoretical and practical knowledge. Such an education is one of the most effectual means to prevent the growth of a mercantile proletariat dangerous to

¹ Published in *Jahrbücher für Nationalökonomie und Statistik*, vol. 19, Heft 5, May, 1900.

² *Essays on Political Economy*, 1882.

the interests of society and economies. The easy accessibility to mercantile business makes a too numerous class a ready possibility.¹

It is unfortunately true that other countries have for some time been ahead of Germany in technically commercial education. Though, as Bruno Zieger proves, a German, Paul Jacob Marperger, of Dresden, court councillor and counselor of commerce, drew the attention of the Saxon Government to this subject in a petition, 1715, and though in 1773 the idea was carried out in Leipzig by adding a commercial annex to the Nicolai High School, no even progress was maintained. For a long time the Commercial Academy of Hamburg, of world-wide reputation, was the only institution of its kind in Germany. While this institution remained a private enterprise, that declined after the death of its founder, Professor Büsch, foreign governments were more alive to the question and tried to gain an influence over the mercantile class by founding higher schools for them. France, for instance, succeeded in establishing a network of excellently organized commercial institutions with elementary, high, and continuation courses. In Austria, through Zehden's efforts, commercial education received a firm foundation by the establishment of the commercial academies of Prague, 1853, and Vienna, 1857. At present commercial schools of that country are divided into elementary continuation schools, high schools of two years' courses with a preparatory department, high schools of three years' courses, and a so-called university (Trieste, Revoltella Institut). In 1891, in Switzerland, a federal decree went into effect defining the relations between the Federal Government and existing commercial institutions and appropriating 60,000 francs to be used by the Government for the benefit of commercial education.²

England has by no means so neglected theoretical education in commercial science as that country's pronounced preference for practical measures misleads many to believe. Commercial science, of course, has not received the same attention that is given to it now. Besides seven high and elementary schools in London, there are a larger number of so-called technical schools in which commercial sciences are included in the curriculum. Apart from a three years' commercial department of the polytechnic institute in Riga, opened in 1868, the Russian Government has shown its interest in commercial institutes by a new ministerial order of 1896.

In Germany the Kingdom of Saxony alone, moved by the modern commercial spirit, has been actively and characteristically interested in commercial schools for the last half of the present century. The royal authority, the minister of the interior, has shown a deep interest in them, and as merchants themselves have spared no sacrifice, 64 of such schools are now flourishing in Saxony. Accordingly, there are 1.67 schools to every 100,000 inhabitants. In the adjoining Thuringian States, where there are 24 schools, the proportion is somewhat greater, being 1.80 institutions to every 100,000 inhabitants. According to late reports, the number of students in Saxony is 1,921, or 12.2 per 1,000; in Thuringia, 304, or 8.3 per 1,000 persons engaged in commercial study. In Saxony state support is proportionately greater than in other countries. During the fiscal year 1895-96 the Government gave a subsidy of 15,000 marks for the support of commercial schools. The fact must not be left out of account, however, that commercial instruction is given in continuation or supplementary and in technological schools, which likewise receive abundant state support.

Under these circumstances the forming of an association for commercial education is to be hailed with special satisfaction. Not fewer than 191 representatives of boards of trade, mercantile corporations, cities, and continuation schools met on October 4, 1895, in Brunswick to discuss the question of commercial education.

¹ Carl Roscher.

² See Annual Report of the Commissioner of Education of 1896-97, Part I, Chapter VI, p. 218.

That this congress was so well attended may be accepted as a proof of the universally recognized necessity for a change in mercantile education. At the same time the board of trade of Brunswick prepared a paper on commercial continuation schools, which was presented to the committees of the association and was later published as the second volume of the proceedings.

During the meeting in Brunswick, which was most interesting to all present, the desire was manifested that this first meeting should not be the only one. The resolution was passed to establish a union of commercial and continuation schools for entire Germany that should publish a professional paper. A committee was appointed to carry out the plan proposed. Dr. Stegemann was elected chairman, and the effect of the committee's work is the above-mentioned association, which has the purpose of developing an interest in and a comprehension of the importance of systematic commercial education among the mercantile class, as well as among governmental authorities. Its two meetings, held in Leipzig, 1897, and in Hanover, 1899, showed a marked increase in public sympathy. A fresh current of thought is pervading mercantile education, and the movement is felt in constantly broadening circles. The subsequent foundation of a German Institute for the Education of Merchants, under the patronage of King Albert of Saxony, is another encouraging sign. The institute, which has an annual state subsidy of 25,000 marks, is designated to afford poor merchants an opportunity of gaining a more complete education. The high patronage which it enjoys insures the full development of the national idea it represents.

A tendency to be encouraged in commercial education is the attention given to (elementary) commercial continuation schools and high schools. According to a statement of Mr. Schlossmacher, 60 to 70 per cent of those entering upon a business career annually are pupils of elementary schools; scarcely 15 per cent have attended high schools and hold certificates for one year's military service. This manifests the necessity of a continued course of commercial instruction in addition to that given in the lower schools. The disproportionately short term of study in commercial schools at present makes it very difficult, if not impossible, to be informed on all branches of trade. A theoretical education must supplement the practical. A two or three years' course with six to eight hours a week seems to meet present exigencies best. Professor Silbermann proposes the following course of study:

First year: Mother tongue, combined with commercial history, penmanship, commercial arithmetic.

Second year: Mother tongue, combined with commercial and banking knowledge; penmanship, combined with bookkeeping; arithmetic, combined with accounts.

Third year: Mother tongue, combined with economics; arithmetic, with double-entry bookkeeping; law and civil rights and duties, especially in their commercial relations.

French and English may be omitted in these purely elementary schools. Different opinions, however, prevail concerning the limits of this course. According to William Vortmann, principal of a commercial school in Mühlhausen, Alsace, the study of merchandise (Waaren-Kunde) and commercial geography should not be omitted. When it is considered that the knowledge of merchandise is of the greatest significance to the merchant, and that commercial geography extends the intellectual horizon and helps "to make the mercantile office man a man of broad views," these studies claim a place of importance in the commercial continuation schools.

The question of compulsory attendance at commercial continuation schools is still an open one. The president of the chamber of commerce in Hildesheim, Director Schock, advised against compulsory attendance by general law, because

to make a school system uniform might perhaps be possible for a small state, but not for a whole empire. He recommended compulsory attendance by order of communal school authorities, on the ground that commercial education will not greatly advance so long as attendance depends upon the voluntary action of employers and apprentices. As paragraph 120 of the imperial commercial code gives communities the privilege of regulating attendance the proposition seems perfectly in order. This is the best way to surmount the difficulty of all theoretical discussion as to whether anyone may be compelled, beyond the elementary schools, to acquire an education which he himself does not consider necessary, or which he believes he can obtain in a different way. In all cases where compulsory attendance would imply coercion by means of the police force, students of advanced years, say beyond the elementary school age, should be left free to choose.

Commercial high schools and academies (called commercial colleges in the United States) have been proposed as a higher division of continuation schools in which young men, already actively engaged in business, may receive the proper education to meet their special needs. Even if the highest possible general education must be considered for those of the mercantile class, the same model is not equally appropriate. A shopkeeper, or any other retailer, does not need the same education as the merchant engaged in an extensive business or a great industrial plant, or as one who intends to travel in foreign countries. It is therefore advisable to give attention to the different needs of young merchants of unequal preparatory education and even to take local conditions into account—namely, in smaller cities a commercial school with an elementary course suffices for local merchants; in larger cities it would not be inappropriate to establish schools of a higher order that could afford young men¹ advanced instruction in single branches. The professional high schools—the title is of minor importance; any other may be chosen—should be open to practical merchants apart from their occupation in office or store. They are designed for those who have sufficient preparatory education to advance under direction, or for those who from any cause whatever have been prevented from benefiting by systematic instruction after leaving the elementary or secondary schools. For instance, a young man may have been obliged to leave the classical school on account of insufficient means or loss of health, and may enter upon a business career. An elementary commercial (continuation) school is inappropriate for him, and his means do not justify his attending a commercial college. Simple high schools that give the special instruction are just what such a case demands.

However, the preparatory education of a merchant is more important than his subsequent professional education. As was said before, practice in many cases is not sufficient to give a future merchant an adequate training. Employers are not always qualified and willing teachers and have neither the time nor the inclination, to initiate beginners. Night schools, and especially for those who have exhausted their best energies in business during the day, do not effect the desired result. When there is no solid foundation the kindest and most intelligent direction on the part of the employer will not supply all deficiencies, and even the most zealous beginner can not appreciate and assimilate all that comes within his reach.

Consequently, previous attendance at commercial high schools is to be recommended. They afford daily instruction in all commercial studies and in foreign languages. The curriculum includes all the branches mentioned in connection with elementary commercial (continuation) schools. Bookkeeping, correspondence, commercial arithmetic, study of merchandise, etc., all are thoroughly explained in their dependence upon one another. In this way students learn how to apply the suggestions given by their future employers and adapt themselves

¹ It will be noticed that the wants of young women are not considered in this line in Germany.

better and more quickly to the practical demands of business. Such schools may have a two or a three years' course. The conditions for admission should not be so low as to prevent their steady development. The same standard could be accepted as that which is set up for the higher grades of other secondary schools. As models for such secondary commercial schools may serve the public commercial institute of the merchants of Dresden, established in 1855, and the commercial institute of Leipzig, founded by a corporation of merchants in 1831, and maintained by the chamber of commerce since 1887. As soon as the elementary commercial schools become professional by introducing foreign languages and technical commercial branches, the commercial high schools become commercial universities.

An educational medium between the two schools and of great practical value, though not as yet generally recognized, is the model counting house. It is generally believed now that in commercial schools there is danger of losing the necessary touch with the requirements of practical business. The study of sciences alone does not develop the ability to enter upon actual business life. No knowledge of its inner relations is acquired, and commercial branches, if taught in a general way, are supposed to be no more than an incomplete equivalent, which gives no thorough preparation for a business career.

The model counting house meets these objections. As the chemist supports his studies with experiments in the laboratory, so the model counting house affords the commercial student the possibility of concluding scientific study in a business-like manner with a course of practical experience. Director Ahrens, of Prague, is the father of this idea on the Continent. Prof. Joseph Odenthal, of the same city, adapted and developed it and recorded his views and experiences in a book.¹ According to Richter, the course is so planned as to devote the first year to scientific preparation and the second to practical occupation. One hour a week is given to commercial study, another to correspondence, and a third to the work in the counting house.

In Romanic countries this arrangement is considered very practical. The international commercial congress, held in Venice in May, 1899, called forth a number of opinions on the subject. The model counting houses at the commercial colleges at Genoa, Venice, Lyons, and others are reported to be quite successful. The gentleman reporting about the Lyons school stated that students of the model counting house were never embarrassed in any case of actual experience. Quick in understanding the work assigned to them, they have been able to pass from one occupation to another without the least hesitation. In Germany, however, this innovation has met but little approval. Only a few commercial private institutions have followed this practical device in their plan of study. There are many reasons for this evident caution, and the opinion of Professor Adler² is no doubt very much to the point.

He maintains that elementary schools, though they be continuation schools, are not designed to turn out men perfect in practice and to prepare them by mechanical training for different technical branches. The purpose of such schools is to give pupils the best possible comprehension of the principles of their future calling, in general and in particular. Adaptability in actual practice is a natural outcome of an adequate technical preparation. Any imitation of practical experience in schools presupposes a certain restriction, while the very multiplicity of business relations is an important consideration; every business has its own peculiarities that can be learned in no way other than by actual experience. We do not mean to imply that the educational device in question has no value whatever; if it were annexed to a higher grade of schools it could be of great significance. In connection with commercial colleges and universities its importance can not be denied.

¹ The Model Counting House in Commercial Colleges, Leipzig.

² Atti del congresso internazionale, p. 557, ff.

Students of these are not as young as pupils of simple commercial schools, and having had a thorough preparation in mercantile affairs, they can benefit by the model counting house. Hence, in universities, especially, there is hope of realizing the idea with success. Weight attaches to the question whether theoretical study has been so perfectly embodied in form that the student understands how to turn its effects to practical account.¹ Adler believes that success depends principally upon the ability and discretion of the professor, as well as upon a small attendance. The division of work among the students should be regulated as in a business establishment—proprietor, bookkeepers, cashier, correspondents, etc. At the commercial university of Leipzig, the students of the fourth semester have comprehensive exercises similar to those of a model counting house. The importance of such an institute can be judged only from the result of the experiment; it was by no means unanimously approved during the congress in Venice. The next congress is going to discuss the subject again in the light of later experience.

No school reform in Germany has created a greater sensation than the proposition to establish commercial universities. Their necessity is no longer disputed. Privy Councilor Böhmert believes "that the question is perfectly justifiable, whether commerce and trade have not as much a scientific basis and may not be studied as scientifically, as horticulture and cattle raising or the construction of roads, bridges, houses, and machines." The idea is generally accepted, and foreign models are brought forward in illustration. In Paris there is the *École des Hautes Études Commerciales*, with the character of a university, which has occupied its new buildings on the avenue de la République since March, 1899. Founded in the year 1820 as a special school for commerce and industry, it remained a private institution until it was bought by the chamber of commerce in 1839, which body has since supported it. The expense of the new building was \$400,000, of which the city contributed \$120,000. In Antwerp, the *Institut de Commerce* is governed by the communal authorities, which contribute from the city treasury one-third of the expenditures regularly. The beginning of a similar organization was made in London three years ago. The chamber of commerce assisted in establishing a school of economics and political science, with which it is intended to connect a commercial university. The Export and Colonial Academy in Vienna, established by private enterprise on the same lines as the Austrian imperial commercial museum, was opened in October, 1898, as a kind of commercial university, with appropriations from the state exchequer.

As early as the year 1874 commercial universities were discussed during the framing of the new federal constitution in Switzerland. During the following years the directors of the Merchants' Union in Zurich, who turned their attention to elementary and secondary commercial schools, agitated the founding of a commercial university also, and appointed a special committee to arrange a programme of studies. A university of four semesters was planned, to be divided into the following four technical grades: Banking, railroad service, postal and telegraph service, and merchandise and manufacture. In 1877 a special committee was called upon to consider the question by a petition from the association of former students of the Polytechnic at Zurich. The point of argument was whether an independent institution should be established or whether a department of commercial sciences should be added to the Polytechnic in Zurich, as was done in Riga, Russia, and recently also in Aix-la-Chapelle, Germany. From the executive center of the commercial and industrial association of Switzerland, which realized the necessity of better commercial education, the addition of a special department at the Polytechnic was advocated. For a long time these movements remained too feeble to be successful, but they have been strengthened by the late agitation in Germany. The idea was first realized in the private com-

¹ See also account of practical work in Switzerland, p. 543, Annual Report of 1899-1900.

mercial academy under the patronage and direction of merchants, professors, and teachers of Zurich, which academy was founded October 1, 1895, through the efforts of Dr. Bertsch, the director of an international educational institute in that city. A municipal commercial academy and trade school was opened in St. Gall May 1, 1899, with about 10 students in the upper and about 60 in the lower division. A similar institution has been planned by the Merchants' Union in Zurich.

In Germany Leipzig and Aix-la-Chapelle have set a good example. In the former city a commercial university was opened in the spring of 1898. It is affiliated with the university and engages the same teachers. It is occupying the same buildings that had been used for over seventy years by the commercial college. To speak correctly, this college by extending its course and by entering into close affiliation with the Leipzig university has been made into a department of that university. Professor Raydt, the former principal, now acts as director of the commercial department of the university, and the professors of the university lecture in the new department as they do in the medical, law, and natural science departments. [Though at this writing, December, 1900, scarcely two years old, the new institution has proved its necessity; the classes are full and the students' attendance all that can be desired.—TRANSLATOR.] In October, 1898, a two years' course of commercial sciences was begun at the Polytechnic in Aix-la-Chapelle, Rhenish Prussia. In neither school are the studies compulsory. The lectures are proposed to the students and their attendance is optional. [Since this was written Hamburg has opened a commercial university, under the patronage and direction and with the liberal support of the great magnates of commerce of that city.—TRANSLATOR.] Free night schools for commercial men in Berlin, Frankfurt, and Mannheim are not well attended.

As in other cases of human experience, the proposition of establishing commercial universities is nothing new. Marperger, whose efforts in behalf of a commercial academy have been mentioned, referred to the subject in 1723 in his *Trifolium Mercantile Aureum*, or *The Merchants' Golden Clover Leaf*. The unpropitious times prevented the carrying out of his suggestions. Nevertheless, Professor Zieger's references to Marperger in his book, *A Saxon Merchant*, are very interesting, showing that he was one of the first, if not the first, to propose higher commercial education. Professor Roscher, usually a very generous critic, has pronounced an adverse judgment on Marperger. Still, if he does not occupy a prominent position in literature, the writings of Zieger place him in a more favorable light as a practical man.

The system (if this expression be admissible) of the old court councilor, Marperger, culminates in three institutions. He advises (1) a school for penmanship, arithmetic, and bookkeeping—that is, in a measure, a commercial elementary school; (2) a commercial academy, and (3) the opening of a department for commercial sciences in universities. Owing to Marperger's diffuse style, the editor of a later edition of the *Trifolium* has not published the whole work. He gives only certain passages verbatim, with critical notes, so that we can understand and judge Marperger's attitude on different questions of commercial education better than we could from a study of the original.

The commercial academy suggested by Marperger was designed to educate future merchants as well as to prepare official accountants. In essentials it was a novel idea, for even if it came in touch with existing schools for arithmetic and penmanship, its aim was much higher, being intended to give a thorough and extensive professional education on the very broadest basis without ever losing sight of the demands of practical life. The plan of study was calculated to give an insight into the actions of business intercourse, a knowledge of commercial law and the relations to centers of production, of merchandise and the modes of

transportation, and thus to cultivate an understanding for problems of economics and political science. To a certain extent the academy was to be the medium for transmission of commercial tradition and originate a theory of trade based upon experience of the past. The mental horizon of the students was to be broadened, their adaptability for practical experience awakened, and their observation quickened. The spirit of patriotism, which places general above private interests, was to be fostered above all things else.

In the same way the departments of commercial sciences in universities were to serve a double purpose. They were designed not only for merchants, but to give administrative officers their preparatory education. In so far as the academy served commercial interests by preference, these university departments were meant to give a thorough training to future Government officials, and especially to members of boards of trade. A commercial counselor, i. e., a member of the board of trade, must be "experienced by study, and especially well informed in political economics and commercial law, history, and mathematics; he should have traveled abroad and be acquainted with foreign languages and know the police regulations and commercial habits of foreign countries, as well as their geographical condition and their commercial and manufacturing status, the power and wealth of their inhabitants; moreover, he must have a practical knowledge of the origin of foreign merchandise and be able to compare it with that of his own country." According to Marperger, this is what a commercial counselor should be; and besides he should know a great deal in connection with special commercial questions. Consequently, the education which he thinks fit is by no means limited. In point of fact, however, he demands no more than what is expected of a modern man of administration—a knowledge of political economy.

If the necessity of a thorough commercial education seems therefore to have been thus early recognized, it is worthy of mention that universities at the close of the last century opened their doors to the disciples of Mercury. In 1787 Prof. John Nicholas Müller proposed the establishment of a commercial academy in Göttingen, which was a little more than an elementary school hardly in touch with the alma mater. In 1795, however, Professor Canzler advanced the project of an actual commercial department as an integral division of the university. Through Zieger's efforts the pertinent article entitled "The commercial education of certain students at German universities, especially Göttingen," published in the *Journal of Manufacture, Trade, and Fashions*, has been studied in recent times and republished. Since all the lectures to be attended by the commercial students were specified with the names of the professors who delivered them, and Dr. Canzler, at the close of the announcement, offered more detailed information, especially on the expenses of attendance, we may conclude that the arrangement was, for a time at least, in force.

In Leipzig the first German commercial university was opened at Easter, 1838. It was established by the chamber of commerce in union with the academic senate of the university, and receives annual subsidies from the city of Leipzig and the royal Government of Saxony. Any deficiency is guaranteed to be made good by the chamber of commerce. The salaries of the dean, or director of studies, and of the teachers of the commercial academy employed, rent, printing, and other expenses are paid from these sources.

The students pay tuition fees for the privilege of attending lectures. The salaries for lectures delivered by the teachers of the commercial academy (an old-established secondary commercial school, now used as the practice school of the commercial university) are fixed at 4 marks per hour; and, as a rule, the honorarium of university teachers does not exceed that amount. The lectures delivered within the halls of the academy are paid for by the students to the treasurer of the chamber of commerce; and as an entrance fee of 20 marks (\$5) is invariably charged,

the annual receipts from fees are considerably more than the guaranteed subsidies. The attendance fees of the university lectures are paid in full to the professors and lecturers through the treasurer of the university.

Prof. H. Raydt in the First Yearbook of the Commercial University, gives detailed information on the institute's organization, business direction, supervision, conditions of admission, order of examination, and other items. The conditions for admission deserve special mention. They were discussed at length at the meeting of the national commission of commercial universities during its sitting in Hanover, November 27, 1897, when the opinion was almost unanimous that no certificate lower than that given for the completion of studies in nine-grade secondary schools should be accepted. Professor Raydt and Dr. Soetbeer were among the few who opposed these as unconditional terms. The former maintained that anyone who possessed the general education required to hold a certificate of one-year military service (secured after six years' attendance in a secondary school), and had had some years' practical experience in business service would be able to understand the lectures in question. The other gentleman, in addition to what Professor Raydt had advanced, expressed the apprehension that the opportunity for merchants to acquire a higher education would be too limited if a graduation diploma from a secondary school were to be taken as a test for admission. In his estimation, those who had attended secondary schools for more than six years were no better prepared for commercial universities, since political economy and law, the chief commercial studies, are not included as preparatory studies in the curriculum of any secondary school, whereas a few years' practical experience would be an undeniable benefit to the student.

However, in principle the diploma of a nine years' preparatory course was adopted as a condition of admission at the commercial university at Leipzig; still, merchants who have won the certificate for one-year military service by having attended the preparatory schools for six years, and have completed their term of apprenticeship in business, are not refused admission, nor are they required to pass a test examination. The consequence is that two-thirds of all the students in attendance do not possess the diploma of graduation from a secondary school.

The milder judgment, therefore, has governed in practice, and the large attendance of those who possess no graduation diploma makes the necessity of this milder judgment evident. The benefit of advancement should most assuredly be within reach of the greatest possible number. Whether those who are not fully prepared for the lectures are able to follow them intelligently, experience must decide. A positive tradition will, no doubt, be soon formed by the mercantile class as to what plane of previous preparation will, in pursuance of professional study, promise the greatest advantage for the future. Anyone who has just completed his apprenticeship in business will of course find difficulty in following the lectures of university professors. His scholarship will be of little use to him, for the practice which he has had, since that time, will have weakened his taste and understanding for theoretical instruction. Instances will naturally occur where students will enter the university direct from the preparatory school without passing through any practical countinghouse or other business experience. Whether such a course is the best and most beneficial, and whether it is to be recommended, is an open question. It may be that in the countinghouse or ware-rooms much is learned that need not be known, or can be acquired in a short time. Generally, however, it is of the greatest advantage to a merchant to have served as apprentice for a certain length of time. But whether high-school graduates or not, the student of a university must be actuated by honest desire and zeal in order to overcome the difficulties that beset him in his studies. His own industry must overcome the deficiencies that he will realize in himself. The same energy which nerved him in the countinghouse and in practical work must urge him in

his studies. Whether much or little is assimilated will depend upon his attention, intelligence, and love of work. And if little of what is given to him by lectures or exercises strikes root, as deplorable as the case may be, the time devoted to study will not have been altogether lost. Therefore it is believed that the condition of admission should be simply this: That every applicant who has completed his apprenticeship and has led a blameless life should be admitted to the commercial university.

The curriculum received the closest attention from the regents of the university. Nearly the whole of the seventh volume of the reports of the national commission is devoted to the different opinions and programmes of study proposed. As there is a two years' course, it is believed that commercial studies should predominate. It will be hardly possible for a student 20 years old to give attention to his general advancement simultaneously in the four semesters allotted. Even students at the university who have as many years as the former have semesters will have the acquisition of a professional education for their chief end in view.

Accordingly, the precaution must be taken not to teach that for which the future business man will have no use, and which he can not acquire without neglecting for a time the necessary knowledge of his calling. The chief studies to be considered are political economy in all its branches, combined with economic and especially commercial history and economic geography, general technology, as well as commercial and marine law and law of exchange, and the principles of the civil code together with modern economic legislation. These are calculated to keep students busy during the four semesters. Only the most competent can master statistics, finance, jurisprudence, anthropological geography, ethnography, and other similar studies within the same length of time. If these studies are not condensed to meet the necessities of university students, they will do well to obey the advice given in the programme not to overburden themselves with lectures, as they are expected not only to take in facts, but to assimilate knowledge.

Some restrictions there must be, as commercial exercises and foreign languages can not be neglected. The curriculum of the University of Leipzig includes in the former correspondence and countinghouse work, commercial arithmetic, bookkeeping, extensive commercial exercises, mechanical technology of textile industry, and chemical technology. Too much stress can not be laid upon the necessity of these branches, which every business man must know. All that these subjects include affects practical experience, and is connected with the occurrences remembered from the days of apprenticeship. More difficult questions can be considered theoretically in universities than is possible in secondary commercial schools. Respecting such, it may be that the principal or employer had not the time to do for the student what would have been desirable for him in the future, or, perhaps, he was lacking general knowledge of the many-sided bearings of commerce himself, hence was unable to initiate the apprentice into the relations of business with affairs as they frequently occur outside of the countinghouse. In such cases, systematic instruction is especially beneficial, cultivating in the student who returns to practical work the ability to systematize what he sees and combine the teachings of theory with the treatment of practical cases.

At the University of Leipzig these exercises are arranged by the teachers of the commercial academy, who are four in number. Five teachers are engaged for languages, two for stenography, and one teaches typewriting.

It is characteristic of the Leipzig Commercial University that a final examination is considered advisable and has been introduced. At the meeting of the national commission of commercial universities in Hanover, November, 1897, one of the merchants present remarked that the mercantile class needs no official seal for the elevation of its profession; as Bismarck justly remarked, the desire

for it is a national fault of Germans. This assertion, made in a different connection, may be applied to examinations for merchants. It is difficult to believe that employers will prefer to fill positions with applicants who can show good diplomas. The chief test for appointment and position will most likely always be a recommendation of practical ability as apprentice. With the diploma as proof of having completed a two years' course at a commercial university added, any applicant will, of course, be received with greater favor. But why the test of an examination? The impression prevails that a kind of proof of competency is about to be smuggled into the free mercantile class.

It can not be denied that an evidence of students' efforts on the completion of their studies is in every way of excellent disciplinary force. The hope of being able to better their prospects by securing a high certificate will urge them to continuous zeal and any exertion which health, power, and ability permit.

As the case may be, if a final examination is to be held the order adopted at the Leipzig University must, on the whole, be approved. With one exception the compulsory subjects of study and hence of examination seem well selected. The train of thought sketched in the foregoing, which culminates in the condensation of subject-matter, has been likewise adopted in the programme of studies. Only it is doubted that it be right to place the study of finance on a par with political economy, and rest content with the outlines of commercial history and economic geography. The reverse would seem a better arrangement. Finance, or the science of the pecuniary management of a State, is interesting to a merchant, but so comprehensive an understanding of the subject which requires universities to devote four hours a week to it is hardly necessary. In the discussions of the national commission of commercial universities, which met at Eisenach, October, 1897, this standpoint was maintained, and it was unanimously decided to abide by an introduction or the outline of finance. The order of examination in Leipzig should therefore include no more, whereas economic geography and commercial history are considered studies with which a merchant must be thoroughly conversant. Consequently their entire text, and not merely their main features, should be taken into account in the examination.

The short term of existence of the Leipzig Commercial University prevents a just appreciation of its effects. The attendance, however, has been large beyond all expectation. Whereas the estimate or expectation for the first two years was 50 students, 244 were matriculated at the beginning of the third semester, to which a number who attend only special exercises must be added. Such an attendance manifests the urgent necessity for a more complete education among the mercantile class. And when we consider that men over 30 years of age—even 40 and 46 years old—do not disdain to devote their time again to theoretical study, we may well believe that the institution has made a reputation for itself. Prof. H. Raydt in his annual report expresses none but favorable comments on the students' conduct. He says: "The serious deportment of the students, their diligence, and the intelligence displayed in dealing with difficult subjects during school exercises justify the most sanguine expectations." The professional opinion is not less encouraging that merchants having a diploma of a six years' attendance at the preparatory school "have, neither by their deportment nor by any want of understanding of scientific exercises, occasioned the least scruple."

The opening of a commercial department at the polytechnic institute in Aix-la-Chapelle is less promising. No fault can be found with the students' deportment, for they manifest great interest. Many of the students of this technological university have attended the commercial courses; still the number of commercial students proper is small, being one-tenth that of the Leipzig University. The cause of this is not very apparent. Perhaps it is that the Prussian Government, although not opposed to commercial universities, has nevertheless extended no

direct patronage to the new institution. This circumstance may have contributed to the fact of the school's relative obscurity. It may be, too, that Leipzig has a stronger attraction for students than Aix-la-Chapelle on account of its more favorable geographical position. Still the conditions in Aix-la-Chapelle need not be looked upon in any pessimistic light. If the idea has been so happily realized in Leipzig, it will in the end also succeed in Aix-la-Chapelle.

Woman's entrance into public life in modern times has brought the question before the National Commercial Union as to how to provide for their proper education. From 1882 to 1895 the number of women employed for commercial work increased 70 per cent, in contrast to 35.8 per cent increase of men similarly engaged. It is no wonder, then, that associations have been everywhere formed to assist women in business and approve their preparatory education. Otherwise the just complaints that woman labor decreases the salaries of men could never be silenced.

Dr. Silbermann, the general secretary of the union, has written an article on the subject, and the annual meeting of the union, held in Hanover in 1899, discussed the question in detail. Silbermann reviews all the commercial schools and courses for women, as well as all the continuation schools (evening and day schools) open to them in Germany. They are found in thirty-two cities of the Empire, and have been established by merchants' associations, municipal administrations, women's clubs, associations for public benefit, and by private enterprise. But, as Silbermann states, the founders or directors of all these institutions, which exist under various names, have no clear idea of their end and purpose. The prevailing unsystematic diversity is not advantageous either for the girls and women employed in business or for the whole mercantile class, which is constantly employing woman labor to an increasing extent. Miss Agnes Hermann, in *Social Practice*, justly deplures that many families who intend their girls to be employed in business have no conception of their duty to provide them with an appropriate education. A six months' practical training behind a counter, or a three to six months' course at a so-called commercial school, better named steam press, is considered sufficient to launch them in the world as saleswomen or bookkeepers. The plans of the existing lower commercial schools for women correspond to such claims made by parents. The result is unsatisfactory labor and insufficient pay to saleswomen and women bookkeepers. Under such conditions there is no need of proving the necessity of reorganizing the education of business women.

Whether a compulsory attendance at continuation schools (schools open to children having completed the elementary schools at 14 years of age) should be required of women is a question that has not yet been decided. Silbermann is in favor of it, but the merchants' congress only admitted its importance, recommending earnestly that every urban community should establish commercial evening schools, with a course of study of at least two years, for women. State governments should be petitioned to see to it that employers allow the necessary leisure for a compliance with the legal obligation of attendance.

It is frequently claimed in Germany that a compulsory commercial education is especially necessary for women. It has been opposed on the ground that business is only of minor importance to many, and that they give up their positions as soon as they marry. Moreover, the fear has been expressed that the power of the merchants' union will decline if it is called upon to give attention to the education of women also. Besides, the opinion has been maintained that the influx of women employees is sufficiently great without its being increased by any outside efforts.

It seems, however, that it is to men's interests to make women competitors equally competent; for salaries are kept down just by those who have "picked up" their knowledge and have no special education worthy of the name. Men must to-day reckon with saleswomen, women bookkeepers, etc. It is therefore of

manifest importance that women competitors should be equally educated, so as not to force men under. Just because many parents think that their daughters' education can be restricted to the narrowest limits, and that they themselves are satisfied with modest demands and beggarly wages, compulsory attendance, as is required or contemplated for men, would therefore be most appropriate for women also.

What has been said makes it self-evident that commercial evening and day schools for women should be better planned. Silbermann justly asserts that the work of reform must begin with commercial schools now existing and with similar institutions which unscrupulously claim to "educate" hundreds and thousands of girls in six weeks or three months. That the mercantile class has so many incompetent members is due to them; and they explain, also, why a woman bookkeeper with a salary of \$30 a month displaces the man who receives \$50 a month or more. Well conducted, thorough commercial schools would attract competent and exclude incompetent students. There is no more grateful element than girls.

Separate institutions for women, in place of annexes to schools for men, are to be recommended for practical reasons.¹ The studies and terms of tuition must, of course, be identical; judgment could then be pronounced on the competency of women. "The purpose," in the words of Silbermann, "is, on the whole, the same, hence the means should not be different. It is to be hoped that merchants, mercantile corporations, chambers of commerce, and independent merchants' unions will understand this fact and act accordingly." From what has been said of the efforts of the national union in behalf of commercial education we may believe that Germany is following the best line of action to provide for the education of the future merchants of the Empire.

V. SCHOOL SUPERVISION IN GERMANY.

It is undeniable that the urban school systems of the United States are provided with more superintendents, assistant superintendents, and supervising principals than any school system in central Europe, although the rural districts of many States in this country lack efficient supervision, while in central Europe they are supervised almost as much, or as little, as the urban schools. That it is not thought necessary in Germany, Austria, and Switzerland to appoint supervisors and inspectors in such numbers as here, is owing to the thorough professional preparation of all teachers. No person can be employed as an elementary teacher in central Europe unless he have a certificate acquired in a State examination after four years' (in some German States six years) attendance in a normal school; and no one can be appointed to a position in a secondary school who is not a university graduate or has university and normal school training combined. This, naturally, does away with the necessity of constantly directing the teachers in their daily work, and hence the small number of supervising officers.

School supervision as organized in central Europe, particularly in Germany, is not well understood in this country, nor is it plainly set forth in governmental reports of those countries. It is therefore desirable to show the system of supervision as it exists in Germany. There the functions of a superintendent (inspector or school councilor) are, in the main, the same as in this country, only he has greater authority in questions of attendance of pupils and promotion of teachers. There is also a better division of responsibility and authority in Germany, as will be seen from a statement made by Prof. Theodor Franke, of Wurzen, Saxony.

¹ The Germans are not friendly to coeducation of the sexes

He describes the system of supervision of his State, and lays especial stress upon the importance of district or county supervision. The description he gives is essentially true for all German, Austrian, and Swiss States, for the differences found here and there are grown out of local circumstances and are not important enough to be here enumerated.

Prof. Theodor Franke's paper appeared in the *Oesterreichische Schulbote* (July, 1900, Vienna), and is here reproduced in translation owing to the comprehensive review it offers within a small compass. He describes the various grades of supervisory authorities in Saxony, their functions and their relations to the State school system. He says:

SCHOOL SUPERVISION IN SAXONY.

School supervision is an important part of the entire State system of education. Its character and organization is a proper standard of measurement for the whole system, and the more perfect and appropriate it is, the more the interests of education are promoted, and the better will be the results. School supervision in Saxony is divided into three grades, all of which have essentially different functions and authorities. They are known as local school supervision, district or county supervision, and State supervision.

(1) *State supervision.*—State school supervision is exercised by the minister of worship and education, a member of the King's cabinet. He is assisted by a professional school councillor, who is at the head of the ministerial division of education. Formerly, some teachers opposed the union of worship and education in the ministry as a recognition of the superiority of the church over the schools. It may be stated, however, that no such objection has been raised within the past ten years. During that period an advance has been made in teachers' salaries, the lowest salary for beginners having been raised from \$210 to \$300, and the highest salary of simple class teachers increased for the stipulated term of service from \$300 to \$525. It must be remembered, however, that besides the money paid in form of salary an extra sum is allowed for rent of house and garden, and that only the minimum salaries are fixed by law at the figures stated. Urban communities give much more salary as an inducement for the best teachers. At present a movement is afoot for a union among all the cities of the Kingdom to agree upon a definite limit of increase of teachers' salaries.

The minister of education represents educational interests in parliament, makes rules and regulations affecting the educational institutions of the State, prepares the annual budgets submitted to parliament, and acts as the highest court of appeal in cases of discipline of teachers. It is the general opinion that the State supervision is excellently adapted to conditions and most satisfactory to teachers. The high regard and deep affection manifested toward the professional assistant of the cabinet minister, Privy Councillor Kockel, is a proof of this, further substantiated by the fact that the minister has considered the repeated and well-founded petition of teachers to curtail the time devoted to instruction in religion, which was out of proportion to the time given to other branches. If, according to some, this curtailment is still insufficient, allowance must be made for the fact that in this regard the minister does not enjoy entire liberty of decision, being restricted by the Evangelical Lutheran Consistory. Nevertheless, the decreed omission of much memorizing of bible verses and hymns considerably lessens the burden for children, especially since the most difficult passages have been excluded.

(2) *Local supervision.*—Local school supervision is not the same everywhere in Saxony, nor for that matter in Germany. It depends upon the size of the community; it is partly professional and partly not so. The law of April 26, 1873, defines the following:

Local school supervision under State jurisdiction is exercised (a) over such schools as are superintended by a principal (called director) through him; (b) over such schools as have no principal (chiefly ungraded schools) through the clergyman who is a member of the school board, provided the State authorities do not revoke this commission or appoint a professional inspector. The office is a position of honor without remuneration. The local superintendent or inspector shall assist teachers in the fulfillment of their duties and acquaint himself with the condition of schools by personal visits, drawing attention to any faults he notices; comments disparaging to teachers must not be made during class or in presence of pupils.

The church exercises special supervision over religious instruction and the teachers of religion.

Professional local school supervision, therefore, exists for all graded systems of

school, i. e., schools that have principals or directors. Still as early as 1873 the desires of the teachers, as expressed in petitions to parliament and the minister of education, included more professional supervision. Before the passage of the school law (1873), the teachers of Dresden and Leipzig presented a petition for the abolition of ecclesiastical supervision even over ungraded schools.

There are no imperative reasons for any such request, complaints about ecclesiastical supervision are very rare, and when they occur the motives at bottom are usually personal. The complete abolition of such supervision amounts to nothing more than a question of increased honor for and appreciation of the teaching profession. This was accepted as a principle of action in parliament when the school law was under discussion. The committee of the lower house explicitly advocated the amendment which was adopted, that the supervision of public schools should, whenever possible, be intrusted to professional educators. No satisfactory arrangement to substitute professional for ecclesiastical supervision of ungraded schools has as yet been suggested; and it is self-evident that its abolition on the mere plea of some teachers, that the schools have enough supervision without it, is not to be expected.

It has recently been suggested that a change could be made without much attendant difficulty or any special increase in the expense. Local school supervision of ungraded (usually rural) schools could be intrusted to so-called supervising teachers. These could perform the duties of supervising several teachers as easily and efficiently as directors in city schools.

As no examination nor special conditions besides a certificate of middle grade is prescribed by law for superintendents in Saxony,¹ there is really no essential difference between supervising teachers and directors (principals), though many urban communities at present elect only those teachers as directors who possess an academic (university) education. As the State government exercises an influence over the appointments to the positions in schools without directors, it could also manage that only competent and worthy men should be selected to fill the office of supervising teachers exercising directive power under its orders. Danger to the uniformity of the system could thus be avoided, as progress is then the sure outcome of directive supervision. There would then remain only some rural schools, very far apart, having only one teacher each, to whom the position of supervisor could not be given for personal reasons. For these, small districts could be laid out and the worthiest and most competent teacher within a district could act as supervisor. This arrangement would give a commendable incentive to teachers to win the confidence and esteem of higher authorities and fellow teachers by commendable efforts and successful work. It would, moreover, be a powerful means toward fostering self-education among teachers. Just in this respect it is highly important that excellent teachers may have the prospect of a good position, even though it be unremunerative. At present there is no sign of carrying the policy of professional supervision into effect. As has been said, there is no imperative reason for immediate radical action, gradual changes seem advisable. Only the preliminary petition should be presented to give the State authorities the right to appoint the "directing" teachers at urban or village schools of several teachers to the position of supervising principal. In this way professional supervision would be gradually extended and the slow change from present conditions would avert all the evils attendant upon radical reconstruction of the system.

(3) *County or district supervision.*—The term district is not to be confounded with the American school district. A governmental district in Saxony is one of the political divisions of the State, hence it is rendered county in the following explanation. County school supervision ranks between State and local school supervision, and was likewise affected by the school law of April 26, 1873. Before that date clergymen fulfilled the duties of the office in addition to their own on their ministerial rounds of visits. Consequently, before the passage of the new school law there existed no professional supervision over counties. These conditions, which provoked just complaint, chiefly from teachers, were changed by the law mentioned. Ecclesiastical supervision was abolished, and the clergymen were relieved of their duties as school inspectors. Their places were taken by special county school inspectors, civil officers in charge of the supervision of the elementary schools without any further duties. They are appointed by the minister of education and receive a salary of not less than 5,400 marks (\$1,285), which is considerably increased according to the number of schools in their districts and age of service; some of these inspectors have a salary of \$3,000 per annum. They have the title school councillors, and this gives them the rank of fourth-class councillors in the State service. The law defines that they be selected from

¹ In other states of Germany supervisory officers have to pass severe examinations.

among teachers of good standing. Some have acquired the academic degree of doctor philosophiæ; nearly all possess an academic or university training, while a few have taken preparatory courses at classical high schools, and received professional training in normal schools. Most of them had, previous to their appointment as school inspectors, acted as principals of large schools. In many instances they were selected from principals of normal schools, high schools, and technical schools, very rarely from among elementary teachers. As a rule, the best known and most excellent men receive the distinction of an appointment to the district inspectorship. The large cities in Saxony place the principals of their city schools on an equality with county school inspectors as regards salary, so as to keep the best men in their positions. In almost every case principals of medium-sized cities are selected, apparently for no other reason than that most principals in large cities do not desire to accept the appointment.

Saxony is divided into 28 school districts, coinciding with the political districts. This uniformity is owing to the desirability of not duplicating the administrative machinery. Each county has its own school board, of which the inspector is in a large measure the executive officer, and this board is the authority over local school boards, hence is responsible for the administrative order of the system. This county inspection is differently managed owing to different political organizations among the districts. In cities where the so called revised municipal order obtains, the county government is not in force, hence city schools are not subject to county inspection exclusively, but the city council and county school inspector together form the authority. In cities of over 5,000 inhabitants the town council manages the business of schools, presided over by the burgo-master, or mayor, who must possess the legally prescribed education, and this local board is assisted by the county inspector. In all other cases, especially in rural districts, the school board consists of the county officers and the school inspector. The highest authority under the minister, naturally, is the governor of the county.

The members of the county school board agree upon regulations for the schools. In disputed questions the minister of state for education decides. All petitions addressed to the county board are first referred to the member who is a lawyer, who passes them over to his pedagogical colleague, the school inspector, for consideration and decision. The school board (board of county school supervision, as it is called in Saxony) is nonsectarian, and therefore independent of the influence of any religious corporation, and is the first authority over religious schools, where they exist, except the local board. This necessarily makes the school inspector the executive officer of the board, independent of ecclesiastical interference.

As the county board of supervision is also an office of legal authority, certain legal matters receive its attention, namely:

1. It attends to the execution of State laws and regulations that apply to schools.
2. It directs all negotiations for the admission and dismissal of pupils, and besides superintends, through its school inspector, buildings, rooms, and appliances, as well as the payment of teachers' salaries.
3. It makes all necessary investigations prior to the appointment of teachers, i. e., passes upon their diplomas and examines and confirms or rejects regulations proposed by local school boards.
4. Where no special authority for the purpose exists, it attends to the execution of the protective State law applying to irreducible funds and endowments.
5. It examines the annual county appropriations for school expenses, as well as the disbursing officer's accounts.
6. It forms a court of the first instance for disagreements on administrative questions and settles differences of opinion concerning tax levies for school purposes, and likewise approves or disapproves of petitions for State appropriations.
7. It decides all differences between the local boards and its executive officers, and settles all other difficulties arising in the school affairs of the district.
8. It manages all affairs of discipline with respect to the conduct of teachers, and is the agency for the first and second reproof. It likewise has the right to suspend teachers temporarily for a period not to exceed three months; the minister of education alone can discharge or summarily dismiss a teacher from office upon motion of the county board, which takes action upon motion of the inspector.
9. At stated intervals the county board presents its suggestions and reports for the improvement of external school organization to the minister of education.

When through any necessary resolutions and decisions the county school board comes in contact with church authorities, they act in concert. This usually occurs in appointing teachers for positions in parochial schools and in superintending the study of religion in all the schools. In matters pertaining to school hygiene the district or county physician who acts as health officer, and is a member of the county government, is consulted.

The business devolving upon county school inspectors as professional educators is of prime importance to teachers, as it affects the inner working of the school system. All public elementary schools in the county are superintended by the county inspector, as well as the course of study in so-called preparatory schools, attached to secondary schools, all kindergartens and schools for the defectives, together with the private instruction given to children of school age withheld from school owing to physical or mental defects.

Inspectors must visit all the schools under their charge at stated intervals and inform themselves of their condition. As a rule they should visit each school at least once in two years; according to discretion, oftener, especially where little progress has been made and conditions are less favorable; by so doing improvements can be suggested. The dates of the inspectors' visits are not specified by law or regular announcement, nor are they rigidly observed if announced. In larger districts with a full force of teachers it often happens that inspectors do not make a round of visits in four or five years. The apprehension, expressed by those who opposed the new order of affairs at the time of the abolition of ecclesiastical supervision, namely, that the inspectors would become a public annoyance, has proved altogether unfounded.

According to the present plan of supervision, the inspectors must give their attention to the following points:

1. In the first place, they are required to ascertain whether the regulations concerning the admission and dismissal of pupils are properly observed; in fact, they are charged with the supervision of the working of the law of compulsory attendance. They require from each school a report of the number of children whose parents have different religious creeds than prevails among the majority; a similar annual report is requested stating the attendance at religious instruction of those children who are not members of the religion taught in the school. Before presenting the statement to the minister, inspectors add the necessary explanatory notes.

2. Their most important duty is to observe whether the diligence and deportment of teachers, as well as the discipline, order, and cleanliness of their schools, are open to censure or not. No opportunities should be neglected to advise, assist, improve, admonish, correct, and warn teachers professionally if necessary. In the discharge of these duties, the inspector must consider the standing of the teacher and the honor of the profession in school and community; those who willingly follow his counsel should have his unreserved support. During their visits, inspectors examine the class rolls to see that enrollment is not over the prescribed maximum, and investigate whether the books and official blanks are used as intended, and whether any weak-minded or neglected children who belong in special institutions and schools provided for them have been admitted. Where the diligence and deportment of teachers is open to censure, the inspectors are called upon to propose professional means of improvement. Generally they see to it that teachers present an example to pupils in conduct and intercourse, so that the schools may be in reality nurseries for education, culture, and piety. In particular, they see to it that strict discipline and order are maintained, to the exclusion, however, of all measures detrimental to the development of character or apt to destroy children's love and esteem for teachers and their love of study. Any unlawful exercise of the right of punishment is reprovod.

3. The inspector is required to investigate whether the course of study is adhered to, and whether the method of instruction and the progress of the pupils realize expectations. Consequently they examine and approve of all itemized or detailed courses of studies for elementary schools and for continuation schools that come within the range of elementary institutions. These courses are submitted to the inspectors, and they have to see whether the requirements specified by State law are carried out in them. They are also notified of all changes in the grading of classes, which changes are approved or rejected by them.

With regard to the methods of instruction, the inspectors are commissioned to see that education develops moral character and will power, and that diligence and obedience are not the outcome of fear. Instruction must develop, as far as possible, all the pupils' inborn powers, so that no special preference be given to any branch of study at the cost of the children's all-sided development. With respect to religious teaching the inspectors act in unison with church authorities, whom they must support in the exercise of their rights whenever desirable.

4. The scientific professional education of teachers and their occasional supplementary occupations for pay after school hours are also subjects of the inspectors' attention. At least once a year inspectors call a meeting of all the teachers and principals in their respective districts. In their addresses they usually express their views on teaching and training, and endeavor to inspire teachers with renewed

and cheerful devotion for their responsible duties, while one of the teachers, in accord with the inspector, expounds a pedagogical or practical subject. During the discussion connected with the lecture all are allowed free expression of opinion. These county teachers' meetings accomplish their purpose and contribute a great deal toward maintaining friendly relations between inspectors and teachers, and calling forth mutual esteem and full confidence.

Inspectors exert a still greater influence over assistant teachers who have not passed the second or final State examination. For them they arrange conferences in which trial lessons are conducted, and the work done is criticised. Important publications on psychology and pedagogy are discussed, as well as sections of the school law; practical and theoretical suggestions are given, and the novices in teaching are in every way urged to a deeper study of didactics. Whenever occasion admits counsel is given on diligence and department, which proves an advantage for as yet untried and unformed character.

5. In the interests of educational progress, inspectors devote a great deal of attention to educational text-books and aids or devices, and to the arrangement of matters of instruction. The rural schools of Saxony are indebted to their untiring efforts for the gradual increase of educational aids and material for object lessons. Though they were powerless to give direct compulsory orders, they nevertheless exercised a controlling influence in defining the measure which requires that an annual appropriation must be expended in every school district for educational helps as a part of a school's equipment. Moreover, the continuous admonitions to negligent communities had a good effect. Unfortunately, at times even the most convincing proofs brought forward by teachers are set aside by school boards, and in such cases exhortation and persuasion on the part of inspectors gain the desired result.

As many antiquated and inappropriate educational devices were still in use when county-school supervision was inaugurated in 1874, a broad field of beneficial action in this respect was open to inspectors.

In respect to the old courses in study, the minister of education earnestly requested the county inspectors to examine them, remedy conspicuous faults, and abolish prominent evils, but refrain from any radical reconstruction on individual authority, as the State authority itself intended to define the principles of the course of study for all elementary schools in Saxony. As, however, this official course prescribes only the very lowest standard for ungraded elementary schools and is intended to further rather than forbid any special individual methodic application, each school is still charged with the duty to arrange a detailed course adapted for existing local conditions. The mere decree of a course of study from an inspector has, therefore, no legal value. If a common order for any one branch or an entire course were to be introduced in a district or county it could only be done by general consent. Until now very few efforts toward a uniform plan of study for all the elementary schools of one county have been made, and these were rather with reference to separate branches, such as reading and language. Even from a pedagogical point of view, a certain uniformity in regard to these studies is perfectly justified.

In general, uniform courses of study can not be regarded as beneficial or progressive. As a teacher at one of the national teachers' meetings pertinently remarked on one occasion, an inspector or supervisor must be a man of broad views and great foresight not to run aground on details. This assertion applies as well to methods as to courses of study. In truth, on their entrance into office most inspectors emphasize the fact that they recognize liberty in methods of instruction within absolutely necessary limits; unlimited liberty or license is not and can not be accepted or granted at any time. Liberty of method is just as indispensable and advantageous for devotion to the vocation of teacher as liberty of conscience and profession of belief are in religion. Even though attempts have occasionally been made to prescribe certain methods, it is noted with pleasure that such efforts have been discountenanced by the State authorities who vouchsafed the teachers' liberty in the choice of methods.

6. Inspectors are obliged to pay attention to the economic conditions of schools, especially to the prompt payment of teachers' salaries and the support of schools generally, as well as to the hygienic conditions and otherwise legally required provisions for the health and comfort of pupils. For these reasons they examine all local budgets and school-tax levies and are advised of any changes in the teachers' salaries. On all important questions concerning the improvement of the condition of schools inspectors endeavor to be in accord with the local school boards, so as to avoid disagreements between authorities and make possible appropriate organization and pleasant intercourse.

7. Finally, it is the duty of inspectors to superintend the official action of local

school boards. They are called upon by law to examine the minutes of all the board's meetings and have the right to notify the presiding officer to call a meeting at any time. On their rounds of visits they are obliged to see that the conditions of a permit for conducting a private school are observed and that the limits of their rights are not overstepped.

Inspectors must keep special registers of their visits. The result of their observations should be frankly communicated to teachers and principals, but never in presence of pupils. In graded schools the inspector may hold a special conference for the purpose. A brief written review of the condition in which he found the classes and the studies is entered in the school's journal over his signature. A condensed statement of the notes of each visit is arranged in tabular form, and at the end of the year a report of all the visits made is presented to the minister of education. In this report any bad conditions and serious obstacles to progress are stated and the proper means for improvement suggested. All county inspectors meet once a year at the capital of the Kingdom to discuss measures for the improvement of schools, the introduction of educational devices, necessary changes of standards, and other subjects affecting school interests. To these conferences the best Saxon teachers—men of recognized merit—are invited, often also school principals, who are justly looked upon as future inspectors.

The annual reports must state the standing of the schools within the district, the changes that have taken place in organization and the teachers' positions, as well as the condition and renovation of buildings; they must mention teachers who have either excelled in work and deportment or have not reached the required standard, as well as give an opinion on the action of principals, inspectors, and school boards. From these reports the minister of education is enabled to form a correct idea of the condition of the lower schools throughout the State and of particular schools that require his attention. Thus he can exercise beneficial influence in all directions as occasion demands. If during the year circumstances arise necessitating the minister's immediate action, he is to be notified at once. Inspectors must carry out special commissions on the part of the State authority and must acquaint teachers with all ministerial decrees. In this way they are intermediate factors between the supreme authority of the State and the teachers.

In all cases where the minister exercises the right of nomination of teachers, namely, for positions in places with fewer than 5,000 inhabitants, inspectors advertise the vacancies and examine the applications. In making the appointment three names of applicants are proposed to the minister of education, with the reasons for their selection. As a rule, the inspectors conduct a competitive trial of the three applicants, unless this is set aside by the local board. The taking of the oath and installation into office of permanently appointed teachers and principals also devolve upon them. While teachers are usually initiated by the local authorities or by the principal commissioned by the county inspector, the installation of a principal, as well as the dedication of new schools, is conducted by the inspector himself. Both events are celebrated by spirited addresses on educational topics. Substitute teachers are appointed without any action on the part of school boards. By the middle of February inspectors must notify the minister how many assistants will be required in respective districts at Easter (the beginning of the school year); they assign positions to applicants, which these may not give up without permission until the examination for eligibility has been taken. Assistants present their petition for admission to examination to the inspector, who examines them and adds his comments on the conduct, talent, etc., of the candidate before sending it to the State authority, the minister. The same course of action is pursued with petitions for admission to special examinations in gymnastics, drawing, and French.

All petitions for leave of absence pass through the hands of inspectors. Leave of absence for one day to three days can be granted by the local school inspector according to his discretion, although the county inspector must be notified. The latter can grant leaves of absence for from four days to four weeks, while requests for a longer time must be sanctioned by the minister of education; still, the petitions must be presented to and approved by the county inspectors. These officials also approve of children attending other schools than those of their native districts, and give permission for children to leave school earlier than they otherwise could, i. e., before the completion of the fourteenth year of life and the satisfactory completion of the prescribed course. This last-named regulation, as well as that which defines keeping children at school a year longer because of their deficiency, is put into practice only in exceptional instances. Such a course of action redounds only to the advantage of schools.

Many county school inspectors are also royal deputies at the State teachers' examination for eligibility, and can thus exert an influence on the methods of conducting examinations. County school inspectors naturally have a great deal

of writing to do. This clerical burden is made lighter through the assistance of a secretary, otherwise they could not do justice to their purely educational work. In spite of the help they thus receive, they are only too often confined to their desks. From all this the necessity is easily recognized of appointing these supervisors or inspectors instead of leaving that work to be done by the clergymen, as was formerly done. For more than twenty-five years Saxony has enjoyed the benefit of county school supervision by officials educated in the profession of teaching, and advocates of the old order of ecclesiastical supervision of schools have made little opposition. It can not be denied that the progressive movement of education noticeable in Saxony since the foundation of the German Empire is due in part to this professional supervision, though it must not be forgotten that the teachers themselves have aided the movement zealously. Their petitions to the State authorities culminated in the reform of normal schools and the elevation of the purpose of public education. The excellent corps of teachers of Saxony is at present strong in the power of direction and application, and this is a powerful means to the highest possible end of State education.

VI. INSTITUTIONS FOR THE DEFECTIVE IN GERMANY.

[At various times the Annual Reports of this Bureau have given accounts of the systems of education prevailing in Germany; the elementary, secondary, and higher schools have been treated with all possible completeness, as far as statistics could give an adequate picture of the system. But it always has been difficult to give account of what is being done for defective children, statistical reports of such institutions being very rare. Prof. J. Tews, of Berlin, supplies the information in a review on pathological institutions (Heilpädagogische Anstalten) in "Zeitschrift für Philosophie und Pädagogik," vol. 7, No. 1. The article is here reproduced in English, owing to its accurate statistics.]

The following review of the pathological institutions of Germany lacks completeness in a few items. In no branch of our modern school system does the idea of searching out and nursing defective humanity express itself so purely as in these institutions. Children of five senses and children who are morally sound have been taught and trained with zeal and success for centuries, but it was reserved for our nineteenth century to lift to the level of complete development the poorest and wretchedest to whom nature had apparently closed the way to nobler culture and purer ethical training. In this department of education particularly, the Pestalozzi idea and Pestalozzi's devotion celebrate their highest triumphs. It is confidently expected that if the development of our civilization continues at its present rate the care for children of four senses, for mentally defective children, and those morally abnormal will gain in extent and be better adapted to the special needs of the unfortunate than is the case now.

Heathen antiquity got rid of human beings neglected by nature, and it was done in the most heartless manner, presumably in order to purify the species "homo sapiens" of elements diseased and weak. The present time pursues another method. We attempt to develop even the most imperfect germ, and firmly believe that in this way the human family in its totality will not only not degenerate, but will gradually be lifted to a higher degree of perfection in all its members, more surely than by means of the cruel method of the ancients. Yet, only recently a much-read educational journal contained the following sentiments: "I beg to state that our custom to preserve, by every possible method, the lives of crippled and diseased children is not at all to be recommended. Antiquity had in this respect undoubtedly better views than ours." This expression is prompted by a brutality not generally found among educators, and was characterized as such without delay.

Hand in hand with pathological pedagogy, of course, should go efforts toward improving the environments and conditions of life of those strata of the population, especially the poorest, which generally furnish the candidates for pathological institutions. If that were done, the number of defective children deserving of admission to pathological institutions would diminish gradually, as is noticeable already in the smaller number of blind children admitted to blind asylums. It is reasonable to suppose that other defectives would similarly decrease in number.

As the present generation in Germany has succeeded in reducing the number of beggars to a vanishing quantity by offering work for all, and by caring for the aged and infirm, it has also succeeded in withdrawing children of four senses and mentally abnormal children from public pity, and offering to them a possibility to equip themselves for the struggle for subsistence by means of associated charities and State asylums. The following review is almost complete for Prussia, but somewhat defective for the smaller States of the Empire.

I. BLIND ASYLUMS.

In connection with blind asylums the Prussian governmental statistics of June 27, 1896, give information with reference to the number of blind persons in the Kingdom. In 1880 there were counted 22,677 blind. Of these only 918 males and 786 females were born blind; 6,969 males and 6,875 females had lost sight after birth. Of 3,456 males and 3,673 females, a statement as to the time of beginning blindness had not been made. The number of cases of blindness has gradually decreased, partly owing to the progress made in ophthalmology, partly to the decrease in cases of smallpox, a disease which is a very frequent cause of blindness among children.

Number of blind persons in Prussia.

Year.	Males.	Females.	Total.	Of every 10,000.		
				Males.	Females.	Total.
1871	11,066	11,912	22,978	9.1	9.5	9.3
1880	11,343	11,334	22,677	8.5	8.2	8.3
1895	11,238	10,204	21,442	7.2	6.3	6.7

The decrease is obvious. Especially has blindness decreased among children of school age, as is seen from the following data:

Year.	Age less than 10 years.			Age 10 to 20 years.		
	Males.	Females.	Total.	Males.	Females.	Total.
1871	664	658	1,322	1,013	845	1,858
1880	572	488	1,060	992	823	1,815
1895	461	367	828	1,003	730	1,733

Hence, at present (in 1900) there may be between 1,450 and 1,500 blind children of school age. The number of blind persons varies considerably in the different provinces, the eastern provinces showing a higher percentage than the western. That blindness increases in frequency with age is a well-known fact. In the age from 0 to 15, for instance, there were, in 1895, only 4 males blind, but in the age from 50 to over 70 there were 105.3 in every 10,000 male inhabitants. The following

table shows the number of blind not yet 20 years old for the various provinces of the Kingdom:

Table showing number of blind persons of school age in Prussia.

Provinces of the Kingdom.	0 to 5 years.		5 to 10 years.		10 to 15 years.		15 to 20 years.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
East Prussia	10	6	20	20	30	27	41	27
West Prussia	7	9	18	17	23	21	25	25

There are 15 asylums for blind children in Prussia, in which 411 boys and 292 girls, in all 703 children, between 6 and 14, are taught. The following table gives the details:

Table showing number of pupils in schools for the blind in Prussia.

Institutions.	Pupils 6 to 14 years.			Number of teachers.

Of these 15 schools 13 were situated in cities, 2 in the country. One is a royal school, 11 are provincial, 1 is a municipal, and 2 are private schools. One is ungraded, 3 have 2 grades, 1 has 3, 5 have 4, 4 have 5, and 1 has 10 grades. These 15 schools have an average of 47 children, and the classes average 12.

The Kingdom of Bavaria has 4 such institutions, Saxony 2, Württemberg 3, Baden 2, and other States each 1, as is seen from the following tables:

Table showing number of blind children in asylums in the lesser States of Germany.

Altogether, Germany has 33 schools for the blind. Other countries, so far as information is received, are well provided with such institutions also. Austria-Hungary has 12; Denmark, 1; Russia, 23; Belgium, 5; France, 23; Spain, 12; Australia, 5; Switzerland, 3; Sweden and Norway, 8; Netherlands, 7; Great Britain and Ireland, 40; Italy, 14; the United States, 36.

II. INSTITUTIONS FOR THE DEAF.

Institutions for the deaf are more numerous in Prussia than those for the blind, simply because the number of deaf children of the age in which they may receive a school education is much greater. On December 2, 1895, the Prussian census found the number of deaf children of less than 20 years to be as follows:

Table showing the number of deaf persons under 20 years in Prussia.

III. INSTITUTIONS FOR IDIOTS.

The care for weak-minded or mentally defective children and schools for their instruction have in recent years greatly increased. So-called "closed institutions"—i. e., asylums for idiots and epileptics—have existed for many years, but during the last few decades special attention has been given to other children who are mentally weak but not idiotic—children who can not possibly keep up in their studies with normally endowed children, and retard the progress of the school. Such children have been gathered either in special ungraded schools or separate classes. A number of German cities have proceeded to thus aid the weak and at the same time enable the classes or grades of normally endowed to progress at a more rapid rate in their studies. The following table gives the details concerning schools or asylums for idiotic and epileptic children in Germany.

On January 1, 1898, there were in Germany 59 of such asylums, with 11,964 inmates; 6,490 of these were boys, 5,224 girls. Of two institutions the number of boys and girls is not stated separately; only the total, 250. Of the total number, only 3,685 were capable of being taught. The others are only occupied with manual labor or only fed.

Closely related to schools for idiots are the private institutions for intellectually backward children, of which there are a number in Germany, not included in the foregoing list. Some of these schools are designed for children of wealthy parents exclusively, and hence charge heavy tuition fees. Between the large group of normal children and that of pathologically weak (idiotic) children and degenerates there is another group who are hard to educate, being in danger of developing abnormally in physical, intellectual, or moral regard. Since 1890 Professor Trüper has opened a school for such children near Jena. Here children are instructed and trained with success according to the principles of neuro-pathology or psychopathology.

IV. SPECIAL SCHOOLS OR CLASSES FOR THE MENTALLY WEAK.

The number of institutions for the education of mentally weak but not idiotic children has greatly increased during late years. While in 1894 Prussia had only 16 cities in which provision was made for 700 such children, there were in 1896 as many as 27 cities maintaining 33 schools with 2,017 children. Such institutions are all within the city school systems; they are integral parts of the system; hence its statistics of attendance are contained in those of the elementary schools. These unclassified schools and classes are established for two purposes, (1) to give special aid to weaklings and (2) relieve the generally overcrowded classes of elements which would retard the progress of the average.

V. REFORMATORY SCHOOLS.

The first institutions of this kind in Germany were established by the Pietists during the eighteenth century. Men like A. H. Francke collected moral degenerates or children exposed to vicious influences. Pestalozzi continued this work of mercy and charity. Later on schools of refuge were established on a large scale by Zeller in Buggen (Baden), by Count von der Recke in Overdyk and Düsseldorf (Rhenish Prussia), and Johannes Falk in Weimar. While formerly orphan asylums and houses of refuge were combined, they are strictly separated in late years. Germany had, in 1897, 342 houses of refuge or reformatory schools, viz, 209 in Prussia, 20 in Wurttemberg, 26 in Saxony, 20 in Bavaria, 14 in Baden, 11 in Alsace-Lorraine, 9 in Thuringia, 9 in the three free cities, 4 in Hesse, 4 in Anhalt, 2 each in Mecklenburg, Oldenburg, Brunswick, and Lippe-Detmold. The total number of inmates in Protestant refuges approaches 10,000. The value of grounds and buildings is estimated at between 8,000,000 and 10,000,000 marks. The tuition fees vary between 75 and 600 marks per annum.

Through the criminal code (1871) for the German Empire and the law of 1878 concerning the care of neglected children a new kind of institutions has been recognized, to wit, institutions for obligatory training (*Zwangserziehung*). These are maintained by societies and subsidized by the State. Between October 1, 1878, and March 31, 1897, there were in Prussia 27,645 children assigned to such communal institutions. Other communities and provincial governments have performed their duties, imposed upon them by the law of 1878, by assigning children who have been found guilty in the police courts to private families, where they receive strict attention. Some communities who have no houses of refuge have made arrangements with institutions of other cities to receive their children convicted in court. In March, 1897, as many as 10,542 juvenile criminals were provided for in the various ways indicated, which cost the communities \$349,246.58 to maintain during the year ending March 31, 1897. In 1896 as many as 140 of these institutions had special schools for their inmates.

Of these schools 95 had only 1 grade, 24 had 2, 16 had 3, and 5 had 4 grades each. The classes averaged 31 children. One hundred and twenty classes were exclusively attended by boys, 30 exclusively by girls, and 75 were mixed classes. Institutions which have no special school facilities send their inmates under escort to the city schools.

The kingdom of Saxony has 27 houses of refuge or reformatory schools, with 703 inmates. The expenditures for maintaining these institutions amounted to \$49,457 in 1897. To these should be added an asylum for children who have not been convicted in court, but were brought to this institution because they were in danger of becoming degenerates, the parents being in prison or irresponsible educational agents. This asylum is situated in Bräunsdorf and has 26 teachers, 11 classes, and 327 pupils (252 boys, 46 girls, and 29 advanced pupils the sex of whom is not stated).

Orphan asylums in Germany are not classed among the educational pathological institutions. The care of orphans is a duty of the communities, nearly all of which maintain orphan asylums; rural communities often place their orphans in private families. In 1893 Prussia had 78 orphan asylums provided with schools, in which 5,192 children were taught by 172 teachers. Wherever such schools exist they are not classed among the public schools.

VII. A NEW LAW CONCERNING REFORMATORY EDUCATION OF CHILDREN IN PRUSSIA.

[A law concerning obligatory education of minors has recently been passed in the Prussian House of Deputies (May 21, 1900). The circumstances necessitating obligatory education are found in social conditions over which no state government can have full control. A chief factor which, as a rule, is overlooked in judging depraved youth is found in the pathological conditions of the soul and in the education at home (or rather the want of such education), in school, and in public life—in short, in the diseased soul and its environment. This factor has not been taken into consideration by the framers of the law as much as was desired by persons who have made the saving of neglected and depraved children their business. The editor of *Kinderfehler, Zeitschrift für Kinderforschung*, sharply criticises the law as inadequate. Still, if compared with the laws on the subject in other countries, it would seem to go beyond the requirements in force elsewhere.

A careful reading of the law will show that the parental Government of Prussia concerns itself much more about the unfortunates than do other governments.

Of late German teachers pay much attention to pathological education, and it was to a large extent their wishes which were consulted in the framing of the new law. That some of them find it unsatisfactory is easily understood, for no law is made in advance of conditions to be combated. Law always lags behind. The text of the law is here given in English.]

ART. 1. Obligatory education, as the term is used in this law, is the education under public supervision and at public cost, in a suitable family or in an educational or reformatory institution, of minors exposed to evil influences or neglected and depraved.

ART. 2. In case of minors who have not completed their eighteenth year obligatory education may be enforced—

(a) If the presumptions of paragraph 1666 or of paragraph 1888 of the civil code exist, and such education becomes necessary to prevent moral depravity of minors.

(b) If a minor has committed any criminal act for which he can not be punished under criminal law on account of his youth, and if obligatory education is necessary to prevent further moral depravity because of the character of the occupation and the personality or other guardians, and the minor's special environments.

(c) If, aside from such cases, obligatory education is necessary to prevent complete moral ruin on account of the insufficiency of educational influence provided by parents, other guardians or schools.

ART. 3. Obligatory education is enforced after the orphan court (Vormundschafts-Gericht) has decided upon the existence of conditions stated in article 2 in view of facts accepted as proved, and has ordered the enforcement of the provisions thereof.

ART. 4. The orphan court takes action, either on authority of office or upon motion. In rural districts the county mayor (Landrath), in urban districts the magistrate and the board of police, make the motion. These authorities have not only the right to submit such cases to the court, but it is their duty. Before passing decision the orphan court is required, as far as it is practicable, to hear the evidence of parents, legal guardians of the minors, and in all cases the communal authorities, the minister of the parish, and the principal or teacher of the school which the minor attends or last attended. If the court acts without previous official motion, its resolutions, accompanied by testimony, must be submitted to the local authorities (mayor, magistrate, and police board) for consideration before they can be passed. The decision must be delivered to the legal guardian, or to the minor himself if he has completed his fourteenth year of age, to the mayor, magistrate, and police board. An appeal may be taken immediately from the decision. This appeal has the power of postponing action.

ART. 5. In danger of delay, the orphan court can issue orders for temporary charge of the minor. In that case the police board of his locality must see to it that the minor is placed in an available institution or family. If obligatory education is eventually enforced all attendant costs must be borne by the communal authority (paragraph 14). If the court's decision is reversed the costs of temporary assignment are paid from the same funds from which the local police force is paid. In all cases the police board must advance the costs of a temporary assignment.

ART. 6. If parents or legal guardians have not been able to give their evidence, as required by paragraph 4, they have the right to demand a renewal of proceedings.

ART. 7. In so far as no specific procedure is defined in this law, the court procedure is to be conducted according to the regulations governing the optional jurisdiction of regular courts.

ART. 8. The legal proceedings are free of fees, and documents require no stamps; cash expenses must be paid out of the State treasury. Contracts for the charge of wards likewise require no stamps.

ART. 9. It is the duty of the communal authorities (see paragraph 14) to attend to the execution of a decree for obligatory education; they decide in what manner wards are to be brought up. Wards are delivered at the place of assignment by the police of their places of residence.

ART. 10. Wards must not be placed in a workhouse or public poorhouse; neither can they be placed in institutions for incurables, the deformed, idiots, deaf mutes, and the blind for any longer time than their physical or mental condition requires. For the fulfillment of obligatory education in cases in which action is pending in

court, wards may remain in their families subject to the supervision and recall of the communal authorities.

ART. 11. The communal authorities must make provision for the supervision of the education and care of any wards assigned to a private family. Women may hold the position as supervisor.

ART. 12. On motion of the communal authorities (having due regard for the regulations contained in article 78, section 1, of the law for the execution of the civil code) a guardian board selected from the directors of State reformatory institutions may be appointed for wards placed in the institutions for the reasons given in articles 2 and 3. The same applies to wards who, under the supervision of the directors of an institution, are educated in private families selected by them. If the supervision of wards is in charge of an official appointed by the communal authorities, he can, upon motion by them, be appointed guardian instead of the directors of the institution. No additional guardian can be appointed besides the one heretofore stated. The guardian enjoys the privileges allowed by article 1852, of the civil code.

ART. 13. Obligatory education is discontinued upon decision of the communal authorities, or upon motion of parents or legal representatives of minors, if its purpose has been accomplished or is otherwise assured. Discontinuance can be granted subject to revocation in case of necessity. Within a term of two weeks from the day of the deliverance of a negative decree by the communal authorities, a petitioner has the right of appeal to the orphan court, from whose decision appeal may be taken by the local authorities. Such an appeal has the power of postponing action. A rejected petition for discontinuance can not be renewed before the end of six months.

ART. 14. The provincial authorities in Hesse-Nassau, the county officials of Wiesbaden and Cassel, the State authorities of Lauenburg and Hohenzollern, as well as the city of Berlin, are required to institute measures in accordance with this law for the obligatory education of minors decreed by the orphan courts. They are required to erect educational and reformatory institutions, if there is no opportunity to place wards in families or in public, parochial, and private institutions. Provision must likewise be made for a proper home after obligatory education is completed. Suitable accommodation must be provided by those communal authorities within whose jurisdiction the place lies in which the court has acted as an orphan court.

ART. 15. Expenses which accrue from placing a ward in a family or institution and the cost of a first regulation outfit, as well as traveling expenses of a discharged ward, must be paid by the local directors of the poor where the ward resides; all other costs of support and education, as well as of the provision made on the completion of obligatory education, must be defrayed by local authorities. These receive an appropriation from the State amounting to one-half of their outlay, which sum, by agreement with the different local authorities, is paid regularly in average installments, or, where agreement exists, is fixed annually by the minister of the interior upon the basis of the previous years.

ART. 16. The communal authorities have the right to demand reimbursement of the cost of a ward's support during the term of obligatory education from himself and, when such action is impossible, from the person responsible for his support. The rate of payment is fixed by the minister of the interior upon hearing of the communal authorities. The costs of the general administration of obligatory education, the construction and maintenance of institutions erected by local authorities, is not herewith included. If any opposition is made to a demand for reimbursement the county authorities or the municipal council, upon request of the officials, have the deciding voice. Their decision is final, unless an appeal is sustained by a civil court. One-half of the amounts thus recovered must be handed over to the State.

ART. 17. Local authorities are required to draw up regulations for obligatory education and for the management of reformatory institutions established by them. Regulations concerning the admission, treatment, instruction, and discharge of wards must be approved by the minister of the interior and the minister of education conjointly. Private institutions may continue to comply with existing regulations.

ART. 18. The legal requirements concerning religious education for children in general are likewise applicable to the obligatory education defined by this law.

ART. 19. If wards of school age (6-14) can not be admitted into the public schools without detriment to the morality of other pupils, the authorities must see to it that the wards receive the benefit of instruction elsewhere during the term required for school attendance (6-14). Disputed cases are decided by the governor of the province.

ART. 20. The school supervisors or inspectors of city and county districts, and, in higher instances, the minister of the interior, are required to exercise superintendence over institutions designed for the reformatory or obligatory education of wards; they are therefore entitled to institute personal inspection.

ART. 21. Excepting cases that come under paragraphs 120 and 135 of the criminal code, whoever attempts to release a minor for whom obligatory education has been decreed, or tries to influence him against complying with the law, or is in any way accessory to his noncompliance, shall be subject to either two years' imprisonment or a fine not exceeding 1,000 marks (§238), or both.

ART. 22. The minister of the interior is herewith charged with the execution of this law.

ART. 23. This law is in force from the day of its passage (May 21, 1900). At the same date the law of March 12, 1878, relating to the custody of neglected children, is annulled.

Attested by the minister of the interior:

FREIHERR VON RHEINBABEN.

REPORT ACCOMPANYING THE BILL.

The report presented with the bill when it was submitted to the legislature is deserving special attention on the part of pedagogical pathologists. It discloses a sad view of the growth of neglect and depravity of youth. The document reads:

The obligatory education law of March 12, 1878, owes its origin to paragraph 55 of the criminal code of 1871 and its first draft of February 23, 1876. It is restricted to neglected children, between the ages of 6 and 12, who have committed criminal acts for which they can not be punished on account of extreme youth.

This law of 1878 has proved insufficient to prevent the constant growth of criminality, neglect, and depravity of children. Up to March 31, 1899, the law had been enforced in 10,759 cases where children under 12 years of age were protected against further neglect and evil influences by obligatory education. But while neglected, though law-abiding, children under 12 and neglected children over 12 were left to themselves, and the latter were prosecuted only upon commission of crimes, criminality among youth has increased to such an extent as to threaten social order.

Article 56 of the criminal code, which grants judges the right to clear any minor incompetent to understand the culpability of his act and allow him the benefit of obligatory education, has had no successful result. Courts have made very little use of their privilege in this respect. According to the statistics of crime for 1896 (Statistics of the German Empire, new series, vol. 95, I, page 28), sentence against minors in cases of crime and violation of public law was pronounced in 1882 in 30,697 cases, in 1896 in 43,962 cases, in 1897 in 45,327 cases, showing an increase of 43.2 per cent and 47.3 per cent, respectively, since 1882. Investigations for the years 1898 and 1899 show a further increase.

Statistics prove not only an absolute, but also a relative, increase as regards the whole population. In 1882, from among every 100,000 minors between 12 and 18 years of age, 568 were sentenced by the courts; in 1896 there were 697, an increase of 22 per cent. This fact is the more serious, as the growth of criminality among adults during the same period shows absolutely 34.1 per cent, relatively to population only 16 per cent increase.

The kind of criminal acts committed by minors likewise deserves most earnest thought. Whereas the number of cases of theft during this period has remained approximately the same (among 100,000 minors there were 344 cases in 1882 and 340 in 1896, or 1 per cent decrease), the number of cases of serious bodily injury rose from 48 to 102, an increase of 112.7 per cent; judgments on the ground of compulsion and threats were trebled in number.

It is generally evident that increase of crime among minors is greater than among adults. How ineffective criminal laws have been to prevent increase of crime among minors is shown by the following figures: In the year 1896, out of 43,962 cases of minors tried in court, 7,191 were fined, 9,104 reprovved, and the remaining 27,667 were placed in custody. Of the latter, 62 were merely kept in houses of detention and the others imprisoned; 5,524 for less than 4 days; 4,921 for from 4 to 8 days; 6,851 for from 8 to 30 days; 4,560 for from 1 to 3 months. That any prevention of future criminal acts can not be expected as regards the 21,918 cases of imprisonment under 3 months is evident. Whether any better results can be anticipated in the 4,863 cases of imprisonment from 3 to 12 months is a matter of doubt. In general, it must be accepted that the time of 3 months to 1 year is too short to counteract criminal tendencies or remedy the effect of neglect

among minors. The 911 cases of punishment from 1 year to 2 years and the 287 cases of 2 years and over are the only instances that promise any kind of success.¹

The failure of these criminal laws expressed in numbers shows that depravity among youth is gaining ground year by year. Of 100,000 minors in 1889 there were 614 condemned to punishment; 93 had already been sentenced (58 once, 28 twice, 14 from 3 to 5 times, and one 6 times). In 1896 (seven years later) there was an increase to 702 sentenced, 132 of whom had been sentenced before. Of the latter 71 had been punished once, 23 twice, 24 3 to 5 times, and three 6 times and oftener. During the year 1898-99 26 per cent of the inmates of Prussian houses of correction were under 18 years of age. According to an examination made in 1894, as many as 9,489, or 53 per cent, of the 17,867 inmates of Prussian houses of correction had suffered the three forms of punishment by imprisonment (penitentiary, jail, and reformatory custody till the close of minority), and, what is more, of these several had been imprisoned for six months and longer; 8,789, or 93 per cent, were regarded as utterly unfit to associate with others, hence dangerous to society, and of these 34 per cent had been imprisoned before they were 18 years of age.

With the full knowledge of the lack of efficacy of imprisonment as far as concerns minors, all civilized nations have adopted the measure of replacing it by systematic education under State supervision (obligatory or reformatory education). Before criminal acts bring minors before courts of justice they are taken in charge as soon as any evidence of depravity, the precursor of crime, is noticed. Owing to present economic and social conditions, a much larger proportion of minors are occupied outside of homes, the influence of which was formerly a protection to them. Scarcely out of school, they begin an independent career of business and pleasure. Many rush into life uncurbed, dissipating the powers of body and soul. Ruined by evil companionship, they are tempted by others or follow their own bent unrestrained by force of will. In order to gratify often a most senseless desire, when means fail, the sins of lying, theft, and embezzlement are committed without thinking, and even burglary presents no horror. To satisfy unbridled passion, the worst crimes against morality are committed without scruples. In cases of resistance to public authority, tumult, or riot, half-grown boys usually form the largest contingent and are the most violent aggressors.

If what has been said refers chiefly to boys and young men, the want of reformatory education shows even a worse effect among girls and young women. The ones who go wrong among the young, some still at school and others immediately after leaving school, are constantly increasing. For certain reasons, girls of vicious habits under 16 years of age are placed under police control, and present legislation has devised no measures to induce or force them to change their evil life until they have fallen so low as to come under paragraph 361, article 6, and paragraph 363, article 2, of the criminal code. Little is gained by even such measures. The term of detention in the house of correction is usually too short for any beneficial result. Experience proves that a large, if not the largest, number of such women are hopelessly lost before their sixteenth year of age.

The statistics of houses of correction in Prussia show with what little success penal measures have been attended. During the year 1898-99 1,193 women and girls were inmates of houses of correction: 910 of these because of evil practices; all the others for begging, vagrancy, and being homeless, almost without exception led evil lives; 231, or 19 per cent, were minors, and 54 of these under 18 years of age; 296, or 25 per cent, had been sentenced to imprisonment before their eighth year.

Religion and education are the first agencies calculated and intended to remedy these serious moral and social evils. Religious influence particularly will do much to lead the erring back to a practice of virtue. Still it is impossible in all cases to remove minors from their harmful surroundings or lead them to suppress their innate criminal tendencies by subjecting them to educational influences calculated to improve soul, mind, and body. To give them in sufficient measure what their nature requires must be considered a high responsibility of the State,

¹The sum total, 27,667, mentioned first, does not tally with sum of the itemized cases, which foot up to 27,373.

The editor of *Kinderfehler* criticises the above conclusion, saying: "In this respect the views and experience of educators differ from those of the lawyers who wrote the report and framed the bill. Minors are seldom reformed in prisons and houses of correction; many, in fact, are only made worse. Sinners are reformed by a positive care of the soul; in other words, by true education. Other nations seem to understand this fact and act accordingly. The law in question, unfortunately, does not consider the full consequences of these experiences." (Compare: Monroe, *The Treatment of Criminals*; Grossmann, *How do Children Become Criminals?* Both articles published in *Kinderfehler*, 1898. Compare also: *Yearbooks of the New York State Reformatory*, 1898.) Still, encouraging concessions are made by the lawyers.

a duty of generous human charity, and an economic provision for the future welfare of society.

The report accompanying the bill then shows how, upon the ground of imperial laws, "nearly every one of the twenty-six separate States of the Empire has either changed or made more stringent its laws of obligatory education, or contemplates their reconstruction." That this is likewise necessary in Prussia, and that broader measures must be adopted in behalf of criminal, neglected, or depraved children can not, after all that has been said, be denied.

In considering reconstruction, three questions naturally suggest themselves: (1) What is the extreme limit of age of minors to be defined for obligatory education? (2) Who shall assume the responsibility of obligatory or reformatory education? (3) Who shall defray the expenses of such education?

In answering these questions the editor of *Kinderfehler* refers only to those points which are within the educational province and omits purely administrative questions. The document quoted states:

Obligatory education touches so closely the relation of minors to parents and family that in many cases a complete separation of minors from their families becomes a necessity. It should, therefore, be enforced only in the most extreme cases when all other measures at command of the orphan court have failed. However, the imperial law grants the right of option to State authorities, for it provides: Obligatory education can be enforced when criminal relations of parents or culpable acts of minors are beyond dispute. Nevertheless, this measure can be executed only in cases where it seems necessary for the prevention of complete moral ruin of minors. The use of the prerogative bestowed by paragraph 135 of the criminal code is most earnestly requested for the general interest of communities. Utter demoralization and a consequent development of crime can often be prevented by prompt interference.

The age limit specified is identical with that defined by the imperial law:

Since the civil code has transferred obligatory education from the narrow confines of general public education to the other field of public guardianship and social-political care of minors, the reconstructed laws of several States (Brunswick and Oldenburg, for instance) have adopted the age limit of minority defined for the application and extension of the civil law; others (Mecklenburg and Wurttemberg, for instance) have fixed the age limit at 16; others, again, have had the eighteenth year as age limit before. All, however, agree upon the extension of obligatory education law till the age of majority (21 years), where such an extension is peremptorily demanded by the interests of society.

The bill in question (which, as has been stated, is now a law) has adopted the age of 18 years for its general application and the age of majority (21 years) as the limit of its extension in urgent cases, for the following reasons: The young are exposed to the danger of depravity not only during their school life but even to a greater degree during the first years after they leave school, when, whether willingly or under necessity, they have left the paternal home discipline and attempt to fashion their own career independently. It is of the greatest importance to extend the period during which interference for the prevention of depravity is allowed just to these years. On the other hand, the limits of interference must be so defined that the period from the beginning of obligatory education till its legal close suffices to insure the success of the measure. If obligatory education is enforced shortly before the end of the eighteenth year of age, three years are left for its execution until the age of majority. This length of time is requisite, and at the same time reasonably adequate to insure some measure of success.

The law only regulates obligatory education at public cost. However, it recognizes other agencies.

Voluntary and religious charity have done much in Prussia to provide for vagrant, neglected, and depraved children. On October 1, 1898, authentic investigations in Prussia showed that 678 educational institutions for orphan, neglected, and depraved children had been established and were supported by voluntary charity. Their wealth in real estate and capital is estimated at nearly 100,000,000 marks (\$33,800,000). Their annual expenses exceed 11,000,000 marks. They could accommodate 40,626 wards, but the actual number of inmates is 30,722. Besides these institutions, many educational societies are in existence that place

vagrant and depraved children in families and contribute nearly all the means for their support. In future orphan courts will give greater consideration to the cooperation of voluntary assistance in the care of neglected minors. This privilege is granted in paragraphs 1666 and 1838 of the civil code and is calculated to lighten and promote the work of voluntary charity. The chief obstacle in the way of beneficial action of such institutions and societies is that the admission and length of stay of the children in institutions and families depend upon the consent of the parents. Foolish or mercenary parents either hesitate to confide their children to these institutions or allow them to be educated free of cost until after they are able to earn money. As soon as there is any prospect of profiting by their children's labor these are removed, even though their education is not completed, and the unfavorable relations in which they are placed destroy the good results of the education which they have enjoyed. Judges of orphan courts have the power to interfere in all cases where the physical and intellectual welfare of children is jeopardized by the way in which parents and guardians exercise their authority.

To interfere with charity by legal measures might disturb its effect and prevent the growth of its work. It is of the highest importance that charity should care for neglected and depraved youth. Civil authority should be exercised only when efforts of charity fail.

According to experience in Baden, Hesse, and Alsace-Lorraine, the number of wards in reformatory institutions will double in Prussia after the law is in force. The number of inmates is now 10,687 to 31,585,123 inhabitants, or 3.4 to every 10,000 inhabitants.

In conclusion, it is interesting to note what position the law holds in the old question of dispute—whether education in families or in institutions is better for neglected children.

At present the dispute may be considered settled, in so far as no decisive distinction can be made between the two methods, nor can any legal decree be defined for the application of either. Each case must be decided on its own merits, according to a ward's individuality, the kind of causes of his depravity, and the possibility of finding a proper family. In point of practice, younger children not much depraved at first receive their education in families. If this measure proves untenable, institutional education replaces that in families. Wards who have left school or wards whose moral depravity is at a lower ebb shall, in the first place, be put into institutions to undergo a physical and moral cleansing process. As soon as this is over they shall be placed in families under the supervision of the head of the institution, those attending school to be cared for, those who have left school to be employed as apprentices and servants. If they conduct themselves badly or if the family proves unsuitable, they shall be taken back into the institution. After a certain time the attempt at education in families shall be renewed. The necessary result is that by far the largest number of wards will be in families, and all, whether apprentices or servants, will be under carefully regulated supervision.

This is the ground covered by the law. As in all matters of education, so in this case Prussia is not the first or pioneer State of Germany; still its action foreshadows that of others, and States which have not yet revised their obligatory education laws will no doubt conform their amendments to the law of Prussia.

VIII. CHILD LABOR IN GERMANY OUTSIDE OF FACTORIES.¹

Results of an official inquiry (1898) by the Imperial Chancellery.²

Topical outline: (1) Purpose and nature of the inquiry. (2) Results: (a) Statistical results; (b) kinds of occupations; (c) age of children; (d) duration of daily work; (e) condition of work-rooms; (f) legal conditions of child labor; (g) wages of laboring children; (h) police regulations of child labor outside of factories; (i) proposals for future regulation of child labor. (3) Supplement I: Conditions of child labor in some other countries. Supplement II: An article from the Rundschau.

¹ Translated from Vierteljahrshefte des Kaiserlichen Statistischen Amtes, 1900, Heft III, p. 97.

² Compare article entitled "Children's claim upon childhood," in Annual Report of the Commissioner of Education of 1899-1900, p. 810.

1. PURPOSE AND NATURE OF INQUIRY.

On December 9, 1897, the imperial chancellor addressed the following circular letter to the governments of the twenty-six States of the Empire:

According to the census of June 14, 1895, there were in Germany 45,375 children under 14 years of age who were wage-earning; 38,267 were employed in industries, 5,276 in trade, and 1,812 in occupations of other kinds. Besides these there were found 135,175 who were employed as farm hands and 33,501 as domestics. These figures apply only to the most important occupations of wage-earning children, and, even so, are far from being accurate statements of actual conditions, since it may be taken for granted that not all wage-earning children have been registered or reported by the census takers. To my knowledge, the number of children employed in partly remunerative labor has not yet been calculated, but from all indications far exceeds the figures quoted in the census summaries.

As regards the distribution of wage-earning children among the separate branches of industry, the only authenticated fact is that but a proportionately small number are employed in factories; the reports of factory inspectors for the year 1896 give 5,312. The inference is that child labor in factories, for which an imperial law, usually called "industrial order," contains restrictive regulations, has lost much in significance, and, on the other hand, has largely increased in occupations outside of factories—in trade and home industries,¹ for instance.

To exact a certain amount of work from children is perfectly justifiable, as it accustoms them to physical exercise, arouses a sense of diligence and economy, and prevents idleness and wrongdoing, if parents are not in position to give them the necessary watchful care. Moreover, out of consideration for health, a moderate application to field and garden labor which, when properly regulated, gives children the opportunity for exercise and occupation in the open air, according to their strength, is not only allowable, but useful and commendable. Child labor, where it is intended to help parents in meeting the expenses of a household, is to be countenanced only in exceptional instances, especially as children's pay is very insignificant and disproportionate to the disadvantage of the drain upon their physical powers. In all cases, however, when the kind of occupation is not adapted to children, when working hours are too long, when the work required must be done at unseasonable times and inappropriate places, child labor deserves the most serious reflection. The question concerns not only danger to health and morals, but presents difficulties in enforcing school discipline and under some circumstances makes compulsory education an illusion. Children who are tired out, and whose energies have been taxed in unwholesome rooms till late in the night, have not the strength to give attention to study. I need only mention boys who are employed late in bowling alleys, newsboys who work early in the morning, and the great increase in the number of children engaged in all branches of home industry. Recent investigations in different places show that the interests of children necessitate giving the most earnest attention to their employment as wage-earners; and that without interfering with dependent interests, and especially parental authority, glaring evils should be remedied and further harm prevented. The press, of whatever political persuasion, has lately drawn attention to this matter.

Present legislation allows the following course of action: In the first place, the regulations of the industrial order of 1891, applying to the employment of children in factories, restrict child labor in so far as articles 3 and 4 of section 154 may be respectively extended to workshops in which motors are regularly used, and also to workshops in which none but members of the family of the employer are employed, as well as to buildings. Inquiries into the necessity and manner of execution of section 154, article 3, are almost completed, while, in pursuance of the decree of May 31, 1897, concerning the execution of sections 135 to 139 and 139b of the industrial order toward workshops of clothing and laundry establishments, investigations have begun. Furthermore, the provisions of section 120c of the industrial order grants a certain degree of redress by compelling employers who engage hands under 18 years of age to take the necessary precautions toward health and morality in the arrangement of their shops, as well as in the regulation of work, which the age of their employees demands. In pursuance of this regulation, the police have in several places interfered, with some success, to prevent the abuse of child labor. The enactment of general regulations through the instrumentality of the federal council (Bundesrath or Senate) is suggested in connection herewith.

Meanwhile it seems as though not all evil conditions can be improved by the

¹ This term is applied to trades in which the employees do their work at home, having tools, such as looms, of their own.

application of the regulations mentioned. Thus section 154, articles 3 and 4, can only reach children employed in workshops, and so can only be applied to their occupation within the said confines. Besides, the extension of protective regulations to workshops in which motors are not used regularly is allowable only if the employer engages at least one person who is not a member of his own family. Consequently the regulation of child labor is not even possible in all workshops. On the other hand, independent of the fact that its applicability to the conditions in question is disputed by many, section 120c becomes ineffective where children are not bound by contract, but help their relations with the work done.

A right judgment on all pertinent questions is possible only when evidence is perfectly clear as to the existence of evil conditions of child labor in certain branches of industry, and likewise as to the nature of the evil. The information so far obtained is very deficient. For complete knowledge, it seems, therefore, necessary to institute inquiries as to the age of wage-earning children; the kind of occupation; the length and distribution of working hours; the arrangement of workrooms, as well as the legitimate nature of labor conditions; the increase of wages resultant from limitation of child labor and industrial child labor outside of factories, and to the exclusion of agricultural occupations and domestic service. Then the question whether, and how far, investigations based on the execution of section 154, article 3, can be deferred may be considered later on.

In the prospective inquiries I intend to cooperate with the commission on labor statistics. This commission shall be informed, above all things else, of the number of wage-earning children in general and the number of those employed in separate branches of industry, as well as of their distribution throughout the different sections of the Empire. Furthermore, it is desired that the said commission be acquainted with what information has already been gained on the subject, and that it receive a statement of what measures have been taken by the different States to suppress unwarrantable industrial labor.

I therefore beg leave to request of ——— to oblige me with all pertinent information obtained, and at the same time to give me the necessary data for respective districts under the following heads:

(1) How many children under 14 years of age are employed outside of factories? These shall include all who are engaged in any industry exclusive of agriculture, gardening, fruit and vine culture, or in menial service, even though they receive no wages and are not bound by contract, but only assist other members of their families.

(2) In what branches of industry and for what occupation in these branches are children employed? The important fact here to be kept in view is the service for which children are preferably made use of to create the product.

(3) How great, approximately, is the number of (a) children employed in the separate branches of industry; (b) of those employed within these branches in work specified under the second heading?

As regards the execution of the requisite preparatory inquiries, the cooperation of teachers has much in its favor, since their control of children during school hours gives them the opportunity of learning whether these are employed when away from school, and consequently whether their strength is overtaxed. In this case it must be borne in mind that many parents, from fear of having their children's assistance limited in consequence of the inquiries, will influence them to make false report, so that conditions may present favorable appearance. I therefore urge that the measure of cooperation of teachers be carried out as secretly as possible, so that any unwarrantable influence on the part of parents be prevented.

I request that all communications be delivered by April 1 of next year.

Thereupon the different State governments conducted investigations from January until April, 1898. These extended to nearly all parts of the Empire. Wurttemberg reported for 24 of its 64 governmental districts (the municipal district of Stuttgart and 23 more important districts, including the Schwarzwald industries); and Saxe-Coburg-Gotha confined investigations to 63 centers of industry, while its communities number 306. In Bavaria and Bremen the police acted as agents; everywhere else, teachers of elementary schools.

The limits of the inquiry are partly narrower and partly more extensive than as defined in the circular. Whereas child labor was to be considered as it occurs in industry, though outside of factories, Saxe-Coburg-Gotha limited its report to children employed in home industries. Lübeck and Alsace-Lorraine included children employed as farm hands and waiters; Saxony, Wurttemberg, Baden, Mecklenburg-Strelitz, and Saxe-Altenburg included those in menial service. The

pertinent calculations have, therefore, not been considered in the Imperial statistical report. In some cases, as with Prussia and Saxony, whose inquiry blanks specified all occupations in industry, trade, and commerce, children employed in factories have been included. Prussia, Wurttemberg, Brunswick, Lübeck, and Alsace-Lorraine sent in separate reports for the sexes; others followed the same plan in part, and others, again, omitted making any such distinction.

Some States considered the remark made in the circular that figures relating to distribution of child labor have value for legislation only when they are accompanied by references to age, length of working time, night and day work, the arrangement of workrooms, and wages, and acted accordingly by giving detailed information.

A few States examined the further points, whether certain occupations are appropriate or inappropriate, age and strength of children of school age (6-14) considered, and what influence they exert on body, mind, and soul. Apposite statements of police regulations concerning the restriction or prohibition of different occupations, and further measures to be adopted, were handed in in connection with the statistics. The subsequent statement of results will mention which States treated these questions and in what manner.

If, as regards the points of view considered in the inquiry, the material at hand is varied, not being uniform even for the same State, it is much more varied as regards its arrangement and revision on the part of the separate States. As the circular made no reference to the grouping of the occupations, etc., the separate States did not follow the same plan of classification. Prussia, Bavaria, Baden, Hesse, Mecklenburg-Schwerin, and Alsace-Lorraine adopted the arrangement of census statistics for industry. Saxony, Saxe Weimar, Reuss, and Bremen arranged the industries in alphabetical order, and Reuss gave the occupations within the limits of each industry, likewise in alphabetical order. Brunswick, Anhalt, and Hamburg worked on individual lines with specially prepared blanks. Other States made no attempt at a general review. To systematize an Imperial or federal report from the statements thus offered was very difficult and took a great deal of time; a certain degree of uniformity was obtained only by a positive classification of the separate reports into an Imperial scheme.

That of Prussia, in essential features, was adopted as a model. According to this scheme, two tables have been prepared which give the important data on the kind and distribution of child labor. These are headed:

(1) Children throughout the Empire under 14 years of age employed outside of factories, with full data relating to the kind of occupation.

(2) Children in the different States employed outside of factories, without specifications as to kinds of occupation.

In the following article the chief results of this tabulated report are briefly discussed, and in connection with this are given expressions of the different States on questions regarding the distribution of child labor. The supplement is a brief sketch of legislative measures adopted in foreign countries.

2. RESULTS OF THE INQUIRY.

I. NUMBER OF CHILDREN EMPLOYED OUTSIDE OF FACTORIES.

For the year 1898 there are reported to have been employed outside of factories¹ 532,283 children of school age (6-14).

This number, a round half million, expresses the approximate extent of industrial wage-earning child labor, or about 1 per cent of the population of the Empire. As has been stated before, not all districts came under examination, and not all examiners understood the term "industrial labor" alike. Moreover, it must be

¹ This term is understood to include all those manufacturing plants which are classed as "Fabriken" in the census schedule.

remembered that investigations were conducted during the winter months of January and February and partly during the spring of 1893, consequently during a period when the services of children, at other times employed in industries, were made use of for agricultural labor. At all events, the figures are far from giving actual conditions.

The great contrast between the figures of the inquiry of 1898 and those of the special census report of 1895 need create no surprise. In 1895 only 45,375 children were reported to have been employed in industry, trade, commerce, and other wage labor. The enumerators of that year were instructed to report persons without duplication; hence children attending school were specified in the "household lists" as having no other occupation. The 45,375 mentioned as wage earners were, in point of fact, numbered as being persons wholly occupied with industrial labor (Hauptberuf). Such sole employment is a rare occurrence among children, as those under 14 years of age must attend school, and, as a rule, parents in filling out the blanks laid greater stress upon school attendance than upon wage labor, and, accordingly, considered any industrial occupation as a secondary employment (Nebenberuf).¹ What is most astonishing is that as many as 45,375 children should have been found to be exclusively occupied with wage earning. This may be partially explained by the fact that investigations were made in the summer of 1895, and that in many districts so-called summer schools exist which are attended only two to three hours a day. Under certain conditions dispensations from school attendance are granted, and in these cases the remunerative labor of children ceases to be a secondary occupation. The cases in which children dispensed from school attendance in order to receive private instruction are, of course, exceptions. On the other hand, the much higher figures of the inquiry of 1898 are due to the fact that investigations were limited to industrial occupation; consequently children otherwise employed, for instance, as farm hands, domestics, or helpers in industrial work at home, are considered in the inquiry of 1898 as having a single occupation, and are all included in the number of industrial wage-earning laborers, even though this kind of employment plays a more subordinate part than the other kinds. No such course of action was followed in the special census report of 1895.

The value of the present inquiry lies less in the resultant statistics than in the different questions which it has provoked concerning child labor. The following numbers are reported for the different States and provinces:

TABLE I.—*Children under 14 years employed outside of factories in the various States and provinces of Germany.*

States and provinces.	Number of children employed in industry.	Total number of school age, 6-14 years. ^a	Percentage of those employed.
Prussia.....	269,598	5,209,518	5.18
East Prussia.....	5,781	323,860	1.79
West Prussia.....	5,515	257,029	2.15
City of Berlin.....	25,146	196,050	12.83
Brandenburg.....	23,165	425,976	5.44
Pomerania.....	7,008	252,966	2.77
Posen.....	5,771	320,550	1.80
Silesia.....	48,456	741,352	6.54

^a In Prussia and Brunswick the number of children of school age refers to the beginning of the year 1898 (the date of the inquiry); in Bavaria, to the school year of 1895-96; in Saxony, to 1893; in Wurttemberg, to 1896-97; in Hessa, Mecklenburg-Schwerin, and Bremen, to 1897. The numbers of the other States are taken from the school census of 1890.

¹ The Germans are very particular in specifying a man's "Hauptberuf" and "Nebenberuf," i. e., principal and subordinate calling or occupation. A physician acting as health officer would naturally be enumerated as a physician "im Hauptberuf" and as a health officer "im Nebenberuf."

TABLE I.—*Children under 14 years employed outside of factories in the various States and provinces of Germany—Continued.*

States and provinces.	Number of children employed in industry.	Total number of school age, 6-14 years.	Percentage of those employed.

Alsace-Lorraine	17,878	245,876	7.27
The Empire	α 514,283	8,334,919	6.53

α Inclusive of 40 municipal districts of Württemberg estimated to have 12,000 wage-earning children, no special effort having been made in investigating the conditions; but the estimate is a fair one.

The great variations in the figures of the foregoing table showing the extent of child labor are particularly noticeable in the third column, which exhibits the percentage of children of school age, and are altogether of a formal nature, based upon the already mentioned differences in the methods of enumeration and the different interpretations of the terms used in the circular letter. Nevertheless they undoubtedly correspond to actual conditions. For instance, if when compared with the percentage found for the whole Empire (6.53 per cent) of wage-earning children of school age the city of Berlin, the Thuringian States, and especially the Kingdom of Saxony, with as high as 22.8 per cent, show a large percentage, the inquiry confirms the fact already known that industrial child labor is made use of to an alarmingly great extent in large cities and in the home industries of Thuringia and Saxony.¹ The relatively low figures of East and West Prussia (the two provinces farthest east on the Baltic), Pomerania, Posen, and Mecklenburg are explained by the fact that children are employed for agricultural labor.

KINDS OF OCCUPATION OF CHILDREN.

Children are employed in many kinds of industrial occupations. To give a brief review of these they have been divided into seven groups.

¹ For instance, in some parts of Saxe-Coburg-Gotha 86 per cent of school children under 14 years of age are employed in home industries (see foot note on page 55), and 57 per cent in the district of Sonneberg, in Saxe-Meiningen, the center of the toy manufacturing of Germany.

The first group includes all assistants in industry proper, subdivided according to the census list of industrial statistics into subgroups, classes, and kinds. (A separate statement of the number of children employed in these subdivisions is contained in the report, but is here omitted. The exhibit covers a number of pages of close print, which would be of interest only to specialists. Instead of it a summary is offered in Table III.)

The second group comprises assistants in trading, such as selling of merchandise, peddling, etc.

The third group, the smallest of the seven, includes all assistants in the business of transport on land and water. The full tables go into particulars only for a few States, since other States gave only summary reports on these employments.

The fourth group treats of occupations in connection with taverns and hotels, such as setting up pins in bowling alleys, serving beer, waiting upon guests, and cleaning rooms or utensils.

The fifth group refers to different services as carriers and deliverers (the delivery of bread, cake, etc., milk, newspapers, books, coal, and laundry).

The sixth group includes all messengers and errand boys and girls.

The seventh group comprises all other assistants in wage-earning labor (clerks, copyists, helpers in public shows, collectors of manure, bones, and rags, etc.).

A brief summary will be found in Tables II and III, the latter giving the subdivisions of Group 1 for industry proper.

TABLE II.—*Kinds of occupation.*

Groups of occupation.	Absolute numbers.				Relative numbers.			
	Boys.	Girls.	Sex not stated.	Total.	Boys.	Girls.	Sex not stated.	Total.
A. Industry proper.....	72,428	59,318	175,077	306,823	<i>Pr. ct.</i> 57.82	<i>Pr. ct.</i> 55.09	<i>Pr. ct.</i> 75.11	57.64

Total.....	191,496	107,676	233,111	532,283	100	100	100	100

¹ See footnote to Table I, which explains the apparent discrepancy.

More than one-half of the half a million children employed are engaged in labor of a purely industrial character. A fourth are employed for errands and in delivery service. As regards children employed in industry proper the most, 143,710, or 46.84 per cent, are engaged in textile industries. Cabinet work and carving, manufacture of clothing and scouring come next in order, with 40,997 children, or 13.63 per cent. Home industry has a special significance in these groups. On the other hand, few children are employed in those industries necessitating factory labor exclusively, as the manufacture of chemicals or of illuminating materials, fats, oils, etc., or in those whose character presupposes certain qualifications of the labor personnel, as mining and the arts. If children are employed at all they are only minor assistants. The cases in which they are direct labor factors form exceptions. The extremely low figures in this connection, sometimes only one child listed for the whole State, are due either to a vague view of the employment in question or to the fact that the occupation was pursued accidentally but once. Any regular or extensive employment in such occupations is forbidden by imperial law.

In various reports the following occupations are mentioned as inappropriate for children: The breaking of stones, working in marble quarries or stone pits, stone cutting and polishing, brick burning, masonry, forging, locksmith work, and the sawing, carrying, and piling of lumber. Objection is made to these occupations on account of the so-often attendant physical exertion. (Reports from Hesse and Anhalt.)

Other kinds of work are characterized as peculiarly prejudicial to health, as glazing and the crushing of dyes and clay in potteries; cleaning of rabbit pelts, because of the offensive effluvia which give the children pale complexions and are spread in schools through clothing; the manufacture of buttons, tobacco, cigars, and slate pencils, because of the dust developed; the making of explosives by means of fulminating silver, which occupation was forbidden in Saxe-Altenburg in paragraph 120 d of the industrial law of that State. Bead work, the shredding of saffron, and the sorting of the different parts of saffron mills, and

other work by which dense dust is developed, as well as the occupations mentioned before, as the stripping of tobacco leaves in cigar factories; the making of buttons and slate pencils is particularly ruinous to the eyes, bringing about inflammation and near-sightedness. All such work as painting on porcelain ware, frequently done at night by lamplight (report of Schwarzburg-Rudolstadt), is likewise injurious to the eyes.

Numerous occupations engaged in at home are given as very injurious to health, such as textile work, basket braiding, chair caning and reed work, the manufacture of toys, buttons, porcelain, and glassware. Work of this kind is often done in musty rooms that serve as sleeping apartments as well as work and living rooms, and are seldom thoroughly aired, particularly during the winter months. Independent of this fact, complaints are made that children employed at home are obliged to tax their strength to a great extent, working mostly, as Anhalt reports, till 9 and 10 o'clock at night; young children, whose school hours begin later than those of the older ones, work one or two hours before school. During the term of urgent work in home industry the occupation of children is particularly taxing and uninterrupted.

The consequence of excessive employment of children is arrested physical and mental development. According to the reports of the teachers of the city of Greiz (Reuss, senior line), detrimental effects were noticeable in 56, or 11.5 per cent of all wage-earning children, and especially in those employed in weaving. The children look pale and sickly; are narrow-chested; have curved spines; suffer from eye troubles; forfeit mental vigor, and become dull and uninterested. Overexertion and inadequate food often produce nervousness and weakness among children. Education suffers under these conditions. Besides, work that occupies children until late at night and keeps them away from home and among adults exercises a bad influence on morals and manners; unbecoming conversation is often held between half-grown boys and girls. In many cases the immoderate taxation of strength during youth is followed by premature physical debility and incompetency for work in school. (Reports from Bavaria, Wurttemberg, Hessa, Saxe-Altenburg, Saxe-Coburg-Gotha, Anhalt, Reuss senior line, and Schwarzburg-Rudolstadt.)

Other more favorable judgments of child labor, however, are not lacking. Reports were sent in by some districts in which no detrimental influences have been noticed. When child labor is not carried to excess, and is counterbalanced by activity in the open air, that is by farm or garden work, or gathering berries, wood, and leaves, it is not to be condemned without further cause. (Reports from Wurttemberg, Gotha, Schwarzburg-Rudolstadt.) Thus, in 33 of the 63 localities of Saxe-Coburg-Gotha in which children are employed at home, no disadvantages were noticed. Among the remaining 30 with evil effects, 4 reported disadvantages to the physical, 11 the same to the mental, and 15 the same to the mental and physical development. The percentage of children employed in wage-earning was particularly high in these places. While in the 33 school districts without detrimental results of child labor only 23.6 per cent of the children were employed, the percentage in the remaining 30 school districts was as high as 37.8 per cent, in the 15 school districts, with equal disadvantages to body and mind, the percentage rose to 46.5 per cent.

The opinion of the factory inspector of the Duchy of Saxe-Coburg-Gotha on child labor, based on personal observations, is worthy of consideration. He considers it proper when (a) children are thus accustomed early to regular occupation (cultivation of diligence, prevention of the incipient dangers of idleness); (b) the wages of parents are thereby considerably increased; (c) the cares of households are thereby lightened. On the other hand, he considers it a curse when (a) children are employed at too early an age; (b) children are employed for too long

a time on one day; (c) early in the morning, before school; (d) till late at night; (e) the workrooms are arranged without regard to hygiene; (f) workrooms serve as sleeping apartments; (g) a large number of children congregate in strange houses for work.

Among the occupations entered in the other groups (see Table II, B to G) the following are mentioned as deserving of some reflection: The delivery and selling of bread and cakes and fish, milk, newspapers, etc., the setting up of pins in bowling alleys, and tracking game. The delivery of bread and cakes not only occupies children at too early an hour, so that they get to school too late, and are sleepy, apathetic, and exhausted, but it also keeps them working until late in the night. In delivering goods and selling flowers and small articles of use, children go from one tavern to another, hear improper language, sacrifice the love of truth by trying to get rid of their wares through all possible kinds of representation, form the habit of taking things to eat by stealth and indulging in smoking at too early an age, and accustoming themselves to the drinking of spirituous liquors, for which they spend the money they have received. The same evil consequences attend employment in bowling alleys and playing dance music, which occupations continue till late in the night. The delivery of newspapers that occupies children before and after school hours overtaxes physical strength, and the result is that children get to school tired out. (Reports from Bavaria, Hessa, Anhalt, Schwarzburg-Rudolstadt.)

The foregoing summary (see Tables III a and III b) gives an approximate idea of the number of children employed as above mentioned. The specification as to States and districts in which the evils occur is omitted here.

III. AGE OF WAGE-EARNING CHILDREN.

Prussia, Hessa, and Reuss, senior line, give detailed information concerning the ages of wage-earning children. The Prussian reports refer to 11,891 children, or 4.04 per cent; most of the fourteen provinces of the Kingdom are included. These 11,891 children are specified as follows:

Ages (years).	Number of children.	Percentage.
6 to 7.....	175	1.5
7 to 8.....	491	4.1
8 to 9.....	843	7.1
9 to 10.....	1,378	11.6
10 to 12.....	3,511	29.5
12 to 14.....	5,493	46.2

Hessa classes the children in two groups—in those 6 to 10 years old and those 10 to 14 years old—and distinguishes the different occupations. The following summary is worthy of attention:

Occupations.	Children.	
	6 to 10 years.	10 to 14 years.
Setting up pins.....	305	1,013
Delivery of bread and cakes.....	<i>a</i> 196	850
Delivery of newspapers.....	<i>a</i> 275	653
Stringing and sewing on beads.....	242	252
Spooling.....	161	288
Stripping tobacco leaves.....	106	94
Cleansing of pelts.....	95	62
Peddling.....	147	76

a Among them one child less than 6 years old.

In the city of Greiz (Reuss, sen. line) wage-earning children were found of the following ages:

Age (years).	Boys.	Girls.	Total.	In textile industry alone.
6	4	1	5	4
7	13	12	25	20
8	16	24	40	29
9	23	17	40	26
10	37	27	64	31
11	70	28	98	34
12	54	36	90	40
13	59	20	79	16
14	39	6	45	11
Total	315	171	486	210

Very young children are employed particularly in the weaving industry.

Saxony mentions that in many branches of industry—as lace making, straw and reed braiding, the manufacture of stockings and gloves—children are employed before they are required to go to school. No accurate figures concerning this point could be obtained. The Duchy of Saxe-Meiningen reports that, as a rule, children are required to work as soon as they are old enough to go to school, and that in some cases children of 4 years are put to work, because the critical position and paltry wages of many branches of home industry necessitate the utilization of any available labor factor.

IV. DAILY WORKING HOURS.

Prussia, Wurttemberg, Mecklenburg-Strelitz, Saxe-Meiningen, Saxe-Coburg-Gotha, Anhalt, and Reuss, sen. line, reported on the length of time in proportionate numbers; also to a limited extent Bavaria, Schwarzburg-Rudolstadt, Hessa, and Saxe-Altenburg.

The Prussian reports have been based upon the question proposed by the circular letter of inquiry as to how many wage-earning children work more than three hours a day and on how many days in the week they are required to work longer than three hours. The results of investigation are:

Child labor in—	More than 3 hours a day.			Percentage of working children.
	Boys.	Girls.	Total.	
A. Industry proper	36,430	26,927	63,357	<i>Per cent.</i> 56.06
B. Trading	3,556	1,810	5,366	48.11
C. Transport business	974	44	1,018	49.63
D. Taverns and hotels	6,066	494	6,560	47.47
E. Carriers and deliverers	14,677	4,771	19,448	19.95
F. Messenger service	12,932	538	13,470	54.74
G. Other service	1,207	256	1,463	19.63
Total	75,842	24,840	110,682	41.05

The number of those who work more than three hours a day is, accordingly, large in proportion. To form a correct conclusion, however, we must consider whether those working hours are uninterrupted, whether they are arranged before or after school hours, etc.

Among the 110,682 children the following numbers were occupied more than three hours a day during the week:

Branches of work. <i>a</i>	Once a week.	Twice a week.	Three times a week.	Four times a week.	Five times a week.	Six times a week.	Seven times a week.
A.....	1,933	7,956	3,711	4,584	4,324	39,378	1,471
B.....	639	1,122	461	354	184	2,089	517
C.....	94	167	60	79	15	492	111
D.....	2,324	1,361	743	425	191	841	675
E.....	4,771	3,586	1,446	728	579	5,353	2,980
F.....	896	2,133	631	498	251	7,381	1,710
G.....	181	431	135	120	45	394	157
Total.....	10,808	16,756	7,187	6,788	5,589	55,933	7,621
Per cent.....	9.76	15.14	6.49	6.13	5.05	50.54	6.89
Of these were girls.....	2,597	3,967	1,951	2,175	2,447	20,024	1,649
Per cent.....	7.45	11.47	5.60	6.25	7.02	37.48	4.73

a See foregoing table for classification.

More than half of all the children employed for over three hours a day worked thus intensively on six days in the week. If we add to these the children who work still harder, namely, more than three hours every day, Sundays included, Prussia has not fewer than 63,554 school children (41,881 boys and 21,673 girls) who perform industrial labor beyond reasonable limits.

The reports from Wurttemberg lead us to infer that working hours, in by far the greatest number of instances, never exceed 3 hours a day, especially in summer and during harvest times, when there is greater need of agricultural hands. Nevertheless, the district of Neuenburg reports that children are occupied from 3 o'clock in the afternoon till far in the night in making chains of silver and rolled-gold wire; the same can be said of lace and crochet work and spooling in the district of Nürtingen, where evening work sometimes lasts until 11 o'clock. In Spaichingen children are employed in pulling feathers, by which much dust is developed, until 10 o'clock at night, and in manufacturing parts of shoes, from half-past 5 until 9, and sometimes until 11 or 12 o'clock. In Geislingen from 1 hour to 6 hours are demanded for the manufacture of corsets and tights, and for filing and polishing metals. The working hours are the same for Gmünd in reference to goldsmiths' wares. Balingen, another school district in Wurttemberg, reports that children are employed in making tights, not only after school till late at night, but during the midday recess.

In Mecklenburg-Strelitz 62 of 213 children work longer than 3 hours a day, as follows: Thirty-five work 4 hours; 16 work 5 hours; 9 work 6 hours; 2 work 7 hours a day. Of these 213 children 108 are employed on all 7 days, 43 on 6, and 20 on 3 days during the week; 72 work at night, 42 in the morning, 16 at noon, 18 in the morning and at night, 2 in the morning and at noon, 30 in the morning, at noon, and at night, and 19 indefinitely.

Saxe-Meiningen reports that children as a rule work only after school, from 3 o'clock in the afternoon until about 9 o'clock at night. More detailed information on the length of time of child labor was given by the industrial district of Sonneberg. Working hours (almost exclusively in home industry) in Sonneberg are specified as follows:

In 4 school districts till 9 p. m.; in 8 school districts till 10 p. m.; in 13 school districts till 11 p. m.; in 8 school districts till 12 p. m.; in 3 school districts till 2 a. m.; in 2 school districts till 3 a. m.; in 1 school district till 4 a. m.; in 3 school districts all night, i. e., toward Christmas.

In 62 localities of Saxe-Coburg-Gotha working hours are reported to be as follows:

Number of localities.	Number of hours per day.	In these localities the work caused—	
		No harm.	Harm.
13	3	11	2
23	5	12	11
9	6	6	3
2	7	-----	2
10	8	2	8
1	9	-----	1
4	10	-----	4

Labor in these instances means turning in wood, wood carving, making buttons, weaving baskets, webbing (gurtweben), spooling, and making toys. With the exception of 2 in all the above-mentioned localities, with more than 6 working hours, evil effects were noticeable in the children; whereas in the 45 localities, with from 1 to 6 hours, only 16 cases of harmful influence are recorded. According to the experience of the factory inspector, 4½ hours are the maximum time during which children can be employed without detriment to their health and school duties. Even then it is presupposed that they are not occupied every day in the year.

The reports from Anhalt state that children work under great strain until 10 o'clock at night, making rush mats and reedwork; children carry bricks from 1 till 6 o'clock in the afternoon, and become very exhausted. In the cigar and tobacco factories of Anhalt children work from 1 hour to 6 hours a day (from 3 or 4 till 6 or 8 p. m.), in close rooms, the air of which is filled with tobacco dust, stripping and smoothing tobacco leaves, wrapping, and pasting labels and paper boxes.

In the city of Greiz (Reuss senior line) hours vary between 3 and 50 a week. In most instances children work from 3 to 4 hours a day. The highest number of working hours a week is reached in cigar factories, in the book trade, and in taverns. In the first mentioned children are occupied from 29 to 38 hours and during vacation 60 hours a week. These figures prove that children are made use of to a most pitiable extent, especially when we consider that just in this line of occupation they work together in large numbers and in poorly ventilated rooms, and receive only from 1.20 marks (30 cents) to 1.50 marks (38 cents) a week as wages. (Greiz has introduced measures to remedy these evils.) The children employed for setting up pins in bowling alleys work from 30 to 49 hours a week, often till 2 and even till 3 o'clock a. m.

Schwarzburg-Rudolstadt reported that children work at rope making in Frankenhausen, as a usual thing, from 3 till 7 and 8 o'clock p. m. In Leibis (district of Königsee) children help their fathers in sawmills till 11 o'clock at night. In several localities children work a few hours before school in the morning and are, besides, employed in the afternoon till late at night.

Bavaria mentions the fact as an existing evil that children are employed till late at night in setting up pins in bowling alleys and serving beer and liquor in taverns and country inns. Like reports were sent in from Hessa which particularly condemn the fact that children are employed in playing dance music till morning. Similar reports come from Schwarzburg-Rudolstadt and Saxe-Altenburg.

V. ARRANGEMENT OF WORKROOMS.

In regard to the condition of the workrooms, Hessa reports that the cleaning of pelts and hair clipping deserve special consideration when it is done in close quarters. Nevertheless 114 children under 10 and 97 between 10 and 14 years of age were thus employed.

Saxe-Meiningen stated as a well-known fact that small workrooms in which meals are prepared and varnish or lime kept hot during work hours are most prejudicial to the health of adults and children. This is especially true of rooms in which wooden toys are made, as they are heated, even in summer, so that the goods may be dried before being delivered.

Anhalt stated that the 145 children employed in the manufacture of tobacco work mostly in rooms that are likewise used for living rooms and sleeping apartments and are poorly aired, particularly in winter.

VI. LEGAL CONDITIONS OF CHILD LABOR.

Only Mecklenburg-Strelitz, Saxe-Meiningen, Anhalt, and Lübeck reported with reference to the legal status of child labor. In Mecklenburg-Strelitz only 26 of the 213 children employed in wage earning possessed a contract which provided for a period of giving notice to quit; 4 had a week's notice, 6 a 2 weeks', and 16 a month's notice. The other children were, in part, under contract without any notice of leave, and in part worked in the homes of relatives.

Saxe-Meiningen reported that, as a rule, children worked in the families of their nearest relatives. The same can be said of a large number of children in Anhalt, who are employed in most cases without pay and leave by relatives in their fathers' trade and under the supervision of parents. Even when they work away from their own home no contract in the legal sense of the term exists. Still cases are cited where children are engaged subject to a month's notice to deliver bread, etc., and for work in breweries (washing bottles and pumping water) subject to a week's notice.

In Lübeck 649 of the total number of children under 14 years of age (1,308) employed outside of factories assist their relatives; 659, or 50.4 per cent, stand in some relation by contract to an employer.

VII. WAGES OF CHILDREN.

As the majority of children work for relatives, chiefly parents, they in most cases receive no especial monetary compensation. Even when they work for strangers they are paid by board and lodging. Mecklenburg-Strelitz, Saxe-Meiningen, Saxe-Coburg-Gotha, Anhalt, Schwarzburg-Rudolstadt, and Reuss senior line reported the amount of wages received by children.

The oft-mentioned 213 children in Mecklenburg-Strelitz receive monthly wages, as follows:

	Marks.
2 children.....	0.50=50.12½
13 children.....	1.00= .25
29 children.....	2.00= .50
47 children.....	3.00= .75
25 children.....	4.00= 1.00
6 children.....	5.00= 1.25
4 children.....	6.00= 1.50
2 children.....	7.00= 1.75
1 child.....	8.00= 2.00
84 children, partial or full board and occasional tips.	

Saxe-Meiningen reported from five localities in the district of Saalfeld that the weekly wages of children vary between 2.40 marks and 4 marks. In some instances 5 pfennigs (=1¼ cents) per hour are paid. School children who serve as waiters receive for a day's work up to 6 hours 1 mark (25 cents) to 4.50 marks (\$1.12½) per month. Their pay is often turned into the school savings bank.

The following amounts are reported from Saxe-Coburg-Gotha as daily wages. The least money is earned in the manufacture of buttons. Excepting two localities, which pay from 25 to 30 pfennigs (5 to 6 cents) a day, three pay 4 and 5, and others

10, 12, and 15 pfennigs (1 cent, $1\frac{1}{4}$ cents, $2\frac{1}{2}$ cents, 3 cents, $3\frac{1}{2}$ cents). In some places child labor in the manufacture of dolls is paid 10 to 12 pfennigs, in most 18, 24, and 30 pfennigs, and in four 50 to 80 pfennigs (4 German pfennigs equal 1 cent). In Gotha the manufacture of toys pays 8 to 30 pfennigs, in Coburg 20 to 60 pfennigs. For paper articles (masks, pasteboard goods, and Chinese lanterns) children receive 20 to 50 pfennigs; in only one locality 4 pfennigs (1 cent) are paid a day. For basket weaving and metal work 15 to 30 pfennigs, as a rule, are received. Wood carving pays 20 to 60 pfennigs a day. The factory inspector remarks that in estimating the daily earnings of the 5,455 children in Gotha it must not be forgotten that the total receipts from child labor are considerable and contribute greatly to lessen the burden of household expenses; but whether the material gain counterbalances the evil and harm of extensive home industry, conditions in Saxe-Coburg-Gotha lead one to doubt.

The report of Anhalt states that when not employed at home children receive from 2 to 12 marks (50 cents to \$3) a month in baker's and butcher's shops; from 2 to 5 marks (50 cents to \$1.25) in tailoring, shoemaking, basket weaving, turning, locksmith work (blowing bellows), trunk and box manufacture, and in book-selling; from 1 to 6 marks (25 cents to \$1.50) a month in bookbinding; from 1 to 12 marks (25 cents to \$3) in glass works, porcelain painting, lacquer work, and aiding wheelwrights; from 2 to 10 marks (50 cents to \$2.50) in cigar making; from 1 to 6 and 9 marks (25 cents to \$1.50 and \$2.25) as newsboys and errand boys; from 30 to 60 pfennigs ($7\frac{1}{2}$ to 15 cents a day) for setting up pins in bowling alleys. Working clay in potteries and washing bottles pay best, from 8 to 12 marks (\$2 to \$3), and from 10 to 12 marks (\$2.50 to \$3), respectively, a month.

In Schwarzburg-Rudolstadt, district of Frankenhausen, the delivery of journals and newspapers pays from 6 to 8.50 marks (\$1.50 to \$2.12 $\frac{1}{2}$) a quarter; setting up pins pays 30 pfennigs ($7\frac{1}{2}$ cents) an hour; in one case 40 pfennigs (10 cents) an evening (from 7 until 11 o'clock). Children who assist their parents at home in making buttons earn about 2 marks a week. In the manufacture of cordage (knitting, crocheting, weaving, and the like), children's wages in one locality (Mehrstedt) amount to 20 and 30 pfennigs (5 and $7\frac{1}{2}$ cents) a day during the winter season and to 20 to 50 pfennigs (5 to 12 $\frac{1}{2}$ cents) during the summer. In another locality (Schlotheim) only 6 to 8 pfennigs ($1\frac{1}{2}$ to 2 cents) a day, or 12 to 18 pfennigs (3 to $4\frac{1}{2}$ cents) a day, and in most instances less than 1 mark (25 cents) a week are reported for the same kind of work. The report of the district of Königsee, in Schwarzburg, states that despite the pittance of 15 pfennigs ($3\frac{1}{2}$ cents) a day, the father of a family can and must take these amounts into calculation, owing to the extremely low wages paid to adults generally.

The city of Greiz, in Reuss senior line, reports from 1.20 to 1.50 marks (30 to 37 $\frac{1}{2}$ cents) a week for employment during sixty hours in the manufacture of cigars. These amounts are not increased in vacation.

VIII. POLICE REGULATIONS CONCERNING CHILD LABOR.

Most States reported details of how child labor is restricted by police regulations.¹ These apply principally to the selling of wares in public streets, on squares, on doorsteps, in vestibules and open stairways, and to the employment of children till late at night for setting up pins in bowling alleys and to assist in public shows or to help in taverns.

In Prussia nearly all districts have adopted different measures directed against the employment of children during school hours and forbidding their working at night, late in the evening, and early in the morning. The limits of time vary.

¹ These facts refer, as expressly stated, to conditions at the beginning of the year 1898. Since then other more extended measures not mentioned in this summary have been taken to restrict child labor.

Furthermore, the selling of wares on the street or public places is either limited or altogether forbidden. Children are not allowed even to accompany peddlers. In some districts measures exist to protect children against some kinds of work. In Arnberg children under 15 years of age are forbidden to work at sharpening needles, nor may any under 8 years of age be employed in stringing beads. The government of Düsseldorf allows the employment of school children at home only between the close of school in the afternoon and 7 o'clock in the evening (in the manufacture of articles of clothing and the making of match boxes). Finally, the assistance of children in all kinds of public shows is subject to restrictive laws.

Bavaria reports the resolution of the minister of the interior relative to child labor (children under 14) transmitted to the various authorities of the Kingdom on April 27, 1898. It reads:

As a result of the inquiries pursuant to the cabinet order of February 4 of this year it has been observed that, excepting in large cities and in cases of home industry, the employment of children under 14 years has given only occasional cause for police interference. But as a deplorable evil must be considered the employment of children till late at night for setting up pins in bowling alleys. In large cities children are overtaxed by delivering articles of food (milk, bread, etc.) and newspapers. Objection was likewise raised against the peddling of flowers and small articles of use, as well as against the protracted occupation of so-called "piccalos"¹ in taverns. The greater number of evil conditions in question can be remedied by applying paragraph 130c of the Imperial Code.² It is therein defined that employers who engage laborers under 18 years of age are bound to consider, in the arrangement of workrooms and the regulation of work, the special claims on health and morals which the age of such employees demands. In so far as the kind of employment and the length of hours may be prejudicial to children's health, the police authorities have the right to enforce the restrictive measures designed to prevent injury. In the same way interference is permissible in cases of occupation at home if anyone not belonging to the family is engaged. District police authorities are hereby directed to oppose the evils which arise from the employment of children in the manner prescribed. Relative to children's peddling, in pursuance of the ministerial resolution of February 7, 1898, regarding the execution of the imperial law (see Ministerial Organ, No. 7), section 5, and paragraph 30 of section 2, containing directions for execution, are to be followed exactly. Continual attention shall be given to the employment of children at home by their own families, and any particularly harmful effects noticed must be reported within a year. A copy of this resolution shall be sent to all industrial supervisors to insure their cooperation for the correction of the evils in question.

In Saxony the city councils of all four counties have issued police regulations against children peddling, delivering breakfasts before school, and setting up pins in bowling alleys till late at night. The limits of time and the ages mentioned vary. In Bautzen these occupations are forbidden after 11 p. m., in Dresden after 9 p. m., and in Neustadt after 8 p. m. In Pegau children engaged in these occupations must be at least 10; in Wurzen at least 12 years of age.

In Hessa police regulations have likewise been issued to prevent abuse of child labor. It is forbidden, for instance, to employ children in bowling alleys within the city.

In Saxe-Weimar a ministerial decree of May 5, 1897, based upon one dated March 20, 1875, defines that children shall not be employed in any kind of taxing home or field work until after school hours, and then two hours at least must be reserved for the preparation of lessons and recreation. For certain kinds of work they can not be employed at all, or not until their thirteenth year of age, and then only two hours a day.

In Saxe-Meiningen evils arising from selling bread and cakes in public places, setting up pins, etc., are checked by local regulations and by decree of the county

¹ A localism derived from the Italian, "little ones."

² This paragraph prohibits child labor in factories.

authorities, so far as this was permissible, by the ministerial decree of March 20, 1892, paragraphs 120a, 120b, Section XIV.

Saxe-Altenburg refers to the order of the city council of Eisenberg which permits children who are physically well developed to sell eatables and small articles of use from their tenth year up, though not without special permit from the city council. In Schmölln school children are absolutely forbidden to peddle and exhibit wares on public streets and places, on doorsteps, in vestibules and courtyards, as well as in public houses. (Decree of January 17, 1894.)

Schwarzburg-Sondershausen quotes the following order which pertains to the district of Arnstadt:

It is forbidden: First, that school children play any kind of music on the streets, in public places, and localities (hotels and taverns, restaurants, confectionery stores, theaters, and shows), present any exhibit, offer theatrical show, lecture, or other amusement, or be employed by others in such amusements and performances. If any higher interest of art or science be involved, local police authorities may make exceptions. Second, that children, unless properly attended, visit any public locality (places of amusement), during the performance of any kind of amusement whatever. The special rules prohibiting the presence of children at public dances are not referred to in this. Third, that school children carry around bread, cakes, fruit, petty wares, flowers, or other articles for sale, or receive presents on the street, in public places, taverns, or private residences, also children be employed to act as waiters in public places or at drinking stands. Any violation of this order on the part of the employer, as well as on the part of parents or guardians who allow this order to be disobeyed by any child under their authority shall be subject to a fine not to exceed thirty marks (\$7.14), or imprisonment.

In Schwarzburg-Rudolstadt children are forbidden by the orders of August 30, 1888, and September 3, 1889, to set up pins in bowling alleys or sell goods after 9 o'clock p. m. Hawking on the street and in public localities is strictly prohibited.

In Reuss, junior line, the following regulations are enforced respecting peddling, setting up pins, and industrial occupations:

I. In pursuance of the law on the authority of the police in decreeing punishment, dated June 8, 1864, and relative to the revised imperial industrial code of 1883, the following rules have been issued for the lowland districts: 1. The peddling of articles of whatever kind, whether on the street, in public places, or buildings frequented by the public is positively prohibited with regard to girls of school age; the peddling of such articles by boys of school age is allowed only upon special permit granted by the local police. 2. All those who, without permission from the local police, employ their own or other children in the above-mentioned occupations, or who allow children under their care to peddle, as well as innkeepers who allow children without a permit from police authorities to sell goods within their precincts are responsible for the observance of the foregoing order. 3. Violations against the order given under 1 are punishable by a fine not exceeding 30 marks (\$7.14) or imprisonment. 4. Considering the positively evil consequences of such vending to the physical and moral well-being of children, local police authorities are advised to limit the permits within their power to grant according to 1, and restrict them to the hawking and peddling of articles in common use when the said occupation is pursued as a local or general custom.

(Gera, May 13, 1884. Council of the principality.)

II. In pursuance of the law regarding police authority in executing punishment, June 8, 1864, innkeepers are hereby prohibited from employing children of school age later than 10 p. m. for setting up pins in bowling alleys, under penalty of a fine not exceeding 150 marks (\$35.70). Parents and guardians who allow their children or wards to be employed in setting up pins beyond that time are subject to the same punishment.

(Gera, November 5, 1892. City council.)

III. In pursuance of the law regarding police authority in executing punishment, June 8, 1864, the following orders are hereby issued in the interest of the common weal: 1. During the hours before school in the morning children may be employed outside of the homes and shops of parents only in light domestic work, but in no case in industrial occupations. Only in very exceptional cases, but never as a rule, may children stay overnight in the homes of their employers. 2. Any remuneration in money for the services of school children shall not be paid

to these, but to their parents or guardians. 3. Violations of these orders by parents or guardians, and employers, are punishable by a fine not exceeding 150 marks (\$35.70), and in case of nonpayment, by imprisonment. (Gera, August 5, 1897. City council.)

In Bremen children under 15 years of age are prohibited from assisting in free or public musical or other entertainments and shows later than 10 p. m.; furthermore, children under 14 years of age are not allowed to peddle on public highways or in public places.

In Hamburg, since June 23, 1897, children under 12 years of age are prohibited from being employed in restaurants and taverns later than 8 p. m.; those above 12 years, later than 9 p. m. Other police regulations refer to child labor by separate mention. In 1869 children of school age were prohibited from assisting in public shows (exceptions granted); in 1891 children were forbidden to sell any wares publicly; in 1893 the selling of articles by children in taverns was forbidden; in the same year the employment of children in shooting galleries and merry-go-rounds at Christmas fairs was forbidden. By a decision of the Hanseatic supreme court, a police order of July 16, 1897, forbidding children to deliver newspapers and fresh bread early in the morning was declared null and void.

IX. PROPOSITIONS FOR THE FUTURE REGULATION OF INDUSTRIAL CHILD LABOR.

The reports from the States of Bavaria, Saxe-Coburg-Gotha, and Saxe-Meiningen are the only ones expressing opinions as to how improper child labor may be restricted in the future. The government of Meiningen declares it imperative that industrial child labor be regulated and restricted by imperial laws. Bavaria remarks that in so far as evil consequences of child labor necessitated official interference, such based on paragraph 120c of the imperial industrial law had been successfully attempted. Nevertheless, the interference of police authority was excluded in cases of employment of children at home where most of them belonged to the family. The supervision of the occupations in question offered almost insurmountable obstacles, and the oft-attempted cooperation of official inspectors had met with little success in families. Moreover, because of the very precarious circumstances of those engaged in home industry the greatest caution must be exercised with protective measures for children forming a part of the working family. At all events the absolutely necessary protection of children against danger to health is to be recommended for federal or imperial legislation.

In the report from Saxe-Coburg-Gotha the opinion of the factory inspector was quoted. In his estimation an essential amelioration, if not complete correction of the evil consequences of home work with children might be effected, if their employment (*a*) would not begin before the close of their ninth year of age and be subject to the consent of a physician; (*b*) if it would not begin early before school hours; (*c*) if it would not continue longer than four hours a day; (*d*) if it were interrupted by recreation or work in the open air; (*e*) be confined to appropriate places; (*f*) be under parental supervision at home and not in common among strangers in strange houses; (*g*) if it be prevented from serving as a pretext to keep children out of school, parents often making use of the excuse that "the child is sick."

3. SUPPLEMENT I.

REGULATIONS CONCERNING INDUSTRIAL OCCUPATION OF SCHOOL CHILDREN IN SOME FOREIGN COUNTRIES.

The restrictions of industrial occupation of school children in the countries under consideration are, in part, connected with the public school laws, and are principally intended to aid the schools generally and school attendance specifically whenever practicable. Furthermore, prohibitory or restrictive measures are

enforced with regard to industrial labor of children in general, or to certain kinds of work that endanger the physical, mental, or moral development of children. The last-mentioned regulations are enforced where industrial work is performed in easily recognized, well-defined labor precincts, i. e., in factories, workshops, etc. The employment of children in factories and like places, such as mines, foundries, wharves, etc., that come under the protective labor laws of Germany, is not considered in the inquiry in question, and legislation in foreign countries relative to such employment is therefore not discussed. However, it should not be forgotten in what follows that the term "factory" in foreign laws has not the same significance as in our industrial law. Consequently the foreign "factory laws" could not be set aside altogether; while, on the other hand, the regulations referring to the employment of children in mining, concerning which special laws have, as a rule, been enacted are not mentioned herein at all.

The main point to be shown is, to what extent industrial occupation of children in petty industries and labor at home—as in trade, commerce, restaurants, and taverns—is restricted in foreign countries; that is to say, in countries of advanced industry. For, as the following quotations show, several countries have decreed significant restrictions of wage-earning by children not only in industry proper, but also in workshops, and in more than one instance in other branches of wage-earning, besides productive labor. On the other hand, it is apparent that still many kinds of work are not affected by these measures; for instance, the employment of children outside of labor centers to deliver newspapers, bread, and the like, or to sell flowers, matches, and other articles on the street or in public places. As numerous abuses in the employment of children are in Germany prevented by simple police interference, so this may be the case in other foreign countries. How much misery is thus prevented in other countries can not be stated without previous comprehensive inquiry any more than the same can be estimated in any other way within the States of the German Empire.

I. ENGLAND.

The English factory and workshop act (41 Vict., c. 16) of May 27, 1878, supplemented later and partly changed by the amendments of August 25, 1883, August 5, 1891, and July 6, 1895, includes, besides restriction of employment in the general interests of children, also regulations defining a certain degree of compulsory education for children employed in factories and workshops, as these terms are used in the law, which class of children were accordingly obliged to attend school before a like obligation in general was recognized in England. Obedience to these provisions, still in force, has been made a condition of industrial wage-earning occupation.

The following restrictions are decreed by the factory and workshop act: Children under 11 years of age shall not be employed in factories and workshops. Older children up to the age of 16 may be admitted to factory labor only if they possess a physician's certificate stating their physical ability to perform factory work. This last regulation may be extended to workshops when protection of the health of the children employed seems a necessity. Further restrictions apply to the employment of children and young persons in special places of work, such as mirror and white-lead factories, glass manufactories, and brick kilns, etc.

As far as the employment of children is permitted by the law alluded to, it may follow the "system of half-timers," of employment in morning and afternoon sets, or of employment on alternate days only. The beginning and close of working hours, intermissions for meals, the change of sets and particularly work on Saturday, are accurately regulated. According to circumstances, working hours may reach as high a figure as 56½ to 60 hours every two weeks. In workshops the hours of half timers in general are limited to 6 or 7 o'clock a. m. and 1 p. m., and between 1 p. m. and 6 or 7 o'clock p. m. When children work on alternate days, they begin at 6 or 7 a. m. and end at 6 or 7 p. m. However, no child is

allowed to work more than five consecutive hours without at least a half hour's intermission.

In addition to these, the following regulations apply to the education and schooling of children under 14 years of age employed in factories or workshops. In cases of half-timers, children must attend school at least once every day in the week. In cases of employment by sets, they must attend school twice on every day preceding a workday. Employers are prohibited under penalty of fine from giving work to any child who has not fulfilled the obligation of attending school the week before. All employment must cease until the time of absence from school has been made up. Every Monday employers must receive a certificate from the respective teachers attesting the school attendance of the children they employ, and they are not allowed to give any work to those who have no satisfactory report of school attendance. The only exceptions to these obligations are children 13 years old who possess a school certificate that may be given on completion of a certain amount of study, or at the close of a certain time of attendance according to special school regulations.

The regulations mentioned extend beyond factories, as the factory and workshop act applies to very small shops in so far as they possess what are defined in the law as partly general, partly special characteristics. In consequence the law would include the workshops of nearly all industrial production in the broader sense of the term, namely, all places in which work is done for business or profit, to make, alter, improve, or decorate wares or prepare them for sale. Home labor for business purposes is not excluded altogether, but special regulations apply to the so-called domestic workshops, namely, such work as is done without any mechanical motor by the members of the family living in the place where the work is performed. In these cases children may be employed according to the half-time system, either in the morning between 6 a. m. and 1 p. m., or in the afternoon between 1 and 8 o'clock (Saturdays till 4 p. m. only), but not longer than 5 hours continuously, and must observe the law of school attendance mentioned above.

The introduction of general compulsory education in England has been gradual. It is only since the elementary-education act of August 26, 1880, supplementary to the laws of August 9, 1870, and August 15, 1876, that the local school boards and school-attendance committees are required to issue statutory regulations for the attendance of children within their districts. Some general points are, nevertheless, regulated by the law. Thus, according to the laws of September 22, 1893, and July 13, 1899, children under 12 years of age are not allowed to be employed even as half-timers if they are thereby prevented from receiving elementary instruction. The employment of children over 12, and accordingly their total or partial absence from school, is permissible if they possess a certificate that they have taken the studies required by the school law. The regulation applies in full to all manufacturing industry, not to agriculture.

In some branches of industry child labor is regulated by special laws—as the coal mines regulation act of September 16, 1887; the metalliferous mines regulation act of August 10, 1872; the pawnbrokers' act of August 10, 1872; the shop-hours' act of June 28, 1892, and the chimney-sweepers' acts of 1840, 1864, and 1875.

The prevention of cruelty to children act of August 17, 1897,¹ is designed to protect children against abuses and neglect on the part of parents and guardians. One section is devoted to the restriction of the employment of children in wage-earning. Begging, singing, playing, selling articles of merchandise, and like occupations are forbidden. Whoever allows or forces any child (boys 14 years old, girls 16) under his or her care to be present for the said purpose on streets, in public buildings, in squares at night (between 9 p. m. and 6 a. m.), in public localities where spirituous liquors are served, and in public places of amusement, shall be punished by a fine not exceeding £25, to which three months' imprison-

¹ An older law of the same title was passed as early as 1891.

ment may be added. This law similarly forbids the training of children in the age mentioned for dangerous performances (acrobatic and circus performances, etc.), while an older law—the children's dangerous performance act of July 24, 1879—had already prohibited like employment of children under 14 years of age.

Many complaints are made against the laws mentioned, especially that their execution leaves much to be desired and that existing evils require further reformatory measures.

II. FRANCE.

The law of November 2, 1892, by which the industrial occupation of children and women is regulated, contains the following regulations concerning the employment of children:

As a rule, children may not be employed in the work that comes under the law until they have completed their thirteenth year of age, when obligatory school attendance ceases. (Law of March 28, 1882.) However, the employment of children at least 12 years old is permitted, if they have a certificate for completion of the elementary course of study required, and physician's certificate stating that they are physically able to work in factories. Factory inspectors have the right at all times to have children under 16 examined by a physician and to effect their dismissal if the conclusion is unfavorable.

Children under 16 whose employment is permitted are, like those older, allowed to work ten hours a day at most. Until their eighteenth year night work, namely, between 9 p. m. and 5 a. m., is prohibited; besides, one day of rest during the week and the observance of legal holidays is prescribed.

In regard to day work, as well as to many kinds of labor specified as unhealthy or dangerous, the employment of children is regulated by special orders.

The application of the law of 1892 extends to all industrial establishments, as well as to factories, mines, foundries, yards (*chantiers*), and small workshops (*petits ateliers*); only those work places are excepted in which members of the family alone work under the supervision of father, mother, or guardian, if no mechanical motor is applied and the work is not considered dangerous or unhealthy. On the other hand, there are many kinds of industrial labor the work places of which (in trade and commerce, stores, offices) are not specified in the law and are therefore not subject to the prescriptions mentioned.

In a report of the "commission supérieure du travail dans l'industrie," based upon the statements of factory inspectors for the year 1898, the law is stated to have been efficacious in bringing about rather good results independent of many evasions made possible by the exceptions granted. Conditions manifest very decided progress since its application.

A great improvement has been caused by the supplementary law of March 30, 1900, which defines the longest workday to be eleven hours for all persons under 18 years of age, and directs that two years after its passage the workday is to be shortened to ten and one-half hours and two years later to ten hours. Consequently, on April 1, 1904, a workday for children under 18 will be ten hours.

In pursuance of the law of 1892 and one of December 7, 1874 (relative à la protection des enfants employés dans les professions ambulantes)¹ special provisions apply to the employment of children in shows. If under 16 they may not be employed to execute dangerous tricks; neither may they appear with traveling companies, unless under direction of parents, from their twelfth year on. The employment of children under 13 in theaters and concert halls where regular performances take place, is not permitted. Certain performances are excepted. Besides, the law of 1874 prohibits the employment of children for regular or systematic begging.

¹ Modified by the law of April 19, 1898, on the prevention of violence, beating, acts of cruelty, and other crimes committed against children.

III. AUSTRIA.

In Austria compulsory school attendance begins with children in their sixth year and continues till their thirteenth; still, after six years' attendance, absence is granted for half days, special days, and certain seasons.

According to the industrial code, children not under 12 (in factories not under 14) may be employed "for regular industrial occupation" * * * "provided their work is not injurious to health and does not prevent physical development and the fulfillment of the legal obligation of school attendance." However, they are not allowed to work longer than eight hours a day, and night work is prohibited (between 8 p. m. and 5 a. m.). In regard to night work, exceptions may be granted by ministerial decrees, in pursuance of which, among other occupations, boys are permitted to work as waiters till midnight.

As is seen from this measure, the Austrian regulations are not limited to manufacture or factory work. The industrial law applies rather to "all industrial or wage-earning occupations, whether they refer to production or remodeling of articles of trade, the pursuit of business, or the discharge of service and other labor."

Certain industrial occupations are excluded by the provisions of the industrial code, and special laws apply to them, such as agricultural and forest production with their dependent industries, mining, and others that might be enumerated; the publishing and printing of periodicals and their sale; public shows of whatever kind; furthermore, customary day labor, peddling, and (as the amendment of 1883 states) "the whole of home industry."

The term "home industry" was at the time explained in a ministerial order; the term expressed primary or secondary industries for which the work is done, according to local custom, in workshops only with the help of members of the family. But in time this definition for the earliest development of home industry in Austria was no longer suitable, and often doubts arose as to the legal position of respective employees. The term "factories" has likewise been explained by a ministerial decree; the characteristics of such are defined as being the usual employment of more than 20 workmen, the use of machines, both as motors and tools, the manner of division of labor, and the position of the proprietor. As is evident from what has been said, the protective regulations specified, exclusive of the more severe ones for factories, have a very extended application to small industries and trades. On the other hand, the Austrian law of prohibition of child labor refers, of course, only to "regular" occupation.

Among other laws, excepting the industrial law, that relative to mining (June 21, 1884) contains protective measures for children which do not come under consideration here. What has been said of England in regard to restricting wage-earning occupation of children applies to the Austrian laws; they are seldom observed in practice and often seriously sinned against. The causes for these sad facts are frequently found in the economic and moral conditions of the poorer classes among whom parents do not want to, or can not, support their children, partly because of poverty and partly because of indolence. (Social administration in Austria at the close of the nineteenth century, Vol. I, Social Economy, Vienna, p. 47.)

IV. OTHER COUNTRIES.

Legislation in other countries can only be touched upon here. Only such countries will be considered as have introduced compulsory education: Switzerland with different terms in the 25 cantons; Italy, for children 6 to 9 years of age; Sweden, as a rule, from the seventh to the fourteenth year inclusive; Norway, throughout seven years between the ages of 6½ and 15 years.

In Switzerland the law of March 23, 1877, regulates uniformly for all the can-

tons only the work in factories, in which the employment of children under 14 is positively prohibited. According to the standard maintained by the Federal Council, the term "factories" includes not only all places of manufacture with more than 10 workmen, but even places with only 5 workmen where mechanical motors are installed, or where the work implies certain dangers to the health and life of the employee, and, finally, even the smallest places if they present extraordinary dangers to health and life or show the unmistakable character of factories. Besides these general regulations, there exist in a number of cantons cantonal protective labor regulations which affect a wider range of labor, such as small industries, stores, etc. They refer principally to woman labor, but also contain measures for the employment of children, especially male and female apprentices in workshops. Thus, for instance, in a number of cantons (Glarus, Lucerne, Soleure, St. Gall, Zürich), the order has been issued that girls under 14 must not be admitted into workshops which, not being affected by the federal factory law, employ women and girl apprentices.

In Italy, where protective labor legislation is backward, the protection of children is less significant than in other countries. In pursuance of the law of February 11, 1886, and the order for its execution of September 17, 1886, children under 9 years of age are not allowed to work in factories; that is to say, in places where mechanical power is applied or at least 10 workmen are employed. Older children are admitted only if they hold a certificate of physical ability. Besides, certain kinds of work declared to be dangerous or unwholesome are prohibited, or allowed only on conditions. The length of hours, as well as night work, is subject to limitations.

In Belgium the law of December 13, 1889, respecting woman and child labor forbids the employment of children under 12. The application of this law is extended not exclusively to factories in the narrower sense of the term, but to mines, quarries, yards, harbors, wharves, transport establishments, theaters, laundries, and other places, and especially to a large number of occupations enumerated in the law as dangerous or unwholesome (*établissements classés comme dangereux, insalubres, ou incommodes*). Only those employments are excepted in which members of the family exclusively are engaged by parents or guardians and with which no mechanical power is applied, provided they are not considered dangerous to life and health. This law has extended application; it includes nearly all (large and small) industrial plants specified as dangerous or unwholesome, establishments, too, which would be classed among workshops in Germany and England. An order, dated February 19, 1895, for the execution of the law, extends the prohibition of certain occupations likewise to children over 12 (till the fourteenth or sixteenth year of age). The number of working hours per day and their distribution is regulated exactly, partly in the law, partly in the ministerial order. As a general thing boys under 16 may be employed twelve hours at most; night work (from 9 p. m. till 5 a. m.) is forbidden for them; furthermore, certain intermissions and days of rest are prescribed. An older law of May 28, 1888, protects children employed in ambulatory occupations. They are forbidden also to be employed for dangerous feats, as acrobats, tight-rope walkers, etc.

In the Netherlands the labor law of May 5, 1889, which includes all small manufacturing plants and home industries, prohibits the employment of children under 12. All dangerous or injurious occupations are forbidden, or are permitted only on condition to older children (persons under 16 years of age). The working hours shall not exceed eleven, and not be arranged between 7 p. m. and 5 a. m.; in exceptional cases work is allowed until 10 p. m.

In Sweden the law of November 18, 1881, defines that children under 12 years of age shall not be employed in factories, in trades, or other occupations. In factories children 14 years old or less are not allowed to work more than six hours a

day; night work is totally prohibited. This law has been but partially successful. A new law on the employment of children and women, which was passed by the legislature in 1900, has not yet been accepted by the Royal Government. The employment of children (boys under 14, girls under 15) in public shows has been prohibited by a royal order of December 10, 1897. Furthermore, the order of December 4, 1896, as well as one prior (June 10, 1891), prohibits children of the same age from selling certain articles (flowers, papers, etc.) on the street or in public places between the hours of 8 p. m. and 8 a. m.

In Norway a protective labor law was passed June 27, 1892, which, in imitation of similar laws in large countries of western Europe, introduced, to a certain extent, socio-political legislation in Norway. The law refers to all industrial plants in which a greater or less number of workmen are employed regularly and at the same time; also to all trades and various other branches of industry, if carried on "on factory lines." In cases of doubt, the supervisory authorities decide whether a manufactory comes under the law. The employment of children under 14 is forbidden in the places specified. If, at the ages between 12 and 14, they hold a physician's certificate of ability, they may, with the consent of the supervisory authorities, be employed in light work six hours a day. Certain dangerous occupations (at machines) are altogether prohibited for them. According to the law of August 6, 1897, children under 14 are also forbidden to work in bakeries. Besides, the public school law of June 26, 1889, contains regulations by which all employers are forbidden, under the penalty of a fine not exceeding 100 crowns (§26.80), to employ children between 6½ or 7 and 15 years of age, at such hours as to prevent their attendance at school or their preparation of studies.

In Russia protective regulations relate principally to factories.

SUPPLEMENT II.

DISCUSSION.

Concerning the subject of wage-earning children, a daily paper in Berlin (*Tägliche Rundschau*, No. 275, 1899) contains an article, a translation of which is added to the foregoing official statement, because it discusses the details of child labor frankly and openly, partly also because it may lead readers in America to understand the social misery which industrial, agricultural, and commercial competition has caused in recent years all over Europe.

Dr. Wiese, the author of the article, quotes the imperial law of 1891, which provides that in factories and shops, as well as in mines, children of school age, or, rather, children under 14 years, shall not be employed; that children between 14 and 16 shall not be employed for more than ten hours a day, and not during the night (between 8.30 p. m. and 5.30 a. m.), nor on Sundays or holidays. The Bundesrath, or Federal senate, has the right to prohibit wage labor of women and children in especially dangerous kinds of employment; that is, dangerous to life, health, or morals. The law further provides for an obligatory factory inspection, aside from the customary police inspection. There are at present (November, 1899) 300 of such professional inspectors, all scientifically and technically trained; in some German States women inspectors have been employed. Especially important is the fact that the imperial law does not permit any exception whatever, and forbids peremptorily all employment of school children in factory and shop labor.

It is interesting to see whether the law is an actual protection of the weak. The school census of 1899 in Berlin, instituted by the school authorities, revealed the fact that 25,394 school children are employed in some sort of wage-earning labor, namely, 17,636 boys and 7,758 girls. It was found that 11,091 children were engaged for more than three hours a day. The total number of school children (6 to 14 years of age) in Berlin was 231,362; hence about 11 per cent were wage earning. It is true that these children are not working in factories, but they are breadwinners nevertheless. The teachers have been active in urging the authorities to suppress child labor, and they have proved from reports of the Prussian industrial councilors that child labor has increased throughout the State, especially in home industries, to an extent of which the public has no idea. These con-

ditions have led to interference on the part of the provincial government. Several Prussian industrial courts have repeatedly given utterance to protests, without thus far being able to mitigate the evil.

The comprehensive reports of the school inspector for the district of Minden, called for by the imperial chancellor, deserve special attention. In this district, in 1,939 school classes, with an attendance of 105,407 children, 10,326, or 9.8 per cent (6,016 boys and 4,310 girls), were wage earners; 5,872, or 5.57 per cent, were required to work longer than three hours a day. The majority of wage-earning children, namely 5,863, were employed in cigar making, an industry conducted on a large scale, especially in Herford. Of these latter not fewer than 3,551 were obliged to work longer than three hours a day, and 3,066 were employed longer than three hours for every day of the week. The conditions in Minden prove beyond all contradiction how little good has been effected by the prohibition of factory labor alone. In 1890 as many as 1,797, and in the following year as many as 1,883, children were employed in cigar factories. In the year 1896, owing to the passage of the protective labor law, only 11 were thus engaged and since then there have been none. Instead, however, home industry has developed and is carried on principally through child labor, the incredible extent of which is made apparent in a table giving statistics of separate classes in schools of Halftern, Ostscheid, Overnbeck, Spenge, and Vlotho, small communities in the district of Herford. These five schools, collectively, number 1,461 children, in 23 classes. Of these 721 are employed in cigar making, 531 working longer than three hours on every week day. In the upper two grades of the five schools there are 649 pupils of whom 379 are engaged in cigar making, 353 of whom working longer than three hours every week day. Even pupils of the lowest school grades are employed in this notoriously unhealthy occupation, a considerable number working longer than three hours a day regularly. In view of these deplorable conditions the chamber of commerce in Minden has proposed a regulation, to wit: "Home work in the cigar industry shall only be performed by adults." Even if the execution of such a rule were under strict supervision a prohibitive measure like that would have no other result than that cigar making would be replaced by a different industry, perhaps less remunerative and utilizing child labor to even a greater extent.

The root of the evil lies in the fact that the father of a large family of children must compete with single men. In this respect legislation must act as it does in cases of old age and infirmity. Legal prohibitive measures, limiting or forbidding specially harmful forms of child labor, would not be superfluous; on the contrary, they could be carried out strictly according to letter, so that no equally great or even greater evil than the one abolished need be anticipated in its stead. (*Pädagogische Zeitung*, No. 36, 1900.)

Reports on child labor in other parts of the country are most discouraging. The facts brought to light by factory inspectors are such as demand stringent legislation. The effort to cheapen labor often lays burdens on children that are in startling disproportion to their physical strength. The report of Wurttemberg shows that the detrimental consequences of working children overtime are felt years afterwards. The population does not come up to the same standard of physical stature and strength, and consumption has increased to a notable degree. In Saxony, in the district of Bautzen, school children even have been employed for breaking stones. Independent of the disturbing influence on education and health, child labor creates competition for men which, in consequence of cheapness, prevents their earning better wages, so that the original expedient of assisting fathers by child labor becomes a permanent practice.

Political or legislative measures are absolutely necessary for these evil social conditions. Police regulations could, first of all, bring about a change. Home industry likewise needs protective legislation, and that implies the great question to be solved concerning the occupation of children of school age. The prohibition of factory work for such children, provided for in the imperial industrial code, must be more minutely defined to be adaptable to existing evils.

In Austria the law can easily be evaded in every instance. It is true, children may not be engaged in all industries, but exceptions can always be made. The maximum length of a workday for children 12 to 14 years of age is eight hours. The prohibition of factory labor under 14 years and night-work also "admits of exceptions." The same may be said of children working in mines; if 12 years old, they may form exceptions. Illegal extension of working time and deficient execution of the regulations applying to school attendance of child wage-earners or apprentices are often deplored by Austrian officials and provoke action against unscrupulous employers.

No country boasts more loudly of its socio-political laws than England. Let us see how facts correspond to legislation. Children under 11 years can, under no

circumstances, be employed in factories and shops. When necessity demands, the employer is held responsible for the required school attendance of their hands from 11 to 13 years of age; above 13 years children must hold a school certificate before they can be employed; persons between the ages of 11 and 16 may be employed in factories if they conform to the regulations of the home secretary, and in workshops if they hold a physician's certificate of health. In textile factories children may not be employed for more than one-half of the 56½ hours per week defined for woman labor, as they are not allowed to work more than a half day, or a whole day on alternate days. In work at home, children's time is limited to half-days from 6 a. m. to 1 p. m., or from 1 p. m. to 8 p. m. In mines, boys under 12 can not work under ground, and in coal mines children under 12 can not work at all. The length of time is fifty-four hours a week under ground at most for boys from 12 to 16 years of age. For children 12 to 13 years old, the work over ground must not exceed ten hours a day. If they work more than three days in the week, six hours is the highest limit per day. In shops—namely, places of sale of all kinds, including hotels and excepting pure family industries, according to the law of 1892, persons under 18 years of age may be employed only seventy-four hours a week, including intermissions. Industrial inspection has been in existence since 1833. At present 114 officials are appointed for 200,000 factories and shops and one-half a million of laborers.

Whoever thinks that despite these laws child labor is made use of to a smaller extent than on the continent, is mistaken. For example, in England 114,025 children under 14 years of age work from 72 to 87 hours a week. At the conclusion of last year's address to the House of Commons, in which the department of education requested an appropriation of nearly 180,000,000 marks (£9,000,000 or \$45,000,000) for educational purposes, the under secretary of state, Sir John Gorst, himself stated that there are boys not yet 12 years of age who are obliged to work 100 hours a week. Others of these "white slaves," as he called them (17,084 in number), work from 72 to 87 hours a week for less than 12½ cents per week, others receive \$1.75. Again, 181 children regularly employed are not 6 years old, the age defined by law for school attendance. Such a utilization of child labor is only possible on account of the "half-day law," which provides that children may work half a day if they spend the other half in school. As many children are dismissed from school as early as 10 years of age, namely, if they can pass an examination covering all that is taught in elementary schools of England, which is very little, and as they come under the labor law only later on, parents make use of just these years for the greatest amount of labor, and often most inhuman labor. Sir John Gorst, moreover, remarked that of 5,000,000 children of school age over 1,000,000 did not attend school. If no criticism on such conditions can be too severe, the kind of labor exacted from children calls forth even sterner judgments. Boys are required to spend hours, and even whole days, watching teams, while the driver is attending to the loading and unloading of the wagon. If such occupation is continued for weeks and months, the boy naturally develops into an idler or idiot who prefers to beg later on.

In the large cities of Germany, too, especially in Berlin, boys of school age are often employed in the business of transportation, as so-called "Rollmöpfe" (team watchers). Observations made by teachers of that city show that the police allow such things with indifference. Daily contact with nearly always rough drivers corrupts boys in an alarming way; it leads to coarseness in expression and manners and accustoms the boys to drink, while exposure to wind and weather undermines the health of such pitiful creatures only too often scantily clothed. The same applies to making use of children for agricultural labor. In itself this is calculated to benefit rather than harm children. But who is to protect them against the coarse and immoral conversation and manners of farm hands and the temptation to drink? The curse of child labor is not always the work itself, but oftener and almost exclusively the absence of care for the physical and spiritual welfare of children during work.

Furthermore, if in England—and complaints in this respect are numerous—girls pass all the day on the street, spending their valuable time in carrying messages, uncared for and unadvised, they develop the dangerous inclination of wandering about that no philanthropic efforts later on can root out, and that slowly leads them to their destruction. As in these cases, mind and soul are gradually deadened, so, in others, the physical constitution is weakened, if not ruined, by systematic wear and tear. In one instance, in London, a boy 13 years old was obliged to work thirty hours a week in a pool room for \$1; in another instance, a boy was required to assist his father by hard labor in keeping a provision stand; he worked from 3 a. m. till the opening of school and from the close of school until 9 p. m. The most distressing sight, however, is to see school children employed as street cleaners, working all night, from 8 p. m. till 6 a. m. All their moral and physical

energy seems to have been exhausted when they come to school. What a sad kind of citizenship is to be expected from them when they grow up, if they ever do.

Italy and Spain have large numbers of cripples and beggars. While in the former there is some mention on paper of protection of children, not even this much can be found in the latter. If we ask where Italy gets her many cripples and beggars, the answer is given, by the white slaves employed in the sulphur mines of Sicily. The fact is well known and has been repeatedly discussed that boys of tender years are required to carry heavy sacks of sulphur up small ladders. The lowness of the tunnels forces them to stoop constantly, and a few years suffice to bend the tender limbs. Mercilessly driven out when they are unequal to the task imposed, and incompetent for any other work, they increase the countless hosts of beggars the sight of which is repulsive. The Government can find no remedy at hand for this public nuisance. There is but one—a positive prohibition of child labor and its effectual execution. But then what would the mine owners say and do?

In sunny Andalusia children under 8 years of age supply the deficiency of water in the conduits. Eight hours a day they carry heavy buckets of water on their heads into the fields in order to protect the germinating seed against drying up. The worst lot, however, falls to the children of Catalonia. The pen almost refuses to picture the barbarity practiced by employers on the tender bodies of children and with the full knowledge of the Government. Thousands of children under 6 years of age are daily employed in the magnesia mines. The tunnels are so low that grown persons can not enter them; so the youngest and smallest children are hired for the work. The poisonous vapors generated in the mines produce a frightful disease, "colica saturnans," which claims its victims daily and rages as an epidemic during certain times of the year. Still the mine owners continue to employ little children for this horrible labor, giving them but a small pittance in return.

It is seen from the foregoing that many countries of Europe possess laws for the prohibition or restriction and regulation of child labor, but that these laws are not put in force; that some kinds of work, as that connected with home industry, are not sufficiently protected; and that others, again, have no provision at all for the protection of children. It is to be hoped that the time is not far distant when all countries will remember their sacred duty for their own interests and protect children against unscrupulous parents or greedy capitalists. Until this happens it will be necessary again and again to draw public attention to the facts, arouse public conscience, and spread information on so highly important a question over as broad a field as possible. It is one which in the end affects the well being of the State, which must have an interest in the development of a strong and sturdy youth, for it is they who will have to meet the claims of later life. Hence in protecting the children the State protects itself.

IX. THE GERMAN LIBRARY SYSTEM.

Praiseworthy as the educational system of the German Empire may be, and unquestionable as its results prove to be, there seems to be a weak spot in it which is well-nigh incomprehensible to the American and English observers. It is the fact that comparatively little is done in maintaining public libraries such as are supported by local taxation in the United States and in England. This auxiliary to the nation's educational institutions is still in its infancy in Germany. Not that they have no large libraries in that country; but they are old university libraries reserved for the students, royal or State libraries, or venerable provincial libraries closed to the general public; there were, not many years ago, even extensive city libraries in which rarely any other footfall than the librarian's and his assistants' were heard. In late years, however, efforts are being made to supply the deficiency, and notable librarians, like Prof. C. Nörrenberg, of Kiel, and Prof. Ed. Reyer, of Leipzig, are making themselves heard in behalf of the rights of the great majority of the population, claiming that the public should have access to the enormous library treasures heaped up in State, provincial, and university libraries, and voicing the desire of the people for wide-open town and city libraries.

A quarter of a century ago the profession of a librarian as an independent profession was unknown in Germany. When in America and England professional librarians had long been numerous, in Germany the custom was still to intrust a professor or teacher in annual rotation with the care of the library of an institution. A change has come over the people, and after the model of Americans and Englishmen they began to apply local self-government to the question of public libraries. At first numerous cases of private enterprise showed the way; then many city and town governments, prodded by public-spirited men, appropriated money annually for the establishment and maintenance of such institutions. The management of large libraries, hitherto closed, changed also, and the millions of books that had been collected for centuries were slowly made accessible not only to students but to the general public. In all publications on the subject in Germany again and again the United States are set up as a model for imitation.

Recently a work has been published in Germany by Dr. Ernst Schultze on *Free Public Libraries, People's Libraries, and Reading Rooms* (pp. 362, with numerous illustrations). In this work the author lays bare the weakness of the German library system, and with constant reference to conditions and institutions in the United States and England, as well as other countries, he advocates a reform which is sure to come. He does not spare his language, but reports the facts, both positive and negative, without regard to the uneasiness he may cause to conservative institutions or to legislators and officials who fail to see the rights of the people to the freest possible access to the world's intellectual treasures.

Mr. Thomas E. Maw, librarian in King's Lynn, England, subjects the book to a critical review in the *Library World* (London) and quotes the author copiously. This review is here inserted:

One would imagine that the nation of thinkers and poets, a nation enjoying the highest and best of modern elementary education, and a nation which points with pride to a State whose people are the best educated in the world, would have no need of such an enthusiastic advocate of the public library cause as Dr. Schultze.¹ English and American readers unfamiliar with Germany will be surprised and puzzled at the existing state of affairs in the German library world, for it is generally believed in Germany and England that the "Volksbibliothek" is very much like the "public library," and the number of Volksbibliotheken is large enough to confirm our belief that Germany is always trying to get ahead or to keep abreast of others. The author points to the folly of raising monuments to the memory of their great writers when their works are unknown or forgotten by the people, owing to lack of opportunity for reading them. He also calls upon the nation to have a fitting Gutenberg celebration "by making it possible for books—living witnesses of this world-changing discovery—to be read by everyone, even in the remotest hamlet, instead of feasting, carousing, and parading with Chinese lanterns." That the old German appetite is potent enough to hinder the progress of education and culture is evident. "As I write these lines I am informed that a German university town which in many ways takes high rank, and which also has a large working-class population, is going to celebrate the matriculation of the one thousandth student. The municipal authorities had previously decided to show their appreciation of the growth of the intellectual life of their town by establishing a public reading room, which had long been projected, but which all private efforts had been unable to effect. But what did the city fathers do? They thought the one thousandth student could not be welcomed in a worthier manner than by filling him with strong drink. And how much was voted for this object? One hundred and twenty-five dollars, or even \$250? Oh, no; not at all—but thrice that amount, \$750! The reading room remains a project—to commemorate the intellectual importance of the town!"

Dr. Schultze lays stress upon the rights of all men to share in the national treasure—good literature. "Who has the effrontery to say," he asks, "that it is good for him to read, but at the same time fears that reading would be dangerous for his uneducated brother?" That there is a strong craving for reading of some kind he amply demonstrates. Small libraries have had their stock quickly used up, and

¹Dr. Ernst Schultze. *Freie Oeffentliche Bibliotheken, Volksbibliotheken, und Lesehallen*. Pp. 362. Illustrations. Jannenberg, Stettin. 1900.

are unable to replace worn-out books, and the enormous sale of sensational trash of the worst kind is an evil only to be remedied by the supply of pure literature by means of public libraries, for all legislative attempts to suppress such productions have been ineffective. The author, with enviable optimism, believes the public library to be a panacea for most of the existing evils. "The uneducated workman who knows nothing of life but the dusty factory, the ill-ventilated sleeping room, and the reeking tap room, can not understand what is meant by the State, and can not believe that it has any right to exist." Immorality and crime, the daughters of drunkenness, will go the way of anarchy if reformers turn their attention to providing counter attractions to the public house in the shape of good literature. Dr. Schultze regards the public library as essential to any complete system of national education. Not only does literature raise the standard of the worker as a producer, but it enlarges the spiritual and mental horizon, and, what is of great importance to a German, either calls into existence or strengthens the deepest feelings of patriotism. The building of a public library is one of the finest and noblest monuments they could raise in memory of the heroes who had given their lives for their country, for "on entering the library * * * he sees the names of those who fought for freedom and right, and he must surely receive a strong impulse to read the history of his own nation, and thereby learn to love his country more and more. I can think of no war memorials more likely to really serve their purpose than these public libraries."

Dr. Schultze does not enter into the details of library management, but gives merely a brief outline of the methods of working which he has seen in the English public libraries. His chief concern is with the crying necessity for the establishment of public libraries in Germany and the satisfactory results achieved in England and America. He condemns, in no half-hearted way, the effete institutions known as Volksbibliotheken (literally, people's libraries), and asks for a library which will supply the pressing needs of all classes to-day. "The Volksbibliothek movement in Berlin has considerably influenced the movement throughout Germany," so it will be well to see what has been done in Berlin if we are to judge of the future prospects of the Volksbibliotheken. In 1847 a few professors of the Berlin University formed what we may call a university-extension society for scientific lectures, with the secondary object of founding Volksbibliotheken. A small charge for admission to the lectures was made, and, the lecturers giving their services free, a considerable sum was acquired for the Volksbibliotheken, and in 1847 the society was able to offer 12,000 marks (\$3,000), which the city accepted, and in 1850 the amount was increased to 18,000 marks (\$4,500). On August 1, 1850, the first four Volksbibliotheken were opened. They were governed by commissioners selected from the society and the city councils; the city had to contribute \$750 yearly, and the society gave the proceeds of the lectures. Besides these annual contributions, the society gave an endowment of 30,000 marks (\$7,500), which produced \$300 a year. Altogether the society gave the city over \$25,000 up to the time of its dissolution in 1879. Although there are now 27 small Volksbibliotheken in Berlin, there is no central library, so that their usefulness is very greatly diminished, because either the 27 must all buy the same books, thereby necessitating wasteful and costly overlapping, or the readers of 26 are deprived of that particular book in the library where it has been purchased.

"The 27 libraries together contain 104,356 volumes, giving an average of less than 5,000 volumes to each, and this for a city of nearly 2,000,000 inhabitants, the capital of the Empire. The absurd hours of opening are the greatest inconvenience. It seems incredible, but it is none the less true, the majority of them are opened for only six hours weekly, and that at midday—Wednesday and Saturday from 12 to 2, and on Sunday, 11 to 1. That may, perhaps, have suited the times in 1850, but to-day such hours are totally inadequate. But can it be seriously thought that the lower classes can find time, in the middle of the day, not only to go to the library but to take their place in the crowd always there and wait half an hour or more until those before them have received their books? It really says something that, in spite of this, the use made of the library is, according to statistics, very considerable. Happily these hours of opening are now being changed; 1896-97 Nos. 1, 16, 20, and 27 were opened during the evening instead of midday. * * * These four are open from 6 to 9 p. m., and how this tends to increase the usefulness of the library is shown by the last official report. No. 1 issued in 1895-96 only 11,528 volumes, but in 1898-99, 68,578 volumes."

Prussia contributes over 1,000,000 marks (\$250,000) annually to the university library and the royal library in Berlin, but only 50,000 marks (\$12,500) for the Volksbibliotheken throughout the State. Dr. Schultze thinks that no part of this money should go to the city libraries, as these are able to take care of themselves; but to the village libraries, whose existence depends upon outside support.

Dr. Schultze gives well-deserved praise to the Society for the Extension of Popular Education, which, since 1892, has devoted its entire attention to the founding of "ländliche Volksbibliotheken" (village libraries). From August, 1892, to the end of 1900, it established no less than 760, with 46,257 volumes, and gave to 348 others 10,724 volumes.

The advocates of the public library meet with the same unreasoning opposition and same lack of understanding as we have experienced in England. The necessity for such libraries is questioned, as if the popularity of the existing libraries did not show that the people were eager for the spread of libraries throughout the land. "Then the city fathers come with long faces and talk of the great demands upon their resources, but a fortnight afterwards the same city fathers are ready to vote hundreds of dollars toward entertaining any congress, great or small. That, however, is the recognized thing to do, and is reported in the newspapers, but the other works silently, yet would amply repay the costs."

The author says he has "purposely almost ignored the Stadtbibliotheken (city libraries), which so many towns possess, because the greater number do not at all represent the public library as understood in this country. Instead of trying to keep abreast of the times they have slavishly followed their original plan of buying only theology, history, and philology, thereby making them useless except to the learned, and as their means increased during this century they have gone on in an objectless way trying to rival the university libraries. * * * They are very little used, * * * cost the towns enormous sums, and would be decidedly better if converted into real public libraries."

Dr. Schultze meets present and future objections by saying that there is no reason why German public libraries should not be as successful as those of England and America, for although there are not so many men of enormous wealth in Germany as in America, yet they could surely do what had been done in England, as English public libraries were not so much indebted to private benefactors as to municipal enterprise. "For do we not follow England in many other things in which a few decades ago she seemed to be far ahead of us? Have we not outdistanced England in many branches of industry? Have we not so developed our commerce that England is seriously affected by it? Are we not trying to put our fleet on an equal footing with the English, as seems so desirable to friends of the navy? And then are we to resignedly take a position behind England in a matter which hitherto has always been regarded as the peculiar province of German culture—in the matter of education? Such resignation shows little spirit and little reason. * * * We must first of all have it clearly and thoroughly understood that we are here dealing with a duty imposed by civilization which, strange to say, has been grossly neglected by us for generations, and that we owe it to our national honor and national greatness to see that we promptly and fully atone for our neglect." It will indeed be strange if at the end of the nineteenth century such a plea as is contained in this book of nearly 400 pages can be put forth in the cause of education without producing effect. In any country it would be remarkable, but in Germany it would be incredible.

Although English librarians will feel highly pleased to read the nice things said of them and their libraries, they will not find Dr. Schultze chanting pæans to all their ways. In a brief mention of the debated "open access" question he says that the system commends itself to his favor, but that there is not much prospect of unanimity of opinion on this question, which is attacked and advocated by strong partisans, but the fact of opposition being made to the newer system is not to be taken into account in judging its merits, for "all English librarians are not so practical in all matters as we might have expected them to be. This is especially noticeable in the usual English practice of dividing English libraries into two parts, the lending and reference libraries. It might be thought that this division only went as far as keeping in the library all purely reference works, such as dictionaries, atlases, etc., and costly and sumptuous books, while all others might be issued for home reading. No; far from it. A very large part of the collection is taken and made into a reference library, and nearly the whole of the science books are put into this section. Why? Because it has always been done, and also, perhaps, because the British Museum does not issue its books for home reading, and in order to make it possible for readers who are making special studies to obtain the book at any time, as in the British Museum.

"It is at the same time forgotten that the British Museum serves only for special purposes, but that in a smaller town the specialists are very few, and for them there are generally science libraries, and that limiting the use of large collections of books to the reference library reduces its usefulness to a mere shadow. Many warning voices have been raised against the extension of the reference library, but I can not go further into this matter here, and only point to the folly we would be guilty of were we to unquestioningly copy not only the good and admirable quali-

ties of the English public library, but also the bad. Fortunately there seems no disposition to do this."

Our Sunday is as strange to the continental as a German Sunday is to the Scottish Presbyterian, and it is not surprising to hear that when public libraries are really established in Germany they will open on Sunday. Dr. Schultze puts the case for Sunday opening just as strongly as do all who advocate a rational Sunday, but even those who would open all public libraries on Sundays must notice that the British artisan does not crowd his fellow in the reading rooms on Sundays. However, conditions are different in Germany. The conscientious objector who regards Sunday opening as sinful (the difficulty of staff can be overcome by employing Jews, as in Birmingham) receives no mercy at Dr. Schultze's hands. "It is to be hoped that we shall remain free from such aberrations. Happily it is an understood thing that we shall have Sunday opening when the time comes."

This book will certainly interest German readers, and ought to be of interest to librarians, for the survey of public library work covers the world. The photographic illustrations might have been more numerous. In this edition they are limited to pictures of typical libraries. The prevailing opinion in Germany and England is that the Volksbibliothek and public library are identical. There is now no longer excuse for belief in this popular fallacy.

Dr. Schultze concludes finely by saying that to cool, calculating reason the establishment of public libraries now appears to be a pressing necessity, and this necessity is more and more recognized by every generous nature. "And though I speak with the tongues of men and of angels, and have not charity, I am become as sounding brass or a tinkling cymbal." Love for our fellow-men—surely that will help us to do what we acknowledge to be our duty. True, many difficulties are to be overcome, but if the right spirit is in us the tide of hope shall sweep away all barriers."

X. HIGHER EDUCATION OF WOMEN IN AUSTRIA.

[Little has been said hitherto concerning the higher education of women in Austria, but in reality strong efforts are being made there to lift the education of women to a higher plane, and it is the men who aid the cause in many ways, as will be seen from a brief summary which appeared in the *Deutsche Stimmen*, a magazine published in Cologne, Germany, and which is here reproduced in English.]

Since the entrance upon office of the minister of education, Dr. von Hartel, who in his former position as court librarian showed on different occasions that he was a friend and advocate of the education of women, an earnest effort has been manifested in Austria toward the reorganization of the entire system of female education. The former chief in the ministry of education, Baron von Gautsch, had already taken measures to regulate the higher education of women in general, and for the establishment and organization of secondary schools for girls in particular. For this purpose the present minister sent an experienced educator to Germany, with the commission to study the system of secondary schools in that country and report the result of his investigations to the minister of education. Reports on their organization, attendance, and the professions open to their graduates were likewise requested of the girls' high schools already existing in the different Crown lands of Austria, so that the minister had at hand abundant material in order to discuss the principles of a plan for reorganization of girls' high schools in a conference of professional men.

This conference took place in the ministry of education on May 14 and 15, 1900, and framed resolutions on the basis of which a speedy reform of female education might be undertaken. Before giving the results of this discussion, a few brief general remarks on the education of women in Austria may be made.

This country was comparatively late in affording girls the possibility of attending advanced educational institutions after leaving the common school upon completion of the obligatory course of study—that is, after the fourteenth year of age. As in cases of different character, private enterprise made use of the circumstance,

so that the State made no provision for further education of girls. Thus as early as 1839, by sanction of the imperial public school law which annexed a three-graded burgher school to the five-graded elementary or people's school in cities, a large number of private institutions were called into existence, which, under such names as female continuation schools, schools for girls, or girls' lyceums, aimed at giving young ladies instruction beyond that which is offered even in well-advanced elementary schools, especially in the study of foreign languages. In the year 1883 the conservative amendment to the school law of 1839 was passed, which contained the following paragraph relative to the secondary education of girls: "For girls who have attained an age beyond that of obligatory school attendance, courses of study may be instituted for the purpose of advanced education" (allgemeine Fortbildung). In 1885 a ministerial decree regulated the system of secondary education, formerly only subject to local legislation, from a pedagogic-didactic standpoint.

Among these newly founded institutions, the schools established by the Woman's Industrial Society of Vienna, in 1867, occupy a special place; they include a lyceum for girls, a business college for girls and women, a drawing school (a school of design, as it would properly be called), a dressmakers' school, a studio for decorative art, courses in foreign languages, in knitting, embroidery, hairdressing, etc. Since its foundation the society has instructed about 20,000 pupils and has done much to develop the idea of professional education of women.

A similar association was founded in Vienna, the Society for the Higher Education of Women, which established a classical high school for girls October 1, 1892. One year after, an institution of the same character was opened in Prague by the Minerva Society. Since its foundation the society in Vienna has accomplished a great deal and has opened many lines of occupation to women. Its final and chief aim is to open the Austrian universities to women, to gain for them the right of practicing medicine, and also to make the higher positions in the teaching profession accessible to them.

A great deal has been accomplished in this regard within the past few years. In 1897 women were permitted to take the university course of philosophy after they had been allowed to attend the lectures of private professors by invitation since 1878. The regular students of the optional course of philosophy are likewise admitted to the obligatory course, if they have attained the age of 18 and possess a diploma from any Austrian gymnasium (classical high school) or one admitted by the minister of education to be of equal rank. Until further action, the decree of the year 1896 holds good, allowing the young women of Austria to be matriculated for the course of medicine if they have studied ten semesters at a foreign university after passing the State examination. The study of medicine is therefore open to women, although the well-known physician, Professor Albert, in 1895 emphatically declared himself opposed to the admission of women to the profession. Recently, Prof. Edmund Bernatzek, of the Vienna bar, has, upon request, published an opinion¹ on the admission of women to the study of law. He advocates their admission as a consequence of the graduation examination allowed in the classical preparatory schools. He also requires, as a further consequence, that women be admitted to the practice of law, as the consent to study would otherwise not be complete, and useless. "Not all positions in the legal profession, it is true," he says, "are appropriate for women. Still, they can with propriety fill those in which they do not come in direct contact with the public." In pursuance of this opinion, the faculties of law at the universities of Prague and Vienna have admitted women to their lectures.

A wide field of action is open to the women of Austria in the profession of teach-

¹ The Admission of Women to the Study of Law, by Dr. Edmund Bernatzek, Vienna, 1900, published by the Society for Higher Education of Women.

ing in elementary and burgher schools, as women who have received their education at State or private normal schools are preferred for the lower grades of such schools as well as for kindergartens.

In addition to these institutions for higher female education, the Society for Academic Lectures for Women, the so-called Ladies' Academy, founded by private enterprise in 1895, but receiving State support, gives a scientific education to young women and girls of the upper classes adapted in text and outline to the future vocations of the students, and is, in a certain sense, a continuation of the girls' gymnasia, designed, as the then chief of the section of the ministry, Dr. von Hartel, announced at the opening of the academy, "to refute the opinion of serious-minded men, that women are not adapted and competent to accomplish any earnest scientific work."

The youngest higher institution for women, still in its earliest stage of development, is the Atheneum, a kind of woman's university for scientific lecture courses founded by voluntary action of the Austrian university lecturers, and designed, primarily, to consolidate the heretofore divided separate scientific efforts in behalf of women. The attendance of women teachers and educators, in particular, is anticipated and solicited, and their professional needs will receive consideration. Women and girls are instructed in all the sciences, without, however, the prospect of receiving a diploma or any certificate testifying to their ability in any branch. No attention is paid to business education; the effort of women to advance in learning alone is considered. Lectures are delivered on chemistry, the hygiene of food, hygiene of female life, the history of civilization, political economy, and French, German, and English literature. If the attendance proves sufficiently large, the courses may be extended and supplemented. The Atheneum began its work October 1, 1900. Among the lecturers are professors to whom Vienna owes the introduction of the popular lecture courses, the so-called university extension.

The official inquiry referred to in the beginning of this article was to determine, in the first place, whether a reorganization in the sense of uniformity were desirable; whether the existing type of six-graded lyceums were to serve as a model and what studies were to form the curriculum; and, finally, to decide whether it be wise to admit all teachers to the full course of study.

In the discussion the fact was not ignored that female education by no means meets the demands of the times, which present new conditions of the social and economic life of women entirely different from those of former epochs, and for which the schools of the present period sufficed. Neither was it forgotten that women have been admitted to professions which require an academic education and were, until recently, open to men only, and that a strong movement has been manifested which demands for the broader sections of society something beyond the obligatory common-school education from which a professional and industrial education must result. The inquiry furthermore considered the differences existing in the various girls' schools of Austria, numbering 47 at the time, with regard to their organization, and concluded that a reorganization of female education was necessary to the end that the more numerous peopled strata of society be provided for before measures can be taken for the establishment of State institutions for the well-to-do classes. These latter are in a position to acquire an advanced education by private means without making a claim for assistance from the State.

Concerning the results of the inquiry, most of those actively interested advocated a reorganization of the six-grade girls' lyceum, which may be attended till the seventeenth year of age, after completion of the studies of the five-grade people's school. For this lyceum a uniform curriculum was advised, the foundation of which was to be, as before, the humanistic branches, language forming the central study. Foreign language study, as well as the natural sciences applied as closely as possible to practical demands of life, should have a sufficient number of

hours assigned. A conspicuous fact is that religious instruction is likewise designed for these institutions. Different privileges, among them admission to university courses, are to be granted to graduates of such normal lyceums. It was advocated to employ women teachers who have graduated from these lyceums and have attended lectures at the university, but before such a reform can be carried out, a teacher's diploma issued after an examination for positions in girls' lyceums must be insisted upon, lest these schools be injured from the start by inferior teachers.

The establishment of State gymnasia (classical schools) for girls does not come within the scope of the plan of the minister; still, girls who have privately acquired a classical preparation are, upon passing the required examination, granted certain rights that were proposed for discussion. The main purpose of female secondary schools, according to the resolutions of the conference, is to give a certain degree of thorough general education especially adapted to women; consequently, no superficial smattering of many studies, but a solid knowledge and ability in the important branches of female education. Elementary female education, particularly in burgher schools, was also discussed during the conference, as well as industrial technical schools for the poorer people. These schools for a long time have been a social problem of vital importance to general social order. The struggle of women and girls to extend their field of labor has become a serious social necessity.

The less conspicuous efforts to meet the pressing needs of extensive social circles by education above that which is offered in obligatory elementary schools also received attention. In that regard a recently published article has stirred the authorities to action. It is entitled *Technical Education for Women and its Organization with Reference to the Practical Demands of Life*, written by the ministerial councilor and well-known organizer of industrial and commercial schools in Austria, Dr. Franz R. von Haymerle. In his opening address Minister von Hartel referred emphatically to this article. The trend of thought in his remarks was the same as that followed by Haymerle in his excellent treatise.

The well-informed author undertakes to point out partly new ways of female education, and in giving the character, outline, and arrangement of instruction, based upon thoroughly practical grounds, he shows ways and means to increase the labor power of women. In the beginning of his article he distinctly states that he has expressed only his private views, nevertheless they may be accepted without fear of contradiction as those now dominant in Austrian educational circles. He advocates the establishment of cooking schools and training schools for factory hands, orphan-asylum and domestic-service schools (Austria numbers a half million house servants, Vienna alone 86,000), and courses in bookkeeping; consequently, the establishment of institutions designed for the education of the wage-earning classes, in the narrower sense of the term, besides schools for technical education in special branches, as, for instance, the training of nurses for infants and nurses for the sick, also special preparatory courses for business positions, office work, agricultural pursuits, as well as for various arts and industries.

According to Haymerle's plan, a second group of institutions, schools for domestic economy, housekeeping high schools, and courses on sanitation are designed to teach housekeeping and its refining technical side. Another group includes technical continuation schools for girls, especially apprentices. To the last group belong all preparatory institutions intended as a foundation for higher courses and studies. To crown the whole structure, Haymerle proposes the establishment of a female technical labor museum, and a central place for the encouragement of the arts, in which all ramifications of the organization shall find a common focus.

It is in a high degree significant that the author of this study considers the development of female education from its beginning on, keeping woman's inde-

pendent ability to earn a livelihood in the foreground, and not ignoring the application of female power to manual, industrial, and administrative purposes. In the year 1890 there were in Austria a round half million more women than men; and of nine millions over 10 years of age, almost five were self-supporting; of these about three millions were unmarried. These must be provided for first, not the upper ten thousand, "who may seek their educational benefit in æsthetic and philosophic studies, and in following the beaten paths in which the alternations of life depend upon a more or less successful penetration into the secrets of Latin and Greek grammar, or may do homage to more practical aims." In our estimation, also, the main point of issue in the modern woman movement in Austria is to apply the efforts toward advanced education to the benefit of the middle and lower classes especially, whose professional and technical education must be provided for by the State. To quote Haymerle again: "Only the authority of the State and the established confidence in its actions can make an educational institution popular in the broader sense of the term." For the current year (1900) 8,220,000 crowns (about \$2,110,000) have been appropriated for industrial and commercial education; only 153,000 crowns (about \$39,000) of this amount, however, is to be expended on female schools. These conditions can not continue; changed social and economic relations must be taken into account. Female education must be recognized, so that women and girls who are not provided for may acquire the means to earn their own livelihood.

The question of support has become so prominent that it forms the basis of all other reflections. During the women's congress in Munich, October, 1899, Professor Haushofer spoke on "Woman in business," concluding his address with the words that—

If women want to improve their position they must not fail to observe three things incessantly: First, a uniform movement must be supported by all the women of Germany; that which has been attained can not be given up, the as yet unattained must be striven for with the evidence of its being necessary and deserved. Second, women must take the peculiarly feminine virtues into public life—patience, punctuality, carefulness, and æsthetic taste in all they do. Finally, women must learn of men the ability to organize and administrate, to separate personality from objects in view, and to discipline self.

We believe that the women of Austria in their struggle for opportunities of education and labor should not ignore the admonition of one who has so thorough a knowledge of our economic conditions.

XI. AGRICULTURAL SCHOOLS IN AUSTRIA.

Contents: General review. I. Higher agricultural and forestry schools: (a) University of Vienna; (b) University of Krakow; (c) Technological University of Vienna. II. Secondary agricultural schools: (a) Agricultural colleges; (b) forestry colleges; (c) wine, fruit, and gardeners' schools; (d) brewers' school. III. Lower agricultural schools: (a) day schools; (b) winter schools; (c) forestry schools; (d) dairy schools; (e) schools for special branches, such as fruit, wine, flax, and hops; (f) schools for brewers and distillers. Statistical data.

[NOTE.—For the exposition in Paris, the Austrian Government prepared a number of monographs descriptive of various characteristic features of the Austrian educational system. Among them was one giving an account of the efforts in behalf of agriculture and forestry, which was prepared by Friedrich Ritter von Zimmerauer, chief of the educational section of the department of agriculture in Austria. It appeared simultaneously in German and in French.

This pamphlet is of unusual interest, inasmuch as it shows not only what is done for agriculture in Austria, but how it is done. It is inserted here in English owing to its lucid classification and the numerous hints it offers for similar schools in other countries. The author evidently has the educational side of the question

of agriculture near at heart, and he states the facts in simple, unequivocal style. His comprehensive statistical tables are here omitted, as being of no immediate use to the American readers; only summaries are offered.]

GENERAL REVIEW.

The manifold forms of agricultural and forestry education in detail in Austria¹ may be classified in a system with three main groups of schools: A. Higher institutions, of university rank; B. Secondary schools; C. Lower schools. The basis for this division is found in the higher or lower curriculum designed for the different schools.

The course of study determines for what occupation within the broad field of agriculture—eventually for what particular specialty—the separate institutions prepare their students. As manifold as their purposes may be, they are nevertheless, at least approximately, referable to one of the following three fundamental ideas: (1) The course of instruction takes pupils so far as to prepare them to manage independently a small estate (a farm, for instance), which means a business in which the proprietor and manager, as a rule, does part of the work himself. (2) The course may give an advanced education required for agricultural and forestry pursuits in which the manager gives no assistance by manual cooperation, but only distributes or directs labor. (3) Or, finally, the course insures the highest scientific education in agriculture and forestry preparatory for practical work or technical teaching and original investigation.

Upon this difference in the aim of the studies, with which, as a matter of course, various demands with reference to preparatory courses go hand in hand—as any technical education presupposes a certain degree of general education—rests the above-mentioned fundamental division into the three categories of lower, secondary, and higher schools.

To this first and most important classification, however, a second is added with regard to agricultural schools. According as all agricultural studies are taught to an equal extent and adapted to the purpose of the institution, or only special branches (for instance, fruit culture, vine raising, dairy farming, housekeeping, etc.), these schools are divided into (1) general agricultural or agricultural technical schools, and (2) special agricultural schools.

Considered from the two points of view mentioned, there exists in Austria to-day (1900) the following kinds of independent agricultural and forestry schools:

A. Those of the lower grade, distinguished as general technical schools (including all general studies pertaining thereto)—farming and agricultural winter schools, sylvicultural schools and training schools for foresters; also special schools for the study of horticulture, fruit culture, vine raising, dairy farming, housekeeping, brewing, and distilling.

B. Those of the secondary grade, distinguished as general technical schools, the so-called agricultural institutes or colleges, and the secondary agricultural and forestry schools, an œnological and pomological institute, a secondary school for fruit culture and horticulture, and a secondary special school for brewers.

C. Higher schools or universities—only one institution in Vienna—with three departments, namely, for agriculture, forestry, and the technique of agriculture. Also, an agricultural lecture course at the University of Krakow.

As a rule, the completion of the course offered in elementary or people's schools is the condition of admission to the schools of the lower grade (A).

For schools of the secondary grade (B), as a rule, the completion of the studies of the lower grade of general secondary schools (so-called high schools of six

¹ In this article Austria is understood to mean Austria proper, officially called Cisleithania, which does not include Hungary.

years' course), or at least graduation from a burgher school (advanced elementary school with some secondary studies) is required.

The highest grade of agricultural and forestry education offered in institutions of university rank (C) presupposes the passing of the graduation examination of either classical or modern high schools of nine years' course, which admits anyone who holds this certificate of graduation to universities or polytechnical schools.

The three chief categories of independent technical schools mentioned by no means exhaust all the opportunities offered for an agricultural education in Austria. To the foregoing should be added the instruction in agriculture and forestry given in all polytechnical institutes under the form of lectures by private and regular professors; furthermore, the obligatory courses in agriculture in normal schools, and, finally, the so-called agricultural continuation courses designed for the more numerous classes of society, and forming part of the curriculum of people's (or public) elementary schools.

All these manifold forms of agricultural education are still further supplemented by the extensive system of ambulatory lectures, the freest form of professional instruction, which is, literally speaking, brought to the door of the rural people; also, by the frequent courses in agriculture and allied sciences in schools not directly designed to aid agriculture, which courses are outside the scope of the present article, and will receive no further mention.

An important principle often overlooked is that each one of the three categories of schools mentioned gives a technical education in itself separate and complete, and that consequently the lower grade of schools is not simply a preparatory institution for the higher. This idea is contradicted by the fact that a definite course of study without any reference to a higher course is arranged for each category and requires a certain degree of general preparatory education.

With these remarks, necessary for the correct understanding of the system of agricultural and forestry schools, we shall proceed to give a short sketch of the most important features in the organization of each of the three categories mentioned. We shall begin with the highest grade—the university.

I. HIGHER AGRICULTURAL AND FORESTRY INSTITUTIONS.

The following institutions in Austria are devoted to the highest agricultural and forestry study: The Agricultural University of Vienna, established by the department of agriculture and opened in 1872; the faculty of agriculture at the University of Krakow, established in 1890; the lecture courses in agriculture at the technological universities in Vienna, Graz, Prague (both in the German and the Bohemian), Brünn, and Lemberg; and, lastly, the two courses of agricultural technique in the institutions at Prague.

1. THE AGRICULTURAL UNIVERSITY AT VIENNA.

For the establishment and support of this institution (which is not to be confounded with the ancient university of that city) the law of April 3, 1882, appropriated all expenses. It is designed (according to its charter, dated June 6, 1872) to give "the highest possible scientific education in agriculture and forestry."

Founded by the department of agriculture, the institution was transferred in the beginning of the year 1878 to the department of education. Still the former department has preserved a voice in the management of the institution, such as questions of organization and the nomination and appointment of professors.

The didactic direction of the university is confided to a faculty of professors who are responsible for the fulfillment of the purpose of the institution. The rector is at the head, and is elected by the faculty for a term of one year from among the regular or ordinary professors. The department of education has the right of confirming or rejecting the election.

The teaching personnel consists of 17 ordinary and 3 extraordinary professors; 21 private docents; 3 teachers and 12 assistants. Since the school year 1883-84 three courses of study are pursued: (1) For farmers; (2) for foresters, and (3) for agricultural technologists.

For the matriculation of regular students a certificate of graduation from a classical or realistic high school of nine years' course is required. Regular students of a technological university (polytechnicum) are admitted if they hold the same certificate. Students may be admitted as mere hearers or extraordinary students if they do not hold the graduation certificate but possess sufficient preparation and have passed their eighteenth year of age.

Liberty of choice is allowed, both in regard to studies and direction; nevertheless, a plan of studies arranged by the professors for each of the three courses for a term of three years is outlined to be a guide for students. The following condensed remarks refer to the system of examination in vogue:

Regular students have the right to be examined in their special studies at the close of each semester by the respective lecturers and receive certificates of progress. The examinations are intended to prove the diligence and knowledge of students with respect to certain leading courses or branches. To attest the result of the entire course of study, public state examinations are held; three for the students of the agricultural and forestry department, and two for those of the course in agricultural technique.

The first (general) state examination includes the fundamental branches of all three courses of study. The subjects of the technical branches of agriculture and forestry are divided into two examinations—the one including production, the other agricultural industry or management. The course of technique comes within the scope of a single examination, aside from the general examination, which is common to all courses. In point of succession, after the general or first State examination the examination on production forms the second and that of agricultural industry the third State examination. Students of agriculture and forestry are required to pass the first State examination at the close of the second or during the third semester; the second at the close of the fourth or during the fifth semester, and the third at the close of the sixth semester or later. The students of agriculture technique are admitted to the first examination at the end of the third or during the fourth, and the second at the end of the sixth semester.

To conduct the State examinations the minister of education appoints special committees, composed partly of professors and lecturers at the university, partly of men not connected with it. The minister of agriculture, as well as the minister of education, may delegate special government commissioners to the State examination.

Other purely scientific examinations, the examinations for diplomas,¹ introduced in 1875, are designed to prove the highest scientific ability for the profession of agriculture and forestry. Only regular students who have completed at least the chief studies of the three years' course are eligible for diploma. The attendance at lectures as regular students at a technological university, or of those on philosophy at a university is accepted; however, attendance at the university in question for three semesters at least is required.

The diploma examinations for the two branches mentioned are divided into two groups, the first of which includes the preparatory sciences and law. The first group is open to candidates after their third semester of the university course, if they have followed the plan of study recommended. The second group is open to such candidates as have completed at least the chief branches of the respective technical studies as regular students of the university. Oral examinations are conducted publicly, written examinations privately and under surveillance.

The committee on diploma examinations is composed of the regular and extraordinary professors and lecturers of the studies forming the subjects of examination. All candidates who pass receive a diploma stating their ability in agriculture and forestry in the terms "competent" or "highly competent." The State teachers' examinations in agriculture and forestry held at the university form no specific function of the institution.

For a number of years special courses on practical agriculture and forestry have been held at the university. The latest results of investigation by practical men are given in lectures and demonstrations. These courses are usually delivered

¹ Academic degrees are not granted at the agricultural university.—TR.

toward the close of the winter semester and include an extensive series of lectures and demonstrations on the most varied branches of agriculture and forestry.

2. THE AGRICULTURAL COURSE AT THE UNIVERSITY OF KRAKOW.

This course was established in 1890. It is the second higher agricultural institution in Austria and the only one connected with any of the old universities. Together with all its accessories, collections, laboratories, and other helps it forms an integral part of the department of philosophy. Being, therefore, a State institution, it is subject in its entire organization to the law governing universities and departments of philosophy in particular. Consequently only those are admitted as regular students who have passed the graduation examination of a gymnasium and hold a certificate of admission to universities. Other applicants, particularly graduates from a realistic high school, even though they hold certificates of admission to a technological university, are only accepted as extraordinary students, so-called hearers. In accord with the academic council (or senate) of the university, the minister of education decreed in 1891 that students who are graduates of a realistic high school may, upon request of the professors, be admitted to the promotion and graduation examinations if they attend all the lecture courses of the regular study plan.

By statute of the university the course on agriculture must "afford future agriculturists the opportunity of acquiring a thorough general and specific education, and enable students of other courses to gain a practical knowledge of agriculture of use to them in their vocations." The complete course requires three years. A definite plan of study is outlined, which must be followed for intended graduation. Polish is the language of instruction.

At the end of the first and second years promotion examinations, and after the third year a final examination, are held. Students who pass the last mentioned are graduated. Regular students who have taken a four years' university course can, in conformity with the rules, receive the degree of doctor of philosophy. The dissertation submitted for that purpose may have an agricultural subject.

A permanent committee, composed of specially appointed professors of agriculture and three professors of natural science, manage all matters pertaining to this department. Chairman of this committee is the regular professor appointed by the minister of education, and serving for three years as director of the agricultural course. The corps of teachers consists of five professors, two substitute teachers, and several assistants and demonstrators, besides a large number of professors of the philosophy faculty, a few of the law faculty, one veterinary surgeon, and two teachers from other schools in Krakow.

The agricultural course at the university of Krakow was opened in October, 1890; the following year the second year's course was added, and the third in 1892. The appointment of teachers and the fitting out of collections went parallel with this successive extension. In 1893 the first graduates left the institution, and since then it has become more and more solid within the compass of the organization sketched in the foregoing, and is at present an important factor in the system of technological instruction in Austria.

3. HIGHER AGRICULTURAL COURSES IN OTHER INSTITUTIONS.

Besides the university of agriculture in Vienna and the agricultural department of the university of Krakow, the various technological universities (polytechnica) give a higher course of instruction in agriculture. It is especially worthy of note that the German and the Bohemian technological universities at Prague have courses on the technology of agriculture in which the important branch of technique receives very much attention.

The studies of agriculture and forestry are naturally only secondary at techno-

logical universities. Nevertheless they form a very valuable addition to allied subject-matter in purely technological branches, and afford students of the last mentioned a welcome opportunity to acquaint themselves with the essential principles of agriculture.

As a matter of course the instruction given is essentially encyclopedic. Usually there is but one teacher, who, however, is greatly assisted by the lectures held on the comprehensive studies that form the course at technological universities, especially the natural sciences, agricultural chemistry, the studies of mechanics and machine constructions, and the technique of agriculture.

Lectures on agriculture are held every year at all technological universities—that is to say, in Vienna in two departments, in Gratz, in Prague in two institutions (the German and the Bohemian), and at the institutions in Brünn and Lemberg. In Vienna and Brünn the lecture courses are conducted by regular professors, in Prague by extraordinary professors, and in Gratz and Lemberg by private lecturers.

Forestry is included in the lectures on agriculture at the technological university in Vienna. At the two institutions in Prague and at that in Lemberg it forms the subject of separate lectures. In Gratz it is omitted altogether, and in Brünn special lectures on the damming of rivers closely connected with forestry are held.

II. AGRICULTURAL AND FORESTRY SCHOOL OF SECONDARY ORDER.

1. SECONDARY AGRICULTURAL INSTITUTIONS AND MIDDLE SCHOOLS.

In considering the agricultural and forestry schools of the secondary category—that is, the schools which hold a rank between the universities requiring a complete academic education, heretofore discussed, and the lower schools founded on the elementary schools—we shall first speak of agricultural schools exclusive of forestry schools.

Among these the schools at Teschen-Liebwerd and at Tabor, in Bohemia, and at Dublany, in Galicia, entitled “secondary agricultural institutions,” rank first and hold a somewhat exceptional position. The two schools in Bohemia require for admission graduation from an advanced agricultural school or the completion of six grades of a classical or a realistic high school. The institution in Dublany requires, as a rule, the completion of studies at a classical or a realistic high school, although a less complete preparation, though not below the completed sixth grade of a high school, may admit applicants if they pass a severe matriculation examination. These three institutions have a three years’ course each.

Excepting these three institutions, whose exceptional position depends upon particular historical developments, the organization of all other agricultural secondary schools in Austria is alike in essential features. They are at Mödling in Nether-Austria; Chrudim, Kaaden, and Raudnitz-Hracholusk in Bohemia; Neutitschein and Prerau in Moravia; Oberhermsdorf in Silesia; Czernichow in Galicia, and Czernowitz in Bukowina. Applicants who have finished the six years’ course of any high school are admitted. The schools in Bohemia and Moravia admit also graduates of a burgher school.

All agricultural secondary schools have a three years’ course, during which agriculture is thoroughly taught, besides the natural sciences and the general studies (language, history, geography) connected with the required preparatory education. The examinations are, as a rule, so arranged that pupils receive a certificate at the close of each semester and one at the end of each year. All students who complete the three years’ course may take a final examination for graduation, for which they receive a diploma. Students leaving before the close of any school year receive a certificate of attendance.

The most important, the final or graduation examination, is both written and

oral. The latter includes the following studies: Anatomy of plants; stock raising, based on physiology of animals; the study of agricultural implements and machines; the system of melioration; agricultural chemical technology; industry, and taxation. The purpose of this examination is not only to learn what the students have gained in each branch, but also, and particularly, how their knowledge is correlated, so as to facilitate the utilization of one science by the aid received in another.

The corps of teachers consists of a director, who represents the institution and is responsible for its management, and the required number of regular teachers or professors, besides substitutes and assistants for inferior studies. All the higher and secondary agricultural schools are State institutions, with the single exception of the "Francisco-Josephinum," at M \ddot{u} dling, which is supported by an association.

The graduates of all these institutions, like the graduates of other high schools, enjoy the privilege of only one year's military service. To the three institutions mentioned first (see p. 93) the further privilege is granted that even students of the senior year may enjoy the same favor before they have graduated, provided they make application during that year.

2. SECONDARY FORESTRY SCHOOLS.

The secondary forestry schools correspond to the agricultural schools of the second category just discussed. There are three of them, located in Weisswasser, Bohemia; Weisskirchen, Moravia; and Lemberg, Galicia. The first two are association institutions; the last mentioned is a State institution. There may also be mentioned a similar school in course of construction in Bruck, on the Mur River, in Styria.

All these schools follow the same course of study. The statutes of the school in Weisskirchen define that "students shall be educated by thorough courses in forestry and correlative sciences, so as to be able to pass the State examinations required for the practice of forestry." The two years' course formerly adopted in these schools proving altogether insufficient, a third year was added to the course, which enables the faculty to give more thorough instruction and in systematic order, especially in the natural sciences and mathematics, and, above all, in forestry and its relations. The humanistic branches are taught to a limited extent in the most important general disciplinary studies, religion, language, history, etc.

The condition of admission is the completion of the studies of the lower grades of a classical or a realistic high school and one year's actual practice in forestry. So much objection has recently been made to the value of this practice, owing to the youth of the students, that it is no longer strictly required.

The corps of teachers is composed of a director, the requisite number of specialist professors and lecturers, and several assistant teachers. As regards examinations, it need only be remarked that they are held at the close of every semester, and at the close of the third year upon completion of the course, when those who pass receive a diploma. With reference to the one-year military service, graduates of these secondary forestry schools enjoy the same privileges as those of secondary agricultural schools.

3. SECONDARY SPECIAL SCHOOLS FOR WINE RAISING, FRUIT CULTURE, AND HORTICULTURE.

The Oenological and Pomological School at Klosterneuburg, near Vienna, holds a special rank among the technical special schools of the secondary category. It is the only State school of agriculture, and as such is under the jurisdiction of the department of agriculture. The aim of this institution is to add to the education received in the lower half of any general secondary school technical instruction in wine raising, wine making, wine treating, and in fruit culture the profitable

utilization of fruit, so that students are prepared for positions as managers of vineyards, cellarers, teachers of lower special schools, and ambulatory teachers of the courses on wine raising and fruit growing, or as directors of schools for wine raising and arboriculture. Furthermore, that owners of large vineyards and orchards, as well as wine merchants, may be enabled to conduct their business intelligently. Besides these special branches, agriculture, mathematics, law, and political economy are taught.

The purpose of the studies taught is attained by a two years' course of theoretical instruction, corresponding demonstrations, and practical exercises in vineyards, orchards, and cellars, and by appropriate excursions. The students are either regular or transient students. The condition for admission of regular students is the satisfactory completion of the course of study of a general secondary school and a certificate of some practical experience in wine and fruit raising. Applicants who are prepared to leave the lower grades of a high school of six years' course may, upon consent of the minister of agriculture, be admitted after passing an entrance examination, to which special rules apply. Transient pupils form an exception, and special regulations apply to their admission. For the first year's course the number of students is limited to 25.

Independent of tests during the semester, examinations are held at the close of each semester and upon completion of the course of study. The subjects of the final examination are limited to the oenological and pomological branches and agriculture and their correlated sciences. Those who pass receive a diploma. The corps of teachers consists of a director, three professors, two lecturers for agriculture, law, and political economy, one substitute, and several demonstrators for practical experiments. The director has full charge of the management, represents the institution, and is responsible to the department of agriculture for the position of the institution in didactic, disciplinary, and economic relations. All the teachers are State functionaries and are entitled to pensions. With regard to the one-year military service, the students enjoy the same privileges as those of agricultural secondary schools.

Important supplements to the curriculum are the annual special courses for practitioners on management of cellars, grafting, protection against the *Peronospora* and *Oidium* of the vines, and on fruit culture and the utilization of crops. The most important of these courses is the one on management of cellars, held every year for two weeks, usually during February. It embraces a complete series of lectures (48) and a number of demonstrations and excursions in the afternoons.

Besides the institution in Klosterneuburg, a second technical secondary school for horticulture and fruit culture has been in existence in Austria since 1875. It is the school for horticulture and fruit culture in Eisgrub, Moravia. It was originally a high school for horticulture only.

This institution was opened in 1895 through the initiative of the Horticultural Society of Vienna, with appropriations from the department of agriculture and the Diet of Moravia and the munificent support of the Prince von Lichtenstein, by whose generosity the school was built in the extensive gardens of the Prince at Eisgrub. The purpose of this special school is defined by its statutes "to give, on the basis of the preparation acquired in the lower divisions of a general secondary school, or by the completion of the studies of a burgher school, a practical scientific and artistic education in all branches of horticulture and fruit culture; to make the students competent for new applications of all kinds of gardening; an intelligent management of vegetable gardens; the direction and supervision of public and private gardens, of whatever kind, and an intelligent management of fruit culture on a small or large scale." The course requires three years. The condition of admission for ordinary students is the preparation mentioned in the statutes and at least one year's confirmed apprenticeship in a large horticultural

establishment. The number of students, for whom a boarding school exists, is limited to 20 a year. Transient students may be admitted according to the limit of accommodations.

Besides the natural sciences and the chief branches of the humanities (religion, language, history, geography), statistics, and the technical disciplinary studies, the curriculum includes special practical instruction, upon which great stress is laid and for which the extensive gardens of the prince afford a field for demonstrations and exercises hardly equaled in extent and variety.

The system of examinations and certificates is similar to that of Klosterneuburg. The institution is under the management of a board of curators, composed of delegates from the authorities that contribute to its support. The corps of teachers consists of the director, three chief teachers, and a number of substitutes and assistants. The favor of one year's military service is also accorded to this school.

4. SECONDARY SCHOOLS FOR BREWERS.

Another establishment of recent times within the domain of agricultural instruction is the academy for brewers, found in Vienna (Suburb Währing) in 1895 by the Austrian experiment station for brewing and malting. The aim of this institution is to educate technologists competent to fill positions as managers in the establishment of this industry. Besides instruction in the theoretical branches and a thorough understanding of the technical auxiliary studies, as construction, machines, electrotechnics, and the administrative and commercial studies, the school offers opportunity to attain the high degree of proficiency required for the management of any large brewery in the present state of high development of this industry.

The degree of education required for only one year's military service in Austria-Hungary—that is to say, as a rule, the completion of the course at a general high school—as a condition for admission, corresponds to the high aim stated above. Those holding no such certificate are required to pass an entrance examination. The course requires two years, of which the first is devoted principally to the natural sciences, mathematics, and mechanics, and the second to the technical branches and several auxiliaries, as economics, law, industrial hygiene, prevention of accidents, the keeping of draft animals, etc.

The academy for brewing is connected with the experiment station for brewing and malting in Vienna, and the Technological Industrial Museum, also in Vienna. The lectures and exercises of the first year are conducted in the latter. Those of the second year are held in the building of the academy and the experiment station, where a large lecture and drawing hall, a finely equipped chemical, a microscopical, and a biological laboratory, a great "culture station," also valuable collections of helps to study and a completely equipped school brewery and malt kiln, erected at great cost, are at the students' command.

The corps of teachers consists partly of lecturers appointed for the academy, partly of lecturers of the Technological Industrial Museum. Examinations on the practical and theoretical branches are held at the close of each year and certificates are given. Those who complete the second year's course receive a certificate of graduation. Those who have had a three years' practical experience, either before or after completing the course at the academy, are entitled to a "brewing masters' diploma."

III. ELEMENTARY AGRICULTURAL AND FORESTRY SCHOOLS.

1. FARMING SCHOOLS.

These farming schools are elementary agricultural schools with instruction all the year round. As different as the purposes of these institutions, designed prin-

cially for the farming population, may be, there is one thing in which they are alike, to wit: The statutes define in the first place that pupils who have completed the studies of an elementary school shall receive a practical and theoretical education which will enable them to manage a small farm intelligently. Many of the regulations emphasize the fact that these schools are designed for the peasantry, young men from that class being admitted in preference to others. The further purpose of these institutions is to educate intendants, managers, fodder masters, cheese makers, and other auxiliaries in agricultural industry. Many of these schools limit the number of pupils from didactic reasons and because of the limited accommodations of the dormitories often connected with them. Twenty is the largest number of admissions for each year's course.

Farming schools strive to attain their purpose by theoretical instruction, not only in agriculture and natural science, but in the ordinary branches of general education, the main point of instruction in the latter branches being to confirm the knowledge acquired in people's schools. Practical instruction is likewise given in all work that a farmer should know how to do, such as cabinetmaking, wheelwright's work, basket braiding, etc. In by far the greater number of these schools the course of study requires two years. The exceptions are only two farming schools in Lower Austria (Edthof and Edelhof) with a course of one year and a half, and the five schools in Galicia with a three years' course.

A characteristic feature of elementary agricultural schools in Austria, presupposing the preparation of an elementary school, is the specialty of practical instruction, for which reason they are open all the year round, even during summer, the most important time for practical work. Therefore, a sufficiently large farm (a practice farm) is required by statute in connection with them, and forms an indispensable means for demonstrations and exercises. Many enjoy the advantage of possessing such an experiment station, others are obliged to rent a piece of ground.

The corps of teachers consists of regular teachers permanently appointed for farming schools, and of a requisite number of assistants. The number, usually two or three, is defined by statute; one of the teachers fills the position of director or principal of the school and the school farm connected with it. The regular teachers enjoy permanent positions and, being ranked as public functionaries, have a right to pensions when they retire.

The greater number of these schools are under the management of a board of curators composed of delegates selected by those who contribute to the support of the school. They supervise the instructions, administer all their financial affairs, and in case of vacancies in the faculty make new appointments, while the appointment of assistants and all the laborers is under the immediate control of the schools themselves. The highest administrative authority emanates from the State governments of the crown lands or provinces. As a rule, two kinds of certificates are issued: the so-called classification certificate, stating the results of examinations held during the year, and certificates of completion of the studies given as a result of final examinations.

2. AGRICULTURAL WINTER SCHOOLS.

The purpose of agricultural winter schools is to give pupils who have left elementary schools and desire to become farmers on a small scale a theoretical preparation, principally for the profession, with the least expenditure of money and time. As the name implies, these institutions are open only during the winter months. In the spring the pupils return home to begin practical field work.

There are three kinds of agricultural winter schools—those with a one year's course, those with an optional two years', and those with an obligatory two years'

course. The first class, open only one winter (five or six months), are gradually decreasing in number, as it is beginning to be understood that their purpose can be attained only by a two years' course. In those with an optional two years' course the instruction given during the first winter is reviewed, applied, and greatly extended during the second winter. In those with an obligatory two years' course the students are divided in such a way that the fundamental branches precede the technical, and the first course devoted to the first-mentioned branches forms no complete whole, but is simply a preparation for the second, the two forming a complete course.

The winter schools have increased to a remarkable extent in Austria during the last ten years. As the statistics show, fifty-seven, or more than one-third of the one hundred and fifty-nine agricultural schools in 1898-99, were winter schools. The favor which these schools enjoy in preference to schools open all the year round is attributable to the fact that attendance being required during the months from October to April only, pupils are able to return home in the spring and help their parents in outdoor work. The people attach great weight to this circumstance, though they realize the disadvantage of having no practical field exercises which would be of great value to the pupils combined with theoretical instruction.

Several winter schools are trying to remedy this evil by brief, practical, summer courses on certain branches of agriculture (for instance, fruit, fodder, and vegetable culture). It stands to reason that no exhaustive practical instruction can be given. The curriculum, in general, includes all the fundamental branches taught in farming schools limited by the shorter terms. The personnel of teachers, as a rule, consists of only one permanent teacher, who is the director and teaches the technical branches and natural sciences, and of a small number of assistants or substitutes for the general studies. For each of the agricultural winter schools in Bohemia and Moravia two special teachers are appointed.

Although almost all these schools are supported by associations, the teachers enjoy the rank of government officials, and are pensioned like those of farming schools. Winter schools in all economic and administrative affairs are under the management of boards of curators composed similarly to those of farming schools and under the jurisdiction of the local government council. According to the statutes of organization, final examinations are held at the close of the course and certificates are given to those who pass them.

3. ELEMENTARY FORESTRY SCHOOLS.

As farming and agricultural winter schools form the lowest grade of agricultural, so the two kinds of elementary forestry schools, namely, "forestry training schools" and "sylviculture schools," form the lowest grade of forestry instruction offered in Austria. The number of these schools is conspicuously small. While in the school year 1898-99 there were 97 farming and agricultural winter schools in all Austria, there were only seven forestry schools. It is not surprising, then, that an effort has recently been made to establish more of such institutions. Very lately, in 1899, two new sylviculture schools were established in Bohemia, and both opened with favorable attendance.

The purpose of all forestry training schools, four in number at the close of 1899, is to educate foresters and assistants, especially for State forestry. On account of the extensive forests of Austria and the consequent need of foresters, these schools are State institutions and are subject to the board of directors of forests and domains, and in the last instance to the minister of agriculture.

Instruction is given during eleven months, beginning with October 1, and is during the winter, till the close of March, confined to the class room. During the summer practical exercises are conducted in the woods. The conditions of admission are relatively high, being the completion of the studies of a burgher school, or three

years of a high school, and at least one year's practical experience in forestry. The curriculum includes elementary instruction in the studies of arithmetic, geometry, surveying, mensuration, natural science, natural history, penmanship, drawing, and the technical branches of silviculture, preservation, use, and administration of forests, besides instruction in hunting and fishing, the study of game laws, outlines of construction, and first help in cases of accidents. The personnel of the schools is selected from the board of administrators of forests and domains, and always consist of a director and one or two assistants—forest assistants or advanced students. Pupils are obliged to pass public examinations at the close of the course, which are divided into those held in the woods and those held in the school-room.

The second type of elementary forestry schools in Austria includes the so-called silviculture schools, all of them institutions supported by associations. The one in Aggsbach, Lower Austria, and that in Pisek, Bohemia, are connected with farming schools, that of Weisskirchen, Moravia, is connected with a secondary forestry school.

These institutions are designed to educate foresters, assistant foresters, and guards. For admission the school in Pisek requires the completion of the studies of a burgher school, or four years' attendance at a high school of six grades; the other two require one year of preparation less, but all have the indispensable requirement of one year's practical service in forestry.

The course of study at the school in Pisek, which has by far the largest attendance, is the most extended and requires two years; the other two have only one grade. All three institutions teach the studies of a general education, particularly language, the fundamental branches of the mathematics and the natural sciences, besides technical subjects with correlative and auxiliary branches, as construction, hunting, fishing, and game laws. In Pisek the encyclopedic study of agriculture is added to this curriculum. All three institutions attach great importance to practical instruction in the woods.

In Aggsbach the teaching personnel consists of two specially appointed teachers, one of whom acts as principal. In Weisskirchen the teachers are selected from those of the higher institution, and in Pisek partly from those of the farming school. Semiannual examinations are held at all these schools, and a certificate for completion of studies is given if the final examination is passed.

4. DAIRY AND HOUSEKEEPING SCHOOLS.

While all the categories of schools that have been discussed are open only to boys and young men, dairy and housekeeping schools are designed either exclusively for girls and young women or they admit them. The purely housekeeping schools are meant exclusively for girls. Their purpose is to instruct young women in household duties and to create skill in the management of a country home. Instruction, therefore, includes management of stables and dairies, vegetable and fruit culture in home gardens, the utilization of fruit, and general housekeeping (superintendence of kitchens, including baking and laundry), female handiwork, hygiene, and care of the sick. Besides religion, language and arithmetic are taught. The latter branch includes the keeping of household accounts. Some schools also include the education of children. These schools are differently arranged in details, and it is beyond the scope of this article to enter upon these differences. It is almost needless to remark that these institutions are arranged as boarding schools, the pupils being as a rule arranged in groups, for special importance is attached to practical exercises in work. Three female teachers are in charge. The matron supervises and teaches the branches of housekeeping; the stewardess instructs in stable and dairy work, and the industrial teacher teaches female handiwork, arithmetic, and composition (letter writing). Besides these

three there are some assistants for other branches according to local demands. The course requires one year.

Housekeeping schools, according to experience so far, are very successful. Attendance has steadily increased. Where regular schools with dormitories do not exist, short courses on housekeeping are held for several months, mostly in elementary agricultural schools, especially in winter schools. In these courses the most important branches of the above-mentioned curriculum are taught within a more limited space of time.

In Friedland, Bohemia, there is, aside from a regular housekeeping school, an independent dairy school, governed by its own statutes and possessing steam appliances. It is designed exclusively for dairy instruction and several courses of lectures are given during the year, some for men and some for women.

5. ELEMENTARY SPECIAL SCHOOLS FOR HORTICULTURE, FRUIT, WINE, FLAX, AND HOP CULTURE.

Necessities felt in various branches of the agricultural industry have in the course of time led to the establishment of schools for special branches which can not receive sufficient attention in general agricultural schools. For this reason special schools for horticulture, wine, fruit, and hop culture have been established, with extensive buildings and experimental fields, designed to give their pupils, who, as a rule, have completed the elementary course of a people's school, theoretical and practical instruction, so that they may be able to practice their specialty intelligently later in life. Those for wine and fruit culture, chiefly State institutions, may be considered the most important of these special schools. The next in order are horticultural schools for the education of practical vegetable gardeners.

The institutions belonging to this category, included in the statistical notes following, are arranged very differently to satisfy local demands and the reasons for their foundation. They are partly State, partly association, partly community, and partly private institutions. The term of instruction varies between a winter course and one of three years. The studies in subject-matter and extent likewise show the greatest variations, but it is impossible to classify or group the schools as was done with others in the foregoing paragraphs.

6. ELEMENTARY SCHOOLS FOR BREWING AND DISTILLING.

Strictly speaking, these schools belong rather to technical industry than to the culture of the soil. In Austria they are represented by two schools for brewing and two for distilling. One of the schools for brewing is connected with the agricultural secondary school Francisco-Josephinum as a branch institute, and is managed by a board of directors under the control of the board of curators of the agricultural school with which it is affiliated. This school, with which a well-equipped school brewery for experiments is connected, is designed to give practical brewers theoretical instruction combined with laboratory exercises in chemistry and experiments in the school brewery. The elementary school branches are included in the curriculum. The school year is divided into two terms of equal length, technical instruction being confined to the second term. Applicants with an advanced preparatory education—for instance, that offered in the lower-grade general high school or in a secondary agricultural school, as well as those who are older and who have held independent positions in the business—are admitted at once to the second course. The conditions of admission to the first course are the completion of the studies of an elementary school and at least a half year's practical experience in a brewery.

The city of Prague possesses a similar school which belongs to two associations, the brewers' association in Prague and the industrial brewing association of Bohemia. The preparatory education required is the completion of the course of

studies of a burgher school, commercial school, or the lower half of a general high school. Those who can not comply with these conditions are admitted if they pass the entrance examination. The school year begins with the first of November and ends with the last of June and is not so strictly divided into two terms as that of the school in Mödling. Owing to the shorter term the course of studies is somewhat less extensive. Nevertheless the institution, which gives instruction in two languages, German and Bohemian, and admits pupils of both nationalities, has a very good annual attendance.

There are also two elementary schools for distilling, one in Prague, founded by the association for the alcohol industry in Bohemia. This school has an experiment plant. The other school is at Dublany, Galicia, and was founded by a committee of the higher agricultural institution of that crownland. Both schools are designed to prepare managers of distilleries, theoretically and practically, by a seven months' course of study. Those who have completed the course of a high school of six years, or that of an agricultural school, and practical men who can pass the entrance examination, are admitted. Great importance is attached to experimental lessons in both schools, that in Prague dividing its students into four groups, each assigned to different work. Frequent distribution of work enables the students to acquire a general and thorough knowledge of distilling in a short time.

STATISTICAL DATA.

To complete the foregoing condensed account of the system and organization of agricultural and forestry schools in Austria a few statistical data may follow:

At the close of the school year 1898-99 there were 159 agricultural and forestry schools in Austria. These include 2 institutions of university rank; 12 secondary agricultural schools and colleges; 3 secondary forestry schools; 2 secondary special schools for wine and fruit and horticulture; 1 secondary school for brewers; 40 farming schools, or elementary agricultural schools, open all the year; 57 agricultural winter schools; 7 elementary forestry schools; 13 dairy and housekeeping schools; 18 elementary special schools for fruit, wine, and hop, and horticulture; 2 schools for brewers; 2 schools for distillers.

According to the school census of 1898-99 these institutions were attended by 5,343 students.

According to the language of instruction, these 159 institutions were divided into 65 German, 62 Bohemian, 6 mixed German and Bohemian, 17 Polish, 3 Slavonian, 2 Italian, 1 Servo-Croatian, 1 German-Italian, 1 German-Ruthenian, and 1 German-Roumanian.

The detailed statistics are here omitted, but from what has been said it is seen that instruction in the important study of agriculture, the basis of the nation's prosperity, is comprehensive and regulated by a definite system. If, besides agricultural and forestry schools, we consider the other manifold institutions for instruction in agriculture not organized as separate schools, such as: (1) Instruction given in agriculture and forestry at many schools as a supplementary branch; (2) ambulatory lectures on agriculture; (3) the very large and constantly increasing number of special popular courses given by expert professors; (4) the instruction in agriculture offered in rural continuation schools (which is in need of extension and vigorous development) for people too old to attend elementary schools, and (5) other agencies for disseminating knowledge of agriculture, we may assert that in Austria—thanks to the active and unselfish cooperation of all factors concerned, State and provincial governments, special corporations, societies, and private citizens—those who intend to follow, or are following already, the profession of agriculture and forestry enjoy the advantage of perfecting themselves in the most varied manner and according to their necessities in all the special branches of their profession.

All existing institutions with this purpose in view are in a state of constant progress and development so as to be able ever to meet new demands and new necessities; this sketch is therefore not a representation of a complete development, but only of the present progressive state of affairs.

XII. NOIRÉ'S LOGOS THEORY.

[Prof. Ludwig Noiré, in his book on "Logos, Ursprung und Wesen der Begriffe," closes his interesting philosophic discussion with a chapter entitled "The Logos Theory." In this chapter he elucidates the theory of apperception in so instructive a manner that it seems proper to render it in English as a contribution to the discussion on psychology, especially on apperception, at present going on in the educational press of this country.]

I shall call my theory of the origin of language the logos theory. Two other names are appropriate for it also, to wit, "sympathy theory" and "causality theory," though not completely, because they do not include all the various parts of the whole organic analysis. The term logos theory puts the weight of the argument where it belongs, namely, in the origin of the idea and the combination of the various opposing elements which had to join and organically combine to generate and develop language and thought, the greatest wonder, the pride of creation. These contrasts or opposites may be plainly shown, in order to make the reader conscious of the many powers which had to combine to form the seed bud of linguistic life and to prove the absurdity and the nonsensical triviality of the so-called "imitation and interjection theory;" for these are explanations of the process of thought that can suit only such people as do not think. I will begin with a comparison of language and poetry.

Poetry is, even to-day, creating language, that is to say, ideas, and all original creating of language was poetry—high, ideal poetry. When in the midst of the chaotic, noisy, many-voiced concert of sounds of volition and emotion, for the first time on our earth a sound was heard that had a distinct comprehensible sense, an objective meaning, it was a moment of lofty poesy, for then the sixth day of creation dawned.

Let us, therefore, look into poetry as the living, ever-widening stream of the power of language for an explanation of the essence and characteristics of human thought in its perceptible, tangible appearance in language. Above all, let us see what ultimate contrasts are lying hidden in its depth, which in their combination and cooperation constitute its life.

Jean Paul¹ says of the drama that its most important task is the correct statement of motives. "But what else is this than to make inner necessity appear in the external succession of facts and scenes? This is possible in four ways: (1) Inner phenomena arise from outer, (2) outer from inner, (3) outer from outer, (4) inner from inner phenomena."

The drama is the core of all poetry, for in it speech and action, action and speech, are of equal importance; each pervades the other, both elucidate each other. What, then, Jean Paul says of the drama may be applied to all poetic expression. I shall proceed to present the four categories in their natural succession and explain them by examples. Action implies doing or working (*wirken*); but doing implies causality, the fundamental object of thinking, and hence the only means of portrayal in poetry. We may use the term "originate" (grow out of) instead of "*wirken*" (doing or performing).

1. In poetic expressions exterior things work upon other exterior things. This relation—that of cause and effect—is the fundamental category of all our compre-

¹ *Vorschule der Aesthetik*, II, p. 80.

hension of the perceptible world. Everything is traceable to it; everything must be expressed through it; without it no expression is possible. It therefore must be presupposed, as a matter of course, in all the following cases, since, evidently, all inner things can only be existent for language and thought after they are expressed, i. e., after appearing as perceptible words. Hence that which distinguishes the first category from the three following ones is the fact that in it only a purely mechanical process takes place, while the interior—the will—does not apparently come into consideration. It is the source of its appeal to sense-perception (*Anschaulichkeit*), the supreme merit of all poetry.

Horace says: "You see how Mount Soracte stands out covered with deep snow; how the moaning trees bend under their burden; how, arrested by the frost, rivers and brooks halt in their courses." All this is outer causality, outer change, very characteristic through the contrast to the former natural condition, when Mount Soracte appeared green, the trees stretched their limbs aloft, and the rivers and brooks incessantly hurried onward. An opposite case is found in a similar form of representation:

*Diffugere nives, redeunt iam gramina campis,
Arboribusque comae.*

And here are two more: "May is laughing, the woods are free of rime and icicles; snow is gone, at every green grove songs of joy are heard." "Freed of ice are streams and brooks through Spring's gentle reviving glance."

All these exhibit outer changes conceived as processes of causality, the more effective and expressive the stronger the contrasts that connect them. Nevertheless, one sees here, as everywhere in poetry, the inner life appear; in the "gentle reviving glance," "the laughing May," "the songs of joy," "the vanishing of snow."

Schiller describes the power of Charybdis in the following: "Ah, many a vessel, caught by the whirlpool, shot down into the abyss; and shattered keel and mast alone arise from the all-devouring grave."

Again, outer mechanical causality. Great and lofty verses often owe their beauty to the apparent want of relation between cause and effect, by creating an enormous effect from an insignificant outer cause, whereby the great power of the originator appears in a bright light. To this kind belongs also the famous line:

And God said, Let there be light: and there was light.

The simple word of command is the cause. Haydn has so interpreted this passage musically that, at the last word, an immeasurable fullness of tone, ever broader and broader sequent chords, signify the immensity of the effect in contrast to the simple command. The opposite was done by Handel in his admirable oratorio "Israel in Egypt:"

He commanded the sea—and it dried up.

Here the command is all-powerful, the effect "*pianissimo*," the sea obeys humbly. Both composers intended to express the same thing in opposite ways. Haydn describes the majesty of the Creator by the grandeur of the effect produced; Handel through a perceptible minimizing of the effect which, yet, is perceived to be immense.

To this kind of poetic expressions belongs also the passage from Homer in which Zeus by the mere frown of his dark eyebrows and a nod of his head makes great Olympus shake, a passage which three Roman poets have adopted:

Horace: "Cuncta supercilio moventis."
Virgil: "Annuit et totum nutu tremefecit Olympum."
Ovid: "Concussit terque quaterque
Cæsariem cum qua terras, mare, sidera movit."

Here, in order that the supernatural strength of the thunderer be made obvious, the mechanical effect (effect of outer things upon outer things) is presupposed,

although I do not mean to deny that as concerns the humbly obeying sea, ethical motives, that is, a mythological style of speech, may also be presupposed. In that case it is the living God who has created all and whose voice is heard by the trembling creature, which latter obeys unconditionally. If viewed in that sense the example may be classed in the third category.

How picturesque is the outer effect in the following by Uhland: "And the boatman kneeled oars at rest until he had softly said his Ave."

Can the peace of eventide be expressed more beautifully than by saying that upon the ever restless ocean the boatman may rest upon his oars and kneel to say a prayer?

2. The effect of the outer world upon the inner world is naturally very much more frequent in poetry, since it is one of the most effective means at the disposal of the poet in order to put reader or hearer into suitable mood. When in Schiller's *Diver*, after a twice-repeated summons of the king, in presence of the ladies of a resplendent court, "all remains silent as before," how can the awe-inspiring Charbydis be described more vividly than through this effect upon the mind? How ancient Homer delineates the beauty of Helen passing, by the one cry of rapture of the old men—the one pen stroke which surpasses all possible description—Lessing has shown us. Such lines as, "And a cry of horror is heard round about" in Schiller's *Diver*, instead of "The youth leaps down," "And all present turn pale," in *The Struggle with the Dragon*, as the master puts the stern, unexpected question, are means of poetic representation, equally eloquent and simple. This subject is so extensive that it can never be exhausted in this discussion.

3. The effect of the inner upon the outer world can happen only where sympathy is presupposed, and is therefore closely connected with the first category (which is decisive everywhere) as well as with the fourth. When at the sound of Amphion's lyre silently stone fits itself upon stone, or when it is said of Orpheus, "*Mulcentem tigres et agentem carmine quercus*," material and wild nature feels the charm of the song, otherwise these miracles could not happen.

When Virgil describes the wild uproar of an enraged populace which subsides suddenly at the appearance of a distinguished man we may consider this as one of the most beautiful examples of moral or spiritual effect, very well adapted to exemplify the appearance of a god who commands repose to raging storms and furious waves. Of similar sublimity is the passage in "*The Struggle with the Dragon*," where the commotion of the people who are storming and raging, a fully painted scene, is instantly quieted by the imposing personality:

"Then the master sternly knit his brow
And commanded silence."

The more imposing the outer appearance in which the process takes place, the more plainly is the inner process demonstrated. This third category may best be termed the rule of expression, the second the rule of impression.

4. The last category is that of the effect of the inner upon the inner world. While the first is the only material of poetry, which can exist only through illustration (*Veranschaulichung*), the fourth is the source of poetry, as indeed of all art. For in art soul speaks to soul, but it is able to do that only through the medium of sense perception, through outer representation. Speaking generally, all four categories are effective in poetry simultaneously. I have separated and distinguished them merely with reference to their greater or less effectiveness. Even the purely objective process of the first category must interest from another reason than the simple recognition, it must, at least, express a mood, a disposition, hence be spiritualized. The last category is the law of sympathy.

It needs no proof that all this, as a last contrast, rests upon the relation of subject to object. For the inner world (we may call it will, emotion, sentiment, idea, or what not) is always the essential part of the subject, the outer (the representa-

tion in time and space) the essential part of the object. Hence there are only two conceptions of the world possible, one given within, an ethical, and the other determined from without, a physical conception. To show how art steps in between and mediates is the task of æsthetics.

The whole presentation includes, as we see, the essence and effect of modern poetry. It starts with the presupposition which is the self-evident basis and law of all cognition, namely, that the outer world has an effect upon outer things, according to the law of causality. As has been shown, poetry always deals with inner motives, not exterior cognition; it ever dives down into the earlier sources from which cognition itself has arisen. But to us who are occupied with the origin, the coming into existence of cognition, the premise taken as self-evident, namely, the effect of object upon object, is the problem, the end to be sought. For we know that this apparently natural relation is the hard-earned fruit of human reason, for it is by no means simply a relation of natural objects, but in truth the "causal nexus" of ideas.

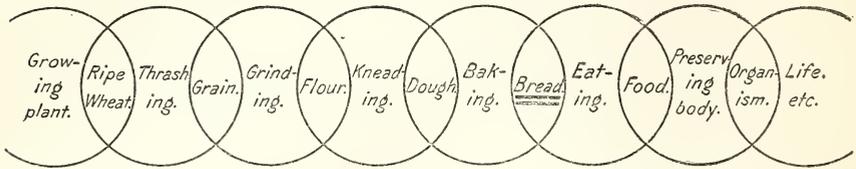

Much more original and natural are therefore the other links or categories in which the subjective essentially participates, as we see in animals whose intellect never passes out of the subjective sphere, but always perceives objects and causes effects directly. Our task, to aspire toward the highest character of human reason, objectivity, leads us to develop the relation between subject and object in inverse succession.

I shall now proceed to demonstrate how my theory of the origin of language embraces and connects this deepest contrast in its fourfold development. The theory starts from the last root of the effect of the inner upon the inner world, will upon will; that is, the ethical element. Above all it presupposes sympathy, and explains, first of all, our social relation. This sympathetic subjective common will becomes objective, it expresses itself in effects produced by common physical powers. Common will becomes objective by common activity and thereby becomes conscious of itself; hence it is the third category (effect of the inner world upon the outer), the many wills attuned alike, which are here represented. It is clear that not the will produced changes, but the physical being of man, his objective body, but that is in this case both will and consciousness. With the production of a lasting effect, the digging of a ditch, the braiding of the pliable willows, the second category comes into play also. The produced outer object becomes the cause of a common sense-perception, a common seeing, a common representation. How this develops into an intellectual action through causality which connects active will with passive perception (the law of expression and impression) I have stated elsewhere. Now, after these preliminary conditions the law of causality appears in its objective generality as a law of cause and effect between bodies in time and space, and with it the first category steps into the foreground. But, with this, thought arises, the idea is generated. Idea is, as we have seen, the combination of two conceptions (*Vorstellungen*) into a unity through necessity (causality). This combination could only occur where an objectively conceived process, the digging, for instance, joined another objective conception, namely, the ditch, to form a unity in thought through cooperative power of conception. That this can take place only in social relations by means of a perceptible equivalent, entirely independent of both ideas, i. e., the sound, the word, needs no new demonstration it is hoped.

What Logos is, how many contrasts it has to unite in order to be what the name implies, has been revealed to us plainly.¹ Independence, independent existence of ideas, which, though defined in the mind by sharply drawn boundary lines, yet are at the disposal of the mind, since they may at any time be called up

¹ The author presupposes a perusal of his previous chapters in which Logos is amply discussed. Translator.

through the word and the generic idea—that is the highest performance of Logos. Thus it originated; this ability to unite and distinguish is preserved in all its functions from the very beginning of thought to the present day, when the immeasurably involved operations of thought are performed with an instinctive, lightning-like swiftness and surety, so that it is well-nigh impossible to trace the separate threads. For the purpose of giving greater clearness to my meaning I shall by means of an illustration show how a single idea contains a number of

simpler elements of thought, also ideas, and how, through their cooperation and the assistance of others governed by them, may result a chain of thoughts which culminates in the one from which the others again radiate. I select the idea bread. Toward the left in our illustration the idea is developed genetically, toward the right teleologically. From left to right the idea becomes more and more special; that is, it absorbs more determining factors; radiating from the center in ever more general ideas, which, all because of their general character, may be brought into connection with it.

By such an illustration it is shown how for the human being ideas may play the rôle of real objects and how he gains the capacity to unite the most remote objects in his ideas, and thus to realize the great wonders of industry and commerce. Without the general ideas which give unity and independence to his separate concepts and make possible their rational combination, as well as their multiplicity, such processes would be impossible. This is the reason why an animal never goes beyond the concept of the present time, and why it can not escape from the limited sphere of its needs. Alas, contrary to this rule, the ants carry on to this day a regular systematized agriculture; they have their live stock and servants as we have. Yea, they have been detected in spending a whole quarter of an hour in gossiping. May God better it.

The idea of causality between objects! It is so simple, so plain, and withal so clear and convincing a distinction of Logos, i. e., human reason, as against all animal instinct, that it appears incomprehensible why this distinct and plain dividing line has not been observed and determined long ago. In order that this causality be comprehended by the mind, it is necessary that in the very beginning one of the two causal members be existent as idea, and that the other be produced through the process of thinking. In the expression "here somebody has been digging," the thing seen points to a past activity as cause. In the other expression "this is to be dug," it points to a future activity as an effect. Hence two ideas must be present in both cases, i. e., only one of them through representation; that, however, is possible only through the idea, the word: Therefore, only man, and never an animal, can be found in possession of a tool.

Kant has demonstrated, profoundly and convincingly, that certain original elements of thought must be added to give ideas reality, i. e., independence and subsistence. He has been roughly criticised by Schopenhauer, unjustly, I think; for the latter attributes to the animal likewise independent, objective ideas, which is a great error. On the other hand, Kant rated sense-perception too low, because he restricted himself too much to pure passivity, whereby he did not sufficiently consider that sense-perception is developed constantly through thinking, and especially in the direction which Schopenhauer justly terms intellectual intuition (*intellektuelle Anschauung*). This is, as has been seen, the most beautiful and ripest fruit of thought; and only man possesses it, whose capacity for sense-

perception is only awakened through language, and has developed through constant reciprocal activity side by side with language.

After thus arriving at a clearness which enables us to see that the life of ideas (*Vorstellungsleben*), both in form and essence, constitutes human thought, that its infinitely increased activity and capacity causes the immeasurable superiority of man over animals, and daily widens the unbridgeable chasm between them, it remains, in conclusion, to follow the subject to its last philosophic depth by investigating how the life of ideas (*Vorstellungsleben*) and the formation of thought are related to the fundamental faculties of man. For that volition, imagination, and thought are equally participating in the process, must have been brought to our attention at every step of our demonstration.

In the foregoing we analyzed perceptive activity alone, as it is met in poetry, into its last principle, according to which it enters into combination with thought, i. e., the principle of causality, and, in doing so, we defined four categories. Now, it remains to compare our division with that presented by Schopenhauer's fundamental work, in which he speaks of the fourfold root of the principle of sufficient cause. We shall find a marvelous agreement in them, and, in conclusion, I shall derive the terms fitting my theory of language.

Like Kant, Schopenhauer starts from abstract cognition as it appears in human judgment. In this he is right, and therefore causality is with him "der Satz vom Grunde," the principle of cause. For, as we know, all higher human cognition is realized in judgment, in assertion, in combination of subject and predicate; hence the first question we shall have to ask is after the—

(1) ¹ Cause of cognition, "*ratio sufficiens, ratio cur sit verum.*" Why is any assertion, any judgment true? The sources of cognition may be whatever they are, every judgment has to pass muster in the forum of thought, and that asks for the foundation or cause of the assertion. The most important source of cognition, of course, is sense-perception furnished by everything material, but which goes back to outer changes and is therefore dependent upon the—

(2) Cause of coming into being, the law of cause and effect, be it that we judge from effect (upon eye, ear, touch) back to cause (that which is seen, heard, touched), or that we judge from the cause to the future effect, from the blow to the murder. This is causality in its purity, the fundamental law of all outer, empiric cognition. It consists, as stated before, only of phenomena in time and space and forms an endless chain in these two forms. But since this causality is applicable only to that which presents itself in time and space, it therefore deals exclusively with matter which itself is only an idea, an objective action, as it were. Schopenhauer deemed it necessary to separate from it the categories of transcendental forms, namely the uniformly extended time and space and to define them and their legitimacy by the—

(3) Cause of being in thought. This cause forms all mathematical judgment. Every Why? in mathematics is answered by the presumption of complete uniformity of all parts of time and space. That this is another Why? than that of coming into being, is beyond doubt, because the latter is always empiric, while mathematics consists of nothing but synthetic judgments "a priori." Nevertheless, the two classes are so inextricably interwoven that it does not occur to many why they should be separated, the more so, as, according to Kant's dictum, there can be in any branch of knowledge only as much true science as there is pure mathematics in it. It is therefore best to make it clear through examples, that whenever the question is one of pure mathematical quantity, a statement of time or space (i. e., a number) the Why? is of quite a different nature from the Why? of real relation of cause and effect. The originality, that is, the presupposition of

¹ I have taken the liberty of changing the succession of the four forms as they are presented in Schopenhauer's work. His real views are thereby placed in a clearer light and become better understood.

those statements of time and space necessary for the process of thought and the formation of empiric judgment, is seen from the fact, that a Why? can never explain to us how our thoughts are inseparable from these forms; nor will it ever be able to give us the least explanation of why our earth, our solar system, in short, every single phenomenon exists here in this particular part of space, and now in this particular time. Why did Goethe die in the year 1832? That is a question which has no sense, except a mathematical, because from two statements of time (the date of his birth and his age) the third is derived. Time determines time; space determines space; time and space determine each other reciprocally. That is the foundation of all mathematical, and lastly, of all human knowledge.

(4) The fourth division, finally, embraces the cause of action or the motives of it. While in the former three classes we dealt with intellect, here volition comes into play; here perception and idea are only means. As we said before, man is not only a knowing being, but foremost and above all a being of volition. Through ideas and cognition our will becomes conscious, illumined, our action is the result of motives. Hence Schopenhauer is right when he says: Motivation is causality viewed from within. What we call in plants stimulus (*Reiz*), in animals impulse (*Trieb*), is in man the idea (*Vorstellung*), namely motive or cause of action. But since his ideas are infinitely numerous and inextricably interwoven, just like the real objects they represent, his actions are very complicated, and hence circumspect and conscious of their purpose. However, that which really acts, is as immediate and simple as it is in plants and animals: it is the will.

But because the subject of the will is given immediately to self-consciousness, it can not be more minutely defined or described what will is; it is rather the most direct of all our cognitions whose uncommunicability must throw light upon all others which are not so direct.¹

To this last sentence I have not added a word to furnish the proof of the justness of our method which starts from that which is certain, the will and its expressions. Kant's and Schopenhauer's procedure is analytic, they penetrate from mere perception to the depth; Kant does it in transcendental presuppositions of ideas or categories. Schopenhauer by inquiring into the last root of the fundamental essence of man. Our method is deductive and genetic; we attempt to accomplish what Locke attempted: a genesis of reason. Hence, Schopenhauer's fourth class becomes the first.

(1) The law of motivation concerns the antithesis and unity of will and ideas. This law we have noticed before as the fundamental law of poetry and, we may add, of all art. Poetry and art appeal to man in his totality, the willing, feeling, and thinking man in the unity of his actions. Every action appears to us by means of ideas illumined by consciousness; hence connected by inner necessity, by motives. Who would deny the fact that the series of ideas connected with the will and standing in close relation to it must be the most natural, the most original of all? Furthermore, that practical thinking, so to speak—that is, thought directed by interest—based upon the foundation of the will, must be placed first? Is it not, even to-day, the object of life for most people? Liberation of thought from desires and volition constitutes progress toward theoretic knowledge. This proves that at first thought was intimately connected with the will; hence that ideas combined with others in the consciousness of original man, not in causal, genetic, and intellectual combination, but in form of instinctive impulses, accidentally or through natural causes. The will was autocratic ruler for a long period of time. All speech aimed at practical effects, at sympathetic agreement, impulsion to common action. From the first instinctive expressions of will, which may have been sounds of incitations uttered during aboriginal activities, such as

¹Schopenhauer, *Vierfache Wurzel*, sec. 43.

digging, braiding, etc., up to the inflaming eloquence of the popular speaker who kindles the souls of men to enthusiastic warlike courage by pictures of desecrated graves and temples, of destroyed cities, of women and children dragged into slavery, there is active everywhere the same law—the effect of will upon will by means of sympathetic mood accompanied by related ideas. There is everywhere imitation, activity, will. Hence my theory has justly, I think, been called “Sympathy-theory,” because it builds its superstructure upon sympathy. From this we arrive by means of a narrow but firm bridge to our second (Schopenhauer’s first) class, namely:

(2) *The cause of coming into being.* This is the important fundamental rule of all outer and inner comprehension, and with it we approach the intellectual field. For though in the foregoing class an idea is the cause of action (i. e., an inducement for the will to express itself), it need not by any means be an insight into the causal procedure such as is seen from a burnt child dreading the fire as instinctively as the dog the whip, or the bird the rifle. Motivation is found in all these cases, but comprehension none or very little. Where, however, the coming into being, the change, is subject of observation and contemplation, there begins comprehension of the causal process. The narrow bridge which leads to this was the common self-activity of sympathetically attuned aborigines. The bridge was firm, because it connected with the will and the interest which at every hour controlled imperiously the races which were forming languages, and never released them from their bondage. Without this healthy, strong, wild stem of knotty hard wood the noble twig of cognition could never have developed. Our ancient fathers were not singing shepherds or ambulatory natural investigators; they grew up in the hard school of necessity and its constant defense, first, through physical power and then through the increasing power of intellect and comprehension.

This category is the true medium between the first and the third, for it connects unconscious will and instinctive action (of which all organic life consists) first of all with comprehension whose essence is the insight into the causal process, the plain distinction of the two links “cause and effect.” The outer effect, while produced by the changing activity of man himself, presented itself to his view, was, so to speak, produced from his most ancient labor and artistic activity; that effect was an important and decisive step toward objective cognition. Nevertheless, this activity and effective labor was to a great degree unconscious or instinctive, and not until we enter the fourth category will the light of comprehension beam brighter and brighter, illuminating the causal process, thereby elevating and improving this activity in the consciousness of the actively laboring human being. According to the process just described my theory deserves the name of activity theory.

(3) The principle now following corresponds to the third class of Schopenhauer. It concerns the faculty of sense-perception (*Anschauungsvermögen*) awakened, which constantly elevated and improved man’s own activity and its effects. This power derives its ultimate causes singly and solely from the pure forms of time and space. Thus, for instance, in seeing a circle, which should consist of twelve nails placed at equal distances, but of which one is missing, we instantly ask, Why is that nail missing? The powerful ally of art (activity) and mind (logos), namely, imagination, rules as supreme queen in this region. In order that imagination may not grow wild it is bound to the presuppositions of art activity, and that it may not degenerate it is curbed by the strict rule of thinking reason. Placed between these two, action and reason, it tries at all times to encroach upon them, now tempting art to phantastic caprices, then leading thought to irregular roving and groundless suppositions. Now, that to-day all things are viewed in definite forms and outlines; that the whole world is to us not as it is to the animal, a confused

wild chaos without rule, order, and oversight, but a well-ordered system of objects in strict regularity and engaged in incessant reciprocal action—that has become possible alone through imagination. It developed side by side with language and awakening thought from intellectual contemplation of that which was produced by the creative activity of the ancestors of our race. Hence a fitting name for my theory may be the theory of sense-perception (*Anschauungstheorie*).

From the principles (2) and (3) there arose really, as seen in Schopenhauer's theory, perfect causality, the comprehension of which would not have been possible without will and activity, nor without the transcendental scheme of time and space, the armor of imagination. This axiom of the Kant-Schopenhauer theory, so difficult for ordinary comprehension, becomes perceptible by the organs of sense almost, through my theory of the first origin of reason. For there we see the active causality of our will produce effects, create forms half in dream, which then perceived by the senses (passive causality) change into ideas and subsequently enter again consciousness as reflex-activity of the will. But that is no succession of acts or items, although it appears as such, but simultaneous action, the essence of causality and reason. Therefore, one of the most important sides of my theory may be termed the causality theory.

(4) But the most important is still missing—the free, regular, well-organized combination of ideas, a combination which is guided and illuminated by the light of comprehension, in a word, the *logos*. For, despite all unity of causality in the cases heretofore stated, the idea is still closely connected with will, emotion, and immediate sense perception. To liberate the idea from this bondage of coarse empiric reality, to lift it entirely into the ideal sphere, where it can enter into numerous combinations with spiritual liberty, to create this miracle, causality must liberate itself and become a powerful weapon, an ever-ready tool of the human mind.

With the production of ideas and words causality became free. The most ancient words—digging, braiding, binding, separating—have no other content than causal relation, the combination of two concepts formed by sense perception which constitute the causal links, i. e., the *logos*.

The causal relation contained in all ideas and words, i. e., their verbal element, which has its true beginning in their origin in activity, in connection with the substantiality of the ideas themselves, makes possible their combination.

Thus words and ideas unite to form human judgment, and with that we arrive at the first (second) class of Schopenhauer's classification—abstract thought and its ultimate principle, the cause of cognition. But all judgments, be they of whatever nature they are, have as a first presupposition nothing but ideas derived from sense perception, from which they have risen and to which they descend again from their abstract height where they have to find their application.

Combinations of perceptions with perceptions, of ideas with ideas, of judgments with judgments—all this is *logos*, and hence my theory of language deserves the name of *logos* theory.

XIII. GOETHE AND THE GREAT THINKERS.

[By Prof. Rudolf Eucken in Jena.]

[NOTE.—In *Die Zukunft*, a weekly in Berlin, Prof. Rudolf Eucken published recently an oration on Goethe and the Great Thinkers which he delivered before the Goethe Society of Germany. The oration is so replete with practical pedagogical allusions and delineations of psychological processes that it seems most desirable to reproduce it in English to make its contents accessible to American readers. There has hardly been another mind of such magnitude in modern times as that of Goethe's, hence it is interesting and instructive to see how the great

thinkers of all ages, especially of antiquity, have influenced Goethe; how their lofty thoughts have entered his mind and there abided, molding his aspirations, sentiments, and judgment, and thus proving the sublime truth that the civilization and culture of any person or of any nation is inextricably interwoven with the civilization and culture of all ages preceding. The following is Professor Eucken's oration.]

Last year I had the honor to address the Goethe Society on the subject of Goethe and philosophy. My effort then was necessarily circumscribed because confined to the discussion of a specific purpose. It would have led me too far to explain Goethe's relation to the history of philosophy and his connection with the separate great thinkers. This subject has a peculiar charm. It not only allows us to see with great clearness what Goethe tries to find in philosophy and what to him appears great, but it also reflects in characteristic manner in general his way of accepting men and things. It instructs us very lucidly as to what position we have to take toward Goethe if that is to be done in accordance with his own mode of thinking. To the solution of this problem I desire to add my contribution.

We know that Goethe's world of thought was not formed in close adherence to any philosophic system, and, indeed, not out of philosophy at all, but that it arose from the inner necessity of his own nature and the experiences of his life. Still, to an existence founded upon itself a strict seclusion is not suitable. Goethe felt that, for he ever considered himself as one growing (*ein Werdender*). As such he could seek the object of his life in becoming and being more and more at one with himself, open to suggestions, grateful for aid offered him. Freedom in this case was quite in harmony with honest reverence for everything great "which lifts us above ourselves and like a guiding star lights the way ahead." This greatness Goethe found, among other sources, in philosophy, especially in that of the leading philosophers, who stood before him in the impressive totality of their being. That which he sought in them was never mere information, but reanimation and increased vitality for his own actions. This relation had throughout a personal character, because in others he always valued, and from them he accepted and acquired, that which promised aid to his own process of life. In so far Goethe is an eclectic; but he is that only in the sense which he gives to the term, since he called an eclectic "one who accepts of all that surrounds him only that which is in accordance with his nature." But Goethe had the advantage of a very peculiarly individual nature which saved him from unprincipled vacillation and allowed him above all to develop his own life in absorbing alien thoughts. Such absorption was never a passive process with him. It seemed to him characteristic of the living unity of an *entelechy*¹ that "it accepts nothing without acquiring it by additional self-action." Thus to him every recognition of the thoughts of others, like a translation into his own language, becomes thereby an inner transformation.

Goethe was perfectly conscious of this personal nature of his relation to the great thinkers. He wished to delineate not only what these thinkers were in themselves, but what they were to him. He never demanded that the particular mode in which they were reflected in his mind should be authoritative for others. He at the same time reserved to himself the fullest measure of freedom with reference to the great thinkers and declined with the greatest determination to blindly subject himself to them. In point of fact, he thought it quite impossible to completely understand anyone in his own sense. Such sentiments Goethe expressed frequently with the clearness so characteristic of him. While, for instance, he recognized with grateful veneration what he owed to Spinoza, he protested at the same time against accepting all his works or confessing himself to be his disciple: "For that no one understands another; that no one in the same words

¹ An *entelechy* is, according to Aristotle, a self-active being or soul.—*Translator*.

thinks what another means by them; that a conversation, a reading, awakens different thoughts in different persons, I had clearly understood long ago; and it may be taken for granted that the author of Werther and of Faust, deeply convinced of this disproportion, would not fall into such an error as to claim to have completely understood any man." Of Kant, with whom Goethe, after some reservation, occupied himself more and more, he said: "I merely expressed what he had excited in me, but not what I had read."

One would think that in consequence of such personal manner of acquisition Goethe had abandoned all inner community with others and that truth had been dissolved in him in an infinite number of subjective reflex pictures, but that was not at all his intention. His fundamental convictions offered him a firm support against such a destructive relativism, for throughout his life and work he was impressed with the conviction that as all the fullness of individual formations must be embraced by one universal life, so all the differences of individual comprehension can not annul a common truth; on the contrary, they only confirm it. Though everyone expresses truth in his own language and, in fact, acquires it individually, it still remains the same truth within which we all stand and which we all serve. Thus individuality and universality are not opposed to each other; "everyone can have his own truth, and yet it is the same truth." In this way the thoughts of others may be translated with perfect freedom into one's own language without abandoning their truthful contents.

A lucid example of such a weaving of alien and one's own thoughts is offered us in Goethe's treatment of the æsthetic Hemsterhuis. He said:

I could not make Hemsterhuis's philosophy, his foundations and course of ideas, my own in any other way than by translating them into my own language. Beauty and that which delights us in it is enjoyed when we can conveniently perceive and comprehend the greatest number of ideas in one moment, he said; but I should think beauty is that in which we recognize the life of the individual conforming itself with freedom to that of the social whole (*gesetzmässig Lebendige*) in its greatest perfection, and are thereby induced to reproduction, and feel animated to a like increased activity. Forsooth, the one is the same as the other, only expressed by different persons.

How much more has Goethe made of Hemsterhuis, how has he translated the scholasticism of his theory into that which is purely human, how has he lifted the mere intellectual into general mentality! and yet there is preserved a certain connection—that which is common is noticeable among all differences.

Such personal and individual mode of treatment has undoubtedly its limits. It instructs, strictly speaking, less about others than about Goethe; it results in no consistent representation of the history of philosophy; it is ever in danger of missing the core by attempting to form a collective picture of some captivating impressions of great personalities. This is seen from the famous description and comparison of Plato and Aristotle in Goethe's history of the theory of color. When Goethe here makes Plato, the most fiery and combative of all the ancient thinkers, appear in relation to the world "like a departed spirit who is pleased to abide in it for a while," and when he speaks of Aristotle, the originator of systematic metaphysics, the master of those who know, as one "who regards the world like an architect; one who happens to be here and is bound to create and labor; one who investigates the soil, but only as far as necessary to find bed rock; one to whom all else below down to the center of the earth is indifferent," his pictures are distorted, not only in the details of their execution, but in their fundamental sketching. They are so lamentably out of perspective that only the luminousness of their coloring can make us understand why even in manuals of philosophy they are still quoted as authority.

Such errors arose, in fact, from the circumstance that Goethe departed from the field in which he demonstrated his greatest strength and became didactic. Whenever he stayed within his limits and presented the great thinkers in that which

they were to him personally he stood on firm ground, and then he offered something incomparably more valuable than anything which customary dullness of thought and life is apt to praise as objectivity. His relations to the great thinkers are, in the first place, development of his own being, confessions concerning his own aspiration. We see cycles of thought touch each other; see how syntheses of beings arise; see how life streams from one to the other. The peculiarity of Goethe's mode of thinking is thus comprehended in a special subject, but likewise the other thinkers are made more comprehensible through his contact with them. While Goethe's penetration ever seeks things essential, productive, purely human in his reading; while his seeing consists in discriminating simple principles; while his descriptions cause inner animation, some of this reflex action in his clear and subjective mind also throws back bright light upon the authors he reads; hence they appear in amplified and purer features before our eyes. Now, let us see whether the actual treatment of those thinkers who were most important to Goethe confirms this statement.

Goethe's estimate of Greek character necessarily made valuable to him those, like all the ancient thinkers, who understood how to express in thought the peculiarity of classic intellectual life. Socrates, Plato, and Aristotle—among them especially Plato—of course stand in the foreground. In two respects Goethe felt himself attracted and benefited by them, first, by their great simplicity and unity in contrast to the ramifications and complexity of modern life, which made him greet as an event every approachment to those three intellectual heroes. As he states it, "We find in them that which we feel most joyfully and which will promote our education at all times most powerfully." Yes; as a refuge from the limitless multiplicity, dismemberment, and confusion of modern natural science the question might appear: "What attitude would Plato have assumed toward Nature, as it appears to us in its ever-increasing diversity despite all its profound unity?"

The second point connecting Goethe with the ancients is the synthetic manner in which the close relations of man and world are expressed by them. That famous saying, that the eyes should be sunlike (*sonnenhaft*) to enable us to see light, is not only connected with Plato outwardly; it is the Platonic conviction of the essential relation between soul and world, of a reunion of both in cognition, which governed Goethe's thoughts. In following the ancients in this there took place at the same time a confirmation of his own essential being.

It requires traveling through long periods of time to reach a thinker who influenced Goethe as much as Plato did, but having found him in Spinoza we have also reached the zenith of the whole course of Goethe's development, for with no one else did he enter into such intimate relations as with him; nowhere else did the other become so immediately present in his own life's process as in this case. Goethe confessed more than once that the one thing which attracted him to Spinoza was the peaceful effect he received from him—the atmosphere of peace that seemed to waft to him from Spinoza's works. He derived from him not only invigoration, but restoration, for he felt, especially during the epoch of storm and stress, the compensating placidity of Spinoza as a most beneficent contrast to his own all-exciting aspiration. In later years likewise he liked to flee from the chaos of life and disagreeable impression of alien modes of thinking to this "refuge of old."

Here he found himself aided in the desire to be superior to all partial resignation by means of a placid and pure resignation in a totality; here he was charmed by an unlimited disinterestedness of sentiment; here he saw ideas of the world severed from the trifles of men; here he found all multiplicity embraced by a grand, universal life, and at the same time he found his deep-rooted view confirmed that the divine could not enter the world from without, but that God was to be sought in nature and nature in God. Whatever there was in Spinoza unas-

simulative to Goethe the latter simply severed and laid aside without prejudice to his reverence for the philosopher. Thus, for instance, the mathematical turn Spinoza gave to his thoughts; thus the cumbersome armor of his argumentation, and everything which could in any way oppose independence of the individual and freedom of movement. When Goethe abstracts the great intuitions of Spinoza and clings to them he of course presents us only with Goethe's Spinoza, not the universal Spinoza; but is not thereby the immortal truth in the philosopher's life work demonstrated with especial clearness?

Leibnitz recedes far behind Spinoza; but Goethe did not only grow up during an era which was saturated with Leibnitz's thoughts—his own nature contained points of contact with the great monadologist. Especially is this noticeable in his idea of individuality and that of "being-with-oneself in inner life." Who else but Leibnitz blazed the way for the idea that nothing can come into man's mind from without, since "the monads have no windows;" that, on the contrary, all mental progress is an unfolding from within; that man does not live to see things, but himself in the things that surround him? Likewise, through Leibnitz, Goethe certainly acquired the Aristotelian expression of "entelechy," which is to serve as the vessel for that conviction. According to his own methods of procedure, Goethe could accept that estimate of individuality and that idea of the process of life without getting into contradictions with the universal life taught by Spinoza. Another point of contact with Leibnitz is Goethe's exalted valuation of the principle of constancy (continuity) in nature and history. Leibnitz had announced this principle with especial emphasis as his own. However much Goethe differed with him in carrying out this principle, in the fundamental idea he remained his close adherent.

Goethe's individuality demonstrates itself especially plainly in his relation to Kant. The latter's mode of thinking could, from the very beginning of the contact, not be sympathetic for Goethe; nevertheless he succeeded in becoming familiar with it and in deriving much good from it, as soon as a point of contact was found. After Kant's Critique of Pure Reason, lying entirely outside of Goethe's horizon, had produced no strong effect, the point of contact was found in the Critique of the Power of Judgment. Preserving all his self-dependence, Goethe could now enter into inner communion with Kant:

Although it was not always possible to adapt myself and my mode of thinking to the author's, missing a point here and there, yet the fundamental thoughts of the work were quite analogous to my previous doing and thinking. The inner life of art as well as nature, their unfolding from within outwardly, were plainly expressed in the book. The products of these two infinite worlds should exist for their own sake, and that which stands side by side should stand also for each other, but never intentionally opposed to each other.

After thus establishing inner communion, a more positive view of the totality of Kant's work resulted for Goethe. He welcomed thereafter not only the Critique of Pure Reason, but also partly Kant's Philosophy of Nature, many ideas of which he accepted gladly. A new epoch, a new movement, seemed to have been inaugurated by Kant, the influence of which scarcely anyone could escape with impunity. Thus we see that that which had been repulsed at first became a positive factor in the life of Goethe.

Of the successors of Kant no one came nearer Goethe than Schelling. Not only did the great poet praise in the whole of Schelling's method "the great clearness despite its profound depth" (an estimate which to-day is not shared by many), but he received the strongest impulses from Schelling's natural philosophy. If in later years Goethe seemed to see a lack in his former conception of nature—"the idea of the two great driving wheels of nature; the ideas of polarity and growth, the former of matter as far as we think it material, the latter in so far as we think it spiritual"—this progressive movement is evidently owing to Schelling's influence.

But also the general method of Goethe's philosophy is in sympathy with the artistically inclined mode of thinking of Schelling. For the latter's way of placing contrasts prominently before the eye and yet keeping them in live relations, meets the deep-rooted aspiration of the poet to calmly and considerately analyze reality in a series of contrasts, to unfold the various sides and bring them into productive reciprocal action. In my lecture on Goethe and Philosophy I have elaborated upon his way of presenting reality in a large texture of contrasts and complementations. With such positive relations to Schelling, Goethe brushed aside other things of his which were to him as unsympathetic as to us modern men; for instance, the boldness of Schelling's speculations and the hasty superficial manner of his work.

A review over the manifold relations of the great poet to the great thinkers gives at the same time a general review of Goethe's thoughts. From that which he seeks in others it is plainly obvious what philosophy is to him as a whole. It means to him no brooding over hidden causes of things, no stepping outside of the world in order to develop it from his superior point of vantage, but it is to him a taking of an inventory in a world surrounding us with inexhaustible fullness of life. It is to him a clearing up of our relations to ourselves and the world without, and hence it adds to human growth. This is quite in harmony with his prevailing artistic, nay, plastic mode of procedure. Whether this type of thinking may not give fruitful suggestions and additions to philosophy itself, whether it might not promote the scholastic manner of the philosopher's work by transforming it into the purely human (in's *Reinmenschliche*), is a question which can not be discussed here to-day.

But I should like to say a word or two concerning that which Goethe's attitude toward the great thinkers offers for our own attitude toward them, namely, a shining example. Goethe occupied himself with the other thinkers only in the interests of his own development; he accepted them no further than they promised furtherance to his own life; he educated himself with them rather than through them; he always preserved his self-dependence as the most precious of possessions. Accordingly, he himself did not wish to appear to others as a master, but as a deliverer. In this predilection he did not mean to depreciate his own work. Such a man is not honored as he wished to be honored when he is considered a binding authority or a general rule, or when his guiding idea is confused, namely, that the highest effect of the mind is to create mind, or of individuality to awaken individuality. We shall only treat Goethe in the sense of Goethe when we recognize in him, above all, a strong, incomparable individuality and try to assume an independent relation to this individuality; when we take him as an aid to develop in ourselves a clearly distinct type. But to do that we must preserve the same freedom toward him which he preserved toward others and which he by no means considered a privilege of genius. The urgent admonition is not superfluous yet, namely, that we should practice less Goethe worship and enter more into fruitful relations to him, so that we may gain more furtherance for our own life.

XIV. STATE APPROPRIATIONS FOR EDUCATION IN EUROPE.

I. ANNUAL BUDGET OF THE MINISTER OF INSTRUCTION IN RUSSIA FOR 1900.

The expenditures of the Russian Empire estimated for 1900 reached the large sum 1,757,387,103 rubles, against 1,571,732,646 rubles in the preceding year, an increase of 185,654,457 rubles. The appropriation for educational institutions, so far as they belong to the jurisdiction of the minister of education, amounted to 33,180,829 rubles for 1900. This is an increase of 4,419,638 rubles over the previous year.

The following list¹ gives an itemized account of how the 33,000,000 rubles are divided:

[One ruble equals 51 cents.]

	1900.	1899.
	<i>Rubles.</i>	<i>Rubles.</i>
Central administration.....	366,167	352,987
Administration of the school provinces.....	622,182	606,860
Universities.....	4,463,965	4,108,045
Secondary schools.....	9,779,999	9,399,510
Elementary schools.....	6,484,623	5,411,206
Normal schools.....	1,269,598	1,237,350
Special schools.....	1,656,800	1,571,399
Academies of sciences.....	1,292,708	1,260,470
Preparation of professors.....	1,793,506	1,372,846
School buildings.....	4,481,798	2,588,214
Miscellaneous.....	969,483	852,234

II. SWITZERLAND AND PRUSSIA COMPARED.

In 1898 the expenditures for the entire system of schools in Switzerland amounted to 43,587,000 francs (1 franc equals 19.8 cents) which, with a population of 2,917,749, shows a per capita of 14.9 francs, or 11.92 marks German money (\$2.84). The expenditures for the primary schools alone amounted to 28,204,996 francs, being 9.7 francs per capita of the population. In the Canton of Zürich the per capita was 19.7 francs, in Basel 18.1 francs, but in Valais only 2.9 francs. Each primary pupil cost 58 francs (or 46.40 marks or \$11.48). In Zürich the per capita per pupil was 113 francs, in Basel 170 francs.

The Kingdom of Prussia spent for its elementary schools 185,917,495 marks (1 mark equals 23.8 cents) in 1896, which is a per capita of the population of 5.84 marks and a per capita of the pupils of 35.50 marks (\$1.39 and \$8.45, respectively). The expenditures for all educational institutions (elementary, advanced elementary, secondary, and higher, except the various special schools) in 1896 amounted to 247,500,000 marks. The population of Prussia at that time was 31,885,123; hence the per capita of the population, 7.77 marks (\$1.85). If Prussia paid as much for education as Switzerland does, it would have to spend 379,713,066 marks for all the schools and 247,195,754 alone for elementary schools.—(Pädagogische Ztg., Berlin.)

III. ANNUAL BUDGET OF THE MINISTER OF INSTRUCTION IN PRUSSIA FOR 1900 AND 1901.

The annual budget submitted to the house of deputies and passed without essential changes closes with a sum total of 153,468,730 marks (1 mark equals 23.8 cents). This shows an increase over the preceding year of 1,359,945 marks. But this sum includes the appropriations for churches, hygienic affairs, universities, secondary schools, as well as for elementary schools. For elementary schools alone the appropriation amounts to 82,074,691 marks, an increase of 373,999 marks over the preceding year. Of course, these 82,000,000 marks represent only the State's contribution, not the taxes raised for school purposes by cities, counties, and other authorities. The following is an itemized statement of the expenditures contemplated for 1901:

	Marks.
(1) Normal schools.....	7,020,422
(2) Preparatory schools to normal schools.....	920,625
(3) Schools for teachers of gymnastics.....	120,605
(4) School supervision.....	3,395,640
(5) Girls' schools.....	230,000

¹ Zeitschrift für ausländ. Unterrichtswesen.

STATE APPROPRIATIONS FOR EDUCATION IN EUROPE. 117

	Marks.
(6) Elementary schools.....	69,845,147
(7) Schools for the deaf and blind	120,040
(8) Orphan asylums, etc.....	125,712
(9) Funds at the disposition of the minister	296,500
Total.....	82,074,691

For 1901 the budget has been increased, as is seen from the following items: The sum total for elementary schools is now 85,265,261 marks, to which comes a building appropriation of 13,930,171 marks, and other incidental expenditures amounting to about 500,000 marks. It is interesting to notice the various items of the whole budget of which the foregoing are only parts.

Budget of the department of education, worship, and medical affairs.

	Marks.
A. Permanent expenses:	
Expenses of the department.....	1,233,730
Protestant consistories.....	1,598,695
Salaries for pastors.....	1,737,918
Catholic institutions.....	1,256,300
Salaries for priests.....	1,363,017
Old Catholic churches.....	54,000
Provincial school authorities.....	832,280
Boards of examiners.....	98,636
Universities.....	10,707,352
Secondary schools.....	13,020,675
Elementary schools.....	85,265,261
Art and science.....	5,041,665
Technological schools.....	2,343,301
Education and worship combined.....	17,521,199
Medical affairs.....	2,754,453
General funds.....	273,655
Total.....	145,152,437
B. For buildings and incidentals:	
For the department.....	1,454,250
For universities.....	4,997,136
For secondary schools.....	1,059,120
For elementary schools.....	13,900,171
For art and science schools.....	6,205,049
For technological schools.....	2,028,595
For education and worship combined.....	500,000
For medical and sanitary affairs.....	621,750
Total.....	30,826,121
Grand total for 1901.....	175,978,558
Or an increase over 1900 of.....	22,629,828

IV. COST OF PROFESSIONAL PREPARATION OF TEACHERS IN SOME GERMAN STATES.

The following statistical data are taken from the budgets of the ministers of public education of the larger States of Germany for 1900. The calculations and comparisons can not lay claim to absolute exactness, owing to the variations in the different appropriation bills, their nomenclatures, as well as the variety of organizations of the school systems, which presupposes inequality in many ways and makes uniformity in expenditures as impossible as in similar relations in the United States. The Empire of Germany is a federation of 25 States, each one of which manages its schools independently. For rough calculations, however, a comparative review of the following data may suffice. It is a postulate of German statecraft that the State alone must support the normal schools, aside from tuition fees. No communal, county, or provincial taxation adds to the income of institutions providing the State with teachers, who, being indebted to the State for their professional education, are imbued with the idea that they are morally obliged to uphold the State.

A.—Grand totals of regular expenditures of ministers of worship and education.

Country.	Expenditures.	Per capita of the population.
	<i>Marks.</i>	<i>Marks.</i>
Prussia <i>a</i>	137,619,795	4.32=§1.03
Bavaria	29,029,320	4.99= 1.19
Saxony	19,013,743	5.28= 1.36
Württemberg	12,556,396	6.03= 1.44

B.—Regular expenditures for education only. The States' quota.

Country.	Expenditures.	Per cent.	Per capita of population.
	<i>Marks.</i>		<i>Marks.</i>
Prussia	112,703,655	81.9	3.54=§0.84
Bavaria	21,393,338	73.7	3.68= .88
Saxony	16,523,858	86.9	4.36= 1.04
Württemberg	7,440,095	59.8	3.57= .85

C.—The States' quota for education in detail. (b)

Country.	Secondary schools.		Normal schools.		Elementary schools.	
	Marks.	Per cent.	Marks.	Per cent.	Marks.	Per cent.
Prussia	12,355,271	11.0	7,981,048	7.1	74,093,643	65.7
Bavaria	3,682,837	17.2	1,200,139	5.6	16,391,846	48.1
Saxony	3,078,311	18.6	2,058,124	12.5	8,025,847	48.6

D.—State expenditures for normal schools in detail.

Country.	Salaries.		Scholarship and other aids to students.		Buildings and equipment.	
	Marks.	Per cent.	Marks.	Per cent.	Marks.	Per cent.
Prussia	3,763,776	47.2	2,783,937	34.9	1,433,335	17.9
Bavaria	827,229	68.9	102,135	8.5	270,775	22.6
Saxony	1,454,865	70.7	116,780	5.7	486,499	23.6
Württemberg	224,225	57.7	133,960	34.5	30,496	14.9
Baden	167,374	69.1	38,710	16.4	58,465	14.5

E.—Per capita for professional preparation of teachers.

Country.	Per capita of population for normal schools per annum.	Per capita of students—		
		In preparatory department per annum.	In normal schools per annum.	During entire term of preparation.
	<i>Mark.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>
Prussia	0.25	360	599	d 2,889
Bavaria21	338	505	e 2,024
Saxony54	(e)	562	f 3,372
Württemberg19	276	555	2,217
Baden14	217	450	1,734

a After deducting sums spent for medical affairs.

b In Table C, expenditures for higher seats of learning, administration, etc., are not specified; hence the partial sums for the three categories of schools are not equal to the total amount paid by the State for education.

c The regular expenditures for education amounted to 9,299,932 marks.

d The assumption is that a normal school student before his admission has spent three years in the preparatory school; but many come from secondary schools, and hence the quota for preparatory courses is only 11.46 per cent of the total costs of the professional education of teachers in Prussia.

e Saxony has no preparatory departments in normal schools.

f Saxony pays comparatively more for the preparation of teachers than the other States. The course of a normal school in Saxony is one of six years, while in the other States it is one of four years.

V. BUDGET FOR EDUCATION IN ITALY IN 1901.

The budget passed by Parliament for 1901 provides for a total appropriation of 47,334,294 francs, which is an increase of 1,651,609 francs over last year. From this sum total should be deducted the burdens "del debito vitalizio," which would leave 44,519,299 francs to be expended. This is equal to 1.40 francs per capita of the population. Of these expenditures 6.21 per cent are for administrative purposes, 26.1 per cent for elementary schools, 35.5 per cent for secondary schools, 18.71 per cent for normal schools, 3.98 per cent for scientific purposes, 10.31 per cent for art and archeology, and 0.18 per cent for unspecified purposes. In order to judge this rightly, it should be stated that in Italy the elementary schools are almost wholly supported by the communities, and that the provincial governments share in the expenses for scientific and technological schools.—(Pädagog. Ztg., Berlin.)

XV. MISCELLANEOUS TOPICS.

Contents: Health and Mortality of Teachers.—Continuation Schools in Germany.—Growth of German National Teachers' Union.—Cost of Free Text-books in Zürich.—Sons of Laborers in German High Schools.—Teachers' Salaries in Prussian Cities.—German University Students.

I. HEALTH AND MORTALITY AMONG TEACHERS IN BERLIN.

Dr. H. Schröder, of Kiel, an untiring worker in behalf of the interests of high-school teachers in Prussia, has in numerous pamphlets and magazine articles referred to the disregard of teachers in contrast to other State officers of university education, and makes a demand of the State for better pay and shorter hours. His reason for the latter-named demand is the great mortality among high-school teachers. By means of statistical tables, he proves that their strength or vitality declines much sooner than that of judges, army officers, etc. Such statements are not easily prepared, as official statistics do not specialize the professions as well as might be desired. The untiring energy of Dr. Schröder, therefore, deserves recognition beyond what the actual figures suggest. Even if exact comparative statistics are impossible, a cursory comparison of the figures given with those applying to elementary school-teachers proves conditions among the latter to be still more unfavorable. Unfortunately, teachers have attached too little importance to this subject, and hence they are now beginning in Germany to keep an exact account of the death rate and pensioning of public school-teachers, so as to define how soon their vitality is expended as contrasted with other officers or employees of the Government.

As a matter of course, a distinction must be made between cities and country.¹ Large cities in particular must be treated appropriately to their individual conditions. For Berlin a teacher, Mr. Gaulke, has prepared a statement giving the average term of life, for a number of years, of principals and teachers deceased. The figures do not refer to calendar but to school years (May 1 to April 30); however, that fact is of no significance, and that the averages specified for the years 1867 and 1871 refers only to the members of the union of communal teachers affects their importance but little. Here is the table:

Years.		Years.		Years.	
1867	39	1882	42	1891	46
1868	37	1883	37	1892	42
1869	33	1884	37	1893	51
1870	39	1885	44	1894	48
1871	46	1886	50	1895	44
1878	41	1887	42	1896	51
1879	49	1888	53	1897	51
1880	42	1889	41	1898	49
1881	40	1890	47		

¹ See article on this subject in Ann. Report of 1898-99, vol. 2, p. 1488.

This table proves in the first place that mortality was much greater in former years than now. From 1866 to 1886 there is only one instance of a year in which the average age was 50 years. The reason is that mortality is less among the population of Berlin in general, because of improved sanitary conditions. Moreover, in former years the energies of teachers were used up to a much greater extent in private schools with deficient hygienic arrangements.

Salaries naturally exert an influence on mortality; the lower the pay the more time teachers are induced to devote to outside occupation. As a matter of course, a greater amount of vitality is thus expended, and those whose health is not very strong consequently die an earlier death than they otherwise would. The moral is self-evident.

The foregoing table is deficient in the one respect, that the calculations upon which it is based include only teachers who died in office. Exact deductions are therefore impossible. To give the consumption of vitality with any degree of definiteness the three following groups must be considered: (1) The average age of all deceased teachers; (2) the average age of those who died in active service, and (3) the average of those retired. The last point is one of great importance, and would no doubt furnish astonishing facts. It is to be regretted that no pertinent statistics of earlier decades are available. Late investigations define the ages of principals and teachers retired since October 1, 1896, with the following result:

One pensioner was between 25 and 34 years old; 8 pensioners were between 35 and 44 years old; 5 pensioners were between 45 and 54 years old; 15 pensioners were between 55 and 64 years old; 19 pensioners were between 65 and 74 years old; 3 pensioners were over 75 years old.

According to the pension law of 1885, pensions can be granted to teachers under 65 years of age only if the school authorities, upon conscientious investigation, decide that they are permanently unfit for the duties of their position because of physical defects or physical or mental infirmity. Since October 1, 1896, 58 per cent, or more than half of the number of pensioned teachers and principals, were retired because of sickness before they reached the sixty-fifth year of life. Only 42 per cent preserved their health in active service till their sixty-fifth year.

Even considering that mortality among the entire population is greatest between the ages 35 and 44, the proportionately large percentage of teachers retired at that age is most striking. There would be many more instances of disability on account of failing health among the teachers of Berlin if school boards were not so liberal with granting furloughs, and were less generous in decreeing compulsory retirement. According to the official report of the city board, April 1, 1897, till April 1, 1898, as many as 19 principals and 103 teachers were allowed longer summer vacation for reason of health. During the same year 531, namely, 23.02 per cent, of 2,307 teachers were furloughed for some time on account of sickness. The following table gives the details:

Number of teachers ill.	Per cent of whole of same age.	Number of days ill.	Age of teachers ill.
65	20.06	1,785	20-29
182	19.78	6,008	30-39
134	21.54	5,189	40-49
106	32.72	3,711	50-59
44	37.61	1,550	60 and over.

In former years, corresponding figures showed the following results: Extended summer vacations were granted on account of health to 29 principals and 108

teachers in 1891-92, 22 principals and 81 teachers in 1892-93, 26 principals and 104 teachers in 1893-94, 20 principals and 109 teachers in 1894-95, 17 principals and 93 teachers in 1895-96, 18 principals and 101 teachers in 1896-97.

The following table gives particulars concerning furloughs on account of sickness during the year when school was in session:

Year.	Teachers.	Per cent.	Aggregate number of days.
1894-95 <i>a</i>	490	22.25	18,813
1895-96	442	19.75	19,402
1896-97	475	20.86	20,712
1897-98	531	23.02	18,243

a Reports of earlier years do not include these statistics.

Though these figures prove that the condition of health among elementary teachers in Berlin is no worse than in former years, still the number of sick, including from one-fifth to one-fourth of principals and teachers, is proportionately large.

Diseases which may be designated as diseases peculiar to the profession are disorders of the eye, throat, and nervous system.

Year.	Eye dis-	Throat	Nervous
	cases.	diseases.	diseases.
	<i>Cases.</i>	<i>Cases.</i>	<i>Cases.</i>
1894-95	16	68	76
1895-96	17	68	66
1896-97	13	109	89
1897-98	17	109	74

The great increase of throat troubles and laryngitis is particularly noticeable; if the increase continues, the question will naturally arise whether the evil is not due to existing school arrangements. Meanwhile it is reasonable to suppose that the high figures for the last two years are merely accidental.

In conclusion we may consider the mortality among the teachers in other German cities. In Leipzig, for the year 1897-98, the average age of teachers who died in active service was 40 years; in Dresden, from January 1, 1883, to April 15, 1898, it was 49 years and 7½ months; in Hamburg, in 1898-99, it was 42 years. In Leipzig the average age of pensioned teachers for the same period was 67 years; in Dresden, 53 years. Further comparisons are unfortunately impossible. The figures given have been taken or calculated from the teachers' rolls of the cities mentioned. The teachers of Berlin are urging those of other German cities to recommend that statistics referring to mortality in the teaching force be inserted in the official reports.

Since the foregoing was prepared the official statement concerning the year closing April 1, 1899, for Berlin has been published. The following items are taken to complete the foregoing statement: For considerations of health the summer vacation was prolonged for 29 principals, 135 male teachers, 145 female teachers, and 21 female teachers of woman's handiwork. Including furloughs granted during the year the numbers swell to 575 male teachers, inclusive of principals; 474 female class teachers, and 85 female teachers of handiwork; making a total of 1,134 teachers who were furloughed on account of sickness. The furloughs covered

42,037 days, averaging, therefore, 37 days to one teacher. The furloughs are distributed as follows:

Month.	Male teachers.		Female teachers.		Handiwork teachers.	
	Number.	Days.	Number.	Days.	Number.	Days.
1898.						
April	43	881	35	605	9	124
May	80	1,110	68	1,444	11	181
June	124	2,073	108	1,871	11	225
July	110	3,415	85	2,598	11	330
August	184	2,643	66	2,783	23	338

III. INCREASE IN THE NUMBER OF WOMEN TEACHERS IN GERMAN CITIES.

The Statistical Yearbook of German Cities for 1900 gives a review of the status of women teachers in cities over 100,000 inhabitants from which the fact is noticeable that the ratio of women to men is different in various portions of the Empire. Catholic provinces of Prussia and Catholic States outside of Prussia have many more women teachers in their city schools, while in the Protestant parts of the Empire their number recedes. The following table is instructive. Protestant cities, like Duisburg in Rhenish Prussia and Zwickau and Plauen in Protestant Saxony, have very few women teachers, while Catholic cities like Freiburg, Aix-la-Chapelle, Metz, Strasburg, Cologne, and others have a good many. Thuringia has very few women teachers.

Ratio of women teachers to men teachers.

Low ratio:	Per cent.	Medium ratio:	Per cent.	High ratio:	Per cent.
Nuremberg.....	2.5	Magdeburg.....	18.0	Aitona.....	57.4
Chemnitz.....	2.9	Bremen.....	19.7	Düsseldorf.....	81.8

Wiesbaden.....	10.9	Hamburg.....	54.5	Freiburg.....	134.9

IV. GROWTH OF THE GERMAN NATIONAL UNION OF TEACHERS.

In its yearbook of 1900 the German Teachers' Union states that the membership has risen from 76,523 in 1899 to 80,251 in 1900, or about 4.87 per cent. The Prussian Teachers' Union, a branch of the former, has increased its membership during the same period from 48,710 to 51,612, or 5.96 per cent. The following table shows the growth of both associations during the last decade:

Year.	National Union.	Prussian Union.	Year.	National Union.	Prussian Union.
1890.....	38,912	30,450	1896.....	62,274	43,082
1891.....	44,440	35,512	1897.....	64,906	44,953
1892.....	49,636	39,410	1898.....	67,271	46,610
1893.....	53,023	40,470	1899.....	76,523	48,710
1894.....	55,134	41,081	1900.....	80,251	51,612
1895.....	60,797	42,240			

The increase in ten years in the National Union amounted to 41,339 members, or 106.24 per cent; that of the Prussian Union 21,162 members, or 69.49 per cent. In a number of States and provinces every teacher (except the women teachers, who have a union of their own) is a member; in others very few teachers are still outside the union. These unions are not loose associations that count as members those who attend annual meetings, but both are firmly organized into local and state associations, each of which maintains intimate relations with the central management. In annual or biennial meetings only delegates of state, provincial, and local societies can vote. The influence of the union upon school legislation has greatly increased. It must be understood, though, that the members of the union are only the teachers of elementary schools; secondary teachers and professors in higher institutions are not members, nor do they participate in the deliberations of the union. Teachers of secondary schools have their own associations, one representing classical, the other modern realistic high schools and academies. Professors of universities, again, come together in their association for the advancement of science.

V. COST OF FREE TEXT-BOOKS IN ZURICH.

The annual reports of the school authorities of Zurich, Switzerland, give information concerning the cost of free text-books and stationery for the pupils of the lower city schools. In 1896 the cost for each primary pupil was 0.94 franc for text-books and 1.50 francs for stationery and drawing material, a total of 2.44 francs. In the grammar schools the books for each pupil cost 5.03 francs, the stationery and drawing material 7.39 francs, a total of 12.42 francs. In the year 1899 the cost for books in the primary schools was 1.23 francs per pupil and 2.74 francs for stationery and drawing material, a total of 3.97 francs. In the grammar schools the cost had increased to 6.28 francs for books and 7.48 francs for the other material, a total of 13.76 francs. For material used in the lessons in female hand work (worsted, needles, thread, shirting, etc.) 1.86 francs per pupil was expended in primary schools, 2.96 francs in grammar schools. Hence the city spent about 3 to 4 francs for every boy in primary schools and for girls 5 to 6 francs. In 1899 the total cost amounted to 103,075 francs (about \$20,000) for 14,833 children in the primary and 2,471 children in the grammar schools. The

latter schools are parallel to our seventh and eighth year grades. The expenses for this purpose rose from 86,068 francs in 1894 to 87,541 francs in 1895, 87,480 francs in 1896, 98,809 francs in 1898, and 103,075 francs in 1899. Zurich has at present a population of between 160,000 and 170,000. The elementary schools of Zurich are among the best in Switzerland. Hence it is reasonable to suppose that the expenses for similar purposes in other cities of the Republic are not any higher than in Zurich. Both teachers and parents are well satisfied with the result of this comparatively new policy of the school board, the former because they now have a much-desired uniformity in the stationery and books, the latter because the cost is much decreased and is paid indirectly by all the taxpayers.

VI. SONS OF LABORERS IN GERMAN SECONDARY SCHOOLS.

Mr. Bernhard Harms, in Tübingen (Wurttemberg), Germany, has made an inquiry (by circular letters to the principals) as to the number of students in secondary schools in the two Kingdoms, Prussia and Wurttemberg, whose fathers are artisans, i. e., follow a trade, either as master or assistant. The question is of importance both to the educator and to the economist, inasmuch as the result of the inquiry would show the relative position of the laboring people in the national aspiration toward advanced education. Of 600 circular letters sent out 330 came back with minute replies. While thus it would seem that any tabulation of these replies can only embrace a partial statement of the conditions found, yet if it is taken into consideration that replies came from every province of Prussia and from every subdivision of Wurttemberg, and that Prussia represents the north, while Wurttemberg represents the south of Germany, it is reasonable to say that the results as stated below are fairly representative for the whole German Empire, especially since the tables state the number for twenty-five years, i. e., from 1876 to 1900.

The results are these: Among 143,135 students in high schools of all kinds there were 15,668 sons of tradesmen (artisans), 10.5 per cent. While the number of sons of those not following trades increased constantly and regularly, the number of sons of tradesmen vacillated according to the condition of depression or expansion of industry. During the period of depression (1881-1885) a great decrease was noticed, during the period of great industrial expansion an enormous increase. Another difference is quite obvious: Few sons of tradesmen enter the classical (Gymnasia) and semiclassical (Realgymnasia) high schools, but in realistic or modern high schools (Realschulen) the increase in the number of tradesmen's sons amounted to 214.3 per cent in recent years. A few details are interesting: Sons of bookbinders show an increase of 150 per cent; printers, 400 per cent; watchmakers, 337.5 per cent; bakers, 288.8 per cent; butchers, 211.4 per cent; shoemakers, 170.4 per cent; tailors, 435.3 per cent; locksmiths, 466.6 per cent; painters, 461.8 per cent; joiners, 425 per cent; other trades, 129.8 per cent.

The general summaries of the author's tables show that attendance at classical high schools during the last twenty-five years of sons of artisans has decreased, but that it has disproportionately increased in so-called modern high schools in which modern languages have replaced the classical.

In Wurttemberg a similar observation is made, only that the number of artisans sons is very much larger in the high schools of that Kingdom, being 20.6 per cent of the whole number of students, or about twice the number of those in Prussia. This is owing to the fact that trades and home industry have been preserved in Wurttemberg better than in Prussia, where factories on a large scale have replaced home industries. Altogether, it is not a bad showing, for when 10.5 per cent and 20.6 per cent, respectively, of the students are sons of laboring people who can afford to send their boys to the high schools, where heavy tuition fees are charged, it is a sign of healthy and worthy aspiration.

VII. SALARIES OF TEACHERS IN PRUSSIAN CITIES.

The following figures represent the salaries of regularly appointed elementary teachers in towns and cities of over 12,000 inhabitants of the Kingdom of Prussia. It does not include the salaries of principals of graded schools nor of probationers. The numbers are grouped according to the 13 provinces of the Kingdom, Berlin being a province of itself. The amounts stated are cash salaries, exclusive of free rent, or rent indemnity, which is usually valued at 25 per cent of the cash salary a teacher receives.

Provinces of Prussia.	Salary at beginning of service.	More or less than the average in the Kingdom.	Periodical increases.	More or less than the average in the Kingdom.	Average salary per year for 25 years of service, including columns 2+4.	More or less than the average in the Kingdom.
Averages for the Kingdom.	\$298.21	-----	\$40.70	-----	\$474.81	-----
Westphalia.....	329.15	+30.94	44.03	+53.33	521.22	+\$46.41

East Prussia.....	253.23	-44.98	37.13	-3.57	413.88	-60.93

VIII. GERMAN UNIVERSITY STUDENTS.

In all the twenty-one German universities, including the Academy of Münster, which has only a theological and a philosophical faculty, there were in 1900 (summer semester) no less than 34,339 matriculated students and about 10,000 non-matriculants or hearers; in 1899, only 33,563. This is an increase which represents almost exclusively the native contingent, for while the number of foreigners rose from 2,284 in 1899 to 2,322 in 1900, i. e., an increase of 38, the increase of native students is 788. Ten years ago, in 1890, the German students, not counting foreigners, was 27,463; this number decreased to 25,553 in the winter of 1893-94; from that year on the increase was steady and large. Taking the number of 1890 as a basis, it is found that the increase within ten years has been 16.7 per cent.

In attempting to compare the attendance at the several faculties it is necessary to confine the calculation to the Prussian universities. The following review gives for each group three numbers, (a) the number for 1890; (b) the numbers of 1899, and (c) those of 1900. It will be noticed that the chief groups of the philosophical faculty are separated.

Students in Prussian universities.

	1890.	1899.	1900.
Protestant theology.....	2,652	1,429	1,314
Catholic theology.....	643	950	811
Law.....	3,106	5,294	5,580
Medicine.....	5,172	4,410	4,158
Philology and history.....	1,534	2,273	2,371
Mathematics and natural science.....	1,207	2,300	2,323
Pharmacy.....	580	736	755
Agriculture <i>a</i>	386	521	535
Forestry <i>a</i>	64	192	232
Dentistry and Veterinary surgery <i>a</i>	203	298	322
	15,412	18,303	18,401

a These numbers represent only those who study at the university. There are independent agricultural, forestry, and veterinary schools not affiliated with the universities in Prussia and other German States.

The following comparison is interesting, owing to the details it offers for several German States:

Students in every 100,000 inhabitants.

States.	Law.	Medicine.	Philology and history.	Mathematics and natural science.
Prussia.....	17.5	13.5	7.4	7.3
Bavaria.....	18.7	14.5	11.1	7.7

The whole Empire.....	18.3	13.9	8.4	7.8

Prussian students studying in other States.

	Per cent.	
Medicine.....	37.6	} A total of 29.3 per cent (or 13,004) Prussian students studying in Bavaria, Saxony, Wurttemberg, Baden, Hessa, etc.
Pharmacy.....	37.4	
Mathematics and natural science.....	36.6	
Law.....	29.8	
Catholic theology.....	13.8	
Protestant theology.....	13.6	

In view of the fact that among the 2,284 foreigners studying in German universities, in 1900, there were about 300 from America (not exclusively from the United States), it is of interest to note an opinion expressed in the New York Evening Post of April 22, 1901, which refers to the value of attendance at German universities. The article is here quoted in full:

HIGHER EDUCATION MADE IN GERMANY.

M. Gaston Deschamps, in his very entertaining account of recent lecturing experiences in the New England colleges, expresses his surprise at the dependence of American upon German scholarship. At Yale, for example, he found that they knew and used the German standard text-books on all subjects, ignoring the French, and generally that in all the higher studies the university looked to Germany. M. Deschamps adds, with a certain bitterness, that the French, who for a generation have done nothing but advertise German methods, are to blame for their own lack of honor in America. M. Deschamps has correctly observed the fact. In a score of lecture rooms to-day American professors trained in Germany are lecturing in an English intelligible only on condition of having first learned German, and hundreds of incipient doctors of philosophy are seeking their academic salvation in "Grundrisse," "Abrisse," "Aufsätze," and "Abhandlungen." But the French observer has curiously misjudged the cause and the importance of this fact of the partial Germanization of the American university.

When Edward Everett and George Bancroft, early in the last century, went to Göttingen, they went not so much for definite facts as for inspiration, and the movement of which they were pioneers has been a veritable evangel of sound learning. As Americans, our inheritance was a certain contempt for science and an invincible confidence in rule of thumb—"the English notion," as Matthew Arnold called it, "that you can do a thing right by doing it, and not first by learning how to do it right, and then doing it." This swaggering insouciance our social conditions have tended to exaggerate, and if it has been corrected, it is largely due to that spirit of disinterested love of science, and of confidence in the ultimate value of the orderly search for any kind of truth, which America has since learned from Germany. Professor Paulsen, of Berlin, says that you find in the German university "the spirit of inwardness—the calm delight in her employment, the faithfulness of work, and the love of truth." These were things worth studying and worth imitating. And it was properly and worthily the ideal of every young scholar—American, French, or Italian (the English only were blind)—in the fifties, sixties, and seventies, to study in a German university and bring back its degree.

What they sought, to be more specific, was the vaunted scientific method—wissenschaftliche Methode. This formidable phrase meant chiefly thoroughness, the willingness to count no fact small and no effort great in the search for truth. It meant, besides unsparing industry in the mere accumulation of facts, a certain

constructive quality of mind which mastered the facts and set them in philosophical relations. These qualities the great German scholars, the Grimms, the Diezes, the Rankes, had preeminently; and they held themselves—their knowledge and ideals—at the disposal of every youngster who sought the life of research. It is one of the proudest titles of American scholarship, that it early recognized that intellectual good was to be found in Germany; that it sought it there and brought it back to be a fruitful principle of our own intellectual life.

To deplore the fact that our scholarship has a strong German tinge would be like apologizing for the loins from which we sprang. And yet it is a question if of recent years we have not followed German methods too exclusively and too unintelligently. You may crack a filbert with a trip hammer; you may put *wissenschaftliche Methode*, too, to the most trivial uses. The Germans themselves often so misuse it. Scholarship suffers from an enormous overproduction of monographs in which an ambitious method stretches a thin substance to the cracking point. As Kant imagined a pure reason (*reine Vernunft*), so we are in danger of coming down to pure method (*reine Methode*). There is a craze, not to prove something valuable, but merely to prove something. What shall be said of the graduate student who sorts and weighs the descriptive adjectives in a popular novel of the day, and proves that on a basis of a thousand the rose is red 333 times; crimson, 197; blushing, 69; of him who shows that the average sentence length of, say, Thomas Hardy was 24.56 at the period of *A Pair of Blue Eyes*, but had risen to 25.46 by *Jude the Obscure*? Yet such things are done among us in the name of scholarship.

It would not be fair to hold the Germans wholly responsible for such caricature of their method. But they themselves are ready to acknowledge a defect in their scholarship which ours has not escaped. Large intelligence has always been the characteristic of the German scholar. A fine sense of form has rarely been his. The enthusiasm which carries him to a difficult result expires when the result is reached, and the scholar who will give ungrudgingly a lifetime to the discovery of a new principle often grudges the time to present that principle clearly and attractively to his colleagues—so much so that it is sometimes as difficult to read the account of a research as to conduct the research anew. This comes partly from a defect in national temperament, but even more from the fact that the German scholar writes only for scholars, and evades the discipline of writing for the larger educated public. In his scorn of the popular he is likely to fall into the obscure.

Now the sense for form is almost as much a matter of good morals as it is of good taste. French scholarship has it in a high degree. Not only are learned works clearly and logically constructed from a scientific point of view in France, but the most erudite scholars write in a style to be read with pleasure by the average person of culture, and condescend to present the results of their investigations in popular form. The result is a type of scholar with a juster sense of proportion, a better knowledge of the world in which he lives, and, without any impairment of his position as a specialist, with a far greater influence than is commonly the portion of the German scholar of equal rank.

We have surely gone too far the German way, and when M. Deschamps pokes fun at the German flavor of higher studies at Yale, he touches a sore spot. It is well for us that we have made our own everything that is good in German scholarship. But loyalty to our foster fatherland need not extend to imitating its defects and accepting its limitations. It is a hopeful sign, from this point of view, that our graduate students look in increasing numbers toward France. French scholarship—and our own traditions may well reinforce the lesson—has this to teach us, that there should be discrimination even in the ardent search for truth, and that a slovenly presentation of results demeans the most notable investigation. Nothing our universities have learned from Germany is to be disowned: an added grace is to be sought—the admirable clearness, intelligence, and attractiveness of Latin scholarship.

CHAPTER II.

A LEGISLATIVE HISTORY OF THE PUBLIC SCHOOL SYSTEM OF THE STATE OF OHIO.

[Compiled from the Session Laws enacted by the General Assembly. By Mary L. Hinsdale, A. M., graduate student of the University of Michigan, with historical notes by the late B. A. Hinsdale, Ph. D., LL. D., professor of the science and the art of teaching in the University of Michigan, supplemented by Mary L. Hinsdale.]

PREFACE.

What is called the American system of public schools or of public instruction, strictly speaking, is rather an idea than a fact. At most it is a fact of the human mind and not of history or objective life. It is a conception that combines the essential or characteristic features of our principal State systems of public schools. This conception is formed by the familiar processes of observation, analysis, comparison, and generalization. It is not found pure and simple in the system of any one State, but some of these systems approach it much more nearly than others. We may, however, here avoid metaphysical distinctions and speak as though this system had external reality.

This system is a recent growth. There were, indeed, anticipations of it in a few of the States, beginning with early colonial days; but, generally speaking, there is no trace of it until the present century. More narrowly, it is practically the work of two-thirds of the century, for it was not until about 1835 that the great common school movement in the United States began.

To enter upon a full account of the origin and development of this system would be to enter upon a very difficult task. It would involve the careful comparative study of many thousand volumes of school laws and reports and other similar documents, together with the personal history of the principal men who have contributed to the work. A similar account of the system of a single State is at once a far less onerous undertaking, although by no means a slight one, while it also has some points of superior interest. For one thing, the subject in such case is an individual, concrete reality, and is, therefore, free from the abstractness of the more general inquiry. This will appear in the sequel. The present chapter is devoted to the school system of the great State of Ohio. It does not attempt, however, to deal exhaustively with the origin and development of this system, since that would include results and much other matter that it has been found necessary to omit. It is, rather, the origin and development of this system as a legal organization. Again, it has been found necessary, as a matter of course, to sink a vast number of details of legislation in the general account. Manifestly, to note each smallest forward or backward step was as unnecessary as it was impossible. And yet the facts used have been so chosen and combined that they furnish a full and, it is believed, a luminous view of the subject. The chapter rests immediately upon the enactments of the general assembly, and not upon

secondary sources of information. As the dates of the legislation described are sure guides to the session laws containing these enactments, it has not been found necessary to refer to them by volume and page in the footnotes.

I. THE PERIOD 1785-1821.

The period from 1785 to 1821 in the history of Ohio includes within its legislative enactments measures that compose a most interesting prelude to the legislative history of public instruction in the State. It was not until the latter year that the first common school law of Ohio was passed, while in the former year the Continental Congress passed the land ordinance in which originated the educational land-grant policy of the National Government. This ordinance decreed that the territory northwest of the Ohio River ceded by the individual States to the United States, which had also been purchased of the Indian inhabitants, be surveyed into townships 6 miles square, and that these townships should be subdivided into lots 1 mile square; it prescribed an order for numbering these latter sections, and declared that the lot numbered 16 in every township should be reserved for the maintenance of public schools within that township. These provisions were not applicable to all the lands that went to form, in 1802, the State of Ohio. In the northeast there was the region reserved by Connecticut out of her western claim, known as the Western Reserve. Southward, between the Scioto and Little Miami rivers, was the district that Virginia retained for the remuneration of her soldiers: and, touching this on the north and east, a section appropriated by the United States to the Revolutionary soldiers, who, under the legislation of Congress, were entitled to land bounties, called the United States Military District. Generally speaking, about 15,000 square miles of territory comprised in the 41,000 square miles did not come within the range of the legislation of 1785.

By the act of April 30, 1803, which authorized the people of Ohio to form a constitution and State government, Congress made the people the offer of section 16 in every township for the use of schools. The constitutional convention, in accepting this offer, added the condition that those parts of the State to which the existing legislation did not apply should enjoy equivalent advantages with the others, namely, that Congress should donate to the United States Military District one thirty-sixth part of the lands thereof for the support of schools; that it should similarly appropriate unlocated lands for the same purpose in the Virginia Military District; that it should make such provision as it found expedient for the inhabitants of the Western Reserve, and should donate for public school purposes one thirty-sixth part of lands purchased thereafter of the Indians. In reply to this Congress passed an act March 3, 1803, satisfying all parts of this request. But as it proved to be impracticable to execute the donation made to the Virginia Military District, an act was passed March 2, 1807, granting to that division of the State 18 quarter townships and 3 sections. Still further, the extinction of Indian titles so retarded an appropriation of school lands for the people of the Western Reserve, all of which lay beyond its limits, that it was not until 1834 that the donation to them finally amounted to one thirty-sixth part of the area of the Reserve.

Congress also made endowment for higher education at the beginning of her land legislation for the Northwest. The terms of the sale to the Ohio Company, made July 23, 1787, stipulated that land amounting to not more than two townships be given perpetually for the purpose of an university, to be laid off by the purchasers as near the center of the tract as might be, while the patent to John Cleves Symmes, September 30, 1794, declared that one complete township should be held in trust for the purpose of establishing within the area since known as the Symmes tract, lying within the two Miami rivers, an academy and other seminaries of learning.

The sum total of the lands dedicated to the purposes of education was about

1,100 or 1,200 square miles of the area of the State. The title to these lands Congress vested in the general assembly in trust for the uses specified, and no other uses, and a large part of the legislation which we have styled a prelude to our proper subject relates to laying off lots, improvements, leasing, sales, and providing administrators. The period of sales, however, did not begin until 1827.

The earliest law touching the subject was enacted by the Territorial legislature November 15, 1799, and provided:

If any person or persons shall, after the passage of this act, under pretence of any lease or otherwise, cut, fell, box, bore, or destroy any black walnut, black, white, yellow, or red oak, white wood, poplar, wild cherry, blue ash, yellow, or black locust, chestnut, coffee or sugar tree, or sapling, standing or growing upon any lands within the territory reserved, appropriated, or intended for the use and support of schools, * * * such person or persons shall forfeit and pay for every such tree or sapling so cut, felled, boxed, bored, or destroyed the sum of \$8.

If a tree or sapling of any kind, not herein enumerated, were injured, the fine was \$3. The values here placed upon the timber seemed to prove that the school lands would be exploited with an eye single to the interests of education; but time was to show that the promise would be rudely broken. The legislation of the general assembly on the subject of school lands was marked by great incompetency and unfaithfulness.¹

Before 1802 it had become common for the States to incorporate into their constitutions articles or clauses concerning education in schools. The practice was not universal, but Ohio, made up as her population was, was not likely to fall short in the matter. These are the educational clauses that the State set in her first fundamental law, so far as they relate to our subject.

ART. VIII. 3. * * * But religion, morality, and knowledge being essentially necessary to the good government and the happiness of mankind, schools and the means of instruction shall forever be encouraged by legislative provision, not inconsistent with the rights of conscience.

25. That no law shall be passed to prevent the poor in the several counties and townships within this State from an equal participation in the schools, academies, colleges, and universities within this State, which are endowed, in whole or in part, from the revenues arising from the donations made by the United States for the support of schools and colleges; and the doors of the said schools, academies, and universities shall be open for the reception of scholars, students, and teachers of every grade, without any distinction or preference whatever contrary to the intent for which the said donations were made.²

The character of that legislation of the period which pertains to education more directly may be inferred from the following titles: 1802, January 9, an act establishing a university in the town of Athens; 1805, February 21, an act incorporating the Dayton Library Society; 1803, April 16, an act to incorporate the trustees of the Erie Literary Society; 1803, February 15, an act incorporating the Dayton Academy; 1803, February 18, an act to incorporate the trustees of the Chillicothe Academy; 1809, February 7, an act to establish the Miami University.

¹ No small portion of these lands was occupied at an early day by persons who settled on them without any other title to them than mere occupancy gave them. These occupants made no valuable improvements on these lands, but they contrived in time to obtain various acts of our general assembly in favor of such squatters. Such acts increased in number every year until they not only had cost the State large sums of money for legislating about them, but some entire sessions were mostly spent in such unprofitable legislation. In the meantime scarcely a dollar was ever paid over to the people for whose benefit the lands had been given by Congress. Members of the legislature not unfrequently got acts passed and leases granted either to themselves, to their relatives, or to their warm partisans. One senator contrived to get by such acts 7 entire sections of land into either his own or his children's possession. (History of the State of Ohio, Natural and Civil. Caleb Atwater. Second edition. Cincinnati, 1838, p. 253.)

² Those parts of the eighth article of the constitution that relate to slavery, religion and schools, or education, were prepared and introduced into the convention by Judge Ephraim Cutler, one of the representatives of Washington County, and a son of Rev. Dr. Manassah Cutler. (Life and Times of Ephraim Cutler. Julia Perkins Cutler. Cincinnati, 1860, p. 77.)

An act of general application, to provide for the incorporation of schools and library companies, passed January 24, 1817, shows that there had come to be a good deal of private educational activity in the State. This act runs:

At any time when six or more persons shall have associated themselves together for the purpose of establishing a school and building a schoolhouse, or for the purpose of establishing a library, and shall have given themselves a name, it shall and may be lawful for such person. to obtain letters of incorporation, etc. * * * All existing associations for the establishment of schools and library companies may obtain letters of incorporation under this act.

It will be seen that, down to 1831, although the State constitution said that schools and the means of instruction should ever be encouraged by legislative provision, the State did absolutely nothing to carry out the provision, and instruction was wholly a voluntary matter.¹

The first public-school law passed by the general assembly, January 23, 1831, was entitled, "An act to provide for the regulation and support of common schools." It ordered that the trustees of the several townships in the State should submit to the people at the next township elections the question of organizing the respective townships into school districts. If the majority of the householders favored such organization the trustees should, within twenty days, lay off the township or any part of it into school districts, which should contain not less than twelve nor more than forty families each. Joint districts including parts of several townships might be laid off by the joint action of the different boards of trustees, in case the inhabitants of any neighborhood wished it. The township clerk should record each district laid off. The trustees were to have regard for all school companies incorporated under the act of 1817, or any other, by including all members of any such company within the same school district, and leaving their corporate rights undisturbed.

The remainder of the act relates to the school committee, the forerunner of the board of education. It provides that the householders in each school district shall meet annually on the first Monday in May, ten being a quorum, and elect three householders as a school committee for the district; also one person to be collector and treasurer; these officers to hold their appointment until their successors should be elected and qualified. The householders, assembled in district meetings, were also to vote upon the question of erecting a schoolhouse, a majority of two-thirds being necessary to carry it. The school committee were authorized to cause the erection of such schoolhouse in some convenient place in the district, and to purchase or receive by donation land for the purpose, not exceeding 2 acres, the title to be vested in the committee or their successors. The committee were made a taxing authority, with power to levy, upon all property situated within the district and belonging to residents thereof which was liable to taxation for State or county purposes, an amount not to exceed in any one year one-half of the amount that the law authorized for State or county purposes. Another important function of the school committee was the employment of a teacher or teachers. No provision was made for certificating these persons. The schools were to be kept open to all scholars of a suitable age within the district. The length of a term was to be such as the school committee judged to be for the interest of the district. Running expenses might be assessed quarterly by the committee on the parents or guardians of the scholars, in proportion to the number of scholars, it being left to the discretion of the committee, however, to remit assessments on persons unable to pay, and to make up any deficiency thus arising out of the fund raised by taxes. It was

¹ Before the introduction of a school system as defined in the laws * * * the existence of a school in any neighborhood depended solely upon the efforts of one or more individuals, who would take the trouble to raise by subscription money to employ a teacher, and either build a house or set apart a room in their own dwelling for that purpose. (Life and Times of Ephraim Cutler, p. 172.) Many schools were taught in private houses. (Ibid., pp. 49, 88.)

the duty of the district collector to collect both taxes and assessments. As treasurer he might be required by the school committee to give bonds. He was permitted to retain 2 per cent of the moneys received as his compensation; but all other school officers were forbidden to receive compensation for their services. The concluding section of the act provides:

In such townships as by law are entitled to public moneys from the rent of section number sixteen or other school land, the trustees of such township shall allow said school district its proportion of such money, to be ascertained and proportioned under such laws as may be enforced at the time application may be made regulating the application and division of such school fund, and the treasurers of the several school districts are hereby authorized to receive the same, for which they shall be accountable to said committee.¹

II. THE PERIOD 1821-1825.

The school law of 1821 was wholly inadequate to set going any vigorous common school movement because it was not mandatory but permissive, leaving the organization of schools entirely to the will of the householders of the township. It made possible a conflict of authorities. This brings us to notice the dual township system of Ohio, which has received large recognition in school legislation down to the present time.

The original surveyed townships are areas of land 6 miles square that were laid out in obedience to the Congressional land ordinance of 1785, and to other provisions for the same purpose, except in the Western Reserve and the United States Military District. Until 1806 these townships had only a geometrical existence. On the other hand, civil townships or, as the statutes of a certain period describe them, the organized townships, existed to meet the needs of local government. Such townships began to be organized as soon as the Territorial government in 1790 authorized the courts of quarter sessions to take such action, while the State law afterwards authorized boards of county commissioners to lay off townships. The source of confusion is that the areas of the two kinds of townships are not always identical, and that it was necessary to identify the school system for purposes of administration with the civil townships, while the educational land-grant policy of the United States gave the original surveyed townships a political status in the school system on its fiscal side. The township that had to do with the administration of schools was not necessarily the township that owned lot No. 16. In the early history of the State civil townships were large, often embracing many original surveyed townships. Laws passed in 1806 and 1810 provided for the organization of the original surveyed townships and fractional townships in which there were sections of land reserved by Congress for the use of public schools therein. As soon as any such township should number 20 qualified voters they were authorized to elect 3 trustees and 1 treasurer for the purpose of taking into their care the section above mentioned, who shall be a body politic, corporate, etc. Still further, the acts provided for the creation of school districts, viz, the trustees are hereby authorized, as soon as they may think necessary, to lay off said townships into proper divisions and the same to alter from time to time as they shall think proper for the purpose of establishing schools therein. The earlier of these two acts provided that the divisions thus laid off should share the profits arising from their reserved section according to the number of inhabitants; the later one, that the schools thus established should share according to

¹ Little is known concerning the enactment of this law. In 1819-20 Judge Ephraim Cutler, the author of the educational clauses of the constitution, a determined advocate of public education, procured the passage of a bill in the house of representatives by a vote of 40 to 20; but the bill failed in the senate. This bill appears to have been substantially the same one that became law two years later, if, indeed, it was not identically the same. (*Life and Times of Ephraim Cutler*, pp. 113, 115, 123, 123; *History of Ohio*, Caleb Atwater, p. 254.) Atwater says of the bill of 1819: This bill, after being much injured by amendments, passed the lower house of the legislature, but was either not passed by the senate or so modified as to render it useless.

the number of scholars and in proportion to the time they had been taught in the schools.

The school law of 1821 speaks in two places of the trustees of townships. It seems to have meant that the trustees of the civil township should organize school districts, which was in conflict with the act of 1810 that was still in force; but there is no doubt that the trustees who were ordered to pay over to the treasuries of the school districts the moneys arising from the rent of township school lands were the officers of original surveyed townships.

The school law of February 5, 1825, has been regarded as the true beginning of the organization of public schools in Ohio, because it was mandatory. The act of 1817 to provide for the incorporation of school and library companies had been repealed in 1824. The law of 1810 relating to original surveyed townships remained in force till 1839. The school law of 1825 makes it the duty of the trustees of each incorporated township, meaning civil township, to organize school districts. The law of 1821 had pointed out the mode of creating school districts, differentiated the school district officers, determined the general nature of their duties, defined their official relations to the civil community, and provided for conveying the income from township school lands into the school district treasuries. The new act retained these provisions for the most part and made important additions. It created a county school tax, which did not disappear till 1851, making it the duty of the county auditor to levy upon all the taxable property of the county half a mill upon the dollar to be appropriated for the use of common schools within the county. He was to enter into an account for this fund with the school districts, basing his apportionment upon an enumeration or list of householders. This act also made it necessary for teachers in the public schools to be examined and to hold certificates of qualification and of good moral character. The branches of study were reading, writing, and arithmetic. The county court of common pleas should appoint annually 3 examiners of common schools, who, in addition to examining candidates for certificates, were clothed with the function of visiting the schools that in many States is intrusted to a county superintendent. But the exercise of such power was only permissive and not mandatory. The district meeting was to provide fuel and the means of erecting a schoolhouse. To the payment of teachers the revenues arising from the school lands were to be applied; after these had been exhausted, the school directors were to refer the teacher to the county auditor, who should draw on the county treasurer not to exceed the amount due therefrom to the district in question. This act left the rate bill or fee bill in vigorous life as before.¹

¹ Certainly little and probably nothing came from the act of 1821. But now the matter of providing a system of common schools for the State was taken up with a good deal of earnestness, and we are, fortunately, in possession of material facts relating to the enactment of the law of 1825. In December, 1821, the house of representatives appointed a committee of 5 on schools and school lands. The chairman of this committee was Caleb Atwater, afterwards an historian of the State. The report of this committee, which was adopted by the two houses in January following, closed with a resolution authorizing the governor to appoint a commission of 7 members, whose duty it should be to collect, digest, and report to the next general assembly a system of education for common schools and also to take into consideration the state of the fund created by Congress for the support of such schools. Atwater was the chairman of this commission and Cutler was also a member. The commission prepared free pamphlets for general distribution, one showing the actual condition of the school lands, one containing the draft of law to be submitted to the assembly, and the third an explanation of the system proposed. These documents were freely circulated through the State in the year 1823, but the legislature was opposed to all action and nothing was done at the time. The sequel Mr. Atwater relates in this manner: "During the next summer and autumn the contest about the sale of the school lands, the school system, the canal, and an equitable mode of taxation was warm and animated, but the friends of all these measures triumphed over all opposition at the polls at the October election of 1824. Large majorities were elected in both houses friendly to these highly beneficial measures. These measures were carried through the general assembly, and the greatest revolution politically was effected that our history offers to the reader. That legislature was the ablest in point of talents and moral worth that we ever had in the State." (P. 262.)

III. THE PERIOD 1825-1838.

In 1827 the general assembly began to provide for the sale of the school lands, the leasing plan having failed. Three years earlier this body had addressed a memorial to Congress on the subject, which cites the original grants and the provisions of the State legislature relative to leasing the land and to the distribution of the rents. The memorial accounts for the failure of the leasing policy as follows:

By reason of the facilities which the State of Ohio affords for acquiring a property in real estate, a necessity exists of leasing the lands in question to persons almost wholly destitute of pecuniary means whereby the avails of those lands are rendered at least uncertain. * * * The great body of those who constitute the strength and basis of every government and who are to be considered as the friends of good order and public improvement are among those who are the owners as well as the occupiers of the soil.

As Congress made no reply to this memorial the legislature assumed that it already had the authority to sell the lands and accordingly passed a series of acts enabling the voters of the townships and districts that possessed lands in common to decide whether the lands should be put on sale, and other acts defining the method of procedure. This change of policy gave rise to "the common school fund" of Ohio. The original law relating to the subject was enacted January 30, 1827. It orders that—

All moneys paid into the State treasury arising from the sale of any land appropriated by Congress for the use of schools in any original surveyed township or other district of country within the State shall constitute an irreducible fund for the support of common schools within the township or district of country for which such land was originally appropriated.

The act pledges the faith of the State for the annual payment of interest upon this fund at 6 per cent. It made the auditor of the State the accountant for the fund and provided that he should open an account with every township and district of country for whose use the lands were appropriated, and ordered the interest to be paid over annually to the respective officers authorized by law to receive it. The act also vested in the common school fund any donation that should be made for common school education. It further created a fund to belong to the people of the State in common for the support of common schools, to consist of the proceeds of the sales of salt lands which Congress had given to the State. There were at the time in the State 819 townships and 3 school-land districts, namely, the Western Reserve, the United States military lands, and the Virginia Military District. By this legislation it will be seen the school system began to make use of the machinery of the State government. It had already become identified for certain purposes with the county and township. Henceforth the political organization of the original surveyed township tended to lose its importance, although the statutes of the State still authorize it to elect officers.

The act establishing the common school fund was superseded March 2, 1831, by another very much like it, which made the additional provision that the interest on the other fund belonging to all the people of the State in common, which should accrue from the sale of the salt lands, be funded until January 1, 1835, and thereafter be annually distributed to the several counties of the State, in proportion to the number of white male inhabitants above the age of 21 years. Similarity of subject makes it in order to notice in this place the fact that this incidental fund was increased in 1851, March 2, by the proceeds of the sales of the swamp lands, which had been granted to the State of Ohio by act of Congress, September 28, 1850. The interest on this money was to be funded until January 1, 1855. Thereafter it was to be distributed on the same basis as the interest of the salt lands fund. The legal status of the salt land and swamp land funds has at times been laid open to dispute by the indefinite attitude of the school law towards them. They are, as the law now stands, distinctly recognized as sources of common school revenue.

The interest on them has come to be distributed, like other school moneys, on the basis of the enumeration of school youth.

Between 1825 and 1838 there were four general school laws passed, their dates being February 10, 1829, March 10, 1831, February 28, 1834, and March 12, 1836. Each one of these laws was merely the combination of its predecessor, which it repeated in its essential features, with two or three minor amendments that had been enacted in the interval. In 1827 a supplementary school act provided that each householder whose school-district tax would amount to less than \$1 by the regular levy should be assessed \$1, which might be commuted to two days' labor on the schoolhouse. A similar provision for commuting the local school tax remains in the legislation of the State until 1838. The act of 1827 contained also the provision that all fines imposed and collected by any justice of the peace for any offense or immoral conduct done or committed in any school district should be by such justice paid over to the treasurer of such district for the use and support of schools within the same. This provision does not appear in the school laws proper later than 1829, but it comes to be reiterated in great detail in the penal law.

With the act of February 10, 1829, begins a significant discrimination, which was continued until the negro race was finally put upon a new civil footing. It is to the effect that nothing in the act shall be so construed as to permit black or mulatto persons to attend the schools hereby established, or to compel them to pay any tax for the support of such schools. The rate of the county tax is increased to three-fourths of a mill on the dollar, and more detailed provisions are made for the district-school meetings than before.

The regulations that hedge about the assessment of schoolhouse taxes through this period are almost amusing in their seemingly petty complexity and bespeak considerable unpopularity for these school-district levies. To vote these taxes the quorum required at the district meeting is larger than for other business; the vote must have a larger majority; the maximum tax varies, being at one period graduated to the amount of taxable property belonging to residents of the district. The minimum amount to be assessed on any taxable person ranges from \$1 to 25 cents. There are provisions for commuting this tax into labor or schoolhouse materials. Lands situated more than 3 miles from the site of the schoolhouse are exempted from taxation. Districts are to share the rents accruing from the school lands in proportion to the number of families. The gradation of teachers' certificates begins, their time being limited to one year from date. The minimum period for which schools may be kept open any year is three months. Voluntary subscription or assessment upon parents and guardians is to be resorted to if the funds applicable to paying teachers are inadequate. Those who have studied the actual working of these early laws tell us that the attendance fell off as soon as the public moneys were spent. We find no provision of law for commuting any part of the teachers' compensation into boarding and lodging from house to house, but custom tended to establish and perpetuate that practice. School districts were not to be altered unless the trustees should make public their intention to do so. Joint districts are authorized, even when the townships interested therein are situated in different counties. By the law of March 10, 1831, school directors are constituted a body politic and corporate. A very important new feature of the same law is the distribution of school funds in proportion to the number of children in the districts. This necessitates provision for an enumeration of children; hitherto there had been only an enumeration of householders. In its earliest form this provision reads:

The clerk of each school district shall annually in the month of November take a list or enumeration, in writing, of all the white youth in his district between the ages of 4 and 21 years, not including any who are married, and shall return the same to the auditor of his county. * * * If any school district shall be

partly situated in an original surveyed township or fractional township to which belongs any section 16, * * * granted by Congress for the use of schools in such township, or to which belongs any interest arising from the money for which such land has been sold, the clerk of such district shall, in taking the annual enumeration of youth therein, * * * enumerate separately those residing in that part of the district situated in such original surveyed township or fraction of township; * * * and where any district comprises a portion of two or more civil townships, the clerk shall specify in his enumeration of the youth the township in which they severally reside.

The scheme of apportionment now established is described as follows:

That the auditor of each county shall * * * apportion to the several school districts in such county all the money in the treasury of such county for the use of schools, therein, as follows, to wit: All the money collected on the tax duplicate of any township for the use of schools shall be apportioned to the several districts and parts of districts in such township; all the money received from the State treasury on account of interest on the money accruing from the sale of section 16, or other land in lieu thereof, shall be apportioned to the several districts and parts of districts in the original surveyed township or fraction of township to which such land belongs; all moneys received by the county treasurer from the State treasury on account of the Virginia Military School fund shall be apportioned to the several school districts and parts of districts within the county lying within the Virginia military district; all other money for the use of schools in the county shall, if its appropriation is not otherwise directed by law, be apportioned to all districts in the county; and all such apportionments shall be made to the several districts and parts of districts in proportion to the number of youth therein as returned by the district clerks in November next preceding.

The law of 1831 declares that no certificates of qualification shall be issued to any teacher unless he or she be found qualified to teach reading, writing, and arithmetic; but a later amendment to this section provided that whenever the inhabitants of any school district should be desirous of employing a female teacher for instructing children in spelling, reading, and writing only, and the directors thereof should signify the same in writing to the school examiners, it should be lawful in such case for the examiners to give such teacher a special certificate. Although women did not yet enjoy their rights with respect to school administration, they seem to have been compensated, as the phrase goes, by privileges. The school law of 1834 makes it the duty of the county board of school examiners in each county to appoint one school examiner to each township in their respective counties to examine female teachers only; but the section quoted adds that these examiners in granting certificates shall be governed by the same rules and regulations as the county board, and the exemption from the examination in arithmetic is not continued.

The acts of 1833-34 suggest some of the practical difficulties attending the collection of school taxes payable in goods. The former provides that when the inhabitants of any school district shall neglect or refuse to furnish sufficient fuel for such school, it shall be lawful for the directors to apply such sum out of the treasury of said district in the purchase of such fuel as may be necessary to obtain the same. However, the pioneer custom was not readily abandoned; for the next act declared, that it should be the duty of every person sending a child to any district school to provide his just proportion of fuel for the use of such school to be determined by the directors in proportion to the number of children sent. It adds that if any person liable to make the contribution of fuel failed to provide it after due notice and warning, the director shall furnish the fuel and charge the same to such person. The amendment of February 13, 1833, contains the first reference to the school term; it declares it lawful for school directors to apportion the school funds applicable to the payment of the teacher to the different terms or divisions of the school year.

The law of March 12, 1836, included little that was new. The rate of the school tax assessed upon the counties had been steadily increasing. At this time the maximum was fixed at $1\frac{1}{2}$ mills on the dollar, and county commissioners were

authorized to allow an additional half mill. In case they refused it was made lawful for any township in the county to have an additional mill and a half assessed upon itself. County auditors were, for the first time, required to report the enumeration of school children for their respective counties to the auditor of State. This was to become a matter of greatest importance, as the basis of apportionment for such school funds as should belong to the people of the State in common.

The general assembly took its first serious step toward superintendence in a law enacted March 27, 1837, to create the State office of superintendent of common schools.¹ The incumbent of this office was to be elected for the term of one year by the joint resolution of the two houses of the legislature. He was to be commissioned by the governor, take an oath for the faithful performance of his duties, and receive the compensation of \$500 a year. His duties had to do largely with statistics. He was to report to the general assembly the following matters: Number of districts in each township in each county; the number of white youth between the ages of 4 and 21 years, specifying the number of each sex; the number attending school every year; the average time of attendance; the time the schools were in session; distinguishing the time they were supported by the proceeds of the irreducible funds, the time supported by taxation and the time supported by voluntary subscription; the amount paid to teachers in each district, township and county, and from what sources derived; the amount paid for buildings, for repairs, distinguishing the amount received from taxation from voluntary contributions. It was also made his duty to report upon the condition of the several school funds and upon the operation and defects of the common school system, and to suggest plans for its better regulation and improvement. The law authorized circulars of inquiry to be addressed to county auditors and to local directors and made it their duty to assist the superintendent in securing information. This last clause, as carried out by Hon. Samuel Lewis, the first and only incumbent of the office, meant a great deal. It was his effort, largely, if not mainly, that secured the enactment of the great school law of March 7, 1838.² There was a great awakening of interest in common schools throughout the State as

¹ The office of superintendent of common schools is one of the results of the exertions of the College of Professional Teachers and Western Literary Institute, established in Cincinnati, seven years ago. It has continued to grow in talent and numbers, and is now extending its vast and benign influence in the cause of education throughout the West and South.

At the instance of Albert Picket, senior president of the institution, the Ohio directory, consisting of Elijah Slack, William H. McGuffey, M. G. Williams, A. Kinmont, B. P. Aydelott, and C. E. Stowe, nominated adequate persons to represent the objects of the College of teachers before the legislature of the State. The persons named for that purpose were Samuel Lewis, Calvin E. Stowe, William H. McGuffey, Edward D. Mansfield; men of acknowledged talents, and who performed their duties with great zeal and ability. Their powerful appeal to the legislature in behalf of education induced legislative action and led to the establishment of a superintending officer. Samuel Lewis, esq., was selected, and we know of no one from whom the State may expect more untiring zeal in the faithful discharge of his official duties than from the object of their choice. (The Western Academician and Journal of Education and Science, Edited by John W. Picket, A. M., Cincinnati, published by James R. Allbach, 1837-38, pp. 381-382.)

² Comparison of the provisions of the school act of March 7, 1838, with the recommendations of the first annual report of Superintendent Lewis shows that he fully deserved the honor of having that great law called by his name. The history of the enactment of this law has been summed up thus: His report was favorably received by the people, and its suggestions were commended by leading newspapers. W. B. Van Hook was chairman of the school committee of the house of representatives. Accepting Mr. Lewis's views as those of a wise and well-informed man, he reported to the committee a bill embodying nearly all of his recommendations. That bill was introduced to the house on the 5th of February, 1838. It was discussed with earnestness, and bitterly opposed; but, on the 17th of February, passed by a vote of 46 yeas to 20 nays. After slight amendment, it passed the senate on the 3d of March by a vote of 21 yeas to 13 nays. The house concurred in the senate amendments, and on the 7th of April, 1838, the law was in force. (System of Common Schools in Ohio, William T. Coggeshall, published in American Journal of Education, Vol. VI, p. 87.) The 3d of March seems to be an error for the 7th of March.

the appointment of Prof. Calvin E. Stowe as a State commissioner to report on the schools of Europe and the publication of his report indicates. A resolution adopted in January, 1838, directs that 8,500 copies of Professor Stowe's report on elementary public instruction in Europe be printed and deposited in the office of the secretary of state, subject to the future disposition of the legislature; also that 1,000 copies be printed for the use of members of the general assembly, 300 for the author of the report, and 200 for the superintendent of common schools.

The keynote of the Lewis Act is supervision. Interwoven with the scheme to establish local superintendance is an attempt to centralize school administration by preferring township officers to district officers. Probably there was no conscious approach to the township district system, although the new legislation suggests that system. Moreover, there was a partial return to the old status of the district officers between this date and 1853. By the act of 1838, every township clerk was made superintendent of common schools within his township, his duties including visiting all the schools annually, inspecting the teachers' records, observing the management and making suggestions to teachers, filling casual vacancies in boards of directors, assuming directors' functions himself when boards failed to serve, and taking the enumeration of school children, a task which had hitherto devolved upon the district clerk since 1831. The minimum school year being fixed at six months, the township superintendent was directed to estimate the amount of money needed beyond what was available from other sources to carry on the schools, and submit to the voters at the annual township election the question of raising the same by tax. The next year there was supplied the provision to return to voluntary subscription or special assessment upon parents and guardians in case the tax was not voted. Another step toward identifying the district with the township was intrusting the township treasurer with the handling of all school funds distributed from the State treasury and accruing from the county and township taxes, leaving to the district treasurers only the collection of the district tax for buildings, fuel, furniture, etc.

The powers and duties of directors as newly defined point to the laying aside of some of the narrow district ideas and practices. Directors are authorized to levy a tax for incidental expenses not exceeding \$20 a year without the sanction of a district meeting. The old limitation upon the district tax growing out of the nonresidence of the property holders disappears. Not only householders but all voters have a place in the district meeting. The needs of schoolhouses in the way of furniture and other appointments begin to be recognized. More important than these things, there is an enlarged conception of school organization and of what a common school education ought to include. Directors are authorized to determine at what ages children may attend the different schools and during what terms; also what number shall be assigned to each teacher giving to all in the district an equal privilege. They may determine the studies to be pursued so that the three R's shall all be taught in the English language, and they may permit the teaching of other languages. Most significant of all is the provision that cities, incorporated towns, or boroughs shall constitute separate school districts wherein the electors shall choose either 3 directors from the district at large, or 1 from each subdistrict. Directors may divide such districts into subdistricts and may establish schools of different grades and ordain such rules for their management and discipline as they may think conducive to their good. There was a corresponding provision for special taxes.

It must not be supposed however, that this was the earliest response of the legislature to the educational needs of populous communities in the way of graded schools, for special laws authorizing such schools had already been enacted for Cincinnati and Zanesville. In Cleveland, however, the promoters of the early high school defended that institution against unwilling taxpayers by citing this provision of the general law. The visiting and advisory functions of the exami-

ners of teachers now disappeared before the more systematic provisions in relation to superintendence. A new function, however, given to these bodies, is prophetic of one of the liveliest chapters in school history—that is, school examiners are given authority to recommend text-books to school directors. The county auditor is styled the county superintendent of schools, his school duties pertaining entirely, however, to accounts and statistics. In addition to the enumeration of the school youth the reports deposited with him and transmitted to the State superintendent were to include a school directors' report showing the number of schools; the number of teachers, male and female, wages paid to each; length of school session in each district; number of pupils enrolled, male and female; average daily attendance; houses built and cost of each; value in quantity of school lands in or belonging to the township, and its annual rent; and such other information as might be called important. The teacher's report was now required to be more elaborate than before, and it was made unlawful for teachers to receive more than two-thirds of their compensation until their reports had been placed in the hands of the township clerk.

‡ State superintendence was the leading feature of the act of 1838. The act of the preceding year relating to the subject was substantially incorporated in it, while additions were made. The term of office was lengthened to three years and the salary increased to \$1,200 a year. The duties of the office included the editing of a periodical named the Ohio School Director, which was to be published for one year at the State capital.

‡ An important new principle appears among the fiscal clauses of the act, viz: The practice is established of appropriating State funds or property to public school uses. The "State common school fund" is created. This must not be confounded with the "common school fund" that was created in 1829, and was more permanently regulated in 1831. The State common school fund, as constituted by the Lewis Act, included interest on the surplus revenue at 5 per cent; the proceeds of the salt lands; the State revenue from banks, insurance, and bridge companies; and other funds appropriated, sufficient to make the sum annually distributed equal to \$200,000.¹

‡ Twelve days after the passage of the Lewis Act a law was enacted to levy the first State school tax. It declared that there shall be levied annually for the State common school fund a tax of half a mill on the dollar of the valuation of all property entered for taxation on the general list throughout the State.

IV. THE PERIOD 1838-1853.

The great act of 1838 was too generous to the schools; it was not suffered to stand in its entirety. An amendment passed the next year authorizes county commissioners to reduce the rate of the county school tax to 1 mill on the dollar; the limit had been raised to 2 mills by the preceding act. Narrower limits were also set to the local school taxes. Neither was the public ready for Superintendent Lewis's conception of superintendence and local centralization. So the township superintendent is excused from the performance of some of the duties most characteristic of his office. Still more, in 1840, when Mr. Lewis resigned the State superintendency, the general assembly abolished the office and imposed some of its duties upon the secretary of state. There are indications at this time of strife between the English-speaking and the German elements of the population over the question of language. The clause in the law requiring that reading, writing, and arithmetic be taught in the English language is repealed.

¹ The "surplus revenue" mentioned was the portion of the surplus revenue of the National Government that was deposited in the custody of the State by direction of an act of Congress passed in 1837. This fund is more commonly referred to as the "United States Deposit Fund." The total amount that fell to Ohio was \$2,077,260.34. (*The History of the Surplus Revenue of 1837, etc.*, by Edward G. Bourne, 1885, p. 142.)

German district schools are recognized. German children residing in districts where the teaching is done in English are permitted to attend in other districts and to draw at the same time their share of the public money. Night schools are first authorized at about this period. The provision of 1839 provides that in town and city districts evening schools may be carried on for the benefit of male youths over 12 years of age who are prevented by their daily vocations from attending day schools. In 1842 the school district clerk had his former functions relating to the school enumeration restored to him. The district also enjoyed new dignity in the lengthening of the directors' term of office to three years, the order of election being so arranged that one director should be chosen and one should retire annually. It was now eleven years previous to the time when the township should supersede subdistricts and the subdirectors lose their corporate character. In 1847 the rate of the county tax was reduced to two-fifths of a mill in consequence of the increased value that the tax law of 1846 had given to the general list of taxable property.

It is in order to consider at this point the extraordinary development of city and town school organization that set in at the middle of the century. A phrase in the common-school law of 1839 had suggested that populous communities ought to be for school purposes a thing apart from the township. On February 12 of that same year the legislature passed the first special city school law. Its title was: "An act in addition to the act entitled an act to incorporate and establish the city of Cincinnati." It made the city council the responsible authority for maintaining schools, clothed it with power to tax, vested in it all titles to school property, and imposed all the necessary fiscal duties and some administrative ones. It was not until 1873 that the connection between boards of education and municipal legislatures was dissolved in great city districts. The act of 1839 created a board of trustees and visitors, which should consist of one member from each ward, elected by the voters. This body was vested with the appointing and organizing powers, and was responsible in financial matters to the city council. A third authority was the "board of examiners and inspectors," whose members were the appointees of the board of trustees and visitors, to which they reported regularly concerning the instruction given and the government of the schools. Examining teachers was one of their important functions. The law called for brick or stone schoolhouses, two stories high, and empowered the city council to borrow money to build them, but it did not grant any large powers in the way of extending the range of instruction. As has already been noticed, the general school law of 1838 made every city, incorporated town, and borough a separate school district and sanctioned graded schools. In 1839 a special law was enacted for Zanesville; in 1845, one for Columbus; and in 1848, one for Cleveland. In 1846 there was a supplement to the Cincinnati law which was also made applicable to the schools of Dayton. It declared:

1. The trustees and visitors of common schools of the city of Cincinnati, with the consent of the city council, * * * shall have power to establish and maintain, out of any funds under the control of said trustees and visitors, such other grade of schools, than those already established, as may to them seem necessary and expedient for the above-named purpose; and they are hereby authorized to have taught therein such other studies in addition to those now taught in the common schools of said city, under such regulations as said trustees and visitors may from time to time describe: *Provided*, That said funds shall not be appropriated toward the establishment and maintenance of such other grade of schools so as in anywise to impair the efficiency and permanency of the common-school system now existing in said city.

The power conferred upon the trustees and visitors of the common schools of the city of Cincinnati in the first section of this act is hereby conferred upon the managers of the common schools of the city of Dayton.

In 1850 was passed an act to authorize the appointment of a superintendent of common schools for Cincinnati. It provided that the qualified voters of Cincin-

nati should elect annually in April one superintendent of common schools for the city. The duties of this officer were to visit all the common schools in the city and establish under the direction of the board of trustees and visitors a course of study; also to make rules and regulations to promote the progress of the schools. The board of trustees was to fix the amount of the superintendent's compensation and had the power to remove him from office on good cause shown.

In this connection it is well to observe that the office of superintendent originated in the specialization of administrative and not of teaching functions. Therefore, to vest in it, power to appoint or at least to nominate teachers, is entirely congruous to the nature of the office.

Cincinnati, Zanesville, Columbus, Dayton, and Cleveland had entered upon the organization of graded schools earlier than 1847. But the really great impetus in this direction in the State was given by the so-called Akron law, which was passed February 8, 1847. It applied at first only to Akron and Dayton, but a supplementary act extended its provision to all cities and incorporated towns, two-thirds of whose inhabitants should petition the town council for its adoption. On February 21, 1849, a similar act was passed for the better regulation of the public schools in the cities, towns, etc. This might be adopted by any incorporated city, town, or village, containing 200 or more inhabitants not governed as to schools by any special law, upon the vote of the qualified electors. Both of these laws provided for the election of 6 school directors in the town, arranging the election so that 2 should be chosen annually for a term of three years. This board of education was constituted a body politic and corporate in law. The members were required to organize by choosing from their own number a president, a secretary and a treasurer, and to hold regular meetings. The Akron law vested the title to school property in the town council together with power to sell, lease, and convey such property with the advice of the board of education. It also made the council the taxing authority for school purposes, requiring the board of education to furnish an estimate of the amount of money needed. The next year the rate of this tax was limited to 4 mills. Such functions as determining building sites, erecting schoolhouses, and dividing the school year into terms were assigned to the board of education and not to the council as they had been by the Cincinnati law. The act of 1849 for cities and towns seems to have given the municipal council no place at all in the system. The board of education was made the taxing authority, but it had to submit the question to the people and the rate of tax was limited to 4 mills. A statement of finances and certain other matters had to be made public at each annual election. Moreover, the board of education was given power to borrow money for the erection of schoolhouses upon the favorable vote of the electors of the district. An act supplementary to the Akron law passed at this time made it possible for districts organized under it to exercise this power also.

But the most important feature of these two laws is the range of instruction which they contemplated. The Akron law provided that the board of education should establish in different parts of the town corporate of Akron, so soon as they should realize sufficient funds, six or more primary schools in which the rudiments of an English education should be taught; also, that it should establish a central grammar school where instruction should be given in the various branches and parts of study not provided for in the primary school and yet requisite to a respectable English education. The law of 1849 said on this subject:

It shall be the duty of said board, as soon as the means for that purpose can be provided, to establish in said district an adequate number of primary schools, to be so located as best to accommodate the inhabitants thereof, and in which the rudiments of education shall be taught; and it shall be the further duty of said board to establish in said district a suitable number of other schools of a higher grade or grades, wherein instruction shall be given in such studies as may not be provided for in the primary schools, the number of schools and also of the differ-

ent grades thereof to be determined by said board; and it shall be the further duty of said board to decide what branches shall be taught in each and all of said schools, provided that no other language than the English or the German shall be taught therein, except with the concurrence of two-thirds of said board.

The act of February 21, 1849, for the better regulation of the public schools in cities, towns, etc., was amended on March 13 of the next year so as to give union school privileges to smaller communities. The amendment declares that "the act * * * is hereby extended to incorporated townships and to school districts * * * which shall adopt the same in the manner specified." It provides, however, that said act shall not be so extended to any township or school district containing less than 500 inhabitants, unless said school district consists in whole or in part of an incorporated town or village.

The act of February 21, 1849, shares with the Akron law the honor of being the effectual charter of graded schools in Ohio.¹ Both were repealed, together with numerous other special acts, by the school legislation of 1873, when town and city districts were systematically classified and a greater degree of uniformity was secured. This mass of legislation for cities and towns brought with it the regulation of some matters that had never been specifically provided for in the common school laws. The relations between teachers and pupils began to receive attention. Suspension and expulsion, inflicted with proper deliberation, were prescribed for the more serious evils that had been left by tacit understanding to the rod and ferule. A larger publicity came to be required of boards of education. Much visiting of schools was required of school trustees and teachers' examiners. There are provisions in two or three special laws, including the Cincinnati act, for a public examination of pupils by these visitors. The city council of Cincinnati by the law of 1829 was authorized to spend \$100 a year for premiums to pupils.

Within the six years next preceding the passage of the great act of 1853, a series of brief statutes² were enacted which added entirely new features to the body of State school legislation. Some of these were repealed as separate laws and incorporated in the act of 1853; one or two were abandoned. February 28, 1846, is the date of an act authorizing school districts to establish libraries for the use of common schools. All legally constituted school districts were hereby authorized to expend for books and apparatus moneys not to exceed \$30 the first year and \$10 any subsequent year. These funds were to be raised and handled in the same

¹ About 70 of the towns and cities of the State established free graded schools, and of these more than 50 have been organized within the past three years and by the adoption of the law of 1849, for the better regulation of public schools in cities, towns, etc. (Report of Lorin Andrews, general agent of the State Teachers' Association, published in Annual Report of Secretary of State on Common Schools for the year 1851.)

² During the period 1840 to 1853 the secretary of state reported annually to the general assembly concerning the condition of the common schools. Indeed one or two of these gentlemen performed the duties that had been superimposed upon the more appropriate functions of their office better than could have been reasonably expected. Nevertheless the first years of the interval were marked by retrogression. For the quickened educational activity of the years 1847-1853, the highest credit is due to the Ohio teachers' association. Organized December 31, 1847, through the private initiative of the leading schoolmasters of the State, this society discharged, up to the time when the office of State superintendent of common schools was restored, functions that appertained more suitably to the State government. It sustained in the field a general agent who did much to prepare the public to demand and support the progressive measures that were to come; it kept in close touch with the secretary of state and saw its resolutions incorporated into his school reports. A parallel might be drawn between the State teachers' association, as a force in educational progress at this juncture, and the College of Professional Teachers and Western Literary Institute at a similar time in the preceding decade. The following statement was made in 1859: Recommendations of the Ohio teachers' association have been embodied in laws for teachers' institutes, for school libraries, for high schools, for township boards of education, for a State instead of a county tax, and for a state commissioner. (System of Common Schools in Ohio, William T. Coggshall; published in American Journal of Education, Vol. VI, p. 552.)

manner as district taxes. School directors were to make rules for the use of such books and apparatus. The school law of 1853 was to make a great advance upon this. It ordered a State tax of one-tenth of a mill, to be levied for the purpose of furnishing school libraries and apparatus to all the common schools within the State.

On February 3, 1847, the first act relating to teachers' institutes was passed. It has an instructive preamble, which runs:

Whereas it is represented that in several counties associations of teachers of common schools, called teachers' institutes, have been formed for the purpose of mutual improvement and advancement in their profession, which, it is represented, have already accomplished much to elevate the standard of common school instruction in their respective counties; therefore, in order to encourage such associations and thus promote the cause of popular education, be it enacted, etc.

This law provides for the support of institutes by authorizing county commissioners to apply to the purpose part of the annual proceeds of that portion of the surplus revenue which had been deposited with the counties pursuant to an act of March 28, 1837. Funds thus appropriated were to be disbursed by the county board of examiners; at least one-half was to be expended to employ instructors and lecturers, and the balance for a suitable common school library for the use of the association. The privileges of every institute were to be free to all common school teachers of the county and to all persons within the county who intended to become common school teachers within twelve months.

On February 23, 1847, was passed an act to provide for the appointment of county superintendents of common schools in certain counties, which were named, twenty-five in number. The superintendents were to be elected by the clerks of the school districts in the county. They were to be ex officio chairmen of the boards of school examiners and were to sign all certificates issued; they had power to renew certificates at their discretion, also to annul them for cause, with the concurrence of one other member of the board. They had large duties as visitors and inspectors of the county schools, and were also to encourage teachers' institutes and educational societies, and to labor to stir up popular interest in education. Township superintendents were to report to them and they were to report to the secretary of state. The act was afterwards made general, but only one county availed itself of this privilege, and it was repealed in 1853. The county in Ohio has never become an established unit or district for school superintendence, as it has in nearly all of the Western States.

The most interesting of the new features of this period appears in the act of February 24, 1848, to provide for the establishment of common schools for the education of the children of black and mulatto persons. Since the act of 1829 declared itself nonapplicable to such persons, the school law had ignored them wholly, except to protect their property against taxation for school purposes. The new act ordered taxes to be collected on such property for the support of colored schools. It declared every city, town, village, and township in which there were at least twenty black or colored children of any age desirous of attending school, to be a school district for such children; and it made it lawful for the colored persons residing in such district to assemble and organize themselves, to appoint school directors of their own number, to erect and repair a schoolhouse, to procure suitable teachers, and to assume for such purposes the same powers as were possessed by white persons under the act of 1838. Any colored district that contained 50 or more scholars might be divided by its directors, provided no district was made that contained fewer than 20 scholars. The law permitted mixed schools, providing that in every community containing less than 20 black or colored children desirous of attending school, it should be the duty of the directors of the schools organized for white children to admit the blacks upon the same terms as the whites, provided no written objections were filed with the directors, signed by any person having a child in such

school, or by any legal voter of such district. The law contained nothing to indicate whether such schools were already permitted to any extent by the public sentiment of the community. In cases where the white inhabitants would not tolerate mixed schools and the number of colored children did not warrant the establishment of a colored school, the property of the blacks was exempted from school taxes. The following provision is of interest:

When schools for blacks shall have been organized * * * the children of such schools shall be enumerated and have the exclusive benefit of any donation or grant of land which shall be made by any person or persons or by Congress for the support of such schools, which shall be vested in the legislature of this State and appropriated to such schools only.

In 1853 colored children were included in the general district enumeration, only they were to be distinguished from the white children. By this time colored children seem to have become sharers in the great school funds of the State. The act of February 10, 1849, which repealed that of the preceding year, may be interpreted to indicate a larger tolerance of mixed schools. It left the establishment of dual districts for white and colored children to the discretion of boards of education. It provided that such trustees and directors or other officers having authority in the premises of each city and incorporated town or village should be authorized and required, respectively, in case they should not deem it expedient to admit the colored children resident in such township, city, town, or village, into the regular common schools therein established, to create one or more school districts for colored persons in every such township, city, town, or village, which district or districts should include all the territories thereof. Both laws provided that the school taxes on the property of the colored population in mixed districts should be added to the common district fund.

On January 21, 1848, an act was passed to secure the returns of the statistics of the common schools. This declared it to be the duty of the teacher, on presenting to the township treasurer an order for the payment of services, to accompany the same with an abstract of his daily record. It further declared it unlawful for any township treasurer to pay and redeem any order to a teacher unless the same should be accompanied by the abstract required. It made it the duty of the township treasurer to return such abstracts to the county auditor in making his annual settlement, and declared it illegal for the auditor to give credit to the treasurer for any order that had been unlawfully redeemed. It made it the duty of the several county auditors to carefully examine the abstracts and statements of teachers thus returned to them, and in their annual reports to the secretary of state to give such a tabular statement thereof as the said officer should require. There is abundant evidence that the evil of defective returns from the public schools was not eradicated by this legislation, for it was in 1858 that all the counties made for the first time a report of their school affairs.¹ An amendment to the Lewis Act that was passed March 12, 1849, ordered that English grammar and geography should be taught in any school upon the requirement of three or more of the householders interested. These two subjects were also added to the list of those in which candidates for teachers' certificates were required to be examined. This was the first mandatory advance beyond the three R's.

In 1850, March 22, a law was enacted for the appointment of a State board of public instruction. This was an attempt to put in commission the department of State educational supervision. It created a board of five citizens to be appointed by joint ballot of the two houses of the general assembly, one annually for a term of five years. The senior member was to be styled the State superintendent of

¹ Fifth Annual Report of the Commissioner of Common Schools, Columbus, 1859, p. 3.

common schools; the others, district superintendents. To the head of this board were assigned all the duties that had attached to the former office of superintendent of common schools except the inspection of schools; the other members were to attend to this duty, each in the quarter of the State assigned to him. The district superintendents also had duties in connection with county boards of examiners. One of these was to furnish for the semiannual examination of teachers lists of questions which the State superintendent had prepared. This included the earliest provision for uniform examination questions. A fee of \$1 was imposed upon every applicant for examination, the first instance of the kind in any general law in the State; and the fund thus accruing was to be applied to the support of the State board. One clause of the act put rare faith in the impartiality of man; it authorized the State board to issue life certificates to applicants who were recommended by their proper boards of county examiners and by their district superintendents. But the law was enacted too late in the session to permit the appointments to be made, and seems never to have gone into operation.

On March 24, 1851, an act was passed bearing the cumbersome title "An act providing for school districts and school-district meetings, prescribing the duties of district officers, and clerks and treasurers of townships, and increasing the State and county common-school funds." This act restores the law of 1838 in many respects to its original substance and vigor. That act had made an approach to the township district system established later, by the act of 1853, by devolving important school duties upon both the township treasurer and township clerk. A series of amendments had subtracted from the powers of these officers in favor of the district treasurer and district clerk. The act of 1851 fully rehabilitated the township clerk in the capacity of township superintendent of schools, allowing him, moreover, \$1 a day for time spent in visiting schools. It renews the distinction between district taxes levied for building, repairs, fuel, etc., and the special tax to make the school session six months long. It assigns the collection of the former to the district treasurer; the latter it views as a township rather than a district tax and limits it to 3 mills on the dollar. On the other hand, this law stops short of the enactment of 1853 in that it makes very much of district directors and of the annual district meetings. It increases the amount that the directors may levy without the sanction of a school meeting to \$50; it makes the rate of the county tax 1 mill on the dollar, which had been put as low as two-fifths of a mill in consequence of the tax law of 1846, and it orders that the State common-school fund be so increased that the amount yielded for annual distribution shall equal \$300,000.

The 1851 constitution of Ohio, which took effect in 1851, assigned to education a stronger position than that of 1803 had done. The bill of rights contained the following declaration:

Religion, morality, and knowledge, however, being essential to good government, it shall be the duty of the general assembly to pass suitable laws to protect every religious denomination in the peaceful enjoyment of its own mode of public worship, and to encourage schools and means of instruction.

The educational article runs as follows:

ARTICLE VI.—*Education.*

SEC. 1. The principal of all funds arising from the sale or other disposition of lands or other property granted or intrusted to this State for educational and religious purposes shall forever be preserved inviolate and undiminished; and the income arising therefrom shall be faithfully applied to the specific objects of the original grants or appropriations.

SEC. 2. The general assembly shall make such provisions, by taxation or otherwise, as, with the interest arising from the school trust fund, will secure a thorough and efficient system of common schools throughout the State; but no

religious or other sect or sects shall ever have any exclusive right to or control of any part of the school funds of this State.¹

The great principle of free common-school education was put into operation under the school law of March 14, 1853, which left the rate or fee bill to be a thing

¹Information at first hand regarding the framing of these clauses is given by James W. Taylor, as follows: Early in the session of the Ohio constitutional convention, which assembled in Columbus May 6, 1850, and closed its deliberations, after an adjournment to Cincinnati, on the 10th of March, 1851, the subject of education was intrusted to a standing committee, composed of the following delegates: Harmon Stiger, of Stark; Otway Curry, of Union; Samuel Quigley, of Columbiana; James W. Taylor, of Erie; Jacob J. Green, of Defiance; A. G. Brown, of Athens, and John A. Smith, of Highland. On the 5th of July (the fiftieth day of the Columbus session) the following report was presented from the standing committee upon education.

SECTION 1. The general assembly shall provide for the election, by the people, of a superintendent of common schools, whose term of office, duties, and compensation shall be prescribed by law, and shall provide for the election or appointment of such assistants or other officers as may be found necessary, prescribe their duty, term of office, and compensation.

SEC. 2. The general assembly shall encourage, by suitable means, the promotion of moral, intellectual, scientific, and agricultural improvement.

The proceeds of the sale of lands that have been or may hereafter be granted by the United States for educational purposes, and all lands or other property given by individuals for like purposes, together with the surplus revenue deposited with this State by the United States (until reclaimed), shall be and forever remain a permanent, irreducible fund; the interest and income therefrom shall be faithfully applied to the specific objects of the original grant, gift, or appropriation.

SEC. 3. The general assembly shall make such provision, by taxation and other means (in addition to the income arising from the irreducible fund), as will secure a thorough and efficient system of common schools, free to all the children in the State.

Mr. Curry submitted the following minority report:

SEC. 1. Religion, morality, and knowledge being essentially necessary to good government and the happiness of mankind, schools and the means of instruction shall forever be encouraged by legislative provision not inconsistent with the rights of conscience.

SEC. 2. It shall be the duty of the general assembly to provide by law that the principal of all funds arising from the sale of lands heretofore or hereafter granted or donated, from any quarter, for educational purposes, together with the principal which may be realized from donations of personal property and money for like purposes, and the surplus revenue deposited with this State by the United States (until reclaimed), shall be preserved inviolate and undiminished; and that the interest and income arising from such funds shall be faithfully applied to the object of the original gift or grant: *Provided*, The general assembly may at their discretion appropriate all or only a part of the proceeds of the surplus revenue to educational purposes.

SEC. 3. The general assembly shall provide for the election of a superintendent of schools and seminaries of learning under the care and patronage of the State. They may also provide for the election or appointment of such assistant superintendents or other officers as may be necessary to carry into effect a thorough and uniform system of common-school education; and they shall prescribe by law the terms of office, compensation, powers, and duties of all officers elected or appointed under the authority of this section.

SEC. 4. The general assembly shall provide by law a system of common schools, and permanent means for the support thereof, by which a school shall be kept in each school district in this State not less than six months in each year, and which shall be open to youth of all classes, under such regulations as may be prescribed by law; *Provided*, That black and mulatto youth shall not attend the schools for white youth, unless by common consent.

SEC. 5. Provision shall be made by law for the establishment and support of as many normal institutes as the general assembly may find to be necessary for the thorough instruction of professional teachers of the common schools of the State; and all persons applying to any of said institutes for admission and instruction shall be required, before admission, to give such assurance as may be specified by law of their intention to devote themselves to teaching as a profession.

SEC. 6. No religious sect or party shall ever have exclusive right to or control of any part of the common-school fund, or of any of the schools, seminaries, or institutions of learning under the care and patronage of the State.

At the Cincinnati session the foregoing reports were fully discussed. Upon the various amendments offered the following points were elicited, indicative of the temper of the body:

1. That it was inexpedient to limit the educational bounty of the State to white children by any terms of direct exclusion, but how far colored children should be entitled to public instruction was made a subject of unrestricted legislative cognizance.

2. Propositions to augment the State school fund to a sum which would produce a revenue of about a million of dollars and to enjoin a minimum of six months' instruction were not adopted, some apprehending that the people would not sustain such forward movements, while others believed that the Ohio school system would be even more progressive than its most sanguine advocates in the convention anticipated. The experience of a few years has fully vindicated the latter view.

3. An amendment directing the organization of normal institutes was lost by 20 to 57.

4. Even the clause establishing, in express terms, the office of superintendent of common schools was not retained in the final action of the convention, the precise methods of superintendence being left to legislative discretion. (A Manual of the Ohio School System. James W. Taylor. Cincinnati: 1857. Pp. 211, 212-215.)

of the past. This important measure has been popularly called the Rice act.¹ Its substance is well summed up in its title, "An act to provide for the reorganization, supervision, and maintenance of common schools." Under the head of reorganization the new law took the first step toward the fusion of the rural districts of a township into a single township district, though nearly fifty years were to elapse before the work should be completed. The partial consolidation of the act of 1853 carried with it the substitution of township school taxes for the more local school taxes of the earlier system. The county school tax disappeared. Pursuant to the provision of the new constitution of the State, the sum raised for common schools by levy of the general assembly was greatly increased. Hitherto the State common-school fund had never amounted to more than \$300,000. The act of 1838, which created it, had provided for only \$200,000. The language of the act of 1853 on this subject is as follows: "For the purpose of affording the advantages of a free education to all the youth of this State, the State common-school fund shall hereafter consist of such sum as will be produced by the annual levy and assessment of two mills upon the dollar valuation on the grand list of the taxable property of the State."

Under the district system for country schools, as established in 1853, the township district was composed of subdistricts, which were naturally a continuation of the districts of the old order. Each subdistrict elected a school board of three members; one of these was chosen clerk by his colleagues; the old district meeting survived in the form of the subdistrict election. The school board of the township district was composed of the clerks of the subdistrict boards, together with the township clerk. The township treasurer was ex officio treasurer of the school district. The functions retained to the subdistrict boards were the employment of teachers, inspection of schools, and contracting for buildings, repairs, and furniture. The character of body politic and corporate was taken away. On the other hand, the township school board was created such a body. It was made responsible for all the school property within the township district, having authority also to hold subdistrict boards responsible to itself. Its ordinary functions were to estimate the school tax necessary to be raised by the township levy in order to carry on the schools seven months in the year; to prescribe regulations for all the schools concerning subjects taught, text-books, discipline, etc.; to assume the duties of local directors in any subdistrict where failure or incapacity arose on the part of the regular officers, and to fix, under certain regulations, the boundaries of subdistricts. Naturally enough, cases of conflict arose between the two kinds of school boards. The reports of the State commissioners for the next

¹ A monument to Hon. Harvey Rice has been erected in Cleveland, one of the inscriptions on which styles him the "Father of The Common School System of Ohio." All the provisions of the Rice act that were new are to be found among the resolutions of the State teachers' association for the years immediately preceding its enactment. Mr. Rice's relation to the measure is shown in the following account: It devolved upon the senate of Ohio, at the first session of the general assembly, to initiate the very important measure which is the topic of present consideration. The standing committee of that legislative branch to which the subject of "common schools and school lands" was referred, consisted of Harvey Rice, of Cuyahoga; George Rex, of Wayne, and Alonzo Cushing, of Gallia. On the 29th of March, 1852, they reported the senate bill No. 94, "to provide for the reorganization, supervision, and maintenance of common schools." It reached its second reading April 1, after which it was committed to the committee of the whole and made the order for the same day, but it was not reached in committee until the 13th of April. Its discussion continued until the 15th, when the committee rose, and the bill, with various amendments, was tabled for the residue of the session. * * * The interval between the regular and adjourned sessions of the general assembly had been improved by Mr. Rice, the author of the bill, for a thorough canvass of public opinion. The most experienced teachers and careful legislators of the State had been furnished with copies and their suggestions invited, and probably no similar measure ever engrossed more anxious attention than did the well-known "Senate bill No. 94," from the beginning to the close of the session of 1852-53. (A Manual of the Ohio School System. James W. Taylor. Cincinnati: H. W. Derby & Co., 1857, pp. 215, 216, 220.)

few years say much on the subject. A seemingly important provision of the law was the one that authorized any board of education to appoint one of its members acting manager of schools for the township, with such duties as the board might prescribe with relation to the management and supervision of the different schools. Any member of a school board appointed to such duty was to receive compensation for his services. It does not appear, however, that acting managers of schools were appointed to any great extent.¹ In addition to the duties enumerated above, the control of any "central or high school" that the township carried on was vested in the township board. Authority was given to establish schools of a higher grade than primary after the qualified voters of the township should have authorized the necessary steps, granted the taxes, etc. In city and village districts school boards were clothed with larger powers in the matter of providing for secondary instruction.² The law authorized them to divide their districts into subdistricts, establish schools of different grades, ordain rules for their regulation, etc. Herein could be found authority to establish "central or high schools" without submitting the question to the voters of the district. The law of 1853 did not clear away the existing mass of special school systems. One of its provisions was that the new act should not interfere with schools governed under the Akron law or the law of 1849 for cities and towns. It authorized cities and towns to adopt the new law in place of any earlier one by vote of the qualified electors. The scheme which it offered for the administration of city and village schools was no advance beyond the Lewis act. The reports of the State commissioners of education give instances in which boards of education did not know under which law their schools were organized. Under the head of supervision the new law repealed the act to create a board of public instruction. It restored the office of State superintendent under the title of "State Commissioner of Common Schools."

The regulations relating to this office are that the State commissioner shall be elected triennially for a term of three years by the qualified electors of the State, and shall give bond to the State in the sum of \$10,000. He shall have an office at the seat of government. His duties shall include encouraging teachers' institutes, conferring with township boards of education, counseling teachers, visiting schools, and delivering educational lectures. He shall spend at least 10 days annually in each judicial district. He shall purchase and direct the distribution of the libraries and apparatus provided for in this act, have a certain supervision over the educational funds of the State, prepare forms for school reports, direct the printing and distribution of school laws, and make an annual report to the general assembly. His salary shall be \$1,500 annually, to be paid out of the State treasury.

Among the miscellaneous provisions of this law should be noticed the special State tax of a tenth of a mill for the purchase of common-school libraries; the appointment of county boards of examiners by the probate judge; the allowance of \$1.50 a day to such examiners, to be paid out of the county treasury; the addition of orthography to the list of subjects in which examination was required, and the dropping of the sex qualification for admission to the evening schools. The management of colored schools was intrusted to the regular district school board. Separate schools for colored children might be established if the number of colored scholars in any district was equal to 30. They were to be discontinued for a period of six months after the average attendance had fallen below 15 for

¹ Fourth Annual Report of the School Commissioner. Columbus, 1858, p. 18.

² At the commencement of 1847 there was not a single well-organized public high school in the State. Now there are more than forty in which a thorough academic education is given, besides nearly an equal number in which instruction is given in some of the higher branches. (Report of A. D. Lord, 1854, as general agent of the State teachers' association, quoted in *American Journal of Education*, Vol. VI, p. 535.)

any one month. The school law of 1853 repealed a mass of legislation equal to ten times its own bulk, although it numbered 69 sections itself.

V. THE PERIOD 1853-1873.

It was natural that some retrogression should follow such a long stride forward, but it is gratifying to find that almost all of the thrusts at the new law were parried in the general assembly by a wise majority. The rate of the State school tax was reduced to a mill and a half at the session of 1854.¹ The library tax clause was allowed to operate for the years 1854, 1855, and 1856; it was suspended for 1857; again for 1858; it was allowed to operate for 1859; but in 1860 it was repealed.

Twenty years elapsed before there was further public-school legislation of very great importance. The interval was not so productive of new features as the fifteen years between the Lewis act and the Rice act had been. In 1857, April 17, a mode of procedure was prescribed by which teachers who had been dismissed could bring suit against the district or subdistrict. Provision was made January 24, 1859, for the school board of any incorporated village to unite with the board of the township in which the village was situated for the establishment and maintenance of a central high school. On March 18, 1865, that section of the law that related to colored schools was amended. The amendment provided that all school officers having authority in the premises should establish separate schools for colored children when the whole number of such children exceeded 20; when the number was less than 20, joint colored districts might be formed; when distance rendered separate schools impracticable, the full share of school funds belonging to colored children was to be set apart and appropriated each year for their education, which indefinite arrangement proved inadequate in practice. On the same day the law was passed that created the State board of examiners. This body as originally organized consisted of three members, who were appointed by the State commissioner of common schools. It held its first meeting in July of 1864, and granted eleven State certificates. It was also provided at this time that every applicant for a teacher's certificate should pay 50 cents for the privilege of being examined, and that the fund accruing from this source should be paid into the county treasuries and constitute teachers' institute funds. It would have required only a little foresight to perceive that the component parts of township school districts as arranged by the law of 1853 were not likely to hold together in all cases, with the question of maintaining "central or high schools" left to the vote of the electors of the township. The "special school district" was added to the types that had been differentiated earlier, by an act of April 19, 1867. This measure made it lawful for any subdistrict or group of contiguous subdistricts which contained not less than 275 inhabitants to become a separate school district. Separate German schools were still in vigorous life, as is shown by the act of May 8, 1868. This required that all teachers employed to teach German should be examined and found qualified to teach in that language all the branches taught in the common schools. An act of April 16, 1870, made the managing authorities of teachers' institutes responsible for furnishing statistics of such institutes to the State commissioner of common schools. A vaccination law was passed March 7, 1872. This seems to have been the earliest sanitary measure affecting schools. March 31, 1871, is the date of the first of that very interesting group of laws which were necessi-

¹ According to the best authority on the history of the Ohio school system for this period, this step did not actually cause any loss to the schools. The State school tax, at the session of 1854, was reduced from two mills to a mill and a half. Nevertheless, in the presence of a grand duplicate much enlarged by the revaluation of real estate in 1852-53 and the legislation pursuant to the new constitution, the amount collected at the lesser rate was \$1,208,283.84, against \$1,118,089.02, which was the proceeds of the two mill levy of 1853. (A Manual of the Ohio School System. James W. Taylor, p. 233.)

tated by the activities of school-book publishing houses. Its language seems to imply that the book agent was abroad. Herein the following conditions were imposed upon the changing of text-books: The expiration of two years since the adoption of the book already in use, otherwise a three-fourths' vote of all the members of the board, the action to be taken at a regular meeting.

Within this interval of twenty years there was special school legislation for the cities of Cleveland and Cincinnati. The Cleveland law of 1848 had silenced the charge that the high school of that city was not authorized by law. In 1859 a much more elaborate school law was enacted for Cleveland. It provided that the board of education should be elected upon the principle of ward representation. It authorized the appointment of a superintendent of schools, with the curious requirement that he be appointed from the body of qualified voters of the city. This, however, was dropped the next year. In its provision for a superintendent of schools the Cleveland law had been anticipated nine years by the Cincinnati law. Three persons were to be appointed in each ward to act as a visiting committee. The date of the next act applicable only to the Cleveland schools was 1868. The growth and increasing complexity of the school machinery are reflected in the detailed character of the provisions of this law. Hereby the board of education is to consist of two members from each ward, elected one annually for a term of two years. Regular board meetings are to be held once in two weeks. The board is empowered to appoint a secretary, not of its own body; also an overseer of buildings. Compensation for services and pecuniary interest in any contract on the part of any member of the board are declared unlawful.

The Cincinnati school law of 1853 differed greatly from the original one which had been passed in 1829. It declared that the school board should consist of two members chosen from each ward. It vested in this body, and no longer in the city council, the functions of levying school taxes, providing schoolhouses, and laying off school districts. It required that the school board should sustain a suitable number of German schools and of colored schools. The next year the additional requirement was made that the regular school board should appoint colored directors for the colored schools. In 1856 it was provided that such directors should be chosen by the adult colored males of the city. The different way that the race question has operated on the school system of the two leading cities of the State and the circumstances which caused this difference would be an interesting subject for investigation.

The school law of May 1, 1873, is the longest document which the investigator of the present subject has to examine. It also comes the nearest to being tedious. It made no great contribution to the principles that shape the school system of the State; neither did it add any important device to its machinery. It repealed practically all of the school legislation that it found in force—some twenty-six laws and numberless amendments. It stated their substance anew, going back as far as the laws that related to school lands and to the funds accruing therefrom, but where there had been a confusion of schemes, as for cities, towns, and villages, it brought order out of the chaos. This legislation is classed with the epoch-making measures of 1835, 1838, and 1853 by reason of its giving the State a school code in a more scientific sense than that in which it had one before.¹

¹The following is a good specimen of the calls for the codification of the school law that had been heard for several years:

The necessity of a codification of the school laws was presented in the last and also in several preceding reports. A codified bill was introduced in the general assembly last winter which was received with great favor, but it failed to become a law. There are about 40,000 school officers and 20,000 teachers in the State. That they may be enabled to perform their duties understandingly the school laws should be plain and definite in statement, so as to reduce all doubts as to their meaning to the fewest possible. A codified bill, it is hoped, will secure this desirable result, as well as furnish the occasion for making such changes in our school system as may be deemed expedient. It is confidently expected that the general assembly will pass an act which shall comprehend the whole system of the State, and be easily interpreted and

The new law classified school districts as city districts of the first class, city districts of the second class, village, special, and township districts. All cities having a population of 10,000 or upward were to constitute the first class of districts; those having a population of less than 10,000 the second class; every incorporated village a village district; every organized township a township district; school districts which did not correspond to any of these districts, but were organized by act of the general assembly or by vote of the electors in accordance with such act, were special districts. It is noteworthy that no progress is herein made in the centralization of country schools, and that subdistricts remain as they had been established twenty years before. The schemes of administration for the respective classes of districts are as follows: In a city district of the first class the board of education is composed of two members from each ward, but any such district whose board already consists of only one member from each ward may remain as it is. The term of office is two years. Elections are so adjusted that where the two-member system is established each ward shall elect one member annually, and where the one-member system is retained the wards having odd numbers shall alternate with the even-numbered ones in holding school elections. In city districts of the second class, as well as village districts, the board of educa-

administered. (Eighteenth Annual Report of the State Commissioner of Common Schools, Columbus, 1872, p. 55.)

Little heed was paid to the changes that had been recommended by the educators of the State. The annual reports of Wilson D. Henkle and Thomas W. Harvey, the State commissioners of common schools, during the period when the codification of the school law was being agitated, had urged upon the general assembly the need of provision for county superintendency, State normal schools, and township districts that should be such in fact. The Ohio superintendents' association resolved, July 4, 1871, "That the association approves the recommendations that have been from time to time made by the Ohio teachers' association and the State commissioners of common schools in reference to engrafting upon the common-school system of Ohio the following features: A judicious and efficient system of county superintendency; the adoption of the township system of school administration; an efficient system of district normal schools." (Published in Proceedings of Ohio Teachers' Association, 1868-1875, p. 82.) It was also resolved by the same body that the constitution of the State should be so amended as to provide for an efficient State board of education, the secretary of which should be the State commissioner of common schools. (*Ibid.*)

A third constitution was framed for the State of Ohio by a convention that sat at Columbus May 13 to August 18, 1873, and at Cincinnati December 2, 1873, to May 15, 1874, but when it was submitted to the people for their ratification it was rejected by a large majority. The course of the debate on education may be inferred from the character of the resolutions. On May 29, 1873, a resolution was introduced to the effect that the standing committee on education be, and hereby are, instructed to inquire into the expediency of making the commissioner of common schools a constitutional officer. This was reported back by the committee on education without recommendation. Later a resolution was introduced to secure the perpetual maintenance of separate schools for white and colored children, but to permit the admission of both to the same school upon vote of two-thirds of the electors of any school district. This seems to have attracted no further attention. The report from the committee on education was read to the convention on February 14, 1874. The six members united in the opinion that a section 3 should be added to Article VI of the constitution as adopted in 1851, to wit, that women over 21 years of age should be eligible to any office under the school laws of the State. Four members of the committee recommended the following addition to section 2 of Article VI: "The power of taxation conferred by this section shall be limited to a sum sufficient to educate all the children of the State in such common and necessary branches of learning as shall be provided by law." Another group of four recommended the addition of a fourth section to Article VI of the constitution: "The general assembly may, by law, require that every child of sufficient mental and physical ability shall attend the public free schools during the period between the ages of — and — years, for a term equivalent in the aggregate to — years, unless educated by other means to the same extent." One member proposed to strike out that clause of Article VI, section 2, which prohibits any religious or other sect or sects from having exclusive right to or control of any part of the school funds of the State. After the final revision by the convention, the education article contained three sections: 1 and 2, as in the constitution of 1851, 3, as follows: "Women having such qualifications as to age, citizenship, and residence as may be prescribed for electors shall be eligible to any office under the school laws except that of State commissioner of common schools." (Debates Ohio Convention, Cleveland, 1873-74.)

tion is to consist of six members, unless it has already been established with only three, the term of office being three years; such districts may, however, adopt the one-member system of ward representation. In township districts the school board is to remain as constituted by the law of 1853. In special districts it is to consist of three members, elected one annually for a term of three years. The new law takes an important step in separating school government from the municipal government by vesting in the board of education any property for the use of schools that had hitherto been invested in the city or town council. It empowers the board of education of each school district to appoint a superintendent of schools and to fix his salary, which had not been done before except by implication. It also goes further than the act of twenty years before in its provision for secondary instruction; it says that one or more schools of higher grade shall be established whenever the board of education shall deem it necessary for the welfare of the educational interests of the district.

The regulations for examining and certificating teachers were much changed in points of detail. The most important new features were the addition of the theory and the practice of teaching to the list of subjects; the disqualification of persons directly interested in normal schools as teachers for the office of examiner, the exemption of teachers of special subjects from the regular examination. Teachers' institutes were put on a less voluntary basis than before by authorizing the State commissioner to organize an institute association in every county where there was none already existing. It was made voluntary with city districts of the first class to hold separate institutes for their teachers. An end was made of separate German schools by that provision of the law which required the common branches to be taught in the English language. The German language was permitted to be taught as a separate study at the discretion of any school board, and instruction therein was obligatory upon a sufficiently strong petition from resident freeholders of the district. The new law raised the minimum legal school age from 5 years to 6. It defined the school week as consisting of 5 days and the school month of 4 weeks; it fixed the minimum annual session at 24 weeks and the maximum at 44; it set apart as legal school holidays New Year's Day, the Fourth of July, Thanksgiving Day, and Christmas. Finally, the fiscal provisions of the act were that the State common-school fund should consist of such sum as would be produced by the annual levy and assessment of 1 mill upon the dollar valuation on the grand list of the taxable property of the State, and that boards of education might levy upon the taxable property of their districts as high as 7 mills. Although the rate of district taxes has been frequently restated, 7 mills has usually been the maximum for all districts except the large cities, for which special rates are fixed by the school-tax laws.

VI. THE PERIOD 1873-1900.

Since the school law was codified in 1873 there have been additions of the greatest interest and importance. Some of these are compulsory education, woman suffrage on school questions, free school books, and the centralization of country schools. Almost all of these have been made within the last ten years, although several less novel changes were made earlier. In 1875 it was made lawful for all districts except those of the township class to maintain evening schools. The same classes of districts were given authority to expend public money for library books and philosophical apparatus. In 1881 authority to appropriate money for library books out of their contingent funds was extended to all districts, as the old provision for a school-library tax that was made in 1853 and repealed in 1860 had never been reenacted.

Relative to the certificating of teachers, the legislation has been extensive and

complicated. In 1882 the candidate's experience in teaching was made an element in the grading of the certificate. In the same year United States history was added to the list of subjects; in 1888, elementary physiology. A law of April 16, 1888, handled the subject of examinations in all its parts. It declared that the State board of examiners should consist of five members, residents of the State; that they should be appointees of the State commissioner of common schools, and that not more than three of them should belong to the same political party; it authorized this board to issue life certificates of three grades for three different grades of schools. New restrictions were imposed upon county boards of examiners by this law. An interest in any publishing or book-selling concern was made a disqualification for membership. The grades of county certificates were fixed at one, two, three, and five years. Boards of city examiners were to consist of either three or six persons, as the board of education should determine; five years' experience in teaching was made a qualification for eligibility to the position; but in 1891 this requirement was eased so that it was necessary for only two members of the board to have had such experience, and the period was reduced to two years. The law of 1891 on this subject set up also an experience qualification for members of county boards of examiners. In 1893, April 25, an important act was passed entitled, "An act to provide for a uniform system of examinations of teachers in the State of Ohio." It fixed upon the second and fourth Saturdays of the ten months from September to June as the days upon which county examinations should be held, and ordered that the questions used at these examinations should be prepared by the State board of examiners and the State commissioner of common schools. This act, however, is not mandatory. Civil government was added to the list of subjects by act of February 20, 1896. On April 6 of the same year certificates valid for eight years were authorized. The classification of teachers' certificates as pertaining to counties was readjusted April 13, 1898, and now stands:

The board may grant certificates for one, two, and three years from the day of examination, which shall be valid in the county wherein they are issued, except in city and village districts that have boards of examiners, * * * and the examiners may grant certificates for five years to such applicants as, in addition to the necessary qualifications, have been for three years next preceding their application engaged in teaching, twelve months of which shall have been in one place; and such certificates for five years shall be renewable upon the same condition, but without examination, at the discretion of the examining board; and the examiners may grant certificates for eight years from the date of examination to such applicants as, in addition to the necessary qualifications, hold or have held certificates for five years and shall have been for three years next preceding their application engaged in teaching, eighteen months of which experience shall have been in one place; and the applicants for such certificates for eight years, in addition to the other qualifications, shall be required to pass a satisfactory examination in botany, algebra, natural philosophy, and English literature; and such certificate for eight years shall be renewable upon the same conditions, but without examination, at the discretion of the examining board.

The general assembly of 1900 authorized the board of examiners for Cincinnati to grant life certificates. It is a noteworthy matter that one of the qualifications for these certificates is the evidence of a satisfactory knowledge of the history of education, science of education, and psychology. In city and village districts which have special boards of examiners the gradation of certificates has always been left to those bodies.

By acts passed in 1885-86 subdistrict directors were authorized to provide fences and trees for the schoolhouse grounds. In 1885 an act was passed enabling township, village, and special school districts to unite into one special district for the purpose of maintaining a high school only. In the same year that section of the law which regulated the change of text-books was so amended that the time neces-

sary to elapse after the adoption of the book in use was increased to five years; otherwise there must be favorable action by three-fourths of the school board, taken at a regular meeting. By an act of March 21, 1887, the classification of school districts into five groups was so enlarged as to add at the head of the list city districts of the first grade of the first class and city districts of the second grade of the first class; this was a device to put Cincinnati and Cleveland each into a class by itself.

An act was passed April 11, 1888, to expedite the collection and publication of school statistics. The reports which are required of the different groups of school officers culminate in the annual report made by the State commissioner of common schools to the general assembly. The first group of statistics required by the law, as it now stands, relates to the enumeration of the school youth. This is taken annually in each school district, all unmarried persons from 6 to 21 years of age resident in the district being included. The clerk of the school board is required to transmit the district enumeration to the county auditor; the latter officer, to the State commissioner. In the second place, each board of education is required to deposit with the county auditor statistics of the following facts: Receipts and expenditures for the district; the number of schools sustained, and the time they are in session; the enrollment of pupils, with average monthly enrollment and average daily attendance; the number of teachers employed; salaries; the number of schoolhouses and schoolrooms, and such other facts as are required by the State commissioner. The latter officer receives these reports through the county auditors. The third group of school statistics relates to teachers' examinations. The clerk of every county board of examiners is required to transmit directly to the State commissioner statistics of the following matters: The number of examinations held within the year; the number of applicants examined; the number of certificates granted; the amount of fees received, and the amount received from the county treasurer for the services of the board of examiners. In the fourth place, each teachers' institute committee is required to report directly to the State commissioner the number of teachers in attendance, the names of instructors and lecturers, the amount of money received, etc.

On February 22, 1887, the "black laws" were repealed. This included that section of the school code which authorized separate schools for colored children.

Strange to say, the subject of normal schools is conspicuously absent from the statute books of the State of Ohio.¹ The sole provision of this character is for the maintenance of a combined normal and industrial department at Wilberforce University, Greene County. This department was established by act of March 19, 1887.

The law imposed a check upon nepotism in the public schools in 1889, April 5, by declaring it unlawful for any local director or member of a board of education to vote for or participate in the making of any contract as a teacher with any person to whom he is related as father or brother. A penalty for the offense was imposed.

The first compulsory school law was enacted April 15, 1889. Its title was, "An

¹ Extending over a period of sixty years, the claims of normal schools were never more forcibly or intelligently presented than in Ohio by Governor Worthington (1817), Calvin E. Stowe (1837), Samuel Lewis (1839), Emerson E. White (1865), and others. The question can not fail to occur, Why, then, has Ohio no State normal school in this year of grace 1876? (Delia A. Lathrop, *Normal Schools, Education in Ohio: Centennial Volume*, Columbus, 1876, p. 255.)

After showing that every one of these agitations proved to be ill timed, this writer goes on: "The idea is quite prevalent among legislators that the professional work demanded is being satisfactorily carried on by private enterprise, and if the State does not intermeddle, the supply and demand will in time somehow regulate themselves." (*Ibid.*, p. 287.)

act to compel children under 14 years of age to attend school a certain length of time."¹

The chief provisions are as follows: That all parents, guardians, and other persons who have care of children shall instruct them, or cause them to be instructed, in spelling, reading, writing, English grammar, geography, and arithmetic, and that every person having control of a child between the ages of 8 and 14 years shall be required to send such child to a public or private school for a period of not less than twenty weeks in each year in city districts, at least ten weeks of which shall be consecutive, and in village and township districts not less than sixteen weeks, eight of which shall be consecutive. Authority to excuse children from such attendance, upon its being shown that their physical or mental condition will not permit it, or that they receive suitable private instruction, is given to school superintendents and boards of education. The employment of any child under 14 years of age by any person or corporation is forbidden unless substantial proof be given that the school requirement has been complied with. The law fixed a fine of \$50 as the penalty for employing any child contrary to this law. It further provided that all minors between the ages of 14 and 16 years who can not read and write the English language are required to attend school one-half a day, or to attend evening school, or to take regular private instruction to the satisfaction of the school authorities, and employers of such youth are held responsible for the observance of this requirement. The penalty laid upon parents and guardians for neglecting to comply with the requirements of this law was originally a fine of from \$5 to \$20 for the first offense, to be increased for later offenses. The chief official responsible for the enforcement of the compulsory education law is the truant officer. He is vested with police powers, is authorized to enter factories, workshops, stores, etc., and to perform such services as the superintendent or board of education may deem necessary. Some suspension of the law at the discretion of the proper authorities is provided for in cases where the employment of children is found to be absolutely necessary to the family support. If children are proved to be habitual truants, the law prescribes their commitment to some juvenile reformatory. In 1890 the additional requirement was made that the youth aged from 8 to 16 years must attend school for the full term in their respective districts unless they were engaged in some regular employment or were duly excused. The original act on this subject was superseded April 25, 1893, by the present law, which is entitled "An act to compel the elementary education of children." This repeats the main provisions of the original measure; it further establishes the right of parents and guardians to appeal from the decision of a superintendent of schools or a board of education to the judge of the probate court; and it authorizes the officers charged with poor relief to give aid in cases where children are required to be kept from school for the support of the family. This latter legislation also lightened the penalties imposed for violation. By virtue of a factory law that was enacted April 19, 1898, the age up to which attendance at school is compulsory was practically raised to 15 years.

¹ In 1838 Samuel Lewis had written: "It must be admitted that education is as important here as in Prussia, but different means must be used to secure its influence. There the King issues his edict and obedience follows. It would not be politic here to make a law compelling children to attend school; but we must exert some other influence." (First Annual Report of the Superintendent of Common Schools, Columbus, 1838, p. 31.)

Among the rejected propositions for amendment to the act of 1853 that were offered while the bill was under consideration in the lower house was one imposing a fine on guardians for not sending children to school at least three months in the year. (System of Common Schools in Ohio, William T. Goggeshall, p. 101.)

In 1871 a report on compulsory education was read before the State teachers' association, and a resolution in favor of a truant law was adopted. (Proceedings of the Ohio Teachers' Association at its Twenty-third Annual Meeting, pp. 3, 5.)

It has already been noticed that this subject attracted some attention in the constitutional convention of 1873-74.

In 1892, April 13, it was enacted that training in physical culture should be given in the common schools of the city districts. On March 14, 1893, a law was passed to secure schoolhouse sanitation. It required that school buildings should be inspected at least semiannually by the board of health. On March 22 of the same year evening schools were provided for on a larger scale than ever before. This gave authority to the school board of any kind of a district to establish such a school upon receiving from parents and guardians of school youth a petition which gave the names of at least 25 youths of school age who desired to attend school, but were prevented from doing so during the day.

The kindergarten was authorized as a part of the common-school system which might be established in city, special, and village districts, by act of April 27, 1893. A special tax of 1 mill was authorized for this purpose.

The act to secure a voice in school affairs to the women of Ohio on equal terms with men was passed April 24, 1894. It declares that every woman born or naturalized in the United States, 21 years of age, who has resided in the State one year and in the electoral district the same time as the law requires for men, is entitled to vote and be voted for at any election for choosing school directors, members of boards of education, or of school councils.

On March 25, 1896, was passed the law that requires the United States national flag to be displayed upon schoolhouses during the daily school session.

The undertaking of the State to furnish free school books has grown out of a series of steps to secure cheap school books.

The first law on this subject was enacted April 22, 1885. It authorized boards of education to buy books and school supplies directly from the publishers or dealers at the lowest wholesale or contract price, drawing upon the contingent fund for the purpose, and to furnish the same to pupils at cost price. In 1890 a law was passed to create a schoolbook board. This body was to consist of the governor of the State, the State commissioner of common schools, the State superintendent of printing, one practical educator, and two practical business men, one of these to be selected from each of the two leading political parties. Their duties were to fix upon prices which might be paid for schoolbooks, which were not to exceed 80 per cent of the lowest prices offered at the time by publishers to dealers; to receive propositions from publishers, and to furnish boards of education with lists of books and prices as agreed upon. School boards were required to adopt books found on these lists until they proved insufficient. This scheme was carried further by an act of May 4, 1891. This authorized the schoolbook board, in case the publishers' proposals proved to be insufficient, to contract with authors or compilers for a series of schoolbooks for the State of Ohio. The date of the free-schoolbook law is May 16, 1894. Boards of education are hereby permitted to furnish the necessary schoolbooks free of charge, and are authorized to levy an additional tax for the same. The books are retained as the property of the school district, being loaned to pupils on terms prescribed by the board.

Legislation on the interesting and highly important subject of country school centralization has been as follows: An important act was passed on March 15, 1892, which declared that the office of local director in each subdistrict should come to an end, as soon as directors should be elected and should qualify under the new law; that the entire management and control of the schools of the township district should be intrusted to the township school board, and that this should consist of one director elected from each subdistrict for a term of three years, with the township clerk serving as clerk of the school board but having no vote. The same assembly, a week later, March 22, passed a law that accomplished the articulation of the country schools with the public high schools. This provided for the examination of pupils in the country schools under the direction of the board of examiners for their respective counties in all the common branches of study; also for

the awarding of diplomas to successful candidates, which should secure their admission to the high schools of the county without further examination. The law also permitted any board of education to pay tuition charges at such high school for any pupil belonging to its district. A part of this work of centralization was to be undone. The office of subdistrict director was restored by act of March 11, 1898. This put the township school districts anew into the plight of having one township board of directors together with as many subordinate boards as it had subdistricts. By the terms of this act the township board was to be organized into three standing committees on the subjects: Teachers and text-books, buildings and grounds, and supplies. The function of the subdistrict board was merely the appointment of teachers.

The cause of country high schools was advanced by an act of April 25, 1898, which enabled two adjacent township districts to unite in the support of such a school. This act also made it obligatory for a township board to submit the high-school question to the voters of the district upon the petition of ten such persons. It also authorized the discontinuance of subdistricts of less than 15 pupils. Finally, the general assembly of 1900 dealt the decisive blow to the subdistrict system, or, more accurately, it defined the nature of the blow, leaving the question whether it should be dealt to the voters of the townships. The act to provide for the centralization of township schools and provide a high school for the same was passed on April 16, 1900. "Centralization" is herein defined as "a system of schools in a township providing for the abolishment of all subdistricts and the conveyance of pupils to one or more central schools." By the terms of the act the question of centralization may be submitted by any township board of education to the voters of the district, and must be submitted upon petition of one-fourth of them. If it fails to carry, two years must elapse before it is submitted again. If it carries, the board of education must proceed at once to secure a building site and erect suitable schoolhouses. The board of the old type, consisting of one member from each subdistrict, together with the township clerk, gives place to a board of five members. These are elected for a term of three years, not more than two members being elected any one year. The township clerk and treasurer are ex officio clerk and treasurer of the school board. Boards of education thus constituted are required to maintain and support a graded course of instruction, and may include a high-school course of not less than two years. They are also required to furnish transportation to and from school to all pupils living more than three-fourths of a mile from the central building. Two days later, on April 18, the assembly supplemented the law providing for the admission of country school pupils to high schools by enacting that boards of education are bound to pay the tuition charges of pupils belonging to their districts unless the district maintains a high school of its own. The operation of the centralization law is bound to be watched with eager interest. The summer of 1900 saw considerable activity in the erection of buildings for the use of centralized schools.

Another movement of absorbing interest in the school legislation of recent years is the return to special systems for the cities. The classification of city school districts was made to follow that of cities more closely than before by act of April 12, 1900. The advantage of this device for the purpose of special legislation is obvious. The present Cleveland school law was enacted March 8, 1892; the Toledo law, March 23, 1898; Cincinnati has a series of special laws enacted March 21, 1887, May 17, 1894, April 14, 1896, and April 16, 1900. The Cleveland law created a double governing authority in the form of a school council and a school director. Both are elected by the people. Members of the council receive \$360 annual compensation. The director is expected to devote his entire time to the duties of his office, and receives a salary of \$5,000. The ordinary executive functions are vested in the director; the ordinary legislative power in the council,

which consists of seven members. The superintendent of instruction is appointed by the director and confirmed by the council; he is removable by the director, under certain conditions. The appointment and removal of teachers is vested in the superintendent, subject to the approval of the council.

The Toledo law created a board of education, consisting of five members. These are chosen by popular election. The superintendent of instruction is the appointee of this body. He himself appoints and removes teachers, subject to approval by the board of education. The board appoints also a business manager to be its executive agent.

The Cincinnati system still retains ward representation as the principle upon which its board of education is constituted. That body, after readjustment by the acts of 1887, 1894, and 1896, consists of one member from each ward, elected for a term of three years. The nomination of teachers was vested in the superintendent of instruction by the act of March 21, 1887. The act of April 14, 1896, developed an appointment schedule, which that officer is obliged to follow. Hereby a teacher after a service of five years in the high school, or seven years in the elementary grades, is secure against removal except for specified causes. The same act created also the teachers' pension fund, with accompanying provisions for the retirement of teachers. The pensioning system was modified in detail by the act of April 16, 1900. The fund is at present maintained by deducting \$2 a month from the salary paid to every teacher in the schools and by donations. Teachers may be retired on account of physical or mental disability after twenty years of service, fifteen of which must have been rendered to the schools of the city or, at least, the county. Such retirement must be sanctioned by vote of the board of education. After thirty years of service, fifteen of which have been rendered to the city or county, a teacher may retire at will. Beneficiaries of the teachers' pension fund must have contributed to that fund a sum equal to \$20 for each year of service, but the total contribution is never to exceed \$600. The amount of pension paid is \$10 annually for every year of service rendered, but in no case can it exceed \$500 a year. In 1896, April 27, the law created a school-teachers' pension system for Toledo, and on April 10, 1900, the same thing was done for Cleveland.

The school law as unified in 1873 can be identified in the statute book, as it reads to-day, only with difficulty, it has been added to or subtracted from in so many parts. As was the case in the fifties and sixties, its most progressive portions are special systems. It has already been seen how the centralized administration and large privileges that were granted to special cities and towns at the middle of the century came within a few years to be the rule for those classes of districts. It remains to be seen whether the special laws of the close of the century are going to remain only an excrescence upon the general system. Are nonpolitical school boards, a larger element of one-man power with its fixed responsibility, security of tenure for teachers, etc., going to become regular features of the system? In the light of such facts as the provision for centralized rural schools and additional special legislation for city schools, it is safe to say that the general assembly of 1900 did not complete the story of the Ohio school laws, but left it involved in new issues of the greatest import that must yet be worked out.

CHAPTER III.

CONSOLIDATION OF SCHOOLS AND TRANSPORTATION OF PUPILS.¹

CONTENTS: A visit to the centralized schools of Ohio—Consolidation of schools and conveyance of children in Massachusetts—Transportation of pupils in Indiana—An inquiry regarding conveyance of children in New Hampshire.—Transportation of pupils in Nebraska.

A VISIT TO THE CENTRALIZED SCHOOLS OF OHIO.

[From a report made by O. J. Kern, superintendent of Winnebago County (Ill.) schools, December, 1900.]

In company with State Superintendent Bayliss and Supervisor Black, of Owen, chairman of the committee on education of the Winnebago County board, I had the great pleasure of visiting the centralized schools of northeastern Ohio in October last. It was an extremely interesting and profitable trip. So numerous have been the inquiries for information concerning the improved system for district schools in Ohio that as a result this report is given in pamphlet form, in the hope that what is herein described of our visit to Ohio may lead to better things for Illinois. * * *

The first place we visited was Perry, Lake County, where there is a township high school. The principal, Professor Morrison, is a pioneer in the matter of centralization. He assured us that the experiment was no longer an experiment; that the new movement was the logical solution of the country school problem, and that centralization of districts with transportation of pupils had come to stay. It gave much better schools with but a slight, if any, increase in the cost to the township. The opposition to the plan has long since died out. This has been the testimony at every place visited thus far. At this particular place, however, there was only one wagon drawing children. So we drove on to North Madison, in Madison Township, where three wagons are used. On our way there we saw the first wagon. We stopped at the farmhouse and talked with the driver. He carried all the children from one district, about twenty in number. His route was 5 miles long. That is to say, starting at the first home to pick up a child until he arrived at the central school was 5 miles.

Then he drove back home after delivering the children, thus covering 10 miles in the morning. Of course he traveled the same ground after school, thus making 20 miles in all. He got \$1.20 a day for his work. We asked him if he made any money at it. He said he did, as he was working a small farm that did not require all the time and labor of himself and team. We asked him if he had any trouble with the children and he replied none. He said he was employed by the township

¹For other information upon this subject in the Bureau's Reports, see Rep. 1894-95, Vol. 2, pp. 1469-1482; 1895-96, Vol. 2, pp. 1353-1358; 1898-99, Vol. 1, pp. 526-529; 1899-1900, Vol. 2, pp. 2581-2584.

board of education, who put him under bond to be careful with the children; to have a safe team; to provide a suitable wagon, covered and provided with curtains, and containing soapstones and lap robes for the severest weather. We asked what objections the parents along the route had to the new plan. His reply was that the only objection was on the part of two or three at the beginning of the route, as they had to get their children ready somewhat earlier than they used to when they went to the district school. Of course the children must be ready when the wagon came. He aimed to start at 7.30 and arrive at the building not later than 8.45. Thus there were no children tardy; none came with wet feet or clothing; the attendance was greatly increased and much more regular. The driver believed the movement had come to stay; that the people would not consent to go back to the old way. A short distance on toward the centralized school we had a very interesting conversation with Mr. Fuller, a member of the township board of education. Mr. Fuller is a public spirited, prosperous farmer, and believed in giving the county children the best educational advantages possible. And while the new plan did not materially increase the cost, yet the amount of taxes was not the first consideration. He had four boys. One was at home on the farm; another was in Delaware University; a third was in school in Cleveland, while the fourth was in business in Cleveland. His girls were in the centralized school. He knew the value of the new plan and was sure the people would not go back to the old method. The opposition had long since died out, and the bitterest opponents three or four years ago are now the most enthusiastic supporters. They have seen the value of a well-graded school, with good teachers, over an ungraded one, with oftentimes indifferent teachers. We visited the schoolhouse during the noon hour and did not have time to see the school in operation. We next drove to Unionville, and had a pleasant visit at a two-room school. The children were fine specimens of the American public school. The principal, Mr. Adams, was township superintendent for Madison Township, and has had considerable experience with centralized schools. His testimony as to the value of the new system over the old and his belief in the permanence of the movement was stronger if anything than that which we had heard at Perry and North Madison. The cost had not been increased.

We next visited Kingsville, in Ashtabula County, 401 miles east of Chicago. This was our farthest point east. Kingsville is a small village with a township high school. To this school are brought all the children of the township, with the exception of two districts. Four wagons are used, at a cost of \$20, \$25, \$24, and \$28 per month, respectively, for a month of twenty days. The school year is nine months. Five teachers are employed in the building. The testimony of the principal of the school, the town clerk, and Mr. Kinneer, of the board of education, was that there was an actual saving in the total cost to the township under the new plan; and while money was expended for transportation of pupils it was more than saved in the fewer number of schools operated. And as to the increased efficiency of the new centralized school over the scattered schools, that was beyond a question of doubt.

It was here that the Ohio plan of centralization had its origin in 1892. The erection of a new building in one of the districts of Kingsville Township brought up the question whether or not it would be better to abandon the school in that district and take the children to the village school at the general expense. In this first case of consolidation in Ohio the schools were centralized at the village school, a village situated about a mile and a half from the railroad. The results, educationally, in the small districts were far from satisfactory. In order to consolidate and transport children at public expense, special legislation was necessary. So the Ohio legislature passed the following bill April 17, 1894:

SECTION 1. *Be it enacted by the general assembly of Ohio, That any board of education in any township which, by the census of 1890, had a population not less*

than 1,710 or more than 1,715; of any county which, by the same census, had not less than 43,650 nor more than 43,660 inhabitants, may, at their discretion, appropriate funds derived from the school-tax levy of said township for the conveyance of pupils in subdistricts from their homes to the high-school building of such township: *Provided*, Such appropriation for any subdistrict shall not exceed the amount necessary, in the judgment of the board, for the maintenance of a teacher in such subdistrict for the same period of time.

The Kingsville plan proved such a success that on April 27, 1896, the Ohio legislature passed a bill for the relief of the counties of Stark, Ashtabula, and Portage, which provided that the board of education of any township of those counties may, "when in its opinion it will be for the best interest of the pupils in any subdistrict, suspend the school in such subdistrict and provide for the conveyance of said pupils to such other district or districts as may be convenient for them; the cost of such conveyance to be paid out of the contingent fund of said district: *Provided*, The board of any special school district in any county mentioned above may provide for the conveyance of pupils out of the contingent funds, the same as townships aforesaid."

Since then a general law has been enacted permitting the people of any township at the annual town election to vote "yes" or "no" on the proposition to centralize the schools of that township, i. e., to abandon the small districts and transport the children at public expense to the central school. Such, in brief, is the history of the legislation. And as to the result of the Kingsville experiment I can do no better than to quote from the *Arena* for July, 1899.¹ It was a beautiful day in October, 1900, that we visited Kingsville, and our inspection of the school, our conversation with the teachers and school officers, our seeing the children loaded into wagons and driven to their homes, made a deep impression on me at least. But the quotation:

The residents of the subdistricts of Kingsville Township which have adopted this plan would deem it a retrogression to go back to the old subdistrict plan. It has given the school system of Kingsville an individuality which makes it unique and progressive. Pupils from every part of the township enjoy a graded school education, whether they live in the most remote corner of the township or at the very doors of the central school. The line between the country-bred and the village-bred youth is blotted out. They study the same books, are competitors for the same honors, and engage in the same sports and pastimes. This mingling of the pupils from the subdistricts and the village has had a deepening and broadening influence on the former without any disadvantage to the latter. With the grading of the school and the larger number of pupils have come teachers of a more highly educated class. Higher branches of study are taught; the teachers are more conversant with the needs of their profession; the salaries are higher; the health of the pupils is preserved, because they are not compelled to walk to school in slush, snow, and rain, to sit with damp and perhaps wet feet in ill-ventilated buildings. Nor is there any lounging by the wayside. As the use of indecent and obscene language is prohibited in the wagons, all opportunities for quarreling or improper conduct on the way to and from the school are removed. The attendance is larger, and in the subdistricts which have taken advantage of the plan it has increased from 50 to 150 per cent in some cases; truancy is unknown. It has lengthened the school year for a number of the subdistricts; it has increased the demands for farms in those subdistricts which have adopted the plan, and real estate therein is reported more salable. The drivers act as daily mail carriers. All parts of the township have been brought into closer touch and sympathy. The cost of maintenance is less than that of the schools under the subdistrict plan; the township has had no schoolhouses to build; it has paid less for repair and fuel. Since the schools were consolidated the incidental expenses have decreased from \$800 to \$1,100 per year to from \$400 to \$600 per year. In the first three years following its adoption Kingsville Township actually saved \$1,000.

We left Kingsville feeling that we had traveled nearly 500 miles to a good purpose. Before leaving we had an amateur photographer take snapshots of the wagons, children, school building, and ourselves (See plate No. 1.)

¹ The article in the *Arena* referred to was reprinted in the Bureau's Report for 1898-99, Vol. 1, pp. 526-529.

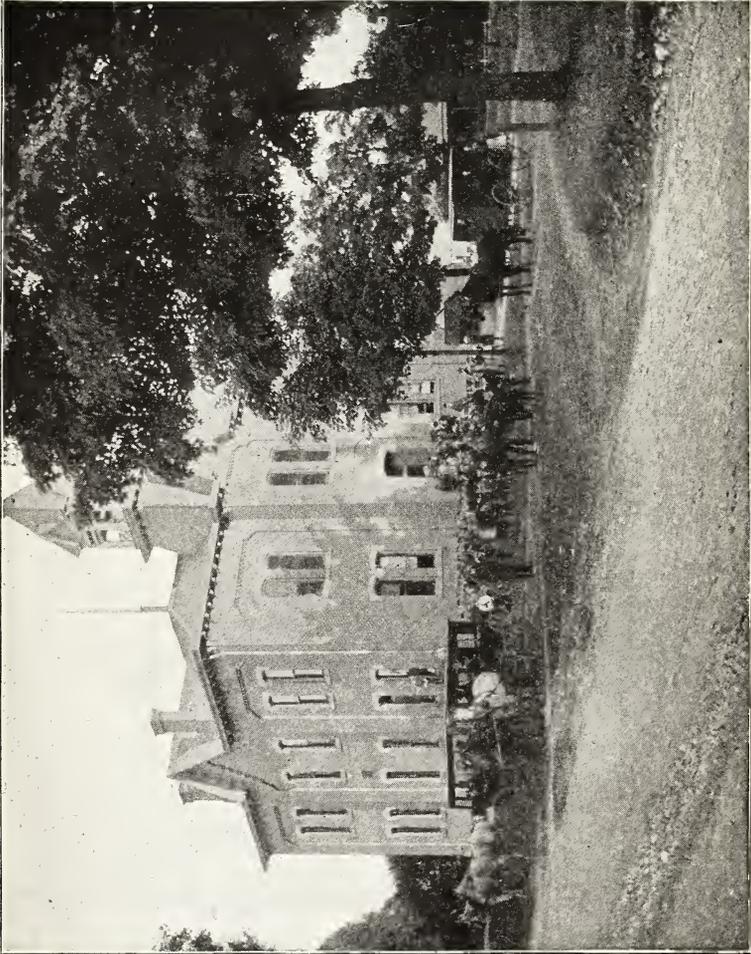

PLATE No. 1.—Central school building, Kingsville, Ashtabula County, Ohio.

The schools we visited in Lake and Ashtabula counties were village schools with the children brought to these villages from the outlying districts. In each case there was a saving of expense. Superintendent J. R. Adams, of Madison Township, Lake County, whose school we visited, says that "under the new plan the cost of tuition per pupil, on the basis of total enrollment, has been reduced from \$16 to \$10.48; on the basis of average daily attendance, from \$26.66 to \$16.07. The total expense will be about the same in this district as under the old plan, but the cost per pupil will be much less." This is easily explained when one understands that the school attendance has increased from 217 to 300 pupils since consolidation has been effected.

But we wished to find centralized schools in a purely country township, where there was no village or village school, a place where country life was being preserved. We went 35 miles south from Ashtabula and visited Gustavus and Green townships in Trumbull County. The first place visited was Gustavus. This township is exactly 5 miles square, as are all the townships of the Western Reserve with the exception of those along the shore of Lake Erie. In Gustavus Township the town hall is situated exactly in the center of the township, as is the case in Green Township. Here was a church, the post-office, a country store, and a few houses.

I had a picture of the centralized school of Gustavus Township and was anxious to see the real thing. We saw it and all was as represented. The school building is located in the center of the township. The school has been in operation two years. It is a four-room school, having a principal and three assistants. All the children of the township are brought to this central school and nine wagons are employed in the transportation. (See Plate No. 2.)

The wagons are provided with curtains, lap robes, soapstones, etc., for severe weather. The board of education exercise as much care in the selection of drivers as they do in teachers. The contract for each route is let out to the lowest responsible bidder, who is under bond to fulfill his obligations. The drivers are required to have the children on the school grounds at 8.45 a. m., which does away with tardiness, and to leave for home at 3.45 p. m. The wagons call at every farmhouse where there are school children, the children thus stepping into the wagons at the roadside and are set down upon the school grounds. There is no tramping through the snow and mud and the attendance is much increased and far more regular. With the children under the control of a responsible driver, there is no opportunity for vicious conversation or the terrorizing of the little ones by some bully as they trudge homeward through the snow and mud from the district school. The accompanying diagram (p. 167) is self-explanatory.

The average price per day per wagon is \$1.25 and the length of the longest route is $4\frac{3}{4}$ miles.

During the school year 1898-99 there were enrolled in the grades below the high school 82 boys and 52 girls; in the high-school room 17 boys and 35 girls; making a total in the building of 186 pupils. The average monthly enrollment for the entire school the past year was 163, while the average daily attendance was 77.4 per cent of the total enrollment. This is a fact of great significance. The children are regular and are getting the benefit of such a course.

Keep in mind that this school is not in a village and the children are scattered over 25 square miles of territory. The children are not tardy. How do they do it? you ask. Well, they do it and that is enough for me. Anyone who stands in that building, looks at those children and wagons, must be convinced that here is the solution of the country-school problem, because this problem is being solved in the country over 6 miles from the nearest railroad. There is an organ in every room and the walls are being decorated with pictures. They have started a library. In the high-school room were 52 enrolled, with 50 present. Here was an opportunity for the big boys on the farm to get higher education and still be

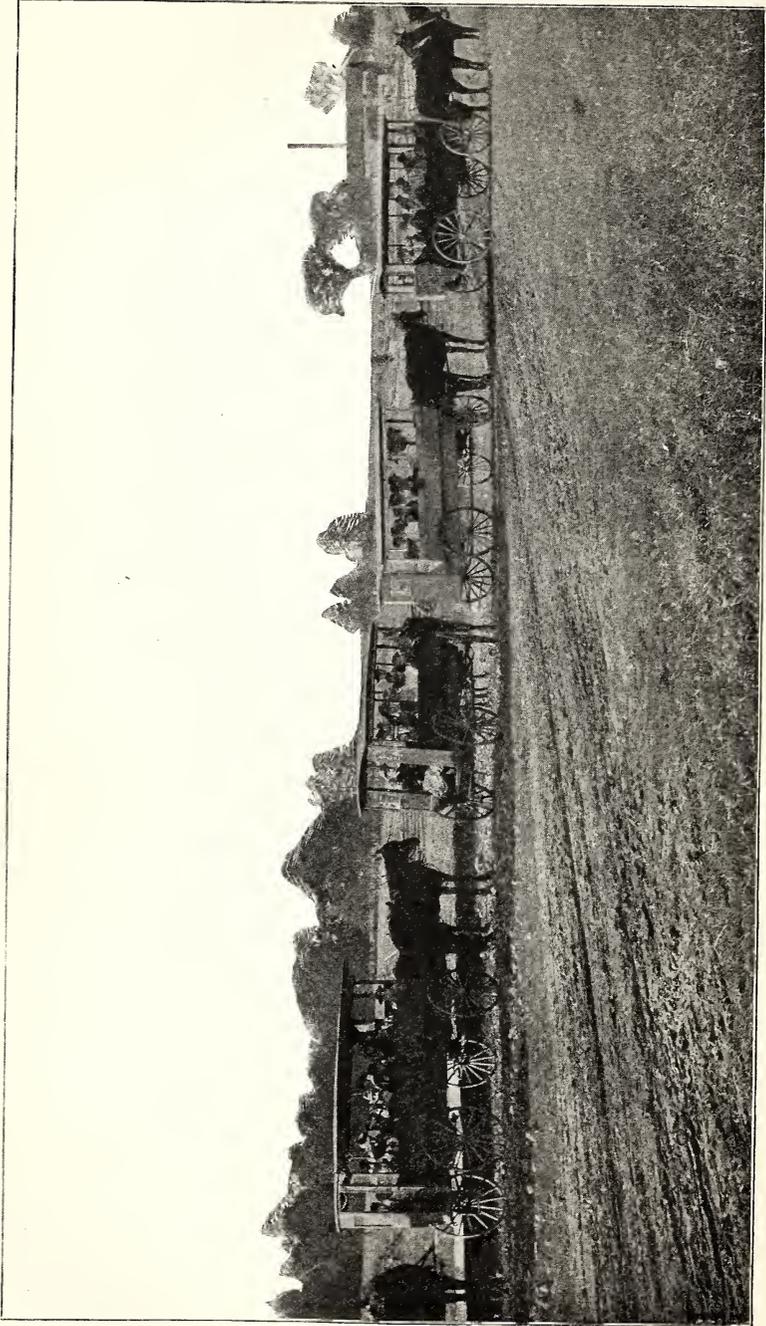

PLATE No. 2.—Wagons used in the transportation of children, Gustavus Township, Trumbull County, Ohio.

at home evenings secure from the temptations and dissipations of city life. They rode home in the wagons with the children of the lower rooms and thus were able to be of service on the farm.

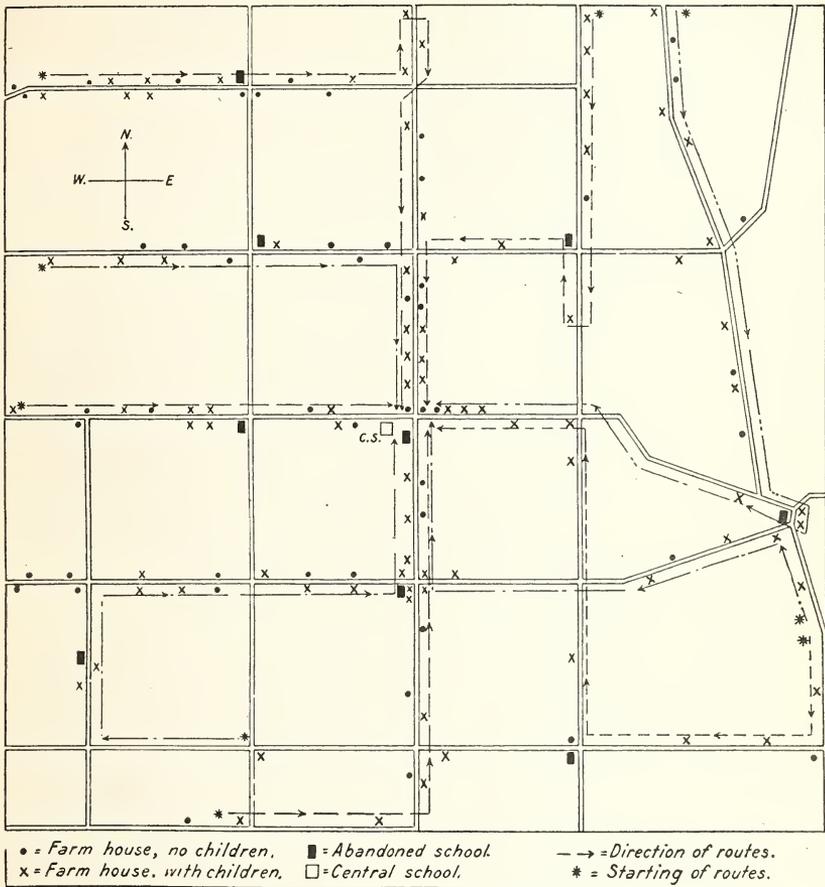

Diagram of Gustavus Township, Trumbull County, Ohio, showing transportation routes.

The building is a frame structure erected at a cost of \$3,000. It is heated by steam. The principal gets \$80 per month, while his assistants each receive \$27.50. The wages of the assistants should be larger. The drivers receive, respectively, \$22, \$30, \$18, \$25, \$30, \$32, \$16, \$30, and \$17 per month, making an average of \$1.25 per day. Before the adoption of the centralization the average daily attendance was 125 pupils. It has increased to 144 at the end of the second year, and the principal told us the attendance is increasing all the time. Before the schools were centralized the cost for the entire township was \$2,900. Now it is \$3,156, being an increase of only \$256 annually. And as to the character of the school, who will claim that the nine scattered schools were doing the work of a well-graded four-room school? There is absolutely no comparison. In order to keep up the school and pay off the school bonds the township board of education made a levy of 9 mills on a valuation of \$373,000. There was opposition to the plan at first. The people who were opposed simply took the ground that the thing had not been done and therefore could not be done—just as there are always people opposed to any progress. When I was a boy sensible people said a man was a

fool to think about binding grain by machinery. They were not ignorant; they were simply mistaken. So those who were opposed to centralization of schools frankly acknowledge their mistake and are found among the staunchest supporters. We have found this true at every place we have visited.

A special committee was sent from an adjoining county to investigate the Gustavus school. The committee was composed of one person opposed to the system and one in favor. They traveled over the township and talked with the people, as we did. In their report, out of 54 families interviewed, only one person with children was opposed; seven of those in favor were formerly strongly opposed, while none that were at first in favor of the system are now opposed. The same committee adds: "Although the system costs a little more (the belief is that it is cheaper after building is paid for) yet the people as a whole are highly pleased, and are very enthusiastic and proud of their schools. Several of the neighboring townships, after carefully watching the system, have decided to centralize, and the growing opinion is that centralization is in harmony with educational progress."

The committee's report is certainly correct. Bear in mind the roads in this township are but a trifle, if any, better than the average of Winnebago County. In fact, two or three townships of our county have, as a whole, better roads. The people are simply determined to have better schools, and will not allow obstacles to remain in the way of their children's fullest and freest development, even if it does cost a few hundred dollars more per year for the entire township. What would \$1,000 more per year on the \$373,000 valuation of Gustavus Township amount to? The average taxpayer would not know it. The testimony has been, that after the new school building has been paid for, there is an actual saving per capita of children of school age in the township. Then think of the superior value of the new school over the old. It can not be a question of a few hundred dollars.

While we were at the Gustavus school the principal advised us to drive 5 miles to the west into Green Township, where the people had centralized and put up a fine new brick building at a cost of over \$6,000. The people of Green Township had watched the school in Gustavus Township for two years and believed so thoroughly in the new plan that at the last April election they voted to centralize and bond the township for a long term to erect a new building. The vote was overwhelmingly in favor of the new school. We drove west to the center of Green Township, which is 5 miles square. This township is 11 miles from one railroad and 6 miles from another. So it is distinctively rural. To be sure, there is the townhall, a post-office, a church or two, a country store, and a few dwellings. That is New England brought to the Western Reserve. We all were enthusiastic over this building for country children. We never saw the like before in the country, to take the place of miserable box-car, 1-room structures. And the possibilities of such a school, who can measure it? (See plate 3.)

This building stands in the center of the township in a community distinctively country. There is no village, beyond a store and post-office, a townhall, a church or two, and a few dwellings. It is 11 miles from one railroad and 6 miles from another. It was built in 1900, at a cost of \$6,000. There are 6 schoolrooms, with 2 additional, 1 of which may serve as a library room and the other as an office and reception room. There is a basement under the entire building, part of which may be utilized for laboratory and gymnasium. The building is heated by steam.

To this building are brought all the children of the entire township. The educational influence of a building over that of eight or nine widely scattered neglected district buildings is beyond controversy, to say nothing of the sanitary improvement in the way of seating, lighting, heating, and ventilation. Such a building may be had in hundreds of townships of Illinois. It would not be a burden to the taxpayers of any township of Winnebago County. Bonds could be issued for thirty years' time; money could be borrowed at 4 per cent. The annual inter-

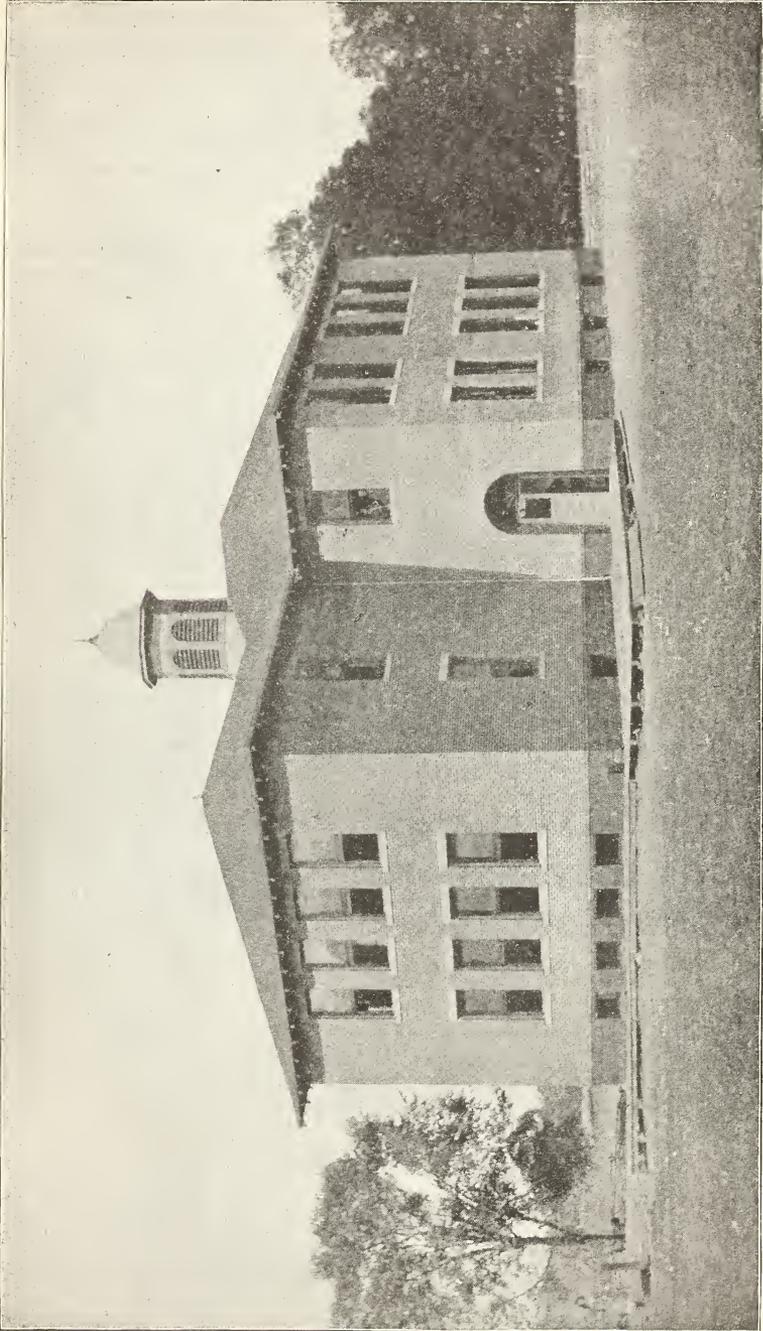

PLATE No. 3.—Central School, Green Township, Trumbull County, Ohio.

est on \$6,000 at 4 per cent would be \$240, an amount no larger than the repairs on seven or eight district schoolhouses from year to year if kept up as they should be. One-thirtieth of the principal, or \$200, plus the annual interest, \$240, would make a total cost of \$440 for building purposes for the first year, decreasing every year afterwards as bonds are paid off. The total valuation of Owen Township, according to the Winnebago County board of review for 1900, is, real estate, \$253,632, and personal, \$310,038, making a total valuation of \$563,660. An annual tax of \$440 for such a central building as here shown, on a valuation such as the township of Owen has, is cheaper in the long run than under the present plan.

They began this school in September last. The enrollment is 180 over 150 of last year in the scattered schools. Four teachers are employed. All the children of the township are brought to the school and eight wagons are employed in the transportation. The campus has about three acres. Shade trees, school decoration, library, etc., will come. How that school can be made the social, literary, and musical center of the entire township. What an inspiration it must be to a corps of teachers to work in such a community as that.

In the primary room were all the little ones of the entire township in a beautiful room, while in the high-school room were many large farmer boys getting an education they could not otherwise obtain. On the playground all the big boys of the township play baseball. Think what it is to get all the boys of a township, country boys, I mean, on one playground. There will grow up a unity. Each boy, having studied and played with other boys of the entire township, will be stronger for it. When the football team or baseball team or literary contests of Green Township compete with Gustavus Township on athletic ground or in town-hall, each team will have the backing of an enthusiastic township. In a great many districts there are hardly enough boys to play "two-cornered cat." Can you wonder that children get tired of district school after a certain age? I am not sure that I have yet grasped the full significance of what we saw here. If that is good for Ohio boys, why not the same for Illinois?

The day spent at Gustavus and Green Township schools was by far the best one in the Western Reserve. As far as educational matters are concerned, it was far ahead of anything I had ever seen.

We returned to Ashtabula fully realizing that it was a good day, well worth our coming nearly 500 miles. Superintendent Bayliss and Mr. Black returned home from here. I paid a visit to Thompson Center, Geauga County. They did not have centralization, but the special district plan, a modification. It is not so good as centralization, but much better than the old way. They now wish they had complete centralization as in other townships, but the special district plan was the best they could do then. Certain sections of the township were jealous of the other, and after the most determined opposition those in favor of better schools at last, by a decree of the probate court, succeeded in getting two districts consolidated. A new schoolhouse was built, a graded school was organized with three teachers, and the children transported themselves. Now instead of nine small schools there are five on the special district plan. They expect to reduce the number.

On my return from Thompson Center I stopped at a district schoolhouse where the school had not yet been centralized. It was a small building, with no shade trees in the yard. On entering the house I found a teacher and four pupils. There were no more in the district. I asked the teacher why this school was not centralized. She replied that it would be next year. The teacher was getting \$30 a month to teach four pupils. She said that for the same money she would rather teach a room of 30 pupils in a graded school than to teach the four she had. Besides the possibility in the way of enrichment of country life which the centralized school promises, it also will bring better roads.

School building district No. 6, Durand Township, Winnebago County, Ill. Erected 1899. School directors: Messrs. Niles Patterson, Alfred Orth, and A. W. Goodrich.

At the Green Township central school, where the new \$6,000 brick building has been erected, I asked a high-school class how the roads were when they were bad. A young lady said they were real bad, while a young man said they sometimes found it necessary to put four horses to the wagon. The principal said the people were preparing to improve the principal roads over which the wagons ran. Thus better schools bring better roads. * * *

ADDENDUM.

This new school building (p. 171) was erected in 1899 at a cost of \$900. It is the best district school building in Winnebago County. Readers of this pamphlet are requested to contrast the above building with the central school building of Green Township, which represents the best of the new system in Ohio. The two buildings furnish some idea of the comparative cost of the two systems as far as buildings are concerned. Eight district school buildings, at \$900 apiece, is a total cost of \$7,200. The one in Green Township cost \$6,000. The new building in district No. 6 has a basement under the entire building and is heated with a furnace. The furnace cost \$75. Such a furnace (from personal observation) will easily heat a small dwelling of four rooms, and it is safe to say it could heat three schoolrooms of the size of the above building if properly arranged. It does not require very much calculation to prove that one large furnace in a central building is cheaper than furnaces or stoves in eight different buildings. Then the directors of district No. 6 were compelled to sink a well, at the cost of \$110. Now, one well at a central building is cheaper than a well at each of eight different buildings. And so on for many other items of expense. The above figures are facts and must appeal to every taxpayer. Please contrast the best of the old system with the best of the new as far as material equipment is concerned. A fair-minded person must come to the conclusion that centralization is the best system in every respect.

CONSOLIDATION OF SCHOOLS AND CONVEYANCE OF CHILDREN.

[Report made by G. T. Fletcher, agent of the Massachusetts State board of education.]

District schools fifty years ago.—The question of the consolidation of schools has for many years received the attention of educators. Conditions pertaining to changes in the population and the wealth of communities, as well as the increasing educational demands of the times, have rendered necessary a certain centralization of forces for economy and efficiency in school work. Fifty years ago a large percentage of the people of Massachusetts belonged to the "original stock" and lived in country towns. District schools were numerous and large. Seldom did a school register less than 25 pupils; not infrequently 75 were enrolled during the winter term, ranging in age from 4 years to 21. An attendance of 40 or 50 pupils was a common occurrence. Many of the schools were taught in winter by college students—often the brightest young men from the rural communities, whose example was a stimulus to the boys of the district to get an education. In the summer the teacher was often a young woman from the country academy, whose scholarship and character were an inspiration to the children. The district school was a center of interest and influence in the rural community. The range of studies was narrow, but the few branches then taught are regarded to-day as fundamental in a broader system of education. The independent thinking and the individual doing of pupils, whose age gave maturity to mind, were educating. The school was a "consolidation" of numbers and ability sufficient for the edu-

cational needs of the times. Similar conditions exist in a few country towns now, and such schools may well be nurtured by town and State in the place of their native growth. A home life of frugality, simplicity, and industry is a potent factor in the upbuilding of body and mind. But there were many poor schools then, as there are now.

Changes that have come to the district schools.—Within the last fifty years great changes have been wrought in social life and conditions. The increase of population and wealth in centers of commerce and manufacturing is both a cause and a result of an exodus of the farming population to the cities and large towns.

In many rural communities farms were abandoned, or only the "old folks" left at home, to pass there the remnant of their days, while the farm constantly depreciated in value. The young, vigorous element of the population left home to work in store or factory. Families remaining in the "hill towns," or coming to them, had few children, and as a result the schools became small, the local interest in them often decreasing in the same ratio. These changes came in different degrees of severity to different towns. Those most favorably situated for farming purposes "held their own" to quite an extent, in adult population and wealth, but the number of children constantly lessened and the schools, though not generally reduced in number, were reduced greatly in attendance. Occasionally schools were united to increase the number of pupils, or a winter term was held at the center of the town for the older pupils of all the districts. Just when and where consolidation on a small scale began we can not tell. The cause and the fact of a beginning are both evident. There came to the people, slowly at first, a realization that the interest, economy, and efficiency that had in many cases characterized the large schools of former days were wanting. The struggle to retain the same number of schools as when the adult population was greater, the property valuation was twice as large, and the town had three times as many children of school age was as painfully evident then as it is now. The school had been the common center of interest, and the thought of its closing was a shock to the people. No wonder a deep-seated feeling existed, and still continues, that home interest and property valuation would suffer from the discontinuance of the local schools. * * *

Consolidation as seen by the State board of education.—In the report of Agent G. A. Walton to the State board of education, in 1889, consolidation of schools is recommended. In more recent reports of the board many facts and opinions, based upon observation and upon information received by the secretary and agents, may be found. Some of the reasons advanced by them for the consolidation of schools and the conveyance of children may be briefly stated in abridged form, as follows:

Diminished school population, rendering the schools small and expensive, making it difficult to secure competent teachers for the wages that can be paid.

The cost in some small schools of five pupils was \$50 per pupil, while in schools of 25 pupils the cost was only \$10 per capita.

Two essential things must be kept in view—efficiency and economy. To secure these there must be comfortable, convenient schoolhouses, necessary appliances, intelligent teaching, skilled supervision, and no more schools than are needed for the number of pupils.

In some towns two or more schools may be united, according to convenience of location. In others most of the outlying schools can be accommodated at the center by transportation of pupils.

In a few towns of large area, bad roads, and scattered population, little or no combination can be effected. In such cases the schools, small or large, must have such attention by the town, and if necessary such aid by the State, as will make them as good as possible.

One of the results that follow from consolidation is a better grading, a better classification of pupils, by placing them where they can work to the best advantage.

Consolidation gives a better opportunity for special instruction in music, draw-

ing, and nature study, and brings all the schools under closer oversight by the superintendent.

It insures better school buildings, appliances, and teaching force.

The money saved in a small town by reducing the number of teachers is often large enough to furnish better school accommodations to the children, better wages to better teachers, such transportation as consolidation requires, and longer schooling.

Objections to consolidation.—It must not be supposed that policies of consolidation are adopted without earnest discussion. In some cases the opposition has been so strong as to stave off favorable action for years. Among the reasons urged against consolidation the following may be cited:

Injury to the district by removal of the school.

Risk to the health of children because of long rides in cold and in stormy weather.

Association in carriages and during the long noon intermission at the schoolhouse.

Injury to health of cold dinners hastily eaten.

Long absence of young children from home.

It may be questioned whether the objection regarding injury to the property valuation of the district is a serious one. People having children to educate are not slow to see that educational advantages are not represented in their fullness and completeness by near schoolhouses. This property objection is well met in the replies to questions submitted to the towns, to which later reference will be made.

The objections to the risks of conveyance and of the noon intermission are of serious import, and can be met only by making transportation safe to health, manners, and morals, as well as comfortable, and by requiring the presence of a teacher at the noon intermission.

Are towns required by law to convey children?—Questions frequently come from parents to the secretary and agents of the board as to whether towns are required by law to convey their children to school. All that can be said in reply is substantially as follows:

1. It is made by law the duty of every town to "provide and maintain a sufficient number of schoolhouses, properly furnished and conveniently located, for the accommodation of all the children therein entitled to attend the public schools."

2. It is recognized everywhere throughout the State that a schoolhouse is conveniently located if it is within reasonable walking distance of its pupils, or if, the schoolhouse not being within such reasonable walking distance, the pupils are conveyed to it at public expense.

3. The law does not determine what a reasonable walking distance is; that must be decided by the school committee.

4. Whatever the school committee decides to regard as a reasonable distance for school children to walk, that is the distance they must walk. If a child within the compulsory age limits is not sent to school on the ground that the distance prescribed for him to walk is an unreasonable one, it is the legal duty, nevertheless, of his parent or guardian to send him to school, unless other legal provision is made for his education. Failure to do so, if adjudged by the courts to be a violation of law, is punishable by a fine.

5. It is the duty of the truant officers to follow up such violations of the law, and of the school committee to see that the officers whom it appoints for the purpose do their duty.

6. Chief Justice Shaw, speaking of the power of school committees in connection with certain general duties, where there is an absence of specific legislation, says (5 Cush., 207-209):

When this power is reasonably exercised, without being abused or perverted by colorable pretenses, the decision of the committee must be deemed conclusive.

7. The State board of education is given no authority to decide what a reasonable walking distance is.

Progress of consolidation.—The progress of consolidation through transportation for the last ten years is indicated by the tabulation of expenses, as given in the sixty-second report of the State board of education:

*Aggregate cost of conveyance for the State.*¹

Year.	Amount expended.	Year.	Amount expended.
1888-89.....	\$22, 118. 38	1893-94.....	\$63, 617. 68
1889-90.....	24, 145. 12	1894-95.....	76, 608. 29
1890-91.....	30, 648. 68	1895-96.....	91, 136. 11
1891-92.....	38, 726. 07	1896-97.....	105, 317. 13
1892-93.....	50, 590. 41	1897-98.....	123, 032. 41

Further consolidation needed.—Now that the law extends the minimum length of the school year to thirty-two weeks, some small towns will be obliged to reduce the number of schools in order to pay their teachers sufficient wages to make them eligible to the payment of \$2 a week to teachers of exceptional excellence from the school fund, as provided by a recent law. Quite a number of these towns are now paying over \$5 a year on \$1,000 valuation for school purposes, and they can hardly bear any heavier school expense. These towns and the State ought to cooperate to maintain good schools for all the children. * * *

Distances.—In Victoria the law provides that the following shall be deemed a reasonable excuse for nonattendance upon the public schools:

That there is no State school which the child can attend within a distance of 2 miles, measured according to the nearest road, from the residence of such child; excepting when the child is more than 9 years of age, then the distance shall be within 2½ miles from the residence of such child, measured as aforesaid; and when the child is more than 12 years of age, then the distance shall be within 3 miles from the residence of such child, measured as aforesaid.

Victoria has eight times the area of Massachusetts, but only half the population. Nearly half of this population is rural.

The Massachusetts legislature has never made any requirement about the limit of distance beyond which children should be conveyed to school at public expense, except in a single instance. Chapter 541, Acts of 1898, provides that the town of Boxford may use the Barker Free School as a high school upon complying with certain conditions, one of which is that the town shall furnish free transportation to the school for pupils who live more than 2 miles away from it.

The following quotation is from the fifty-ninth annual report of Frank A. Hill, the present secretary:

The secretary, when asked his opinion about reasonable distances, inclines to the view of his predecessor—that little children should not be made to walk much over a mile, although older children of grammar-school age may walk a mile and a half, or even more. But numerous conditions may serve to modify this opinion. If for little children the mile lies through lonely, unfrequented, wooded, or difficult roads, it would be too great or too dangerous a distance for them to walk. If, on the other hand, the way lies over a well-traveled thoroughfare, with good sidewalks and houses all along the road, it would not be a hardship for the children to walk a considerably greater distance than 1 mile. Transportation should not be used to reduce sturdiness, self-reliance, and reasonable self-denial in boys and girls. It often has to be partial for some, while complete for others. In cases of genuine doubt, the leaning should be toward the convenience of the child.

* * * * *

Circulars of inquiry.—To secure as complete information as possible regarding

¹ In 1898-99 the amount expended was \$127,409; in 1899-1900, \$141,754.—ED.

the history, progress, means, and results of consolidation of schools and conveyance of children in Massachusetts, circulars containing inquiries regarding the different phases of the plan were sent to the school officials of all the cities and towns of the State. Nearly 200 replies have been received, representing conditions and practices in all sections of the Commonwealth, from the largest cities to the smallest towns.

When their gist is contained in a few similar words or sentences these replies are given only in percentages, or in a general way. Special facts, opinions, and suggestions are quoted as fully as space will allow. As the circular calls for information upon more than twenty different phases of the subject, it is not possible in the space allowed to this report to name the towns responding. The returned circulars are on file at the office of the secretary of the State board of education in Boston.

The circular of inquiry began with the following letter:

NORTHAMPTON, MASS., *December —, 1898.*

To the chairman of the school committee or the superintendent of schools of ———:

Many inquiries come to the State board of education, not only from our own towns and cities, but from those of other States, regarding the need, operation, and results of plans for the consolidation of schools and the conveyance of children that naturally accompanies such plans. That such inquiries may be answered fully and intelligently your cooperation is earnestly desired. Will you favor me, therefore, with such information about your own town's (city's) experience with consolidation and conveyance as is called for under the heads herewith given? Please forward your reply as soon as possible to—

G. T. FLETCHER,

Agent of the State Board of Education.

The inquiries are given in full, as follows, the answers to each inquiry being given in immediate connection with it and with various degrees of abridgment:

I. GENERAL CONDITIONS FAVORING OR REQUIRING CONSOLIDATION.

Changes in population, property valuation, etc., that have impaired the efficiency of your schools by reducing their size, increasing their cost, making it harder to get good teachers, etc.

More than 50 per cent of the towns report changes in population and property valuation in the towns as a whole, or in sections of them, that have affected the school conditions.

The following statements are samples of those coming from a large number of rural towns:

Attendance of pupils reduced; cost in a small school per pupil for a year, \$46.82; in the central building, \$16.30.

Difficult to retain good teachers.

Population diminished more than a half and property valuation more than a third since 1875.

Loss in population and property valuation makes it hard for us to meet increasing educational demands.

Good teachers command better wages than we can pay.

In one district that formerly had 60 to 80 pupils there are now 13. The farming population has disappeared.

Farming population once over 1,100; now only 605. Valuation reduced from \$375,000 to \$309,000.

Population reduced from 2,300 to 1,400 in thirty years; loss of \$70,000 in valuation in five years.

Farms abandoned; not children enough in any district to keep a school.

In many towns the loss in population and wealth is only in sections, usually in outlying districts, and so affects certain schools only. Many towns have gained in the villages as much as they have lost in the rural sections. Some towns and

all of the cities have gained in population and wealth; yet most of them in some quarters have had to deal with diminishing schools.

II. WHAT THE TOWN HAS DONE TOWARD CONSOLIDATING ITS SCHOOLS.

The number of schools that have been closed, whether the consolidation is partial or universal; whether it has gone on gradually or was brought about at one stroke; whether any children are sent to schools in adjoining towns or not; whether higher grades are taken to the high school building or not, etc.

More than 65 per cent of the towns and cities reporting have found it necessary or advantageous to close and consolidate some schools. Movements of population within town or city limits as well as the exodus of people from many towns have led to the closing of schools, but have not always involved the transportation of pupils.

Probably Quincy was the first town to act under the law of 1869, having closed two schools in 1874 and transported the children to other schools.

In the year 1893 Seymour Rockwell, the veteran school committeeman of Montague, said:

For eighteen years we have had the best attendance from the transported children; no more sickness among them and no accidents. The children like the plan exceedingly. We have saved the town at least \$600 a year. All these children now attend a well-equipped schoolhouse at the center. The schools are graded; everybody is converted to the plan. We encountered all the opposition found anywhere, but we asserted our sensible and legal rights and accomplished the work. I see no way of bringing the country schools up but to consolidate them, making them worth seeing; then the people will be more likely to do their duty by visiting them.

This statement indicates that consolidation of schools was heroically completed in Montague in 1875.

Consolidation was begun in Concord in 1879.

Prior to that time and for many years afterwards there was a rapid diminution of school population in the outlying districts. Of late the school population of these districts has increased. We attribute this to the willingness of young married people to settle on these farms, since transportation secures to their children educational opportunities as good as the town provides. Consolidation, begun as an experiment, was carried to completion at the desire of the population affected.

From another town came this suggestive statement:

Once when a man wished to sell his farm he advertised, "A school near." Now he advertises, "Children conveyed to good schools." Farms sell more readily now.

Other towns report as follows:

We have closed only one school, and that for two terms during the year, as the lot will revert to the former donor unless a school is kept in the building.

The scattered population renders consolidation undesirable in our town.

Planned at one time to close a school, owing to smallness of numbers, and convey the pupils to the next village. After consideration, decided that only an unwise parsimony on the part of the town could favor the project, and it was abandoned forever.

A few years ago the town tried to "double up" the schools and convey the pupils, but the people would not listen to the suggestion, mainly through ignorance.

Attempted to build a new schoolhouse and grade the schools, but bitter opposition upon the part of the older people defeated the plan.

We believe in closing the schools when it can be done.

Our rule is to keep a school as long as there are 10 pupils in it.

From one to ten schools have been closed in different towns. Consolidation is generally partial; in a few towns, complete. Most frequently it has been accomplished gradually; in some instances at "one stroke." In twenty-five instances pupils belonging to higher grades are taken to the high school building.

III. APPROPRIATIONS FOR CONVEYANCE.

Whether the town raises money for the purpose by a specific appropriation separate from the regular school appropriation or by making the regular school appropriation include transportation.

About 60 per cent of the towns reply, "By a specific appropriation separate from the regular school appropriation." Forty per cent, "Make the regular school appropriation include transportation." It seems evident that the law requiring towns to raise money for school purposes should include in the amount so raised whatever sum may be needed for transportation.

IV. DISTANCES.

(1) The conveyance of children, whether they are conveyed all the way to school or only a part of it; whether the carriage goes to the house in every case or some pupils have to meet it at designated points, etc.

More than 50 per cent of the towns report that they "convey all the way from the home to the school." Other towns say that unless the conveyance, carriage, or car passes their homes the children walk to the main street or to designated points or to the closed schoolhouse or to the streets through which the electric cars run, etc. In a few towns the carriage goes to every home in stormy weather to take and leave the children. In some towns conveyance is furnished only in winter or in stormy weather. In some cases children are conveyed to school, but not from it unless the weather is stormy or the traveling bad.

(2) The distance children are conveyed, whether they are fixed absolutely or approximately; what they are and what conditions determine them, etc.

Those who interpret this question to mean the distance within which children will not be transported to school at public expense make the distance from 1 mile to 2 miles. In one town small children will in some cases be conveyed to school if the distance from home is less than a mile. There seems to be no consensus of opinion regarding what is a "reasonable walking distance." Age, sex, and strength of pupils, nature of the road, the amount of money appropriated, and the disposition of the committee seem to be determining factors. It is the one difficult question which committees must settle for themselves, making such judicious provisions as will insure school attendance for all without undue hardship to any.

The majority of committees and superintendents understand the question to refer to the maximum distance of conveyance, and reply that they convey pupils "all the way from home to school" or "from the closed schoolhouse to the new one," or 2, 4, 6, or 8 miles, as the case may be.

(3) Questions of conveyance and distances, whether in deciding them young children are considered more than older ones; girls more than boys; the lower schools more than the high school; wooded, lonely, or difficult routes more than open, easy, and populous ones, etc.

Approximately 45 per cent of the towns report that they give equal consideration to young children of both sexes.

Ten per cent report that they give a preference to girls in their plans.

In 12 per cent of the responses the character of the routes was mentioned as an important factor in determining plans.

Thirty-two per cent make no discrimination as to children, schools, or routes.

V. PAYMENTS FOR CONVEYANCE.

Whether payments for conveyance service are made to the parents of the pupils or to persons hired for the purpose; whether they are made by the trip, the week, the term, or the year, with or without reference to the precise number carried, or in accordance with a fixed charge per pupil or a fixed rate per mile or some other system; with one or two illustrations of the amounts paid or rates fixed for definite services.

Payments are sometimes made to parents for the actual attendance of their children—so much per day a child, the teacher keeping a record. It is noticed in such cases that the attendance is very regular and that the children are able to walk most of the time. Payments are most frequently made to persons hired for the purpose, or in some towns and cities to steam and electric railroad companies. Illustrations:

One parent was paid 50 cents a trip for conveying his children 3 miles.

A parent carries his children for \$10 a term.

A parent transports his children 2 miles for \$15 a year.

The foregoing may be cases in each of which the father takes his children to school as he goes to his work.

Some parents carry the children of several neighbors with their own for a moderate sum.

Five cents a day for each pupil attending school.

Many pupils ride on electric cars at half fare, tickets being furnished by the school committee to be distributed by the teachers.

Carriages hired by the week: \$9 for transporting 12 children 2 miles; \$4 for transporting 4 children $1\frac{1}{2}$ miles.

Some make yearly payments as follows to persons hired for the purpose:

Seven pupils, 3 miles, for \$75; 29 pupils, $1\frac{1}{2}$ miles, for \$80; 11 pupils, $2\frac{1}{2}$ miles, for \$85; 7 pupils, 2 miles, for \$70.

Six hundred dollars a year, without regard to the number of pupils.

One school, one year, \$175; another school, one year, \$195.

Two hundred dollars and \$300 a year, without regard to number.

By the week for a certain number of pupils, one route, \$3.10; another and shorter route, \$1.30.

One route, \$5 a week; on a bad road, two children, \$6.25 a week.

VI. DETAILS OF TRANSPORTATION.

Persons who are charged with the duty of bargaining for and settling the details of transportation; the vehicles selected, whether covered or otherwise made comfortable; the drivers, whether selected with reference to their trustworthiness and fitness to care for children, etc.

In 43 per cent of the towns the school committee makes bargains and settles details; in 10 per cent, a subcommittee of the school committee; in 5 per cent, chairman of school committee; in 12 per cent, the superintendent of schools; in 4 per cent of the towns arrangements are made by the committee and the superintendent. In about half of the towns vehicles are covered and comfortable; in the others, not covered excepting in bad weather.

Nearly all of the drivers are reported to be "trustworthy." Some are said to be "as good as we can get." Some are of "doubtful qualifications." All committees and superintendents regard trustworthiness and fitness in the driver as of the highest importance. One committee says:

Only such persons should be employed as we would trust with the care of our own children.

A few committees say that they have to watch drivers of conveyances and hold them to strict account. Some complain that children are not under proper control

in the carriages; but, upon the whole, there seems to be a good degree of satisfaction with such vehicles and drivers as have been employed.

VII. ADVANTAGES OR DISADVANTAGES OF CONVEYING CHILDREN TO SCHOOL.

(1) *Effect, if any, on promoting attendance.*

The testimony upon this point is nearly unanimous that attendance is improved by conveyance of pupils. Some speak of the increase as very decided; a few say, "No effect."

(2) *Effect, if any, on health of children conveyed.*

A majority see "no effect upon health." A large number say, "Effect good;" and add that there is less exposure to rain, snow, cold weather, sloppy or muddy traveling; consequently, fewer colds. A few speak of the unfavorable effect of cold dinners hastily eaten. A few others say, "Not healthy." Much depends upon the vehicle and the driver.

(3) *Any trend toward needlessly short distance for conveyance or toward reduced self-reliance and sturdiness on the part of the children conveyed?*

The larger number of replies are to the effect that no such trend is noticeable, but about three-fourths as many replies are to the contrary effect. Comments:

Depends upon the firmness of the school committee.

We have a rule, and when parents and children know what it is, nothing more is said.

We meet all reasonable demands, then stand firm.

Pupils have so much done for them that they are not willing to do anything for themselves.

(4) *Effects as regards (a) the character of the school buildings and equipment, (b) the classification or grading of pupils, (c) the quality of the teachers and their work, (d) the efficiency of the pupils, and (e) the general spirit of the school.*

The larger number of towns report under (a) an improvement in the character of school buildings and equipment resulting from consolidation. Some say, "No effect yet." Under the remaining subdivisions of (4) there is a very marked accord that in all respects improvement is very evident.

A few comments:

Better ventilated rooms, hence more healthful.

Costs less for repairs; better janitor service.

Houses closed were in poor repair; good teachers would not remain in them.

Pupils better classified; 3 teachers do the work of 5 in ungraded school.

Too strict grading not beneficial.

Petty local jealousies lost in the larger school.

I question if the too closely graded school of 50 pupils reciting in one division is not inferior, from the pupil's standpoint, to the ungraded school of 20 pupils. Advantage of the ungraded school lies in the greater freedom of the individual pupil to advance at a rate best suited to him.

Pupils are more studious in the graded schools with only their classmates with whom they must compete.

Greater incentive and enthusiasm.

In the graded schools pupils lose the personal oversight of the teacher, which in small schools is of so great advantage.

(5) *Any further results, good or bad, to be expected from the extension of the consolidation policy?*

None but good.

Pupils become better acquainted with people, hence less bashful and awkward.

The time lost by the superintendent on the road is saved by consolidation of schools.

It becomes possible to give to all the pupils of the town the advantages of special teachers in drawing, music, etc.

Real estate men think it will reduce the value of their property in the rural districts.

Objection to having small children so long from home.

Our people would as soon think of having district churches as district schools.

Association with others whose lives are less restricted than their own is a gain in social graces.

Much is to be expected in moral influences, as conditions are better in the graded than in the ungraded schools. This is especially true as regards outbuildings or basements in their sanitary arrangements, and the oversight had in and about them.

Economy and efficiency.

I do not favor too great efforts to consolidate. Drivers are not and can not be expected to be men who can control children and hold their respect.

A compact neighborhood with a good school should be let alone.

(6) *The cost of the schools after consolidation, whether less or greater than before, or the same, and whether with poorer, equal, or better results.*

Sixty per cent of the towns report the cost as less, but the results as better; 15 per cent cost the same, but results better; 8 per cent cost more, but results better; 8 per cent cost more, but results not stated; 8 per cent cost less, but results not stated.

(7) *The public attitude toward the policy, whether one of approval or not.*

Reports of approval, in some cases of modified approval, are related to cases of strong opposition about as 70 per cent to 30 per cent. Comments:

At first opposed; later approved.

Those favored by the plan approve it; those not, oppose it.

Sanctioned when committee advocated it.

Opposed to extension of policy.

No "public attitude" here.

The policy is never questioned.

Opposed.

Toleration.

VIII. CONSOLIDATION NOT DESIRABLE OR FEASIBLE.

(1) *Any large rural schools—schools of 25 to 40 pupils—that probably would not be helped by processes of consolidation?*

More than half the replies indicate that there are rural schools that would not be helped by consolidation. Several towns report having one or more rural schools with an attendance of 20 or 40 pupils. Some special replies:

Distance and size render transportation difficult and expensive.

Retain such schools if good teachers can be secured.

Would not consolidate a school of over 20 pupils.

One school 6 miles from the center.

We have a large rural school of 50 pupils with two teachers.

I would prefer that a child of mine should be educated, up to the high school grade, in a school of 30 pupils under a superior teacher rather than in the ordinary graded school with the average classroom instruction. I think there is a tendency to grade too much. In a well-organized and conducted ungraded school there is an unconscious review all the time and an anticipation of what is to come. The whole is there and the part in relation to the whole.

A good district school, with 25 pupils and an efficient teacher, can be made equal to any closely graded school, and better than most of them.

Consolidation has disadvantages as well as advantages.

Thirty towns report that consolidation would help all of their ungraded schools; it would provide better houses, appliances, teachers, and superintendence at equal or less expense.

(2) *Conditions that largely or wholly forbid consolidation.*

About 50 towns mention objections of varying degrees of seriousness that have been urged against consolidation:

- Too long distances; bad roads, blocked in winter for weeks.
- Pupils too young to ride long distances.
- Lack of money to pay the expense of suitable transportation.
- Strong opposition of the people to the machine-like system of conveyance of pupils.
- Saloon at the center; can not have a schoolhouse near.
- Invasion of individual rights.
- Belief of farmers that closing rural schools reduces the value of their property.
- Willingness of village people to allow those in the outlying districts to have their own way. "Ephraim is joined to his idols; let him alone."
- Not room enough in the center buildings for more pupils.

IX. MISCELLANEOUS.

Any facts about consolidation and conveyance in your town not directly called for under the foregoing heads, or any brief statements about school conditions that need improving but can not be met by schemes of consolidation?

Illustrations of replies:

The greatest need is money to pay higher salaries to teachers. Must be more State aid.

All possible consolidation of schools, also skilled superintendence, should be made compulsory.

We encourage higher grades to go to the center.

All high school studies should be eliminated from upper rooms, that grammar-grade work may be better done.

If let alone, we are well enough. Too much disposition to make our schools large and expensive.

Consolidation should be carried far enough to warrant three rooms and three teachers below the high school.

Partial consolidation under some conditions would seem to be feasible and desirable. (1) As of adjacent districts far from the center but not very distant from each other, a team between the two buildings, placing the younger children of both districts in one of these buildings, and the older children in the other. (2) If new outlying buildings are constructed, make them two-room buildings, on the dividing line of two or more districts. Collect pupils by transportation of those farthest away.

Various ways and means of improving the schools are suggested in the replies received. Approval and disapproval of theories and practices are freely given. Results are stated. On the whole, the smaller schools of Massachusetts are gaining through consolidation; they may be made more efficient by an earnest determination of the people that they shall be more efficient; but mutual concessions and hearty cooperation are essential to that end. * * *

Conclusion.—While the weight of opinion is decidedly in favor of consolidation of schools, as being in the line of economy and efficiency, there are strong arguments in favor of the fair-sized, well-organized, thoroughly taught ungraded school. Small, isolated rural schools must exist in some towns of the State for years to come. The children are not responsible for the unfavorable conditions in which they are placed, and they are morally and legally entitled to a good education. Some of these schools are taught by women of rich culture, and of large previous experience in other educational fields. They are now "home talent" because of the love and care needed by aged parents. The teaching and the character-building in these little schools are of rare value. There are other teachers of exceptional abilities who will for a reasonable compensation do needed work in communities thus situated. The State is in duty bound to aid the town in securing to every child good educational advantages. If such influences of frugality and industry as characterized the home life in the country in former days can be

kept up and supplemented by excellent teaching, these isolated rural schools may do good work, even if they are denied the advantages of consolidation.

FURTHER INFORMATION AS TO MASSACHUSETTS—EXPERIENCE OF THE TOWN OF WARWICK.¹

There has been some extension of this plan during the year in towns more or less favorably situated for conveyance of children. These conditions should always be taken into careful consideration: The size and distance of schools from some central location, and the possibility of securing conveyance that is commodious and comfortable, affording adequate protection to children in all kinds of weather. Such conveyances, if not steam or electric cars, should be drawn by good, safe horses, under the charge of competent drivers, who are persons of good manners and sound moral character. It is the duty and the right of parents to demand comfort and protection for their children in the public conveyance to and from school. Provision should also be made for the care of children during the noon hour at the union school.

Consolidation of schools has not only its advantages, but its difficulties as well. Perhaps no other rural town in western Massachusetts better illustrates changed conditions through consolidation of schools than Warwick, in Franklin County.

Six years ago Warwick maintained 9 schools twenty-four weeks per year. The average attendance of pupils in the town was 87. Teachers' wages in the 8 outside schools were \$5 per week; in the center school, \$6 per week. With few exceptions, the teachers were young and without experience, educated in the district schools. Some were under 16 years of age, one term a pupil in a school, the next term a teacher. Occasionally, in recent years, a teacher of marked ability and successful experience has been employed, but the number of schools made it impossible to pay wages that would retain the services of well-qualified teachers many terms. The schools were poorly supplied with books and materials.

Now all of the pupils in town are in three rooms of one modern, well-lighted, heated, ventilated building, pleasantly situated in the center of the town. The rooms are supplied with good blackboards and with books and appliances for the use of pupils. The school has three teachers,—normal-school graduates of exceptional ability. The average wage paid is \$9 a week; the school year is thirty-six weeks. Special teachers of music and drawing visit the schools each week. Pupils are conveyed to the center union school from distant parts of the town. The average attendance in the fall term was 96, a gain over the attendance in all of the 9 schools six years ago. The schools are well graded from lowest primary to highest grammar grade, three classes in a room. Teachers are selected whose qualifications are especially adapted to the ability and needs of the pupils under their charge. The number of recitations being less than in ungraded schools, the teachers and pupils do much more effective work. The relation of the teachers to one another is one of mutual helpfulness, and the association of so many pupils in the schoolrooms and on the grounds under the supervision of the teachers is pleasant and beneficial.

As a result of the consolidation of its schools and a wise administration of school affairs, the town has in six years lengthened the school year 50 per cent, increased the teachers' wages 75 per cent, and employed special teachers of music and drawing without materially increasing the school tax of the town. Because of the reduction of the number of schools through consolidation, the cost of instruction by the regular teachers has been lessened. A large increase in the amount of money received from the income of the State school fund has been of great benefit to the schools.

¹ 64 Mass. Rep. (1899-1900), pp. 392-394.

Much time that would be needed for travel by the superintendent and special teachers in reaching many small scattered schools is saved for profitable use in the one building of the union school.

The citizens of Warwick have manifested a deep interest in their public schools by the employment of an efficient superintendent, the erection of a school building which is a credit to the town, the consolidation of its schools, and the employment of efficient teachers.

TRANSPORTATION OF PUPILS IN INDIANA.¹

[By State Supt. FRANK L. JONES.]

* * * Twenty years ago public education in rural communities was conducted upon a curriculum composed largely of the common branches. The teaching of physical geography and algebra in addition to the common branches was not uncommon, though it was not general. Great credit was given a township for its progressiveness and advancement. High schools were not established except in the larger cities. Young men and young women attended the rural schools until they were 21 years of age, and repeated annually the work of the advanced grades, thus often filling those schools with as many as 75 pupils under the direction of a single teacher whose business often degenerated into "keeping order." We need not turn to the statistical files of the department to prove that the large rural school was the rule and not the exception, such a condition being within the recollection of all mature people.

In the decade 1870-1880 the average number enrolled in each school district was 54. During the next two decades a constant decrease in the average is reported. The whole time of prominent educators was given to the rural common school. The favorite expression of one of Indiana's foremost State superintendents, in both oral and written statement, was, "Establish a rural school at every crossroads." This stimulus to rural schoolhouse construction multiplied those schools unduly, and many of them need to be abandoned at this time. With the development of the course of study, the grading of schools, the introduction of new methods of teaching, and the growth of high schools, the young men and young women were sent to the new secondary schools in the villages, thus relieving the common school of many of its students. Furthermore, the growth of cities demanding and attracting laborers thereto, and the demand for fewer laborers on the farm upon the introduction of improved machinery, reduced the number of young, vigorous, family-producing men and women in the country. Again, it is argued that there are not many large families of children in the country as in former years, and it is not difficult to prove that such is true. An examination of a large number of school registers throughout the State during the last eighteen months shows in very few instances more than two pupils from one family, and in only one instance were there as many as four pupils enrolled from a single home. Two decades ago the school registers often contained the names of five or six pupils from one home, and it was not as uncommon to find two or more enrolled from a home as it was to find only one. All of these conditions and movements have led not only to a lessening of rural school attendance, but have, in many cases, left so few pupils that we can not maintain with profit, either financial or social, a great many of these schools. The great evil of the small rural school lies in its nonsocial character. It is wholly unable to furnish each of its pupils that educative influence that comes from association with many of the same age and same degree of advancement; it can not have, in many classes, enough of honest and helpful

¹Ind. Sch. Rep., 1900, pp. 520-558.

competition to establish a standard to which many a bright pupil would raise himself, and fails therefore to bring from him that supreme effort which develops and ennobles and which comes only from a vigorous contest with his fellows. The humdrum and monotony of a recitation in a one-pupil class is discouraging to both pupil and teacher. Not only is the mental work of the school thus impaired, but the lack of enough pupils to organize a game on the schoolhouse yard prevents adequate exercise and tends to make morbid, selfish, and pessimistic all who live in its atmosphere—the deadly quiet and inactivity of the small school kills the spirit. * * *

The per capita cost in these small schools is not only much too large, but is continually increasing. In 1879 the cost of education per capita was as follows:

In townships	\$6.21
In towns	5.21
In cities	7.48

In 1899, twenty years later, the cost was:

In townships (per capita)	\$10.50
In towns (per capita)	11.10
In cities (per capita)	7.07

These tables are of more than usual interest on this point, and present to the taxpayer a strong argument for a solution of the problem of the small school. It will be observed at once that the per capita cost of education is constantly increasing in the country and towns and decreasing in the cities. This condition in the rural school arises wholly from the prevalence of small schools. There were as many rural schools in 1899 as in 1879; the salaries in the former are not substantially different from those in the latter; the investments in schoolhouses and appliances would about equal, but the attendance in them has constantly decreased. This condition makes necessary an expenditure for teachers, fuel, apparatus, and repairs for the small school of to-day equal to that of the large one of two decades ago. In the towns the increase is due quite largely to the establishment and equipment of high schools of small enrollment. Nearly all cities show congested schools, making necessary many pupils under the direction of each teacher, thus reducing the per capita cost. Add to this a saving in fuel, repairs, buildings, and appliances, and the reduced cost of education in cities is explained. * * *

The small schools are more numerous than most citizens and schoolmen know. That there are within the State 108 schools with fewer than 5 in average daily attendance; 487 schools with fewer than 10 in attendance; 1,253 schools with fewer than 15 in attendance; 2,332 schools with fewer than 20 in attendance, making in all (including counties not officially reporting) more than 4,200 schools in each of which there is an attendance too small for vigorous and highly profitable work, is a matter of no little importance, either educational, social, or financial. At the average rate of wages paid rural teachers, and for the legal minimum term of six months, the cost of instruction alone in 108 schools is \$48 per capita; in 487 schools, \$34 per capita; in 1,253 schools, \$16 per capita; in 2,332 schools, \$12 per capita. This calculation does not take account of the building improvements, cost of fuel, janitor service, repairs, and apparatus. These items added to the cost already given would increase the amount considerably. * * *

No school can claim good conditions for work if it contain fewer than 25 pupils; nevertheless, one-half of the rural schools of Indiana are in operation with numbers ranging from 3 to 25 pupils in average daily attendance.

The problem of the small school, therefore, is a real one, and each year becomes increasingly difficult. It is pressing itself more and more upon our attention and now requires a solution. In these schools we must lessen the cost; we must enlarge the classes; we must improve the school socially and athletically. The question now arises, How shall we proceed to accomplish this much-needed reform?

Upon one proposition we must all agree at once, namely, that our pupils must be collected into larger groups. We know that this means the abandonment of many schoolhouses, consolidation of the schools, longer distances to school, and the transportation of pupils. It means the abandonment of the traditional "home school." It does not matter how much we deplore the condition which makes consolidation of schools necessary, the fact remains that it is the only rational solution of the question that has been offered. Before entering upon the details of the problem of consolidation and transportation it might be well to say that the thing most to be avoided is the destruction of rural life and the rural view. The very strong movement which leads to the centralizing of schools in towns and cities is to be deplored and should be avoided if possible. The preservation of the conservatism of the farm; the simplicity of its manners and dress; the ruggedness of its life; the peace, quiet, and contentment of its homes; its formation of good habits; its absence of vice; its opportunities for physical development, and its making of men and women of clear consciences are items which argue eloquently for rural life and make its preservation of vital necessity to the welfare of our nation. It must not be required that the problem be solved by consolidating about the towns, but that consolidation which is distinctly rural is expedient, economical, and wise. Some of the best graded schools in the State are at a great distance from either cities, towns, or villages. * * *

WHAT INDIANA IS DOING IN THE TRANSPORTATION OF PUPILS.

In July, 1900, the superintendent of public instruction in Indiana sent to the county superintendents the following inquiries, and below may be found their answers, all of which gives in detail the status of the work in Indiana. Forty counties have already begun the work of collecting pupils into larger groups by transporting them.

QUESTIONS.

1. *What is the sentiment among your trustees relative to abandoning small schools and consolidating the schools of the townships?*
2. *In what townships of your county has consolidation been tried, and with what effects?*
3. *What do you find to be the advantages and the disadvantages of the system, if you have tried it?*
4. *What do the patrons think of the plan where it has been tried?*
5. *How far do you transport pupils?*
6. *Give briefly the history of any one experiment in the transportation of pupils.*
7. *General remarks.*

The answers received were as follows:

ANSWERS.

Adams County:

1. They have talked the matter over at different times. They came to the conclusion that bad roads in Adams County will be a great drawback. I believe the idea of consolidation is a good one, and am anxious to have it tried here. At present the sentiment of trustees is somewhat against it from the standpoint of bad roads.

2, 3, 4, 5, 6, and 7. No answer.

Allen County:

1. We have not discussed this subject in any of our board meetings, but I am sure that a majority of the trustees feel that we are not yet ready to vacate very many of our schools. Transportation depends so largely upon the condition of roads that in many places this is not yet feasible.

2. Wayne Township, Allen County, has transported children for two years in one district. It is a case in which a small school of about 20 pupils was closed and the children transported to an adjoining school, a distance of 2 miles. I asked the teacher to make a separate report of their attendance. It proved to be 10 per cent better than that of those not transported.

3. Our experience is too limited to allow a valuable opinion. It seems to improve attendance, prevents tardiness. The pupils are much less exposed to the inclemencies of the weather, being in closed rigs, which are heated in severe weather. The saving amounts to about \$1 per day.

4. They are pleased.

5. Two miles.

6. No answer.

7. I am of opinion that there is danger in the system when carried too far. One township grade school large enough to accommodate all the children in a township, in my judgment, will embrace too much territory and contain too many pupils for the best results.

Bartholomew County:

1. Generally in favor of continuing local schools as long as a reasonable number of pupils support the school.

2. Transportation has been tried in 1 township only, Columbus Township, with very satisfactory results.

3. Pupils of 1 school district transported to an adjoining school district. Advantages: (a) Better teaching; (b) satisfied pupils; (c) satisfied parents; (d) satisfied school officials; (e) net saving of about \$35 per month.

4. See No. 3.

5. About 3 miles.

6. Experiment referred to in No. 3 has been in operation for the last two years, with results as indicated.

7. Personally we believe that local schools should be continued so long as enough pupils attend to keep up a reasonable interest in the school. (The public school as the local institutional unit is the hope of our country.) After that, consolidation.

Benton County:

1. Our trustees all favor it.

2. Bolivar, Pine, and York townships, with good effects.

3. The advantages are that it gives the pupils of the smaller schools better opportunities for classification, gradation, and instruction, and financially is a saving of fully 50 per cent of the amount it would cost to keep open the schools that are closed.

4. The sentiment for and against the plan is about equally divided.

5. From $2\frac{1}{2}$ to $3\frac{1}{4}$ miles.

6. One school that has been closed for three years formerly cost the township about \$50 per month, or \$400 for a term of eight months, the usual length of schools in that township. The schoolhouse has been sold and the pupils have been transported to other schools for \$25 per month.

7. It is very difficult to get the consent of the parents to close schools.

Blackford County:

1. Favorable to it.

2. Licking Township. Good effect.

3. Avoiding dead schools, as all small schools are apt to be, and a financial saving of \$150 per year.

4. Satisfied.

5. Two and one-half miles the farthest.

6 and 7. No answer.

Boone County:

1. I think the sentiment among trustees favors the change mentioned.

2. In none.

3. The county has no examples.

4. Have not tried it. The patrons strenuously oppose its inauguration.

5 and 6. No answer.

7. The trustees have so far allowed the patrons' opposition to prevent the abandonment and consolidation of schools. The township reform law tends to weaken the purpose of the best and most enterprising trustees.

Carroll County:

1. It is the prevailing opinion among the trustees of this county that small schools—those with an enrollment of 10 to 15—should be abandoned. They also think that much better school work could be done at less expense by consolidating all the schools of the township. I think they are in favor of it only where a graded school is already established near the center of the township and where the roads are good.

2. Transportation has not been tried at public expense at all. In Jackson Township several families take their children to Flora and Camden at their own expense, and some other families are paid something by the township. In these instances the children do not wish to go again to the country nor do the parents desire a change.

3. In the cases under "2" there is a financial gain of about \$500, as 2 schools were abandoned.

Pupils transferred to Flora cost about \$75. I should say there is a gain of \$400. The advantage of the graded school over the country schools can not be estimated. It is severe on these children to make the drive on the extremely cold days. They don't complain much, however.

4. They are in every instance well pleased.

5. From 2 to 4 miles.

6. A school meeting was held in a certain district to see whether the plan would be acceptable. Patrons came prejudiced, thinking we were going to rob them of their school and build up the school at Camden. They were almost unanimously against us. We set forth the plan, but they raised all forms of objections and never would submit. Some now come to Camden at their own expense and are well pleased.

7. Good roads would make it practicable. The results would be incalculable in the way of better training for the children. It would be a great money saving, I think.

Cass County:

1. I think that there will be at least 4 schools abandoned this year. The trustees are nearly all favorable, but there is some opposition among the patrons. It has never been tried in Cass County.

2, 3, 4, 5, 6, and 7. No answer.

Clay County:

1. The sentiment is gradually growing in this county. It is limited, however, to abandoning the small schools.

2. None have tried it.

3, 4, 5, and 6. No answer.

7. In many townships the relocating of schoolhouses would lead to a saving of 1 or 2 schools in each township so adjusted. At this time the above seems to be the need along the line of abandoning schools in this county.

Clark County:

1. They are generally in favor of it.

2. Charlestown Township. Good effects.

3. Advantages: Pupils have the advantage of a longer term of school, a better graded school, and usually (not always) of a better teacher. It is also a financial saving. Under very unfavorable conditions it saved this township \$75. Disadvantages: It has a tendency to make less attractive and inviting the life of rural people by destroying their schools.

4. They are in favor of it.

5. Two, 3, and 4 miles.

6. One school abandoned in Charlestown Township and 5 pupils transported to town of Charlestown. Patrons pleased; pupils in a better school. Other township schools run longer. Saving to township that transported

7. No answer.

Clinton County:

1. Most of them are in favor of it, but only where the roads are good; the schools to be abandoned are small, and all conditions favorable. I found 3 schools this year with an attendance of 6 pupils. I shall recommend to the trustees that these schools be abandoned.

2. Owen, Perry, and Ross townships, with very good results. In the first two, hacks were furnished. In Ross Township the trustee paid the parents to furnish conveyance for their children. The latter plan seems to give the better satisfaction, as the children can bundle up and start at once directly from home.

3. Advantages: (1) Better school. There are more incentives to study and more rivalry among pupils in a class of 8 or 10 than in a class of 1, and usually the good teacher is selected for the larger school, while "any one" can teach a small school. (2) A saving financially. Counting interest on the investment, the transportation will cost no more than the running expenses of the school, exclusive of the teacher's salary. Thus a saving of from \$1.65 to \$2.50 per day.

4. I have found no serious objections to the plan. Some complaint has been made that the children are exposed too much in bad weather. But in the face of this a few families are sending their children away from a district school (within three-fourths of a mile) to a graded school nearly 4 miles away.

5. From 2½ to 4 miles.

6. A hack from Colfax made the trip morning and evening, taking the pupils of a small district 2 miles north of Colfax to another small school 4 miles north of Colfax, thus combining 2 small schools. Last year the trustee allowed the patrons of the school 2 miles north of Colfax to send to either of the other schools, and he paid their transportation, the patron furnishing his own conveyance. This plan seems to be preferable.

7. This is a good plan in some cases; but I believe it will be a long time before the sentiment in favor of the crossroads schoolhouses changes. When the roads are good and the school is small, or the pupils want high-school privileges, the plan is all right. But I seriously doubt whether a radical change to this system would bring about generally good results.

Decatur County:

1. There is no active interest manifested. Mr. O. B. Trimble, of Clay Township, thinks the plan a good one, and would attempt it if he had time to complete the work. Mr. C. C. Lowe is also an advocate of the plan, but his township is so arranged that it is impracticable. Roads run to Greensburg, with very few convenient crossroads. To consolidate schools would require exceedingly long drives. Other trustees have had no special interest in a general plan of "consolidation."

2. In Fugit Township 1 school was abandoned in 1898-99. Pupils were transported, but the country school is opened again this year.

Clay Township abandoned 2 schools in 1898-99, and 2 in 1899-1900. No transportation was needed except in 1 school this last year. It was offered there, but not accepted.

In Adams and Jackson townships each 1 school abandoned, 1898-99. No transportation needed.

Clinton Township abandoned 1 school 1899-1900, and provided transportation for from 6 to 10 pupils.

(These conditions remain at present as stated above.)

3. It has not been sufficiently tried to give fair basis for judgment.

4. There is quite a general feeling among patrons of rural communities that they are entitled to school privileges at home. In communities where schools are small the people are scattered over considerable territory. Pupils would have to walk, in some cases, about as far to the transportation wagon as they now have to walk to school. In two or three of the cases above cited opposition was strong. There is a general anxiety, however, on the part of trustees to close the smaller schools.

5. In Fugit Township, from 2 to 3 miles. In the proposed plan for Clay Township, from 3 to 4 miles. In Clinton Township, about 3 miles.

6. No answer.

7. I think the best plan here would be a gradual development of the system in two or three townships. Small schools in a few cases could be transported to others without overcrowding. In three or four townships a partial consolidation could be easily put into effect. The condition of roads has been a hindrance to even fair consideration of the plan; but three townships now have petitions filed for extensive "pike" systems.

Crawford County:

1. Consolidation of schools has never been tried in this county. Two trustees have abandoned a district each and the pupils enter the nearest adjoining district without transportation.

The idea is considered a good one, but not practicable in this county, owing to poor roads and so many hills and small farms.

2, 3, 4, 5, and 6. No answer.

7. I believe if Crawford County could have good graveled roads, which I think she will have before long, the solution would be solved in this county.

DeKalb County:

1. As far as I am able to learn they favor it. I think they would favor it were it not for the expense of building new houses.

2. It has not been tried, though it has been talked of quite favorably in a few instances. The sentiment is growing in favor.

3. Not tried.

4, 5, and 6. No answer.

7. It seems to me that we are rapidly approaching the concentration plan.

Delaware County:

1. The sentiment is universally in favor of consolidation of small schools. There is not a dissenting voice in Delaware County among the trustees. The only question to be determined is how fast to push the plan in face of some opposition among some few patrons who are content to let matters rest where we now have them.

2. In Hamilton and Perry townships, with the best results claimed for the change. Some economy, regularity in attendance, better attendance, better health of pupils, better gradation and classification.

3. Better gradation and classification, better teaching, better attendance among those conveyed, better health of children, due to care in getting to and from the school. Saving of money where two schools can be changed.

Three hundred dollars in 1 township, 1 school abandoned.

Three hundred dollars in another township, 1 school abandoned.

Six hundred dollars in another township, 2 schools abandoned.

In the townships where there is some conveyance the saving in teacher must be applied to conveyance. Where the two schools are conveyed the saving is 25 cents per day.

4. The plan seems to give entire satisfaction thus far.

5. Some are transported from 4 to 5 miles.

6. Two schools abandoned in Hamilton Township and children conveyed. Pupils in each school, 10. Cost of transportation, \$1 and \$1.10 per wagon. Cost of teacher under old plan, \$2.25 each. One additional teacher required at the consolidating point. Number of departments, 3.

Township high school possible. Satisfaction given, good. Sentiment in township, very favorable. Excellent prospects for the future.

7. No answer.

Dubois County:

1. They favor it, but citizens oppose it to such an extent that no trustee in this county is likely to move hastily in the matter.

2. None.

3, 4, 5, 6, and 7. No answer.

Fayette County:

1. The trustees are favorable to the above-named plan.

2. In only 1 township, Harrison. The patrons of 2 of the schools abandoned were very strong against it at first, but most of them are now satisfied and like the plan. If they had school in all their buildings, they would have had 3 schools with an enrollment of 10 or 12 pupils each. Now no school has an enrollment of less than 20. The teachers are pleased, and I think the schools better.

3. Advantages: First, larger schools, causing pupils and teacher to be more interested. Second, more regular attendance. Third, patrons are not bothered with taking their children in bad weather, but have them taken.

Financial statement:

Cost last year, 6 teachers, \$45 each per month, 6½ months.....	\$1,755
Cost this year, 4 teachers, \$40 per month each, 7 months	1,520
Cost this year, 1 principal, \$80 per month, 7 months	560
Cost this year, 2 wagons, \$20 per month each, 7 months	280
Total	2,360

\$2,360—\$1,755=\$605, extra cost to have one-half month more school and have a high school. The township did not have a high school until this year. I do not know whether there will be any savings in special school money or not.

4. No answer.

5. Three miles is perhaps the farthest and, as the wagon takes all on its road, some only a short distance.

6. Pupils in district No. 6, Harrison Township, Fayette County, transported to district No. 7, in said township and county. The first day the wagon went to the house of the children; but as the parents were opposed to the plan, they would not let the children go to school. The trustee told the driver to go after them every day until he told him to stop. The trustee then came to see the county superintendent, and it was decided to send the truant officer to see the parents. In the afternoon of the second day the truant officer made his visits, and on the morning of the third day all the children rode to school and have been doing so all term.

7. First. It is a good plan when a township has too many schools. Fayette County has about 10 schools too many.

Second. It is very difficult to get parents to see the advantages.

Third. Trustees do not care to do what the patrons do not want done.

Fourth. I think new trustees will be more willing to act than old ones.

Floyd County:

1. The sentiment is very much in favor of so doing.

2. It has not been tried in this county.

3, 4, 5, and 6. No answer.

7. This county is so hilly and the roads for the most part are so rough that I fear that the transportation system would not be successful. However, there is a growing feeling that it would be best.

Fountain County:

1. In favor of it as far as practicable.

2. Richland and Van Buren. Good. Fulton will try it next year to their new graded school. A great many children drive themselves several miles in all the townships.

3. There are no disadvantages, except bad roads. There is a saving, but can not give the figures.

4. They like it after trying, but generally oppose it before trying.

5. Three and 4 miles.

6 and 7. No answer.

Franklin County:

1. Trustees favor the plan. The people are not so favorable. They have no real reason, but give the "stock" argument.

2. Not tried.

3, 4, 5, and 6. No answer.

7. The sentiment is growing in favor of consolidation.

a This should be \$1,120, if the number of teachers and their salaries are given correctly.—ED.

Fulton County:

1. The majority favor it.
2. None at expense of county.
3. (1) Better grading; (2) thorough work; (3) the teaching of special branches; (4) better teachers; (5) large classes; (6) broader companionship and culture; (7) better buildings, roads, apparatus, etc.; (8) creates a good school sentiment.
- (1) Lack of proper conveyances. (2) Many patrons object to children going so far from home.
- (3) Riding in hacks with all classes of children.
4. Would have no other. They are well pleased.
5. We transport none. They all walk or drive. Five miles.
6. No answer.
7. I think the majority of the people in Fulton County favor centralization.

Gibson County:

1. Favorable. No gravel roads in the county, and for this reason the plan has not been tried.
- 2, 3, 4, 5, and 6. No answer.
7. I believe the plan will be satisfactory in a short time. Gibson County is now considering the road question, and as soon as the roads will permit we shall be ready to try the experiment.

Grant County:

1. The trustees are very generally in favor of doing away with the small district schools and sending to larger and more inspiring ones.

2. In Franklin, with good success.

It places the students in schools where there are more pupils and greater interest. The teacher seems to be inspired to do better work. In the small school generally the interest is dead. It is very clearly a financial saving to the township. The pupils are taken to school and brought back by a competent person, and when so many come together it lessens the chance for children to lower their morals. It is unsafe to let a boy and a girl of this age walk home together for any length of time. You see what I mean.

4. At first they objected, but are now seeing the benefits.

5. Three miles.

6. In Franklin Township the trustee did away with 3 schools, and in 2 of them the pupils were close enough to be as well accommodated in regard to distance as they were before the abandonment. One school was out of reach of others, and a small village wanted a new school, and it is these he hauls to a centrally located graded school. The pupils of the other two schools still walk to the other school districts.

7. At the next meeting of the trustees one of them, Mr. Slater, will read a paper on the subject. I think now we will abandon a number of our schools next year. We will simply abandon them temporarily. I think the plan a good one.

Greene County:

1. Sentiment not favorable to abandonment.

2, 3, 4, 5, 6, and 7. No answer.

Hamilton County:

1. We have tried the plan in a number of cases, and it is very satisfactory to officers and patrons. Under the plan we have vacated 20 little schools and saved hundreds of dollars of expense, and the pupils had better school privileges. There should be a direct law on the matter to allow trustees and township councils to do as they think best in such instances.

2. Adams, Clay, Delaware, Jackson, Noblesville, Washington, Wayne, and White River. In some cases the trustee furnished a wagon; in others an allowance was given some patron to do the transporting. B. C. Sherrick, of Washington Township, has vacated 4 schools and should vacate 3 more.

3. The pupils get better schools, the expense is less, good attendance, no tardiness, and better teachers in the schools. The pupils take more interest in study, dress, neatness; in short, conclude school is business.

4. At first seriously object, but afterwards favor it. It is an idea that is growing. It can be better favored where there are good roads. We have not attempted it on dirt roads.

5. From $\frac{1}{2}$ to 4 miles. The nearest district house to Carmel graded school is 3 miles away. The parents do their own transporting in most cases.

6. The trustees of townships where there are stables pay liverymen for caring for pupils' horses. In townships not so favored the trustees build stables. At No. 1, White River Township, S. D. Basey has the whole school transported for \$1 per day. At No. 2, in Clay Township, J. W. Morrow transports for 50 cents a pupil, doing the driving.

7. To favor this plan, put the very best teachers in the center schools, give a music teacher, furnish every encouragement, and people go there of their own accord. The idea is well supported in Hamilton County.

Hancock County:

1. The sentiment of the present trustees is decidedly in favor of above plan.

2. In Center Township; to a very limited extent in Jackson. The effects have been entirely satisfactory to all who comprehend the best interests of their children.

3. The advantages are numerous; among them, greater class interest, by reason of larger classes; promptness of attendance; general interest, by reason of better graded schools. There has been much financial saving, but I have no statistics which would enable me to give actual figures.

4. Most patrons who have tried it are satisfied. Some complain—would rather have their children wade the snow for a mile and a half than ride two and a half. These are the exceptions, however. Generally I have found the patrons satisfied. The greatest difficulty is one of sentiment. Patrons do not like to abandon their home schools, however much time and circumstances may have depleted them.

5. Such pupils as have been transported in this county have been taken from 2½ to 3 miles.

6. This I am unable, at present writing, to do.

7. I very much fear that consolidation is blocked for the present in this county. There is even a pressure being brought to bear to reestablish some schools long since abandoned. I am combating this with all my might, but there is opposition to consolidation.

Hendricks County:

1. All my trustees feel that small schools should be abandoned.

2. Middle, Liberty, Guilford, Eel River, all with good effect.

3. Better the pupils' school privileges by placing them with teachers who have fewer grades to teach. For every school vacated, saves about \$2 per day. It has so far worked no disadvantage of which I know.

4. Patrons are well pleased, because the children are doing better.

5. Two and one-half to 3½ miles.

6. At first neither patrons nor pupils like it. But after starting they do not wish the school reinstated. We have had no trouble, and in some districts the patrons talk and apply for abandonment and transportation.

7. We have in the last six years consolidated and abandoned about 15 districts in the county, and prospects are for the abandonment of 10 more this and next year.

Henry County:

1. The sentiment is favorable to discontinuing the small schools so far as most of the trustees are concerned.

2. Dudley Township, with good success. Harrison Township, with success not so good.

3. Advantages: (1) Can procure better teachers. (2) Longer term. (3) Longer period for recitation. (4) Classes better and more evenly graded. (5) Cheaper and better buildings.

Disadvantages: (1) Pupils may have to wait for hack on bad days. (2) Where hack is not heated it is too cold. (3) Frequently too much crowded and might tend to cultivate habits unfavorable to etiquette. (4) It throws the good country boys in association with the uncouth, cigarette-smoking boys of the villages, since the graded school is in the village usually.

4. Dudley Township, the patrons like it fairly well. Harrison Township, not very well, owing partly, I think, to the prejudice occasioned by opposing it in the start.

5. As far as 4 miles.

6. In Harrison Township the patrons wanted a schoolhouse built in the district. The trustee thought there were not enough scholars to justify it, and refused. He transported the pupils. The pupils and patrons decided to oppose it, and have done so. They call the hack the "ice wagon," although it is well inclosed. Other districts, fearing a trustee might do them likewise, made it a trustee election issue and won.

7. I am not in favor of transporting good country schools where they are large enough to keep up a good interest; but am decidedly in favor of transporting small schools or schools in settlements where the patrons do not work in harmony with the schools. It seems a good thing where it can be done by the consent of the patrons, but not so good otherwise.

Howard County:

1. Nothing of the kind has been done yet, but I think it will be tried in some townships next year. Some trustees and members of advisory boards think it is the proper thing to do. I am encouraging the movement all I can, for I have found many schools too small for good work. I really believe that better work is done in the overcrowded school than in the schools with a small enrollment.

2, 3, 4, 5, 6, and 7. No answer.

Huntington County:

1. Very favorable.

2. (a) In Lancaster and Polk townships. (b) A strong sentiment against it by the patrons before being tried; but almost universal satisfaction at close of the school term.

3. (a) Regularity of attendance, no tardiness, no playing "hooky," less or no complaint about conduct of pupils in going and returning from school, less liability to colds, therefore better health; and hence a much better school; longer term of school. (b) Complaint of patrons about destroying the sacred "little red schoolhouse." No real disadvantage. (c) In one case, instead of paying the teacher \$2 per day and other necessary expenses, pupils conveyed for 89 cents per day. In the other case a saving of a little over \$1 per day, besides the necessary expenses of fuel, etc.

4. Universally favorable in Polk Township. In Lancaster Township a few oppose it, but on no legitimate grounds.

5. In Lancaster Township, 3 miles. In Polk Township, about 4 miles.

6. At the time of taking the enumeration the trustees secured the consent of the majority of the patrons, and then let the contract of conveying the pupils to the lowest responsible bidder soon, and made other minor necessary arrangements. In both cases trustee bought hacks. The drivers at first found some trouble in discipline until the teacher and trustee gave the pupils to understand positively that the driver had the necessary power delegated to him by the teacher and trustee. No trouble afterwards.

7. Both the trustees (L. L. Ulrich, of Lancaster Township, address, River, Ind., and John M. Rodgers, of Polk Township, address, Monument City, Ind.) and myself gratified with the results.

Jackson County:

1. The trustees of this county favor it as far as practicable. In some townships the roads will not permit of it.

2. In Carr Township, it was a success. At first the patrons objected, but after it was tried they seemed to be satisfied.

3. An advantage in the case tried; was not only a financial one, but a great advantage to the pupils. It placed them in a good graded school, one in which there was an interest manifested in the class, also on the play grounds, gave them longer time for recitation, etc. Financially, a saving of 75 cents per day.

4. The most of them favor the plan. Some oppose, to be on the contrary side.

5. About 3 miles.

6. In Carr Township there is a school about 3 miles from Medora, a graded school. This school enrolled about 12 pupils. The trustee hired a man to convey them for 75 cents per day. He went out at a certain time and they were on the road when he arrived. The pupils were never tardy and were regular in attendance.

7. No answer.

Jasper County:

1. Decidedly in favor of discontinuing small schools. Under favorable circumstances in favor of consolidation.

2. Walker. We had a school of about 8 pupils. It cost us about \$90 to have these taken to another school. We saved over \$200. The pupils were better instructed and we were well pleased with the result.

3. It increases the length of school term. We can pay more, and thereby secure better teachers. It aids in the supervision of the county superintendent. Pupils were better taught. We saved about \$200 in one school last year. (Teacher, 130 days at \$2 per day, \$260. Fuel, \$40; Total expense, \$300. Cost of transporting, \$90. Saved, \$210.)

4. Objected at first, but were well pleased later. I think, however, that patrons as a rule are very largely opposed to the idea of consolidation.

5. Two miles.

6. We had a school of about 8 pupils. They lived about 2 miles from another school. We had been having a very poor school here, and decided that it would be best to take them to the other school. The year before our school cost us about \$300. We took these pupils to the other school for \$90 and gave them a much better school.

7. The great barrier in our way of consolidation is "bad roads."

Jay County:

1. There isn't much sentiment in favor of the plan, except in the case of very small schools. There has been but 1 school abandoned in Jay County in the past three years. That one was in Richland Township. Former pupils of that school are now sent to adjacent schools in the same township or are transferred to Dunkirk.

2. There has been but one attempt at transportation. That was in Penn Township, Granville-Phillips, trustee. He had planned to discontinue 2 of his smallest schools and transport the pupils to Pennville, but when school was about to open such strong opposition was manifested by the patrons that he thought best not to attempt it.

3, 4, 5, 6 and 7. No answer.

Jefferson County.

1. The question of abandoning the small schools and consolidating the schools in the various townships of this (Jefferson) county has been discussed at the meetings of the board of education for the past few years, but thus far no definite action has been taken. They are fully alive to the merits of the plan, but are not ready to pronounce it feasible on account of many of the township roads being almost impassable during certain periods every year.

2. It has not as yet been tried.

3, 4, 5 and 6. No answer.

7. Several small schools have been abandoned in this county during the past three years, resulting in quite a material saving financially and in strengthening the other schools without working any great hardships on the pupils in the districts temporarily abandoned.

The roads are becoming much better year by year, but at present the plan of consolidating the weaker, or all of the schools of the townships, is almost impracticable.

Jennings County:

1. Except in 1 township (Spencer) there has not been any sentiment on part of trustees. In township named, with 20 miles of new pike road, the trustee has abandoned 8 country schools, and children attend the Central Township school at Hayden. There are other country schools yet in township, but I do not think they will be abandoned.

2. In none.

3, 4, 5, and 6. No answer.

7. I have been working on trustees and patrons along the line of consolidation in some localities, but as yet we have not been able to overcome the prejudices against the idea. I believe, however, with better roads, we are soon to be able to abandon quite a number of small schools.

Knox County:

1. The trustees, as a rule, think favorably of the plan and have discussed it freely. The conditions in this county are unfavorable to carrying into effect this plan. We have no good roads in this county at present, but elections have been held in 2 townships this month and good roads were voted. For the past three months the roads have been impassable.

2, 3, 4, 5, 6, and 7. No answer.

Lagrange County:

1. They are in favor of consolidation so far as the size of the school will permit economy and the topography of the country does not interfere. The probabilities in this county are for limited consolidation.

2. Springfield, Bloomfield, Johnson, Clay, and Van Buren. The parties transported are generally well pleased. All complaints come from unsatisfactory conveyances.

3. I do not have the figures, but trustees are largely figuring on whether they can heat, repair the house, and pay teachers so cheaply as to secure transportation elsewhere with its teaching. Half of the transportation is to neighboring district schools. The cost is about two-thirds of the old rate for a small school.

4. The graded schools in most cases are not sufficiently well equipped to make their superiority apparent to all. The parents, as well as pupils, like increased numbers and better organization, but resident taxpayers generally work against the abandonment of a school.

5. From $1\frac{1}{2}$ miles on the route to the extent of said route, about 4 miles or more from the schoolhouse.

6. Transportation in this county is in its infancy, as fully half of the transporting was begun this year. They add one school at a time generally, but the additions remain, although the process is not very rapid. Johnson doubled the number of wagons to two schools in 1899-1900. Same of Bloomfield. Van Buren began, and so did Clay.

7. It seems that consolidation will gain ground somewhat in proportion to the number of new houses demanding reconstruction, as few or no new structures will be placed near graded schools already established.

Lake County:

1. They think good roads must be secured first. The people are against it, and the trustees do not care to antagonize them too much.

2. Hobart Township. This was only for high school pupils, and sixteen were transported 4 miles with apparent satisfaction.

3. Have never tried it in country schools.

4, 5, 6, and 7. No answer.

Laporte County:

1. The matter of consolidation of schools has received much attention in this county within the last three years, and trustees are, so far as I am able to learn, unanimously in favor of abandoning small schools and transporting pupils at public expense to village schools or other schools in the townships.

A resolution by the county board favoring the abandonment of all the schools with an enrollment of less than 9 pupils was spread upon the record of March 6, 1899.

2. (a) Galena, Kankakee, Center, Johnson, Noble, and Hanna townships. (b) Has given general satisfaction to patrons and school officers, and made a saving to the townships of over half.

3. I would consider the following advantages: (a) Much cheaper, saving in heat, school apparatus, and repairs of buildings in case schools had been opened in the abandoned districts. The saving must be greater in case several schools are abandoned in the same township. (b) Attendance has been increased and cases of tardiness reduced. (c) Pupils' health has not been impaired by wet feet, etc., and better sanitary conditions have been possible in the school. (d) I believe better roads will follow. (e) It will give a longer term of school under better conditions. (f) Closer and more efficient supervision. (g) It will give a graded instead of an ungraded school, where each pupil will have the advantage of personal contact with his instructor, and the interest and emulation accruing from larger classes instead of being a member of one of eight divi-

sions under the same teacher, and, as in many cases, the only member of his class in the school. (h) It will give each teacher an opportunity to specialize in her particular grade; give her a chance to select the work which she best likes and is most efficient in. (i) Make a united whole of township schools and bring them more nearly on a standard with city schools.

I would consider long distance, in some cases, and bad roads in some localities, as disadvantages.

In no case have all the schools of a township been consolidated in this county. Transportation for the small schools has cost from \$75 to \$160. The cost of maintaining the abandoned schools would have cost—teacher, \$320; fuel, \$25; apparatus and repairs, \$35; total, \$380.

4. Patrons as a rule remonstrated against the plan at first, but in no cases have substantial complaints been made. After the plan is once in operation and patrons see its advantages they show a disposition to advance the cause.

5. Pupils have not been transported more than 3 miles in this county at any time.

6. Worden school, in Noble Township, was closed last fall and a team hired to transport pupils a distance of about 3 miles for \$1 per day. The wagon used was to be covered and to run on schedule time. Patrons were generally pleased until a boy or young man was hired as driver. Young man proved incompetent and a man was employed. In this particular case had the driver been competent from the first, and the wagon been better equipped, the plan would have been highly successful. All is running smoothly at this time, and more schools in the same township will probably be closed in the near future.

7. I think we can safely say that consolidation is the order with our trustees, and small schools will continue to be abolished as rapidly as it is possible for us to do so. We aim to make the change gradually at first.

Lawrence County:

1. They generally oppose it, but it is because the patrons object to it.

2. Not tried.

3, 4, 5, and 6. No answer.

7. There are many places in this county where schools could be consolidated and the schools would be made better and money would be saved.

Madison County:

1. The old trustees (now in office) are in favor of it; but they are afraid to attempt anything now, as we have so many good single rooms.

2. They transport about twelve from Rigdon to 2 miles into Boone. The result was not the best because it crowded the school where they went. It would have been better perhaps to transfer and send them to Grant County.

3. No answer.

4. Don't like it.

5. Two miles.

6. No answer.

7. It has not been sufficiently tested in this county to reach any conclusions in the matter.

Marion County:

1. The sentiment among trustees is strongly in favor of abandoning the small schools. In some instances trustees have attempted the same, but have met with opposition from parents.

2. Transportation (limited scale) in Washington and Decatur townships. In the first instance, the patrons much pleased; in the second, township patrons dissatisfied and demanded the reestablishment of the school.

I am of the opinion, however, that this dissatisfaction arises from the desire to have a certain teacher obtain a school, regardless of advantages.

3. Advantages: Closer grading; broadening of pupils from association; less exposure in bad weather. Disadvantages: I have observed none.

I can not give figures, as a portion of this was barter between trustee and parent.

4. See statement No. 2.

5. Greatest distance, 3 miles.

6. Too irregular to give incident.

7. We have had no regular work in transporting pupils; in one case trustee transported a part of the year and parents a portion of the year. In some instances parents transported their own children and those of one or two other families. The work in this line here is irregular. We meet with much opposition from the older inhabitants; the younger element favor the idea.

Marshall County:

1. Favorable.

2. We have not transported pupils, but have abandoned a few small schools where the pupils would not have to walk more than 2 miles to reach another school.

3. Makes weak schools strong and is less expensive. Can not give figures.

4. Educated people can see the benefit of the combination, thus giving better instruction.

5 and 6. No answer.

7. We do not transport any pupils, but I think if we can get our patrons to see the advantage

of closing the smaller schools and uniting them with the larger ones, we will get the advantage of graded work at a less expense.

Martin County:

1. In the affirmative. Public sentiment is growing in favor of it.
2. Not one.
3. Our disadvantages would be bad roads and number of streams that cut up the county.
- 4, 5, and 6. No answer.
7. The physical geography of Martin County would make it impossible to carry the concentration as far as in a more level country. We shall have to have more schoolhouses than a more level one, as a matter of course.

Miami County:

1. Trustees are in favor of consolidating schools and are doing so as far as practicable.
2. None.
3. Better schoolhouses.
4. Favorable.
- 5, 6, and 7. No answer.

Newton County:

1. In a few townships the trustees favor consolidating schools, but in most townships the roads are too bad during the winter months.
2. In McClellan and Lake. Lake has not tried it extensively, and trustee says but little for or against it, but I think it will be quite popular in the near future. Trustee Elmer Skinner, of McClellan, says: "Increased attendance, little or no tardiness, better work, better teachers at advanced wages, longer school term, better libraries, better supervision."
3. Schools were consolidated from 6 to 3. Mr. S. pays liberal salaries, pays special music teacher, etc., and finds a net saving of \$708 per year.
4. Mr. S. states: "First, only objections, dislike to send pupils so far from home; second, local jealousy and a natural dislike to getting out of the old ruts. The patrons, with few exceptions, are at present pleased with the change."
5. All pupils outside of a 2-mile limit.
- 6 and 7. No answer.

Noble County:

1. Our trustees are now discussing the subject. Some favor and some oppose it.
 2. In Orange Township with excellent and satisfactory effects.
 3. Advantages: Better schools, larger classes in certain grades, better grading, gives teachers a better chance, inasmuch as they do not have so many grades to the room, and, in fact, I approve of it in every way where roads permit of the consolidation.
- In some parts of our county the roads are bad during a portion of the year. I can not give figures of saving, but the trustee of Orange Township, W. W. Williams, can.
4. I believe the patrons are delighted after having tried it. Of course there was some grumbling and "kicking" at first.
 5. I think 4 miles is the farthest.
 6. Mr. Williams will be able to do this far more intelligently than I can.
 7. No answer.

Ohio County:

1. They are very much in favor of abandoning small schools and consolidating when it is practicable.
2. In Randolph Township, and has been satisfactory.
3. Better school, and saving of about \$150 in the one case where we have transported pupils.
4. Some favor and some oppose it.
5. Two and one-half miles.
6. Have only had one, from which I have given the preceding.
7. No answer.

Orange County:

1. In townships where the roads are graveled and country is fairly level it is favorably considered by the trustees, and I believe will be tried before long.
2. None as yet.
- 3, 4, 5, and 6. No answer.
7. One township in Orange County is ripe for the experiment, and I think there would be nothing in the way of successfully putting the plan into operation in this township in the near future. The people have been talking it, and some of the country schools adjacent to Orleans are almost deserted, as the children are going 2 and 3 miles to town, by reason of good roads and superior school advantages.

Perry County:

1. Two trustees have made an effort to abandon small schools. Oil Township has abandoned 3, and a fourth will be this year. Union will unite 2 this year. I am going to try to reduce the number in Clark. Other trustees are afraid of their popularity.

2. Have never tried it. Can not interest anyone in it.
3. We have a few localities where this plan is practicable.
4. Don't think.
5. Condition of our roads will make this impossible in most parts of Perry County.
6. No answer.
7. Tobin Township presents the best opportunity for a trial of transporting in this county.

Pike County:

1. We have discussed the matter but little. There are a few trustees who will have to transport or build new houses. Our trustees are in favor of that measure that will make our schools better. Will discuss that subject at our next meeting—May 1.
2. None.
3. Don't know.
4. They know nothing about it.
- 5 and 6. None.
7. No answer.

Porter County:

1. The sentiment is strong among trustees, but the people of the smaller districts object, and it is difficult to lead them to see the benefit.
2. In Union Township we are transporting one school, and with good effect, but we had much trouble to start them. Now they do not desire to go to the old school.
3. No disadvantage whatever. To say nothing of the \$240 saved, the advantage of having the children in larger classes and having access to a better library and school apparatus can not be estimated.
4. As I stated under No. 2, the parents fought the movement at first. They furnished all kinds of objections, but found by trial that their objections were not well founded.
5. Two miles.
6. We had a school of nine. The parents objected on the ground that if the school was closed they would never have a school again. They threatened to take it to the courts, but the school officials were willing to do so, and finally the parents submitted and are now well pleased.
7. I think as soon as we have the road problem settled we can save much money by having all our smaller schools transported.

Posey County:

1. Generally they are in favor of holding to the small schools. The idea is a new one, and the township trustees of this county are afraid that such consolidation would be condemned by the school patrons of their townships. The subject has been much discussed at the county teachers' associations and also at the farmers' institutes. The farmers of the county are of the opinion that the driver of an ambulance conveying children from one school district to another in the winter season would probably find a Posey County mud hole that would block the entire scheme.
2. None.
- 3, 4, 5, and 6. No answer.
7. It is my opinion that the idea is a good one; but with the consolidation of schools must also come improved and better country roads. I am also of the opinion that the saving in the salary of teachers, improvement of schoolhouses, together with the better culture that would be afforded by consolidation, would be in a great measure sufficient to improve the roads. I am heartily in favor of the scheme, but am of the opinion that it will be many summers and winters before it can be realized in this county.

Putnam County:

1. A few trustees think it would be best to abandon a few schools, but feel that until the sentiment of the patrons favors such a course no work in this line can be done. The patrons soon learn the law when they are requested to agree to have their school discontinued and refuse to do so. They have refused transportation when offered them. Nothing can be done here until the law bearing on the subject is changed.
2. Has been refused in Clinton, Russell, and Floyd.
- 3, 4, 5, 6, and 7. No answer.

Randolph County:

1. No effort has been made in the direction indicated, which would imply that they are unfavorable to the plans.
2. In no townships worthy of noting.
- 3, 4, 5, 6, and 7. No answer.

Ripley County:

1. They are not favorable to it. In two different townships one school has been abandoned on account of average attendance being very small—only about six for the term.
2. It has not been tried.
- 3, 4, 5, 6, and 7. No answer.

Rush County:

1. Favorable, but hesitating to breast the opinion of some people called the "public." A few can make a great noise.
2. Jackson Township tried this during the school year 1893-99.
 - (a) The roads were so bad in the locality in which it was tried that it was almost impossible for the driver to carry out his contract, so it was continued about two months.
 - (b) The children transported at public expense belonged exclusively to poor families, and a vigorous protest was made by heavier taxpayers.
3. (a) The pupils were always on time.
 - (b) The condition of the roads was a decided disadvantage.
 - (c) In this instance there was no saving of expense.
4. Those receiving the benefit were well pleased. The others were greatly opposed.
5. This experiment was made for 2½ miles. It was a little town—Henderson—which was conveyed to an adjoining district.
6. In Washington Township the pupils transport themselves. Some twenty years ago the trustee, W. S. Hall (he is the original promoter of concentration of schools in Indiana), rearranged the schoolhouses, making the number 5 instead of 8, and started a graded school. The township is 6 miles square, so that some pupils must drive 4 miles to reach the graded school. He was bitterly opposed by a majority of his people, but by his tireless energy and determination arranged the township so that money has been saved to the people, and they can maintain seven months of school with a low levy. The diagram at the close of this section will show the location of the schoolhouses. The truant officer has little to do in this township, as there is a splendid school sentiment. Some patrons are now sending their children past other schools to get them into the graded school of three rooms and two years of high school. All eighth-year pupils except two in the township have attended the graded school during the past year, thus relieving the county teacher of some work.
7. No answer.

Scott County:

1. The sentiment is strongly in favor of abandoning small schools and making the districts larger, but is not much in favor of the one schoolhouse idea.
2. Transportation has not been tried.
- 3, 4, 5, and 6. No answer.
7. I do not think the time has yet come in this county for the abandonment of district schools in general, and believe that any attempt at general consolidation will be viewed with suspicion by the people.

Shelby County:

1. I have brought the matter before my trustees several times, and they consider the matter very favorably.

In view of the new township law, however, they are very doubtful whether it can now be done very easily.
2. It has been tried in Hanover Township, Shelby County. It was very satisfactory to the patrons after it had been instituted, but it received their hearty disapproval at the time the trustee had the move under consideration.
3. By this system the pupils were enabled to secure the graded work; they were in classes that were larger, thus securing a better class enthusiasm; it brought the country pupils in close touch with the high-school pupils, creating in the country pupils a desire for high-school work.

I do not remember the exact saving, but the cost per pupil in the transferred school was decreased about one-half.
4. As I understand it, the patrons like the plan very much. The trustee of this township intended to consolidate all the schools of his township this year, but he had an advisory board not in sympathy with his plans; hence he let the matter drop.
5. In this case the pupils were transported about 4 miles, I think.
6. During the last school year William Patterson, trustee of Hanover Township, decided to transfer the school just north of Morristown to the town of Morristown. He secured a closed hack for the purpose, secured a hackman for the sum of \$1 per day, and gave the plan a trial. Mr. Patterson will be glad to correspond with anyone that has a move like this under consideration. As I have said, however, the arrangement was entirely satisfactory in every particular.
7. This plan demonstrates that there are a large number of schools being conducted at an expense out of all proportion to the cost of maintaining other schools that, from the large number accommodated, are far more successful schools; that it gives to the children of the remote districts an opportunity of attending the graded schools, thereby having an opportunity for more extended work than in the districts that work under more competent instructors. The plan recommends itself to every school man, but, I am sorry to say, it does not at first appeal to the mass of school patrons.

Spencer County:

1. There is a tendency here to abandon small schools. I think all the trustees would encourage consolidation enough to have all the buildings of at least two rooms.

2. The townships have not transported any.

3, 4, and 5. No answer.

6. At one place, Lake, some pupils go several miles, using their own means of transportation, and all interested parties see it is the best thing to do at present.

7. No answer.

St. Joseph County:

1. With regard to the report for transportation of children, will say that it has not been tried here enough to tell how it would work. One township is transporting some pupils to prevent transfers, and so far it works very well. The cost is a little less than to transfer, and it makes what was a small school large enough to make a good school. I think that more of this will be done each year, and some small schools may be closed by this means next year.

2, 3, 4, 5, 6, and 7. No answer.

Steuben County:

1. This has been done but little in our county. At present we have but two abandoned schools. The pupils belonging to these districts were accommodated without transportation. When the attendance is but four or five pupils the trustees generally abandon the school.

2. Transportation has been tried once in the county, in Jackson Township. Schoolhouse burned, and trustee transported pupils to his township graded high school. Attendance was fairly good, but not as good as in the home district.

3. In the one case the saving was about one-half. Do not know exact figures. The trustee did not have any extra expense except the transportation. He did not add to his teaching force in the high school.

4. The patrons who sent children accepted the situation, but preferred the school nearer home, so the trustee built new house.

5. About 4 miles was the farthest in the case mentioned. No transportation has been done for over a year.

6. I believe I have given enough data so that you may know the general nature of the experiment. I have given all I know.

7. No answer.

Sullivan County:

1. We are trying to disband the small schools where the pupils can be accommodated at some other place. In the last two years we have abandoned 2. I think we will abandon 2 more the coming year.

2. None.

3, 4, 5, and 6. No answer.

7. I have been trying especially to get country schools discontinued where the school is located near some town. Our roads are just beginning to get in shape to think about transportation of pupils. We have had no gravel roads until the last three years. We have more single schools than we need if we can once get them properly located.

Switzerland County:

1. All school officials of this county know that the plan would not only be universally unpopular, but also appreciate the fact that to consolidate the schools by township, with the view of transportation of pupils would not be practicable, but absolutely impossible, because of the rough and uneven surface of the country, the irregularly and imperfectly laid out system of roads, and in the winter time the absolutely impassable condition of the roads.

2, 3, 4, and 5. No answer.

6. The experiment has not been tried, but the experience of the superintendent in visiting schools this winter is conclusive evidence to his mind that the plan would be a complete failure.

Personally the county superintendent favors the plan in such counties where the roads and the other conditions would make the plan practicable, or even possible.

7. No answer.

Tippecanoe County:

1. The trustees in this county are agreed that something should be done, as indicated above, but I think it will be difficult to accomplish much this year, for political reasons. We have about 25 schools, the enrollment of which is less than 15.

2. It has not been tried in this county. I am trying to get this started in 4 townships for next year. It would be a mistake and defeat the project here if we were to try to make this general throughout the county. If we can start it in a few places and show that it can be accomplished and carried on successfully, then we can make it general. County especially well situated for consolidating schools. High schools in every township and good gravel roads.

3. No answer.

4. Has not been tried.

5 and 6. No answer.

7. If there were some law to warrant trustees to close schoolhouses, much could be done. But as long as trustee has to obtain consent of patrons he can not accomplish very much. A law to this effect would work well here: The county superintendent, the county truant officer, and

the trustee in his respective township to constitute a commission with power to close school-houses and school distance to be 4 miles when conveyance is provided.

Tipton County:

1. All the trustees are in favor of abandoning small schools and placing the children in the graded schools wherever it can be done.

2. In Jefferson Township this plan has been in operation for the past three years.

One school of about 10 pupils was abandoned; a hack used for transportation of pupils to the Kempton graded schools. In Wildcat Township no transportation has been done or schools abandoned by the trustee, but a great many eighth-year pupils in a radius of 4 to 5 miles have been driving in buggies in order to get the better advantages offered in the Windfall schools.

3. One of the greatest advantages in the cases above named is they receive superior instruction; another, they are given more attention. From a financial standpoint it is a great saving to the township. The year just closing Jefferson Township had 120 days of school.

Teacher's salary, at \$2 per day.....	\$240
Cost of fuel.....	22
Repairs, etc.....	10
Total.....	272
Cost of transportation.....	109
Saving in one year.....	172

4. Where it has been tried patrons are in favor of the plan.

5. Four miles one way.

6. Three years ago Mr. A. H. Hinkle, trustee of Jefferson Township, Tipton County, was confronted with the problem either to build a new school building or transport the pupils to the Kempton schools, a distance of 4 miles. He chose the latter plan, although meeting with some opposition from the patrons. The plan has been in operation for three years, and the patrons are now favorably impressed with it, having seen the better advantages their children are receiving in the graded schools, as well as the financial saving of about \$175 each year to the township.

7. Attempts will be made in other townships next year to consolidate some of the smaller schools, and unless we meet with too much opposition there will be 2 schools abandoned in Cicero Township, 2 in Jefferson, and 1 in Liberty.

Vanderburg County:

1. Generally speaking, our trustees believe in the abandonment of small schools.

2. Transportation has been tried in Knight Township, 2 colored schools having been consolidated, 1 school being abandoned. The conditions in this case were peculiarly favorable to the scheme, all the children living almost in one house, the distance of transportation being about 3 miles and the roads good. Naturally it has been a success.

3. There could be but one advantage in this case, and that a financial one. It saved Knight Township one teacher's salary minus cost of transportation.

Previous salary paid to teacher of abandoned school for month.....	\$40
Coal, brooms, etc., per month, probably.....	2
Total.....	42
Cost of transportation per month.....	15
Amount saved to township per month.....	27

4. Patrons approve the plan.

5. Transport pupils about 3 miles.

6. No answer.

7. Plan demands good roads and good vehicles; stoves needed for winter. Outside of inconveniences, such as getting children ready for school very early, bad roads, etc., the plan of course secures, as a result, all the advantages and disadvantages of the graded-school system and loses all the advantages and disadvantages of the district system.

Vermilion County:

1. One township trustee is trying to do this. All agree that it should be done.

2. One township, Helt, has offered this in one instance, but the patrons would not accept.

3, 4, 5, and 6. No answer.

7. The patrons of a small old school cling tenaciously to that school apparently for what it has been. They object to transportation for various reasons, such as "too cold," "too crowded," "danger of runaways," "too far," etc. Prejudice and selfishness would probably cover ground of objections.

Vigo County:

1. The trustees favor consolidation, but have been slow to act because the roads have been so poor that it has been thought to be impracticable at present. An extensive system of gravel roads is now in course of construction, which, when completed, will remove the difficulty of transportation.

2. In Otter Creek Township; failure.

3. No answer.

4. Patrons were opposed to the plan.

5. No answer.

6. The trustee of Otter Creek Township attempted to abandon a school whose enumeration was about 30. The patrons of the school employed attorneys to bring action against the trustee. Before the suit was filed the trustee reestablished the school.

7. No answer.

Wabash County:

The sentiment among trustees is a great deal stronger than it is among the patrons. I do not mean the making of just one school for the township, but the throwing together of two or three district schools.

2. We have not tried transportation except the transporting of a few pupils who happened to live more than 2 miles from any school.

3, 4, 5, and 6. No answer.

7. Personally I am very much in favor of throwing as many small schools into one as possible. We have fairly good pikes, and I am inclined to the belief that consolidation would be possible in parts of our county and better results could be had for the amount of money expended.

Warren County:

1. On account of bad roads the majority of the trustees and people do not favor the plan.

2. No answer.

3. We have not tried the system as yet.

4, 5, 6, and 7. No answer.

Warrick County:

1. Our trustees will not talk of such a thing, much less can I get them to try it. Our roads are 20 feet wide and 2 feet deep during most of the winter, and it is next to an impossible thing to get children to school a distance of 1 mile during a part of the year. It has not been tried in any of our townships, and from present outlook it will not be tried for a number of years, or until the law compels it. People are wanting schoolhouses on every 100 acres of land.

2, 3, 4, 5, 6, and 7. No answer.

Wayne County:

1. Abandon whenever possible and consolidate. In the past ten years we have abandoned 27 schools. We expect to abandon 3 more this year.

2. Boston, Clay, Franklin, Green, Jefferson, New Garden, Perry, and Webster. Very satisfactory results.

3. Advantages: Either graded work or longer school. We have 1 school abandoned—the pupils were divided—a part of whom were within 2 miles of another school; the remainder we haul to another school at a total cost of \$20—saving \$330. Our hacks cost from \$85 to \$120 in the other cases. Counting advantages of graded school work we save at least \$3,000 a year.

4. At least 95 per cent of patrons would not go back to the old plan.

5. From 2 to 4 miles.

6. When the Ballenger school, Green Township, was abandoned, the patrons protested in strongest terms, threatened litigation, etc. The year following one among the first questions asked the trustee when taking the enumeration, "What are you going to do with our children this year?" The trustee wisely asked: "What is your wish?" The answer: "Give us the hack and graded work; we were mistaken last year."

7. "Consolidation" is the only solution of strengthening our schools and reducing the cost, at the same time furnishing better teachers at better salary. (See plan of Webster Township, p. 233.)

Wells County:

1. The trustees of Wells County are conservative on this question. There has been but 1 school abandoned and those pupils are hauled to a township graded school. The principal of that school joins me in making this report.

2. Chester has abandoned 1 school and pupils are transported to graded school. Other districts desire transportation to this school.

3. This is the third consecutive year pupils have been transported from District No. 8, Chester Township, to the Keystone Township graded school. The advantages are more numerous than the disadvantages.

Advantages: (1) Pupils are never tardy. (2) Attendance is better. (3) Pupils reach school building with dry clothes and are not tired. (4) Better teachers. (5) More time for recitation. (6) More pupils in class, hence better discussions in recitation. (7) The expense is cut down at least one-third. (8) Better discipline.

Disadvantages: (1) Pupils living near their proper district are compelled to prepare for school earlier. (The advantages are so great we seem inclined to omit any disadvantages.) (2) Bad roads.

4. The patrons are highly pleased with the plan as long as the driver of the transportation

wagon is qualified and good order is kept along the road. The pupils should be held responsible for their conduct by the principal of school. The patrons will be satisfied as long as transportation is conducted properly, just as they would be satisfied with the proper teacher at their home district. Patrons are not satisfied with a disorderly school; neither are they satisfied with an unsystematic carryall system.

5. In district No. 8. Chester Township, we make a trip of 8 miles morning and evening, or 16 miles per day. It takes about one hour and fifteen minutes to make the trip.

6. September 19, 1898, district No. 8, Chester Township, Wells County, Ind., was transported for the first time to Keystone Township graded school. At first it was a novelty to pupils, patrons, and school officers. The children were not orderly, probably due to lack of government in their former district school. The order gradually grew better, but the climax was not reached until two pupils were punished by principal of school for misconduct. Since that time everything moves off nicely and pupils do not care to return to the district school.

7. No answer.

White County:

1. First class.
2. Jackson, Liberty, Union, and Big Creek.

The "transportation" of Jackson Township was fairly satisfactory to all—will try it again this year on additional schools. One school in Liberty Township has been transported four consecutive years and will be continued. Union Township transported 1 school last year and will transport 3 this year. Big Creek, good.

3. (a) Better classification, more time for recitation, breaks up feuds, and physically better for pupils; also better teacher.

The only disadvantages are: Residence far apart and muddy roads on the prairie. The savings per school are: Jackson, \$150; Liberty, \$180; Union, \$165; Big Creek, \$220.

4. At first they object, but one year will win over four-fifths of them. Our first effort in Jackson Township met with stout resistance, but last year the objectors asked to have the school transported the next year.

5. Varying from 3 to 5 miles.

6. Our first effort was made in Liberty Township, 1896-97. The house in District No. 7 was unfit for use; the trustee had no funds to rebuild that fall, and the only way out was to take the pupils to a two-room school in Buffalo. When the trustee took the enumeration in 1897 the patrons insisted on being transported again the next year, and the next, etc. In my opinion, there will never be another school taught at No. 7.

7. In addition to the townships mentioned in No. 2 (each of which will transport from 1 to 3 new schools next year), Prairie Township will transport 4 schools to Brookston next year; Princeton Township, 2 to Wolcott, and I think others will join the procession later in the year.

Centralization by means of transportation gives the country folk an equal chance and advantages with the towns, and costs less in taxes. The system deserves to be worked hard and live always.

Common wagons and open carriages should not be used to transport pupils. Children have fallen out of these open rigs and received severe injuries.

The common "fair-ground hack" is more convenient, bars accidents, and protects the pupils from sun and storms.

Whitley County:

1. The sentiment of abandoning small schools, especially where they are located less than 2 miles apart, prevails.
2. In Union and Etna townships the results are satisfactory. School work is more interesting.
3. Advantages: A larger school with its consequent inspiration to both teacher and pupils. It is economical. Last year teacher in one school that is now abandoned received:

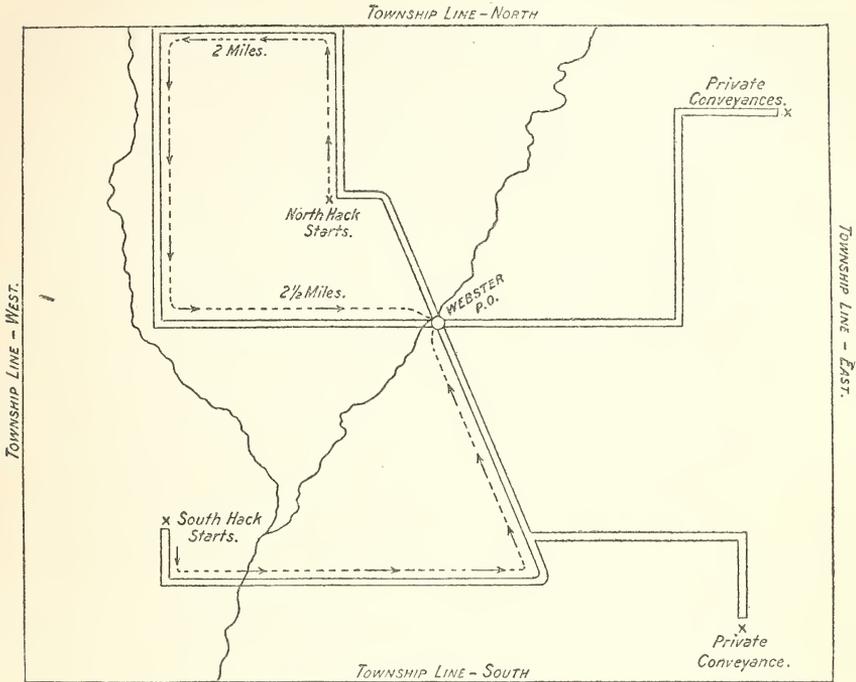

\$36 per month for 7 months.....	\$252
Additional expenses—wood, supplies, etc.....	40
Total.....	292
Cost of transportation, 140 days.....	140
Financial saving.....	152

This is a fair example in Whitley County. The saving in finance is usually added to the salary of the other teachers, giving the trustee an advantage in securing good service.

4. Patrons at first are not enthusiastic. It is not a popular move to take the schoolhouse out of a man's dooryard. However, whenever it has been judiciously tried it has proven satisfactory. In one school the trustee provided transportation the first year; the second year people were so well pleased that they furnished their own transportation. We are particularly careful to secure a good teacher in the school to which transportation is made.

5. From 2 to 3½ miles.
6. See No. 4.

7. We have abandoned 3 schools in Whitley County, and expect to abandon 4 more next fall. No attempt is made to consolidate all the schools of a township at the center.

Plan of Webster Township, Wayne County, Ind. Complete Consolidation of Schools.

CONSOLIDATION IN WEBSTER TOWNSHIP, WAYNE COUNTY.

The accompanying figure gives the township plan of transportation of Webster Township, Wayne, County, Ind. In this township there has been complete consolidation of schools for several years. I made a personal visit to the township and found the citizens, pupils, and teachers pleased with the plan. They have a well graded school, good teachers, three years of high school work, and good society. Compared with the old order, there is a financial saving, though a longer school term and high-school advantages are secured by consolidation of the schools.

CONSOLIDATION IN WASHINGTON TOWNSHIP, RUSH COUNTY.

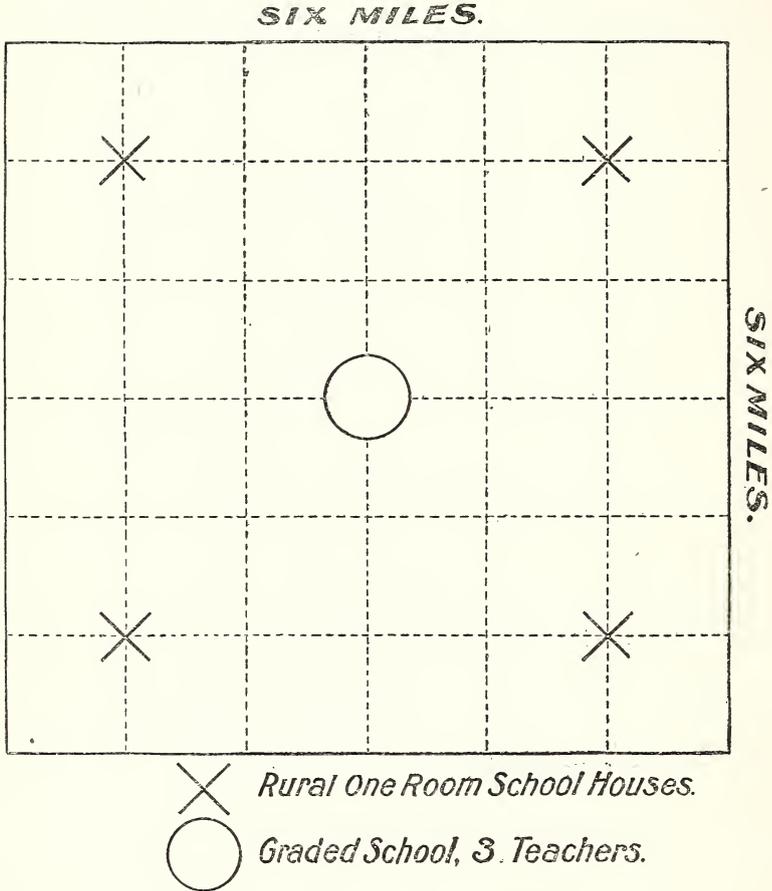

Washington Township, Rush County, Ind., is 6 miles square. The ordinary arrangement of rural schoolhouses in a township of this size would require 9 schoolhouses. Mr. William S. Hall, the original promoter of consolidation in Indiana, made a rearrangement of the township plan during his trusteeship so that only 5 buildings are required—one in each corner of the township, 1 mile from the township lines, and a graded school building in the center (see plan on following page).

The central school has 4 teachers, three years of high school work, and 111 pupils, distributed as follows:

Grades 1 and 2	28 pupils.
Grades 3, 4, and 5	30 pupils.
Grades 6 and 7	25 pupils.
Grades 8, 9, and 10	28 pupils.

Sixty-eight pupils transport themselves without expense to the county. A barn was built on the school grounds, and pupils who drive, stall and feed their horses without expense.

The 4 country schools of the township have an enrollment of 103 pupils. The truancy officer has made only one visit to the township during the three years of the operation of the law.

Plan of consolidation in Washington Township, Rush County, Ind.

The system adopted in the township is a good one. It is economical; it makes possible better supervision; it provides a high school, and organizes the educational forces.

AN INQUIRY REGARDING CONVEYANCE OF SCHOLARS IN NEW HAMPSHIRE,¹

[By State Superintendent Channing Folsom.]

* * * The school board is a court of last resort in deciding what schoolhouses shall be used for school purposes. If this power is used arbitrarily it may do more injury than the best schools can counteract; if used tactfully, if pains be taken

¹ From the Fifty first N. H. School Report (1899-1900), pp. 271-292.

before discontinuing the use of a schoolhouse to show the parents that the children will be benefited by the proposed course, the prompt closing of a large number of schoolhouses and the conveyance of the children to other buildings would undoubtedly result to the educational advantage of the State.

It is unquestionably true that children can be better taught in schools of medium size than in extremely small ones. It is poor economy, both educationally and financially, to conduct a school of four or five pupils, when another school exists within 2 or 3 miles to which the children may be conveyed. The only exception to be admitted in applying this principle should be caused by the inconvenience of sending very young children of different families away for the entire day, when there are no older members of their respective families to care for them during the noon intermission.

The law requires that children of all parts of the district shall be furnished with "equal school privileges, as far as practicable." It is manifestly impossible under any system that all should live at equal distance from a schoolhouse. The framers and enactors of the law provided against a too long walk for children by allowing the school board to expend 25 per cent out of the appropriation for schools in transportation. The district has no right to vote that no money shall be expended for this purpose, and such a vote in the district meeting has absolutely no binding force upon the school board. The law commits the matter entirely to its discretion, and the district may not give instructions.

The objections usually urged by the residents of rural sections against public conveyance in lieu of a local school are:

1. That the closing of the local school tends to the depreciation of farm property.

The public school was not established, nor is it demanded by our State laws, for the purpose of enhancing the value of property in the vicinity of the schoolhouse.

As evidence of this alleged fact, the objectors point to the abandoned farms and cite the small number of children in many towns where the system of conveyance prevails. Such people are disingenuous or ignorant. A study of conditions for the last fifty years would show the confusion of cause and effect. A schoolhouse on every farm would not repopulate the rural sections of our State. If this repopulation ever comes, it will be due to different influences than those of the small rural school.

Much of the opposition based upon this objection is probably really due to the conservatism of our rural population manifesting itself in opposing the full fruition of the town system.

When it is shown, however, that transportation has in many sections tended to build up the rural sections of the town; that under this plan the number of families sending children to school and the number of children attending school have steadily increased since transportation has been substituted for the local school, this objection loses what little weight it ever had as an argument.

2. It is said that a ride of several miles every day to and from school is too hard for children.

In reply to this it may be said that it is easier for child or adult to ride 3 miles than to walk 1, and that in stormy or cold weather the ride entails less discomfort and subjects the rider to less exposure than falls to the lot of the pedestrian.

Records show that punctuality and regularity of attendance have been materially increased by a well-appointed system of transportation. An actual comparison of school registers proves that some children have attended school twice as much during a school year when carried in a comfortable conveyance to a distant school as the same children did when attending their local school.

If a contract for conveyance is made by the school board with some person other than the parent of the children, the responsibility rests with the board to see to the proper character of the driver, the team, and the vehicle.

3. It is objected, generally by people living in close proximity to the local school-house, that children, particularly very young ones, should not be sent away from parental care for the entire day.

This is the objection of the most weight among those usually urged against conveyance. Care should be taken by school boards to guard against evils that may arise under this head. When children of the rural sections are gathered in the village schools, a matron should be employed by the board to take charge during the teacher's absence at the noon intermission. This is demanded by the welfare of the school and protection of school property, as well as for the care of the children. Pupils remaining at noon should be as absolutely in charge of the matron during the intermission as they are in charge of the teacher during the school. Their moral and physical well-being demand this. They should not be allowed to roam about the streets at will, but should be required to remain upon the school premises unless a written request is received from their parents for different treatment.

When this course is not practicable, teachers must be impressed with their responsibility for a proper control during the noon hour.

The advantages to be obtained from discontinuing small schools and conveying children at the expense of the district are:

1. Economy.

Transportation can be performed usually at less expense than a good teacher can be employed, and the money thus saved may be applied to making the enlarged school better in furnishings, in equipment, in teaching.

2. Better teachers and equipment.

The best teachers can not be induced to accept positions in the three-scholar or the five-scholar schools, even when public sentiment allows the school board to seek for them with the offer of sufficient salary. The doctrine prevails that "anybody can teach" the small school. This theory places the small rural school in charge of untrained, inexperienced teachers, many of them of small scholastic acquirement and no professional ambition, who "keep school" until it is "the turn" of some other local favorite of the same kind. Consolidation enables the board to pay better wages, and hence to employ better teachers.

3. Better supervision.

Consolidation, by lessening the number of schools to be visited, enables the supervisor, school board, or superintendent to make more frequent visits and to get into closer touch with pupil and teacher.

4. Regularity of pupils' attendance.

With a comfortable and regular conveyance the weather, temperature, and bad roads cease to be important factors in causing absenteeism.

5. Better educational spirit.

The pupil of the small school lacks that emulation and competition so essentially necessary to progress which will be afforded by contact with a larger number of children. This is true even when the teachers are equally competent. It has double weight when we consider that the better teachers are almost uniformly in charge of the larger schools.

In March, 1900, a letter of inquiry containing the following questions was sent to every school board in the State:

1. What per cent of money appropriated for schools is used for conveying scholars to and from schools, under authority granted by chapter 92, section 1, of the public statutes?

2. What is the least distance that any scholar is conveyed at public expense in your town?

3. The greatest distance?

4. Have you any rule or regulation governing amount to be paid or distance of

conveyance; or do you deal with individual cases according to circumstances? State your regulation, if any.

5. How does the cost, to the district, of conveyance compare with that of maintaining local schools?

6. What are the advantages of conveyance?

7. Advantages of the local schools?

8. In your opinion, would a more general adoption of public conveyance result to the educational advantage of the State?

9. How do the people of your town generally view the matter?

The answers to questions 1, 2, 3, 4, 5, 8, and 9 are here tabulated:¹

Question 1. Per cent of school money used for conveyance.

There are 56 towns that use less than 5 per cent; 53 towns from 5 to 10 per cent; 14 towns from 10 to 15 per cent; 5 towns from 15 to 20 per cent; 4 towns from 20 to 25 per cent; and 1 town the full legal limit of 25 per cent.

Questions 2 and 3. The least and the greatest distance that any scholar is conveyed.

Distance in miles.	Number of towns.		Distance in miles.	Number of towns.	
	Least.	Greatest.		Least.	Greatest.
$\frac{1}{4}$	2	-----	$2\frac{1}{2}$	8	17
$\frac{1}{2}$	2	1	$2\frac{3}{4}$	-----	1
1	16	6	3	6	37
$1\frac{1}{4}$	2	2	$3\frac{1}{4}$	-----	2
$1\frac{1}{2}$	42	9	$3\frac{1}{2}$	1	11
$1\frac{3}{4}$	1	-----	4	-----	10
$1\frac{3}{8}$	4	-----	$4\frac{1}{4}$	-----	1
2	44	29	5	-----	3
$2\frac{1}{4}$	-----	1	$5\frac{1}{2}$	-----	1
$2\frac{1}{2}$	3	10	6	-----	1
$2\frac{3}{4}$	-----	1			

Question 4. General rule or regulation, or dealing with individual cases.

In 133 towns individual cases are dealt with; 10 have a rule, and 1 both.

Question 5. Cost of conveyance compared with that of maintaining local schools.

In 118 towns the cost is reported less; in 5, the same, and in 1, greater; of the towns that report the cost less, 26 give it as $\frac{1}{2}$ that of maintaining local schools; 8 give $\frac{2}{3}$; 7 give $\frac{1}{4}$; 3 give $\frac{1}{5}$, and 1 each give $\frac{1}{6}$, $\frac{2}{5}$, $\frac{2}{3}$, and $\frac{3}{4}$.

Question 8. In your opinion, would a more general adoption of public conveyance result to the educational advantage of the State?

One hundred and twenty-four school boards answer "yes;" 50 answer "no."

Question 9. How do the people of your town generally view the matter?

In 49 towns, favorably; in 83, they are opposed; in 8, divided; in 2, indifferent.

The following verbatim extracts from answers to questions 4, 5, 6, 7, 8, and 9 are made to show the trend of opinion among members of school boards and communities:

Question 4. Have you any rule or regulation governing amount to be paid or distance of conveyance; or do you deal with individual cases according to circumstances?

We pay 5 cents a mile each way for distance over $1\frac{1}{2}$ miles.

Six cents per mile for all distances over $1\frac{1}{2}$ miles and less than 2 miles; 8 cents per mile for 2 miles and less than $2\frac{1}{2}$ miles; 10 cents per mile for $2\frac{1}{2}$ and less than 3 miles; $12\frac{1}{2}$ cents per mile for 3 miles and over, for each scholar conveyed to and

¹ Summaries are here given of the detailed tables which appear in the report from which this inquiry is taken.—ED.

from school, the attendance to be shown and settlement made by the school register at close of term.

We recognize no demand for carriage if distance is less than 2 miles, but the rule is not arbitrary.

The Cheshire County convention of school boards thought 5 cents per mile in excess of 2 miles was fair pay, and we shall probably pay at that rate if we are called upon for payment, but we have no scholars to convey now unless we can consolidate the schools, which ought to be done.

Two and one-half cents per mile each way, based upon actual attendance, and in some cases special arrangement. No ironclad rule.

We pay 10 cents a mile.

Do not usually pay for transporting under 2 miles. A few special cases.

Our custom for the last few years has been to pay 5 cents per mile each way for each scholar living at any distance over $1\frac{1}{2}$ miles from the school, and they furnish their own conveyance. In some cases it is advisable to pay a little more than named.

Usually about 25 cents per day has been allowed to the parents for conveyance.

The scholars are carried by the lowest bidder.

The town decided the rate of mileage, which is 4 cents, going and coming to school; so the scholar that lives 3 miles from school is paid 6 cents in coming and 6 cents on returning, making 12 cents per day.

Have heretofore paid 50 cents per scholar per week. The town voted at the last annual meeting to pay 4 cents a mile for distance over $1\frac{1}{2}$ miles, distance reckoned both ways.

We tried a mileage system, allowing 3 cents per mile each way for distance traveled beyond $1\frac{1}{2}$ miles, but found we could not follow it in all cases, so we follow it in part, and for the rest we make the best trade for conveyance we can, according to circumstances.

Question 5. How does the cost, to the district, of conveyance compare with that of maintaining local schools?

It costs about $33\frac{1}{2}$ per cent of the expense of maintaining those schools which are discontinued on account of such conveyance.

There are several old school districts in this town where there are only 2 or 3 scholars in each. We find it much cheaper to carry those scholars to the adjoining school.

It costs about \$170 a year to maintain a school in the outside districts. We have conveyed from 3 to 5 scholars at an expense of \$69 for the year.

As far as we have gone, the cost of conveyance has not been more than one-third that of maintaining a school.

It costs about one-half as much to convey.

Much less, being about one-half.

Conveyance in nearly all cases costs less than half the expense of maintaining schools.

It costs not quite one-half as much to convey the scholars as it would to maintain a school.

From one-third to one-fourth the cost of a school.

Should say as a rule it would be less than one-half. Some years ago we consolidated two schools for a term, carrying the scholars of one school at an expense of about 40 per cent of cost of running a school.

Question 6. What are the advantages of conveyance?

Pupils in small ungraded schools are placed in competition with pupils in graded classes of from 30 to 45 pupils, thus stimulating them to greater effort.

Economy in expenditure, more interesting schools, enlarging and extending the general knowledge of the child by association with more children, from whom they learn as readily as from their elders.

Better schools, better teachers, greater inspiration for the scholars.

The scholars get benefits of graded schools.

Better interest, improved methods and facilities, more experienced and better teaching force.

Less cost, better interest on the part of the pupils than in very small schools, more money to lengthen schools.

It assembles more scholars together, thus causing more competition in scholarship; costs less when there are but few scholars; can give them better instructors; more weeks of schooling generally.

In our case, better school privileges; in general, one school of 25 scholars is better than 3 of 8, or 2 of 12.

It gives more weeks of schooling. Two of our schools are quite small, there being only 1 pupil in many of the classes. We think they do not have the ambition to try to advance as they do in larger schools.

Many of our schools, if we did not close them, would have only 1 or 2 scholars, consequently conveyance saves money and gives us more weeks of school.

Better teachers, more interesting schools, less money expended for wood and repairs on schoolhouse.

Larger schools and more interest.

More interest in larger classes in the combined schools. Scholars benefited by contact with larger number of their fellows.

Have larger and better graded schools and a higher grade of teachers better paid. A school of 6 pupils and a \$5 teacher is no school.

Better schools, better teachers, more interest taken by the pupils.

It gives us thirty weeks of school each year, for the past four years, against nineteen when they were not conveyed, and better instruction in the school to which they are sent.

We have some local schools with only 2, 3, or 5 scholars in them. The advantage is in making larger schools and more interest with better teachers, consequently a better education.

The child has more incentive to work in larger schools, takes less fuel, saves janitors' fees, provides a small salary to some needy farmer for carrying, and the child will attend more regularly.

Scholars can have better advantages for acquiring an education in schools that are graded than they can in the ungraded district school.

We get better attendance.

Putting the scholar who has been alone in his classes in with a class rouses his ambition, awakens his interest, and is a stimulus in many ways.

It gives the scholar better advantages than to have so many small schools.

Less expense; better schools for those conveyed. Combining schools aids in grading schools. Longer school year for all pupils. Better school supervision.

Better schools and better teachers.

Graded schools; better teachers; better appliances.

Question 7. Advantages of the local schools?

None, where transportation is feasible.

Better average attendance.

Scholars are nearer home. Parents claim they "Do not have to dress them so well." Local school holds up price of real estate.

Community pride. Don't want to see the schools going away from them.

Easier for small children.

We avoid criticism and friction.

The teacher can give each pupil more time.

The children are not so much exposed in all kinds of weather, and unless we build new schoolhouses are better accommodated.

No advantages. These schools are so small that experienced teachers will not engage them.

Convenience for people in the vicinity.

None, as compared with the larger schools.

Only to gratify those who want schools near home.

More convenient and satisfactory to parents, and generally greater improvement by scholars.

The school work is more personal.

Pupils live nearer local schools, and parents usually have more oversight of children.

None that I know of.

None in particular.

None except to very small children.

Better instruction and more regular attendance.

Short terms and few pupils. Some schools as small as 2 or 3 scholars, and not much interest taken.

Better in winter months.

When the scholars are very young and small, it is better for them to be nearer home and not have to ride a long distance in cold and stormy weather.

Local schools satisfy the people, build up local pride in their schools, help to build up personal responsibility, thus making strong, needed citizens.

There are none, unless the cost of conveyance amounts to much more than the cost of maintaining a school, and not then if the number of pupils is less than 10.

I see none.

Only to satisfy prejudices of parents.

There seem to be none.

Don't learn so much mischief.

I think the local school system for the country towns is all right. What we need is more money.

When there are a number of small scholars and the distance is great, possibly it might be advantageous to run local schools.

Keeps peace between the parents and the school board.

I do not know of any.

Little advantage, owing to small number of pupils; small classes; difficult to arouse enthusiasm or interest.

More individual attention from teacher; interest that always centers in a local institution.

The child can do many little things to help the parents and learn habits of usefulness that will be of great value to it in life; the teacher can direct the individuality of the child more. There are many things of more importance to a child than mere book learning; there is too much time between the teacher and the parents, too little time to work, when the child is carried to school, to form habits of industry.

The teacher has more time to give the scholars in small schools. The residents think that to close a school in a given district results in a depreciation of real estate.

Question 8. In your opinion, would a more general adoption of public conveyance result to the educational advantage of the State?

Possibly, as it would bring on a better system of grading in country schools.

I think it would. Advanced scholars should be conveyed to a central high school in every town.

Yes; it would give scholars now attending small district schools better opportunities for acquiring an education.

Be of very great advantage. This town ought to support only 4 schools instead of 8.

Yes. Generally a school with less than 10 pupils is necessarily less interesting than one that is larger.

In our town I would like to see all the 7 schools united in 2 schools, and think the advantages would be much better.

Yes; our schools would be from two to three weeks longer if the scholars were conveyed where they ought to be, with the same money.

Yes; most decidedly, from the very fact that our ungraded schools can not keep pace with our graded schools.

I am most decidedly of the opinion that it would be.

I am in favor of having the scholars come to the center of the town and have a graded school with only 2 teachers. There are only about 75 or 80 scholars in town of school age.

Question 9. How do the people of your town generally view the matter?

Favorably. This is being tried in our own town this term for the first time and seems to be the only thing to be done, and the prospect is that the results will justify the course we have taken.

Some families object to conveyance, while others appreciate it as an advantage to the children. Others say it lessens the value of real estate to have the local schools closed. Opinion is divided, but it seems to grow in favor of transportation. In the case tried, and the one to be tried, the parents are well pleased.

They had rather have a school with three pupils in the woods somewhere and hire a teacher for them than to pay \$1 a week to have them carried to a large school.

A good many would like pay for carrying scholars to and from school. The school board have to put up a big fight with some of the parents.

There is a divided opinion. Some are very anxious to have scholars conveyed to another school and others oppose it.

The people who reside in divisions where small schools are maintained are very much opposed to closing such schools and object to having small children carried a distance from home. At the present time we have four schools in town which, in my opinion, should be closed. We can not afford good teachers for these schools. The people generally have several times expressed themselves on this matter in favor of the school board doing as they deemed best for these schools. The school

board have not closed these schools because the people would not like it, and they would gain ill will, etc.

Every scholar in town should have the advantage of our town graded schools.

About one-third of the town want one graded school. The rest wish to maintain good local schools.

Those living near the large schools have no sympathy whatever with those living farther away.

The townspeople think that every child old enough to become a scholar should be sent to school. If the parents can not convey them, or the distance is too great for them to travel, they should be carried at public expense.

The people generally do not like the idea of conveying children out of the home districts.

Only as they can see pecuniary gain to themselves.

We think the method of conveyance should be systematized, and a regular mileage paid to all scholars (not tardy) according to distance traveled per term, and made uniform throughout the State.

They are very rebellious. But by perseverance we have converted some. They are willing to admit, after a fair trial, that their children improve rapidly. In all instances we convey our scholars to the village schools.

They do not favor the idea. To express it as one of the parents did to me when I was trying to unite two schools of five or six scholars each: "If you convey the scholars, you will have to take the parents with them."

A good many think the children might walk, the same as *they* used to do.

I think the general view is for larger schools and better teachers.

The more intelligent people of the town believe that something should be done in this matter.

We think there are more in favor of conveyance than otherwise.

The majority believe in general adoption of public conveyance.

The districts that have been willing to adopt it see the advantage, I think; other parts, where it ought be adopted, object. I think the people generally favor it.

We think there is quite a difference of opinion. However, we think a large majority favor conveying scholars in preference to maintaining local schools where there are but a small number of scholars.

Believe in having schoolhouses within lawful distance, and in furnishing funds to support them.

The people in the back districts stick for their schools. Remove the schools from these districts and property decreases in value. For instance, if a man is buying a home he won't pay nearly as much for one with school miles away, if he buys it at all. It would be better for the towns and better for the State to build up the rural districts than to break them down.

Their opinion or view is generally based on what they regard as their individual interest, local pride, and a desire to preserve the old landmarks.

They are not in favor of having their children carted for miles and being exposed to the weather.

Divided, but the feeling is growing for establishing a graded school. We live in hopes of better days.

I think our people are generally opposed to the matter, because we have not given it a fair trial. We shall reduce our schools by one this year to try it.

I think they are in favor of having schools united and conveying scholars.

They want the scholars conveyed.

Most of them approve of our course in conveying children.

The better element favors transportation, but a few families are found in nearly all divisions that are so intensely jealous of and spiteful toward the village that any attempt to consolidate is productive of a great deal of friction.

Village people and those not interested in education vote and talk against paying fair prices for conveyance.

We get rid of conveying pupils in various ways. We shut up schoolhouses and have small schools in private houses. We have hired mothers to teach their children at home, and sent children to near schools in another town. We believe that in every instance of this kind we have done the best thing for the children, and we have saved the town many dollars.

It does meet with favor.

Not very favorably at first, but after a while thought better of it.

The parents in outlying districts generally favor transporting. Others do not seem to care.

It seems to be the general opinion that fewer and better schools would be for the interest of the towns and the pupils.

Not favorably. If our parents could see the advantage of uniting some of our schools it would be the best plan we could adopt.

Getting fairly contented with the children being carried, especially along the line of the electric road, where children are picked up at the door and left within an eighth of a mile of the schoolhouse. Of course there are some who object strongly to carrying the children.

In different ways, as is the case in all country towns, but the majority of thinking people would come to favor the consolidation of the schools.

Majority in favor of conveyance.

Most of them heartily sympathize with it. A few cases are obstinately offended, but only a very few. We closed up three schools and ought to close two more.

They are conservative. But I have been doing personal work with the people of one of my small districts, and nearly all have of their own accord sent their children to the graded schools some 2 miles away, so it is only a question of a short time when we shall have no pupils left going to the district school. I advocate transportation in my annual report.

Public opinion has changed very much in the last few years in regard to the matter in this town. The people are more willing to let their children come to the village to school than formerly.

They insist on having a school in every district, and will not put the schools together until the State legislates on the subject.

Many with disfavor. As many prefer to do just as they did forty years ago.

If an annual appropriation from the State could be had, I think our people would be well pleased with one school at the center of the town, with three grades, three teachers, and convey all children there.

Probably the majority of the people in the rural districts would be opposed to the system of conveyance, but there is a considerable number in its favor, and that number is increasing.

With a death grip on their pockets and a jealous eye on any one supposed to have a little advantage in distance or other privileges. We ought to have two graded schools in town and bring all pupils to them.

They are in favor of having schools in every schoolhouse in town. Only in individual cases, where they are getting good prices for conveying, are they pleased. This business of conveying scholars is more trying to the disposition of the people than all other things.

On the part of most where they have had the local school they are opposed to closing it, fearing it will lessen the value of property, and because of the small children. Where the transporting has become a regular thing, and comfortable and safe transport, the objection grows less.

TRANSPORTATION OF PUPILS IN NEBRASKA AND INSTRUCTION IN NEIGHBORING DISTRICT.¹

[By State Supt. William R. Jackson.]

In order to ascertain what is being done with reference to this matter, the following letter of inquiry was sent to the county superintendents of those counties in which the law is applied:

STATE OF NEBRASKA,
DEPARTMENT OF PUBLIC INSTRUCTION,
Lincoln, November 27, 1900.

DEAR SUPERINTENDENT: From your annual report I learn that last year ——— districts took advantage of section ———, Subdivision V, of the school laws of 1899. I shall be pleased to have you inform me without delay concerning the following points:

1. The number of pupils transported under section 4b.
2. The cost of such transportation.
3. The number of pupils attending school under section 4c.
4. The number of months attended.
5. The total cost of such attendance.
6. Do you consider the law beneficial?
7. What are the obstacles in the way of a more general observance of the law?
8. Remarks.

The importance of the subject calls for all the information we can gather, and I shall appreciate your careful consideration of the above.

Very respectfully,

W. R. JACKSON,
Superintendent Public Instruction.

Twenty-one counties contain schools in which one or both features of the law have been tried. Four furnished transportation only, 4 transportation and instruction, and 13 furnished instruction alone.

Replies from part of the 21 superintendents show that 57 pupils were transported under the provisions of section 4b, at a cost of \$560. One hundred and fifty-eight pupils attended school in adjoining districts, under the provisions of section 4c, for an average of seven months, at a total cost of \$1,471.40. Those making the report are unanimous in the opinion that the law is beneficial. Following are some of the replies to the seventh question:

Not fully understood by people.

Local prejudice; ignorance of the true working of the law; object to sending small children in care of driver.

Most of our school districts are large, so that distance to school would be too great for further consolidation.

Generally the board wishes to furnish employment to some relative.

Law not explicit enough.

To induce the school boards to properly make and sign the contract. So much easier to neglect.

The law has not generally been understood.

None; but too great distance.

Difficulty of transporting very small children in bad weather. Desire of some people to be exclusive.

Under "Remarks" are found the following statements:

The law is a great blessing to our people, and 14 out of 36 pupils were transported by their parents free so as to get to a better and larger school.

I think the law will be very popular in this thinly populated county.

It has provided school for children in districts which could not maintain school otherwise, on account of the small number of pupils, or because of great indebtedness of the district, thus enabling the district to conduct a school and at the same time reduce indebtedness.

Mrs. Stelle Smith, county superintendent of Hitchcock County, says:

It furnishes larger associations and better instruction for the pupils. Financially, is more economical. The objections I have met are in regard to transportation; some argue that it would be too expensive and impracticable in the thinly settled districts; but I find that as the people get a better understanding of the law they are favorable toward it.

Supt. W. H. Rhodes, of Thayer County, offers the following:

The children in district No. 96 received nine months instruction at a cost of but \$190. It would have cost \$270 for a teacher's wages alone if they had maintained their own school. Both schools were helped because of increased attendance, and consequent interest and emulation. District No. 96 has never built a schoolhouse. The concentration of school districts must come in the future, and it is now a question of molding sentiment in favor of the same, so that a law may be passed which will make it easier to concentrate. Under our present system (without township organization) no district wishes to yield right of way to others, which is necessary in order to put the combination into effect. The Kingsville plan is O. K., and works out very easily when one board has contract of a township.

The department has repeatedly urged superintendents and school officers to avail themselves of the provisions of this law, but the inclination to be independent in fact as well as in name no doubt is the strongest barrier to overcome. The difficulty in inaugurating any new system where prejudice and long-established usages prevail is met here as well as in other matters. We believe, however, that the plan is a good one, and shall continue to advocate it. In time the people who now hold so tenaciously to the little inadequate home school will find that they can be better served and at less expense by taking advantage of the provision for uniting with another district. This will lead ultimately to the consolidation of districts and the maintaining of a system of graded schools in rural districts.

CHAPTER IV.

AMERICAN INDUSTRIAL EDUCATION: WHAT SHALL IT BE?

[Preliminary report of a committee of the Society for the Promotion of Engineering Education, made at the New York meeting, held July 2-3, 1900.]

To the president and the members of the society.

GENTLEMEN. Your committee on industrial education was appointed to make a report upon the educational means and methods which they are prepared to recommend as best adapted to advance the general cause of industrial education in this country. By industrial education we here mean that education which specifically fits one for an industrial vocation or profession. This report has no reference to educational methods in general, nor to those special kinds of training leading toward the fine arts and to the learned professions, other than engineering. Our problem is: What, in addition to the work that is now done in our primary and secondary schools, is it wise for us to attempt to do in schools of various sorts for those young people who are looking for employment in our manufacturing industries, or in commercial houses, or with our great transportation companies, or in those new or more or less original adaptations of material means to social ends, which are the peculiar problems of the engineering profession?

If the American people can agree substantially on what ought to be done, they can doubtless find the ways and means for doing it. The object of this report is to bring the members of this society into substantial agreement as to what is best to do.

Your committee are of the opinion that heretofore we all have relied too much upon the common schools and upon native ability. We have also conceived the generic American boy or girl as conditioned in a single way, and then have provided educational means and methods to fit this particular condition. But the average or generic boy is no particular boy, and his average condition fits few particular cases. We forget that they are particular boys who are to be trained to do the business of the coming generation, and these particular boys are of all ages, conditions, tastes, and capabilities. Your committee are quite agreed that in America every boy should find his career entirely open at the top. Society here is not to be stratified horizontally, but rather vertically. Our educational ways and means, therefore, must be planned for the purpose of helping every boy or man to make the most of himself, and hence to return to society the most he is capable of. But educational benefits can not be conferred upon unwilling subjects, neither does the wish always bring the opportunity. Our industrial educational advantages and opportunities, therefore, should be both attractive and available to all classes and to all ages. Any person wishing to improve himself, and to make of himself a more useful citizen, should find an opportunity for gratifying this high ambition. There are now in this country only the beginnings of systematic educational opportunities for young people to learn the theory and practice of particular employments for which they are fitted by nature and in which they long to become engaged. We have an excellent system of public and endowed schools, in which are more or less well taught the elements of knowledge and in which a very considerable mental capacity is developed.

After leaving these schools our boys know something, so far as knowledge can be gained from books and oral instruction, but they can do little or nothing. This mental, abstract, and memoriter education needs to be supplemented by a manual, industrial, industrial art, commercial, or engineering education if the boy is to become a doer, or a director. He then not only knows something, but he can do something, and because he can do something he is worth something to society. However much a man knows, he is a drone in the hive if he can not do something for the common good. It must be understood we are not asking for utilitarian education in place of a mind-informing and mind-developing education, but to supplement such cultural education as the boy or girl has been able to obtain. Neither do we care to insist upon young people availing themselves of this utilitarian education. We are only concerned that it should be offered, and we have every reason to believe that it will be a long time before the facilities will outrun the pressing demand for any kind of education which will enable a man to rise, in honor and in usefulness, in his chosen calling. We are not concerned to find the pupils, we are only concerned to provide the schools.

We are now to try to agree upon the various and sundry classes of theoretical and practical schools which are needed in every populous center in this country in order to meet all the educational demands now existing, to say nothing of the great increase in such demands as soon as we begin to meet them. While your committee may not quite agree in regard to the relative importance of the several classes of schools hereinafter discussed, they are in substantial accord in affirming that all have their place in any thorough and general scheme of technical education for American youth. These classes of schools will now be described and discussed separately.

I. THE MANUAL-TRAINING SCHOOL.

There has probably never been a movement in American educational methods which has effected such great changes in so short a time as this manual-training school movement. Growing out of the Russian educational exhibit at Philadelphia in 1876, and out of regular class shop instruction at the Massachusetts Institute of Technology, and still earlier class instruction in shops at the University of Illinois, at the Stevens Institute of Technology, and in the Engineering School of Washington University, St. Louis, the movement was given its American name, form, and significance as a means of general secondary education in the establishment of the St. Louis Manual-Training School in 1880. To Dr. C. M. Woodward, a member of this committee, is due the credit of both the name and the school as we know it in this country.¹ He also was the chief, and at times it seemed almost its only, advocate and defender. He, more than any other, has fixed it in America as a part of the general secondary educational training of a large proportion of our boys who are not drawn especially toward the so-called classical courses of instruction.

These schools need not be here described in detail. Suffice it to say they are intended for boys from 14 to 18 years of age, and they offer three or four years' courses. The time is divided about equally between manual exercises, drawing, and laboratory work on the one hand and regular academic class-room work on the other. No pretense is made of fitting for particular employments, and in point of fact but a very small percentage of their graduates become and remain artisans. A very large proportion of them go into higher education, a majority of these very naturally taking the engineering courses.

¹ It hardly need be said that Dr. Woodward is not responsible for the insertion of the above claim in this report. One member of the committee, also, objects to the mention of any name in this connection. The precedents as to shop-work instruction as here stated are more extended than they were in the report as read at the New York meeting. Hence much of the discussion which followed on this point does not exactly fit the text as given above. * * * J. B. J.

The arguments in favor of these schools are, first, that they at present draw their students very largely from those who otherwise would leave school altogether at about the age of 14 or earlier; and second, that for a very large proportion of city boys this is at present the best kind of a school they can attend at this age, no matter what they expect to do subsequently. For boys who expect to follow any industrial or commercial vocation, and who have grown up with little manual culture, as is the case with most city boys, the manual-training school offers real and permanent advantages. Here the whole boy is sent to school and not merely his head, as Dr. Woodward has so tersely expressed it.

While these schools can not be called industrial, since they fit for nothing in particular, they belong to the industrial class, because the graduates from these schools are well fitted to go at once into any practical trade or business and learn it quickly and effectively. The boys from these schools are not too old or too lofty to enter the industries in the most humble positions; in this particular they have some advantages over the graduates from our high-grade engineering schools. While many of them may begin as artisans, they soon come to be foremen, draftsmen, salesmen, superintendents, and the like, so that a census taken at any time will show very few of them in the artisan class. This fact, which is greatly to the credit of such schools, is frequently cited by shallow critics in disparagement of them; on the other hand, it has also gained for them the logical support of the artisan class, who at first were inclined to oppose them. Your committee are in substantial accord, therefore, in their belief in and in their support of the manual-training schools as now organized and operated. They would like to see these multiply until every boy can have the opportunity of obtaining this kind of education free of charge. The work should be adapted to girls as well as to boys. Thus for girls, cooking, domestic economy, sewing, dressmaking, etc., are introduced to offset the shop work of the boys. Whenever manual training is made a fixed part of the public-school system, however, they most earnestly recommend to all public-school boards a further development of the system as described under the title of

II. MANUAL TRAINING AND ART EDUCATION AS A PART OF ALL PUBLIC-SCHOOL EDUCATION, FROM THE KINDERGARTEN THROUGH THE HIGH SCHOOL.

This we conceive to be the ideal method of introducing both manual and art training into the public schools. In two or three of the lower grades sloyd work and simple hand-tool work might be employed alike for both boys and girls. Free-hand drawing also should be taught alike to all, and this should develop into graduated exercises of simple art designing, modeling, carving, water-color painting, carpet, wall paper, and furniture patterns, etc. Elementary needlework, cooking, and the methods of good plain housekeeping can be taught successfully to girls of the seventh and eight grades. If suitable manual work be distributed over the entire public-school period, it would occupy but a very small part of the average daily programme, and all such work would come as a rest and a recreation from the intellectual tasks assigned, so that instead of being a hindrance it would in fact be a stimulus and a substantial help in the regular class work. The bringing of these exercises into the regular school course would serve also to hold vast numbers in the schools who now lose interest and drop out for all sorts of frivolous reasons, which may be summed up in the two words, "lost interest." Some of our public schools are already moving in this direction. Perhaps the school which has realized this idea as completely as any is the Central School at Menomonic, Wis. Here the management has had the wise counsel and the financial aid of a generous citizen, the Hon. J. H. Stout. He erected and equipped most liberally the necessary buildings, and has continued to pay the annual deficits in the expense accounts, but the city will doubtless soon be able to bear the entire expense, as the school has the loyal and enthusiastic support of the entire popula-

tion. Both the appliances and the instruction in this school are of the highest order, and the results are well calculated to astonish anyone who has never seen this system of public instruction in successful operation from the kindergarten through the high school.

This we conceive to be the ideal public school for America. It is expensive, for three reasons: The buildings and equipments cost large sums; the instruction is of a high order and must be well paid for; and more than both these, the attendance will be greatly increased in the last six of the twelve years of the course, thus requiring additional buildings, plant, and teaching force for these grades. To fully carry out these ideas, therefore, will greatly increase the running expense of the school's as well as the building and equipment account. And yet your committee believe that this is the goal which we should strive to reach. We must learn first to spend wisely the money now raised in our cities for public-school purposes, and then we must almost double the amount.

America is far behind Europe, and particularly France, in all matters pertaining to either fine or industrial art. The highest industrial rewards come for new labor-saving devices and for new art industrial designs. In the former we already lead the world, but in the latter we are far behind. Art can only thrive under conditions of general comprehension and appreciation. We need an art atmosphere. This requires time in which to educate the whole people along these lines, and to effect this the work must be done in the public schools. Even such artists as we have find a scant support, because the masses of the people can not distinguish between good and poor art, and furthermore they care little for art, either good or bad. We are coming to be the richest nation in the world and can well afford to enjoy the highest fruits of wealth, one of which is beautiful and æsthetic surroundings.

But this æsthetic argument will have less weight with our people at this time than will the economic argument which goes with it. The world is now so far advanced in its appreciation of the beautiful that good art pays wherever it is coupled with the useful. Artistic design doubles the value of the product, while it may not appreciably add to its cost of production. Almost all our artistic industrial designers now come from Europe. France fixes the fashions of the world because she is the acknowledged authority in art, and her supremacy in art is the very essence of all her material prosperity. But America is rapidly adjusting herself to this demand for more artistic productions, and the time is ripe for the introduction of this art-industrial education in both our public and in our privately endowed schools.

III. THE STATE AGRICULTURAL AND MECHANICAL COLLEGES.

These schools are now found in one form or another in nearly every State in the Union. Established originally under the several land-grant bills, most of them are now liberally supported by direct State aid, and they serve a very large constituency in the fields of agriculture, the mechanic arts, and engineering.

While the original purpose of the national appropriations was doubtless to train young men for actual practice in scientific farming and in other industrial pursuits, the students from these schools hitherto have very largely developed into civil, mechanical, and electrical engineers. Comparatively few of them have returned to the farms, but many of them are found in the management of our manufacturing industries. These schools all give regular four-year college courses in agriculture and the mechanic arts, but some of them have established short courses in agriculture. In Minnesota and in some other States, to the "agricultural college" has been added an "agricultural school." This is a true secondary industrial school in which the art and science of farming are taught to both boys and girls. It teaches suitable English studies, physics, chemistry, the raising of crops,

the use of fertilizers, animal husbandry, butter and cheese making; cooking, sewing and household economy to the girls, etc. This course is wonderfully successful. Most of these schools, however, have not entirely fulfilled the hopes of their founders in supplying the much-needed school training to farmers and artisans, which was the primary and original purpose of these enactments. Many of them do form a most important class of engineering schools, since they accept students from the leading high schools of their respective States, and give them a sufficient scientific and practical training to make most useful members of the engineering profession in those grades which make up the great body of practicing engineers. They are near to the people, are comparatively inexpensive, and are very largely attended. These schools have thus more than justified their cost, though many of them are not altogether fulfilling the purposes contemplated in the original enactments.¹

IV. THE HIGHER ENGINEERING COLLEGES.

These are strictly professional schools of a high grade, which teach both pure and applied science, and which rank with the best of their class in any country. Many of them are privately endowed and others are under the fostering care of the State, either as departments of the State universities or otherwise. In the training of professional engineers they are about all that could be desired; and they are now, and have been for many years, graduating young men who are as well equipped in both theory and practice as can be found perhaps anywhere in the world. These are to be the future leaders in the new adaptations of the laws, the forces, and the materials of nature to the service of man. These are the men who, after some years of practice, can safely be intrusted to solve new problems both successfully and economically. They are the safe counselors and guides of the capitalist in all new mechanical ventures, and they should be in constant demand by public officials, by boards of direction, and by individuals in all cases where large expenditures are to be made or where important definite results are imperatively required. The scope and purpose of these schools are, however, well understood by our people and they need not be further elaborated here.

V. MONOTECHNIC OR TRADE SCHOOLS.

These schools are comparatively new to the American people. They have long been in operation abroad, and are most fully developed in Germany. But the foreign pattern is not well suited to American needs. There a boy's career can be marked out for him in advance. If he is to be an artisan he is expected always to remain an artisan. The particular trade which he is expected to learn, also, is fixed for him. It is commonly that of his father before him or that of the prevailing industry of the locality. He is at best a sort of machine, an automaton, worked for what he is worth to the family or to the community and the State. His own individual development is not in question. Most commonly he is not even consulted in the matter. His future is his fate, and he yields to it as gracefully as he can. He has little opportunity to rise above the station in which he finds himself. His career is closed in at the top. Society is stratified horizontally. He finds such solace and comfort as he can by ministering to his bodily comforts and his domestic joys, and frets not over vain ambitions. In fact, ambition is a word of little meaning to him since it can have for him no satisfactory fruition. In these foreign countries, therefore, the trade school is primarily a means of more efficient and more economic production and only incidentally is it a means of personal development. Your committee believes that this result of trade-school instruction abroad is very largely due to the character of the people themselves and should not be charged against the schools.

¹ As to the purpose originally contemplated, see Rep. Com. Ed., 1899-1900, Vol. 2, Chap. XXIV.—Ed.

In America all schooling should lead primarily to the elevation and development of the individual, and only secondarily to a greater material prosperity. It is, doubtless, through a mistaken notion that the trade school does not do this, that this class of schools has made so little headway in this country. If we teach a boy a trade it is not only that he may practice it, but that he may become a master workman, an employer, a contractor, a manufacturer, a proprietor, a leader in his calling, and withal an influential citizen and a participant in public affairs. That a properly conducted trade school would lead to these results in this country can not be doubted. We should teach our boys many things besides the mere manual performance of a trade. In the trade school should always be taught some of the scientific theory which accompanies and underlies such performance. It is not necessary, however, to teach all these related subjects in the trade school. We shall continue to rely upon the public schools for the general education. The trade school with us must supplement this and not displace it. It remains for us to work out a system of trade schools suited to our needs.

The need for industrial training in the various practical vocations and trades is becoming daily more apparent. Not only are most vocations becoming more scientific and less traditional in their practice, but the wholesale introduction of labor-saving machinery and the abandonment in large measure of the apprenticeship system, leaves our boys and young men almost without opportunity or resource in entering successfully any of these practical callings. In addition to these inherent obstacles, the rules of the trades unions by which the admission of learners is limited to a very insignificant number, still further shut out young men from all lines of productive employment. In very many cases not even the proprietor's son is allowed to learn the business practically, or if perchance the permission of the union be extended to him to enter the works as a learner, he must beware of his steps, for pitfalls may be set for him at every turn and sometimes even his life may be in danger.

It has come to such a pass, in fact, that the avenues by which American youths can learn almost any practical calling in all its details are often absolutely sealed up. The only recourse is the teaching of all these trades and employments in especially equipped schools. If the would-be apprentice hopes to become anything more than an average workman he must learn the scientific and practical elements of his trade somewhere, and it is well established that he can learn them most successfully in properly operated schools. These schools should not individually attempt to teach too much; they should, however, teach the underlying scientific principles of one or two trades thoroughly, as well as the most improved commercial practice. The practice, however, is the most difficult to teach in the school. In the first place, it is hard to find persons having both the practical knowledge and the teaching ability. To impart practical knowledge rationally one must rest it on some scientific or rational basis, and not simply upon the dictum of tradition. This rational basis of trade practices is commonly either entirely wanting or, if it exists at all, it is quite unknown to the practitioner. His reasons for his doing a thing so and so are usually far from sound. Competent instructors in the practical trades are, therefore, very difficult to find.

In spite of all these difficulties, very efficient trade schools are established and others are called for by the proprietors and managers of various industries. At the last meeting of the American Foundrymen's Association, held in Chicago, June 5-7, 1900, a resolution was adopted calling for high-grade industrial schools to teach the science and art of founding. The school in clay industries started a few years ago at the Ohio State University has already resulted in the establishment of new ceramic works of very great promise. As a rule the expense of establishing and maintaining these schools should be met by industrial corporations, or by individuals, or by the joint action of manufacturers, locality, and State. Some of the more important industries now requiring such schools will be named.

1. The textile industries are among those which most readily submit themselves to monotechnic or trade-school instruction. Trade schools in these industries have long been common abroad, and a most successful one has been in operation for many years in Philadelphia and one for a shorter period in Lowell, Mass. A number of new ones have recently been established in New England. The State of Massachusetts makes a standing offer of \$25,000 assistance to any city or corporation in the establishment of a textile school which complies with certain requirements. In the higher textile schools the science of dyeing and the art of designing are taught as well as the practice in weaving and finishing all grades of fabrics. These higher courses are several years in length, and are best pursued after taking a high school or manual training school course. Even a college or an art school or an engineering school preparation before one enters the textile school is none too much if one wishes to fully master the industry, to understand mechanical and the power plants, and also to become familiar with the business departments of the manufacture and the sale of textile fabrics on a large scale. Many of the highest and latest developments of the science of chemistry find their application in the dyeing of yarns and fabrics, and the large dyeing and printing works in Germany have many chemists constantly engaged in studying new and improved applications of chemical knowledge to the textile industries.

2. The machine trades are at the basis of all manufacturing, and superiority in these very largely sustains our modern national prosperity. The fundamental principles and most of the practice of these industries can best be taught in schools having proper equipments. Formerly a great deal of hand work was done, and every journeyman in the shop was expected to be able to perform any task in the ordinary routine of shop duties. This demanded a long apprenticeship in actual shop practice and the acquisition of a high degree of manual skill.

The recent general introduction of automatic and labor-saving machine tools, and also tools of extraordinary size, has, however, created a demand for an entirely new class of workmen. Now the average workman in our large shops is only a machine attendant, and he is kept employed with a single class of machine tools. His business is to learn the capacities of these tools and to get the most work out of them of which they are capable. In fact some of our most progressive superintendents affirm that they prefer these narrow specialists to the old-fashioned all-around machinists. For a tool attendant of this class very little general training of any kind is required. With good instructions he will learn in a few days, or perhaps hours, to operate a machine intelligently, and very soon he will be working it to its full capacity. Trade schools are not a necessity for these men. This system carries in it, however, the seeds of its own destruction. By this system no one man is learning the business in its entirety, and hence no one is being trained to superintend or manage the business both theoretically and practically. The graduates of our colleges of mechanical engineering would make the most capable men for these higher positions of superintendence if they could be given an opportunity after leaving the schools to learn all the practical details of the business. It has not been possible hitherto to secure such men in sufficient numbers. On the one hand the managers of works have not been fully informed as to the benefits of such a course, and on the other the graduates of our schools of mechanical engineering are not always willing to begin at the bottom to learn the business. Failing of these, the graduates of our manual-training schools would serve very well for these positions of trust and supervision. These are more ready to enter the lower ranks of mechanical employment and work their way to the top. By a special kind of apprenticeship in the shops some of these young men would rapidly develop into very good foremen, superintendents, and managers. In many cases, however, the trade unions would seriously interfere with any free application of this sort of a programme.

Again, it must not be forgotten that many of our most ingenious and capable

machinists and mechanical inventors who have become the proprietors of the finest machine tool works in the world have had no special technical education, but have come up through the old system of apprenticeship. To save this class of talented young men to the business and to enable them to more fully master an industry now that the apprenticeship system has been practically abandoned, some means should be provided for giving them what the former system gave and which the technical and industrial schools are giving to their students. These men will not leave their employment and go back to the schools. Such schooling as they are ever to receive must be brought to them. It is probably true that many of the most capable of this class will now find some means of acquiring a technical education before entering upon industrial employment, whereas formerly apprenticeship was the only way open for entering these industries.

It is probable, therefore, that only a few of the untrained workers in the shops to-day will care to avail themselves of any school opportunities, however convenient, but these few are the ones who would profit most by such training, and whom society can least afford to lose from its high service. These may, with some technical instruction, become leaders and directors of their fellows and founders of new industries, and the rest may remain automatic attachments to their mechanical tools if they choose, without seriously impairing the success of the works and the local and general prosperity resulting therefrom. This is the hardest, though not the largest and most important problem your committee has had to struggle with. How are we to furnish adequate instruction to those young men who will have had no opportunity to secure a technical training, but who, after entering upon some industrial calling, wish to remedy this defect of early education? Such answers as we are able to make are contained in the next section of this progress report. Since nearly all industrial production to-day is mechanical, the solutions which are offered for the technical training of machinists will apply very largely to the workers in all lines of mechanical production.

VI. SUPPLEMENTARY SCHOOLS FOR INDUSTRIAL WORKERS.

These are schools for those bright and promising boys and young men who have from choice or from necessity already gone to work in some industrial calling with little or no scientific or technical schooling, as well as for those boys who can be reached by no other class of industrial or technical schools. The present demand for these supplementary schools is very large, but with the general introduction of manual, scientific, and art education into the public schools the demand for such supplementary schools will be very greatly reduced. The most promising foundations for the organization of these schools your committee believe to be the following:

1. *Proprietary trade schools in connection with industrial works.*—Nearly all lines of production are now organized into a few great manufacturing centers, and all the factories of any one class in the whole country are more than likely to be operated by a single joint stock company. This company shapes the industry over the whole American continent. We believe that it will be profitable in all these great industries to establish industrial schools in connection with all their large factories in which a few of their brighter workmen can be educated, not only in all parts of their business, but in the underlying and related sciences, in order to become capable foremen, superintendents, and inventors. These are at least a considerable proportion of the men to whom the stockholders must look for continued improvements, for skillful management, and for economic operation. After we have passed through the stock-jobbing stages of these new and mammoth combinations, we shall surely come around to this basis of most economic production and safe business management. The machine attendants will com-

monly be taken from the ranks of unskilled labor. These can be taken on and put off at pleasure, and they will be found in that large class of happy-go-lucky individuals who find self-improvement too laborious and confining, and who feel that sufficient to the day are both the good and the evil thereof. In those industries where perfection of workmanship is a prime essential, even the machine attendant must be a bright, skilled, thoughtful, attentive man or woman; and in these works some educational stimulus and some rewards for acquired skill and for fertile suggestions will be found to be not only fair dealing, but a most profitable business policy.

We are now passing rapidly through an evolutionary if not a revolutionary stage in these matters, and our general managers of large works are coming to realize the necessity of an educational side to their business. It is said of Americans that they are quick to see opportunities of improving their business and are ready to adopt any measure which promises a sufficient return for the outlay. Your committee feel that these proprietary schools in connection with industrial works will make their own way in this country without any organized campaigning, but some systematic effort to present their advantages will hasten their general introduction. Whether these schools take the form of night schools, of half-time day schools, or of financial aid to the brighter lads to attend some specific courses in a technical school, or all of these combined, is not now material. That all of our large industrial works and combinations of works should be brought to see it to their interests to furnish supplementary school facilities to their brightest boys is the problem which now presents itself to those who wish to further the course of industrial education in this country. It may well be that many manufacturing establishments will find it to their interest to work in conjunction with a correspondence school as described in the next section. Railway corporations, and large mechanical, electrical, and chemical manufacturing companies, will probably draw all their technically trained men from the regular engineering schools in preference to establishing technical apprentice schools. These are then given a few years of systematic shop and laboratory experience, which serves as their industrial apprenticeship. Some of our railway companies, however, are introducing elementary apprentice school instruction into their large construction and repair shops.

2. *Correspondence technical schools.*—These have sprung up like magic in America in the past ten years, and are now thought by many to be serving a great need. Whether they will remain in demand, or are only a passing phase of educational opportunity, may be a question. Until other opportunities of acquiring a technical training become practically universal, however, it is very clear that they will find a great work to do. The fact that a single one of these schools (the oldest one) is now carrying on its roll of students over 200,000 names is the best proof in the world of the great demand for technical education. These schools supply their students with specially prepared texts and have systematic correspondence methods of imparting instruction. If the student is willing to do his part, he may obtain in this way a very fair substitute for a school training. He lacks the stimulus, however, of a direct personal contact with a teacher and with other workers in the same subjects. This advantage can be partly supplied by a little encouragement from employers. Some establishments are now supplying rooms, fitted with drawing tables, warmed and lighted, where the correspondence-school students among their employees can spend their evenings in study. Where the numbers are sufficient the correspondence schools may eventually find it to their interest to supply local teachers. This would vigorously supplement the work of the correspondence school where it is now weakest. The entire absence of laboratory and shop instruction in correspondence courses, however, is a serious disadvantage, particularly in technical instruction.

An overwhelming majority of the students who begin these correspondence courses become discouraged, or find themselves overburdened, or else have not the requisite application, and so stop work in the early stages of their correspondence courses. This is not surprising when the persistent, systematic, and seductive methods of obtaining subscribing students are fully understood. Still the truth remains that if a young man really wishes a technical education and is willing to do his part, he can get a great deal of elementary assistance in this way, be he in the slums of a large city, or on a cattle ranch in Texas, or in the South African gold mines. And these necessities of the isolated learners will probably always make a large demand for correspondence instruction, no matter how general other means of acquiring a technical education may become. These schools are but another evidence of the quick initiative of Americans. The demand was no sooner felt than the supply was forthcoming in this new and original kind of a school. Such schools, however, can never supply the place of any of our regularly organized and equipped day or even of our evening technical schools.

3. *City and endowed evening schools.*—These are designed to serve young men who are employed throughout the day. They are quite similar to such schools abroad, most of the so-called technical schools of England being of this class. The student comes two or three evenings a week from 7 or 8 to 10 o'clock. He comes more or less worn out by his day's toil, and he reaches home long after his usual retiring hour, practically exhausted. His mind can not be alert with his body in a fagged-out condition, and hence this class of instruction is at once a great hardship and, in comparison with day schools, it is of relatively little profit. Men who are engaged in any kind of actual manual labor through the day are greatly handicapped in their attendance upon such schools. They are most valuable for clerks, bookkeepers, draftsmen, and the like. They can never become a very substantial element in the technical education of the industrial classes.

But besides the inherent weakness of these night schools, we find that many of them are not well taught. The teachers are changed from year to year, and there is no fixed policy or line of study. The teachers, also, are not commonly experienced in imparting instruction, and the whole atmosphere of these schools, especially in our city evening schools, is apt to be very far from stimulating and invigorating.

4. *Y. M. C. A. evening schools and Sunday technical schools.*—The Y. M. C. A. evening schools are now being organized under a competent central supervision and are pursuing fixed courses of study under much more competent and continuous instruction than formerly. These schools now instruct some 26,000 students in the United States, with a high average attendance. Their finishing certificates are accepted as evidence of sufficient preparatory work in about 100 institutions of college grade. Notwithstanding this proof of the great importance of these schools, their work is more with the mercantile than with the manufacturing classes.

Sometimes Sunday technical schools have been tried, but they are not likely to be very largely introduced or patronized in this country. Professor Woodward, who tried for four years in St. Louis the experiment of a "Sunday morning technical school," is of the opinion that such schools could be made very successful if properly equipped and made permanent in any industrial community; but an American community must first get used to the idea.

These supplementary evening and Sunday technical schools, therefore, can never serve as an adequate means for giving to young men in America a high technical development or in preparing them for a great technical service to the manufacturing industries. They are the only resource for a large class of wage-earners, and they should be encouraged and well supported, but they are at best a poor substitute for day schools, and they can not be regarded as anything like an adequate

means of self-improvement for our industrial workers. They are more efficient, when properly conducted, than the correspondence schools, but they can not reach the isolated student as the correspondence school does. Where the evening school is available, as it is in all our larger cities, it should be preferred to the correspondence school.

5. *Half-time self-supporting trade schools.*—This class of schools has recently been ably advocated by Mr. M. P. Higgins in the Proceedings of the American Society of Mechanical Engineers. Mr. Higgins was for twenty years in charge of the shop instruction given in the Polytechnic Institute, of Worcester, Mass. He states that the experience of that institution justifies the claim that well-equipped and officered industrial works—as, for instance, large machine-tool or engine works—joined to good technical schools, could be made to pay a very large proportion, if not all, of the shop expenses. In such a school the boys would spend half the day in the school and the other half in the shop. They would pay little or no tuition, but they would receive nothing for their work. The school would be divided into two sections, and these would alternate in school and shop work. A sufficient number of expert machinists would be regularly employed to oversee the shop work of the boys and to impart the shop instruction, while the theoretical or school work would be given also to both forenoon and afternoon sections by another set of technical instructors. In this way very nearly actual shop conditions could be introduced, and the advantages of the old apprenticeship system could be retained in addition to the further benefit of a regular school training.

If such a system of trade schools be practicable, they may go a long way toward furnishing a final solution to the great problem of the industrial training of the rising generation. It is to be hoped Mr. Higgins will find the means of embodying his ideas in an actual combined shop and school as he proposes, and so proving the practicability and efficiency of his plans by an actual test. For such a trial the most favorable conditions should be secured, the most competent instruction obtained, and the best possible shop equipment purchased. It is vitally important that the first trial of such a plan should be given every fair advantage to prove its worth. If it succeeds, as its chief advocate promises that it will, it may mark the beginning of as great a movement in industrial education as the manual-training school has done in general education. There is no middle ground between the expert machinist and the mechanical engineer. The difference is one of degree rather than of kind. These half-time schools would turn out expert machinists, many of whom might become skillful mechanical engineers. Your committee fear, however, that in some localities the opposition of the trade unions would prove fatal to all such schools engaged in regular manufacturing.

6. *Public libraries, and scientific, technical, and trade journals.*—We must not forget that every man who has come to anything is almost wholly a self-made man. This is particularly true in America, and applies to mental as well as to material acquisitions. The mental atmosphere which pervades our great industrial works is always bracing and sometimes stimulating. If free public libraries are not conveniently available, a free proprietary library and reading room at the works can readily be established. Here all the current technical and trade journals can be kept on file, and those employees who are capable of a large development will find here their mental nourishment. It is, we think, not too much to say that in almost every industry there are now books, technical and trade journals, and catalogues of a very high educational value, which can be continually added to at a small cost. If these reading-room facilities are wanting, therefore, any ambitious boy or man can take one or more of these journals, and by studying them and a few well-selected books he can acquire a very fair scientific knowledge of his calling. A generation ago these also were almost entirely wanting, so that then, with neither schools, nor books, nor journals, the only possible means of

acquiring a knowledge of any industry was through a long apprenticeship in the business itself. But now, if both the systematic apprenticeship and the technical schooling be wanting, there still remains a flood of printed matter in books and journals from which a young man can, if he will, obtain a very fair theoretical grounding in the manufacturing or commercial industry in which he is engaged.

VII. HIGHER COLLEGES OF COMMERCE.

These are common upon the continent of Europe, but have never obtained recognition in England or America. They are now being strongly urged upon our people, and a number are likely to be established in the immediate future.¹ In these a full four years' course of instruction of college grade will be given. The work will include a writing and speaking knowledge of one or two foreign modern languages; a wide acquaintance with commercial geography and the materials of commerce; full courses upon means and methods of transportation and the shipping regulations of various countries; commercial law and customs regulations, both foreign and domestic; the laws and practices of banking and exchange; political and economic science; mediæval and modern history; the history of commerce and manufacture; consular duties, regulations, and reports; international business law, and other subjects which can be taught and which will help to qualify a young man for a responsible position in a large business having foreign relations or as a United States consul. It will be to men having such an education that we must look for a successful competition with Germany in our foreign commerce. But we have already seen the necessity for these schools, and we may confidently anticipate their rapid and successful establishment. We must guard against making the mistake of merely grouping together a series of subjects now taught in our schools and calling that "a course in commercial education." The work must be technical and immediately available and useful rather than general and cultural. The subjects must be taught, therefore, in a way quite different from that employed in our literary colleges. This will require separate class organizations and very largely separate instructors when the school of commerce is made a part of an existing college or university. These schools will, therefore, be expensive. There should also be in connection with every such school a well-equipped commercial museum, in which are kept for examination and study nearly all the ordinary articles of commerce in both the raw and the manufactured state. These schools would then stand in a supplementary relation to the higher industrial and engineering schools. While the latter train the captains of industry, the former train the men to exploit the products of these industries in all foreign countries. In the development of our foreign commerce one is as essential as the other. With both, our material supremacy is assured for all time.

The above is offered as a hasty and provisional review of the field of industrial education in America and as a progress report of your committee. The committee has had to do all its work by correspondence, several of its members being out of the country at the time of this meeting. If the society decides to continue the committee, they will try to make a more mature report, with recommendations, at a later meeting of the society.

To assist them in their work they hope to secure at this meeting a general expression of the views of the members and of others who are exceptionally well-informed in these matters and whom the committee has invited to be present at this session and to participate in the discussion. The duties of the committee are not clearly defined, but we have assumed them to be the critical analysis of existing and pro-

¹ Such schools have now (Oct., 1900) been established in the University of the City of New York, in the University of Pennsylvania, Philadelphia, and in the University of Wisconsin, Madison.

posed methods of industrial education at home and abroad and the indorsement of those which seem to be best suited to American needs.

Respectfully submitted.

J. B. JOHNSON,

Philadelphia, Pa.,
Committee.*

EXTRACTS FROM THE DISCUSSION.

PRESIDENT MENDENHALL (by letter) stated that he * * * thought that the committee had made an extremely interesting and important report and that, in the main, he could subscribe cordially to every proposition. The principal danger which has to be confronted in this matter, and which apparently the committee has fully recognized, is that of magnifying the importance of what we may call the materialism of the twentieth century. Every effort seems to be pointed toward training young men and young women to acquire wealth, and this necessarily means less attention to the cultivation of those finer qualities that contribute, after all, more to the happiness of this life. However, this is a very large subject and no doubt it has received the committee's careful consideration. His own desire would be to guard very closely the real functions of the public school, which are considered by him not to include training for special occupations, but rather the preparation for citizenship, which is apparently so much lacking in these days.

Mr. H. G. PROUT,¹ said that there were two objections to the theory of special training or industrial education, one of them being that it will divert young men from following carefully and thoroughly the broader and more complete education which they would get in the technical and classical schools now established. A certain number of young men would be diverted, probably, because they could get more easily a certain kind of education which promises quick returns. This, perhaps, is not a very important point, because for every young man diverted in that way there would be two or three or a half dozen young men who would be tempted to take this industrial course who would otherwise get no education beyond that given in the high or primary schools. * * *

Another objection which we will hear raised to this kind of training, is that it will turn out upon the world many young men and young women who really think that they are fit to do something, and who are so far artisans spoiled, and have stopped short of being engineers, or whatever else is chosen. That is all true, too, but that charge is brought against all schools; and, furthermore, it is not a very serious objection in this country of ours, where effectiveness is a matter

¹ Editor of the Railroad Gazette.

of course, and where the ineffective man disappears pretty promptly, or finds out that he is ineffective. Of course, the committee are absolutely right in saying, as they do, and bearing down upon the point, that the main thing for all who are instructing is to continue to open up channels by which somebody will be educated who is not now definitely following any channels; that is, to open up a variety of ways of doing this thing. The great difficulty has been the belief that human history began with the Declaration of Independence and that the capacity to do something then descended upon every American. If in any way the necessity for precise training toward definite ends can be urged upon the people a great deal will have been accomplished. Therefore it seemed to him that the whole movement should be encouraged.

The speaker supposed that probably he was expected to say something as to what the railroads have done. He replied that, as a matter of fact, they have practically done nothing in this line. About twenty-five years ago the Lake Shore Railroad started four schools for apprentices, but they were night schools and open to the recognized objections. Only here and there would there be one select fellow who had unusual ability and good physique, who could do anything valuable at it. The Michigan Central also started something of this sort. They have several schools where they teach the boys something; they teach them drawing and simple mathematics, and try to give them a point of departure from which to go on and make master mechanics of themselves if they have the ability.

The Baltimore and Ohio went into an ambitious scheme of this sort, which collapsed with the failure of that company. A good school of this sort that is closely allied to the railroads is that of the Brooks Locomotive Works, established in 1883 by the public spirit of Mr. H. G. Brooks. They have quite a liberal method of helping their boys and the sons of men employed in the works, and it is believed to be doing a great deal of good.¹

In conclusion, the speaker wished to add that, during the last three to five years, it has been his good fortune to see a good many of the engineering colleges of the country, and that he was amazed to see the splendid work they are doing; it has been a liberal education to him. They are doing a grand work all over this country in the way of bringing up young engineers, and the effect of this work upon our country in the next fifty years is something that none can conceive or exaggerate.

Mr. M. P. HIGGINS said that this report, so ably and clearly covering the field of industrial education, was of special interest to him, and that he had read it with keen appreciation and great profit.

He believed that educators, engineers, and manufacturers will generally agree that no more important topic of education has ever been before the American people than the consideration of the future and immediate schooling and training of mechanics and workers below the grade of engineer, who are to carry on our manufacturing and mechanical industries. By "mechanics" he meant all who are engaged in the production of things useful.

The country is not likely to suffer through the lack of the highest scientific knowledge and ability of American engineers, but one can not speak so confidently regarding the rank and file of our workmen, machinists, etc. This lack of confidence exists despite the fact that American boys are superior in native ability, in skill, method, and invention, and this lack is solely because no adequate effort has been made to bring the best boys into the trades or to train them so that our country can hold the supremacy in machine building, in manufacturing, and in other lines of industries.

The common-school system seems to be nearly perfect for taking the boys up to

¹ See in this connection "Educational training for railway service," by J. Shirley Eaton, Rep. Com. Ed. 1898-99, Vol. 1, pp. 871-955.—Ed.

the high school period, but from this point up to the engineering schools the great masses of our boys who ought to be trained as superior, thinking mechanics are drifting aimlessly, and our shops and factories are being unsatisfactorily filled by foreign-born boys, whose mechanical ability is not equal to that of our native boys.

It is evident in the great industrial battle for future supremacy, under the inevitable system of intensified production, that our best boys with the best possible training will be needed; but, aside from this necessity, there is no field so promising and attractive as this for an unlimited number of educated, skilled workmen.

In our common schools there is the important element of manual training, but this training, as the committee truthfully says, makes no pretense of fitting boys for particular employments. There must be training schools for special employments, a training in skill and experience that shall be braced or supplemented by a good, liberal education and a degree of culture such as will develop the individual and attract our better talent into mechanical work. All this is possible by the cooperation of educators and business men in organizing a suitable system.

President Tucker says that the next advance in education must come from without the schools. The speaker thought it better to say that it will come through the cooperation of those without and those within the schools.

The mechanical schools, engineering colleges, and State universities have been so successful that they have gone above the needs of the people for industrial education.

The committee has said: "While the original purpose of the national appropriations was doubtless to train young men for actual practice in scientific farming and in other industrial pursuits, the students from these schools hitherto have very largely developed into civil, mechanical, and electrical engineers." They have not, therefore, fulfilled the hopes of their founders. This is because the working mechanic is not reached by these schools, and the speaker deemed it the object of this report to find a plan to give this important force of mechanical workers an education, a training, and a degree of culture commensurate with their needs and commensurate with the imperative future needs of the mechanical industries.

The report says: "The machine trades are at the basis of all manufacturing, and superiority in these very largely sustains our modern national prosperity." The speaker thought this to be true, and he wished that he had time to show the comparative importance of the machine trades and why this must be the basis of all industrial training.

Then comes a part of the report which he thought was wrong, or at least misleading. It reads as follows: "Now, the average machinist is only a machine attendant." In fact the machine attendant is not a machinist at all, and a machinist is not usually employed as a machine attendant, though he could do it much more effectively, and it might pay to employ him if he were available.

It is a great mistake and one that no person must be led into, to suppose that intensified production by modern methods (by automatic machines, piecework, and what not), does in any way reduce the demand for the skilled machinist or the high quality of his skill. No, it increases the demand and positively advances the requirements for his skill, as well as for his scientific and technical knowledge.

In referring to the machine operative, also, the report says: "Trade schools are not a necessity for these men." Now, this ought not to be said; or at least if it is done it must be because their needs must be postponed, because the classes ranking as machinists are so much more imperative in their needs and demands for immediate trade-school education.

As a matter of fact the machine operator, even, needs an education and a training, and it will pay to give it to him, and he will have an opportunity to obtain it

some time provided American educators recognize American needs and American chances for industrial supremacy.

Again, the report says: "The graduates of our colleges of mechanical engineering would make the most capable persons for these higher positions of superintendents if they would be willing to enter the shops after graduating from the schools and learn all the practical details of the business."

Now, in general, this is not reasonable to expect. In many cases the graduate thinks he can do better. In most cases he has been educated away from such shopwork for the sake of knowledge; in fact, he is rather too old and advanced for that sort of thing. A foundation can be put under a structure after it is erected, but the best time is at the time of its building.

The speaker wished to assure the educators, who are so ably equipped to consider such a subject, that they will be surprised and gratified when they come to gather up all the advantages of real, productive, commercial shop-practice and machine-building experience as an integral part of an educational course. Its intrinsic value is enough to introduce it at almost any cost; its educational value, as a means of strengthening the judgment and disciplining the mind, is of equal or greater value.

The report still further says: "The graduates of any manual-training school would serve very well for these positions of trust and supervision." * * * "These young men would readily develop into very good foremen, superintendents, and managers." But there is a gigantic IF in the way. IF they would enter the shops and learn the trade by "systematic apprenticeship." But there is no "systematic apprenticeship," and can never be in our system of American production. Therefore, because the manual training high school does not teach and does not profess to teach any special trade work and skill, it of course falls short of meeting the demands for a trade-school system.

What has been said in the report regarding night schools fully corresponds with the estimate of any careful observer. The night-school system, upon which England has relied and failed, is entirely inadequate to American needs, and is only a poor crutch to help, save in a few special cases.

The speaker had more hope in the principle of the correspondence system. In good hands and under good control this system is capable of great results among thousands who want training and who can not have the benefits of a real course in a trade school. In the city of Worcester, Mass., there are over 1,200 boys and men devoting their evenings and their money to this system. It certainly indicates a desire for learning, even if the plan is not the best one. He said that among his own men and foremen great progress in sound learning is being made with this system.

In this report there is a statement that is refreshing: "Your committee are quite agreed that in America every boy should find his career entirely open at the top." The speaker liked that "entirely open at the top." It suggests upward draft and feeding at the bottom. In this way the importance may be seen of vertical circulation versus horizontal stratification.

Herein lies the greatest hope, our greatest advantage in the industrial world when the great just conflict of competition is fully upon us—the conflict for supremacy through intensified production. But this is a subject for a whole paper, and not merely for a few remarks upon the general subject.

The speaker referred to one more thing in this report which shows the recognition of a fundamental truth. He left the mention of this idea to the last, because he thought it the newest and best. It is as follows: "The mental atmosphere which pervades the great industrial works is always bracing and sometimes stimulating. Upon this basis he had founded his estimate of the great value of a new and most important feature in our future industrial school system, viz, the shop lecture room.

The idea of the shop lecture room does not confine itself simply to having such a room in the shop building, but carries the idea of teaching much, if not all things, to the pupil in the shop, and while he is at his work, and in intimate, applied connection with his work.

The speaker declared its possibilities to be more than he had time to even mention.

The outlining of such a school plan as published in the Transactions of the American Society of Mechanical Engineers¹ is the result of the speaker's study, experience, and observation for the past thirty years. He thought that it is calculated to better meet our American needs than any plan he had found in this country or in Europe. The half-time school is intended to solve the important question in the family, "What shall we do for our boy?" This question arises thus: John is 14 years old; he has completed the grammar school. If he enters the high school it means four years more. This is often a very important question. The mother sees that, if John goes to work with a doubtful chance of learning thoroughly any trade, he practically shuts the door against future liberal education and culture. The father is earnest and willing to sacrifice heroically, so that John can go on for four years in the high school, although he does not know what the four years more in school will do for him; and so, in his perplexity, he says: "Yes, John, we can get on, I think, for four years in the high school. You will then be a strong man of 18. What will you do then?"

It must be admitted that the answer to this question is not a simple one, although it is a very important one. Now, imagine that John is able to say, "Father the problem is solved. The half-time school is now opened. In it I will become a skillful machinist, able to earn more than a living immediately upon graduation, and I will also have all the benefits of a high-school education at the same time."

The fondest, though hitherto the faintest, hope for a broad, liberal, scientific education dawns in view; bright, real, and possible, without charity or indebtedness; for John will be nearly or quite fitted for the technical or engineering school, which possibly he may enter at the age of 18, or after a year or two of money earning in a machine shop. This certainly would be a new and bright outlook to thousands and thousands of homes throughout our land.

Whatever success may be ascribed to the present methods of technical education, the speaker was confident that all who will study the subject will admit that something else is demanded; a system that will reach the greater number of our sons who should become working mechanics. This greater number can be reached by the proposed half-time school; a system that is recommended and urged because it will not conflict with present good working systems, because it will not duplicate the present common-school system, but will supplement it in a most practical and economical and effective way. And by this system it is confidently hoped to avoid what is the most obvious danger, viz, a failure to enlist and hold our better American youth to our mechanical and manufacturing industries instead of allowing these industries to fall into the hands of others less able to advance them.

PROF. R. S. WOODWARD said that it appeared to him that this report makes an era; that, as far as he knew, it was the first report brought to his attention that distinctly recognizes that there may be many kinds of education. Many will remember that, thirty years ago, there was only one kind of education that was recognized. Men who had been educated in the school of experience, from which there are no graduates, were looked down upon, and yet to-day the authors of the report under discussion have directed special attention to the names of two individuals who are not college graduates, but who will be admitted by all to be very highly educated men.

¹ Papers by Mr. M. P. Higgins, Nos. 850 and 864. Transactions American Society Mechanical Engineers, Vol. XXI.

Another point which struck the speaker as remarkable, is that the authors of the report are willing to recognize that there is more than one kind of liberal education. A few years ago it was thought that there was only one kind of liberal education, and there are a good many people to-day who assume to be able to draw the line very definitely between what is liberal and what is illiberal education. The speaker remarked that during the past two or three years he had met these people, and had sought to determine what their definition of a liberal education is, and, as far as he could find out, it is this—"The sort of education I have had." And the man who uses this definition is the man who has had a classical education. Certainly it is not to be said that the classical education is not eminently valuable and to be commended, but it is not well for any kind of education to secure predominance, and the splendid thing about the report under discussion is that it recognizes that there may be various kinds and degrees and forms of education in our own line which are all good as far as they go. * * *

MR. RICHARD P. ROTHWELL¹ wished to express his admiration for the report which had been made, and proceeded to speak about correspondence schools. One of the most important parts of the education which an engineer receives is the employment of his material where it will produce the maximum useful effect. The education which produces the greatest effect in the aggregate is the education for the masses, for the artisans and workers. There is, of course, no comparison between the numbers who are comparatively uneducated and those who are able to follow the higher branches of engineering or mechanics. The masses—the artisans and workers—are not able to attend schools after they have passed through the public school. Their first object is to earn their living by work in some useful occupation, and they find this to be so engrossing that they usually have no opportunity to study where they have the desire to do so. How to reach these people, how to make them more efficient workmen, and through them to benefit the entire industrial position of the country, is to my mind the greatest problem of the age. There is no question that the greater intelligence of the working classes, the higher will be their efficiency and the better and cheaper will be the product of their labor. The quality and economy of the products of industry are the foundation of national prosperity, and therefore it is desirable to commence with the education of the artisan and the mechanic.

There is nothing which so interests anyone as the occupation by which he earns a living. If one can show a man that if he does this or that he will be a more efficient worker and will earn a larger income from his labor, it will have a direct interest for him that no urging which he may get in the general school or college to acquire abstract information or knowledge will ever have. It is one thing to say to a young man, "Now learn this, for you will probably need it one of these days," and another thing to say to the man at work, "Learn this and you will be more efficient and will earn more wages." There is no doubt that if the proper means are brought to the working classes of the country a greater useful effect will be produced than by educating the higher classes, while, of course, nothing is to be said against that. The speaker remarked that he had the good fortune to study engineering in the best schools of two continents, and appreciates this fully. Yet when it comes to the question of producing the maximum useful effect with the means at command, greater results can certainly be secured by educating the masses than in educating the small number in the higher departments of engineering.

The correspondence school has one of the objections that have been pointed out, that it is a money-making institution, but this does not appear to the speaker to be a drawback. It is well known that when one undertakes to furnish something that people may take or leave, if he does not give the worth of their money he will

¹ President of the United Correspondence Schools of New York.

lose his own, for people will not buy his goods. Now, the fact that a correspondence school is under bond to the amount of its investment to furnish value for what it gets and will lose its investment if it does not, is certainly a strong guaranty that it will furnish more useful information than will the endowed school which furnishes free instruction, and that goes on whether it hits the mark or not.

There are not a few of our large colleges whose courses are designed by gentlemen of great learning, but who have never had to earn their living by labor in the occupations they are teaching. These gentlemen evolve more or less from their inner consciousness what a young man or woman should learn, and not infrequently when these young people get out in life and have to earn their living they find that they should have learned something very different. The best way to know what ought to be taught in any subject is to go to the men who are earning their living in that occupation and ascertain what will enable them to earn more. Teach them what will make them better workmen and able to earn higher wages. When you begin here and work from the bottom up I think it will be almost as much more efficient as the heating of water from the bottom up is more successful than trying to heat it from the top down.

The correspondence school is founded upon supplying the needs of the people who are taught, and any occupation can be taught by correspondence. It says to the workman, "If you knew more about your work, if you studied the reasons for what you are doing, you would be a more efficient worker, and you would be worth and would receive higher wages. Here are the means of acquiring that knowledge. It will cost you but little, and the payments are so distributed that they are easy to make, even for the low-wage mechanic."

I firmly believe that what men get for nothing they value lightly, and that where they have free schools they do not profit by them as if they had to pay something for their education. The speaker declared that a short time ago a gentleman who is much interested in educational matters said that he would like to devote a certain amount of money to free scholarships. He was answered: "Sir, we don't want them. If you will establish prizes for the student who makes the most progress in a given time, that is another matter, but our experience is that a free scholarship does not make a good student."

The teaching of the industrial classes is not difficult if one commences at the right end, by getting down among the workers and finding out what is actually needed to make them more efficient. With women the first essential is house-keeping. No class of mechanics ever struck for an advance in wages that, if they gained it, would have been nearly as important to them as it would be to have their wives and daughters taught how to keep house. Here is one great field for a correspondence school, for these women can not go to school, but they can learn by correspondence how to keep house.

The methods of teaching should be adapted to the people taught. The speaker doubted whether the very learned and able gentlemen who are teaching in Columbia University, and there are no better in the world, would at all make a success of correspondence education. To do this one must understand the people who are being taught. The secret of success is to find the men who can teach the industrial classes. These teachers should have been brought up with them and have learned how to teach them; should have, as it were, their range and be able to hit them.

The courses of most of the correspondence schools are good, some of them better than others, and all are bound to be, in the future, a great deal better than they are now. This is a very new departure, and yet the correspondence schools of this country, which were started yesterday, as it were, are teaching more students to-day than all the universities of the country. He said that the particular school with which he is associated, The United Correspondence Schools of New York, has already far more students on its rolls than has Columbia University in all its

departments; and yet it is but just beginning. No one would pretend to say that the education of the correspondence school is as high as that of some other schools, but each is adapted to its environment. The correspondence school commences with the assumption that the student in many courses knows only how to read and write. The instruction papers are prepared in direct, simple language, and are very accurate, for, with students by tens of thousands, each one of whom wants to know why, the answering of questions that a small number of errors would bring would swamp a school. The aim is, therefore, to have everything accurate. The assumption is that the students are ignorant people, who have studied little beyond English reading and writing, the beginning for nearly all being arithmetic. They go on with a certain amount of mathematics and then branch off into different specialties. If a man wants one line, he is instructed in that and nothing else. The instruction papers are sent to the students after they have paid their first installment, and each paper has a certain number of examinations in it. The students have to answer the questions in writing, and the answers are criticised and returned, with explanations to the student. The same with the drawing. It would surprise most of the members of this society to see the high quality of the drawing done by students at these schools. The drawings given them as models are very well done; the machine drawings especially are done in the very best style.

The method of getting these students, to which the report made some reference, is itself somewhat unique, and to some may seem undignified. It is the method adopted by the insurance companies. That is, in addition to the regular advertising, solicitors are employed to secure students. They are of the class of book agents; very glib of tongue and usually quite well educated and are very persuasive. They post themselves upon the subjects taught by the school, and as they get their living by securing students they are ready to convince those they address of the great importance to them of study and the value of knowledge in increasing their earning power. This may be undignified, possibly, but it is a remarkably effective means for spreading knowledge and inducing those to study who otherwise would never do so.

After he has secured a student the solicitor will keep him studying, because if he does not study he usually ceases to pay his installments and then the solicitor loses his commission. The way this often works may be described as follows: This glib-tongued school "fiend," who persuades the workman that he can not live or die without the knowledge he has to sell, has to deal perhaps with a fireman on a tugboat, who had not the faintest idea of studying anything before he met this agent; but the agent got him worked up and the man paid his fee of \$2 for enrollment. The next month the solicitor comes around and finds that this man has not made much progress, and is disinclined to continue, saying, "I cannot understand that; I can't make anything out of it." So the agent whose commission is at stake says, "Why, what is the matter with it?" and he sits down with Jim and instructs him. It is always in arithmetic that the difficulty comes. After the student has gotten over a few difficulties, even the most ignorant student can understand the rest; but the beginning is difficult for a man who has not studied for a number of years. Very many of them find it very difficult and stop there, but if this number were even larger in proportion than it is the number of those taught, and those who are induced to study who would never otherwise do so, leave the balance altogether to the credit of the system. It may not be dignified, but it is efficient, and that is better. On the whole the correspondence school is, in my opinion, the most important development of modern educational methods.¹

¹As to the methods and courses of study of railway correspondence schools, see Rep. Com. Ed., 1898-99, Vol. 1, pp. 903-907.—Ed.

CHAPTER V.

EDUCATIONAL PATHOLOGY, OR SELF-GOVERNMENT IN SCHOOL.

The pathological side of education receives more and more attention as civilization progresses. While formerly education for the masses consisted in the acquisition of elementary knowledge and the training of children normally endowed, it directs its attention now also to the unfortunate, the weak and depraved, and tries to save those for a life of usefulness who were formerly treated as criminals. Numerous institutions of recent origin, all having pathological purposes, bear witness to this benevolent educational movement. It is not only the blind and the deaf-mutes who are now treated rationally in State institutions, but mentally weak children, though gifted with the five senses, are in many places in Europe and America singled out and educated to the limits of their capacity. There is a double purpose in this: First, proper treatment is given to these children, who would otherwise sink back under neglect into confirmed idiocy; and, second, the schools are freed from an incubus that tends to retard the progress of all the pupils, since a teacher does not then need to waste much of her time on hopeless cases.

Other agencies are awakening to the necessity of healing and preventing social diseases rather than punishing and incarcerating dangerous elements that cause the disease or are subject to it. This is done by reform schools and other institutions, such as children's courts and homes of refuge for children in disgrace or distress. All this is analagous to the progress of physical hygiene. Formerly the State rather stamped out disease with fire and sword than prevented the spread of disease and epidemics by quarantine and actually preventive agencies, as is done now. This prevention of social disease assumes a variety of forms. In the last Annual Report of this Bureau an account was given of public playgrounds in city parks and of summer play schools designed to keep children from the influence of the slums, and to awaken in them higher and nobler ideals of life.

Viewing the efforts at pathological education in the various civilized countries, one can not help noticing how the form of government of a nation and its social ideals have a direct influence even upon these institutions of benevolent purpose. In Germany, for instance, where social classes still exist and a segregation into classes is promoted

by the very organization of the schools, the most popular remedy is found in separating the intellectual and moral weaklings and training and teaching them in separate classes and schools. In attempting to save children from a life of disgrace and crime Americans have in a few instances resorted to a form quite in harmony with our form of government by instituting what is known as "Junior (or Boys) Republics," the characteristic feature of which is self-government. All these attempts at reclaiming waifs, preventing crime, and saving moral weaklings are in their infancy, but the results thus far seem to indicate that the illustrious example of Pestalozzi in Switzerland has not been in vain.

A writer in the *Literary Digest* (Funk & Wagnalls, New York, No. 13, vol. 22) gives a review of some of the attempts at educational pathology under the caption of "Saving boys from crime." The article is here reproduced:

SAVING BOYS FROM CRIME.

The process of making good citizens out of bad ones, transforming society's liabilities into assets, is a work that always commands attention, and when the work is among children it seems to have an additional claim upon human sympathy. The record in this line that has called out the most remark, perhaps, is the boast made by the Children's Aid Society of New York City, that of the boys it has taken from the streets of the metropolis and placed on Western farms, 2 have become college professors, 22 lawyers, 12 clergymen, 9 physicians, 2 railroad managers, 2 governors, 1 a member of Congress, and a number members of State legislatures. Another interesting work that has progressed far enough to make a report is the juvenile court in Chicago, established in 1899. * * * Before it are tried all cases of children, dependent, neglected, or delinquent, under the age of 16. The court was patterned after a similar one in Massachusetts, and its record of a year and a half of existence has been warmly praised. The *American Lawyer* (New York) describes it as follows:

By the provisions of the law no child under 12 years of age can be held in a police station. A room for the detention of children must be provided. The law also enacts that under the age of 12 there shall be no arrests, but that the child shall be brought into court upon summons, and if the parent or guardian of the child ignores the summons he may be arrested for contempt of court. In the case of neglected children without parent or guardian the offender may be taken in charge by an officer and delivered by the court to a probation officer.

The court is empowered to provide for both dependent and delinquent children (by the former being understood children not guilty of offenses but without oversight and in need of it), being authorized to use its own judgment as to commitment. The child can be released upon the responsibility of the probation officer, or it can be committed to industrial or other schools. All offenses of whatever character committed by children under the age of 16 years come under the provisions of the law, which is modeled upon the Massachusetts statute.

The same journal says in comment:

It is useless to refer to the many-times-stated fact that our law is notoriously insufficient in so far as infants are concerned, in that it seems to recognize no real distinction between the juvenile offender and the hardened criminal. Crime is crime, it says, irrespective of the age of the offender, and the same hard-and-fast rules are to be applied whether the wrongdoer be a mischievous schoolboy or a hardened criminal. The reform school, while a step in the right direction, meets the difficulty only halfway, as the child comes from it with more or less of a stain upon its reputation which only time removes. The special need of a court which will not administer strict rules of law, but to which some latitude of discretion will be permitted in cases of infant depravity, is certainly apparent.

Mr. Carl Kelsey, writing in the current *Annals of the American Academy of Political and Social Science of Philadelphia*, says:

Appreciation of the value and importance of the court grows steadily. The judge had few precedents when he began and had to feel his way. To-day he is the enthusiastic advocate of the court. The other circuit judges who have acted as supply judges have become much interested in the court. Venerable Judge Tuley said: "The juvenile court is the greatest work of the kind ever undertaken in Illinois. More can be done in ten years in the juvenile to suppress crime than can be accomplished in fifty years in the criminal court." The State's attorney has said that the expenses of the criminal court have materially decreased because of the operation of the law. Before the enactment of the law there were constantly from 40 to 50 boys in jail awaiting hearing. During the last year only 37 boys were held for the grand jury from the juvenile court. * * *

If possible the judge will put the boy on parole unless home conditions are too bad, and if the record of the boy is fairly good. How successful this work of probation may be it is hard to say. Massachusetts seems satisfied with her experiment and other States are following her lead. Much has been accomplished in Illinois, though the probation officers are overworked. Imagine successful and satisfactory work with 100 boys paroled to 1 officer in addition to his other duties! Out of 1,339 delinquent boys before the court during the year ending June 30, 1900, 1,095 were paroled, and of these only 203 were returned to the court. There were also released from the city reformatory on parole 256 boys, of whom but 23 were remanded.

In New York City, in addition to the Children's Aid Society, the Gerry Society, and other similar organizations, a novel adjunct to the court of special sessions was started about three months ago and is being carried on by David Willard, a young man who is devoting himself to "settlement" work among poor boys in the lower east side, and who is also a teacher in the Tombs prison. The judges in this court have great confidence in Mr. Willard's judgment in the cases of boys and young men, and they parole all offenders between the ages of 16 to 21 for one month in his custody. "While the prisoners are on parole," says a writer in the *New York Evening Post*, "Mr. Willard inquires into the antecedents and environments in each case, and submits a report of his findings to the judges. When the date of the boy's parole expires Mr. Willard appears in court. If he thinks that the boy is not inherently bad or that he can be reclaimed he so reports, and asks that the prisoner be released under suspended sentence. The chances are that Mr. Willard may be able to report that he has secured employment for the offender; at all events the judge knows that a careful watch will be kept on the boy in future, and he almost invariably releases the prisoner as requested." Mr. Willard has investigated between 75 and 100 cases so far, and in the vast majority has requested that the boys be given a chance to reform. The writer continues:

Mr. Willard's work is done without salary. Besides his investigating work he has a little house on Chrystie street, which he has fitted up with eight small bedrooms, where he houses eight friendless orphan boys. As soon as he can find work for one of his "family," as he calls them, and the boy is self-supporting, he must "hustle" for himself and make room for another boy.

When he has room, Mr. Willard sometimes takes some of his paroled prisoners into his house, but he does not often have room. The house is supported by voluntary subscriptions. Sometimes the subscriptions do not come as numerously or as largely as are necessary, and then, as Mr. Willard expresses it, "We have to 'hock' some of our goods at the near-by pawnshop until things look brighter. We have dark days as well as bright ones in my family."

The charter-revision commission has recommended that a children's court be established in New York City, and it is not unlikely that this will soon be done; but as such a court will have to do only with children under 16, Mr. Willard's labors will not be affected by it.

The parole system, however, whether in a juvenile court or in the court of special sessions, puts the boy back on the city's streets, and, as Dr. D. L. Pierson says in an article on the *George Junior Republic* in the *Missionary Review*, "the city's streets are the devil's kindergarten." Another recourse is to place the boy

in some charitable institution; but this plan sometimes proves worse than the other. In his last annual report the secretary of the Children's Aid Society says:

It is an interesting fact that the children who have been most successful in their after careers were not the well-trained children from institutions, as one might suppose, but were mostly boys who had received their early training on the streets and were removed to better environment before they were 12 years of age. On the other hand, the very small number who were arrested for crime or sent to reform schools were in most cases children who came from institutions. The petty crimes they committed were largely due to want of worldly experience—a difficulty in distinguishing right from wrong.

Mr. William R. George, in his now-famous "George Junior Republic," just referred to, believes that he has found the path out of this dilemma. Mr. George started the little republic in July, 1895, and it now has about a hundred citizens, one-fourth of the number girls. Every citizen is paid for his work in tin coins, which he exchanges at the republic store and hotel for the necessities, comforts, and luxuries of life, or deposits in the republic bank. The citizens make their own laws, elect their own president, congress, judges, and other officers, and choose their own policemen, who lock up in their jail the citizens who break the laws. The plan has proved so successful that the Massachusetts State reformatory has adopted its principle, and two other junior republics have been started, one in Reddington, Pa., and the other in Washington, D. C. Mr. George's little democracy is located at Freeville, N. Y., about 8 miles north of Ithaca. A writer in *The Puritan Magazine* remarks that the Freeville Republic "for its simplicity, its decency, and its self-respect, may some day repay the study of the legislators of the larger democracy." Like Mr. Willard's work, the Republic does not seem to be embarrassed by an unmanageable surplus of funds, and all its leaflets announce that contributions of money, materials, clothing, or household articles will not come amiss, and will aid in extending the usefulness of the work. The Republic's last leaflet records the interesting fact that since the work began not one of the citizens has been dismissed as incorrigible, and of the 119 who have left the Republic not one has gone astray. Says the report:

Of the 119, sixty-one were considered by Mr. George positively bad when they entered the Republic. Many of them had been arrested and had served one or more terms of imprisonment in some institution of a reformatory character; others had committed thefts that would have sent them to a reformatory had they not been given the alternative of going to the Republic. Not one boy or girl who has left the Republic has been, up to date, in any difficulty with the public authorities since leaving. So far as Mr. George can learn, everyone is at some honest labor.

The foregoing allusions to the work of Mr. George are scarcely sufficient to give an adequate idea of the historic development and the administrative details of the Junior Republic. A more extended description is found in an article by John R. Commons in No. 3, Volume III, of the *American Journal of Sociology*, which is here inserted to show how the best remedy for social evils is self-help.

THE JUNIOR REPUBLIC.

The Junior Republic is an experiment in charity, penology, and pedagogy. It carries to a consistent extreme the principles of self-help and individuality toward which thinkers and workers in these fields for a decade or more have been urging. Various of its devices have been recently hit upon here and there in reformatories, schools, and child-saving organizations, but it has remained for Mr. George to begin at the foundation and to build up a complete system, untrammelled by traditions, institutions, or trustees. And now that the Republic has become famous, the fascination of its story and its apparent simplicity have led to the establishment of similar republics elsewhere and the adoption of certain of its features in

existing institutions. It is in the effort to imitate the Republic without fully appreciating its motive that discredit is likely to come upon its principles, and the conclusion to be drawn that only under the personal inspiration of a Mr. George can it succeed, or that it is anything more than the fanciful pastime of a harmless philanthropy. In order to show that it has been developed not as an amusement, but to meet the most fundamental practical problem of sociology—the education of personal character for both individual and social responsibilities—I can begin with no more convincing recital than the constitutional history of the Republic.

In 1887, Mr. W. R. George, then about 21 years of age, whose home had been among the hills near Freeville, Tompkins County, N. Y., went to New York City to follow a business calling. All of his leisure time he occupied in making the acquaintance of the street boys and girls of the East Side, in visiting boys' clubs, teaching Sunday-school classes, and becoming deeply attached to these urchins. Impressed by their cramped life, he determined, in 1890, to take a company of 30 to his home near Freeville, where he spent his own vacations in August. He secured railway expenses through the Tribune fresh-air fund, and relied upon his relatives and neighbors to furnish provisions. His only purpose at this time was to give the boys and girls a thoroughly happy outing. The second summer—1891—he took a company of 200, all to be kept on one farm in tents, and from that time to the present the number has ranged from 150 to 200, of whom about one-fourth have been girls. The people and churches of the neighborhood responded bountifully with food and clothing, and these were distributed freely among the youthful claimants. Four summers of this experience focused his attention on its essentially degrading effects. One-tenth of the children came there as a "gang," to fight and brawl and terrorize the country; nine-tenths came for the food and the clothing that they could take back to their parents. From arrival to departure their constant clamor was, "What are dese farmers goin' to give us to take back?" "The woman I was by last year gave me two dresses and sent us three barrels of potatoes in the winter. What are youse goin' to give me?" and so on. Here were two conditions for Mr. George to meet—crime and pauperism, the very life and moving spirit of the political and charitable system of New York City and its tenements. And the fact that 200 of these budding criminals and paupers were on his hands made him think. One day he remonstrated with a crowd of them, "Why do you do nothing but beg and demand things to take back with you? You have done nothing to earn them; they are not yours." A little Italian girl, spokesman of the crowd, drew herself up and said, "Mr. George, wot do youse tink we are here fur, anyway?" "That's the talk," growled the crowd.

The next summer, 1894, Mr. George determined to make them work for what they took. Boxes of clothing sent in by the philanthropic were no longer passed around, but notice was given that only hard work with pick and shovel would be considered a claim for such. The grumbling and muttering were general and ominous. One boy, however, after a period of thinking offered to work for five days for a suit of clothes—the price set by Mr. George. The others hectoring him a fool for working to get what was his by right, but when he walked away with his new suit, the pride of honest ownership, and the immediate capitulation of many others, were the first suggestion toward the Republic's cure for pauperism.

The problem of crime was equally hard. Mr. George made rules against smoking, gambling, stealing, fighting, etc., but how to punish for violations was beyond his comprehension. He even tried the whip, but that failed. He then resorted to a vicarious expedient, offering himself to be whipped and compelling the culprit to do the whipping. This worked better, but crime still flourished. Finally, in 1894, he inaugurated a public trial of every alleged offender, the decision to be awarded by the town meeting. On the suggestion of the boys a jury of the best citizens was selected by Mr. George himself for such trials. At this time, instead

of corporal punishment he substituted fines of a graded number of hours' work. The stone pile was superintended by an adult, one of the assistants, and when one day he was sick the boys proposed that in his place be appointed Banjo, a member of the "Park" gang, which was an offshoot of the famous "Why-ho" gang. Only necessity compelled Mr. George to accept this radical innovation and that but for one day, but its startling success was the first eye-opener on the possibilities of self-government. Banjo got much better and harder work out of the boys than did the adult, for they could not deceive him, and on the other hand Banjo himself became the most self-respecting upholder of law and order in the entire community. He was retained permanently in office.

The summer of 1894 was full of many kinds of experiments. Mr. George knew that something was wrong and he was feeling for remedies. After the children went home he set to thinking. Three facts had impressed themselves upon him. First, the keen sense of justice and power of discrimination shown by the boys in all the trials by jury; second, their superior powers of administration and discipline over their fellows compared with those shown by adults; third, the superior wisdom of the suggestions they had made in modes of government and administration compared with those which had occurred to himself. He therefore reasoned that they might equally well make the laws as judge and administer them, and the idea occurred to him of a boy legislature. Then, too, if they worked for their clothing, why not require them to work for their victuals? All these are just what people in the outside world are doing—why not copy their methods? And if so we have sure enough a republic—yes, indeed, a junior republic. The idea was a flash, an inspiration. It carried our enthusiast off his feet with a shout. At once he announced his plan, and the summer of 1895 was the first year of the Junior Republic.

But the self-governing republic was not born full-fledged. Mr. George was not ready to trust the boys. He made himself president, with a veto on all laws. He appointed adult assistants as chief justice, chief of police, civil-service examiners, board of health, and bank president. He let the contracts to adults.

The first summer convinced him that in every one of these positions the boys themselves would be superior to adults. They knew much better how to deal with their fellows. They would also be more responsible to them, and would give them, therefore, a keener sense of their own responsibility for the execution of their own laws. Consequently, in the summer of 1896 adults were removed from all responsible positions except the presidency and the boys were appointed by the president, and in 1897 another step toward democracy was taken, in that a boy was made president by election of his peers. In all respects, therefore, the Junior Republic is now self-governing and is a coalescence of the Federal, State, and city governments of the United States. The president is elected for one year, senators for two weeks, representatives for one week, and officials are appointed on good behavior. The laws of the State of New York are the laws of the republic, though subject to amendment by the legislature and the president. These amendments, however, are all abrogated on the 1st of July each year, and to remain valid must be reenacted.

While in the form of government the representative democracy has been perfected, the same does not yet hold for the ownership of property. This will appear from the very interesting monetary history of the republic.

In 1895 Mr. George was owner and business manager of all property in the Republic. He employed boys and girls, paying them wages in their card-board money (later tin coin), and they in turn paid him for board and lodging at the hotels. As a matter of form, and to give the government some material reason for existence, the citizen paid small taxes levied by the legislature, though Mr. George, as sole capitalist, paid the bulk of the taxes. In 1896, in order to extend democracy, the contracts for hotels and mercantile establishments were let by the

government to citizens on the payment of a license or percentage determined by auction. But Mr. George still retained ownership of the land and employed a large force in agricultural pursuits. He paid them wages daily, and as he had nothing to sell to the citizens, since his crops would not mature until after their return home the 1st of September, the money was not returned into his hands. As a result, the currency was expanded and continued to depreciate through rapid fluctuations until \$1 of republic money was worth only 5 to 10 cents of American money. The method of determining this depreciation was to note the prices at which clothing and other goods from outside would sell at auction to the citizens in their currency, compared with the customary prices for the same in American currency. The ratio between the two prices would give the rate of depreciation. The causes of this growing depreciation were for several months inexplicable to either the citizens or their patron. It involved serious problems in the distribution of wealth and the contentment of the citizens. Out of it sprang the heated political campaign between the People's Party and the Free Tin Party.

The government, being constantly in receipt of more money than it could use, owing to the growing surplus in the community at large and the feeling that something ought to be done to keep it in circulation, projected large public improvements, such as building highways, sidewalks, drains, and laying out parks. These were let to contractors, who, by paying their laborers 50 cents a day and foreman \$1, were themselves often able to make as profit \$150 out of the \$200 contract. They thus became "millionaires," and flaunted their riches in the face of others, living at the most expensive hotels without the need of work; and the high prices which they paid both depreciated the currency and placed luxuries beyond the reach of the commonalty. Rapidly there appeared a general feeling of remonstrance against these parvenues and a desire to curb their pride. Somehow it was felt that the excessive currency furnished them their opportunities, and the People's or Conservative party was organized, whose platform demanded a high tax rate and the arbitrary creation therefrom of a government reserve in order to contract the currency.

These speculators now, in turn, organized the Free Tin Party, and their popular appeal was "high wages, plenty of work, and prosperity." They told their workmen that they now were able to pay but 50 cents a day, and if currency should be shortened, they could pay only 25 cents; whereas, as everyone knew, it required a minimum of 50 cents a day to pay for meals, lodging, and taxes. These arguments carried with the voters, and the People's Party was overwhelmed. The currency continued to depreciate, and the millionaires to flourish till the end of the season.

In 1897 Mr. George took the matter in hand and returned to his policy of 1895. He became again sole landed proprietor and capitalist. He considers this as far from the ideal, but as a means of regulating the currency it is the only secure plan yet devised. He now pays directly, or through his subcontractors, all the employees except government servants and pays two-thirds of the taxes. He receives an income from the hotels and other sources, and consequently is able to control the currency at par, apart from the regulations by the government. The inference seems to be that popular sovereignty has failed in the field of the currency, just as we often hear it held that it must also fail in the greater Republic outside.

By owning all the industries Mr. George is also able to check the rise of millionaires. He can prevent the merely shrewd and unscrupulous from accumulating wealth as against the industrious and honest. He does this by letting the contracts not merely on the basis of the strict competitive system, as was done in 1896 by the government, but by awarding them to the more deserving in his pri-

vate estimation. Thus, by monopolizing private property, he quietly controls the lives of the citizens, regardless of the complete self-government vouchsafed to them. In this a more ideal justice is measured out, though, of course, in so far, the government has become a benevolent despotism rather than a democracy. This, too, has made the republic less fascinating and less exciting than it was under the political and commercial contest of 1896, and outsiders might wish these competitive conditions had been retained in order to see what sort of an ideal commonwealth the citizens themselves might have worked out. Both Mr. George and the citizens feel this lack of complete self-government, and the plans for 1898 will resume again the democratic trend. Private property in land and all enterprises will be arranged for in some way, and the government will have entire control of the volume of currency.

At present the currency is easily kept at par, as far as the purchase of necessities is concerned. United States money has, of course, a wider value; but if the treasury of the republic had an adequate reserve of candy with which to redeem its currency, the par value of the same could in all respects be steadily maintained. The management wishes to arrange for the redemption of certain portions of its currency in United States money when the citizens return home, but at present the only redemption for the savings of the citizens is such clothing and provisions as may happen to be on hand. The outgoing citizens occasionally retain their republic money and bring it back the following summer for a few days of luxury before settling down to work.

The demoralizing effect upon the community occasioned by the millionaires and their sudden riches would be largely obviated if the government had other means of redemption than merely meals and lodgings. If the millionaires could purchase clothing, shoes, pictures and bric-a-brac for adorning their rooms, books, and other useful imperishables, they would still feel the incentive to work, even with a large surplus of profits in hand, for the surplus would be turned at once into such permanent acquisitions. As it is, the only use to be made of large earnings is to spend them on meals and lodgings throughout a long period of idleness. If the imperishables were donated by outsiders, or even manufactured in part by the citizens themselves with machinery and a plant like those of many prisons and reformatories, Mr. George would see his way again to return to the individual enterprise of 1896. It is toward this ideal that his new plans are tending.

New counterparts with the republic of history are continually appearing. The duration of the republic was originally the two months of July and August. Beginning in the fall of 1895, there were five of the summer citizens who persuaded Mr. George to keep them through the winter until the next summer. These he calls his "original residents." They were the nucleus of a colony of 32 in the winter of 1896-97 and of 53 in the winter of 1897-98. These winter citizens, known as "residents," continue the government through the year under the same constitution and laws, but they have become a patriciate, engrossing the offices, the property, and profitable contracts, to the exclusion of the greater number of plebs, known as "summer citizens," who swarm in during the summer. The winter residents elect the president who appoints the administrative officials, and the winter of 1896-97 they adopted a new constitution, providing that no citizen could be a senator or representative who had not been a resident of the republic for one month. This, of course, excluded the leaders of the summer citizens during the first half of their stay, and since during this first month the majority of these leaders were arrested and convicted on criminal charges, they were further incapacitated for election the second month. The outcome has been that the summer citizens, having three-fourths of the votes, have cast their strength for the weak and inefficient winter residents instead of the capable leaders, and the legislature has therefore been almost a nonentity. This is very like ward politics at large. The residents of 1897-98 are planning to remove the

restrictions on summer citizens, and this will again tend to give the political life of 1898 some of the thrill of 1896.

The main obstacle at present to the successful working of the educational and reformatory principles of the republic is the inroads of summer citizens. Experience shows that at least a year's continuous residence is required to saturate a boy with the spirit of self-help and responsibility. The first month or two is a period of depression and discouragement. The boy is arrested and convicted again and again, spends much of his time in jail and on the stone pile, and only begins to reap the rewards of upright and industrious living at about the time he goes home. The boy who stays through the year gets a closer acquaintance with Mr. George and becomes a model citizen. It is intended to increase the number of residents and lessen that of summer citizens, so as to give a preponderance of at least three-fourths of the votes to the former; also to establish another "state" near by exclusively for the summer citizens.

The republic is based upon the wage system. This is a system of indirect coercion, though corporal punishment and despotic control are based upon the slave system. The indirect coercion is far more efficient both as an industrial stimulus and an educational device. It is deliberate and searching: it stimulates thought and self-examination. I saw two boys go without breakfast because on the day before they loafed, and so failed to earn cash for a day's meals and lodging. Mr. George himself escapes the odium of enforcing this harsh penalty, for it is enforced by the boy proprietor of the hotel, to whom it is a matter of business.

In 1895 taxes were levied to support the poor. Finally a bill was introduced in the legislature and enacted into law stipulating that after a certain day the paupers' table supported by the government should be abolished. There were a dozen paupers who had contented themselves with the spare diet of that table. They treated the matter as a joke and predicted that when the day arrived the citizens would do what the charities of New York had always done—feed the hungry, whether deserving or not. But the citizens were taxpayers. When the day arrived the policemen ordered the paupers to move on. They moved, and before night had found work and earned enough to pay for a heavy supper. Since that day there have been no paupers. Of course there is no problem of the unemployed in this Junior Republic, and so the paupers can not throw the burden of proof upon the philanthropists.

If the wages were uniform for all grades of labor, it would be no better than slavery as a means of individual progress. But by grading the pay according to the quality of service, higher motives than the craving for necessities can be evoked. The minimum wages paid by Mr. George are 12 cents an hour for six hours' work, or 72 cents a day. Curiously enough, when boys employers they pay 10 or 15 cents a day higher wages, but they compel their employees to work harder and somewhat longer. Policemen are paid 90 cents a day; the chief of police \$1.25; senators and representatives \$2 a week; police commissioners and other officers \$1 to \$2 a week. Civil-service examinations are held by the civil service commissioners for the policemen and all appointive officials. The examinations cover the common branches of study as taught in the public schools and at the republic.

As is apparent from the foregoing, self-help, self-activity, mutual supervision and control—in short, self-government—are powerful agencies of pathological education. This is likewise shown in the success of the "Cottage row" at the farm school on Thompsons Island (in Boston Harbor). An excellent account of this institution and its methods is found in the *New England Magazine*¹ (No. 2, vol. 22), where Prof. Max Bennet Thrasher, for two years connected with this school,

¹ Copyright by Warren F. Kellogg.

describes the managements and methods in vogue. A part of the article is here inserted:

GOVERNMENT OF BOYS, FOR BOYS, BY BOYS.

The farm school [originally the Boston Asylum for Indigent Boys] is limited to 100 pupils. Boys are taken between the ages of 10 and 14 years and retained until they graduate from the school department, the training there being equivalent to the best grammar school. At the same time they are taught to work, the aim being to fit them so that when they are old enough to go out into the world they will be fitted to meet and grapple with the problems which life will present. As soon as is practicable after graduation places are found for them in offices, stores, shops, or on farms according as their training or natural ability seem to make most desirable. Boys who have committed crime, or are what may be termed bad boys, are not received. The farm school is in no sense a reform school, but rather a home training school for the boys who are under its care. These are usually orphans or the sons of poor widows who, from force of circumstances, are unable to provide a home for some or all of their children.

In addition to the regular course of study there is a manual training course which includes mechanical drawing, carpentry, wood turning and carving, blacksmithing, and printing. All the boys are employed in turn upon the farm for a considerable portion of the time they are at school, obtaining from this and the use of the boats, which they are constantly taught to use and manage, the very best physical exercise. In addition, all in turn perform some part of the household duties, including cooking, baking, the making and mending clothes, and laundry work. The boys have the freedom of a campus several acres in extent and a large and thoroughly equipped gymnasium.

There is no instinct stronger in the minds of children than that of imitation, and no amusement more universal and enduring than that of playing house. My observations at Thompsons Island lead me to believe that while baseball and football, King Philip, tag, quoits, bows and marbles, and a dozen other games came and went, the one interest that never flagged was that in "Cottage row," the city of playhouses which the boys have built, care for, own, and govern. Each election for mayor, aldermen, and chief of police and other officers is just as warmly contested as the last, and when a boy leaves the school he never has any trouble in finding some younger boy to buy his shares in his cottage, while political aspirants for such official positions as he may have held spring up as suddenly as they do in large municipalities.

The settlement originated in this way: During the summer of 1888 the boys were given some pieces of cast-off bedticking to play with. A chance suggestion was made that these would make good tents. The suggestion was adopted, and several tents were set up, each being owned and occupied usually by a number of boys. Scattered at first irregularly over the campus, the tents were eventually arranged in rows at the north end, and all through the summer this was the favorite part of the playground. As the cold weather came on the boys were so reluctant to abandon their little homes that they utilized pieces of board to make them habitable as long as possible. This gave some of the boys an idea to be acted on another season, and when the spring of 1889 opened some of the most enterprising planned to erect a wooden cottage. With the assistance of the superintendent, material was obtained and the house was built. Others followed, and from this beginning the present "city" has developed. The fact that all of the boys who are old enough take the school's course in manual training makes it possible for them to do all of the work themselves. In 1891 it was decided to be best to limit the number of cottages to 12, the possession of each cottage being divided into 12 shares. Certificates of ownership were given for these shares, transferable through the farm school bank. This bank has been a regular feature of the school for some time. The boys deposit

in it whatever money they may earn or have given them and are paid interest on deposits above a certain amount. Each boy has his own bank book and is furnished deposit slips and checks. If he wishes to buy anything, or to pay out money for any purpose, he draws his check as any other business man would do. Mock deeds of the cottage lots are given to the proprietors. The plan seemed to work so favorably that in 1893 the superintendent of the school issued the following proclamation:

Proclamation.

To the Inhabitants of Thompsons Island:

The playground settlement shall be known as "Cottage row." The government organized by the property owners shall be for the general protection, advancement of good order, adjustment of individual rights, and to assist in teaching the duties of citizenship. All matters pertaining to Cottage row and its government shall be entitled to and given the same respect as is due other branches of the school work.

The officers of the cottage government, consisting of a board of aldermen (3), clerk (1), police (3), street commissioner (1), and jury (5), shall perform their duties with the dignity becoming officers in such positions.

The board of aldermen may elect a janitor for the Cottage Row hall and clubhouse and a director for the Natural History room.

The property owners shall obey and respect their superiors in said government; but when circumstances warrant may appeal to the officer in charge or to the superintendent, as in other matters.

CHARLES H. BRADLEY, *Superintendent.*

An election of officers followed the issuing of the proclamation, and long afterwards a city hall 6 by 10 feet was built to accommodate the newly organized government. Another building somewhat larger was erected and called "Audubon hall." This is for a home for the numerous pets which the school possesses, including a monkey, an Angora goat, pigeons, rabbits, and guinea pigs. Three curators are appointed to take care of the animals, under the direction of the board of aldermen. Since the organization of the government the official force has been increased by the addition of a mayor, an assessor, a judge, and a librarian. All of the officers except the judge are elected. The elections have been held once in three months, on the first Tuesdays of January, April, July, and October. A caucus is held one week previous to the election. The ballots used are printed in the school's printing office by the boys and resemble as nearly as possible those prescribed by the Australian system. The judge holds office during good behavior or as long as he is at the school. There has never yet been an instance of a judge having been removed from office.

One of the features of the farm school which has been found very helpful is a small monthly paper, called the Thompsons Island Beacon, written, edited, and printed by the boys. As they naturally choose subjects to write about in which they are interested there have been a number of articles in this paper at various times pertaining to Cottage row. I do not think any description which I could write could be more interesting or more accurate than the descriptions in these articles, and I therefore quote from some of them. The first article gives a very complete account of the machinery of the city government. It is from the issue of March, 1898:

Cottage Row government.

Our principal officers are elected quarterly by the citizens. The mayor is the supreme officer, and it is his duty to preside at the meetings of the citizens, to enforce due observance of the constitution, and to look after the government in general.

The board of aldermen are the mayor's advisers. They assist him in performing his duties, and their chairman takes the mayor's place when absent.

The judge, who holds his office during good behavior, tries all cases, instructs the jury, and passes sentence.

The police department of our government is a very interesting feature. The

citizens elect the chief of police, who chooses his two patrolmen and two detectives. They have a general supervision over all the boys in Cottage row and on the playgrounds, whether citizens or not. All complaints are made to the chief of police, and after looking into the case he applies to the judge for a warrant, and if this is issued makes the arrest. The judge has charge of the case afterwards. At the proper time, within two weeks after the complaint is made, the judge calls the court to order, and the trial begins. Our trials are very interesting, both sides having their lawyers and witnesses.

The street commissioner, who is elected by the citizens, has charge of the appearance of the row. The cottages are divided into three wards, and a waste barrel is placed in each of the wards. It is the duty of the citizens of each ward to take turns in emptying the barrel, and if a citizen fails to empty in his turn, he is tried and punished. All the citizens are on the same level in this line.

It is the duty of the assessor to set a value on all the cottages and raise it on all improvements.

The city clerk, who is appointed by the mayor, has to make note of all that takes place in the government, such as keeping a strict account of all the shares in the cottages, issuing all certificates and deeds, and making out the minutes of all meetings of the citizens and of the court. His desk, which is in the city hall, contains note heads, envelopes, certificates, and deeds, all of which are printed in our printing office. The clerk also acts as treasurer and has care of the government funds, which are deposited in the farm school bank.

The citizens meet every three months for a caucus and election. The board of aldermen meet about every two weeks, so the affairs of the government are well looked after.

As our city hall is not large enough to accommodate all the citizens, our meetings and trials are held in the large schoolroom, visitors always being welcome. The presiding officer uses a gavel which Mr. Bradley presented to Cottage row, made of wood which he got at Mount Vernon, Va.

Another interesting feature of our government is Audubon hall, the headquarters of the natural history society. It contains rabbits, guinea pigs, a white Angora goat, and an African monkey called "Mr. Stubbs." The hall is very carefully looked after by three curators, who are under the supervision of the board of aldermen.

HOWARD B. ELLIS, *Clerk.*

Another boy, in the issue for May, 1898, writes of his duties as chief of police:

Police department of Cottage row:

I am chief of police of Cottage row. I have two patrolmen, Chester O. Sanborn and Samuel W. Webber. Our duty is to keep order on the playground and on the grounds of Cottage row and to see that no one breaks windows or does anything that would disturb others or prevent them from having a good time. Anyone who offends in this way is arrested and tried before the court. If found guilty, he is punished by being compelled to stay away from the cottages for a certain length of time or is deprived of the privilege of holding office or punished in some similar way.

WILLIAM C. CARR.

In the June number of 1899 the boy who has succeeded the one whose article I quoted first as clerk describes a Cottage Row election:

Election of officers for Cottage row.

Cottage Row officers are elected once in three months. A week before the election the voters hold a caucus in which are elected nominating committees. The mayor chooses three boys who are to serve on the mayor's nominating committee, and the citizens chose three boys who are to serve on the citizen's committee. These committees each nominate enough candidates to fill the offices. Both committees send in their reports to the clerk who has the ballots printed. On the ballot under each name is a letter "C" or "M," which tells by which committee that boy is nominated. Sometimes one boy is nominated by both committees. The election takes place a week after the caucus. It is held in the first schoolroom. Each citizen takes a separate seat so that no two will be together. The ballots are then passed out. After the citizens are through voting the ballots are collected. Then the mayor, aldermen, and clerk count them. This takes quite a while. During the time the ballots are being counted the citizens take a recess. When the ballots have all been counted the meeting is called to order, and the clerk reads the result of the election. First, he reads the names of all the boys

who were nominated and the number of votes each received; then the names of the boys who were elected. Last of all, the boys are sworn into office. The judge swears the mayor in and the mayor swears the other officers into office.

WILLIAM AUSTIN, *Clerk.*

The caucuses, elections, and courts are held in one of the schoolrooms, in order that all who wish may be present. Of course, only boys who are property holders vote. Ownership of one share admits a boy to all privileges. Usually from three to five boys own a cottage together. All the meetings are managed wholly by the boys. Quite often some of the instructors go in, attracted by an interest in what is going on, but they attend only as spectators. The trials are often very interesting, and there are sometimes so many witnesses to be examined that a case can not be completed in one evening.

Some of the boys develop ability as lawyers which would foreshadow legal talent, and these are always in demand for counsel. When the evidence is all in the lawyers make their pleas, the judge charges the jury, and the latter retires. The jury usually agrees on a verdict oftener, I think, than in real courts. Their verdicts are brought in sealed. Sentences are apt to be very practical, as the article of the chief of police which I have quoted intimates. I remember that once a boy, who was convicted of breaking a window in one of the cottages, was sentenced to mend all the broken glass in the entire city, while another, found annoying "Nannie," the goat, who is tethered on the campus, was condemned to feed and water her for a month.

The cottages vary greatly in size and appearance. The smallest are about 4 by 6 feet square. Others are considerably larger, and some of the more ambitious have a bay window or an L. They are furnished according to the taste and means of the owners. A favorite way of finishing the interior is to line the walls with cheap cretonne of a bright pattern, which is bought by the superintendent in a quantity which admits of its being sold to the boys at a price within their means. Pictures and ornaments adorn the walls, and nearly all the boys have a collection of books, which are moved into the cottages early in the spring and kept there until the coming of winter makes it advisable to bring them back to the main building. The municipality itself also has a library of 300 volumes, given it by various friends. These books are kept in the city hall. The librarian is appointed by the mayor. He has certain regular hours when he is at the hall to give out books and receive those returned, and the library, like that of the school itself, is very freely used. Furniture in the cottages depends very largely on circumstances. Every chair and table which is discarded from the main building is quickly snapped up. Some articles the boys can make for themselves, and their eyes are always open for others. I remember that once the frame of a couch came ashore on the beach with other driftwood. The boy who saw it first obtained permission to go and get it and covered it with excelsior and cretonne. Its possession in his cottage for a time made him the aristocrat of the town.

The first days of spring always see repairs begun all along the street, and requisitions for boards, paints, shingles, and materials of all kinds flood the superintendent's desk. Each cottage is surrounded by a plot of ground, and much taste is displayed in laying out these lawns with grass and flowers. The city hall has a lofty flagstaff and a good flag and several of the cottages have shorter staffs and smaller flags. One winter while I was there when property was low, two boys who were both good carpenters bought a small run-down cottage as a speculation. When it came spring, they repaired it thoroughly and painted it. Then they advertised it to be sold at auction, held the sale, though neither of them had ever been at an auction in his life, and cleared \$2.50 by the deal.

As I remember now, I should say that the value of the shares in the different cottages varies from about 60 cents each to \$1.10. Of course, a boy who has no money can not buy stock, but if he has money he can make any trade which seems

to him desirable. The shares bought, he draws his check for the amount, and the seller deposits this check to the credit of his account. In this practice in banking, in the management of real estate, and the learning to adjust prices to values and in the conduct of the city government, I think these young voters of Cottage row become better versed in the duties of citizenship than many adults ever do.

No account of the farm school would be complete which did not give a fuller description of the farm itself than I have yet done in this article, since that branch of the industrial work may be looked upon as the foundation of the system. In the 157 acres comprised in the area of the island there is practically no land that is not available for grazing and used for one or other of these purposes. It is the rule that the work of each boy for the first six months he is at the school shall be on the farm. In many cases the pupil remains longer on the farm, or is detailed to that work again. Visitors to the school almost always comment upon the rugged, healthy appearance of the pupils. There is no doubt that the good health which they enjoy and the sound constitutions which most of them seem to possess are in no small measure due to the healthy outdoor work. While there is no intention of making farmers of the boys, unless they develop a special fitness for it, many have been influenced by their early training at the school to follow farming as a means of earning a living. There is a large orchard of apple and pear trees upon the island and a garden of generous proportions furnishes an ample supply of fresh vegetables in their season and to store for winter. The farm produces all the potatoes and vegetables for the entire establishment. A herd of 25 good cows supplies all the milk needed. The yearly crop of hay is about 100 tons.

At least a bare mention must be made of three other important features of the school: The excellent library, now numbering over a thousand volumes, all standard books, many of them given by friends of the school and all very freely used by the boys; the great flower garden, in which each boy has his own individual garden to care for, and the military vacation camp for the boys, established in 1898 on Oak Knoll, one of the most beautiful parts of the island.

For nearly half a century the Farm School Band has been in existence and has been a helpful and pleasant feature of the school. This band was organized in 1857-58, such few instruments as were then available being used. The next year a set of second-hand instruments was hired. Later a set of first-class instruments was bought, and these have been replaced as occasion required and added to at times by gifts until the organization is now very well equipped. The band numbers from 25 to 30 pieces, and a supplementary organization of the same number of younger boys is maintained from which players are promoted to fill the vacancy in the band proper made by one of the older boys leaving the school. The boys practice in their playtime, except when they are sometimes drilled in the evening by one of their number, or when once a week, except in the winter months, a competent instructor from the city comes down to drill them. They take a great deal of pleasure in the work, and it is seldom during the daylight hours that the tooting of one or more horns in practice is not to be heard coming from the gymnasium. Some of the boys develop decided musical talent. Many continue to play in bands after they leave the school as a means of adding to their income, and several have followed music as a profession and achieved success. The band has frequently gone to Boston to give its assistance to various undertakings. It has played in Tremont Temple, and at the time of the Peace Jubilee, in 1872, was invited to join the orchestra there, playing beside noted bands from all over the world. The band has been occasionally asked to play at the Soldiers' Home at Chelsea for the veterans there, and for the last two years has played on Decoration Day for Thomas G. Stephenson Post 26, G. A. R., of Roxbury.

The question is sometimes asked, "How can Thompsons Island be reached from

the mainland?" There is no regular public means of communication. Once a month, from May to October, one of the boats of the Nantasket Line stops at the school wharf on its way down the harbor, and stops again later in the day on one of its return trips. This enables the relatives and friends of the boys to come and see them. These days are known as visiting days, and the date and hours are announced by cards, which are printed at the school and which the boys send to whomever they wish. For all other visits to island it is necessary to arrange with the superintendent. The school has its own steam launch, knockabout, and several rowboats, ranging in size from a stout ten-oared boat down to one which one boy can row. A capacious scow, towed by the steamer, is used for handling freight. Whenever it is necessary the steamer is used for crossing; but in pleasant weather one or more boys frequently cross in rowboats to carry passengers and light freight, or to do errands. The older boys are thoroughly trained in the handling of boats of all kinds.

In the terrible storm of November, 1898, the island and school suffered severely. Four large schooners which dragged their anchors at their moorings between Thompsons Island and Castle Island drifted in upon one another against the base of the school's wharf. The last of these to come in greatly damaged the break-water and wharf and, striking the school's steam launch, where she was moored, sunk her and completely demolished her. The landing floats were carried away, three valuable rowboats were crushed, and much other serious damage was done, especially to the dikes which protect the low land of the island from the salt water. By the generosity of friends of the school the steamer and rowboats have been replaced. It has been a pleasant fancy, suggested perhaps by a knowledge of the early pilgrims to this island, to give the boats names suggestive of that event. The steamer, the largest boat, is named the *Pilgrim*. The rowboats are respectively *Mary Chilton*, *Priscilla*, *Brewster*, *Standish*, and *Bradford*, while the freight barge bears the name of sturdy *John Alden*.

The value of an undertaking is measured by its results. Since the farm school has been in existence it has cared for 1,800 boys. Most of these have grown to make good and useful citizens. Some have achieved well-earned distinction. If the parent who raises up one good son is said to have done his country a service worthy of commendation, surely credit is due an organization which has sustained a parental relation to so many sons.

SCHOOL GOVERNMENT.

The question of discipline in school, notably during the time of adolescence, has always been a difficult one to solve. Says Prof. Edward J. Goodwin, of New York:

"German children are trained to submit to authority, but our boys must be taught to govern themselves. The former are to be subjects of a monarch, the latter are to participate in the government of a free state. This difference in the purposes of school government involves a corresponding dissimilarity in methods of discipline. In the one country the control of the school is direct, absolute, and sometimes severe; in the other the teacher constantly appeals to the reason of both pupils and parents, and exercises strict authority under the law only as a last resort. To bring a school under effective control by methods that command the assent of reasonable and liberty-loving pupils is just as difficult, and quite as essential, as to give skillful instruction in the several subjects of study. Our boys, as we believe, must have a definite degree of freedom of action, the larger the better so long as the proper work of the school is not interfered with."

This problem seems to have been solved in Chicago by the novel device of changing the school into a self-governing body. Prof. C.W.

French, of the Hyde Park High School, in Chicago, writes on this subject in the School Review of January, 1898, as follows:

While the problem of school government is one of the most important of the whole range of school life, it has received but little attention, comparatively, at the hands of educators. If our system of education has failed to reach its highest ideals in the past, our methods of school control have been at least as much to blame as our methods of instruction. Teachers have been so absorbed in their efforts to develop the intellectual life that they have too often neglected the cultivation of the motive powers. The brain has been taught to do its work well, but the will, the supreme endowment of mankind, has been left to work out its own salvation or destruction without direction or training.

Our free-school system was organized expressly to fit the youth of the land to discharge intelligently the duties of citizenship. It was believed by our forefathers, and with reason, that a free Government could not be maintained in its integrity without the free school, which was accordingly organized and fostered with the expectation that it would become the corner stone of the great structure of American civilization.

We live in the midst of democratic institutions under a representative government, yet our schools, which are intended to fit the youth of the land to participate intelligently in the various functions of such institutions and government, are essentially undemocratic and are controlled by a power which is nonrepresentative and in form, at least, autocratic.

The citizens of a political community have a voice, through their representatives, in the formation and execution of the laws by which they are governed, but the citizens of the school community—for the school is a distinct community by itself, with the interests and latent possibilities, if not with all the functions, of the larger community outside—are subjected to a control which is the very antithesis of a democratic government. And yet men wonder that the rising generation is so poorly fitted to take up and discharge the duties and responsibilities of citizenship. How is it possible to escape the conclusion that political incompetency is the direct and logical outcome of such a condition of affairs?

It is to be noted, further, that while methods of school government are perceptibly moderating in rigidity and severity and are becoming liberalized so as to give more freedom of action and a wider range for the development of individual tendencies, the system itself is as yet unchanged in principle and essence. It is still autocratic, although the slave-driver's whip has given place to the gilded scepter.

This state of things can not continue. Our civilization has reached the point where it demands not the reformation of the old system, but its abolition and the adoption of a radically different one. Already Great Birnam wood is coming to high Dunsinane hill and Macbeth's reign is ended.

The attention of the educational world is gradually, but surely, being attracted to this problem and many attempts are being made to solve it. It is the purpose of this article to describe very briefly an experiment which is being tried in one of our larger high schools along the lines of what has been called, perhaps unfortunately, "student control" and which has been accompanied by some results which are interesting and perhaps significant.

It should be said that the object of this movement is twofold: to teach the pupils to discriminate between right and wrong in their relations to their mates and to the school and to develop within them the will to do the right and shun the wrong; in other words, to substitute a wise and intelligent self-control for a system of external government.

In the main building of the school in which the experiment is being tried, more than 1,000 pupils, young men and women, ranging from 13 to 21 years of age, are

seated in sixteen rooms, including a large assembly hall. The remaining 400, who are seated in another building, have not as yet been included in the new system.

After a somewhat extended discussion of the whole subject with both teachers and students, which made all fairly familiar with the reasons for and motives of the new departure, and engaged their more or less active interest, the initial step was taken last May, two months before the close of the year.

After a short trial some changes were found desirable in the details of the plan which is now in operation, as follows: Each room elects in regular form a representative to a body, which is partly legislative and partly executive in its functions, called the senate. This body elects a president and secretary, appoints the necessary committees, and assumes control of the order in the halls, and of the care of the furniture and building. It formulates a code of laws and appoints a corps of tribunes, to carry them out. These laws are read to the students in each room, and carefully explained so that the reasons for their adoption and the methods of their enforcement are clearly understood, and then are posted in conspicuous places. Whenever classes are passing through the halls, the tribunes are stationed in all the strategic points throughout the building to see that the rules are observed.

The senate also appoints a court of three judges, to whom all cases of lawbreaking are reported, and before whom the more serious ones are tried, with the customary procedure of prosecution and defense. The judges, very wisely, make their administration reformatory rather than punitive in its purposes, and seldom find it necessary to inflict a penalty.

This, in brief, is the outline of the organization, which is of interest only because of the results which it produces. It will be noticed that this scheme of government is distinctly a representative one, and that each pupil can justly feel that he is an integral part of the system. Moreover, the whole body of the students, with very few exceptions, are intensely loyal to the idea. They take pride in the recognition of their rights, and they also feel that they are individually responsible for the welfare and the good name of the school. As a result of this the old spirit of a forced submission to authority is passing away, and in its place is coming a voluntary submission to the general rules of good behavior as embodied in the laws which they themselves have made and adopted; and it is especially interesting to observe that these laws are stricter than those under which they lived during the old régime.

When the experiment was begun, the senate was told explicitly, that for two months the designated functions of the school would be put unreservedly into their hands, and that neither principal nor teacher would interfere with their administration, either to hinder or to help. This announcement was made with some hesitation, but it was determined to give them an absolutely fair trial, and the result demonstrated the wisdom of the position.

The results already manifest are many and far-reaching. They penetrate every function of school life and influence all its relations. There is a better spirit displayed throughout the school, and it is the general verdict of the teachers that never before has the control of the class-rooms been so easy, and it is certain that the number of cases of discipline referred to the principal has materially decreased.

Two important results are evident even to the casual observer. The first is that excellent order is maintained in the halls without any interposition on the part of either principal or teachers. From 5 to 800 students are required to change their rooms at the end of each period and frequently to go from the first to the second floor and the reverse. At every turn and on each of the landings stands a serious and dignified boy or girl, and the slightest disorder is promptly but courteously checked. There is no unseemly haste, no conversation or laughter, but each student goes quietly and promptly to his appointed room, and the whole change is made in four minutes or less.

The second result is to be noted in the change of disposition. Under the old régime, the absence of a teacher from his post removed all visible restraint and frequently resulted in an outbreak of conversation and laughter, and by some it was even considered quite proper to evade the watchfulness of the teacher and to indulge in forbidden pleasures. The very fact that an arbitrary restraint is imposed upon a person by a superior authority, even though its reasonableness is recognized, will frequently arouse antagonism and inspire a spirit of rebellion. Under the new régime this attitude of mind is disappearing. There seems to be no difference in the general conduct, even if no tribune is in sight, and I believe that the present order would be maintained, at least for a time, even if the whole corps of tribunes should be withdrawn. They can hardly be dispensed with, however, because they stand as representatives of the student body and are symbols of its authority. Their presence gives a new dignity to school citizenship and is a constant inspiration to every one who passes by.

One question which was seriously discussed and which many feared would prove an obstacle to the success of a new system, related to the attitude of a student towards an offender. Under a system of self-government would he be willing to give information which should lead to the discovery of a law breaker, when that information should be given to the officers whom he himself had helped to constitute? It was finally decided not to define an issue on this point, nor even to require the students to commit themselves in advance, but to keep still and let the matter take care of itself. And it has been observed with interest that, up to the present time, no student has refused to give his testimony in any case where the integrity of his institution was at stake. In general, such evidence has been given in a manly and womanly way, and no stigma has attached to the witness. If this state of affairs becomes permanent, it will prove a strong argument in behalf of the system.

Of course, the adoption of this system does not constitute the desired revolution, but it must be expanded and adapted to meet all the contingencies of school life, and still further experiments are being continuously tried. The next step has been taken in connection with the senior class, who sit together in the assembly hall and number about 225. They have been selected both because they are the most serious and mature students in the school, and because an exceptional opportunity for the development of this system is offered by the fact that they sit together in one room.

It is impossible as yet to speak definitely of results. The chief features of the organization may be gathered from the following extracts from the constitution, which was drawn up by a committee appointed by the class:

PREAMBLE.

We, the students of the Hyde Park High School sitting in the assembly hall, in order that we may secure training in free government, develop our powers of self-control, and more fully know our relations as individuals to society, do adopt and ordain this constitution as a basis for the student government of the assembly hall.

ARTICLE I.—*Legislative.*

SEC. 1. All legislative powers herein granted shall be vested in a house of representatives under such restrictions as are herein made.

SEC. 2. The house of representatives shall be composed of representatives elected, one from each district, for a term of twelve school weeks, except as provided in section 3 of this article.

* * * * *

SEC. 7. The house of representatives shall convene at 2.15 o'clock on the first Monday after the election of its first members, and every second Monday thereafter, and may continue in session as business may require.

SEC. 8. Special sessions may be held at the call of the president of assembly hall.
* * * * *

SEC. 10. *Clause 1.* The house of representatives may provide that any bill, resolution, order, or other enactment which it may pass shall be submitted to a popular vote of the students for approval or rejection, and a majority of the votes cast concerning such measure shall determine the result.

Clause 2. If any measure so submitted shall be approved by the students it shall take effect as provided, but if any measure so submitted shall not be approved by the students it shall not have any force.

Clause 3. If within three school days after the passage of any bill, resolution, order, or other enactment 50 students shall petition that such measure be submitted to a popular vote it shall be so submitted.

Clause 4. The house of representatives shall provide for executing the provisions of this section.

SEC. 11. The house of representatives shall elect a clerk from the students of the assembly hall not members of itself, who shall serve for six school weeks and whose duty it shall be to keep a record of the proceedings of the house of representatives, to safely keep all records and documents belonging to the student government of the assembly hall, and to file all laws and other enactments in an orderly manner.

SEC. 12. The house of representatives shall have power to organize its own committees and make its own rules; to compel the attendance and good behavior of its members by such rules and penalties as it may choose to adopt; to expel, by a two-thirds vote of its members, any representative whom it may deem to have proven unworthy of the office; to define and provide a penalty for all offenses against the students of the assembly hall; to provide for the general order and interests of the assembly hall; to make such laws and provisions as shall be necessary for exercising the powers herein granted, and for applying all other powers and provisions vested by this constitution in the student government of the assembly hall or any department or officer thereof; to create and name such executive officers, subordinate to those herein provided for, as it may deem necessary; to organize them and provide for their regulation; to make laws for regulating the elections and determining the public will; to provide for the regulation of the board of chancellors, and for the procedure in all trials before it.
* * * * *

ARTICLE II.—*Executive.*

SEC. 1. The executive powers herein granted shall be vested in a president, a supervisor of wardens, and a prosecuting attorney.

SEC. 2. The president shall be elected by popular vote from the students of the assembly hall for a term of eighteen school weeks.

SEC. 3. *Clause 1.* The president shall preside over the sessions of the house of representatives.

Clause 2. He shall have the general supervision of the executive department and shall see that the laws are faithfully enforced.

Clause 3. He shall have power to nominate, and with the consent of the house of representatives, to appoint the members of the board of chancellors, the supervisor of wardens, the prosecuting attorney, and all other officers of the student government of the assembly hall whose appointments are not herein otherwise provided for, and who shall be established by law; but the house of representatives may vest the appointment of such inferior officers as it may think best, in the president alone, in the board of chancellors, or in the head of any department.
* * * * *

Clause 5. He shall have power to remove from office for incompetency or neglect of duty the supervisors of wardens, the prosecuting attorney, or any officer of his appointment, except the members of the board of chancellors whose removal is not otherwise provided for.

SEC. 4. *Clause 1.* The president or any member of the board of chancellors shall be subject to impeachment, by any twenty-five students sitting in the assembly hall, for neglect of duty or violation of the trust conferred in him.
* * * * *

SEC. 5. *Clause 1.* The supervisor of wardens shall be appointed by the president, and shall hold office during good behavior and the term of the president.

Clause 2. It shall be his duty, with the assistance of his subordinates, to enforce the laws; to apprehend offenders and bring them to trial before the board of chancellors; to assist in the collection of evidence and otherwise promote the prosecu-

tion of offenders as the prosecuting attorney may require; to execute such provisions as may be made for the general order and welfare of the assembly hall.

SEC. 6. *Clause 1.*—The prosecuting attorney shall be appointed by the president, and shall hold office during good behavior, and the term of the president.

Clause 2.—It shall be his duty to look after the interests of the students of the assembly hall in all cases before the board of chancellors, to see that all apprehended offenders are prosecuted, to execute any provisions, orders, or instructions which the house of representatives may intrust to him.

ARTICLE III.—*Judicial.*

SEC. 1. The judicial powers herein granted shall be vested in a board of chancellors, which shall consist of five members, appointed by the president.

SEC. 2. Each member of the board of chancellors shall hold office during his good behavior.

SEC. 3. Three members of the board of chancellors shall sit at each and every judicial session as a court to try and determine all cases within the jurisdiction of this government.

SEC. 4. The member first appointed to the board of chancellors by the president as herein provided, shall be the presiding chancellor, and shall sit at all sessions of the board.

SEC. 5. Two members of the board of chancellors shall sit at each session of the board as associate chancellors.

SEC. 6. The sittings of the associate chancellors at the sessions of the board of chancellors shall be so apportioned by law, that no associate chancellor shall sit at more than two consecutive sessions. * * *

After quoting some editorials of the students' own paper, the White and Blue, which reflect the sentiments of the school, he concludes by saying:

In conclusion it only remains to be said that this experiment was undertaken with much doubt and with some hesitation, but with the firm conviction that some system of the kind must be adopted in the near future. The results, however, have far exceeded our expectations, if not our hopes, and the belief that the new departure, when wisely organized and fully developed, would work an important revolution in school life, has become almost a certainty.

Similar to the Junior Republic is the School State at Ellicott City, Md. The subjoined constitution of that state will explain its objects and mode of management. The principal, Mr. J. M. Gambrill, offers the following word of explanation:

The system of pupil government known as the "School State" was introduced in the Ellicott City schools early in the school year 1900-1901. It was adopted with the sole idea of improving the tone of the schools, of training in the power of self-government, and of imparting a practical knowledge of civil government, though it seems to have attracted not a little notice from the public.

The idea of pupil government is thoroughly in harmony with the principles of the "new education." Spencer declares, in his great classics, that the object of discipline is to make a self-governing being, not a being to be governed by others. No very profound knowledge of ethics or human nature is required to perceive that permanent effects on the character must be wrought through impressions on the will of the subject and the exercise of his own self-activity.

The School State is the most complete and fully organized system of pupil government, so far as the author's knowledge extends. The origin of the movement is accredited to Principal John T. Ray, of Chicago. His plan consists in the appointment of class officers called tribunes, who perform a good many of the duties usually assumed by the teacher. There is also a "senate government," and a form known as the "school city," which latter approaches more nearly than any other to the School State. So far as the writer knows, no system of pupil government has heretofore been adopted in Maryland.

During the recent (School State) administration of Governor J. Clifton Harmon arrangements were made for the codification of the laws, the work being done by Charles Alfred Shreeve, formerly attorney-general. The principal was requested to make arrangements for the publication of the constitution and code, which are now issued with the twofold hope that they may aid and simplify the workings of the School State, and tend to perpetuate its existence.

J. M. GAMBRILL, *Principal*.

CONSTITUTION OF THE SCHOOL STATE, AT ELLICOTT CITY, MD. ADOPTED DECEMBER 17, 1900. AMENDED MARCH 6, 1901. AMENDED MAY 17, 1901.

ARTICLE I.

SEC. 1. The purpose of this constitution is to organize the Ellicott City public schools as a School State. When agreed to by the teachers and three-fourths of the pupils it shall be adopted by the departments so voting. The details of such voting, and of all elections, shall be under the direction of the principal.

SEC. 2. As far as practicable the constitution of Maryland shall be the standard in all cases not otherwise provided for in this instrument or by law; and, as far as practicable, the several departments of government shall be guided in the conduct of business by the laws and customs which obtain in the corresponding departments of the government of Maryland; and of the practicability the principal shall be the judge.

ARTICLE II.

SEC. 1. All officers shall serve for a term of two months and until their successors are elected and qualified; and terms of office shall begin on the second Monday, or the next school day thereafter, of alternate months.

SEC. 2. The qualifications of all officers shall be a standing of 90 per cent in deportment and 75 per cent in scholarship. If any officer shall fall below this record after his election, for two consecutive weeks, he shall be thereby disqualified and the vacancy filled according to law.

SEC. 3. Any officer who shall be twice convicted of breaking the laws of the School State shall be thereby disqualified for the remainder of the term for which he was elected or appointed, and the vacancy filled according to law; and if, in the opinion of the court, the crime is of a specially culpable nature, then the offending officer may be declared removed by the court for the first offense.

SEC. 4. Each officer shall qualify by taking an oath of office in the manner prescribed by law.

ARTICLE III.

SEC. 1. The chief executive officer of the School State shall be a governor, who shall always be elected from the high school department.

SEC. 2. In the absence of the governor his powers and duties shall devolve upon the president of the senate, the speaker of the assembly, and the attorney-general in the order named.

SEC. 3. The two upper departments only shall vote for governor.

ARTICLE IV.

SEC. 1. The governor shall appoint, by and with the advice and consent of the senate, a secretary of state. It shall be the duty of the secretary of state to attend all meetings of the general assembly and of the senate, to keep a record of the attendance of the members and of all proceedings, and to record the yea-and-nay votes of the members; to have the custody of the great seal of the School State, and to preserve the official copies of all laws.

SEC. 2. As soon as possible after its organization each general assembly shall elect a state treasurer.

SEC. 3. An attorney-general shall be elected by the high school department, and a state's attorney shall be elected from the high school and one from the grammar school department. If possible, they must be persons who have been admitted to the practice of law in the School State. They shall prosecute all cases for the state and may grant a nolle prosequi in any case with the consent of the court.

SEC. 4. A clerk of the courts and deputy shall be appointed by the governor, by and with the advice and consent of the senate. The clerk (or deputy) shall keep a record of the proceedings and testimony given in the circuit court, and shall also act as clerk of the court of appeals.

SEC. 5. A sheriff shall be elected by the pupils of the two upper departments, and the chief of police and the first two sergeants shall be deputy sheriffs in the order named. It shall be his duty to serve (personally or by deputy) all writs issued by the courts. The governor shall appoint a chief of police and four sergeants with necessary patrolmen. These officers must see that the laws of the School State are obeyed at all times, and report to their chief or to the sheriff all offenders. The sheriff shall instruct and supervise the police in their duties and see that the said duties are performed, and shall report all offenders against the laws of the state to the attorney-general and state's attorney. Neglect of duty on the part of the sheriff or police shall be punished as the assembly shall decide by law, and, in the absence of such legislation, in the discretion of the court.

SEC. 6. Lawyers, in order to practice in the School State, must pass a satisfactory examination given by the principal, and possess a certificate of the same. All such certificates shall be registered by the clerk of the court.

ARTICLE V.

SEC. 1. The legislative powers of the School State shall be vested in a general assembly. The several departments shall be entitled to representation as follows: High school department, 1 member from each class and 4 at large; grammar school department, 1 member from each class and 2 at large; intermediate department, 2 at large; primary department, 1 member at large; by all the departments, 1 teacher.

SEC. 2. At the first meeting of every assembly a speaker shall be elected. The assembly shall meet regularly every Friday (that is a school day) and may meet more frequently if necessary for the transaction of business.

SEC. 3. The members from the high school department shall constitute a senate. They shall elect one of their number president and shall have power to legislate on subjects pertaining exclusively to the high school department. The senate may be convened by its president at any time.

SEC. 4. When a bill shall have passed the general assembly in the manner prescribed by law, it shall be sealed with the great seal and transmitted to the governor for his approval by the secretary of state. If the governor approve the bill he shall sign it in the presence of the speaker of the assembly, the president of the senate, and the secretary of state, or any two of them; the bill shall then be a law. If the governor disapprove of the bill he shall return it to the general assembly within three days, with his objections, or at the next meeting of the general assembly, if there be no meeting within three days. The bill when returned shall again be voted upon, and if three-fifths of the members vote in its favor it shall become a law. If the governor retains a bill more than three days it shall become a law the same as if he signed it.

SEC. 6. The sheriff or deputies shall read every law immediately after its final passage and upon the order of the secretary of state, in each department, and no citizen shall be liable to any penalty for violating a law until after such reading.

ARTICLE VI.

SEC. 1. The judicial power shall be vested in a circuit court and a court of appeals. The members of the circuit court must, if possible, be persons who have been admitted to the practice of law in the School State.

SEC. 2. The circuit court shall be composed of three judges elected from the high school department, two from the grammar school department, and one teacher elected by both.

SEC. 3. The circuit court shall have jurisdiction over all cases arising under the laws of the School State, unless otherwise provided by law. It may call accused persons and witnesses before it, and in the absence of legislation may punish contempt in its discretion.

SEC. 4. The principal shall be, ex officio, a court of appeals. An appeal may be taken to this court in any case, but if the decision of the circuit court is sustained the accused is liable for extra penalty, in the discretion of the court.

SEC. 5. The judges of the circuit court shall elect at their first meeting one of their number to be chief judge. The chief judge shall then name one of the associate judges to preside in his absence.

ARTICLE VII.

SEC. 1. Bills of indictment shall be drawn by the attorney-general or a state's attorney. The attorney-general or a state's attorney shall then ask the court to summon the accused person and the witnesses before it and try the case.

ARTICLE VIII.

SEC. 1. The governor must not practice law by acting as counsel in any case while in office. Judges of the circuit court can not plead before that court in any case while in office.

SEC. 2. No person shall hold more than one office under the School State, but no person shall be exempt from police duty except the governor, attorneys for the state, and judges.

ARTICLE IX.

SEC. 1. Inasmuch as the principal of the schools is responsible to the school authorities for the conduct of the schools it is expressly understood that all acts, executive, legislative, and judicial, are subject to his approval.

ARTICLE X.

SEC. 1. The governor, secretary of state, treasurer, president of the senate, speaker of the assembly, and attorney-general shall constitute a board of public works. It shall be their duty to hold at least three meetings during their term of office, and to take proper steps for public improvement of every kind. The governor shall be chairman of the board, which shall meet on his call.

SEC. 2. There shall be a board of health composed of two members elected from the high school department and one from the grammar school department. They shall elect their chairman and hold at least three meetings during their term of office. They shall take proper steps for preserving the health and promoting the comfort of the citizens of the School State.

SEC. 3. The board of public works and the board of public health shall each make a written report to the general assembly and to the principal of their proceedings. A secretary to perform this work shall be named by the chairman at the first meeting of each board.

ARTICLE XI.

SEC. 1. Any officer may be removed by the governor for neglect of duty, provided that an appeal shall lie to the senate. When such a case is tried before the senate the governor shall present his reasons for removing the officer and prosecute the case. The governor may be impeached and removed by the senate. When the governor is on trial the chief judge of the circuit court shall preside, and the president of the senate shall not sit in judgment. The senators shall take the judge's oath before the trial begins, said oath to be administered by the chief judge of the circuit court.

CODE OF LAWS.

An act adopting and legalizing the code of public general laws of the School State, prepared by C. Alfred Shreeve, in pursuance with a resolution of the general assembly (April 25, 1901) entitled "A resolution to provide for a commissioner to codify the laws of the School State," and declaring the same to be the "Code of public general laws of the School State."

SEC. 1. *Be it enacted by the general assembly of the School State*, That the code of public general laws of the School State, as prepared by C. Alfred Shreeve and submitted to the general assembly in pursuance with a resolution of the general assembly, entitled "A resolution to provide for a commissioner to codify the laws of the School State," the several chapters, articles, and sections of the revised code of School State laws (March 11, 1901), which are hereby repealed and reenacted, with amendments as contained in the code of public general laws of the School State, be, and the same are hereby, approved, adopted, and declared the code of public general laws of the School State in lieu of and as a substitute for the laws in effect on the 14th day of May, A. D. 1901.

SEC. 2. *Be it further enacted*, That this act take effect from the 15th day of May, in the year of our Lord 1901.

Approved, May 14, 1901.

J. CLIFTON HARMAN,
Governor.

FRANK BURTON,
Secretary of State.

J. MONT GAMBRILL,
Principal.

[SEAL.]

Approved, May 15, 1901.

ARTICLE I.—*Judiciary.*

SEC. 1. The courts of the School State are courts of law and equity. The same procedure shall be followed by the court of appeals when exercising original jurisdiction as hereinafter prescribed to be followed by the circuit court in criminal cases.

SEC. 2. The circuit court shall convene at the call of the chief judge, or any three associate judges, and proceed with the trials of such cases as the attorney-general or a state's attorney may be ready to prosecute, and such cases shall be tried as soon as possible after the attorneys for the state shall have notified the court of their readiness to proceed. Three judges must be present to adjudicate a case.

SEC. 3. When the court shall have been called to order the prisoner (who shall have been previously brought by a bench warrant upon the indictment) shall be arraigned—while standing the indictment against him being read by the clerk and prisoner pleading guilty or not guilty—and the plea recorded by the clerk.

SEC. 4. If the prisoner pleads guilty he shall at once be sentenced in the manner prescribed by law: *Provided*, That the court may hear testimony in order to determine the exact nature of the offense.

SEC. 5. If the prisoner pleads "not guilty," the trial shall proceed.

SEC. 6. Counsel for the state and defense, in the order named, may make opening remarks upon the line and character of testimony to be presented.

SEC. 7. Witnesses shall be called at the direction of the chief judge, or presiding judge, for the state and for the defense and for the rebuttal by the state, in the order named. When each witness has given his testimony, the opposing side shall have the right to cross-question, but such questions must be confined to the matter already brought out in the witness's testimony or examination in chief, unless not objected to by the opponent. The side bringing the witness may recross-examine. The court may rule out a question which it deems irrelevant or improper.

SEC. 8. All testimony being in, the counsel on each side (not exceeding two, except that the state closes) may present the argument of his side, the state having the right to open and close.

SEC. 9. The court shall then determine the verdict within three school days, which shall be announced by the presiding judge, as follows:

"In the case of the School State *v.* _____, the verdict is _____ ('guilty' or 'not guilty')."

SEC. 10. If the verdict is "not guilty," the presiding judge shall dismiss the prisoner; but if the verdict is "guilty," the presiding judge shall pronounce the sentence of the court—the prisoner standing—as follows:

"A B, _____, you having been tried before this court on a charge of _____, and found guilty, are sentenced _____."

SEC. 11. A record of every sentence shall be made by the clerk, signed by the presiding judge, and transmitted to the teacher having charge of the prisoner; by said teacher the sentence shall be executed.

SEC. 12. Every witness, before testifying before any court or judicial body, shall, with uplifted right hand, distinctly answer the following question in the affirmative before being permitted to testify:

"Do you, in your testimony before this court, promise faithfully to speak the truth, the whole truth, and nothing but the truth?"

SEC. 13. Any person who shall testify before any court or judicial body, under the oath prescribed by law, and who shall be convicted of making false statements, shall be guilty of perjury. The penalty shall be in the discretion of the court.

SEC. 14. The clerk of the court shall issue subpoena in the form prescribed by law, directing witnesses to appear before the court when requested by the attorney-general, a state's attorney, the defendant, or the counsel for the defendant.

SEC. 15. Any citizen failing to obey a subpoena or any other writ shall be attached; the said writ to be in form as fixed by law.

SEC. 16. All sentences of court consisting of recesses are to be construed to mean two-thirds of the time now known or hereafter designated as recess. It shall be lawful for the court to allow an alternative of work or time equivalent to the recesses.

SEC. 17. The form of indictment shall be as follows:

School State.

The _____ of the School State does present that _____, late of the School State aforesaid, _____ (recite acts) _____, on the _____ day of _____, in the year of our Lord nineteen hundred _____, which said acts are contrary to the form of the act of the assembly _____ (here may be recited

more counts or declarations), _____, and against the peace, government, and dignity of the state.

Attorney _____.

On the back thereof the following:

School State *v.* _____; indictment; filed _____; witnesses, _____; and (nature of offense) _____.

SEC. 18. The form of the bench warrant shall be as follows:

In the _____ court for the School State.

To the sheriff of the School State, greeting:

We command you to take the bod— of _____ and _____ immediately have before our said court here to answer an indictment for _____.

Witness, the Hon. _____, chief judge of our said court, the _____ day of _____, A. D. 190—.

Issued _____, 190—.

_____, Clerk.

SEC. 19. The form of subpoena shall be as follows:

School State, sc:

To the sheriff of the School State, greeting:

You are hereby commanded to summon _____ to appear before the _____ court _____ of the School State, at _____, on the _____ day of _____ next, at _____ o'clock — m., to testify for _____ against _____.

Witness, the Hon. _____, chief judge of our said court, the _____ day of _____, A. D. 190—.

Issued _____, 190—.

Clerk of Courts for School State.

On the back thereof the following:

_____ *v.* _____, summons: _____

Attorney for _____.

SEC. 20. The form of attachment shall be as follows:

School State, sc:

School State to the sheriff of the School State, greeting:

We command you that without further delay you attach _____, so that you have _____ before our _____ court _____ to answer touching a contempt which he has committed against said court, as is alleged, and further to abide such order as shall be made in _____ behalf _____.

Witness, the Hon. _____, chief judge of our said court, the _____ day of _____, A. D. 190—.

Issued _____, 190—.

Clerk of Courts for School State.

SEC. 21. Any citizen who speaks disrespectfully to the court while in session, libels the judge, tampers with witnesses, disobeys writs or orders, misbehaves while an officer of the court in official action, fails to obey subpoena, refuses to testify, rescues or attempts rescue from an officer of the court, fails to appear under a recognizance, shall be guilty of contempt of court. The penalty shall be not less than two recesses nor more than fifteen recesses, in the discretion of the court.

ARTICLE II.—*Officers.*

SEC. 1. Bribe: Any citizen who may offer to reward any officer for not executing any part of his duties or threatens or disturbs him in the performance of any duties which he may have executed, is executing, or ought to execute, is guilty of a misdemeanor, and on conviction thereof shall forfeit not less than two recesses nor more than ten recesses, in the discretion of the court.

SEC. 2. Commission, appointed officers: The form of commission to an appointed officer shall be as follows:

The School State to _____, greeting:

Be it known that, reposing great trust and confidence in your knowledge, integrity, and love of justice, you are hereby appointed _____ to do equal right and justice according to law in every case in which you shall act under this commission, freely without sale, fully without denial, and speedily without delay, and to hold the said office justly, honestly, and faithfully for _____ or until you shall be duly discharged.

Given under my hand and the great seal of the School State, at Ellicott City, Md., on the _____ day of _____, A. D. 190—.

[GREAT SEAL.]

By the governor: _____.

_____,
Secretary of State.

SEC. 3. Commission, elected officers: The form of commission to an elected officer shall be:

The School State to _____, greeting:

Be it known that the people of the School State, reposing especial trust and confidence in your prudence and honesty, did, on the _____ day of _____, 190—, elect you _____, to hold said office from the _____ day of _____, 190—, for _____ or until you shall be duly discharged therefrom, and to execute the duties of said office with diligence and fidelity, without favor, affection, or partiality, according to law.

Given under my hand and the great seal of the School State, at Ellicott City, Md., on the _____ day of _____, A. D. 190—.

[GREAT SEAL.]

By the governor: _____.

_____,
Secretary of State.

SEC. 4. Convening the assembly: The form shall be, for calling an extra or special session of the assembly, as follows:

The governor of the School State to the members of the general assembly, greeting:

Be it known that, by virtue of the power vested in me by the constitution of this state, you are hereby convened on the day of _____ next at _____ m.

Given under my hand and the great seal of the School State, in Ellicott City, Md., on the _____ day of _____, A. D. 190—.

[GREAT SEAL.]

By the governor: _____.

_____,
Secretary of State.

SEC. 5. Dereliction for neglect of duty by police: The sheriff and police must report all infringements that come to their knowledge of the laws of the School State; and if they neglect to report all or any infringements upon the laws they will be deprived of not less than six recesses nor more than twenty recesses, in the discretion of the court.

SEC. 6. Failure to perform police duty: Any citizen not legally exempt shall, upon request of the officer in charge, go upon police duty temporarily. Failure to comply with said request shall be punished by forfeiting four recesses, unless satisfactory excuse be submitted to the court.

SEC. 7. Nomination to senate: The form of executive nomination to the senate shall be in the following form:

The governor of the School State to the honorable senate of the School State, greeting:

Be it known that by virtue of the power vested in me by the constitution of this state, I hereby submit for your advice and consent the name of _____ for (name of office) _____.

Given under my hand and the great seal of the School State at Ellicott City, Md., on the _____ day of _____, A. D. 190—.

[GREAT SEAL.]

By the governor:

_____,
Secretary of State.

SEC. 8. Oath: Every person elected or appointed to any office under the constitution or laws of the School State shall, before entering upon the duties of the office, take the following oath: "I, (name) _____, do on my honor promise that I will support the constitution of the School State and will be faithful and bear true allegiance to the School State, and that I will to the best of my skill and judgment diligently and faithfully, without partiality or prejudice, execute the duties of the office of _____ according to the constitution and laws of the School State (if a judge), and that I will in all cases fairly and impartially, without affection or prejudice, administer justice to all.

Date _____.

SEC. 9. Pardon: The form of pardon shall be as follows:

The governor of the School State to _____, greeting:

Be it known, that by virtue of the power vested in me by the constitution of this state, you are hereby pardoned for _____, of which you were convicted by the _____ on the _____ day of _____, A. D. 190—.

Given under my hand and the great seal of the School State at Ellicott City, Md., on the _____ day of _____, A. D. 190—.

[GREAT SEAL.]

By the governor:

_____,
Secretary of State.

ARTICLE III—Order.

SEC. 1. Disorder: Disorder in the halls, on stairways, or in class rooms during teachers' absence before, during, or after school, during recess or noon hour is forbidden; and any pupil violating any part of this section shall be, on conviction upon a specifying indictment, deprived of not less than four recesses nor more than ten recesses in the discretion of the court.

SEC. 2. Interference: Any malicious interference with any persons, or serious interference without reasonable cause, is forbidden, either on the school grounds or on the way to and from school; and any citizen convicted of violating any part of this section shall be deprived of not less than two recesses nor more than twenty recesses in the discretion of the court.

SEC. 3. Litter, water, and mud: The throwing of litter, spitting, or carrying an avoidable quantity of mud or dirt, throwing or spilling of water in any of the halls or upon any of the stairways is forbidden; and any citizens violating any part of this section shall forfeit not less than two recesses nor more than six recesses in the discretion of the court.

SEC. 4. Article VIII, section 2, of the by-laws, rules, and regulations of the state board of education, which is: "The use of profane and unchaste language, the use of tobacco in any form, and the carrying of firearms or other dangerous weapons are strictly forbidden," and any pupil who violates any part of this section shall be tried by the court of appeals and punished according to the decision of said court.

SEC. 5. Stairs and hallways: All pupils are to pass up and down from grounds to class rooms only upon the order of the sheriff, chief of police, or officer in charge, and at all times in an orderly manner. There shall be no running, but one step shall be taken at a time; no loud talking or other unnecessary noise; no taking hold of, pushing, pulling, or any interference with others will be allowed. The penalty for violating any part of this section shall be not less than two recesses nor more than ten recesses in the discretion of the court.

SEC. 6. Striking: No pupil shall strike another in malice or anger. The penalty for violating this section shall be not less than four recesses nor more than fifteen recesses in the discretion of the court.

SEC. 7. Treason: Treason shall consist in malicious and false representation of the School State in any official character and in intriguing to prevent the accomplishment of justice; the penalty for violating any part of this section shall be the loss of suffrage and of the right to hold office forever under the School State; this disability can only be removed by a two-thirds vote of all the members of the general assembly.

SEC. 8. Trespass: Trespassing upon the adjoining properties is unlawful without the consent of the principal; any citizen violating this section shall forfeit not less than two recesses nor more than ten recesses in the discretion of the court.

SEC. 9. Trespass, library: The books, periodicals, and all other articles belonging, now or hereafter, to the library in the Ellicott City public schools, shall be taken from the library, distributed, marked, covered, otherwise used, and the library opened only by the librarian, his assistant or deputy, or with the permission or by the command of the principal or a teacher. Any pupil violating any part of this section shall be fined not less than 5 cents nor more than 10 cents, or in lieu thereof forfeit six recesses.

SEC. 10. Mutilating: Cutting, mutilating, destroying, or marking on any part of the buildings, fences, or trees, either on the school grounds, or on the way to and from school, is forbidden; and the penalty for so doing shall be not less than six recesses nor more than twenty in the discretion of the court; if in the opinion of the court the offense is of a specially culpable character the offender shall be sent to the principal for punishment.

SEC. 11. Loitering: Loitering on the way to and from school is forbidden; and any pupil on conviction thereof shall forfeit not less than one recess nor more than six recesses in the discretion of the court.

CHAPTER VI.

INTERNATIONAL ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, ARTS, AND EDUCATION.

INTRODUCTORY SUMMARY.

The progress of science is much like that of industry or of affairs. It moves in two apparently opposite directions, which really complete one another. At one period we especially notice the advances in the division of labor and the corresponding progress of detailed investigation. At another time our attention is called to some great reorganization of our industrial processes, some new concentration of capital, or great development of communications. Similarly in science we see separate workers uniting into larger and larger groups, permanent societies, or temporary congresses, as the case may be, while these again may unite into a larger whole, like the sections of the British or the American Association, for instance. The question has been increasingly asked for many years, Why should these processes stop here? Beyond these national societies must we not have completely international ones? Broadly speaking, there are two ways in which this movement might arise, from above and from below, and both have simultaneously and independently been coming to pass. One very natural and obvious method is that the leading scientific society of each country should cooperate with its peers in other countries. Hence a conference was held in the autumn of 1899 at Wiesbaden, and again at Paris in April, 1901, among the representatives of the Royal Society of London, the Academies of Sciences of Paris, Berlin, Vienna, the Smithsonian Institution of Washington, etc., and arrangements for cooperation in various lines of work have since been under consideration. Thus is being founded something corresponding to a high court of science; to an international senate. But besides this upper house of science there remains room for a lower house also, one more fully representative, more widely democratic, one ready to include all who seek to inquire and to know, to learn and to teach. This time we must include the numberless scientific societies of all kinds and all places wherever these may be doing living work, and with these the universities of the world also. We must similarly aim at meeting the needs of all the specialist congresses, and we must naturally also start from the great gatherings of the workers' democracy of science, such as the British Association and its French, American, and other sisters.

The formation of an international association, beginning with these, has again and again been proposed, notably in America. By the British Association meetings at Montreal and Toronto a few years ago interest was so far aroused that a sum of money is said to have been bequeathed in the United States to such an international association when founded. An active step was made in September, 1899, in consequence of the simultaneous meetings of the British Association at Dover and the French association at Boulogne. It was a moment of the general outburst of opinion against the Dreyfus verdict and of a somewhat wholesale denunciation of France in general and of the Paris Exposition in particular. It was even suggested by a great London newspaper that the British Association should boycott the French one, despite all their arrangements for their friendly meetings. This would have been a hard measure in any case, but to an association mainly composed of Dreyfusards and "Intellectuels," and whose last president had just been a martyr in the cause, it was absurd. The British president, Sir Michael Foster, spoke out manfully in his inaugural address and called upon the association not only for every courtesy during the meetings, but for loyal support of and cooperation with the Paris Exposition and its congresses, with their "first Witenagemote of the science of the world."

Encouraged by this generous and statesmanlike lead, a circular testing the opinion of the association was circulated through its committees, and 500 signatures of approval, many of them among the most eminent in British science, rewarded its initiators beyond their most sanguine anticipations. The welcome of the French Association at Dover and Canterbury, and the cordiality of the return visits to Boulogne will not readily be forgotten by those who shared them. That the first international meeting should be held at Paris in 1900 was on all hands recognized as a matter of course. Besides the French Association, no less than 120 specialist congresses were then to meet, and these in all subjects, from archæology to electricity, physics to folklore, meteorology to medicine, bibliography to automobiles. Here then, was already being organized a general gathering of representatives of all studies and from all countries on a scale far vaster than any had ever before dared to dream. The great building erected at the exposition as its Palais des Congrès was thus the center from which the 120 congresses, with as many thousand members, were organized throughout the summer. The steps toward international cooperation then effected are too numerous for record. But a great additional impulse also came from the University of Paris, lately regenerated. Freed from the official tyranny of the Napoleonic University of France, she is now again the largest of the universities of the world. She is the head, too, of a new system of regional universities, all acquiring a fully German, even an American, completeness and equipment. Here, in fact, is a movement of which British educationalists, perhaps even some American ones, still know too little, since their foreign experience has been mainly derived from Germany; but it is time to recognize that French education, as much as the French army, is something very different from what it was before the war. The great founders of the German universities are no longer with us; those of France are still in full activity, like those of America, and it is no disrespect to the university presidents of America to say that here in Paris an even greater task has been successfully carried through. To cite only two or three names, M. Lavisse, the historian; M. Gréard, the rector, and especially M. Liard, the permanent under secretary of state for higher education, a great initiator, organizer, and administrator in one, should all be better known to all who seek to found or to improve higher educational institutions in other countries.

The University of Paris may now, in fact, be taken as not only reorganized upon the highest German level, but as the center of a clear and conscious endeavor to utilize her special advantages, not only historic, but actual, and again to lead, as she was wont to do, both in the educational and in the scientific movement of

the world. Nowhere in the world is the ancient cosmopolitanism of learning, the internationalism of culture, the unity of science more deeply felt or more nearly recovered. The suggestions of the proposed international association were thus warmly received by the university authorities of France. Following the meeting at University College, London, under the presidency of Sir Archibald Geikie, at which a British branch of the association was formed, a meeting was held in Paris, at the ministry of public instruction, at which the French group was constituted. It was decided by both groups to recruit for the congresses, and also, as far as might be, to utilize the vast object lesson of the exposition, viewed as no idle show, but as the museum of the present. Hence was resolved, as the main work of the educational section, an attempt to explain and interpret the many wonders of the exposition, and to renew both the open teaching and the free discussion of the ancient University of Paris in this vast temporary international university of the present.

A cordial invitation was sent, not only from the French group of the new association, but from the University of Paris, to the universities of the world. Prof. Emile Bourgeois was accredited to Berlin and Prof. Patrick Geddes to the universities of America. German, American, Russian, Belgian, and Swiss groups of the association were thus formed, all to meet in Paris. The story of the new association's work in Paris during the exposition and also afterwards is summarized below, while broadly similar undertakings are now being proposed during and after the exhibition of Glasgow, and with the more adequate time for preparation, and of course fuller experience also, much more may be done at the St. Louis Exhibition of 1903. Suffice it for the present to say that for the interpretation of the Glasgow Exposition, British, French, Russian, German, and American cooperation is already offered, so that whoever wishes scientific interpretation and skilled guidance in this subject or that language—say in electricity or in art, say in matters German or French, Russian or Canadian—may readily find it. The Paris Exposition, as museum of the present, has thus been better interpreted and understood, and that directly by thousands, indirectly by many more. A wide and fruitful action, not only upon education, but upon many branches of science and of art, has thus been going on throughout the last summer. From this temporary outburst of international activity new and more permanent activities are in turn arising, for an international exhibition does not simply take stock and close one period of progress; it may also open a new one. And if in Paris, why not now also in Glasgow? Why not next also in St. Louis?

In this way has, in fact, already arisen a second and not less important field of work for the association—that of endeavoring to utilize these great cooperative but transient bursts of activity which we call international expositions for the more permanent advantage of the cities and countries where they may be held, as furnishing permanent international centers also for some at least of the scientific or educational interests represented. Hence besides its assembly, with its scientific meetings and discussions, it has its interpretation of the expositions, and so on, its museums committee, of the work of which at Paris an account is given below.

I.

GENERAL PURPOSE OF THE ASSOCIATION.

The many agencies, the innumerable individuals, occupied in the sciences or the arts, in education, or in social improvement are increasingly felt to be working in harmony. All are seen to be cooperating in the development of a common civilization, and each advance, whatever its place of origin, speedily oversteps local

and national boundaries. Hence have arisen the international exhibitions and congresses so characteristic of our time. To supplement and to advance this international movement, to record its manifold results and to make them more and more widely accessible, to extend their educational usefulness and further their practical applications are the tasks of this association. Its arrangements toward carrying out these in detail, as by contact with societies and congresses concerned with all branches of knowledge, with the various arts and professions, and with education in the widest sense and on all its levels, are naturally still in comparative infancy, but may be best set forth as planned and partially developed in the course of the association's first international assembly, held at Paris during the exposition of 1900

ORIGIN OF THE ASSOCIATION.

The formation of an international association has been often suggested in recent years and even discussed in various forms, as notably between the American and British associations for the advancement of science and at the Montreal and Toronto meetings of the latter. The present organization dates from the (September, 1899) meetings of the British and French associations for the advancement of science at Dover and Boulogne. Here a very large and representative British committee was formed, including upward of 500 members of the British association alone, among whom may be mentioned Lord Lister, Sir John Burdon-Sanderson, Sir John Murray, Professors Haddon, Lodge, Thompson, Schafer, Howes, and Mavor, and with these many leading representatives of applied science and industry and of chambers of commerce. This general committee held its first meeting at London in October, 1899, and elected as its president M. Léon Bourgeois, so widely known as one of the most progressive of European ministers of education and as a leading representative of the recent peace congress at the Hague. As vice-presidents were elected the Right Hon. James Bryce and Sir Archibald Geikie, with Prof. Patrick Geddes as secretary. A corresponding meeting was held in Paris at the ministry of education, and a French committee was constituted, its president being M. Gréard, member of the French Academy and rector of the University of Paris. Steps toward the constitution of other national groups were reported. M. Léon Bourgeois was elected general president of the whole association, with M. Liard (permanent secretary of state for higher education) as its general secretary.

As the result of these meetings it was resolved to hold the first international assembly of the association at Paris during the exposition of 1900. The cordial approval of the authorities of the exposition having been assured, a substantial initial fund was provided alike within the British and the French committees. The association was incorporated in Britain and in France, and offices were opened at Paris, London, and Edinburgh, and in other European cities; while Professor Geddes spent upward of two months in the United States, bearing not only general introductions as secretary of the British group from Mr. Bryce and Sir Archibald Geikie, but a recommendation and mission to the American universities in particular, this being from M. Gréard in his double capacity as president of the French group of the association and as rector of the University of Paris. The formation of an American group was thus prepared for, leaving the question of organization to be decided later by conference in Paris. Preliminary meetings of the association were held in Chicago, New York, Boston, Philadelphia, etc.

The inaugural assembly of the association was spaciouly, if not magnificently, housed within the precincts of the exposition itself, the buildings of the University of Paris, of the Musée Social, etc.

It is unnecessary here to insist upon the magnitude, completeness, and magnificence of this exposition, with its collections illustrating alike the natural products,

the industries and the arts, the commerce, and the institutions of every country. Despite all criticisms, its arrangement was such as to make international comparison easy, and international cooperation, as well as rivalry, in all main departments of activity, perhaps, most obvious of all.

So vast a material display, alike of the resources of nature, of the applications of science, and of the masterpieces of art, and this in all countries, requires a no less complete immaterial counterpart, a correspondingly wide survey of the world of intellect and of ideals, and a no less full application of the highest aims of special and of general education. Hence, in fact, the two characteristic aspects of a modern exposition, its vast development of congresses, no less than of departments.¹

DEPARTMENT OF CONGRESSES.

The first task of the association and its assembly was thus to cooperate with the various international congresses to be held during the exposition, and, wherever necessary or desirable, to aid the existing agencies in recruiting suitable members for these. To the many specialists of all kinds who attended the exposition without being able to be present at the exact time of the particular congress most interesting to them, the congress information bureau of the association and the special rendezvous which it arranged proved of great service. Thus each member of the association, on reaching Paris, was enabled rapidly to reach its resources and to meet his fellow-workers, French and foreign alike. The international assembly was included in the official list of congresses as the permanent "École internationale de l'exposition."

A wide publicity was given by the association to the literature of many of the congresses held during the exposition, and in several cases it recruited members for these. In return, the congresses similarly brought valuable members to the association and contributed much useful literature. This cooperation is one which admits of great development in future years, of course often, and perhaps more and more frequently, in connection with exhibitions, but not exclusively so.

RECORDS AND GRAPHIC SUMMARIES OF THE RESULTS OF CONGRESSES.

Besides keeping record of the congresses in the usual way, it was attempted, in some measure, to indicate their main problems and to summarize their main results by a full use of graphic methods, not only in relation to the contemporary

¹ Membership of the international assembly was obtained by payment of \$5 or £1, which entitled to one week's active participation in the assembly in Paris, and included five tickets of admission to the exhibition.

For continuance in active membership in Paris a further reduced fee of 12s. 6d. (\$3) weekly was charged.

A season ticket for the whole duration of the assembly was obtained by a single payment of £5 (\$25). This included five admission tickets to the exhibition for each week of attendance at the assembly.

Life membership, with full participation in all future assemblies, wherever held, can be obtained by a single payment of £10 (\$50).

The privileges of membership may be briefly summarized as follows:

1. Information and advice as to traveling arrangements and residence in Paris.
2. Use of information bureaus in London, Edinburgh, New York, and Paris. Letters might be sent to the office of the assembly in Paris and appointments made for meetings with friends there. Special assistance was available for those unfamiliar with French.
3. Expert guidance through the departments of the exhibition during any week of the assembly from May to October.
4. Admission to the lectures of the assembly during any one week, with five tickets of admission to the exhibition grounds.
5. Invitations to receptions, etc.
6. Participation in specially arranged excursions in and around Paris at the actual cost of fares.
7. Advantageous arrangements for attending theatrical, musical, and other entertainments.
8. A copy of the guidebook prepared for the assembly.

movement of the sciences and arts, but to their historic development. This was sometimes usefully correlated with the retrospective collections (Musées Centennaux), which proved so interesting a feature of the exposition. These records and summaries aim at uniting the clearest thought of many minds toward an increasingly synthetic presentment of the historic development, the actual state, and the immediate problems of the sciences, and these in their relation to the progressive forces of civilization.

REGIONAL SCIENTIFIC SOCIETIES AND THEIR PROPOSED COOPERATION IN REGIONAL SURVEYS.

As the great academies have recently begun to collaborate in bibliography and in specific tasks, so for a long time past the minor societies witness the annual meetings of delegates at the British Association, and similarly the Congrès des Sociétés Savantes, whose collective exhibition was to be seen in the Champ de Mars. The possibility of a thorough and useful collaboration lies in the coordination of their many studies in regional survey, in the union of their many lines of work and activity upon the map. The ordnance and the geological surveys illustrate this union most perfectly; but botanical, archæological, anthropological, and economic surveys are all already more or less in progress and only await coordination. This question, discussed at a preliminary meeting in Chicago in March, 1900, has already been laid before the delegates at the British Association in Bradford, in 1900, and will be again discussed.

UNIVERSITIES—THE CONGRESSES AS A PANACADEMIC MEETING.

The unprecedentedly vast and varied assemblages of special workers in all departments which the congresses thus brought together in Paris may also be viewed as an almost equally comprehensive representation of the universities of the world, and of its institutions of learning generally; in fact, as having been an informal, yet perhaps none the less important, panacademic meeting. In this vast gathering of the teachers of all countries, and in the many meeting places which were at their disposal, as well as in their special congresses, all subjects of educational interest were actively discussed, and this amid an increase of that feeling of the international unity of the higher learning, and of the essential amity of its exponents, in which the universities of the Middle Ages and of the Renaissance historically arose and to which those of our own day are returning.

FACILITIES FOR STUDENTS.

The assembly, recognizing that these academic attractions did not appeal to the professoriate only, sought to make the special facilities of the University of Paris, as not only much the vastest, but in various ways once more the completest of modern universities, better known by students as well as teachers, and, in addition to this, endeavored to make more widely known the facilities for the study of French language, literature, history, etc., offered by the summer schools of the Alliance Française and other bodies.

INTERACADEMIC RELATIONS.

That special recommendation of the Association and its work, by the head of the University of Paris, to the presidents and faculties of the American universities, which has been already referred to, may thus be understood in the fullest way as tending, in the first place, to bring together the teachers and graduates of American, French, and foreign universities; and, in the second, to promote, under judicious guidance, that widening of the experience of the student which was so characteristic of ancient universities, and which has been so marked an advantage

of German university life in our own times. In every way, therefore, it tended to promote better interacademic understanding and to strengthen the ties which already link universities throughout the world.

UNIVERSITY EXCHANGES.

The meeting of lecturers from many universities, as remote as Moscow and California, which took place last summer, naturally led to the discussion of university interchanges. Not only suggestions, but definite proposals toward the organization of these are being formulated, and will be brought before the Association at Glasgow.

LECTURES AND SKILLED GUIDANCE.

The majority of visitors to Paris last year came, of course, primarily for the purpose of seeing the exposition as a whole, rather than of attending any of its congresses; hence what was practically the largest department of the assembly's work was that of furnishing interpretation and skilled guidance to all the departments of the exposition, so that the visitor might see more thoroughly those things in which he was specially interested, as well as understand more of the exposition generally.

Throughout the main period of the exposition, and in due proportion to the necessarily varying numbers and requirements of its membership, an ample variety of daily lectures and visits was provided. These lectures were of different types, which may be broadly described as introductory, special, and general; or, more particularly, as dealing with the popular, the artistic, the industrial and commercial, the agricultural, the hygienic, the educational, the geographic, the economic, the social aspects and exhibits, interests and ideas of the exhibition and its congresses. Occasional lectures also were delivered, dealing with the historic influence and significance of each group of exhibits and congresses, with their social and educational possibilities, their general and philosophic interpretation. In each department the services of efficient and distinguished lecturers, as fully as possible representative of different countries, were arranged for. The lectures were delivered in English, as well as French, and with such proportion of other tongues as demand justified.

The lectures were broadly grouped under the main headings of art, industry and commerce, agriculture, hygiene and medicine, education, geography, economics, and social science. Each week some lectures were given in all these divisions; but from week to week, and, still more, from month to month, somewhat greater attention was given to one department. This naturally partly depended upon the succession of congresses, partly upon the varying demand of the majority of members. In May, the season of the opening of art exhibitions generally, art received the fullest attention. In June and July industrial and technical questions were appropriately brought forward. In the latter part of July, and especially in August and September, education and hygiene were especially prominent; in September and October, social economy and the general summing up of the results of the exposition.

POPULAR COURSES.

At the beginning of each week were delivered two or more lectures, giving an account of the exposition as a whole, and on the remaining days lectures illustrative of some of its most widely interesting series of exhibits.

ART COURSES.

Art courses by competent critics offered a sympathetic interpretation of this leading aspect of the exhibition, and this not only as regards architecture, sculp-

ture, painting, decoration, and furnishing, but also printing and bookbinding, costume, and the minor arts. Historic and actual technical methods were also outlined and illustrated.

TECHNICAL AND COMMERCIAL COURSES.

These were arranged for all the leading departments of the exposition. They were delivered by leading experts, and illustrated as fully as possible by graphics, lantern demonstrations, etc., and by reference to the actual exhibits.

While some of the lectures were addressed to skilled workmen and others conversant with technical details—mechanical, electrical, metallurgical, textile, and the like—others required no special previous knowledge, but sought to interpret the progress of each art and its underlying science to the intelligent public. The commercial importance of each main industry was also kept in view. These courses were planned with special endeavor to harmonize the statistical and economic with the technological point of view, and this with due recognition of the increasing claims of art.

AGRICULTURAL COURSES.

Here some lectures were addressed to professed agriculturists, as also to horticulturists and foresters, while others broadly interpreted this group of arts and its cognate sciences to a more general public. Increasingly important questions, such as those of irrigation, forestry, and tropical agriculture, were also considered.

COURSES IN HYGIENE AND MEDICINE.

Without attempting to trespass upon the work of medical schools, the assembly organized a series of lectures outlining the advance of medicine and hygiene and indicating the problems at present prominent, particularly in their larger aspects—e. g., the rise of bacteriology and its application to hygiene and to the incipient "municipalization of health." The visits to the magnificent hygiene department of the exposition, with its memorable Salle Pasteur, etc., were specially prominent; visits to the Pasteur Institute itself, also.

EDUCATIONAL COURSES.

These proved one of the most important and most widely helpful features of the assembly. To outline and estimate the recent history of education, and this in its relation to the general progress of the world; to focus and clarify its many discussions; to indicate and outline the best exhibits of the galleries, the best thought also of the congresses, could not but be of manifold service to all divisions and levels of the teaching profession, as well as to the general public.

GEOGRAPHIC COURSES.

As the special sciences may be viewed as rising out of the analysis of the old descriptive geography, so they begin to find again their concrete synthesis in modern geography; all the separate manifestations of energy, all the modes and products of evolution investigated by the separate sciences, being but the scenes and details of a general drama of world evolution, of which the description is geography in the highest sense.

This series was treated with special care and fullness, not only as regards the concrete illustrations of characteristic regions, and of regional survey generally—naturally in the first place with special reference to Paris and its environs, and to France as a whole, and thence to the countries illustrated throughout the exposition—but also as regards the higher aspects of geography as a scientific and educational discipline; of geotechnics also, considered as the highest aspect of industrial activity.

ECONOMIC COURSES.

The relation of these courses to all and each of the preceding ones, industrial or artistic, agricultural or geographic, is too obvious to need comment. It was the task of the concrete economist here to complete the view of each specialist in his own department, to sum up and to coordinate the whole. The geographer, the technologist, the art critic, with their appreciative comparison of all countries and their productions, make not only for increased knowledge, but for better international understanding, for mutual respect and admiration of qualities, for sympathetic recognition of defects also, and hence for greater wisdom of action as well. So it is for the economist to elucidate and set forth that profound solidarity of civilization which underlies all our national differences, and to insist that these differences find their highest expression in that individuality of production which is the greatest incentive to commerce, as this is the very foundation of peace.

SOCIAL COURSES.

Probably in no department did this exhibition more notably excel its predecessors than in the organization of its department of social economy, and this upon a scale of completeness which no future exhibition claiming serious attention can henceforth afford to omit. To bring together this multifarious and unparalleled wealth of materials, and documents, and statistics of all kinds, reports and photographs, plans and models, an exceptional amount of intelligent effort was lavished. To utilize these resources some corresponding effort was required; still more if it were desired to appreciate the best thought of the corresponding congresses, numerous and varied as these were. Here again the aim of these lecture courses was to reconcile breadth with clearness of view, and, so far as might be, not only to point out the highest goals of social effort, but practicable ways toward reaching them.

THE GENERAL COURSES.

These endeavored to interpret the exposition and its main features in a more general and philosophic way, and this in relation to the general progress of the closing century and to the urgent problems of the opening one.

In this way the congresses and the widely representative gathering of specialists of all kinds which they brought together were viewed as a vast resource of educational power, to be as far as possible utilized by the association for the benefit of the intelligent visitor. The assembly thus served as a useful intermediary between the congresses and the public. One of its main tasks was thus to summarize, interpret, and diffuse the results of science, legitimately popularizing these without vulgarizing them; on the one side interesting a widening public, and so recruiting for every science and for the congresses of future years; on the other, aiding the specialist himself to see and to present his subject both from the widest speculative aspect and the most practical side, here developing its applications, there justifying its place in culture. The scheme was not simply that of organizing the most ambitious of summer schools hitherto, but, as already indicated for the congresses, it had a synthetic purpose also. It sought to view and to set forth the exposition in its highest aspect—the museum of the present interpreted by the university of the present.

Against popular schemes of education, such as the summer school, the reproach of superficiality has been made, and perhaps not always without some justice, while purely academic studies are apt to incur either that of narrowing intensity or of vague generality. In presence of this concrete museum of the exposition and of the critical and constructive worth of the congresses, the reconciliation of

specialist accuracy and synthetic clearness was hoped for, and, if not completely, at least in some degree realized.

VISITS—LECTURES.

Daily visits to the different departments and galleries of the exposition were organized. These were nearly always complementary to a lecture, and were, of course, in conveniently small parties, each under an expert guide.

The following lecturers took part in the programmes of the English-speaking groups:

Miss Jane Addams, Hull House, Chicago; Rev. J. O. Bevan, College of Preceptors, London; Prof. A. S. Bickmore, Natural History Museum, New York; M. Jean de Bloch, Warsaw; Mr. B. Branford, Yorkshire College, Leeds; Mr. W. Law Bros, London; Mr. Calloway, Washington; Prof. Adolphe Cohn, Columbia University, New York; Dr. James A. Cree, Paris; Mr. Henry C. Devine, London; Mr. John Duncan, Chicago Institute; Mr. Robert Erskine Ely, Cambridge, Mass.; Prof. Patrick Geddes, St. Andrews University; Prof. N. P. Gilman, Meadville, Pa.; Mr. C. H. Grinling, Woolwich; Prof. Louis G. Janes, Cambridge, Mass.; M. La Fontaine, Brussels; Mr. H. T. Lukens, California, Pa.; Mr. T. R. Marr, Edinburgh; Prof. James Mavor, University of Toronto; Mr. F. W. Michie, Dundee; Dr. D. K. Morris, Mason College, Birmingham; Mr. J. T. Morris, People's Palace, London; Prof. J. Arthur Thomson, Aberdeen University; Dr. W. H. Tolman, New York; the Swami Vivekananda, India; Prof. Lester F. Ward, Washington; Mr. W. Franklin Willoughby, Labor Bureau, Washington; Mr. G. B. Zug, Paris.

To all of these, and to many other friends, the thanks of the assembly are due, but especially to Mr. Law Bros (since unfortunately deceased), Mr. and Mrs. Grinling, and Prof. Mavor, who each, during a prolonged stay in Paris, never failed to put themselves entirely at the disposition of members of the association. Nor should the devoted service of the office staff be overlooked in promoting the success of the meeting.

Besides the direct result of so many hundreds of lectures and demonstrations upon their immediate audiences, the indirect result of these, and of the wide publicity of the aims of the assembly, has been manifest not only in promoting special knowledge and general good feeling, but in the education of opinion, in diffusing through widening circles of press and public alike a fuller appreciation of the exposition and its best exhibits, its higher aspects, its many elements of progress. Hence in all the groups of the association there prevails a feeling of encouragement, and this still more for the future.

DEPARTMENT OF EXCURSIONS—PARIS, IN HISTORIC AND CONTEMPORARY SURVEY.

Paris itself has, of course, an almost unlimited wealth of attractions for the visitor, while the environs are scarcely less rich in historic and in picturesque interest. Hence the scheme of excursions not only comprehended the exposition and even the museums, galleries, and monuments of the city, but was so arranged as to give the visitor an idea of the historic development of Paris through the ages from her initial islet of the Seine to her actual present. Here the collaboration of historian and antiquary and the hospitality of the heads of great institutions was willingly and heartily given. Beyond the city also the visitor was similarly guided outward from the immediate environs and through the historic province toward an extended survey of France as a whole and of her place in general civilization.

For the student of natural science special excursions of geological and botanical interest were arranged. The relations of physical and social geography were kept in view throughout and illustrated as fully as possible, so combining the methods

and utilizing the results of naturalist and geographer, historian and sociologist. This department, in view of its great importance to teachers at the present time, received great attention, for it is not too much to say that in this respect education, alike in Europe and in America, is being revolutionized. The official studies of literature and of science, which have hitherto so largely divided schools between them, are being found to reunite and to acquire new interest and freshness when founded anew upon a broad and deep and first-hand experience—a real and personal knowledge of and interest in the aspects of nature and of human society which lie within the pupils' own immediate environment. For this regional survey of Paris and its surroundings, therefore, the collaboration of leading men of science and teachers, French, American, British, and others, was arranged.

Thursday afternoons were devoted to visits to the more important churches (Notre Dame, St. Germain-des-Près, St. Julien-le-Pauvre, St. Denis, St. Germain l'Auxerrois) and museums (Louvre, Cluny, Carnavalet, Luxembourg, Trocadéro, etc.) in Paris, and to places in the immediate neighborhood (Vincennes for Exposition Annexe, St. Cloud, Sèvres for national factory of porcelain, etc.). On Saturdays longer excursions were undertaken to enable members of the assembly to become acquainted with some of the chief historic monuments in northern France. These expeditions included Beauvais, Chantilly, Chartres, Fontainebleau, Montmorency, Provins, Reims, Rouen, St. Germain, Senlis, Sens, etc.

The special Guide to Paris, so ably prepared for the association by Mr. Stoddard Dewey, the Paris correspondent of the New York Evening Post, with its excellent maps by Messrs. Bartholomew & Son, of Edinburgh, was of great assistance to members in their visits to the exposition and in Paris.

Though the temporary purpose of this volume has passed away, it remains, save for a few pages of exposition details, of permanent value, and this not simply as a repertory of useful information to the visitor new to Paris, but as containing what is certainly one of the most trustworthy, compact, learned, yet withal readable and interesting surveys of historic and contemporary Paris which are to be found in the language. Copies may still be had by members of the association.

DRAMA, MUSICAL ENTERTAINMENTS, ETC.

The attractions and resources of Paris, as the most important center of dramatic art, were also kept in view, and the association obtained for its members some special facilities and advantages. Receptions and social gatherings were held at least once weekly, sometimes in the rooms of the association at the Palais des Congrès, and sometimes elsewhere, as notably in the pavilion of the United States. Members of the assembly were thus afforded opportunities of meeting those of kindred interests, and also of seeing something of the social life of France, and special introductions of both kinds were arranged for as far as possible.

REPORTS.

The example of the summer schools of science, art, and modern languages, now becoming familiar in the great university towns of Europe and America, and the lectures, demonstrations, and excursions in which the British and French Associations set so excellent an example have thus been freely imitated; but the more serious items of the association's programme were not forgotten. In presence of the Paris meeting of the French Association and of 120 specialist congresses, to proceed by the reading of special papers would have been to enter into competition instead of cooperation. Similarly, in presence of the general catalogues and of the specialist literature of the exhibition any mere overlapping of publications would be wasteful; yet the prolonged and detailed study of many parts of the exhibition by the lecturers and staff of the association naturally suggested the preparation of a number of brief reports. These, while necessarily leaving all attempt at com-

pleteness, whether of detail or of special survey, to the various official publications, French and foreign, briefly insist upon some of the features in which the present exposition excels its predecessors, and seek to diffuse some of its most valuable methods and results. Such reports are not so much needed in special arts or applied sciences, which have already an abundant literature, as in the more general fields—such, for instance, as the departments of education and social science, of public art, of the history of arts and sciences. Several of these will be submitted at Glasgow.

LITERATURE, ETC.

Returning to work accomplished, the special literature of the exhibition has been carefully collected and classified. A small collection of appliances to illustrate historic and geographic methods of teaching the elements of the sciences is in progress and should be proceeded with. The contemporary bibliographical movement, though more advanced in America than Europe, still needs active support and workers everywhere. Here the circulation of special bibliographies and card catalogues would be of wide use, and this to special workers in many fields. Some cooperation with the International Institute of Bibliography would in this connection be very desirable.

EXCHANGES.

Some important and valuable exhibits have been offered to the association for circulation or exchange. An initial experiment in this direction had already been in progress. A duplicate of the admirable nature-study exhibit of the Philadelphia Normal College, supplied by the kindness of Professor Wilson and her pupils, has been circulating among Scottish and English schools for some months, and will shortly start from Geneva on a similar journey among Swiss institutions. The principle is evidently one widely applicable, and a great number of interesting and valuable educational exhibits might be obtained, and these from various countries. Here may be specially mentioned a generous offer of cooperation from Prof. Bickmore, director of public instruction of the Natural History Museum of New York, which it is earnestly desired the association may be enabled to accept.

Nor need this be for schools and popular institutions only. The remarkable university exhibits of France and of America would have proved of the greatest service if they could have been circulated among the universities of other countries; for no university can make a stronger appeal to its own city or constituency than by clearly exhibiting the special excellences of others.

Similarly in civic matters. The remarkable tenement-house exhibition recently organized in New York and exhibited in Chicago, Boston, etc., is now available for exhibition in Britain, where the question of the housing of the people is also urgent. Again, such an exhibition as that organized by the Congrès de l'Art Public, under the auspices of the city of Paris, to illustrate the historic aspects and develop the artistic treatment of cities, would have a widened usefulness if it could be circulated from city to city in Europe and America, gathering illustration from each as it went. This suggestion has already been made by one of the trans-Atlantic delegates to the bureau of the congress. The Exposition de la Ville de Paris is also a type of municipal museum which can not be too widely imitated elsewhere.

SPECIAL COMMITTEES, *e. g.*, MUSEUMS.

Without trespassing upon the work of juries or of congresses, several standing committees were formed. Of these a single instance may here suffice—that of a committee on museums. While museums and collections of natural science or of historic art are broadly similar in principle and arrangement throughout all countries, the newer types of museum—geographic and anthropological, historic and antiquarian, educational and social—are still without any coordination or unity

of plan. Many cities exhibit beginnings of these; still more entertain projects. All are in some respects valuable and suggestive, yet all are unrelated and therefore so far incomplete. In March last, in Chicago, a meeting was held of specialists of all kinds interested in such museums—geographers and anthropologists, educationalists and sociologists—each interested in some aspect of his city or region, its natural or historic record or interpretation, its education or improvement. Every project submitted had some constructive interest, yet was vulnerable to criticism, and the meeting thus naturally expressed the need of a standing committee to discuss and report upon the whole question. Similar discussions and presumably similar committees are arising in other centers, as also in connection with future exhibitions; but it was evident that at the forthcoming Paris Exposition the subject could be most fully and adequately dealt with and all the various projects and discussions be most easily compared, and, in so far as might be, harmoniously combined. Hence this museums committee of the association and its possible usefulness.

This example may also serve as a convenient illustration of the essential nature and working of the association, which seeks to utilize and cooperate with the many elements of advance which are still too isolated from each other. It seeks to bring these together, to compare and to coordinate their best elements, and this in ways not only applicable within the greatest of world expositions, but adaptable in their best results to all minor scales of requirement, those, for instance, of museums and reference libraries, and these whether of city, township, or village, of university or school.

The further development of this museums committee in Paris in connection with the Rue des Nations, etc., is mentioned below (pages 280-287).

FINANCE.

Though a balance sheet naturally can not be presented before the general meeting at Glasgow, it is obvious that the expenses, both initial and permanent, of widely international communication, of offices and printing in Great Britain, in the United States, and in Paris, as also of the assembly during the exhibition, are very considerable; while the publication and distribution of reports and the arrangements for the work of this year have also to be provided for. Although initial outlays need not be repeated, neither the permanent organization nor the new developments above indicated can be carried on without considerable expense. The subscription of membership of the association and the proceeds of its assemblies may ultimately suffice for these, but it has been recognized, and this independently, by all the national groups that a substantial sum should be independently raised by each in its own country, the finances of each group being of course kept distinct, and their contributions to the common expenses equitably adjusted. Thanks to the munificent initiative of Sir Robert Pullar, who must be recognized as the founder of the British group, indeed, as yet, also of the American one, and of corresponding donors to the French group, the association has hitherto been worked upon a basis of international cooperation; i. e., the groups first on foot undertaking the main outlays without delaying for the financial organization of others. It has been, of course, amicably recognized that such temporary outlays of one group of the association toward the initiation and early development of others, as of the British for the American group, are to be considered as advances to be reimbursed as soon as possible.

It is estimated, in the light of the experience gained during the first year's work, that to carry out the plans indicated, including the assemblies at Glasgow and St. Louis, a sum of not less than £10,000 (\$50,000) will be needed, and hence an appeal is being made to all interested to become members, and to subscribe as liberally as possible.

FUTURE ASSEMBLIES.

The experience of the Paris assembly has warranted fully the continuance of similar organizations at future exhibitions, for example, those of Glasgow in 1901 and St. Louis in 1903. At these, however, it will be well to reduce the period during which lectures, etc., are given, and so give more attention to the specific tasks enumerated above. At Glasgow the association is already offered suitable accommodation, and it is hoped that a similar arrangement will be possible at St. Louis.

In its relation to exhibitions the work thus begun may be compared to that of the farmer, who begins his work at the great fair with the getting in of seed and implements, and ends it there with the year's crop, yet, none the less, continues it year long in the field.

II.

1. MEETING OF ENGLISH-SPEAKING GROUPS UNDER THE PRESIDENCY OF THE RIGHT HON. JAMES BRYCE, M. P.

A meeting of the English-speaking groups was held in the Petit Palais, Champs Elysées, on September 14, 1900. The Right Hon. James Bryce, M. P., vice-president of the British group, presided. Professor Geddes, secretary of the British and American groups, submitted a report (largely incorporated above) upon the work carried on by the assembly during the summer, and spoke of the necessities and prospects for the future.

The Rev. A. Sternberg then moved "That this meeting, having heard the secretaries' report, cordially indorses the work of the association in its various branches and recommends the publication of the specific reports in progress. It further approves the proposals to hold an assembly at Glasgow in 1901 and at St. Louis in 1903, and desires the executive committee to take the necessary steps."

Mr. J. Martin White, of New York and Dundee, in seconding the resolution, remarked that such an assembly might become of great use in aiding the design and the arrangement, and making clear the classification of future world's fairs.

The motion was unanimously adopted.

Prof. A. S. Bickmore, of the New York Museum of Natural History, moved "That this meeting recommends the association to the support of those interested in its aims and, recognizing the necessarily considerable expenses of organization and maintenance and the need of ample funds for carrying out the various objects indicated in the report, warmly supports the appeal of the general committee on both sides of the Atlantic toward increasing the number of ordinary and life members and of subscribers."

He was glad to know that suitable accommodation for the assembly had been secured in Glasgow, and he could assure the members of the association of a cordial welcome when they come to America in 1903.

Mr. C. H. Grinling, of Woolwich, in seconding the resolution, said it had to be recognized that scientific and educational work could not, in the nature of things, be self-supporting. It was very necessary to face the financial question, to make the association and its work better known, to increase its membership, and to add to the number of subscribers.

The chairman expressed his entire agreement with the speakers, and the motion was carried unanimously.

President Scovel, of Wooster University, Ohio, moved "That our profoundest recognition and thanks are due to the Right Hon. Mr. Bryce, our presiding officer, for giving the influence of his name, character, and position to this work, which

in its broad, international, and deeply intellectual character so well befits his active and generous efforts, and will certainly be rewarded by great success."

Professor Bickmore seconded the resolution.

The Right Hon. James Bryce warmly reciprocated on behalf of the British members what Professor Bickmore had said for the Americans, and assured the latter of the welcome they would receive at the Glasgow exhibition.

He hoped that all those present would endeavor to bring the aims of the organization to the knowledge of those who would be able to give it financial help. Science and learning, indeed, always went hand in hand with poverty, so that those who were engaged in educational work were seldom able to give anything beyond their services. But they all knew many who had never known the blessings and advantages of poverty and who were anxious to spend some of their superfluity in works of benevolence and public utility. Many present on that occasion, both from Great Britain and still more from the United States, had friends who might be interested in the work, and he hoped that whenever they had an opportunity of advising them as to the way in which usefully to spend money they would not forget the modest claim this international association put before them.

He was not able to tell them more of the actual work of the assembly, with its lectures, etc., than they knew already far better than he did. They knew what good work had been done and what better work could still be done. But he wished to say one word of something else which had been suggested to him by his visit to Paris and the assembly. It was a remarkable instance of what could be done by international cooperation, by the cooperation of those who spoke different tongues, inhabited different countries, lived in different fashion, but felt themselves all united by having the same problems to deal with, and felt that they could cooperate in solving them. This was of course best expressed by the union of British and Americans into one section of the assembly. The unity that had lately been growing up between the English and American people had in fact been expressed when one section was formed of the English-speaking people—of United States and Great Britain, with her colonies.

But he would go one step farther and speak of another and wider unity which this might suggest to their minds. There had been meetings of their chambers of commerce, and a great deal had been said of the advantages that were to be derived from peace and harmony between the nations. It was pointed out, too, that industry and commerce lived by peace. We had all to hope that the nations would come to learn that war was their greatest enemy, peace their greatest friend. At the same time they knew that commerce, much as they desired it to be a means of peace, sometimes led to strife. He thought that there was something which made far more strongly for peace than commerce, and that was the science and learning which did not depend for their growth and success on competition and rivalry. Feeling this, he urged that an association like theirs should be a great factor toward international understanding.

It was significant, too, he thought, that the first assembly of the association should be held in Paris, where was the great university of the Middle Ages. For within a mile of where they stood there had been lit in the twelfth century a beacon fire which had done more to advance the higher civilization of Europe than any other, and which had drawn there that great international assembly of those eager to learn and to teach which they now sought to imitate.

The Right Rev. Archbishop Ireland, of St. Paul, supported the views and the appeal of the chairman, and desired to say how much he wished well to the work of the association. It had begun well, had done a useful and important work in education, in science, and in the promotion of international sympathies, and he believed it would do still more in the future.

Prof. Émile Bourgeois, secrétaire-général adjoint, briefly expressed the satisfaction felt by the French members of the association in the active cooperation of the British and American, the German and Russian groups.

Professor Lexis, vice-president of the German group, and Professor Kovalevsky, of the Russian group, warmly concurred.

2. MEETING OF SECRETARIES UNDER THE PRESIDENCY OF M. LIARD.

A meeting of the secretaries of the national and international groups was held at the offices of the association, Palais des Congrès, on October 10, 1900, M. Liard, directeur de l'enseignement supérieur, international secretary, in the chair.

A report by Prof. Émile Bourgeois, assistant general secretary, on the work of the various national groups during the Exposition, was read and approved. The concluding summary may be cited:

Je crois pouvoir rendre aux présidents et secrétaires, aux professeurs des différents groupes un témoignage aussi complet et bien frappant de leur activité, en me bornant à constater que l'École a fourni en quatre mois à peine près de 300 conférences de doctrines ou d'explications générales, sur les acts, d'abord, les sciences appliquées, l'industrie, l'économie sociale, la paix—qu'elle a, en outre, organisé 450 visites au moins dans toutes les sections, pavillons, et palais de l'Exposition. Si grande qu'ait été l'activité de l'École, l'Exposition cependant ne l'a point épuisée: elle a été pour ses différents groupes l'occasion de conférences ou de visites dans les grands établissements ou monuments de Paris et des environs.

A raison de 800 leçons pour 120 jours, c'est une moyenne de 6 leçons par jour qui ont groupé ordinairement de 40 à 50 auditeurs, et souvent jusqu'à 300. Une centaine de professeurs ont enseigné dans les 4 salles: un personnel près de huit secrétaires et de dix employés ont travaillé. Il y a plus d'une université qui dans un semestre ne donne pas une telle carrière. Et je ne crois pas que jamais l'Exposition ait provoqué un pareil mouvement d'études et d'enseignement pour six nations et en quatre langues: ce qui n'était pas la moindre nouveauté. Voilà, messieurs, votre œuvre en quelques mots.

The continuance of the existing national groups was intimated by the respective secretaries, and it was agreed to cooperate in an international assembly at the Glasgow exhibition in 1901, and at that of St. Louis in 1903. For this purpose the vice-presidents and secretaries of the British group were requested to act as the international bureau, and to make all necessary arrangements for 1901.

The objects and permanent constitution of the international association were then discussed. The draft constitution, prepared before the assembly by the British and French groups, was remitted to each national group, in order that a report on this and on the future activities of the association should be presented at a general meeting in Glasgow in 1901.

3. CLOSING RECEPTION UNDER THE KINDNESS OF M. LÉON BOURGEOIS.

A closing reception was held in the American Pavilion, Rue des Nations, Thursday, October 18, 1900, M. Léon Bourgeois, general president, in the chair.

There were present the ambassador of the United States (General Porter), the vice-presidents and secretaries of the French, Russian, and German groups, and a large attendance of members.

A letter of apology from M. Gréard, president of the French group, rector of the Sorbonne, was read.

The secretary briefly recapitulated preceding reports:

(1) As regards lectures, visits, excursions, upward of eight hundred had been given by the various national groups; (2) that the various groups had unanimously decided to hold an assembly at Glasgow in 1901, and St. Louis in 1903; and (3) in regard to finance it was estimated that a sum of £10,000 (\$50,000) was needed to carry on the work till 1903.

Several large subscriptions had already been paid in since the meeting of 14th September, including two of \$1,000 and one of \$500.

M. Léon Bourgeois said that scarcely a year had elapsed since they had met on the initiative of the British group to consider whether it was possible to form an international association, and to hold an international assembly at the Paris Exposition of 1900. Now they had their answer in what the secretary of the British-American group had just said. For months past the school had been at work, offering on the one hand daily lectures and guidance, and on the other aiding special groups of students, teachers, workmen's delegations. This closing reunion did not by any means mean the death of the association; a programme of useful work was in progress and would continue; and though naturally this assembly closed with this exhibition it was only to reopen with fuller experience at Glasgow.

For his own part and that of his French colleagues he could not express their satisfaction in this work of true internationalism, nor overestimate the advantages of these groups, speaking four different languages, yet discussing the same ideas and studying the same facts.

The assembly had carried on at the exposition a great work of peace in studying not the theories, but the facts of industrial and artistic, of social and economic progress, and he believed that with future assemblies this work would become more and more important. He warmly congratulated the British and American groups upon their large contribution to the assembly, and, as general president of the association, he desired to recommend them very warmly to the consideration of the coming great exhibitions and of their countrymen generally. He hoped that he might himself be able to come to Glasgow next year; and, in any case, there would be to aid in the work of the English-speaking groups many representatives of France, of Germany, and of Russia, and he trusted of other European nations. In conclusion, he asked all to join with him in wishing success to the Glasgow International Assembly.

Herr Lüders, imperial privy councillor, vice-president of German group, echoed the words of their president. Although coming late in the field, the German group felt satisfied with its beginnings and was determined to do everything possible to aid next year's work.

Prof. E. de Roberty, vice-president of Russian group, while generally agreeing with what had been said, wished a practical advance in the internationalism of the association. Though the national groups were convenient for administration, he wished to see their action more unified, and divided only according to their interest in different departments.

Mr. Howard J. Rogers, director of education and social economy for the United States, moved the thanks of the meeting to M. Léon Bourgeois for his active interest in the association, and to the office bearers of the other national groups for their cordial cooperation with the English-speaking ones.

III.

INTERNATIONAL MUSEUMS AND INSTITUTES, PARIS.

(COMITÉ D'ORGANISATION DES INSTITUTS ET MUSÉES INTERNATIONAUX.)

I. Following upon the closing meetings and receptions of the British and American groups in October, 1900, a final banquet was organized at the close of the exhibition by the committee of the French group, in which upward of two hundred took part, chiefly members of the French committee and lecturers of the *École Internationale*, but with a full representation of the other national and lin-

guistic groups. M. Léon Bourgeois occupied the chair, and the speakers were MM. Herbette, Liard, Émile Bourgeois, and Choublier for the French group; Prof. Maxime Kovalevsky for the Russian, Mr. Berg for the German, Professor Woodward, United States assistant commissioner, for the American; Mr. Fabre for the (incipient) Canadian group, Professor Geddes for the British, the last-named having submitted the proposals of an informal international subcommittee. M. Léon Bourgeois in his concluding speech, after congratulating the committee upon the first assembly of the association, of which the viability and usefulness had now been so clearly proved, expressed his cordial approval of this new proposal to organize a committee for the preservation, if possible, of a number of the palaces of the Rue des Nations, and their utilization as a series of international museums or institutes, which would not only retain the most striking and impressive example of the international cooperation of the exposition, but perpetuate and develop its best results, and advance the permanent objects of the international association.

II. This committee of initiative, at first known as "Comité pour la Conservation et l'Utilisation de la Rue des Nations," numbered the following among its members: M. Léon Bourgeois; M. Liard, directeur de l'enseignement supérieur; M. Herbette, conseiller d'état; Professor Lavissee; M. Duclaux, director of the Pasteur Institute; Prince Roland Bonaparte; M. Charles Normand, president of the Society for the Preservation of the Monuments of Paris; Prof. Émile Bourgeois, École Normale Supérieure; M. Georges Cain, conservator of the Musée Carnavalet; M. Schrader, the well-known geographer; M. Labusquière, municipal councillor; General Sébert; Dr. A. G. Martin, officer of hygiene for Paris; M. G. Moch, secretary of the Peace Society; Professor Wilson, Philadelphia Museums. Its meetings were first held under the chairmanship of M. Duclaux, and afterwards of M. Louis Herbette; M. Youriévitich, attaché to the Russian embassy and secretary of the International Psychological Institute, and Professor Geddes acting as the secretaries, and afterwards also MM. Friedel and Hamelin.

The question of the actual state and durability of the buildings was referred to M. Louis Bonnier, who, as architecte-en-chef des installations de l'exposition, had superintended on behalf of the exposition authorities the erection of the buildings of the Rue des Nations. After inspection, he furnished a report recommending the retention of twelve of the buildings on the river front, forecasting approximately the outlays which would be desirable for the repair and upkeep of these for ten years, with introduction of the necessary heating apparatus, etc. This amount, after adding a very ample margin for unforeseen contingencies, and allowing for the purchase of rights held by contractors in a number of cases over the materials of the buildings, and of those of the contractors of the projecting platform of the river promenade, seemed fully within the range of practical possibilities, since it is not often that a dozen museum buildings could thus be obtained and put in order for ten years for a sum not exceeding that which had actually been spent less than a year before upon the construction of one of them.

A report upon the possible utilization of each building was next prepared, which may here be briefly abridged, since its principle may be of service in the not too distant future—that of adapting each building, with its well-marked national architecture and associations, to a future use in some department of scientific, artistic, or educational activity appropriate to the racial character, the historic record, or the contemporary achievement of its builders and donors.

The possible uses suggested by the exposition are many. Of these, the following were considered by the committee to be worthy of first consideration:

In the first place, there should naturally be a retrospective museum of universal expositions since 1799. In this museum would be gathered the archives and the illustrative documents of past expositions; and it would thus necessarily give a veritable summary of the history of industry, science, and art during a century of

progress. The museum would illustrate, besides the great series of Paris expositions, those which have been held in other cities from the Crystal Palace exposition of London (1851) till the Chicago (1893) and Glasgow (1901) expositions.

One of the special, and at the same time most useful and attractive of the exhibits, was surely the historic exposition of the immortal works of Pasteur at the Palace of Hygiene. The Pasteur Institute proposes to conserve this collection, and to enrich it by completing the historic part and adding all that can contribute to the illustration of allied works, as, for example, antiseptic surgery, the creation of Lord Lister.

After hygiene one passes, by a natural transition, through the idea of physical education to consider the questions of education in general, which held so prominent a place in the exposition of 1900. Here one finds three principal divisions:

(1) Physical education.

(2) Manual education, which is allied to physical education, and constitutes, with technical education, a distinct ensemble, easy to illustrate by representation of its processes and results.

(3) *School education.*—The exposition contained many collections of considerable importance, which have since, in great part, been dispersed. Most of these collections could be reconstituted, and some even improved. An important comparative museum of the school systems of different countries could thus be formed.

The Palace of Social Economy in the exposition contained a collection of the greatest practical utility, which specialists and the public alike must wish to see conserved and enriched. It comprised documents, pictures, graphics, and statistics of the greatest interest and value for the practical study of such important questions as workmen's protection, provident societies, charity, pensions, cooperation, agricultural syndicates, etc., and of all that affects the relations between capital and labor.

But besides the social sciences, the physical and natural sciences also held an important place in the exposition, and that by the numerous international congresses, as well as in their respective sections. It would be well, surely, to set apart a pavilion for the use of learned societies, often so inconveniently accommodated, and equally for the bureaus of the various scientific and international associations which owe their origin to the great congresses of the exposition. An amphitheater could easily be organized in one of the great pavilions where the reunions of societies and congresses might be held. The Rue des Nations might thus be made the convenient and recognized center for numerous congresses still to come.

The exposition was at least the third where the city of Paris had created a magnificent collection, unique in the world, of all documents and objects relating to civic life and calculated to impress upon the citizen a sense of his duties. All the activities of a great city were represented. It certainly was one of the most useful and most appreciated of all the exhibits; yet it, like the others, has been dispersed. Under the auspices of the city of Paris was organized also a congress on public art, accompanied by an exhibition of public art, too large to be accommodated in the Hôtel de Ville, but suitably lodged in the halls of the Palais des Examens. Around a collection admirably illustrating the transformations and the improvements made in the city of Paris were grouped collections loaned by other cities, French and foreign alike.

The new century has great need of such a museum as this; and if one of the pavilions of the Rue des Nations could be devoted to such a collection, there would be few things more interesting to the public or more useful to the world.

And how better could one finish this series of new museums, of which the exposition gave the inspiration and the example, than by a museum of peace? There was no separate department of peace in the exposition, but the subject was

outlined in more than one exhibit, notably in that of M. Jean de Bloch. The idea, however, is latent everywhere. Clear ideas and honest endeavors are not wanting, and a permanent museum must soon result. Where could a better site be found in Paris or in the world than in the Rue des Nations?

Turning now to the appropriation of the respective buildings, to the installation of the museums and of the learned societies, a practical question had to be decided, viz, to which of the various subjects suggested was each building best suited? It had also to be borne in mind that since each monument was typical of a nation and ought to recall the international sympathy which characterized the universal exposition, the result obtained would be perfect only if, in the allocation of the buildings for their new functions, equal account was taken of the genius and character of the nations which gave the buildings in question. Such an allocation would commemorate in some measure the contribution of each country to the common work of progress and of civilization.

For practical as well as for more sentimental reasons one could not do better than accommodate in the Palace of Germany many of the learned societies. The collections which Germany exhibited there during the summer of 1900 were chosen expressly, according to the catalogue, as an acknowledgment of the artistic impulse which she had received from France, and French science might fitly acknowledge in its turn the impulse which it has received from Germany. The questions of the organization of libraries and of international bibliography, of congresses and of learned societies, might all find a convenient center here, and here, too, might be housed the collections of the Palace of Social Economy.

For the collections of a civic order, for all that relates to municipal activity and to public art, no better accommodation could be found than that offered by the magnificent Belgian Hôtel de Ville, which represents so worthily the high civic traditions of the Flemish communes of the Middle Ages.

From purely practical points of view—the good light from the north and west, the windows greater in breadth than in height, etc.—the pavilion of Great Britain is preeminently adapted for bacteriological collections, the Pasteur museum, and the experimental sciences. The learned societies which have need of laboratories would find better accommodation here than elsewhere; for example, experimental psychology, which requires so much light for microscopes and other apparatus.

The pavilion of Norway might serve as the great lecture and meeting hall for societies and congresses, as the Thingvalla of each society or group of societies. The considerable space afforded by the walls and the gallery might be devoted fitly to the questions of navigation and of fishery, to Arctic exploration; in short, to all those sciences and arts in which Norway has so valiantly won her supremacy.

Finland provided one of the culminating exhibits of geography in the exposition. She offered in her pavilion, by its architectural form and the collection of objects exhibited, a marvelous idea of a regional life in all its aspects—place, work, family, institutions, intellectual culture, art. It would provide an admirable center for geography.

For geography the pavilion of Monaco might also be indicated; but it might more appropriately be devoted to oceanography and to the biological sciences; that is, to a continuance of the function which it served during the exposition.

Where better could we lodge all that relates to history than in the marvelous palace of Hungary, which represents so many places of national evolution, yet one, at the same time, common to Europe; which gather together all styles from the castle and the Gothic cloister to the Renaissance and its modern transformations, and succeeds in reuniting them, notwithstanding all their differences, in a most imposing synthesis. If one wished to build a palace for historical studies, a museum of the history of civilization, one could not build anything more symbolical or more beautiful.

Since the legendary foundation of the city of Upsala till our own days Sweden

has always been at the head of the industries which group themselves around iron. That is perhaps the reason why she has established a recognized superiority in physical education and a remarkable initiative in manual teaching.

The situation of the museum of comparative education would have to be discussed among all the nations. If we submitted the decision to Plato it would be given perhaps to the country which has done most for music—to Austria. If we decided from the point of view of the exposition, it would surely be given to the youngest of all the great nations—to the United States, which has given to the world the most striking example of progressive ideas, of progress at first material, of extraction and exploitation, of production, of transports and commerce; but followed by a new striving not less energetic toward the ideal, the beautiful in art, the true in science and in education, the good in all departments of social amelioration. Surely, then, we could not do better than offer to the United States the honor of accommodating the museum of comparative education.

But we have still to come to the smallest country of Europe and to its most ancient civilization in order to recover the artistic ideal with Phidias, encyclopedic science with Aristotle, the ideal republic with Plato. We could bring together in the beautiful pavilion of Greece the classical ideal and modern aspirations. It would be a new center of legitimate influence for classical archæology and for its contact with modern life. The analogy so striking, the comparison so legitimate and so encouraging between Delphi, with its sacred way, and the exposition, with its Rue des Nations, would thus find a worthy realization.

The retrospective museum of international expositions would be conveniently housed in the beautiful and well-lit pavilion of Austria, without impeding the employment of its central hall for musical recitals.

In the absence of a pavilion of Holland, the country chosen recently by a European congress to render homage to its historic priority in the domain of international law, where should we house the museum of peace? Perhaps in the pavilion of Bosnia; for it is there that have best been united and reconciled the most heterogeneous populations in Europe—the great historic antagonists, the Christian and the Mussulman.

Had more buildings been capable of being retained, the same principle might have been developed, and suggestions were not lacking. Thus, for Spain, geography, and for Russia, geotechnics; for Servia, forestry, and for Denmark, agriculture; for Holland, international law, and for Switzerland, comparative legislation; for Italy, history of the fine arts; for the Ottoman Empire, ethnography; for Persia, oriental languages, and so on; to each country, in fact, some department, in which its historic or its contemporary eminence or its special advantages are generally recognized.

It is not too much to say that the proposals of the committee met with immediate, wide, and even general approval, and especially so far as the preceding principles were concerned. Reference had to be made by some of the national commissioners to their respective governments; in other cases their contractors only had to be arranged with. The German Government at once generously responded, offering its building as a gift; the Finnish commission next followed, and speedily others, and by December even the last contractor was ready to come to terms. From the very outset, also, offers of important collections and of money had begun to come in.

The plan of asking not only for buildings and for money to put them in order, but at the same time for collections to fill them, was soon generously and promptly justified by the response of the public. Although the delays above referred to actually prevented the committee from issuing a subscription list, a leading Paris banker at once offered, in response to an article in the *Figaro*, a handsome sum to head this.

The prime result of scientific cooperation was at once assured. Active steps were taken on behalf of a number of scientific societies toward procuring quarters within the German and other pavilions, and this on the understanding that they accepted their due share of the necessary expenses of adaptation and upkeep. Best of all, actual collections, almost completely as suggested in the initial project, were liberally offered. Thus, the great Pasteur collection, at once the natural and the ideal center of an international museum of hygiene, was offered by the director of the Pasteur Institute, his active collaboration as well, and that of other eminent hygienists.

Through the intermediation of M. Charles Gimond, the eminent historian of Paris, one of the greatest private collections of the history of Paris was offered for the noble civic palace of Belgium. This offer included upward of 25,000 pictures, engravings, maps, and other illustrative objects and documents, besides books, to which the generous donor proposed to add a sum of 50,000 francs (\$10,000) toward the expense of hanging and arranging these.

Another connoisseur offered the committee a collection of sacred art, with 250,000 francs toward the general scheme, should a building be allotted to this purpose.

M. Jean de Bloch—so well known as the author of *La Guerre*, the work which is said to have been so influential in promoting the Hague conference, and which has since been so widely discussed in all countries—personally undertook to be responsible for the peace museum, and to reduplicate, if not actually to transfer thither, the peace museum he has so long been elaborating, and of which a small part was already exhibited in the exposition of 1900.

Toward the retrospective museum of expositions the eminent architect to whom the committee was already so much indebted, M. Louis Bonnier, offered his entire collection of 20,000 illustrative documents, as also his good offices in securing material for other collections.

For the proposed museum of geography (Arctic exploration, etc.), a committee, under the honorary presidency of Dr. Nansen and the acting vice-presidency of M. Schrader, was formed, and similarly the responsibility of initiating the museum of comparative history was undertaken by Professor Lavisse.

For oceanography and fishing the Prince of Monaco promised material aid in the form of duplicates from his well-known museum now in progress at Monaco. A union of resources was also arranged with the special committee for the organization of a fishery museum, M. Edmond Perrier, the director of the museum of natural history, undertaking warmly to cooperate.

Other important possibilities were coming in sight, and had it been possible to inaugurate the scheme earlier in the history of the exposition there is little doubt that it would have been immediately and widely successful.

Difficulties in the way of permanent retention were, however, in existence and were clearly recognized from the first. Besides each of the various national administrations and the administrative body concerned with the winding up of the exposition as a whole, the complex rights over the site had to be reckoned with. Upon the river front those of the ministry of public works, upon the thoroughfare those of the city, and midway those of the tunnel of the Western Railway made up a complex of administrations whose interests and views are not easily reconciled. The long vacation of the Paris municipal council next intervened and involved new delays. The foreign commissioners were necessarily anxious to wind up their affairs and close their bureaus, and thus the time limit prevented the acceptance of the buildings and the consequent execution of the project of housing international museums and institutes within them. This apparent failure of the scheme was, however, neither a surprise nor a discouragement to its promoters, who, knowing well by experience the immense practical and administrative difficulties to be met, had from the first been prepared for this. The buildings of the

Rue des Nations had at any rate not only served as a vivid and world-wide means of popularizing their conception of what the exposition might and should leave behind it and of what future exhibitions might be, but had brought them in an unexpectedly vast amount of material, of scientific cooperation, and even of financial possibilities. After due inquiry some offers were naturally found to be fixed to the Rue des Nations and to fall with it, but the committee were greatly encouraged to find that others (and these the majority) still held good on the simple condition of finding adequate lodgment elsewhere.

A meeting of representatives of all the groups of the International Association was therefore convened on January 4, 1901, by the international secretary, M. Liard, at the ministry of public instruction, the president, M. Léon Bourgeois, taking the chair.

M. Herbette fully indicated the history of the negotiations of the initiative committee, as above outlined, and the proceedings were approved, and the resignation of the committee was accepted.

M. Herbette pointed out that in view not only of the general approval in principle which the project had received, but of the very cordial and substantial support, not only in the matter of the buildings, but in the offer of collections, of specialist assistance, and even of large sums of money, the constitution of a permanent committee of the International Association to carry on the essentials of the scheme was practicable and advisable.

M. Léon Bourgeois then reviewed the work and possibilities of the association, reminding the meeting that when the constitution of the association was drafted last year, necessarily upon a very comprehensive basis, it was agreed on all hands and by each national group that the experience of a year or more would be necessary before formally adopting this, and even before the main lines of its immediate practical policy and international usefulness could be clearly marked out. Now, however, it had already two such lines laid down. The work of the association during the past summer, its recruitments for the congresses, its promotion of inter-university relations, and most of all its interpretation of so many departments of science, art, and education in four languages and for seven nations had made the *École Internationale de l'Exposition* not only a distinguished and a memorable success in itself, but an institution which, he felt convinced, would find an increasing place in every coming international exposition. So now with this more recent undertaking. The vast collections of the exposition were no doubt very largely dispersed, as its buildings were doomed; yet not merely a new principle of great possibilities in the future had been affirmed by this endeavor to retain the Rue des Nations as a group of international museums and institutes, but the practicability had been demonstrated of creating a number of these. He therefore moved that the members of the initiative committee be constituted into a permanent committee of the International Association, with powers to add to their number. This motion was unanimously adopted.

III. This international institutes and museums committee of the association met next day at the Hall of the Mairie of the Fifteenth Arrondissement by the invitation of the mayor, M. Beurdeley, president of the educational press congress, M. Herbette in the chair. It resolved itself for immediate work into two subcommittees concerned with (a) the collections and funds which had been offered to the initiative committee, and (b) the actual organization of the proposed institutes and the problem of finding suitable accommodation for them. Both committees have since met and a memorial¹ has been laid before the municipal council of Paris to ask accommodation for these initial collections in the extensive ground

¹ This "Memoire et Notes Concernant l'Organisation à Paris de Musées Ayant un Caractère International" is from the eloquent pen of M. Herbette, president of the association's committee above referred to. Copies may be had on application to the secretary.

floor of the Petit Palais des Beaux Arts. This building, by common consent the most beautiful as well as the most permanent of the exposition, is, even so far as accessibility, still more as unity and economy and convenience of working are concerned, preferable to those of the Rue des Nations. It lacks, however, that note of varied international cooperation in which the Rue des Nations was so attractive, but the idea was submitted to the municipal council of retaining at least one or two of the durable and easily removable wooden buildings of the Scandinavian countries, and of removing them to the Champ de Mars, as a means of preserving a germ of this portion of the project, which may also develop in future years in Paris, or be applied elsewhere.

Whether or not these precise locations be granted remains to be settled by the municipal council during the present year, but there is little fear that accommodation will soon be found elsewhere, if necessary, for these museums and institutes, separately if not together.

IV. The applicability of the same idea to other cities also is manifest. Thus American members of the committee have already urged its serious consideration from the very inception of the St. Louis Exposition of 1903, so that a number, at least, of the more important special and national buildings should be given sufficient permanence from the first, and that the collections, retrospective and contemporary, of the exposition should be so planned from the outset as to afford, as far as possible, both a nucleus and a residuum of permanent value. Were this done from the first the city, university, and scientific societies and institutions of St. Louis might possess after the exposition of 1903 a set of museums and institutes in many respects unsurpassed in the world. To erect and speedily to destroy buildings which have cost millions, to make collections of the greatest value and interest, and to disperse them, even when their owners are willing they should be retained, is neither economic nor educational. Such vast and costly experiments have no doubt had their uses, but Paris, at least, has made enough of them. It is time for more permanent undertakings. Every eleven years for the past half century Paris has been the world center of one of these vast and splendid, but transient, outbursts in practically all departments of modern activity and inquiry, and though it would be rash to predict what the opening of the second decade of the century may have in store, it would be still more rash to expect that so vast an accumulation of activity and such inquiry will not seek and find outlet and expression, and that both adequate and ample. To insure successful and permanent results preparation must begin years before the actual event. The beginnings made by this committee, whatever the measure of their immediate success may turn out to be, have thus been no mere Utopian endeavor, but a step in the direction of the scientific and artistic, educational and social development of the exposition and museum movements.

IV.

ARRANGEMENTS FOR THE GLASGOW INTERNATIONAL ASSEMBLY, 1901.

A meeting was held on Wednesday afternoon, March 6, 1901, in the Glasgow School of Art, for the purpose of considering the feasibility of organizing an international assembly for the advancement of science, arts, and education, similar to that which was organized in connection with the Paris Exhibition of last year. Lord Provost Chisholm presided, and was accompanied on the platform by Professor Geddes, one of the secretaries of the Paris assembly; Professor Barr, Professor Gray, Mr. J. E. Christie, Mr. Newbery, Mr. James Fleming, Bailie Steele, Mr. Mollison, Miss Paterson, Miss Galloway, and others.

Letters of regret for absence were read from Principal Story, Dr. Robert Caird,

and other prominent citizens, Letters were also read from eminent members of the foreign groups of the association; among others from M. Léon Bourgeois, general president of the association, from the French ministry of education, and from M. Gréard, rector of the University of Paris, indicating, in very full detail, the proposals of the university authorities, who constitute the educational nucleus of the French group of the association, to cooperate in every way by the selection of effective lecturers, prepared at once to express the best results of contemporary science and art, and also to deal more especially with the French exhibits, and containing the promise to encourage the influx of French visitors and organized delegations of picked workmen. Letters recommending the work of the association were also read from M. Herbette, vice-president of the exposition of 1900, from Mr. Thomas Barclay, president of the British chamber of commerce in Paris, and others; as also from eminent representatives of the German and Russian groups. The lord provost, in asking Professor Geddes to explain the constitution of the Paris assembly, and lay before the meeting proposals with regard to that of Glasgow, said he was sure the scheme had in it the elements of success, and that, if it were taken up and wisely and enthusiastically prosecuted, it would assist greatly in lifting up the exhibition beyond the plane of mere amusement and enjoyment, and in making it intensely interesting and highly educative.

Professor Geddes explained in detail the constitution of the Paris assembly, with its varied cooperation of members of the universities of France and many other countries, the technical congresses, the associations of all kinds which met at the exposition, and in particular the scheme of lectures and skilled guidance whereby members were enabled to visit the different sections of the exposition, and to understand the nature or significance of the exhibits in all departments under the leadership of experts. This scheme obviated the great difficulty any one person met with on visiting such a large exposition—the fatigue and confusion caused by the wealth of impressions and the number of things worth investigating. The system would be even more adaptable to Glasgow than it was to Paris, as the exhibition here was not so vast as that of Paris. Such an interpretation of the exhibition—as a museum of the present—tended to raise the scientific temperature of the community by the means of what was practically the university of the present.

After speaking of the aims of the international museums and institutes committee of the association, the speaker asked, Why should not something practical be done at Glasgow for hygiene; why should not the Scottish history collection result in the formation of a Scottish national museum; and why should not this museum have a Scottish history lectureship? Where, again, would we find a better center for a museum of electrical inventions than Glasgow? Over the gateway of the exhibition he would write "Here may ye see infinite riches in a little room," but over the exit "The eye sees only what it brings with it the means of seeing." The membership of the proposed assembly would attend the exhibition very largely, for such an attempt to raise the quality of our visits to the exhibition would naturally increase their number also. He would urge its formation, if only on the simple ground that one of the best ways of helping the exhibition to get as much as it could out of the citizens was to help the citizens to get all they could out of the exhibition.

Professor Barr proposed that the meeting approve the statement and work of the International Association for the Advancement of Science, Arts, and Education, welcome the proposed assembly in Glasgow, and recommend it to all interested in its objects. The bringing together of an international exhibition was always of the greatest value to a community; and they all looked forward to the Glasgow Exhibition to be a very great success, not only financially and temporarily, but by leaving behind it some permanent results. The proposed assembly would, he was sure, prove of great value in these directions.

Professor Gray seconded; and the lord provost, in putting the motion to the

meeting, said the impressions an exhibition made on an ordinary visitor were vague and confused, and anything that resolved these vague impressions into definite information and knowledge would be welcomed by every intelligent visitor. The scheme just outlined would do this, as by its means the many exhibits would be explained by experts, and thus a true mental and intellectual benefit would be derived from the exhibition.

The proposal was agreed to, and afterwards, on the motion of Mr. Henry A. Mavor, seconded by Mr. Alexander, it was decided to form a general committee of representatives of all the scientific and technical societies, etc.; and at the suggestion of the lord provost the above speakers were appointed to organize the general committee.

The committee appointed as a result of the above meeting have since made arrangements to hold an international assembly at Glasgow, from 29th July to 23th September. As at Paris, the chief work of the assembly will be to provide skilled guidance and to seek to interpret by means of lectures, demonstrations, visits, and excursions the international exhibition which will be open in Glasgow from May to October. The arrangements will largely resemble those of a university summer meeting, the subject of study being contemporary progress as illustrated in the collections of the exhibition and the city.

The internationalism of the assembly is assured by the fact that the various groups of the association are cooperating.

LECTURES AND GUIDANCE.

By the kind permission of the university court the lectures will be given in the University of Glasgow. As the exhibition stands practically within the same park as the university, the convenience is obvious.

The lectures, which will be given daily, will be delivered in English, French, and German, and daily visits to the departments of the exhibition will be arranged, usually in connection with the lectures. A due proportion of lectures and guidance will be devoted to geographical questions (including colonization, etc.), to the industrial and commercial exhibits, to the technical and constructive departments, to natural and applied science, to the progress of invention and discovery generally, and also, if possible, to agriculture, horticulture, and forestry, while a large share of attention will naturally be given to the collections of fine arts, archaeology, etc. For the citizen the claims of social science, hygiene, etc., will be kept in view, while the teacher or student may especially utilize the assembly from the side of geography or of nature studies, of Scottish or general history, of modern languages and literature, or of educational problems generally.

The large element of foreign participation introduced by or through the association will be of many kinds—members of many universities, learned societies and professions, educationists from many centers, men of affairs, and workmen's delegates, each bringing some contribution of thought or inquiry during the assembly's two month's activity. Hence facilities will be arranged as far as possible in connection with the lectures in French and German for practical study and conversation in those languages, and conversely for aiding the acquirement of English by the foreign visitors. Such an intercourse can not but act toward the quickening of the intellectual and practical life, the artistic and educational activity, not only of Glasgow and Britain, but of other cities and countries.

EXCURSIONS.

Frequent excursions in Glasgow and the neighborhood will be arranged, and each Saturday a visit will be made to some place farther afield. The weekly excursions will probably be not the least attractive part of the assembly. Glasgow is the best center for excursions to the most beautiful scenery of Scotland; and in

these weekly excursions, conducted under special guidance, the historic or artistic interests, the scientific or industrial aspects of the places visited will all, as far as possible, be pointed out. These visits and excursions are intended to supply the necessary holiday outing, and at the same time to supply further illustration for some of the more general courses of lectures.

RECEPTIONS.

Conversaziones or receptions will be arranged at least weekly to afford opportunity for social intercourse among members.

CONFERENCES.

From time to time conferences will be arranged for the discussion of some points of special interest to members of the association. Among the subjects suggested are the organization of regional surveys, the study and teaching of geography, the formation and arrangement of museums, etc.

CONGRESSES, ETC.

A number of international congresses and many scientific and technical associations will hold their meetings in Glasgow during the summer. Among the latter, the British Association for the Advancement of Science, which meets early in September, and the British Medical Association may be mentioned. An important international congress on engineering will meet in the first week of September.

RESIDENCE, TRAVEL, ETC.—INFORMATION BUREAU.

An information bureau will be established to give assistance in finding suitable hotel or boarding accommodation, to answer inquiries about congresses, lectures, and the sections of the exhibition, etc. Full information will be available as to travel in Scotland, and assistance will be given in arranging tours.

The Queen Margaret Hall of Residence has agreed to receive a limited number of ladies during the assembly.

GLASGOW.

It may be well to draw attention to the importance and interest of the city of Glasgow. Although the site of an ancient and beautiful cathedral and the home of a university which this year celebrates its ninth jubilee, the city has, in modern times, become a busy port, a great center of commerce and industry, and of an intense municipal life. In the field of invention, too, Glasgow has been well represented, the name of James Watt beginning that long period of progress which that of Lord Kelvin fitly crowns.

THE GLASGOW INTERNATIONAL EXHIBITION, 1901.

This exhibition is the most important held in Great Britain since 1851. The wide interests of Glasgow in industry and commerce, science and arts, make it a most suitable place for such an exhibition. The exhibition is strongest in those departments in which the city is most interested. Thus scientific and technical interests, and especially the relations of pure and applied science, are fully represented. Raw materials, agriculture, manufactures of all sorts, mechanism and electricity, engineering and shipbuilding, transport and locomotion, all claim attention in this regard.

Education, too, has its section, grouped with science and music, and naturally technical education receives special attention. A series of daily concerts will add much to the interest of the music section. Nor is the education of the body neglected. A special section contains sporting appliances, while in the grounds a special sports arena is provided.

Industrial design finds its place with manufactures. Fine arts is a strong sec-

tion. The new municipal art gallery houses the fine-art section of the exhibition, and has been fittingly opened with an exhibit representing British art during the nineteenth century. Some representative foreign work is included, and the examples of the work of the "Glasgow school" will have a notable interest. In the same section is included Scottish history and archæology, and here a collection of relics, pictures, books, etc., has been brought together, illustrating the history of Scotland from the earliest times.

The department of social economy, so prominent in the Paris Exhibition, is not included in the official classification. Much that may be classified under this head is to be found in the women's section.

BUSINESS ARRANGEMENTS.

Early in June a full and detailed programme will be ready, containing outline syllabuses of lecture courses.

Membership of the international association (annual, \$5 or £1; life, \$50 or £10) entitles to participation in the assembly.

The local secretary and treasurer of the assembly is W. A. Lawrie Brown, 83 Bath street, Glasgow, to whom subscriptions of membership should be sent, and from whom information may be obtained. Professor Geddes will act as general secretary.

APPENDIX I.

Copy of the letter circulated at the meeting of the British Association at Dover, in 1899, by the small preliminary committee of the International Association (see page 265).

BRITISH ASSOCIATION, Dover, September, 1899.

DEAR SIR OR MADAM: Following upon the hopes and counsels of Sir Michael Foster's presidential address and upon the reunions of the British and French associations, it is felt that the time is now ripe for some more permanent organization which should maintain, develop, and utilize the good relations thus so fully initiated. It is therefore proposed to form a general and advisory committee, consisting of members of the British Association, the Association Française, and of other representatives of pure and applied science, education, art, etc., with the object of promoting arrangements for an international meeting or assembly in connection with the Paris Exposition of 1900. Sectional meetings of the committee will be held in London, Paris, New York, etc.

It is widely felt that there is not only room but need for some organization which would bring together for each of the leading departments and congresses of the exposition the specialist, the educationalist, and the intelligent public; and this on all grounds, from those of personal convenience and economy of time, money, and effort to the highest considerations of scientific progress and international amity.

It will greatly facilitate the arrangements of the committee if you will be so kind as to fill up and return the accompanying form.

We are, your obedient servants,

James Mavor.

Palais de l'Économie Sociale et des Congrès: M. Gide, professeur à la faculté de droit, rapporteur de l'économie sociale pour le rapport général de l'exposition: Histoire d'une vie d'ouvrier.
Pavillon de la ville de Paris:
M. Masson, inspecteur général de l'assainissement de Paris.
M. le Dr. A. J. Martin, membre du comité consultatif d'hygiène publique de France et du Conseil supérieur de l'assistance publique, etc., rapporteur du comité de la Classe III.
Rendez-vous: devant le Palais de l'Économie Sociale, en face la passerelle de l'École Internationale, à 9 h. du matin.

Mardi 23:

Trocadéro:
Les Colonies françaises et étrangères: M. Noufflard, chef du service commercial à l'office colonial.
Rendez-vous: Pavillon de l'administration des colonies (porte Delessert), à 9 h. du matin.

Mercredi 24:

Champ de Mars: M. Léon Guillet, ingénieur des arts et manufactures.
Métallurgie, industries chimiques, électrochimie, blanchiment, teinturerie.
Rendez-vous: Palais des Mines et de la Métallurgie, porte d'angle proche de la tour Eiffel, à 9 h. du matin.

Jeudi 25:

Champ de Mars: M. Guillet, ingénieur civil.
Génie civil et transports, galerie des machines, électricité.
Rendez-vous: Palais du génie civil, porte centrale (près l'exposition rétrospective de la locomotion), à 9 h. du matin.

APPENDIX IV.

CLASSIFIED LIST OF THE LEADING INTERNATIONAL CONGRESSES HELD AT THE PARIS EXPOSITION OF 1900.

I.—*Art.*

Music.....	June 14 to 18.
Photography.....	July 23 to 28.
Dramatic art.....	July 27 to 31.
Architecture.....	July 30 to August 4.
Municipal art.....	August 8 to 16.
Teaching of art.....	August 29 to September 1.

II.—*Mining, engineering, and applied science.*

Gold and silver assaying.....	June 11 to 13.
Mines and metallurgy.....	June 18 to 23.
Automobiles.....	July 9 to --.
Testing of materials.....	July 9 to 16.
Steam engines, etc.....	July 16 to 18.

Applied mechanics	July 19 to 25.
Applied chemistry	July 23 to 28.
Fire brigades	August 12 to —.
Thread numbering	September 3 and 4.
Gas	September 3 to 5.
Tramways	September 10 to 13.
Aeronautics	September 15 to 20.
Railroads	September 20 to 29.
Acetylene	September 22 to 28.

III.—*Maritime affairs.*

Naval architecture and construction	July 19 to 21.
Navigation	July 28 to August 3.
Chronometry	July 28 to August 4.
Merchant marine	August 4 to 12.
Maritime law	October 1 to 3.

IV.—*Mathematical, physical, and chemical science.*

(See also under Maritime affairs.)

Applied mechanics	July 19 to 25.
Applied chemistry	July 23 to 28.
Chemistry	August 6 to 11.
Mathematics	August 6 to 11.
Physics	August 6 to 11.
Electricity	August 18 to 23.

V.—*Natural science.*

Ornithology	June 26 to 30.
Alpinists	August 12 to 14.
Geology	August 16 to 28.
Meteorology	September 10 to 16.
Botany	October 1 to 6.

VI.—*Agriculture and forestry.*

Horticulture	May 25 to 27.
Forestry	June 4 to 7.
Agricultural stations	June 18 to 20.
Viticulture	June 20 to 23.
Cattle feeding	June 21 to 23.
Agriculture	July 1 to 7.
Agricultural cooperation	July 8 to .
Apiculture	September 10 to 12.
Fruit culture and arboriculture	September 13 to 14.
Aquiculture and fisheries	September 14 to 19.
Wine and cider making	October 12 to 13.

VII.—*Medicine, hygiene, etc.*

Homeopathy	July 18 to 21.
Professional medicine	July 23 to 28.
Medical press	July 27 to 29.
Electrology and medical radiology	July 27 to August 1.
Pharmacy	August 8 to .
Medicine	August 2 to 9.
Dermatology	August 2 to 9.
Dentistry	August 8 to 14.
Hygiene	August 10 to 17.
Hypnotism	August 12 to 15.
Physical education	August 30 to September 6.
Pharmacy specialties	September 3 and 4.

VIII.—*Anthropology, archaeology, and history.*

Numismatics	June 14 to 16.
Comparative history	July 23 to 28.
Anthropology and prehistoric archæology	August 20 to 25.

Ethnography	August 26 to September 1.
Basque studies	September 3 to 5.
History of religion	September 3 to 8.
Folklore	September 10 to 12.
Americanists	September 17 to 21.

IX.—*Education.*

(See also X, etc.)

Fencing	June 8 to 10.
Music	June 14 to 18.
Modern language teaching	July 24 to 29.
Higher education	July 30 to August 4.
Secondary education	July 31 to August 6.
Primary education	August 2 to 5.
Philosophy	August 2 to 7.
Educational press	August 9 to 11.
Stenography	August 9 to 15.
Bibliography	August 16 to 18.
Psychology	August 23 to 25.
Teaching of art	August 29 to September 1.
Physical education	August 30 to September 6.
Popular education	September 10 to 13.

X.—*Technical, social, and commercial education.*

(See also XI, XV, etc.)

Agricultural education	June 14 to 16.
Teaching of social science	July 30 to August 3.
Technical and industrial education	August 6 to 11.
Social education	September 6 to 9.

XI.—*Geographical and colonial questions.*

Colonies	July 30 to August 5.
Colonial sociology	August 6 to 11.
Economic and social geography	August 27 to 31.

XII.—*Industry and commerce.*

Grocery trade	June 13 to 15.
Ramie	June 23 to 30.
Commercial travelers and agents	July 8 to 11.
Baking trade	July 16 to 18.
Wine and spirit trade	July 16 to 21.
Commerce and industry	July 23 to 28.
Tariff regulations	July 30 to August 4.
Milling trade	August 9 to 11.

XIII.—*Property and finance.*

House property	May 28 to June 2.
Movable property	June 4 to 7.
Joint stock companies	June 8 to 12.
Landed property	June 11 to 13.
Insurance	June 25 to 30.
Actuaries	June 25 to 30.
Copyright (literary and artistic)	July 16 to 21.
Industrial property and copyright	July 23 to 28.
Comparative law	July 31 to August 4.
Inventors' associations	September 10 to 13.

XIV.—*Literature and the press.*

Press associations	July 23 to 26.
Medical press	July 27 to 29.
Educational press	August 9 to 11.
Stenography	August 9 to 15.
Librarians	August 20 to 23.

XV.—*Labor and cooperation.*

Friendly societies	June 7 to 10.
Young workmen's aid societies	June 11 to 13.
Housing	June 18 to 21.
People's credit banks	July 8 to 10.
Workmen's cooperative productive associations	July 11 to 13.
Cooperative societies	July 15 to 17.
Profit sharing	July 15 to 18.
International cooperative alliance	July 18 to 22.
Workmen's protection and compensation	July 25 to 31.

XVI.—*Women.*

Women's work and institutions	June 18 to 23.
Women's rights	September 5 to 8.

XVII.—*Philanthropy.*

Housing	June 18 to 21.
Vegetarian	June 21 to 23.
Discharged prisoners' aid	July 9 to 12.
Life saving and first aid	July 17 to 23.
Poor relief	July 30 to August 5.
Blind	August 5.
Deaf-mutes	August 6 to 8.
Antislavery	August 6 to 9.
Red Cross	August 20 to 25.
Abuse of tobacco	August 20 to 25.
Sunday rest	October 9 to 12.

XVIII.—*Peace.*

September 29 to October 6.

CHAPTER VII.

EDUCATIONAL TRAINING FOR RAILROAD SERVICE.

[The Annual Report of the Commissioner of Education for 1898-99 contained in Vol. 1 a chapter on Educational Training for Railroad Service (see pp. 871-955), prepared by Mr. J. Shirley Eaton, which gives an account of what higher seats of learning, and especially technological institutions, do to prepare engineers and other special employees of railroads. This account has been a welcome source of information. The question of a specific preparation for railroad service is being discussed by technologists and railroad men, it becoming more and more clear that much waste can be avoided by such a preparation. The St. Louis Railway Club and the Illinois Society of Engineers and Surveyors have recently discussed the technical schools and their relation to railroads, and since the leading papers read before these two associations may be regarded as supplements to the contribution of Mr. Eaton they are here reproduced in full. The first is by Prof. L. P. Breckenridge, of the University of Illinois; the other by Prof. Edward C. Schmidt, of the same institution. Both gentlemen are well acquainted with the subject, since both are engaged in preparing students for railroad mechanical engineering. It must be understood that they use the term "technical school" in the wider sense in which it is commonly called technological school. In continental Europe the term technical school is used for any institution in which mono-technical instruction is given; the term as it is used in the following papers refers to poly-technical institutions. The courses of study mentioned are, however, those of the department of engineering in colleges of the mechanic arts. In stating the enormous extent of the railroad interests as a factor of the present industrial life in this country, the authors, naturally, prove the necessity of special departments for railroad engineering, and since both are practical inventors of railway test cars, they may be considered as not speaking merely "ex cathedra."]

THE AMERICAN TECHNICAL SCHOOL AND ITS RELATION TO RAILROADS.¹

[By L. P. Breckenridge, professor of mechanical engineering, University of Illinois, Urbana, Ill.]

The nature of the many questions asked the writer by persons unacquainted with the work and scope of the American technical school, suggests the preparation of a paper which shall give certain facts familiar to all the teaching profession, but seldom brought to public notice in an easily digested form.

Still another reason exists in my mind for the subject chosen. Each year the technical school and industrial interests of the country are coming more and more into closer, agreeable, and profitable relations with each other. If this subject could be presented so as to draw from any of you a frank statement of what

¹ Read to the St. Louis Railway Club.

you have found to be the difficulties with men fresh from the school; if you would suggest ways occurring to you wherein the school fails; if you would acknowledge wherein the school has been helpful, you may be sure that all American technical schools would profit by your suggestions and be grateful for words of commendation or of criticism.

The American technical school is represented to-day first by the endowed technical school, supported by the interest on securities donated to the school by some generous benefactor, together with the tuition fees of the students. Such are the Troy Polytechnic, Sheffield Scientific School of Yale, Worcester Polytechnic, Lehigh, Leland Stanford, Stevens Institute, Rose Polytechnic, and others.

It is represented also by the technical departments of the State universities, receiving its support partly by the Federal Government, but largely supported by State appropriations, the fees of the student being in most cases merely nominal. Still other schools enjoy the support of both national Government and State aid, as well as that of private benefactions. Such are Sibley College of Cornell University, Massachusetts Institute of Technology, Columbia, University of California, Purdue, and others.

Nearly every State in the Union has now located and is building up and supporting a State university, and some technical instruction is given in all of these institutions.

The geographical location, the available funds, and the make-up of the board of control determined the character of the earlier technical instruction, but the older and larger of these institutions offer courses of study in nearly all the branches for which there appears a demand.

The meaning of a technical education, as usually implied and as used by the writer, is an education into a knowledge of the useful arts, and leading more specifically into some branch of engineering. It does not imply the education of the mechanic in the trade school, which occupies its distinct and useful place and not infrequently furnishes excellent material for more advanced technical training.

The technical school teaches the live languages in place of the dead languages. It teaches mathematics, the effective tool of the engineer, not the ornament of the mathematician. It teaches chemistry, physics, and mechanics as a compass, as a protection, and as a foundation for the superstructure which is to follow, and on this foundation is built the useful and honorable profession of engineering.

The diversity of interests and the multiplicity of public needs and requirements necessarily demands a division of engineering labor, and, while a few years ago the civil engineer knew how to do everything in a technical line, at present there is abundant additional opportunity for the labors of the mechanical, mining, electrical, hydraulic, sanitary, architectural, railway, and naval engineer, while a place is rapidly being opened up for the pneumatic, gas, chemical, and commercial engineer.

The steps in the education of the American engineer are the kindergarten, the grade school, the high school, the State university or endowed technical school, and practice in the chosen profession. The kindergarten exists in every home, but often has neglectful teachers. The grade school exists in every group of country homes as well as in every town, both large and small. In it are educated by far the greater number of American youths. The high school exists in the larger towns and cities and varies in effectiveness and value, depending upon the enthusiasm, local pride, and generosity of its patrons.

The State university receives the graduates of the high schools and obtains its support from the State in much the same way that the high school is supported by the city or town.

The establishment of a national university has not yet been accomplished, and

the project meets with considerable opposition from those who have given the subject their most careful consideration.

I take it that all of you are entirely familiar with the steps of education which carries the student through the high school—everywhere is the American school-house—and many of our cities have high schools of exceptional merit, their course of instruction is excellent, their equipment is complete, their architectural design and appointments magnificent.

In most of the States west of the Alleghenies the educational step beyond the high school is the State university. These are, for the most part, the outgrowth of what was formerly known as the "land-grant college."

The land-grant colleges were the result of early legislation by the General Government. Senator Justin S. Morrill, of Vermont, introduced the land-grant bill into Congress in 1858, and secured its passage only to see it vetoed by James Buchanan, then President of the United States. Not to be subdued, the bill was again introduced into the next Congress, and the next, until finally the measure became a law in 1862, when, on July 2, the hand of Lincoln signed the act of Congress which granted to the several States public lands—"30,000 acres for each Senator and Representative in Congress"—from the sale of which there should be established a perpetual fund, "the interest of which shall be inviolably appropriated by each State which may take and claim the benefit of this act, to the endowment, support, and maintenance of at least one college, where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts in such a manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." The act forbade the use of any portion of this fund, or interest thereon, for the erection or maintenance of any buildings, and the several States claiming and taking the benefit of the provisions of the act were required, by legislative assent previously given, "to provide within five years, at least, not less than one college" for the carrying out of the purposes of this act.

The wisdom of the act just cited becomes more and more evident as time goes on. It was but the beginning of an era of popular enthusiasm in favor of practical education. The States, notably in the West, have generously augmented the gifts of the General Government, and in some cases the wealth of individuals has been added to both, notably the gift of \$4,000,000 to California State University by several philanthropists, followed by the Phœbe A. Hearst architectural competition plan for the building of the entire university, Mrs. Hearst giving \$300,000 to pay for all expenses of competition.¹ The first prize, \$10,000, has just been awarded to E. Benard, of Paris.

The States obtained very variable returns from the sale of the lands, some obtaining but 41 cents an acre, and from this up to \$5.57 an acre. On this account what was intended to be an equitable allotment proved to be, in this, far from it.

In 1890 the Hatch act was passed, giving to each college established under the previous act funds which will soon amount annually to \$25,000. This amount, however, was appropriated for agricultural experiments.

It is hoped that a similar bill may soon be passed for establishing "engineering experiment stations."

The University of Illinois is a representative State university, and the familiarity of the writer with this institution is sufficient excuse for using it to illustrate what is believed to be the object, scope, and plan of operation of all similar institutions, within the limit set by the pride and the financial support given to it by the citizens of the State which it represents.

¹ Review of Reviews, October, 1899.

The University of Illinois is made up of four colleges, as they are called, namely:

1. The College of Agriculture.
2. The College of Literature and Arts.
3. The College of Science.
4. The College of Engineering.

Besides the colleges it includes various so-called schools, such as the school of law, medicine, pharmacy, music.

The university policy, as relates to methods of instruction, courses of study, and general plan of operation is determined by the university faculty, consisting of the heads of all university departments. The college faculty includes all members of the corps of instruction in that particular college, and this body takes action on all matters which relate to its college only.

The head of each college is known as the dean, and the college is made up of departments in charge of a professor, aided by associate professors, assistant professors, instructors, assistants, and fellows.

The College of Engineering is then one of the colleges of the State university, and in it the student receives his technical education. Admission to the College of Engineering is possible in three ways: (a) By certificate from fully accredited high school. (b) by examination, (c) by transfer of credits from some other college or university. There are in the State of Illinois about 250 high schools; of these, 162 are on the accredited list of the university for all or a part of their work. Applicants must be at least 16 years of age.

A law passed by the general assembly of the State of Illinois at the session of 1895 provides that there shall be annually awarded to each county of the State one State scholarship, which shall entitle the holder thereof to instruction in any department of the university for a term of four years, free from any charge for tuition or incidental charge, except it be for materials used or damage done to university property. Entrance examinations under this law are in charge of the superintendent of public instruction, and competitive examinations are held upon the first Saturday in June at each county court-house of the State.

The subjects upon which entrance examinations are held for admission to the College of Engineering are as follows:

<i>Prescribed list.</i>		Credits.
Algebra (through quadratics).....		4
Geometry (plane, solid, and spherical).....		4
English composition.....		3
English literature.....		6
French, or German, or Greek, or Latin.....		6
History.....		3
Physical or biological science.....		3
		29
<i>Elective list.</i>		Credits.
Astronomy.....		1 to 1½
Biology.....		3 6
Botany.....		1½ 3
Chemistry.....		2 3
Civics.....		1 3
Drawing.....		1 3
French, or German, or Greek, or Latin.....		3 9
Geology.....		2 3
Manual training.....		1 2
Physics.....		3
Physiography.....		1 3
Physiology.....		1½ 3
Zoology.....		1½ 3

Each student is required to pass examinations in all studies of the prescribed

list, and enough from the elective list to aggregate 7 credits, making in all 36 credits for admission. A credit being equal to one subject pursued in a high school for twelve weeks with daily recitation. Admission by transfer of credits is obtained by filing of certificate of honorable dismissal from the college from which the student comes, and submitting credits for work done at another institution to a special committee appointed to report on these special cases.

Persons over 21 years of age, not candidates for a degree, may be admitted to classes when they possess the requisite information and ability to profitably pursue the chosen subjects.

It is not necessary that a student be a resident of the State of Illinois to enter the university, the only requisite for admission being ability to pass the examinations and a good moral character.

The work of the student after entering the College of Engineering depends somewhat upon the course of study which he elects to pursue. The courses of instruction offered at present are:

1. Architecture and architectural engineering.
2. Civil engineering.
3. Electrical engineering.
4. Mechanical engineering.
5. Municipal and sanitary engineering.
6. Railway mechanical engineering.

All of these courses are similar as far as their work pertains to such foundation studies as mathematics, physics, mechanics, elements of drafting, and chemistry. Similar also in their work pertaining to culture studies, composition, rhetoric, English, French, German, Spanish, economics, ethics, and history. They differ in the several departments, in that each department applies the principles of these fundamentals to the special examples, problems, designs, constructions, and duties which will naturally follow in the chosen profession.

In each department the special studies of the course number about twenty-one, divided as follows: (a) Recitations, (b) drawing and design, (c) shop or field work, (d) laboratory work, the amount of work depending upon the particular course. As an example of a four years' course of study it seems appropriate to give here the course laid down as the course in railway mechanical engineering at the University of Illinois:

First year.

1. Advanced algebra and trigonometry.
2. German, or French, or Spanish, or English.
3. Elements of drafting, descriptive geometry, lettering, and sketching.
4. Shop practice in pattern making, foundry work, and forge work.
5. Military tactics and drill.
6. Physical training.

Second year.

1. Differential and integral calculus.
2. Physics, experimental lectures, and laboratory practice.
3. Drafting, elements of machine design.
4. Shop practice in machine work and bench work.
5. Rhetoric.
6. Military training.

Third year.

1. Analytical mechanics, resistance of materials, and hydraulics.
2. Chemistry.
3. Kinematics—the relative motion of bodies.
4. Surveying.
5. Electrical machinery.
6. Steam engines and boilers.
7. Laboratory practice in steam engineering and power measurements.

Fourth year.

1. Thermodynamics - theory of heat engines.
2. Mechanics of machinery.
3. Locomotive engines and locomotive design.
4. Railway shop systems.
5. Compressed air in railway service.
6. Advanced designing.
7. Seminary—review of railway periodicals and society transactions.
8. Laboratory practice—locomotive road tests and dynamometer car tests.
9. Thesis.

The first three years of this course is identical with the straight course in mechanical engineering, but during the last year, as is usual in all departments, particular stress is laid on the specialties of mechanical engineering as applied to railway problems.

It will be seen from this example that for the first three years the time of the student is largely spent in becoming thoroughly grounded in the fundamentals, learning, as it were, the names of the mental tools of the engineer, and which of them should be used in the solution of various problems, just as he learns in the shops what metal tools there are to be used in the various mechanical problems of construction and destruction.

During the last year some time is spent in advanced theoretical work, but a considerable time is taken up in the application of the previous teachings, while the student is still under the eye of his teacher. More and more he is thrown on his own resources and pushed into positions of responsibility requiring independent judgment and thought. He begins now to see the "use of things," where all along he has had his doubts. He puts more confidence in his teachers, becomes interested and absorbed in the work, accomplishes much more than ever before, and realizes that his time is short in the gold fields of education and that he soon must commence life where all successful engineers have started, at the bottom of the ladder and work up. The thesis is his last and best independent effort before graduation, and not infrequently shows the individual himself, as well as his teachers, about what four years of time and study has amounted to in fitting him for a starting place in the chosen work.

The expenses of the student in the College of Engineering are about as follows:

Matriculation fee (for each student not holding a State scholarship) payable upon admission	\$10.00
Diploma fee, payable before graduation	5.00
Incidental fees, payable each year	24.00
Special students (not candidates for a degree, pay in addition to above incidental fees), each year	15.00
Laboratory fees for materials used vary in different departments and during different years; average per year	10.00
Room rent, board, fuel, light, washing, at private houses, varies from	\$160.00 to 200.00
Books, drawing instruments, and miscellaneous supplies, average cost per year	25.00

The university makes no provision for room and board, but these may be easily obtained at reasonable rates at Champaign or Urbana, in which town the university is located. The stranger never knows where one town "leaves off" and the other "begins," and there exists no reasonable excuse for the two towns. The total expense per college year may be as low as \$200, but in most cases \$300 would be a safe estimate as the necessary expense. Of this the university receives less than \$30 per year, including matriculation and graduation fees.

Some of the special features of technical instruction are its shops, laboratories, and drafting rooms. Considerable difference of opinion exists as to the usefulness of shops in this system of education. My observation is that the "Worcester" system is right at Worcester; the "Lehigh" system is right in Pennsylvania, and the "Illinois" system is right in Illinois.

It is evident that the same system is not possible or desirable in the heart of

manufacturing communities and in the center of a vast agricultural district. In any place shops are a desirable feature of a technical school. In all of our Western institutions they are an absolute necessity.

It makes a vast amount of difference whether a boy's early environment is shops, mill, and factories, or whether it is corn fields and prairie. In the technical school shop the object is not to make skilled workmen, although this result is frequently obtained. The rule of the school shop is: "As soon as a student knows how to do a thing, put him at something else."

The total time spent in the shops is comparatively short. At the University of Illinois the students in mechanical, electrical, and railway engineering departments spend 180 hours in the pattern shop, 90 hours in the foundry, 90 hours in forge shop during their first year, and 270 hours in the machine shop the second year, making a total of but 630 hours (=63 days) in the four shops. In this short time spent under competent instructors, each a specialist, it is truly surprising how much is accomplished. It is here that a student gets a chance to use his hands in acquiring education, and the education which reaches us through our hands stays with us better than that which comes through any other channel.

The shop does not undertake to manufacture articles for sale; if it does, there immediately springs up a tendency to keep students too long on the same kind of work. There may sometimes be one or two special articles advantageously made and sold, and there will always be work on additions to the equipment, but no large amount of commercial work can be undertaken to advantage. The operation of shops is expensive, and the cost of material used up and tools broken amounts to approximately \$2,000 a year at the University of Illinois for about 150 students. The machines wear out and become out of date, and must be replaced by modern tools, or else the education is liable to be behind the times. If I were to enumerate some of the advantages of the school shop to the technical student, I should emphasize the following:

- (a) It teaches the student to do something with his hands.
- (b) It leads him to use his judgment and accustoms him to use brain and hand together.
- (c) It enables him to become familiar with the characteristics and properties of the materials of engineering.
- (d) It acquaints him with the possibilities and impossibilities of construction as modified by the equipment of tools.
- (e) He learns how to read drawings.
- (f) It makes his future work in designing easier and keeps it out of many pitfalls.
- (g) It makes him more sympathetic with workmen in general.
- (h) It serves to exemplify the teachings of the class and lecture room.
- (i) It is good physical exercise.

The engineering laboratory for the use of students is an American institution. It has followed, as a natural consequence, the successes of the laboratory methods of physics, chemistry, botany, zoology, biology, and other sciences. It is doubtless the most expensive of all to install, to maintain, and to operate. It is in the extent of its engineering laboratory equipment that one engineering school outstrips its rival more than in any other particular. It seems also true that if any one thing attracts students to one school more than to another it is this same superior laboratory equipment.

At two of the leading American technical schools the appliances and equipment used for engineering laboratory purposes are inventoried at over \$850,000. The methods of the laboratory are the methods of investigation, systematic and scientific experimentation. Familiarity with the instruments of his profession is followed by problems of increasing difficulty and by tests of machines and materials involving more and more care, preparation, and thought.

The natural and intense desire of the average American "to see the wheels go round," to see what is "inside of things," to know "why and how it works," to make it work himself, insures success to engineering laboratory methods.

The nature of the experiments performed by the students covers a wide field and reaches into almost all realms of industrial and commercial enterprise.

I can only enumerate some of the main lines of investigation, each of which has been extended almost indefinitely in all directions:

(a) Tests of strength of materials (wood, iron, steel, cement, stone, brick, mortar, beams, columns, cable, ropes, belts, joints, chains, springs, pipes, hose, stay bolts, drawbars).

(b) In hydraulics—test of turbines and motors, water meters, hydrants, hose, nozzles; flow of water over dams, weirs, notches, through rivers, canals, pipes, and orifices; action of water under impact, compression, freezing.

(c) In steam engineering—evaporative performance of all types, sizes, and designs of steam boilers; tests of the efficacy of various types or kinds of grate bars, furnaces, stokers, economizers, feed water heaters, pipe coverings, injectors, and superheaters. Tests of all types, sizes, and kinds of steam engines, to determine their economical performance under the most variable conditions; high speed versus low speed; throttling versus automatic cut-off; condensing versus noncondensing; high pressure versus low pressure; compound versus simple; jacketed versus not jacketed; the duty of pumping engines; the steam consumption of pumps, pulsometers, air compressors, steam turbines and heating systems.

The same long line of tests as applied to steam engines are duplicated with electrical generators and motors, with gas engines and hot-air engines, with air compressors and pumping engines, with locomotives, with refrigerating machines, with windmills; in fact, nothing escapes the instruments of the experimental engineer.

(d) In railway mechanical engineering much has been done in regular laboratory work; many of the schools have carried on successful "road tests" of locomotives; at least two schools (Purdue and Columbia) own locomotives and have them mounted for testing, and much valuable work has been done in this way.

One school (University of Illinois) has recently equipped a dynamometer car, cooperating in this with the Peoria and Eastern division of the Cleveland, Cincinnati, Chicago and St. Louis Railway, and much important work is being accomplished with this equipment, which is being rapidly augmented and improved. Besides this, numerous miscellaneous tests have been made, such as scale tests, brake-shoe tests, air-brake tests, lagging tests, fuel tests, nozzle tests, oil tests, fire-kindling tests, water-supply apparatus tests, all relating more specifically to railway work, while many of the regular tests of materials and steam and electric specialties apply as well to railways as to other lines of engineering practice.

The value to the student of his laboratory experience might be outlined as follows:

(a) It teaches him to locate wastes (of material, of fuel, of power).

(b) It teaches systematic methods of investigation.

(c) It exercises his ability to make a clear written statement of the results obtained.

(d) It familiarizes him with the various types of commercial appliances used in practice.

(e) It gives him confidence in his own ability to do things.

(f) It fixes in his mind the useful constants, methods, and records of engineering practice.

I have added below several tables of statistics relating to the American technical schools. These I will not undertake to read, but they may prove of some interest when appearing in the proceedings.

(Very complete articles on this subject may be found in the Transactions of the

American Society of Mechanical Engineering, article by R. H. Thurston, Vol. XIV, 1893; also Engineering News for 1892 and 1897.)

Some of the principal engineering schools in America, attendance, expenses, etc.

School.	Yearly tuition.	Estimated living expenses.	Attendance in engineering, 1899.	Location.
1. Massachusetts Institute of Technology.	\$200	\$240 to \$320	936	Boston, Mass.
2. Cornell University.....	100	200 325	713	Ithaca, N. Y.
3. Sheffield Scientific School (Yale).	155	160 600	567	New Haven, Conn.
4. Columbia University.....	150	300 540	380	New York, N. Y.
5. Purdue University.....	Free.	150 ---	377	Lafayette, Ind.
6. Ohio State University.....	Free.	150 250	338	Columbus, Ohio.
7. University of Illinois.....	Free.	150 225	287	Urbana, Ill.
8. Lehigh University.....	\$100	225 340	267	S. Bethlehem, Pa.
9. University of Michigan.....	\$25 to \$35	300 ---	240	Ann Arbor, Mich.
10. University of Wisconsin.....	100	150 300	236	Madison, Wis.
11. Lawrence Scientific (Harvard).	150	240 350	217	Cambridge, Mass.
12. Stevens Institute of Technology.	150	250 450	214	Hoboken, N. J.
13. University of California.....	Free.	150 250	200	Berkeley, Cal.
14. Missouri State University.....	\$5	150 250	185	Columbia, Mo.
15. University of Minnesota.....	Free.	200 275	183	Minneapolis, Minn.
16. University of Pennsylvania.....	\$200	150 210	180	Philadelphia, Pa.
17. Pennsylvania State College.....	Free.	200 ---	158	State College, Pa.
18. Rensselaer Polytechnic Institute	\$200	300 500	142	Troy, N. Y.
19. Iowa Agricultural College.....	Free.	150 225	137	Ames, Iowa.
20. University of Kansas.....	Free.	150 225	112	Lawrence, Kans.
21. Alabama Polytechnic Institute.	Free to \$20	150 200	101	Auburn, Ala.
22. State College of Kentucky.....	Free to \$15	150 200	96	Lexington, Ky.
23. Western University of Pennsylvania.	100	150 200	95	Allegheny, Pa.
24. Leland Stanford, jr., University.	Free.	225 300	85	Paloalto, Cal.
25. Tulane University.....	Free to \$20	250 400	78	New Orleans, La.
26. Princeton University.....	120	170 500	69	Princeton, N. J.
27. West Virginia University.....	Free to \$37.50	130 200	54	Morgantown, W. Va.
28. University of Iowa.....	25	225 ---	27	Iowa City, Iowa.

¹ Includes some students in chemistry.

The foregoing table does not pretend to be more than approximate in order to give some ideas concerning this subject. Where tuition is "free" there are usually certain fees, amounting to from \$10 to \$40 a year, to cover laboratory materials used, etc. Schools omitted from this list were omitted because the writer did not have recent catalogues. It is probable a complete list would include 50 schools. It is believed, however, the above schools contain 85 per cent of the students attending American technical schools.

The relation of the American technical school to the railroads is both direct and indirect.

It is direct when the school supplies the graduate in civil engineering who develops into the surveyor, the superintendent of new constructions, such as roadbeds, tunnels, bridges, culverts, elevated tracks, piers, water towers, etc., the engineer of maintenance of way, or the bridge engineer; when it supplies the graduate in mechanical engineering who develops into chief draftsman, designer, engineer of tests, shop foreman, master mechanic, superintendent of machinery, or superintendent of motive power; when it supplies the graduate of electrical engineering who develops into electrical expert in matters relating to electrical machinery, electrical transmission, telegraphy, telephony, electric lighting, traction, and signaling; when it supplies the graduate of architectural engineering as designer of terminal stations and their appliances for heating, ventilation, plumbing, etc., as well as designer for way stations, depots, freight houses, elevators, shops, and miscellaneous structures; in fact, when any of its graduates are developed into

positions of responsibility and trust anywhere along the line from lowest to highest.

The relation is indirect when the graduate serves to aid by his scientific attainments the development of any of the great industrial or commercial interests of the State or nation, upon the success of which the growth of railroads depends. It is indirect when the graduate enters the field of technical journalism and devotes his energy to the collection, collation, and publication of the results of the world's progress in railway engineering.

It is indirect when the graduate enters the laboratory for research and determines new engineering constants, checks up old ones, or investigates any of the constantly increasing problems which relate to the construction or operation of the simpler machines for the saving of labor, to the perfection of inventions, or the prevention of waste in the transformation of energy.

It is indirect when the graduate fits himself for the duties of a teacher who shall direct again the steps of those following, helping them to avoid the mistakes others have made, pointing out the sources of information in their special lines, molding their lives into systematic investigators, inspiring them by always seeking for the truth in nature, into living lives of truth and fearless adherence to principles of right and justice, not only when dealing with crude materials, but also when dealing with their fellow-men.

The power required in the operation of any industry is somewhat of an index to its position as an important element in the total industrial development and support of our great nation.

In this connection I present the following diagram¹ showing the total available steam power in the United States and its division into three parts, as indicated.

It will be seen that nearly two-thirds of all our power is used in the transportation of materials to the factory and again to the consumer. It also indicates the growth of all railway interests, for it is evident that this available power for operating grows with the growth of the road. Two-thirds of the fuel used for power purposes is probably consumed by the locomotives of our railroads. The probable growth in the near future seems destined to follow the law prescribed by past growth. If it were possible for human hands to perform the work now available in steam power, it would require at least 300,000,000 workmen to do it.

The cost of one horsepower per year, for a period of ten hours a day, varies according to locality, but may be stated at \$15 to \$25 per year. It would require 15 men to perform the same labor, working ten hours a day, six days per week, and the cost of this labor at \$1.50 a day would amount to approximately \$7,000.

It is evident that no nation can expect to advance that does not take every advantage of steam power in the performance of all kinds of labor.

The American railroads require for their direct operation 1,000,000 operators, representing approximately 5,000,000 of our population directly dependent upon railroads. The indirect labor required to supply the railroads with fuel, iron, steel, timber, and other supplies is an untold quantity.

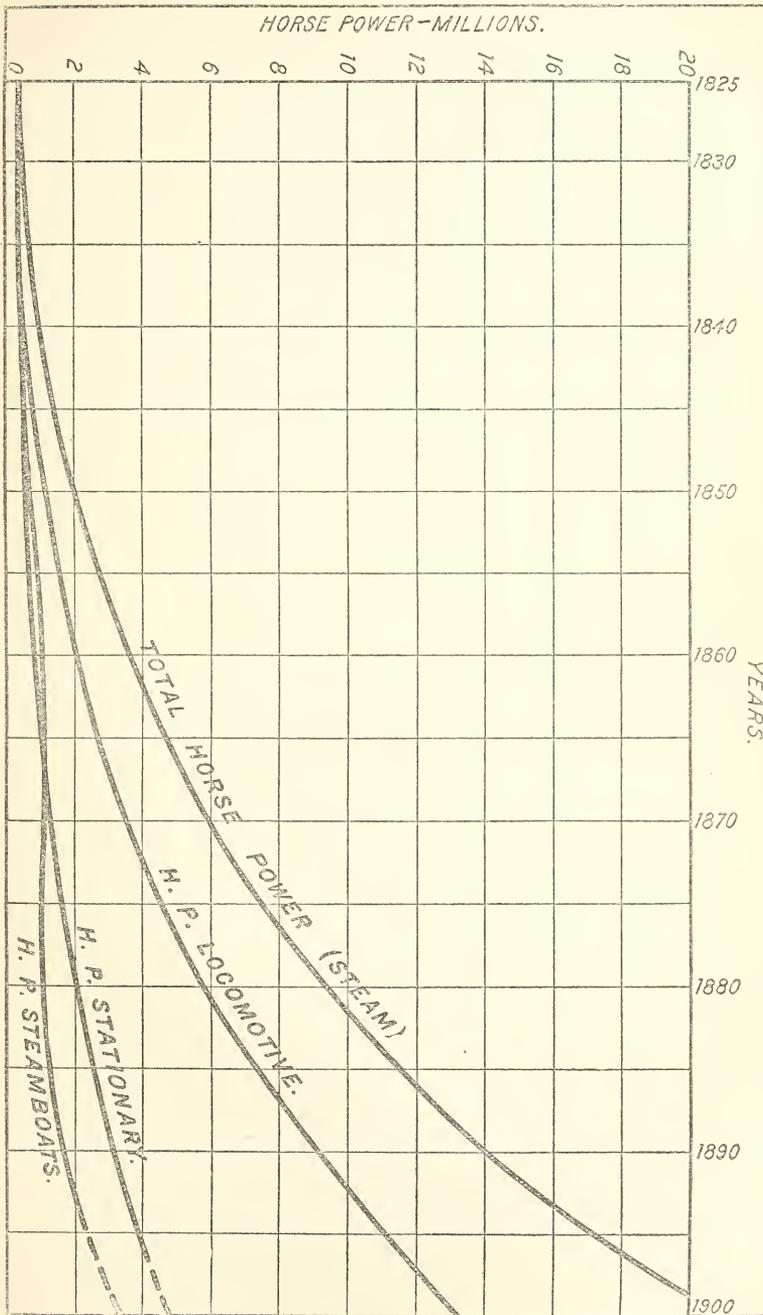

The successful road is alert to obtain all of its supplies of the best possible quality, and not only are its specifications rigid, but its inspection and its tests are careful and more and more scientific.

No one thing may claim especial preeminence and credit for the wonderful development of the American railroad. Great as has been its advance, it is but the result of the sum total of our natural progress. Fuel is supplied cheaper; better steel is provided for rails and for boiler plate, allowing higher speeds on account of safer road beds and higher steam pressure.

Steel castings are replacing iron castings; special machinery for construction

¹ See Thurston's Growth and Development of the Steam Engine.

and repairs has been perfected; compressed air has replaced hand labor to much advantage. The flexibility of the electric light is of much value, and the electric

motor is frequently installed to advantage. Improved methods of signaling and interlocking add safety with increased speed.

Cars are loaded with 100,000 to 120,000 pounds of ore and coal. Brook's locomotive No. 640, recently put in service on the Illinois Central Railroad, weighs 232,200 pounds.

Appliances for facilitating office work have kept pace with other departments, and the telephone, phonograph, typewriter, duplicator, time recorder, all must be given their due share of credit.

All of these devices, all of this improved material, is available and can be secured by all railroads, and yet some roads are not successful. There is one thing needful—one thing absolutely necessary to success, and that is the right man in the right place in each and every department of railway management.

Everyone, from president to shop or road foreman, feels that the success of his enterprise depends more upon having the right man in the right place than upon any other thing. Time and again officers and chief engineers scan the ranks looking for the right man to fill a position of responsibility—sometimes with success, often with failure when compared with their ideal.

It is to this point that I have tried to lead your thought: The American technical school will supply railroads with men. Not laborers, but leaders; not imitators, but originators; not through any process of favoritism, but because of real ability and worth; not because of what the school teaches of railroads, but because what it does teach is the basis and foundation of the science of construction and operation of railroads.

The writer believes that the present grand success attained in railway development has been accomplished with comparatively little help from the technical school. It has been attained by hard and persistent effort, and by the devotion of years of patient toil, energetic thought, careful judgment, and ceaseless application on the part of more men than have given their toil and thought to any other single line of development.

That success has been attained in so many instances is commendable, but may we not hope for the same success with less waste of time and energy by spending a proper amount of time studying principles before studying their applications?

Can we not bring the man to the same plane of development ten years earlier by requiring the boy to spend four years in a technical school?

You will notice that the writer says "will" supply railroads with men. That it has supplied some already many of you can attest, but as you look over the vast army of workers you will discover that back at the beginning of things, in the shops, in the offices, in the field, the sensible technical graduate has started.

No longer can it be advisedly said that the technical graduate expects to step out of school into the president's chair. They are beginning at the bottom, as you began, and now they have started right their progress will be more rapid, but their labors will be no lighter than yours have been.

The measure of success which they will attain will depend upon the same factors which have made men successful always—hard work, good habits, good health.

I predict the success of the technical graduate. The demand at present far exceeds the supply. Many important roads, looking to their future needs, are giving this subject thought and attention.

The sons of railway men are being sent to the school, which shows the thought of the father. There is no escape from the belief that the railways of the near future will owe much to the technical graduate, and it will certainly be within reason to predict that within twenty-five years many of the successful American railways will be maintained, operated, and managed by the successful graduate of our American technical school's.

Let me add but a few more words and I am done, although with the feeling that much remains unsaid.

There should continue to grow a feeling of sympathy and interest between the

technical school and the railroads; their interests may be mutual in many ways. The school could be much more helpful to the roads if some plan could be arranged by which the roads would lend the school one or more men from their engineering corps for carrying on certain tests in the laboratories of the school and working up the results.

The schools are invariably shorthanded for work in this respect. The work performed by these men would be arranged along such lines of investigation as the road furnishing the men were interested in at the time. To put it another way, the schools would lend their laboratories to the roads.

In connection with our dynamometer car tests and inspections, it would be only a step to aid the railroad employees by arranging a series of talks on shop, fuel, injectors, steam, etc., supplemented by "book lists" for young mechanics, to be given in the car at various points along the line.

Desirable as it may be, and although the cost of a technical education is low, there are many that can not afford time to obtain it. The vast army of workers are compelled to commence work before even completing the high school. This country needs more technical high schools; more schools that will fit for life's work rather than for a profession. This need is felt and is being slowly filled. Do not lose any opportunity of aiding in the introduction of manual training into your public schools. This advice is evidently superfluous in St. Louis where so much has been done in this direction. The influence of the technical school is working back along the line of the preparatory schools, and makes the place of the trades school and manual training in the lower schools more and more evident.

The twentieth century is before us. We are advancing into light from all directions; the mysteries of the past are becoming the familiarities of the present. If there is encouragement in any one thing above all others it is this, that the individual, the private corporation, the people, are finding out that it pays to be honest, to deal squarely with facts, and with fellows. "The solution of the labor problem is to be aided most," says the Commissioner of Labor, "by honest, fair, and just dealings, as between employer and employee." If there is anything that will teach the necessity of honesty, it is the work of the student of the technical school—true fits, true sizes, true drawings, true tests, true reports—a deviation from truth anywhere means disaster. If there is any place or position requiring honesty and truth it is in the service of the American railway.

I earnestly hope that the success of the past may be augmented in the future, and that the interests of the American technical school may be in part at least the interests of the American railroad.

In the discussion following this paper, Prof. C. W. Woodward, of St. Louis, Mo., said:

I enjoyed the spirit and hearty appreciation with which Professor Breckenridge entered into his subject and his grasp of the subject. Of course, a great many things occurred to me as he was reading it, and no doubt many of them must have occurred to you. I am strictly in harmony with him; my position in regard to the relation of technical schools to the railroads, and to every industrial order, is just exactly the same as his. The chart (see page 315) which shows in such a striking manner the wonderful development of steam power in this country, might very well be used to indicate the interest of people in technical education. If you go back, say to 1825 or 1830—if you go back even not so many years ago as that—if you go back to 1840 and 1850, you will find that there was but one school of engineering in this country, and that was the Rensselaer Polytechnic, at Troy, N. Y. Then came the School of Mines, in New York City; it was called the School of Mines, because it was taken for granted that they had to have a school to teach the art of mining. Well, that school of mining still exists, but mining is the least factor in the school. Its departments of architecture and civil engineering have altogether outrun its mining department. And then, all over the country, as Professor Breckenridge states, people have begun to learn and study the world as it is to-day, and study the activities of to-day—to study the great principles of

science and methods and mechanics, which underlie all of our industrial order. They have learned, as he said, to study the living things rather than the dead, as the first step in education. After we have built our splendid foundation, and come in touch with the world of to-day, getting a grasp of the dynamic situation that exists in this country, then we are masters of the work, and culture and fine arts will grow and thrive on the foundation of this practical work. I have no hesitation and no fears about the future of this country as regards literature and art; you are laying down the splendid foundation upon which literature and art are to be built. We must have the strength, and we must have a good education. We must have brain and hands cultivated together, and then the culture and the education will come just as sure as the sun will rise.

There was one thing that struck me in this paper of Professor Breckenridge's that would have surprised me had I not known it just as well as he does, and I think it surprised you, and that is the very small amount of time (Professor Breckenridge said 63 days in a four-year course) that is given, for instance, to the element of shop work in an engineering school, and similarly in manual training schools, which are schools of a lower grade—the very small amount of time; but yet, how much importance attaches to it.

As workmen measure time, 63 days represent 630 hours. And yet they learn so much. Well, how is it? It is simply because they spend all their time learning; all the time that they are in the shop their minds are on their work and their hands are on their work; there is no growth and there is no progress made—you will all bear me out in this—when the hands are employed and the mind is far away—miles away. Then there is no progress being made in any schoolroom, or in any shop or anywhere else, and in an organization of learning, or school, when the mind is absent and the hands present—when the boys' minds are on the baseball or football field, or somewhere else—then he might as well be at home or sitting outside on the porch as to be in any shop or recitation room or lecture room. The boy in a shop of the technical school wastes no time in the shop; he never gets tired of trying to do a thing right. He does not reach the stage of drudgery; he learns more sometimes in one or two hours than an ordinary workman learns in a month, and that is strictly true. Now, my boys go out into the world, and they are called upon occasionally—there are two or three of them right here—they are asked, "What can you do?" "Well, put me to work and see what I can do." They are not engineers; they are simply boys who did shop work before they went to college, in a secondary school; yet they will go to work, and by-and-bye people come around and say, "Where did you learn your trade?" "I never learned a trade." "Oh, go away; tell me where you learned your trade." Well, they will say that they got it there at the University of Illinois, or at Chicago, or at the St. Louis Manual Training School—got it somewhere. "How much time did you give to it?" And he tells them how much time he gave to it, and they think it is nonsense. They know that the boy is fooling them; they say, "You couldn't learn what you have learned in the time you have spent in the shop. I spent several years learning my trade." The other day a man came to me and said: "Professor, you think you can teach your boys anything in the shop by keeping them there only two hours a day. You can't do a thing at it; the only way to learn is by putting them to work from 7 o'clock in the morning until 6 at night. Let them stand there and work; you have to go through all that before they have an intelligent idea of the work." Now, I don't believe that I do. I don't believe that you think so, gentlemen.

Other things have occurred to me this afternoon and interested me very much. It is you, gentlemen, that are going to send the boys along. You are not only the men who have charge of these things and give directions to the affairs, but you are men who have boys to educate, and it is those boys that I am interested in, and that Professor Breckenridge is interested in, and I know you are interested in. Let them come along, that they may follow in your footsteps with advantages, perhaps, which you did not have, but which the world to-day offers them.

EDUCATION IN RAILWAY ENGINEERING AT THE UNIVERSITY OF ILLINOIS.

[By Edward C. Schmidt, instructor in railway mechanical engineering, University of Illinois, Champaign.]

The importance of the railroad interests of the country makes it a matter of wonderment that hitherto so little attention has been given to the education of

men for railway work. Until quite recently it has been impossible to obtain, except in some of the allied subjects in civil engineering, any instruction in those matters pertaining particularly to railroads.

Since their beginnings the technical schools have given instruction in those subjects which relate to almost all other branches of industry and manufacture, and we find (for years back) courses in architecture, civil, electrical, mechanical, mining, hydraulic, and municipal and sanitary engineering, and in chemical technology offered in all our colleges of engineering, civil and mechanical engineering being specialized in many cases to cover various fields of industry.

The railroads, however, have not received until recently their share of attention, which is the more remarkable since railroad work, on account of its complexity and intensity, might be expected to require, more than any other profession, men of the most thorough technical training.

Nowhere, certainly, is there keener competition, nowhere more strenuous activity, and in no other profession are men called upon to bear greater responsibilities or to exhibit greater efficiency. It seems fitting, then, that for this work they should have the most complete equipment. The railroads themselves have hitherto met this necessity by educating their own men, usually at a wasteful expenditure of time, which must occur when education is undertaken by an organization not primarily adapted to that purpose.

The need is fortunately now recognized, and within the last few years several of our universities have established courses in railway civil engineering and in those branches of chemistry and economics relating to this work.

The Western universities—Purdue University being the pioneer—were the first to establish such courses, and the University of Illinois was one of the first to offer this work. As early as 1869 courses in civil engineering were there offered and work in railway mechanical engineering has been given for the last four years, during which time this work has grown to such an extent as to make necessary a department of railway mechanical engineering. An outline of the courses of study in these two departments is given below, where the attempt will be made to give an idea of the scope of the work, avoiding details as much as may be.

The requirements for admission into any of the engineer courses at the University of Illinois are given in the list on page 308.

Each candidate must obtain 36 credits, 1 credit being given for the amount of work ordinarily accomplished in one of the three terms of a high-school course. One credit therefore represents the work of 60 recitation periods of forty minutes each. There are required for admission 29 credits in the studies of the prescribed list and 7 credits in any of the subjects of the elective list. This applies only to candidates for a degree.

For the first two years the subjects prescribed in both the railway civil engineering and railway mechanical engineering courses are practically the same, as is shown in the following list:

COURSE IN CIVIL ENGINEERING.

First year.

Advanced algebra.	(Wood shop—foundry and forge shop.)
Trigonometry.	French or German.
Analytical geometry.	English.
Elements of drafting.	Military training.
Descriptive geometry.	Physical training.
Shop practice.	

Second year.

Differential calculus.	Railway curves.
Integral calculus.	Physics.
Land surveying.	Rhetoric.
Topographical surveying.	Military training.
Transit surveying and leveling.	

COURSE IN RAILWAY MECHANICAL ENGINEERING.

First year.

Advanced algebra.	(Wood shop—foundry and forge shop.)
Trigonometry.	French or German.
Analytical geometry.	English.
Elements of drafting.	Military training.
Descriptive geometry.	Physical training.
Shop practice.	

Second year.

Differential calculus.	Physics.
Integral calculus.	Rhetoric.
Machine design.	Military training.
Machine-shop practice.	

These subjects constitute the usual training in mathematics and science necessary for an engineering course, while as much time as possible is given to those studies which are considered solely cultural. Nothing more need be said of the amount of work done in each of these subjects than that it is the same as that ordinarily done in all our colleges and universities.

It will be noted that the only differences in the courses for these two years are in the subjects of machine design and topographical drawing and in shop practice and surveying.

The work of these two years is intended merely as a preparation for the more technical work that follows, and it is only during the latter half of the course that the work is specialized. During the last two years the student in civil engineering or in railway mechanical engineering is engaged in advanced theoretical work and in the applications of the results of his previous study in laboratory and field practice. From this time on the courses are necessarily divergent and must be treated separately.

The equipment in the civil engineering department comprises the usual instruments—compasses, transits, levels, plane tables, sextants, chronometers, and barometers, and for lecture-room purposes a large collection of bridge parts, column sections, lithographs, blueprints of standard drawings, and photographs, which is being constantly increased.

The course in civil engineering for the third and fourth years is as follows:

CIVIL ENGINEERING COURSE.

Third year.

- | | |
|-----------------------------|---------------------------------|
| 1. Analytical mechanics. | 6. Steam boilers. |
| 2. Resistance of materials. | 7. Graphical statics and roofs. |
| 3. Hydraulics. | 8. Descriptive astronomy. |
| 4. Chemistry. | 9. Railway engineering. |
| 5. Steam engines. | |

Fourth year.

- | | |
|---|---|
| 10. Bridge analysis and bridge details. | 17. Engineering contracts and specifications. |
| 11. Bridge design. | 18. Sewerage. |
| 12. Masonry construction. | 19. Tunneling. |
| 13. Water-supply engineering. | 20. Railway structures. |
| 14. Practical astronomy. | 21. Thesis. |
| 15. Geodesy. | |
| 16. Economics. | |

Post-graduate work.

Location and construction of railways.
Maintenance of railway tracks and structures.
Yards and terminals.
Motive power and rolling stock.
Signal engineering.
Railway operation and management.

Railroad engineering, No. 9 in the above list, includes a course in field practice and mapping, in which the students are required to make preliminary and location surveys of a line of railroad of sufficient length to secure familiarity with the methods of actual practice, and for which each one makes a complete set of maps, profiles, calculations, and estimates. Students also take up the study of the economic theory of railway location and railway construction and maintenance.

Courses Nos. 10 and 11—bridge analysis and design—include instruction in computing stresses by analytical and graphical methods, designs, and estimates, and a study of the types and details of design. During this work each student is required to completely design a bridge, proportion its details, and prepare complete drawings.

Course No. 20—railroad structures—is a course of instruction, by lectures, reading, and design in the current practice of leading railroads and an examination of their existing structures and standard drawings. The nature of the other subjects is, it is believed, clearly enough indicated by their names.

The courses for post-graduate work are offered to those who have completed the four years' course or to students with an equivalent preparation from any other college.

The above course of instruction, leading to the degree of bachelor of science in civil engineering, constitutes the preparation given to those who wish to fit themselves for those branches of railway engineering relating to location, construction, maintenance of way, and operation.

For those whose work will cause them to deal with the problems of railroad engineering pertaining to motive power, machinery, and rolling stock, there is obviously needed a preparation very different from that just outlined.

It is the recognition of this necessity which led to the establishment, in the spring of 1899, of a separate department of railway mechanical engineering. This has developed from the railway work of the mechanical engineering department during the past four years. In 1895 the mechanical engineering department undertook, for the first time, locomotive road tests, and since then this work has grown until now there are, on the railroads entering Champaign and Urbana, five locomotives fitted up for road testing.

Two years ago the Peoria and Eastern Railway, of the Cleveland, Cincinnati, Chicago and St. Louis Railway system, built for the university a dynamometer car. This car has been equipped by the university and is jointly owned and operated by the railway mechanical engineering department and the Peoria and Eastern Railway. It has been provided with apparatus for measuring draw-bar pull, apparatus for track inspection, for locomotive road tests, and stationary steam-plant tests, and is used exclusively for this work.

A lengthy description of the dynamometer car would be out of place here, the more so since many members of the society are already familiar with its details; yet it may be well to recall that the drawbar pull is received in a cylinder, from which it is transmitted by oil to gauges in the car above, where records are taken automatically and simultaneously of the train resistance and train speed.

The apparatus for use in the ordinary engine tests consists of the gauges for boiler, steam chest, and air pressure, speed gauge, revolution counters, water meter, etc. A description of the track inspection apparatus which has been recently

installed will soon be published, so that it is sufficient to say here that it also makes automatically a record of deviations from gauge and from level of each rail, of super-elevation of rail on curves, and of time and the location of mileposts. This is accomplished by transmitting, by means of oil, the motions of an independent pair of wheels under the car to small cylinders in the car. The pistons in these small cylinders follow the motions of the wheel below, and their piston rods carry the pens by which the record is made on a moving chart.

A second railway test car is now being built by the Illinois Central Railroad at its Burnside shops in Chicago. This car will also be equipped by the railway mechanical engineering department of the university for the same purposes as those of the dynamometer car described above.

The new car is longer than the one now in use, being 45 feet in length. The dynamometer cylinder will be of greater capacity and the car framework stronger to permit of its being used behind the heavy locomotives now in service on the Illinois Central Railroad. No pains will be spared to have this car as thoroughly fitted out and as well adapted to its uses as is possible. Work on it is now being hurried, and it is expected that it will be in operation within the next three months.

With this equipment and that of its mechanical laboratory the University of Illinois offers opportunities for experimental work along these lines that at present are unequalled elsewhere.

The studies for the last two years of the railway mechanical engineering course are as follows:

RAILWAY MECHANICAL ENGINEERING COURSE.

Third year.

1. Analytical mechanics.
2. Resistance of materials.
3. Hydraulics.
4. Steam engines.
5. Steam boilers.
6. Mechanism.
7. Chemistry, general principles and methods. Calorimetry; analysis of fuels, gases, iron, steel, lubricating oils, boiler waters.
8. Electrical engineering; dynamos—electric machinery and laboratory practice.
9. Surveying, use of chain and compass for finding areas; transits for distance and areas; level for profiles and contours.

Fourth year.

10. Thermodynamics.
 11. Mechanics of machinery.
 12. Locomotive engines.
 13. Locomotive engine design.
 14. Advanced design.

 20. Locomotive road tests.
 21. Dynamometer car tests.
- No. 12, locomotive engines, is a course of study of the various types of locomotives, their adaptations and limitations, and of the constructive features and the relations between size of cylinders, drivers, boiler capacity, speed, etc.
- In Nos. 13 and 14, locomotive engine design and advanced design, a special study is made of the proportions of standard locomotives, and drawings are made of engine details—cylinders, boilers, valves, and valve gears.
- No. 16, compressed air in railway service, includes the study in detail of the construction and operation of the air brake, its inspection, and laboratory brake tests, and also the various applications of compressed air in machine-shop practice.
- No. 17, railway estimates, is a study of the cost of materials and repairs, of

forms of specifications for supplies, and of costs of operation in American and foreign practice.

Nos. 20 and 21, locomotive road tests and dynamometer car tests, constitute the experimental work of the last year. This work includes:

- Locomotive economy and efficiency tests.
- Determination of train resistance on level, on grades, and on curves.
- Determination of hauling capacity of locomotives.
- Establishment of tonnage ratings.
- Experimental determination of track conditions.
- Tests of pumping plants and power plants.

Such is the course of railway mechanical engineering which leads to the degree of bachelor of science in railway engineering.

In addition to the foregoing, the department of economics offers to the students in railway work a course in railway problems which is intended to deal with the social and economic aspects of railways in their relation to the transportation interest of the country.

The course begins with a history of railroad construction in Europe and the United States, in which special emphasis is laid on the progress of consolidation and the development of State control and regulation of railways. Special attention is given to the work of the Interstate Commerce Commission in this country, and the principles which have been developed as a result of its decision concerning rates and discriminations. The course presents also the plan of administration and management of a typical railway in the United States, and discusses briefly the question of private versus governmental ownership and management of railroads at home and abroad.

The kindly cooperation of the railroads mentioned above has aided much in the growth of this work in railway engineering, and with the assurance of their continued interest and the exceptional facilities now possessed railway work at the University of Illinois must continue to develop rapidly.

CHAPTER VIII.

FROM FUNDAMENTAL TO ACCESSORY IN THE DEVELOPMENT OF THE NERVOUS SYSTEM AND OF MOVEMENTS.¹

There are two tendencies in education method which have ever been in more or less opposition. One is based upon some theory of internal order of development in the mentality of the pupil; the other upon the logical division of the subject studied. For example, in learning to read the logical order shows sentences to be made up of words, words of syllables, and syllables of letters. Now, as letters are the ultimate logical units, they might seem to be also the ultimate pedagogical units and the place of beginning for the pupil. But experience has shown that children learn to read far more easily by beginning with words or even sentences. Thus the pedagogical order is almost the reverse of logical order.

Educational reformers have attempted to bring into clearer light a subjective order in the development of mentality, but there is no general basis in positive science for such an order. It would seem natural that the modern biological sciences, especially neurology and experimental psychology, should make contributions to this problem.

It is the purpose of this study to bring together scattered facts in these sciences that bear directly or indirectly on the problem.

SUGGESTIONS FROM THE DEVELOPMENT OF THE NERVOUS SYSTEM.

It is but natural, in the early attempts to find a relation between the various structures of the nervous system and the different degrees of mentality observable in individuals, that attention should have first been turned upon the grosser forms of brain anatomy. Large differences of brain in weight are shown to depend chiefly upon variations in the amount of nonnervous material—the supporting tissues, blood vessels, fluids, and the fatty protecting sheaths incasing nerve fibers. Recent investigation has been gravitating toward a solution in the finer microscopical structures of nervous tissue. While as yet the interpretation of facts in this field is more or less doubtful, nevertheless certain features are suggestive to psychology and education.

Growth of the brain in weight.—Vierordt from records of 415 males and females, ranging to 25 years of age, finds that maturity in weight is practically complete at about the eighth or ninth year. The period of most rapid increase after birth, according to this investigation, is from birth to 4 years of age. Mies places the average weight of brains of new-born males at 340 grams and of females at 330. At maturity he calculates the average as 1,400 grams for males and 1,050 grams for females. The period of most rapid growth is that of the first nine months of life, during which one-third of the whole increase after birth is added. The second third of the whole increase is added between the ninth month and the twenty-seventh month. The remaining third is slowly obtained. Mies says maturity of weight is reached sometime between twenty and thirty years. Pfister, in a study of 156 brains from birth to the fourteenth year, confirms in a general way the rate

¹Digest of article by Frederic Burk in the Pedagogical Seminary.

of growth as found by Mies, and his figures would indicate that the maximum weight is practically reached in the puberal years.

GROWTH IN THE CELL BODY AND ITS PROCESSES.

The process of division by which new cells are created ceases in the embryonic period, as commonly stated, by the fifth month of fetal life. The nervous matter at any age shows what seems to be stages in growth of cell body, and along with the developed cells are to be found small cells, which neurologists have generally considered an undeveloped form awaiting structure or function, education or impulse, or whatever else the inciting cause may be, to call them into active service. Kaiser took similar sections of the cervical region spinal cord in a new-born child, a boy of 15 years, and an adult. The number of developed cells in the new-born child was 104,270; in the youth, 211,800; and in the adult, 221,200. The number of cells which came into function during the first years of life was therefore double the number at birth.¹

There is much indirect evidence for the conclusion that the cell bodies are increasing in size, though doubtless by such small increments as to elude observation by the methods employed, throughout the greater portion of adult life. Ramon y Cajal has attempted to establish the principle that the size of a cell depends upon the number of its processes and collateral branches—that is, upon the number of other cells with which it is associated. Donaldson in his résumé of fatigue says: "In childhood the amount of stored material is small, large in maturity, and small again in old age." Hence the cells would by reason of this fact have the greatest capabilities for work in the middle period. Between childhood and old age there is, however, this difference, that while in the former the nonavailable substances in the cell are developing, not yet having matured, those in the latter may become incapable of reconstruction.

Growth of finer microscopic fibers.—It is a speculation to which neurological theories point that the fibers which connect different parts of the cortex, one with the other, are most likely to be concerned in some way with association and the higher forms of neuroses. While this class of studies, dealing with the growth of the finer microscopical nervous structures in later life, is not as numerous represented as could be desired, yet the results seem sufficient to establish the fact that the finer nervous structures continue to grow until a late period of life; and, further, that there is some definite order in their progressive development.

The order of functional maturity.—The conclusion has now passed into general acceptance that when a nerve fiber acquires its fatty sheath, or becomes medullated as is said, it is then functionally mature. No nervous function is ascribed to the sheath. It serves the same purpose, it is believed, that rubber covering serves for electric wires—it prevents wasteful radiation of the nerve current.

The significance of medullation, once established, becomes a key of great value in determining the order in which the various parts of the nervous system develop. Studies in this direction have been pursued most notably by Flechsig of Leipzig.

Flechsig found that the class of nerve fibers first to take on their medullary sheaths are those connecting neighboring centers in the cord and those concerned in receiving and discharging simple reflex reactions. This medullation process begins in the latter half of the fifth fetal month. The simple reflex mechanism is the earliest in biologic development of the nervous system and, as shown, is the first to mature in the development of the individual. Voluntary movements regulated by the cortex are the most recent in racial development, and the pyramidal tracts which convey these impulses are the last of the spinal columns to

¹ Ueber das Hirngewicht neugeborner Kinder. Wiener Klin. Wochensch, 1889, p. 34.

Die Funktionen der Ganglienzellen des Halsmark, 1891.

reach maturity. We have here, therefore, the illustration of the principle that in the development of human nervous functions the first mechanisms to mature are those which are fundamental and racially the oldest, and that the order of development proceeds from these to those which are of more recent evolution.

Flechsig's most recent studies have attempted, by the same neurological method, to trace the order of development of the various bundles of fibers in the brain proper.

The first of the special sense centers in the cortex to mature, according to Flechsig, is that of smell, which, according to Endinger's studies, is the first sense center to be evolved in the biologic scale, appearing as low as reptiles. The last to mature is that of hearing. The process of medullation of the fibers leading to and from the sense centers takes place rapidly, and by the end of the first month of human life all of them show some evidences of maturity.

Dr. Ross, in his *Diseases of the Nervous System*, was, perhaps, the first to attempt a distinction in the nervous system between structures which in function antedate the human form of the organism and those which have been added during the period of human evolution. He says: "The portions of the nervous system which man possesses in common with lower animals, and which are well developed in the human embryo of nine months, I shall call the fundamental part, and the portions which have been superadded in the course of evolution, which differentiate the nervous system of man from that of the highest of the lower animals, and which are either absent in the human embryo or exist only in an embryonic condition, I shall call the accessory part of the nervous system." Dr. Ross points out that the main movements which distinguish man from the lower animals are those which he has acquired since he adopted the erect posture—the varied movements of the hand in prehension and tool using, which developed after the hand ceased to be merely a foot; the movements of articulatory organs concerned in speech, and movements of facial expression. Dr. Ross, by this suggestive juxtaposition of fundamental and accessory physical parts in the human organism with the fundamental and accessory mental powers of man, has opened a field of inquiry rich in suggestion for psychology and education.

From the evidences of late growth of fibers shown by Kaes and Vulpinus, and of cell bodies by Hamarberg, there is justice in assuming that these processes continue until late in life under regulation by the principle which requires the more general and fundamental structures to develop before the accessory. If this indeed be true, then it is clear that the historic pedagogical contention stated in the preface, that the order of instruction should be regulated by the order of internal development of the mind rather than by the logical order of the subject-matter studied, rests upon a substantial basis.

THE THREE-LEVEL THEORY OF THE NERVOUS SYSTEM.

The conception of the nervous system as an undifferentiated unity, such as pervades the popular notion of mind, is not a view that finds substantiation by modern investigation. The notion that all our actions are dictated from a single center—the brain—is at best but half a truth. Many actions which have every appearance of good sense are regulated entirely within the spinal column; and some from within the walls of the abdomen. The lower orders of animals have no brain ganglia, and the lowest vertebrates no cerebrum. All positive evidences from the sciences of anatomy and physiology, and pathological phenomena as well, go to support the evolutionary view of the nervous system of parts, correlated and closely associated, but nevertheless preserving a degree of relative independence.

It was some thirty years ago that Dr. Hughlings Jackson, the eminent English pathologist, made practical application of the evolutionary theory of the nervous

system to the diagnosis and treatment of epilepsy and mental disease. Such has been the practical success of this application that the so-called Hughlings Jackson three-level theory is now the established basis of English diagnosis.

Jackson conceived the nervous mechanism as composed of three systems arranged in the form of a hierarchy, one upon the other, the higher embracing the lower, yet each preserving for itself some degree of exclusive independence.

According to the hierarchal arrangement of the nervous system the lowest level, as the simplest, oldest, most fixed and nonplastic, contains mechanisms for the simple fundamental movements in reflexes and involuntary reactions. The middle level regroups these simple movements by combinations and associations of cortical structures in wider, more complex mechanisms, producing a higher class of movements. The highest level unifies the whole nervous system, and, according to Jackson, is the anatomical basis of mind. "The highest level centers," says he, "are nothing else than the centers of universal and complex representation, or what is the same thing, universal and complete coordinations, or, using old-fashioned language, they are the whole organism."

The three-level theory grew chiefly out of the need of a practical working hypothesis in the diagnosis of mental diseases, and as such it has proved serviceable in pathological practice. In epilepsies due to affections of the lowest level, there are spasms of the reflex movements without necessarily involving higher and more complex coordinations, as, for example, respiratory fits. The middle level epilepsies are of a more complex order, originating in some point of the extreme periphery and extending in directions that are found to agree with adjacency of centers for these movements in the cortex; loss of consciousness is frequently a subsequent, but not necessary accompaniment.

PEDAGOGICAL APPLICATION OF THE LEVEL THEORY.

Pathological practice in the diseases of dissolution, or "devolution" of the nervous system now accepts the essential conception of the Jacksonian theory as a successful working hypothesis, recognizing, however, that it is a general scheme rather than a detailed plan of proven facts accurate in detail. Its applications have, however, never yet been made to psychology and pedagogy. Education deals with the normal evolution of the nervous system. It therefore, in a sense, takes a complementary view to that of nervous pathology. The introduction of the Jacksonian view of the nervous system may prove as serviceable to education as a working hypothesis, as it has in pathology. In crude outline we must recognize in this hierarchal scheme of the nervous system the analogy of its phylogenetic development. In the lower invertebrates we find, not a centralized nervous system with a cerebral or even spinal central station, but a loose system of local ganglia regulating, in more or less independent manner, special movements of the animal. In higher orders chain ganglia appear with a growing approach to centralization. In vertebrates we find the chain system transformed into the spinal system, and within the cranium are ganglia of the special sense organs, developing in complexity and centralization as we go up the scale. Flechsig's highest association centers, presiding over higher reason, if we accept them, extend as a tapering tongue far down the mammalian scale.

From the order of development in maturity of the fiber bundles of the spinal cord and brain, it is conclusive that each bundle has its special period of immaturity, of plastic growth, and finally fixed maturity when modification is difficult or impossible. This middle nascent period is the period for education. "We know," says Clouston, "that each center has its own nascent or growth period, which is sometimes very short, as it must be in the center in which movements of sucking are coordinated; and sometimes very long, as in those in which we coor-

dinate the movements of the hand, from its first feeble grasp up to its consummate achievements in making and shaping."

On the side of external movement we see corresponding phenomena in development. The cord reflexes appear and perfect themselves, largely in early infancy, it is true, but nevertheless they continue to develop until a comparatively late period. Facts may warrant us in concluding that certain general periods may be characterized by predominance of nascencies in a given level. Thus it certainly may be said that in infancy the nascencies of the lower level outnumber those of the middle and higher; that in childhood up to puberty the sense-center nascencies predominate, though lower level processes continue to appear and a fair number of highest level nascencies occur; and that finally in the adolescent period, highest level growths predominate.

There are many facts which go to support this tripartite progress of nascencies, in a loose sense. Insanity, for example, is rare in children under 15 years, and Mercier explains this fact on the ground that children under the puberal age do not yet possess mature higher centers. Insanity under modern interpretation is an affection of the centers of the highest level. According to Boutteville, the proportion of insane children to insane adults is as follows: From 5 to 9 years, 0.9 per cent; 10 to 14, 3.5 per cent; 15 to 19, 20 per cent. Winslow finds only 8 children under 10 years of age among 21,333 insane patients. But with the beginning of puberty there is developed a variety of psychic phenomena which, while only temporary, are none the less to be classified as within the borderland of insanity—irritability of temper—i. e., lack of inhibitive control by the highest centers, morbid notions ranging into hallucinations, etc. Insanity in children, when it occurs, according to Ireland, is generally an after-effect of certain diseases, tubercular meningitis and fevers, which, we can readily understand, tear down the tissues of the highest centers. The gradations of epileptic diseases indicate a growth by periods. In an unconscious but nevertheless clearly established way, three periods have for practical purposes always been distinctly insisted upon by the popular mind. Infancy has been recognized as a period for learning to creep, to walk, to maintain the equilibrium, and to use hand, arms, and legs in the countless movements that later become reflex. Childhood, by ancient and familiar dogma, is the period for training the sense centers. No period, however, has been so clearly recognized as that of the nascency of the highest system in adolescence. It is a common statement that it is not till a child is 13 or 14 years of age, the puberal period, that it is capable of rational thought and reason. The school has always insisted upon this, giving memory topics in the earlier years and reserving the rational study, requiring higher correlation, for the later period.

In all religions, civilized and savage, there are religious rites, perhaps dependent in origin changes, which are clearly conceived as psychic, recognizing that the child takes on at this time the adult's logical thought. The confirmation services in our established churches are evidences about us, and in evangelical churches there is a prejudice against accepting a religious judgment until after the child is 13 or 14 years. On the other hand, this is the period the child himself chooses to make them. It is more than a merely plausible hypothesis that if the structure governing a given nervous reaction in an activity is carried forward by evolution from a lower to a higher organism, the reaction itself of this transmitted structure must also tend to be reproduced, preserving amid accessory human types of reasoning the vestigial tendencies of earlier racial habits. And it is more than merely plausible, from all we know of the structure and processes of the nervous system, that the accessory or highest human types of action and thought only reach this highest stage by passing through, in infancy and childhood, the lower level types of this process. The central conception is that the higher processes are formed by combination of elements and structures of a lower process

already existing. Children frequently persist in following some strange, useless, or even savage interest quite foreign to our civilization. Upon this doctrine of development by levels these strange and useless experiences nevertheless may be essential as a platform out of which a higher coordination, useful for modern life, may be reached. The intermediate stage or level may be useless or even inimical to our civilization, but yet as a link in evolution be none the less essential.

FROM FUNDAMENTAL TO ACCESSORY IN MOVEMENT.

Muscular movement is the complement of nervous activity. If there has been an evolution from fundamental to accessory forms of structure in the nervous system, we must expect to find a similar evolution in the character of movements. Facts answer fully these requirements of theory. The movements which are regulated predominantly by the accessory structures of the nervous system show certain characteristics distinctly differing from those regulated by the fundamental parts of the nervous system. An illustration of accessory movements in the sense of those which are not possessed by animals lower than man is offered by the complex capabilities of the human hand. To bring out the characteristics of the accessory hand movements, as distinguished from the fundamental movements, we may compare them either with fundamental movements of the human body, e. g., the trunk movements, or with fore-limb movements of the lower animals. The movements of the trunk are limited chiefly to leanings, some slight ability to rotate, and to the respiratory function. "With each step that we take toward the periphery, the number of movements that can be executed and the amount of difference between these movements increases, until at length, when the periphery is reached, the number and variety of movements become enormous. The area over which the hand can be moved is almost as large as that of a sphere whose radius is the length of the arm, and the hand can reach three-fourths of the points between the shoulder and the area thus marked out." The most significant distinction to which Mercier draws attention is that in the association of two or more movements the distinctive tendency of central muscles is to make them simultaneous or alternating, while the accessory muscles are distinctively capable of long and complex sequence. Consider, for example, the habit of sequence which is developed in the fingers of the pianist. The central movements are crude in any work requiring precision and delicate coordination. The central movements enter as associates into these coordinations by providing steadiness, but the finer movements are performed by the periphery. The peripheral movements bear to the central the relation of the special to the general. We can not use our fingers in writing till by the central movements the arm is brought into position and held steadily. We can not speak without the general movements of breathing which force the air through the larynx. The peripheral movements, aided by their power of acting successively and with greater complexity, perform special feats.

The marvelous adaptability of the hand can only be explained on the ground that the higher levels of the nervous system combine the lower level movements into the countless new complexes and introduce the features of sequence, precision, etc., which for the fundamental levels are practically impossible.

General paralysis that begins in the highest centers is accompanied in slighter attacks with almost imperceptible interference with precision; the patient is not able to execute the finer delicate movements. As the disease spreads downward, these more general, more complex, more precise movements are lost, layer by layer, as it were, from accessory to fundamental, from peripheral to central, from highest to lowest level, from the products of latest evolution to those of the older. Such devolution may be illustrated in the early loss of writing power without appreciable loss of fundamental movements of the hand; by the early loss of speech

without loss of eating or swallowing movements of the throat, nor any paralysis of the tongue and lips. In downward progress of disease—in devolution, so to speak—the loss of higher level centers results in loss of peripheral or accessory movements, frequently leaving the fundamental movements quite unimpaired.

Progress in evolution of hand movements in the biologic scale has been from extreme fewness in number to infinite variety, from simplicity to complexity, from clumsy inaccuracy to precision, from simultaneous associations to those which constitute long series in sequence, from the general to the specialized. It is evident that the slight differences in bony or muscular structure are far inadequate to explain the enormous differences between accessory and fundamental. The jaws, teeth, tongue, and palate of lower vertebrates are not so radically distinguishable from those of men to account for the rapidity, complexity, marvelous precision, accurate co-ordination, and successiveness involved in human speech. Yet a civilized man uses a score of thousand words or more, each requiring a special and appropriate set of movements, different from all others; and, moreover, he throws these together in sentences requiring successive coordinations of long sequence with marvelous precision and rapidity. When we attempt to measure the gap between man and the lower animals in terms of power of movement, the wonder is no less great than when we use terms of mentality. We are forced back again for an explanation of this complexity of adjustment to the nervous system, and to conclude that the difference in associational capability between the accessory and fundamental levels must be significant.

RELATION OF ACCESSORY HAND MOVEMENTS TO HUMAN INTELLIGENCE.

The intimate relationships existing between higher intelligence and the more highly developed accessory motility of the human hand has been so striking that it has been noted even so far back as Anaxagoras. The extreme theory has been put forth by many modern writers that human intelligence, as such, has arisen in direct consequence of man's assuming the upright position. The fore limbs, thus relieved of the duties of locomotion, which in lower animals is more or less their exclusive function, have found vent for their energy in manifold new employments, and thus introduced the human race to a varied world of richer experience. Intelligence has been the product.

There is much in psychology that supports the general theory. Stricker contends that in every mental act of the imagination there is a tendency to muscular movement, which in many persons rises above the threshold of consciousness.

Darwin, Duchenne, Pidrit, and Mantegazza have studied the significance of the expressive movements, especially of the face and hands, and in general conclude that these are weakened forms of movements that were once directed to some practical end.

Let us trace speculatively, by way of illustration, the evolution of the nerve processes concerned in a state of moral courage. Our brute-man ancestors did not think courage—they acted it. The kinæsthetic memories of previous similar acts flowed directly into the motor channels of muscular reaction without the complex association of the higher levels. Since consciousness is a concomitant only of sensory processes and not of motor discharges, according to the psychological view now generally accepted, consciousness was of brief duration because the discharge was immediate. Later, however, a portion of the kinæsthetic energy, instead of being wholly discharged into motor channels to excite muscular movement, forced itself upward into higher levels and gradually formed long circuits of sensory irradiation among the structures which are the concomitants of higher ideation. By this irradiation consciousness was prolonged and the energy given to muscular action lessened. The individual deliberated longer and acted less. The kinæsthetic impulses that discharged into the motor channels of our ances-

tors, creating in them deeds of physical courage, discharge, in the lower complex nervous system of their civilized posterity, into the higher levels and excite this moral courage of thought.

For support of this standpoint, theory would require that distinctly lower grades of intelligence should be accompanied by deficiency in manual motility.

The feeble-minded show marked deficiencies in power of movement, and, in general, are wanting in just those movements which especially distinguish the human species from lower animals.

"In the will movements," says Johnson, "the difference between the control of the fundamental and accessory muscles was much more marked in the feeble-minded than in normal children. This was more noticeable the greater the degree of idiocy. Some who could execute gross movements with regularity and control were wholly deficient in the execution of finer movements." Johnson concludes that "the fundamental precedes the accessory in development of motor ability. It is important to note that all the spontaneous movements were fundamental. Hardly a single one of them could be considered accessory. They were the swaying of the trunk, the movement of the jaw, swinging of the arm, reeling of the head, and the simplest finger movement."

Says Ireland:

The best and earliest sign of idiocy is the deficiency of the grasp. The hand is flapped or vibrated about instead of being employed to seize or obtain an object. Imbeciles are clumsy in the use of the hands, and it is difficult to teach them any exercise of handiwork requiring method and dexterity. Even imbeciles are generally very inept at such exercises as catching a ball or aiming at anything, and it is difficult to teach them greater dexterity.

Another series of hand defects of significance is that of the lateral movement of the fingers. This power is partially regulated by the depth of the space between the fingers, a greater depth allowing greater freedom of lateral movements. In the gorilla, for example, the interdigital membrane is large, and reaches far up between the fingers, binding their action. Hartman has found this same feature noticeable in many of the lower human races, notably the negro. In some species of monkeys the fingers are united. Imbeciles frequently show what seems an atavistic tendency in this direction. In persons of normal intelligence, says Féré, the thumb, for example, can be brought to make an angle of 120° to 130° with the index, but in degenerates it is frequently not more than 45° ; the same ratio holds with the other finger angles. Johnson found, by examination, a very general difficulty among feeble-minded children to open and close the fingers laterally; some could open the hand between the index and middle finger, but not between others. Some who could open fingers laterally could not open the first finger alone. In attempting these movements false movements were often made; for instance, swinging of wrist, partly closing hand, or shaking whole forearm. These latter substitutions illustrate the weakness of the control of the higher over the lower centers.

As a rule, in school children, those of quick movement of muscles are considered brighter, mentally, than those of slower movement. In a study which was made to trace the rate of school progress of some two hundred children it was found that 62 per cent of the most rapid pupils possessed strikingly quick control of the movements, while only 8 per cent of this class were slow of movement; on the other hand, among the pupils of slow progress 40 per cent were strikingly halting in their movements, and only 25 per cent possessed a ready control. Also, in the matter of precision, 54 per cent of the rapid pupils possessed accuracy of writing movements against 11 per cent who were not; while among the mentally slowest 59 per cent lacked accuracy of movement and 22 per cent of them were not precise.

The facts which have been reviewed bring out clearly the close and seemingly

organic relationship existing between these nervous structures controlling the movements which constitute man's superiority over lower animals, and those nervous structures which function human mentality. The mentally defective are commonly deficient in the ability to control these accessory movements and show many similarities to Simian traits of structure and movement. Such facts necessarily push us toward the conclusion that defects of mentality, as in power of movement, are commonly due to the failure of higher levels of the nervous system to become functional. It is an interesting corroboration of this view that in the other class of highly specialized accessory movements, as speech, idiots show a very common deficiency. Dr. Down, from an examination of 200 idiots, 7 to 36 years of age, found 33 mute, 16 semimute, 83 with indistinctness, 4 stammering, and 62 with fair speech. It is manifestly incorrect to treat idiots as a single class having common cause of defect. It is with the congenital class that this inquiry is specially concerned, for under this classification fall those unfortunates that date their defect to prenatal life.

Dr. Down contributed a classification of congenital idiots according to ethnic types—negroids, Malays, Indians, Mongols. He asserts that more than 10 per cent of the congenital feeble-minded children are typical Mongols.

They present characteristics so marked that when members of this type are placed in proximity it is difficult not to believe that they are brothers or sisters. In fact, their resemblance is infinitely greater than to members of their own family.

The simple educational and psychological significance of the facts of this chapter is that the individual, from conception to senescence, follows the order of development of the race, and that any serious mishaps upon the way cause an arrest of development of his nervous system at some partial level. But the facts, except in these extreme cases of arrest, are far from fatalistic in their influences. Even among the idiot class, the results of education upon the principle of developing the more fundamental in order to develop the accessory have approached the marvelous. Seguin began the education of the idiot by training of the hand movements, and of these he selected for the first lessons those which were most fundamental—grasping, supporting, letting go, throwing, catching, and leading up gradually by some admirable teaching tact to the accessory, and correlation of eye and hand in natural exercises that called forth the pupil's interest. Strangely, after two years' education on this plan, the general mentality of the boy whom he describes had also improved to a degree that was marvelous even to teachers. The stimulation of the evolutionary levels, in their natural order, through the hand training had strengthened them also for discharge of mental functions.

EVOLUTION OF HAND MOVEMENTS IN THE DEVELOPMENT OF THE NORMAL CHILD.

Some of the movements of new-born infants are extremely simple, and a large number seem to be built up by coordination of these simple movements. But, on the other hand, there are, throughout infancy and early childhood, a number of singular movements which, at their first appearance, are highly complex; they are excited by special stimuli; many of them by irregular modification become adapted to ends for which evidently they were not originally employed. If infants first learned to make all the simple reflexes, and, this step performed, then proceeded to combine these elements into new unities, and so on, we would have a logical order to retrace. But there are few evidences either in infancy or in later childhood of such steps from the logically simple to the complex. Preyer has shown that in the care of the eyes, each eye tends to a certain extent to be a law unto itself, that the two do not move in perfect coordinated unison until several months have passed; yet the same principle will not apply to the movements of the two arms. This pair of bilateral members tend to move simultaneously, when an adult would use one of them independently.

A striking example of this class is offered by Dr. Robinson in experiments upon the ability of new-born infants to hold themselves suspended by grasping a finger or a bar. If we accept the current theory that the immediate ancestry of man lived in trees as many species of monkeys now do, this movement, though highly complex, involving the combination and coordination of several muscles of the arm, wrist, and fingers, is, in an evolutionary sense, fundamental. Robinson has kept records of experiments upon sixty infants, carried out within an hour after birth in the case of at least one-half of them. The infant subject was allowed to grasp a horizontal bar, or a finger, and left suspended in this way, sustaining its own weight. He says that in every case, with only two exceptions, the child was able to hold on for at least 10 seconds; in 12 cases, with infants under 1 hour old, half a minute passed before the grasp relaxed, and in 3 or 4 nearly a minute. When about 4 days old I found the strength had increased, and that nearly all, when tried at this age, could sustain their weight for half a minute. At about a fortnight or three weeks after birth the faculty appeared to have attained its maximum. The feat of hanging from a stick or finger by the hands, logically would imply the prior development of the arm, shoulder, wrist, and finger movements. But such are not the facts. The child grasps a stick and hangs suspended by his arms long before he is able to pick up any object, or put his two hands together, or lift hand to mouth. Logically, the grasp of the whole hand would follow the grasp by the parts, but observation shows us that a certain kind of complex grasp is one of the earliest movements, developed long before some of the very simplest finger movements. Any logical explanation fails at this point. Evolutionary explanation is plausible, for so far as the positive evidence of observation goes the more fundamental and older racial movements appear before the newer and less fundamental, regardless of the order of complexity, except in so far as the accessory as a rule tends to be more complex than the fundamental.

By what process is the transition to the adult form of grasp accomplished? Undoubtedly imitation is the final directing cause, but there is a functional difficulty in the retarded development of the infant's thumb. He is born with a monkey thumb and must first obtain a human thumb and be able to use it in perfect opposition. Preyer, Mumford, and Mrs. Winfred S. Hall have given detailed descriptions of the development of the thumb. For the first two or three months of life the thumb is really a nuisance to the child and is continually in the way. Generally it is curled inside of the grasp. In the case of Mrs. Hall's child it was not till the eleventh week that the thumb was brought outside the hand when the latter was clenched.

Mumford concludes that it is often six months before the development of thumb makes the elaborate movements of the human grasp possible. While the thumb of the hand is thus gradually gaining in motility and strength in a human direction, the great toe is losing motility and strength, also in a human direction.

Several other hand movements could be more or less definitely traced, commencing in the infant with complex reflexes, inexplicable as yet upon any theory except that of evolutionary origin, and developing into human forms by modifications and additions that show no trace of logical arrangement.

Nor do all these complex but original coordinations appear immediately at birth. They are scattered along through infancy by distinct parts observed in the growth of the nervous system. The teasing and bullying instincts of children offer suggestive illustration. Among the commonest movements in these activities may be observed pursuing, throwing missiles, striking, throwing down, holding down, dancing about conquered victim, laughing, clapping hands, pulling hair, pulling ears, etc. Children's natural games are largely made up of mild forms of these elements, the more malevolent tendencies having been eliminated.

These complex movements are ultimate units; they do not conform to the pur-

poses of civilized human conduct and are not explicable nor reducible by any process of logical explanation. Corresponding to them are psychic states of equal complexity which find no explanation in the civilized child's present environment. There is a principle well known in physiology and embryology, that a structure or a movement—useful for a certain purpose in a certain stage of the biological scale—loses this purpose in a higher stage and through modification becomes used for some entirely different purpose. Now what are the applications of this view to many of these strange complexes that appear in early childhood, even to such seemingly evil forms as those which appear in cruelty, bullying, and teasing? May it not be, indeed, that they constitute a level in the evolutionary hierarchy, and, though in themselves useless, are nevertheless an essential platform from which the coordinations of a higher and useful level are formed? It seems plausible that the child needs to live to some extent the life of his ancestors in order actually to develop in his own nervous system the kinæsthetic sensations which by the process of higher evolution may serve as the basis for higher forms of activity in the highest levels. It becomes indeed a question of extreme nicety to determine just the exact moment when sufficient actual experience has fully established the racial tendency and the time for inhibition and radiation of the force into higher cerebral associations should follow. Danger of arrest of development at the lower stage is as important as that the fundamental impressions should not be made. Such a view gives these curious phenomena a natural place in child life, and emphasizes the probability that children's plays and games, as mild vaccination forms, serve as mediations between brutal ancestral tendencies in the nervous system and the higher levels employed in altruistic modern life, between savage racial action and civilized ideation.

COORDINATION OF SIMPLE MOVEMENTS.

One who watches a young infant will notice a number of jerky movements continually occurring in practically all the muscles of the body. Some are merely slight twitchings of fingers and small muscles, and they range in scope to those of flinging hand, forearm, or whole arm about vigorously. The legs are moved in the same way. In the same class we must place the play of features, turnings of the eye, and various other awkward movements.

Slow rhythmical movements of flexion and extension of the fingers occur, which, instead of possessing the quick, incisive character of voluntary movements, partake of the sluggish rhythm so familiar to the visitors to the tanks of an aquarium. They often occur in a series of three at a time during a quarter of a minute. Then follows a pause, during which there is apparently an accumulation of energy in the nerve cells.

Notwithstanding the evident fact that these movements possess strength and energy, the new-born infant is unable to direct his hand or arm movements. He can not for some days, or even weeks, bring his hand to his mouth. Accidentally in these movements the hand frequently is thrown to the mouth, and the infant sucks his finger. He is unable to remove the thumb from his mouth and must wait till some adult or lucky accident of movement removes it for him. Without purpose and without manifest external stimulus the elbow, wrist, and finger joints are continually being flexed. Even months before birth these purposeless movements had commenced. What is the significance? As Flechsig has shown, in earliest infancy practically the whole cerebral cortex is scarcely connected by mature fibers with the centers of action in the spinal cord, medulla, and pons. It is not till well into the first month that these earliest connections are made on the sensory side; and the motor connections by which activity is cerebrally directed do not appear until after the sensory has developed. The child is several months

old before all portions of the sensory bundles of fibers which pass from the cord to the cortex show maturity in every part.

These movements are most common in the earliest weeks of infancy, and tend gradually to disappear. The fact that the connections of the lower centers with the cortex are not made till late leaves us to conclude that these early movements are the products of spinal activity, uncontrolled as yet by the higher levels. They are lowest-level movements in their simplicity, unmodified by the inhibitions of later human experience which lie undeveloped in the higher strata of the nervous system. They must represent the movements which are racially the oldest entering as elements into human activity. If lower animal movements do appear in human activity, it is in this period we most safely can look for them in their most undifferentiated form. Later in infancy the first connections with the cortex are established. Then sensory fibers go upward, and later motor fibers go downward from these middle centers to inhibit and control the lower movements in certain particulars. Association of cell with cell, center with center, develop to modify and make more precise or offer greater alterations in these modifications. Later a still higher system of control is superposed upon this. From this point of view the purposeless movements of infants are more intelligible. They are movements without higher inhibition, movements as yet without halter or rein. The objective evidence bears out this supposition. Gradually this flopping of arm, rhythmic flexions and extensions, and nervous twitchings tend to disappear. Just in proportion to the capability of an infant to execute voluntary movements of a given limb or organ these vagrant movements disappear.

In the light of this consideration, the importance of these rhythmic movements, be they survivals of aquatic and arboreal life or not, is manifest. If through any disorder the lower levels are unable to produce them and the infant lies quiet and motionless, these sensations necessary for willed action never occur, the physical concomitants of mentality are never stored, and the infant lives to become an idiot. These movements, the flotsam and the jetsam of spinal activity uncontrolled as yet by higher centers, are the ultimate units. If we admit that they are survival movements we have here an illustration of a widespread physiological principle, that new uses are grafted upon old structures.

The modifications of the ultimates, whether complex or comparatively simple, with which the infant begins life, proceeds in several directions: (1) the breaking up of old bilateral and simultaneous tendencies, characteristic of central movements; (2) the growth of independent movements of smaller parts that previously only moved in conjunction with larger wholes; (3) the coordination of various series to form long and complex sequences, as we finally find them illustrated by writing, sewing, piano playing, etc.; (4) the development of precision and accuracy; and finally, (5) the response of different movements to a great variety of different stimuli. These modifications perhaps represent the chief accessory lines of development that distinguish human movements as such.

In the development of coordination from lowest to highest, the power of evolutionary habit decreases and the possibility for special modification increases; there is a progress in teachableness or at least the term education must be taken in two different senses. In the lower strata of development, where the steps have been worn by racial experience, education that is most serviceable will be that which takes its cue from the racial stimuli and concerns itself with leading coordination to take these fixed steps as truly as possible. But later, as the higher strata are reached, when the movement emerges from this deep-worn gorge that ancestry had trodden and comes to the point where racial paths are divergent and indistinct, the definition of education changes. Education has now a wider sweep of vision, and instead of following paths, may sight a distant goal and lead more directly to it. In a different terminology we might call this early education which is restricted to aiding the child to follow in the steps of his ancestors "fun-

damental," and that which finds its place later, that which comes in when racial paths grow shallow and divergent and originality more possible, we might call "accessory" education. Taking wider range in this thought we may consider the child as the sum of his movements. We must remember, nevertheless, the principle of development by parts, by which some parts reach maturity at later periods than others, so that we can never say, in an exact sense, that the child is now in the "fundamental" period of education and then in the "accessory." But in a crude, inexact way, it is certainly true that more lines of accessory education are possible in adolescence than in childhood, more in childhood than in infancy. Using the word "teachable" in the accessory sense, we may say that the child is far more teachable than the infant.

The child traverses, before he is 6 or 7 years old, not only the long deep worn road of racial ancestry, reaching back perhaps as far as arboreal or even aquatic life, but I think we may say he takes a few paces in certain few coordinations that are his own, blazes a few trees, and leaves his mark. As we shall later see, by 6 years of age he shows evidences in many lines of being far upon the highway of distinctively human capabilities of movement. His fingers and hand that once tended to act only upon the lower simultaneous principle, now can move in fair degree by the principles of independence and of succession. In the delicate steadiness of central movements and the complex coordinations requiring delicate peripheral movements, he has probably acquired half of the ability he ever will acquire. His nervous system has made a prodigious growth, far outstripping any other system. The coordinations which have made this possible are the products of this growth.

DEVELOPMENT OF HAND MOVEMENTS DURING SCHOOL AGE.

The following is a brief review of the few studies which have been made upon children of school ages by psycho-physical methods, to determine the rapidity, accuracy, strength, maturity, and fluctuating periods in the development of hand movements.

Rapidity of movement.—Dr. Bryan, in Worcester, and Dr. Gilbert, at Yale, have experimented upon the degree of rapidity with which children of different ages were able to tap an electric key which automatically recorded results. Bryan tested four sets of arm muscles—shoulder, elbow, wrist, and metacarpophalangeal finger joints. In order to secure the free separation of these sets of muscles, the arm of the subject was clamped by means of certain devices to allow movement only of the specific set of muscles. The test in all cases was the greatest possible number of taps the subject could execute in five seconds. The number of children (public schools of Worcester) used in the results here referred to is 729. They ranged in age from 5 to 16 years.

The following tables for boys and girls give the arithmetical mean of the tests (right arm) of all boys and of all girls of a given age:

TABLE A.

Boys.

	Age.											
	5.	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.	16.

Elbow.....	22.7	23.5	24.2	25.1	28.2	28.1	29.3	29.9	31	32.7	31.5	32.7
Shoulder.....	18.4	19.8	20.5	22.3	24.1	22.6	24.1	25	25.5	27.2	26.3	28.7

TABLE A—Continued.

Girls.

	Age.										
	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.	16.
Number	28	32	33	43	37	36	33	34	41	32	26
Finger	19.8	20.7	22.2	24	25.8	27.1	28.2	30.3	29.5	29.1	31.3
Wrist	21.6	23.1	24.3	25.5	28.5	30.4	31.6	33.2	30.3	30.9	33.3
Elbow	22.7	23.2	24.4	25.4	27.5	28.6	29.4	30.5	28.8	29.3	30.1
Shoulder.....	19.9	20.2	21.9	22.7	22.6	24.9	25.7	27.5	26.6	26	27.9

Dr. Gilbert has made two studies upon rapidity of tapping, one upon New Haven children and one upon Iowa children. In his tests the elbow was held free from the table and the arm was in no way clamped. The subject tapped with the finger, but the movement must be interpreted largely as that of a wrist movement. The number of children was approximately 50 for each sex and each age—from 6 to 17 years of age. The number of taps in five seconds for both sexes is shown by the following table:

TABLE B.

	Age.													
	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.	16.	17.	18.	19.
New Haven boys	21	22.8	24.9	25.8	27.7	29.7	30.3	29.8	31.2	31.3	33	35	-----	-----
Iowa boys	22.1	23.3	25.8	27.1	28.3	28.1	30.1	31.1	32.4	34	34	34.4	36	36.7
New Haven girls	19.7	21.2	23.9	25	26.9	27.8	29.6	28.1	29.8	31.8	31.8	31.5	-----	-----
Iowa girls.....	22.3	24.2	26	26.7	26.2	28	29.3	29.5	29.4	31.3	33.2	33.8	34.3	35.3

Without holding Drs. Bryan and Gilbert responsible for the form of all conclusions, there may be drawn from their studies the following inferences:

I. The rapidity of motor ability of the hand and arm, as indicated by tapping, increases on the whole with age, and does not reach maturity until the adolescent period.

The immaturity of this movement at the age of entering school is shown by the following table of percentages, assuming the rate of tapping at 16 years as 100 per cent:

TABLE C.

	Per cent of 16-year ability possessed at 6 years of age.		Percent of 16-year ability acquired between 6 and 16 years.	
	Boys.	Girls.	Boys.	Girls.
BRYAN.				
Finger.....	57	63	43	37
Wrist.....	64	65	36	35
Elbow.....	72	75	28	25
Shoulder.....	69	71	31	29
GILBERT.				
Hand (New Haven)	64	62	36	38
Hand (Iowa)	65	69	35	31

II. Girls mature earlier than boys in rapidity of hand and arm movements. This is manifest by a glance at the tables. As shown in Table C, the girls in all but one test (New Haven) have at 6 years reached a larger percentage of their 16-year ability than the boys. At 13 years girls have reached practical maturity, and the rate in some of the tests actually decreases after that age. Bryan's girls

at 13 years have acquired 97 per cent in the finger test, 99 per cent in the wrist test, 101 per cent in the elbow test, and 98.2 per cent in the shoulder test.

III. The rate of improvement in rapidity is not regular from year to year, but proceeds by very marked fluctuations or rhythmic vibrations. Both Bryan's and Gilbert's tables agree in showing four periods of acceleration and four periods of retardation in rate between the years 6 and 17, though there is slight divergence for specific years.

The years of highest rate for boys are as follows:

	Years.			
	8 and 9	10 and 11	14	16
Worcester.....	8	11	14	16
New Haven.....	8	11	14	15
Iowa.....	8	12	14 and 15	16

The years of lowest rate are as follows:

	Years.		
	10	13	15
Worcester.....	9	13	15
New Haven.....	11	13	16
Iowa.....	11	13	16

IV. Rapidity of movements of hand and arm in tapping tends to be greatest when the rate of growth in height and weight is least, and vice versa.

V. The more central (fundamental) movements tend to mature earlier than the less central (less fundamental) movements.

In Table D the relative immaturity of the finger movements is clearly shown. At 6 years the finger has acquired, in both girls and boys, a distinctly smaller percentage of its ability at 16 years of age than any of the others, and the wrist movement is less developed than elbow and shoulder. It has been shown that growth in power proceeds by rhythms, and it becomes interesting to know in quantitative form the relative amounts of development that are added within each of these rhythms of advancing age. Table D is constructed with a view of showing this. Each retardation, with its succeeding acceleration, is considered a period. There are thus, in the case of boys, four periods, 6 to 9, 9 to 12, 12 to 14, 14 to 16; in the case of girls, three periods, 6 to 10, 10 to 13, and 13 to 16. The tapping ability at 16 years is taken as 100 per cent, and the figures in the column indicate the percentage of this 16-year ability added in each of these respective rhythms.

TABLE D.
Boys' right arm.

	Up to 6 years.	6 to 9.	9 to 12.	12 to 14.	14 to 16.	Total at 16.
Finger.....	53	14	14	7	7	100
Wrist.....	64	13	11	4	8	100
Elbow.....	72	14	5	9	0	100
Shoulder.....	69	15	7	4	5	100

Girls' right arm.

	Up to 6 years.	6 to 10.	10 to 13.	13 to 16.	Total at 16.
Finger.....	63	20	14	3	100
Wrist.....	65	21	14	0	100
Elbow.....	75	15	10	0	100
Shoulder.....	71	10	18	1	100

These tables show, (1) that in both boys and girls alike the elbow and shoulder movements have reached a larger per cent of their mature power than the finger and wrist movements; (2) that the finger movement acquires a large per cent of its ability after 9 or 10 years of age—28 per cent in the boys and 17.5 per cent in the girls.

Development of strength.—Peron early in this century showed by experiments with the dynamometer that Malays and the natives of New Holland are distinctly inferior in strength of the hand and arm to French marines. That the civilized races are distinctly superior in hand and arm strength to the lower races of man has many times since been confirmed by Manouvrier and others. Féré goes further and contends that among individuals of the same race the more intelligent have the greater strength of hand. He says that the same dynamometer test, taken upon individuals belonging to different classes of society, has shown that the pressure produced by the effort of flexing the fingers is less with workmen whose profession is exclusively manual than with those whose work requires less muscular force, but whose intelligence comes more in play; and further, that the muscular power is still greater with those of the liberal profession of the same age.

TABLE E.

Age.	Annual increase in kilograms.							
	Porter hand squeeze.		Gilbert wrist lift.		Roberts arm lift.		Gilbert arm lift.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
6½ to 7½	1.6	1.4	1.7	1			8.4	6.8
7½ 8½	1.7	1.6	.8	1			9.5	4.1
8½ 9½	2	1.1	1.1	.0		1	7.2	6.5
9½ 10½	1.5	1.2	1.7	1.5		.1	9.6	— 1.3
10½ 11½	1.5	1.4	.5	.5		2.3	9.5	7.7
11½ 12½	2.3	1.7	1.7	1.1	1	1.2	7.7	6.3
12½ 13½	2.4	2.7	1	1.9	5.7	3.5	8.6	11.3
13½ 14½	3.2	1.9	1.1	.6	2.8	3.2	12.8	6.4
14½ 15½	4.4	2	4.6	1.2	6	4.1	23	5.4
15½ 16½	4.4	1.8	3.3	.6	9.6	2.2	8.3	— 3.2
16½ 17½		.1	3.3	.4	6.4	2.1	20	2.8
17½ 18½			.0	1.2	2.2	5	13.6	1.4
18½ 19½			1.7	.0	1.5	1.9	.0	3.8

It is clear from the table that strength varies from year to year in rhythms, as we have observed in all other tests. In order to determine the relative proportions of increase that occur in different periods I have calculated the following tables. The strength at 16 years has been taken as a base or 100 per cent. By subtracting, the other columns are obtained.

TABLE F.

	Per cent of 16-year strength acquired—			
	By 6 years.	By 11 years.	Between 6 and 11 years.	Between 11 and 16 years.
<i>Boys.</i>				
Squeeze (Porter)	20	46	27	54
Wrist (Gilbert)	21	46	26	54
Arm (Gilbert)	24	64	22	44
Arm (Roberts)				36
<i>Girls.</i>				
Squeeze (Porter)	23	54	31	46
Wrist (Gilbert)	32	65	32	36
Arm (Gilbert)	32	67	23	45

From these calculations it would appear that in the case of boys only about a fifth of their 16-year-old strength is acquired before 6 years, a quarter from 6 to 11, and over one-half from 11 to 16, during the puberal changes. In the case of the test upon the whole arm maturity is somewhat in advance. In the case of girls a greater share is acquired before 6 years. Their strength acquirement is more rapid than with boys from 6 to 11 years, although the largest increment is added also during the puberal flux.

In so far as the lift of the entire arm may perhaps be more exclusively fundamental than the combined movements of the wrist and hand alone, we see from the table that the arm movement seems to mature earlier than the wrist and hand.

Precision of hand movements.—Superficial investigation shows that the nervous mechanism involved in the attempts to be precise with the finger, require first an adjustment of a larger area of muscular and nervous tissues than those of any other movement of the body probably. Precision in drawing a fine line accurately, for example, requires steadiness not only of the finger movement itself, but of the hand, the whole arm, and even of the body. If we observe a child learning to write we find that he holds his breath, and in many cases his legs will be found bracing his body in intense strain. The central muscles of the arm and trunk are called into activity to give support of steadiness as a necessary condition for the fine adjustment to follow. We may, therefore, perhaps consider precision as involving two processes: (1) That of steadiness of the central organization as a platform upon which rests (2) the finer nervous adjustments of the most complex nervous elements.

1. *Central steadiness.*—This phase of the problem has been subjected to investigation by Hancock in the effort of children to stand still. The subject was asked to stand with feet close together and hands at side, to keep his attention on a distant object, and to try to remain still for a minute. By means of the ataxiagraph attached to a cap worn on the head, the bodily swayings of the subject are automatically registered upon smoked paper. The test was made upon 168 boys and girls of Worcester, 5 to 7 years of age. His tests show that during these two years the girls gained in steadiness 32 or 33 per cent of the power of control at 5 years, and the boys gained about 15 or 16 per cent. We may say, therefore, as the indication of Hancock's study, that power of control increases with age (very rapidly at the ages 5 to 7), and more rapidly in girls than in boys.

Curtis in a study of inhibition tested the ability of children of various ages in their ability to sit absolutely still. He concludes: "The ordinary child can not sit still voluntarily. Children under 5 years do not on an average sit still more than 30 seconds, and children from 5 to 10 years not more than one minute and one-half. Curtis explains this condition on practically the same ground offered in the paper, viz, that the higher centers of voluntary control are not developed in any degree of maturity until a late period of child life. He finds that mental occupation materially assists in the control of muscular restlessness, and that these higher centers of brain action are not developed until a comparatively late period.

(2) *Peripheral unsteadiness.*—Corresponding to these larger swayings of the central movements there are numerous small vibrations in the peripheral muscles involved in the adjustment for fine movements. In early infancy these movements are more noticeable in the form of apparently nervous twitchings that constantly occur in nearly every muscle of the body, even during sleep. As has been stated, these are perfectly normal and are signs of health; they tend to disappear in conditions of lowered nutrition, and in idiot infants they are very much fewer or wholly absent. As the infant grows older they gradually grow fewer and less noticeable. The fact that they gradually tend to disappear may be explained on

the ground that as the nervous and muscular mechanism is perfected the lower mechanisms pass under control of higher brain levels.

Lindley has made a study of the automatisms of early childhood, and he shows the persistence of many of these earlier, simpler forms into childhood and even into adolescence. Lindley found that automatisms increase very perceptibly with fatigue; that they are most frequent in accessory muscles, and in general decrease with age.

Precision will depend upon the number of sensory impressions and the accuracy of habitual adjustment between them and motor discharges. Clearly, as experimented facts show, exercise (i. e., the frequency with which they are impressed upon the memory) will go far to determine motor precision.

The development in accuracy of kinæsthetic sensations with increasing age has been demonstrated by Gilbert in his Iowa study. The subject was seated before a table upon which were two points 50.8 inches apart. A pencil in his hand was placed at one end of the line. After carefully noting the distance, his eyes were blindfolded and he was asked to move the pencil along the board and place it as near as possible upon the other point. Five trials were allowed each subject. Averages of these estimates from fifty subjects of each sex and for each age from 6 to 19 are as follows (the figures give in centimeters the averages for each age of the estimate of distance, really 50.8 centimeters):

	Age.													
	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.	16.	17.	18.	19.
Boys.....	10.7	31.2	38.1	44.4	46.5	46.7	44.7	46.7	46.5	50.3	51.5	53.1	54.9	57.1
Girls.....	12.7	20.3	29.7	31.8	38.9	46.5	41.1	43.2	48.3	46.7	51.1	51.0	52.1	51.5

The progressive development with age is clearly shown.

(4) *Growth in precision.*—Bryan with a somewhat elaborate mechanism tested precision of finger movement as it occurs in executing the motions of writing. He used in the test some 600 or 700 boys and girls, ranging in age from 6 to 16. He states in conclusion that “the most obvious fact which appears is the great gain which is made between 6 and 8.” Almost one-half the gain in precision made from 6 to 16 in both “up” and “down” writing movements, is acquired between 6 and 8 years. A second test to which Dr. Bryan subjected the same children was that of their ability with a stylus to strike a fixed point. An electrical apparatus recorded the approximations of error. The boys’ right hand from 6 to 16 years gains in ability 60 per cent; the boys’ left hand, 55 per cent; the girls’ right hand, 56 per cent; the girls’ left hand, 58 per cent. The puberal period seriously interferes with the growth.

In the study, previously quoted, bearing upon characteristics of children who made “rapid,” “normal,” or “slow” progress in school grades under a system of promotion giving freedom to individuality it is shown that 54 per cent of the rapid pupils, 39 per cent of the normal pupils, and 22 per cent of the slow pupils are strikingly careful and accurate in their writing and drawing exercises, while, on the other hand, 11 per cent of the most rapid, 34 per cent of the normal, and 59 per cent of the slow pupils are strikingly careless and inaccurate. From the evidence of this study accuracy on the whole must be associated with a maturer mental development as indicated by school progress.

In the matter of accuracy it may therefore be concluded: (1) That as a primary condition which makes accuracy of hand and arm possible the child must have a matured degree of control under direction of his higher level centers (i. e., volun-

tary). The fact that this maturity is not reached normally until the ninth or tenth year renders questionable the efforts of the school to compel accuracy such as is required by the kindergarten and also by the primary school in writing, weaving, etc.; (2) that the ability to be accurate in hand and finger movements increases very materially during school ages; (3) that accuracy depends indirectly upon the development of the body as a whole, the steadiness of the trunk muscles being as essential as the accuracy of hand or finger movements themselves; (4) that for purposes of delicate peripheral movements, as shown by ataxographic experiments, etc., the child has not a matured power of control until well into the school period and long after severe school requirements of accuracy are demanded; (5) that the evidence goes to show that the sensory kinæsthetic sensations, essential in psychological theory for definite voluntary movements, are in general in a very immature state until 8 to 10 years; (6) that while the early years of school life are doubtless the period of nascency for finger and hand movements, nevertheless there is evident need of a clear realization of the psychological conditions on the part of teachers, not only intelligently to direct the training of these movements, but also to guard against unhygienic requirements; (7) that there are manifest dependent relations between general mental ability and power of accuracy of hand movements; (8) that steadiness of the trunk or central movements (fundamental) necessarily precedes ability to be accurate in peripheral (or accessory) movements.

In conclusion, some of the more general suggestions of this review may be restated briefly as follows:

1. The brain grows in its finer structures until a late period in life. There has been a failure to substantiate connection of differences in mentality with the differences in gross anatomy of the brain, shape of skull, weight of brain, form of convolutions, etc.

2. The order of development of the independent parts of the physical and nervous system is, as a general principle (subject, doubtless, to minor exceptions), from that which is oldest in racial history toward that which is most recent; that those portions which are oldest are most fixed, determined, and least capable of modifications by present environment, and those which are relatively most recent are most plastic and subject to modification by education and environment.

Among the important pedagogical inferences which follow from this principle the following might be mentioned:

1. That, taking the activities independently, there is an early period in the development of each part or process, when the purpose of education must be to follow the fixed innate hereditary line of tendency, and to allow the racial instincts fullest play of development (fundamental education).

2. That there follows a later period, in an activity's development, when it passes partially out of the fixed control of racial habit and becomes more plastic to present environment (accessory education).

3. That the order of logical connection of subject-matter belongs, educationally, to the period of approximate maturity of an activity's development, and must not be introduced in the earlier instinctive period, in conflict with strong evolutionary tendencies.

4. In an extremely loose sense, clearly recognizing the principle that the organism develops by parts, each of which has a different time of beginning its development, a different rate of ripening, and a different period of reaching maturity, nevertheless we may regard the period of infancy as one of predominating nascencies of the oldest fundamental activities largely in control of the lowest level of the nervous system; the period of childhood from 2 years to puberty as the period of predominating nascencies of the special sense and their association one with the other; the period of adolescence as the period of predomi-

nating nascencies of the highest form of associations; i. e., those which have been developed in the history of the human race.

5. The child's hand at the age of commencing school is relatively immature in power of rapidity of movement, strength, and precision. Roughly, it would seem that at the age of 6 the child has acquired only about 20 to 75 per cent of the power at 16 years of age. It is clear that the period from 6 to 10 years is one of extreme nascency.

6. Deficiencies in the structure of the hand and in freedom of its movements are significantly frequent as accompaniments of deficiency in intelligence. The human hand in early childhood needs opportunity for the fullest possible development, which in general proceeds from fundamental to accessory movements.

CHAPTER IX.

INHIBITION.¹

Inhibition is used in its widest sense, in which it is nearly equivalent to natural selection.

HERBART.

For Herbart the whole story of psychology is the story of the struggle of concepts for the possession of consciousness.

The strong concepts drive out the weak; "but as soon as the hindersome yields, the concept by its own effort will again make its appearance in consciousness." "When a sufficiency of opposition exists among concepts, the latter are in equilibrium." The laws of the movement and equilibrium of concepts can be calculated by mathematics. The first law is: "In the case of two concepts, one never entirely obscures the other." "In case several concepts strive together, the sum of arrest will be equal to the sum of the weaker members." The mechanical threshold is the line which separates the conscious from the unconscious. Those concepts on the mechanical threshold, while "out of consciousness, are still effective therein." "But concepts on the statical threshold are in a state of complete suppression, and can not effect consciousness at all. It may be observed that feelings and desires have not their source in the process or act of conception in general, but always in certain particular concepts. Hence, there may be at the same time many different feelings and desires, and these may either agree or entirely disagree one with the other."

"The basis of the reason is the coincident operation of several complete series of concepts." "Will is effort, accompanied by the idea of the attainability of the object of effort." "Freedom of the will is the assured supremacy of the strongest masses of ideas." Friendly concepts unite into apperception masses and resist the entrance into consciousness of concepts antagonistic to them. Sanity is the equilibrium of concepts.

Herbart's psychology contains three chief ideas; prevailing ideas are the content of consciousness; defeated ideas tend continually to return; the prevailing ideas tend to ally themselves with all friendly ideas as men are united into nations or the aggregate of cells makes up the individual body.

Herbart's empirical psychology describes the actual events of consciousness. We all know how the child forgets the old toy in the new; and how new interests, loves, hopes, and fears are continually driving out their predecessors, and being in turn driven out by those which follow them. It emphasizes above all the economy of a monoideistic state of consciousness. Its interest for us is that it shows a form of intellectual inhibition which is practically equal to the "struggle for existence." It is inhibition by individuals rather than by central control.

BENEKE.

The system of Beneke derives much from Herbart. Every idea leaves a trace behind in the original powers, and when this is again stimulated either from within or without the idea is brought again into consciousness. These traces he

¹ Digest of article by H. S. Curtis.

calls "formed primitive powers." Each faculty is only a summation of all the soul's acts of a particular kind, according to the law that "all products of a like kind attract each other, and as a consequence fuse into a whole." He says: "We give the name of understanding to the totality of concepts existing in the soul; judgments to the totality of judgments; inferential power to the totality of conclusions; will to the totality of all ready formed acts of willing; consequently the totality of feeling is nothing more than the totality of all the feelings that arise in the soul and are permanently existent in it." "The developed human soul is a product of simple original powers and of that which has affected them and been permanently retained by them." "For all our powers of sense, together with the products springing from them, form one intimately connected whole; they are the soul." Beneke has dropped Herbart's transcendental ego and made use of his doctrine of apperception to explain the faculties of the soul and the soul itself.

TAINÉ.

For Taine, as well as Herbart, all mental events are determined by the mutual struggle of ideas, though Taine takes the further step of reducing all ideas to sensations.

All the psychic life can be reduced to sensations. "All that observation detects in the thinking being are, in addition to sensations, images of various kinds, primitive or consecutive, induced with certain tendencies, and modified in their development by the concurrence or antagonism of other simultaneous or contiguous images." "Just as the living body is a polypus of mutually dependent cells, so the active mind is a polypus of mutually dependent sensations and images; and in the one case as in the other unity is nothing more than a harmony and an effect. The ego is a mere abstraction; all that is is the individual sensation, idea, or image which may occupy consciousness at the time. As Condillac has said, 'When I smell a rose, this sensation is all my ego.'"

Sensations may be still further reduced to molecular movements in the brain cells. There is no mental product without molecular movement. There is no molecular movement without some mental result, though this may be subconscious. Molecular movement and sensation are really the same thing, and the reason they do not seem so is because we see them from opposite sides.

The most important point in Taine's system is that the elements of consciousness, sensations and images, if left to follow their inner tendencies, would make a pandemonium of the human mind. It is only through their mutual checks and repressions that sanity results.

ROUX.

Just as Herbart and Taine have sought to account for all psychic phenomena by the struggle of ideas, so Roux has sought to account for all psychic phenomena by the struggle of the parts. Those cells which are most often stimulated to functional activity are over compensated for their waste and are thus victorious in the struggle.

In the struggle of the tissues and organs we have the same process repeated. Roux sums up the results of his theory as follows: "Those cells or cell parts will be established which are in the position to bring on functional adaptation, and this is the result of the struggle of the cells." "On the other hand, the struggle of the different organs and tissues among themselves leads to the greatest possible utilization of the space in the organism, to inner harmony, to the perfection of the physiological significance of the parts to the corresponding morphological significance." "Through this struggle a much more perfect adaptation to ends must be brought about and much quicker than, according to the Darwinian principle, of the selection of formal variations among individuals." This view presupposes the same conditions in the body as exist in the external world, namely,

that there are germs of many more cells in the body than can possibly find place there and a consequent struggle for room, and that the amount of food is always limited, and the high nourishment of some means the low nourishment of others.

In the vegetable world the struggle of the parts seems to be yet more apparent. Each twig and leaf struggles for space and sunlight as best it can. The upper branches overshadow the lower and they dry up and drop off, just as unused members atrophy and disappear from the animal body. Each spring a twig starts from beneath the scar of each old leaf along the branch, but if you look again after a year you will find scarce one in a dozen has survived. Only those that have found or won space and sunlight are left. The length of the leaf stalk and size of the leaf are determined by their relations to the sunlight.

THE VAGUS OR PNEUMOGASTRIC NERVE.

Despite the immense amount of investigation to which the vagus has been subjected of late years, its function is still far from clear in details.

The ordinary phenomena seen in the stimulation of the vagus are that the heart is slowed or stopped after the first or second beat and held thus for a few seconds, when it begins to beat again and beats more strongly than it did before stimulation. Of late, however, the most or all of this secondary augmentation has been referred to sympathetic fibers, bound up in the same sheath with the vagus. The action of the vagus varies greatly at different times. With many investigators you can not tell whether the combined nerve (vagus and sympathetic) or the vagus alone was stimulated.

Our knowledge of the vagus is not satisfactory. That it inhibits the heart seems certain, as its rhythm is accelerated on the section of the vagi and retarded by their stimulation. That it has something to do with the nourishment of the heart seems very probable, inasmuch as the same stimulus will not repress the heart long at a time, and there is often a secondary augmentation. Sending a blood solution through the heart after a salt solution has the same effect. If the vagus is cut and the animal allowed to live, the heart atrophies, although with the vagus intact the animal may be starved to death without this occurring.

Wundt says every sensory stimulus first causes nutrition, and nutrition inhibits activity for a time. There seems to be good evidence also that nerve cells and muscles atrophy without their proper stimuli.

He has sought to reduce nerve phenomena to terms of physics and chemistry, so far as possible. The nerve stimulus is the potent factor in nerve growth, activity, and inhibition of activity. The first effect of every stimulus is the nutrition of the cell. The nerve stimulus is turned into a growth force. By this means it is made latent in the fiber for about one two-hundredth of a second and for a somewhat longer period in the cell.

Wundt's system contains two important principles—that the nerve stimulus is nutritive and inhibitive, and that nerve energy tends to equalize itself by overflow from points of higher to points of lower tension.

THE EFFECT OF THE STRUGGLE OF THE PARTS AS APPLIED TO ACTIVITIES.

The general activities repress one another. The store of energy at the command of the organism is always limited, and the using energy in one way must prevent its use in another.

Dr. Sargent represents the amount of force expended by an average man weighing 150 pounds at 3,400 foot-tons daily. He divides this expenditure among the various activities as follows:

	Foot-tons.
Calorific work.....	2,840
Internal (nervous and vital) work.....	260
External (muscular) work.....	300

If these estimates are correct, then several inferences may be drawn. If we suppose the capacity of the individual for continuous work is 3,400 foot-tons, the requiring of 400 tons in muscular work instead of 300 tons would only leave 3,000 tons for nervous and vital processes. Thus a demand upon any one of these activities beyond what nature is prepared to furnish by an increased nutrition must be drawn from the others.

Just as the heart and brain will starve the rest of the body and still be undiminished themselves, so it seems to be nature's law that active parts shall be fed at the expense of inactive ones, if necessary, or even at the expense of parts active in a lower degree. Sargent says:

Porters, draymen, heavy iron workers, and a certain class of athletes often illustrate the effects of an excessive use of the muscular system. Where the body's nutriment is expended in this direction the impairment of the heart and lung tissue is likely to follow.

When a child is growing very fast he is disinclined to exercise. Reversely, too much exercise will probably check growth. But the effects on the brain are most disastrous of all. Many children set to work at 7 or 8, and worked hard, have grown up very dull. Intellectual workers are usually incapacitated for hard work by severe exercise. It is a common experience of students that if they play three hard sets of tennis in the afternoon they can not work afterwards.

Mosso gives many examples of the effect of physical fatigue on mental ability. He says he has climbed Mount Blanc several times, but he can remember nothing of the view from the summit.

Intense cold produces an intellectual lethargy, complained of by Arctic explorers. There is a tendency to go to sleep.

Spencer says the present race of Englishmen are inferior to their fathers in height, weight, and resistance to disease. He thinks the overwork of the school children is the cause. He says this belief has been thrust upon him by observing the constant physical breakdowns in overpressure schools. For every one that breaks down there must be at least half a dozen injured, he thinks.

There is a great deal more or less experimental evidence to show the influence of brain activity on the various bodily and vital functions.

That growth may be checked is difficult of proof. Still it appears that children grow faster during the summer vacation. On this point European statistics seem to be agreed.

Binet and Henri, after careful study of the boarding schools of France, conclude the weight of the children may be actually diminished by excessive brain work.

Mosso, after speaking of how the other tissues are consumed to supply the heart and brain in death by starvation, and the effect of severe brain work on the strength of the muscles, says:

And therefore I hold it for probable that not only by starving, but also by exhausting the brain by excessive work, the muscles may give up a part of their albuminoids to the blood currents to be carried to the brain. I notice in my own case that I grow lean when I am working hard, and begin to gain flesh with a vacation.

Mosso and Binet both found that a brief period of intellectual activity increased physical strength, but a long period reduced it. Dr. Maggiora tested the strength of the middle finger of his right hand on the ergograph in the morning with 40 contractions, amounting to 3,694 kilogrammeters. At 5.15, after examining 19 candidates, he could only make 11 contractions, amounting to 1,086 kilogrammeters. Mosso says: "The tiring of the brain diminishes the strength of the muscle." "The requirement for rest after a period of severe mental work rests in the fact that the nerve centers are depleted and the muscles are weak."

Binet and Henri found that hard mental work began to reduce the rate of respiration after fifteen minutes, and of the heart beat after half an hour. Spencer says this result may become permanent as the result of overwork.

There seems to be a general agreement that dyspepsia may be caused by excessive brain work, and the resistance to disease lowered.

Inasmuch as the function of sleep is mainly brain rest, we may expect the same results from loss of sleep as from excessive brain work.

In experiments carried on in Italy it was found that dogs could be kept without food for twenty days, and lose more than half their original weight, and still survive; but loss of sleep for four or five days proved fatal. If a hibernating animal wakes up too soon it is apt to starve to death, it is said.

In what we have said thus far we have spoken as though the energy for all the activities was drawn from a common reservoir, into which exactly the same amount was poured each day; so that any excess of use in one direction meant a deficiency in some other direction. We have seen that these suppositions agreed fairly well with the facts. Still the case is by no means so simple as this. All activities increase the metabolism so as to compensate for the extra work up to a certain limit or even overcompensate it. Beyer has shown from the measurement of naval cadets that the height may be increased 1 inch and weight 50 to 60 pounds by systematic exercise during the years from 16 to 20. Years in which gymnastics were taken were compared with years in which they were not taken.

In every muscular movement there are three factors involved—the muscle, the nerve, and the nerve cell. It seems to be well established that the nerve itself does not tire, but the muscle or nerve cell may be fatigued. To this fatigue there are two elements—that due to loss of energy, and that due to clogging by waste products. As a rule the nerve cell seems to fatigue first, as a muscle which can no longer be contracted voluntarily still responds for some time to the electrical stimulation. The importance of the nerve cell to physical strength is much underrated in most estimates. If the nerve cell is injured the muscle lies inert and soon atrophies.

It has been shown that students have a stronger hand clasp than laboring men, although they have probably done very little to develop it. It is also well known that the strength varies with various conditions. As has been abundantly shown, any sensory stimulus may greatly augment the knee jerk or the pressure on the dynamometer, if it occurs at the right time. The knee jerk, rapidity of tapping, and power of clasp are all increased by brief intellectual activity. But intellectual fatigue again reduces them below the normal. In a series of experiments which I carried on last year strength seemed to be in a very close relation to mental excitement. Normally I could press from 115 to 120 pounds. But on one occasion, after working for an hour and a half on my thesis and getting very much interested, the average ran up to 127, with 132 as the highest contraction. As similar results were obtained by Binet and Henri, I refer to them instead of treating more of my own results. These facts show the close dependence of physical strength upon brain states.

Those who would explain muscular fatigue by mental work by saying we think with our muscles must take into account the experiment of MacDougal, who found the finger was relaxed during mental effort, and Binet and Henri, who found the muscles of the eye in a similar condition. This theory can not well account for any increase of strength due to mental activity.

There is plenty of direct evidence for discharges from one brain area to another. Stimuli to a single sense stimulate the entire brain. All sensory and motor areas are under voluntary control. This can only mean discharges from the association areas upon the areas concerned. If this were continuous there would be mental exhaustion from muscular work. Perhaps this is the explanation of the mental heaviness of laborers. In case of intense mental work the current may set in the other direction. Motor areas would discharge upon the associational areas and the muscles would be weakened.

More than two-thirds of the entire mass of the brain is made up of the fibers, and of these by far the larger part are associational. This would be meaningless if discharges could not take place over them. Whenever a discharge takes place, there is a transference of force. If one area could not assist another we might expect its degeneration to follow the loss of its appropriate organ. This, however, does not occur except in case of a very young child. The blind do not have visual dreams if they become blind before 5 or 6. If associations become established with other areas the visual seems to be retained.

SUMMARY.

The amount of energy which can be developed by any organism is limited. Up to a certain point exercise causes a muscle to increase in strength; beyond this it is weakened. But this point is only reached when all available supplies are no longer sufficient to repair its waste. Long before this point is reached it begins to draw on the other activities. Active parts are fed at the expense of resting ones.

Excessive physical exercise may stunt growth, reduce the flesh and strength, impair the heart and lungs, and dwarf the intelligence or impair its efficiency for the time being. Where great drains are made on the energy to maintain bodily heat, as in polar regions, maturity is attained later and intelligence is often deficient. By excessive brain work growth may be checked, weight reduced, muscular strength lessened, the heart beat slowed, and dyspepsia and a physical breakdown brought on.

One activity may inhibit another: (1) By poisoning the blood with its waste products; (2) by robbing the blood of its nourishment; (3) by consuming the resting parts; (4) by using its brain area.

The nerve cell is as important as the muscle to muscular strength. Different brain areas are connected by associational fibers. These must imply discharges from one to the other, and hence a transference of energy. If one area could not assist another its degeneration would follow the loss of its appropriate organ. This does not occur unless the loss comes very early in life. The hand can be kept inactive without the hand area's discharging spontaneously. The brain is on the way to unity not yet entirely reached; connections are very poor in the child. "Second breath," or "warming up," means the drafting in of other areas to assist the primary activity. Constant use tends to associate the area used with other areas. Intense effort tends to unify the brain. The brain owes most of its endurance of mental toil to its motor areas. Develop each area and interest in childhood, and use the energy of all in a single activity in manhood.

RESTLESSNESS.

Restlessness is movement without any apparent cause or purpose, resulting seemingly from some inner physiological necessity. Children are very restless, a quality which is shared by the young of all animals as well. It is the root from which the play impulse springs, a surplus of energy requiring employment. As the young animal grows to maturity and requires all his energy to secure his living play disappears; but whenever food is provided and the struggle for existence is made easy a surplus again accumulates and manifests itself in a vague uneasiness.

But anyone who observes children must very soon perceive that they differ greatly in activity from their earliest years. In the hope of securing a more accurate measure of this I secured four American pedometers and put them on adults and children of various ages, and asked some responsible person to keep record of the daily activity for a week. The results were not as satisfactory as might have been hoped, as the pedometers were not very reliable and had to be regulated every week or two to keep them running together. The records given are not really accurate for miles, as the pedometers were all set to a 20-inch step.

This, of course, would be too long for a small child¹ and too short for a man, being an average step for a woman of medium height. This, however, shows the number of steps each person took in a day, or the real activity, which was the thing desired. This means 2,754 steps for every mile represented in the record.

Average ..	10½	7½	8½	8½	Average ..	9½	5½	8½	7½

From these tables and curves it will be seen that the averages of children below the school age are largest; it would also appear that country children are more active than city children. But the activity of the country children from whom the records were obtained was considerably above the average. The activity of the girls and boys, men and women, is nearly the same. The adults were engaged in various occupations; and the lowest record is my own while teaching in a country school.

The activity is least on Sunday for all, and greatest on Saturday for all but the small children. Wednesday and Thursday seem to be days of low activity also.

SITTING STILL.

The syllabus brought in something over 200 returns, of which the larger part were from one normal school. The first purpose of the syllabus was to determine, if possible, whether the restlessness of children is a real physiological necessity, as is so often stated, or that it is merely the result of inclination.

The first question was as follows:

1. Ask your child, or if you are a teacher ask a few children at a time in your room, to take some easy position and see how long they can sit still without any movement; meanwhile, with watch or clock in sight, note time and put down (a) which part moves first—fingers, feet, head, arms, legs, etc.; (b) what kind of motion, usual or unusual, violent or gentle.

What efforts do you see to prevent these spontaneous movements, as, e. g., tension of all the muscles, clenching mouth, hands, etc.?

¹ The real distance traveled may not be so very different, as children run a great deal and take longer steps at such times.

From the nature of the returns it would be difficult to make a table of just how long each child sat without moving. The differences are very great, but the tests in the returns (so far as the exact time is given) will justify the statement that children under 5 will not, as a rule, sit still more than thirty seconds, though now and then one will sit still as long as ten minutes. Children under 10 will not usually sit still more than one and one-half minutes, and oftentimes less than half a minute, though one or two have sat as long as twenty minutes. These results seem to show that the average child can not sit still in a test for more than a very short time.

Probably one reason children do not sit still longer in a test is because they make so great an effort to sit still. They usually clinch their hands, contract their brows, and set their teeth, as though they were going to lift a thousand pounds instead of merely doing nothing. Their breathing is often irregular and they frequently try to hold their breath. They have the consciousness of being watched also.

All these circumstances tend to make sitting still more difficult, but their influence is probably less than we might suppose at first. There are many children who do not make a great effort to sit still, but they do not succeed much better than the others. In the clenching of the hands and setting the teeth also you have an expression of the child's judgment that sitting still is a hard thing to do. In speaking with adults I find that some of them still remember, with a feeling of pain, the times they were required to sit still as children.

I think that, all things considered, the evidence will justify the conclusion that the ordinary child can not sit still voluntarily.

The answers received in reply to the following question show a much greater restlessness.

Question. Will you compose yourself in a comfortable position sitting, lying, and standing, and remain as still as if you were having a slow photograph, and describe your experience freely?

The results are very different from those obtained from the university students, but the conditions were also very different.

Sensibility is much increased. Many sensations which normally remain below the threshold of consciousness are raised into distinctness, and it is the little itching, pricking, rheumatic sensations which soon make sitting still disagreeable if any one allows himself to notice them. So, also, the motor tendencies of all sensations become apparent. Infinitesimal impulses to move are magnified into strong desires by the attention they receive.

I think it is both true that the child is restless because he is inattentive and inattentive because he is restless. But the latter is primary.

RESTLESSNESS IN SLEEP.

Question. If you have an opportunity to observe children or adults in sleep, notice if they are ever perfectly still for any considerable period, or do their eyelids or lips move, expression of the face change, fingers clinch, etc.?

Out of 97 observations on children and adults under this head, 83 report movements and 14 report none. Most of the observations were for not more than ten minutes, and a larger number might have proved restless on longer observation.

THE RESTLESS CHILD.

Question. Describe one of the most restless children you know—complexion, health, stature, flesh, color of eyes, hair, etc., bright or dull, good or bad natured, regimen, discipline, etc., association gay or sad.

The number of cases was 152. The significant characteristics seem to be as

follows: Good health, 93; poor health, 25; bright, 123; of these, very bright, 71; dull, 10; tall, 41. These characteristics came out in answering the questions of the syllabus. The following also came out preeminently, though only incidentally mentioned. They are apt to be boisterous and rude in their play and often hurt other children without intending to. They are mischievous and disobedient to parental authority. They are often whipped, but do not mind the whipping. They seem very insensitive to pain. The majority of the restless children described are under six years old. Restlessness appears to disappear with mental occupation.

The restless child seems to be an especially instructive type and one that is very little understood. He is the child who makes most of the trouble for his parents and the teacher. He is often thought to be willful and bad and may be made so if he does not receive proper training.

Restlessness as applied to children below the school age may be taken as nearly equivalent to activity. The physical activity of a child at this age is a very fair measure of the energy he develops.

The restless child is, as a rule, a peculiarly good animal, as well as, seen from the characteristics given—boisterous, rude, mischievous, disobedient, talkative, insensitive to pain, fond of teasing, often cruel, destructive, social, often leaders, bright, yet thoughtless.

Restlessness in children up to six or seven years of age seems to be a good sign, but a bad sign afterwards. It does not usually last much later than this in its extreme form. The restless child should naturally develop into a man of action.

THE QUIET CHILD.

Question. Describe in the same way one of the most quiet, inert children you know. Are they lazy, self-conscious, companionable? Do they associate with older children? Are they studious, thoughtful, sad or gay, etc.?

Many observers said they did not know any quiet children. Their characteristics, as compared with the restless children, are as follows:

	Quiet child.	Restless.
Number of cases	108	152
Good health (mentioned)	44	93
Poor health	22	25
Bright (all)	57	123
Very bright	14	71
Self-conscious	28	-----
Thoughtful	45	-----
Studious	27	-----

It would appear that the health of the quiet children is not as good, and they are not as bright as the restless children. But of course the numbers are too small for safe conclusions.

Several types of quiet children can be made out—

1. There is the child who seems to lack energy all around. He is inactive mentally and physically. He is the typical dull scholar at school. He can not be educated without unusual stimulation.

2. There is the child who is inactive from sheer rapidity of growth. He grows 5 or 6 inches in a year, and lies around all day.

3. Fat children are nearly always inactive.

4. The large number who are said to have poor health would indicate that loss of energy due to disease is one very important factor.

5. Overwork, mental or physical, produces quietness.

CONDITIONS OF RESTLESSNESS.

In answer to the question, When are children most restless? there were 148 replies.

Out of the 148 returns 2 said children were most restless in the morning, 112 in the evening, 14 on bright days, 107 on cloudy days, 8 in the fall, 110 in the spring; 15 said exercise increased restlessness; 116 said exercise decreased restlessness.

That children, as well as adults, are most restless in spring agrees with general observation. Children certainly are more restless if kept from active exercise, and on bad days. These two cases are often one, but not always. Several teachers from different parts of the country have said that children are more restless on days preceding a storm.

When the class becomes restless the teacher may take it as a sign that the work or method should be changed.

The conditions of restlessness seem to be about the same in adults as in children.

There were 114 cases: Restless, 75; gloomy, 11; fatigue, 7.

Going without exercise, 123 cases: Nervous, 13; stupid, 20; headache, 10; stretch, 47; irritable, 17; yawn, 67; gloomy, 6; restless, 66; sleepy, 18; impulsive movements, 51.

In the case of a change from an active to a sedentary life the resulting restlessness would seem to indicate a certain accumulation of energy for motor uses, which is either used for other purposes later or the rate of metabolism of motor areas shows up to a slower expenditure. In case of going without regular exercise the case is apt to be complicated with overwork and the disturbing of rhythms.

The physical effects seem to be a violent beating of the heart, flushing of the face, increased circulation in the brain, and great irritability of all cerebral cells, which results in a diffuse discharge upon all the muscles and glands, causing tremors, nausea, and various similar phenomena. The individual is very restless and often nervous. The cerebral excitement is too general to be inhibited. A person is thoughtless and impulsive. He tends to speak all his thoughts, is apt to be irritable, and takes offense at the slightest cause. He loses control of his muscles; his hand trembles; it becomes absolutely impossible to sit still; all automatisms become very pronounced; he is unable to sleep at night.

The characteristics of childhood resemble those of a constant state of excitement.

SUMMARY.

The activity of children below 6, as shown by pedometer records, is greater than at any later period. But children differ greatly in activity.

Children under 5 could not sit still longer than 30 seconds in the test. Children under 10 could not sit longer than one and one-half minutes.

Blind children are more restless than other children.

Children are most restless near the close of school, on cloudy days in the spring, when they go without exercise.

Auditory stimuli are perhaps of great assistance in maintaining the activity of the brain. Hearing is inhibited by thought.

PEDAGOGICAL INFERENCES.

From what has been said there may be seen on the one hand a great danger, excessive brain work, and on the other a great need, physical exercise.

The child is still in the animal stage of his existence. The irresistible impulse which has come down from that struggle in ages when life and food depended on fleetness of foot and strength, is still surging within him and drives him on to action. Not only does he refuse to sit still for a half minute at a time, but he

seldom walks when going anywhere, but runs or gambols along like a young animal. Of the children I have questioned as to whether they liked to go to school or not, nearly every one who has said "no" has given as the reason, "because he had to sit still," or "stay indoors," or some other reason which meant restraint of motion.

If childhood is the animal period of life it should be the time for animal (physical) culture. It is then that interest in and love for physical movement is greatest. The greatness of childhood consists in swiftness of foot and strength of body and limb. The school hero is usually the boy who possesses these qualities.

We have seen that excessive brain work may dwarf the stature and weaken the constitution. We know, also, that from 15 to 60 per cent of our children become nearsighted before leaving our schools; that a very large proportion, especially of the girls, have curvature of the spine; that a great many become nervous, and not a few have chorea; that among the girls at least only a very small proportion finish the high school in a state of good physical health. Not all of these evils are due to the school, but at least a part are. To that part for which the school is responsible there are two elements—the one due to overwork and worry and the other to being indoors and enforced inactivity. We have seen how difficult it is for the child to sit still; that it is this which makes school disagreeable to him; that his personal discomfort makes it hard for him to keep his mind on his task; that long restraint tends to make him nervous. However, it seems probable that the lesson of quietness is one which it is necessary for the child to learn. There is no probability of his acquiring the power of deliberation until he has learned to be still. We have conjectured also that the high pressure of motor areas may be instrumental in making their associated connections permeable.

We are suffering from a false ideal of education which has been handed down to us from the Renaissance. We seem to think that to master books is the only way to become learned, and to become learned is the object of education, whereas neither of these propositions are true. One can gain nothing but second-hand information from books, and the object of education is not to make men scholars. The time when a man can become learned from books alone has already passed. We live in an age of science, and observation and experiment are its fundamental methods. Our ideal student is no longer an emaciated consumptive with a wet towel about his brows, bending over his Homer in the small hours of the morning, but rather the well-rounded man of the world; one who knows books, but who knows men and affairs as well; one who has drunk deeply from every experience an honorable life can offer him; one who has ideals of action as well as thought. How absurd in the face of modern culture to teach the child the contents of a few books and think we are educating him! All our cities are becoming cosmopolitan. Almost anything that can be learned from books can be better learned from the observation of the things around us. The city in its parks, museums, libraries, art galleries, theaters, sermons, business, etc., offers a liberal education to everyone whose mind is open to receive it.

The charge of impracticability can always be preferred against book learning. It is less often called up by our everyday experience; its lessons are less easily applied; they are acquired with greater difficulty and more easily forgotten than lessons from observation and experience. It is at least as important that a child be able to observe well as that he be able to master books. Observation is usually of things right about us which will touch our lives the oftenest. The problems which life gives every man to solve can not be solved from books. He must learn to study from nature herself those things on which his success depends. That man is best educated who best knows how to solve his life problems, drawing on every resource everywhere that can help him to that solution. But knowledge in its largest sense is a very small part of a well-rounded education. It is

surely as worthy an aim to admire a beautiful picture or poem as to know how it was constructed; it is as much to love a great good man as to know his biography, and to be able to do a thing is surely greater than to know how it is done.

There are five aims to be gained by a well-rounded education: (1) A good physique; (2) to know what our life requires us to know; (3) to be able to do whatever we need to do; (4) to admire the beautiful; (5) to love the good.

In woods or flowers or animals the child sees companions, and his imagination seeks to fathom the motives of their actions and the pleasure of their lives. Could anything cultivate the heart more than this living world and make it responsive alike to the fancies of the poet and the teachings of religion? Here in this primitive nature love are the roots of the love of the beautiful and the good. The nature lover is always reverent; he believes naturally in the divine. The child's attitude combines the religious and scientific. All true science must be guided by love and reverence.

CHAPTER X.

THE COMMON SCHOOL IN THE SOUTHERN STATES BEYOND THE MISSISSIPPI RIVER, FROM 1830 TO 1860.

By A. D. MAYO, A. M., LL. D.

LOUISIANA.

The present essay deals with the attempt of the State of Louisiana to establish and maintain a system of public instruction, from the year 1840 until the close of the civil war.

Previous to this date, from the year 1803, when the immense territory known as Louisiana came into the possession of the United States Government, the record of the educational history of this people finds itself in contact with an intelligent and active common school public, as this term was then understood. From 1805 to 1808 the Territorial legislature worked at the problem of schooling the few thousand white children and youth by a plan in some way broader and more generous than before had prevailed in the country. It included a central "University of Orleans," with academies in each county, seminaries for young women, and a library in each county. The corporation of the university, besides a number of eminent citizens, consisted of the leading officials of the city and Territory, and it was intrusted with ample power and backed by two lotteries. All authority was vested in this close corporation to establish such educational organizations "as should appear to them most convenient."

In 1806 Governor Claiborne informed the legislature of the lack of success. In 1807 the lottery scheme was dropped. In 1809 the governor pronounced the grand scheme a failure, only one parish having established schools under its authority. Nothing daunted by this collapse of a romantic project, the legislature, in 1811, voted \$39,000, of which \$15,000 was for the central college in New Orleans, and \$2,000 for one or more schools in each county, with three school trustees for each county. By this and subsequent acts a school of the higher grade was kept alive in New Orleans for fifteen years, until 1826, with less than 100 students, largely of the charity order. In that year the State subsidy was transferred to the College of Louisiana, at Jackson, East Feliciana Parish. Despite the lottery, the taxing of the growing population of New Orleans, and other financial devices, the people did not respond, the two public schools subsidiary to the college in the most progressive municipality of New Orleans containing less than 100 poor children.

The numerous changes which this and similar attempts subsequently went through, like the swift turns of the kaleidoscope, are unimportant in a general review of the progress toward a common school. They are deeply interesting as demonstrating the intense desire of the more influential and zealous body of school men to give the children something above the Catholic parochial, private, plantation, and other makeshifts, on which a large portion of the children and youth depended for their only educational outfit in the new American life. The conclu-

sion of the whole matter was that, as late as 1840, not half the white children in thirty or forty parishes of the State were in any school.

One of the hindrances to the success of these preliminary ventures was doubtless the fact that a large portion of the white population of Louisiana were members of the Roman Catholic Church, whose authorities, then as now, in perfect and honest consistency with its ecclesiastical theories, could not approve a school system responsible to any power save the priesthood. This, with the scattered population, the great mixture of peoples, the difficulties of travel, and the obstinate habit of every parish caring for itself, explains the fact that no body of educators, however influential, intelligent, or zealous, could reasonably expect to hold in an organization like the American common school a people in conditions and circumstances so indifferent or hostile to its spirit and methods. Up to that time the national land fund was increasing and money had been liberally spent, both through private and public expenditure; enough, if properly administered, to secure the most favorable results.

But the educational public of the State, nothing discouraged by past failures, rallied and placed in the constitution of 1845 one of the most radical and far-seeing provisions for universal education to be found in any Commonwealth at that period. It provided for a State system of public instruction; free public schools throughout the State, to be "supported by taxation on property and otherwise;" the jealous care of the Government school lands, and the formation of a school fund at 6 per cent interest for the support of the system; the establishment of a State university, composed of four faculties—law, medicine, natural science, and letters. The only seeming neglect was the provision that, after the organization of the university and its endowment by the national land fund, the State should "be under no obligation to contribute to its establishment or support by appropriation."

The public school law, passed in 1847, provided for the schooling of all youth under 21 by a State tax of 1 mill on a dollar, which, with the income of the school fund, was to be distributed to every parish (county) that chose to put itself in contact with the system. It provided that each parish could pass over its own portion of the school lands to the charge of the State. The State superintendent of instruction received the largest salary then paid to that official in the country (\$3,000), with as much additional for clerk hire and incidentals as Horace Mann received annually for all his prodigious work in Massachusetts. The parish school superintendent, elected by a vote of the people, was a salaried officer, at \$300 a year. The district trustees were also elected by popular vote. Mr. Alexander Dimitry was appointed State superintendent of education in 1847, and the new system was launched, like a magnificent river steamer, sailing down the Father of Waters on the crest of a spring overflow that changed the great river to an "inland ocean."

The historians of education in Louisiana date the practical beginning of the new order of public instruction from the change in the schools of New Orleans, between the years 1841 and 1845. The transfer of the College of Orleans, in 1826, to a country parish had left on the ground what was called "the central and primary schools of New Orleans." In the former the academical studies of that period were taught. In each primary school some 50 poor children were instructed gratis. Of all the moneys lavished on the College of Orleans, \$7,000 remained as the capital of the new departure, which a local tax on theaters increased to \$10,000. A general director and twelve "professors" were appointed, and the work again undertaken. The number of beneficiary students was raised, in 1827, to 100 for each of the three schools. In 1828 there were 250 pupils in attendance in all the departments, and \$8,800 had been expended during the past year. In 1831, 245 scholars were reported, and the system was steadily drifting to a pauper school. For the following ten years there seems to have been little improvement. The better-off people obstinately clung to the private, church, family, and neighbor-

hood methods of educating their offspring that largely prevailed in the South until 1865 and in England until a later date. Several hundred thousand dollars had been expended during the thirty-eight years from 1803 to 1841 in the attempt to found something resembling the proper American system of universal education among a people probably more foreign to its spirit and methods than any in the Union. The ideal of the higher education was a term in Paris for that portion of the people of Louisiana still the uppermost in social affairs. The reformed New Orleans schools were somewhat the result of the movement of Horace Mann and Henry Barnard, who were consulted in their organization.

In 1841 a new spirit was infused into the schools of New Orleans by a legislative grant of \$7,500, on condition that the city raised half the sum. One or more schools were organized for each of the three municipalities and one for the secondary education. In 1842 there were in the several portions of the city 300 children in private schools and 2,000 in no school at all. In 1842 the city was divided into three separate municipalities, but the improved facilities offered began at once to tell. The attendance in the public schools rose in one year to 1,000, and by 1844 to 4,000 pupils. It is stated that "the proportion of the pupils to the school population in these schools was as large as in Baltimore or Cincinnati, being equal to St. Louis and New York, and only surpassed in Philadelphia and Boston." In 1844 a single municipality raised by taxation and otherwise \$11,000, and the people of New Orleans were fast learning the fundamental lesson of the common-school system—to put their own hands in their own pockets through the agency of local taxation to supplement the State or charitable aid.

This period, 1842-1845, is noted as the end of the policy that had been adopted by the State for thirty years, of subsidizing colleges, academies, and county schools. The method seems to have been to charter a large number of institutions of learning under church, private, or corporate direction, with a grant of legislative subsidy for a fixed number of years. In the case of the more important institutions, like the College of New Orleans and Jefferson, there were annual gifts of considerable sums. The conditions of the gift were the obligation to school a certain number of indigent children. This policy was pushed with a zeal that testified more to the interest of the legislature and people in the cause of education than to the wisdom of the method of its promotion. The majority, indeed all these seminaries, of whatever degree of merit, were burdened with the same disability. They were all "living from hand to mouth," without permanent endowment, dependent on a capricious student support; the school often little more than the private venture of some enterprising pedagogue. The large number of the schools thus baptized created a strong suspicion of legislative "logrolling;" each locality in the State, through its representative, putting in its claims for a chartered academy, institute, or college. There can be little doubt that there was a fair degree of good schooling through this multiplication of educational institutions, whether in the private school or county academy. But this method of supporting education by State subsidy is invariably ruinous. Thus it ran its race and died of the weariness and disgust of the people, who were stunned by this great clatter of opposing claims and the "thundering in the index" of every new school with a lofty name, the system going out at last in a condition of affairs that left the children without the bread and water of mental life.

It would be beside the purpose of this essay to attempt to give a detailed account of this destructive experiment through a long generation. The historians of the State have given us the names of six colleges, four of which were each, for a brief period, in a flourishing condition, with a promise of permanence. Beside these, fifty academies are named as having existed during a period of less than twenty years. The majority of these no longer exist, or, if their buildings survive, they are appropriated to the uses of the public-school system of the locality. At least \$125,000 had been raised by lotteries. More than \$130,000 had been distributed to acad-

mies in small annual installments. The subsidizing of parish schools had cost the State in thirty-four years \$773,000. The nine colleges "footed up" in the neighborhood of \$1,767,637, and the figures that report the activity of the people of the State in this experiment of giving away public money with small reservation of the power of control over it furnish a very imperfect idea of the result.

The experiment came to an end about the year 1845. The success of the new public schools of New Orleans, under the superintendency of Dr. Shaw, of Massachusetts, sent there by Horace Mann, although they had not been able to reach one-half of the school population, had convinced the legislature that a new departure should be attempted. In 1846 Governor Isaac Johnson, in his message to the legislature, suggested a broad scheme of education, consisting of a university of New Orleans, a seminary of learning, and a system of public schools. The educational committee approved, and, in 1847, as already stated, the first free-school law of the State was passed. It was estimated that there were in the State at the time 29,334 children and youth between the years of 5 and 16. The legal school age was fixed at 6 to 16, while any youth under 21 was admitted to at least three years' schooling. A tax of one mill on the dollar and a poll tax, in connection with the income of the State school fund, were supposed to furnish the financial motor power for the new system. It has already been noted that Prof. Alexander Dimitry, LL. D., a gentleman of undoubted scholarship and a zealous friend of universal education, was chosen State superintendent of schools.

In 1848 the superintendent reports the considerable sum of \$356,230.93 from the mill and poll taxes of the State and the income of school funds. In 1850 692 school districts were reported, with 618 schools and 22,000 children enrolled. In 1852 the number of schools had reached 647, and it was declared that over 50 per cent of the school population was in attendance. There were high schools in nine parishes (counties). In 1861 there were 96,000 educable white children and youth, of whom 38 per cent, and in New Orleans 48 per cent, were reported as in connection with the schools. It should, however, be noted that, with the exception of New Orleans, none of these localities gave the average daily attendance, which is the real test of the condition of the school. This attendance everywhere falls below and, under the circumstances in Louisiana fifty years ago, must have fallen greatly behind the enrollment.

For the nine years from the establishment of the new system of public schools in New Orleans, the advancement had been steady and a success appeared to be assured. In 1841 Hon. Henry Barnard, of Connecticut, had visited the city and the scheme of public education finally adopted was in the line of his suggestions. He was twice urged to accept the superintendency of the system. Probably it was by his suggestion that application was made to Hon. Horace Mann, then secretary of the board of education in Massachusetts, who suggested Mr. J. A. Shaw, of the Bridgewater (Mass.) State Normal School, as a fit person for the place. Mr. Shaw came to New Orleans, and, beginning with the two schools in the second municipality, in 1842, wrought with such vigor, intelligence, tact, and general acceptance that, from 13 pupils, the schools had reached 840 at the end of the first year. By 1850 he had built up a system with 3,155 pupils and 63 teachers. In the first municipality of the city the schools were open in 1844, and from 3 schools, 11 teachers, and 615 pupils, in 1850 reached the number of 12 schools with 50 teachers and 2,010 scholars. In the third municipality, with even a smaller opening in 1842 of 2 schools, 2 teachers, and 110 pupils, we find, in 1850, 17 schools, 21 teachers, and 1,121 pupils in attendance. In the first and second municipalities the system was graded with primary, intermediate, and high schools, established in 1843-45.

These great gains from the feeble condition of public education that had prevailed up to the year 1842 were doubtless largely attributable to the superintendency of Mr. Shaw, who, with Mr. Baldwin as president of the school board, for the first

time placed a system of common school education fairly before the people of the larger cities and more populous centers of the Southwestern States. This success of the free-school system in New Orleans is regarded by the educators of Louisiana as the final transition from the inefficient policy of subsidizing all sorts of educational institutions prior to 1840, to the proper common-school system of 1845-1847, which, in spite of its only partial success, did keep the idea of universal education before the people and educate the State to receive the new departure as the end of all their educational woes, for a permanent policy at the close of the civil war.

Until the year 1842 the State had labored on the plan of subsidizing a succession of schools, really academical, but wearing the title of colleges, and in this vain attempt to build up the higher education hundreds of thousands of dollars had been invested.

With the rejection of this policy in 1842 and the passage of the school law of 1847, began the inquiry concerning the establishment of "a seminary of learning." It was decided that the public interest would not warrant the moving on a line so expensive, especially after a generation of large expenditure and disappointment in this direction. But in 1848 a committee was appointed to consider the subject of a site for the seminary. After four years of the usual campaigning, the legislature secured the amount necessary for the establishment of the "seminary" and selected a plantation near the town of Alexandria, in the parish of Rapides, as the site. In 1853 the bill was passed providing for the founding of the institution. A private estate, fitly named "Pine Woods Seat," was purchased, 4 miles from Alexandria, which, with a subsequent addition, made a generous school estate of 80 acres, valued at \$4,000. The site appears to have been chosen on the principle of the regulation location of the old-time New England country public school-house, as near the center of the State as was possible, with the view in this case also of obtaining favorable water communication on one of the large navigable rivers, which were mainly relied upon for transportation at that date. This parish and the town had also a reputation for interest in education, founded upon the establishment of an academy as early as 1811. From the usual national grant of two townships of land, 80,000 acres, and such additional sums as the legislature could be induced to appropriate, the means of building up the educational support of the seminary were to be obtained.

But it was late in 1857, ten years from the passage of the school law of 1847, when this moderate movement culminated in the appointment of Col. (afterwards General) William Tecumseh Sherman, of Ohio, as president of the new "seminary of learning." The president, at the beginning, seems to have manifested his characteristic energy of administration and undoubted patriotism. In his original address he reminds the students that their seminary is the gift of the Republic. He also took issue at once with the mischievous diffuseness of instruction by crowding the mind with a great array of all the arts and sciences and wrecking the student on the barren shore of mental indigestion or distraction by weighting him with more than was possible for ordinary human nature to endure. As President William Preston Johnston, of Tulane University, more than forty years later declared, President Sherman told the people that there was little fit material in the State even for such an institution as this to set about its studies. Of 71 candidates for the first class, 13 had been rejected as not sufficiently prepared, and the president tells his hearers in his address, "to coerce the institution to receive State cadets who could not read and did not know anything of the studies there pursued would drag it down to a mere common school." The curriculum included the English, Latin, French, and Spanish languages, arithmetic, algebra, and geometry. One hundred thousand dollars was invested in the buildings and the property was estimated at \$136,000. In 1860 \$15,000 per annum was voted as a beneficiary fund for students, and with an income of \$56,000 and an

annual expenditure of \$43,700 the new ship sailed onward, confronting the political perils of 1862.

The history of this institution is soon told. At the secession of the State, Colonel Sherman resigned his presidency, even before he had been able to get his hand fully on the machinery of instruction or discipline. The State seminary was closed in June, 1861; but under a new management it was opened until closed again by the invasion of the Union forces in 1863. At the end of hostilities nothing was left of the institution save the bare walls of the building. In 1865 the seminary was again opened under the presidency of Col. D. F. Boyd, already professor of English literature and ancient languages in an institution at Baton Rouge. After a troubled career of four years, the seminary under financial difficulties staggered toward destruction by the loss of its buildings by fire in 1869. The institution was then transferred to Baton Rouge, where, under a new organization—the State University—it now exists. Up to 1861, 112 cadets had been graduated.

During the troubled period of reconstruction the State government then in power made large appropriations to the university, burdened with the policy of admitting students of the emancipated colored race. In 1872 the legislature refused to make further appropriations and the university, as it was then named, was again suspended. The change in political affairs during the administration of President Hayes, in 1876, brought the institution again into favor with the ruling class. In 1877 it was reorganized by uniting the State University with the Agricultural and Mechanical College in the capital city of Baton Rouge, where it now remains.

The only proper State institution for the higher education in Louisiana from 1845 to 1860 was the university in New Orleans. It was established by the adoption of a private medical college, founded in 1835, the State and city entering into a sort of educational partnership. Between 1843 and 1847 the State University was legislated into existence, with the two faculties of medicine and law, the great Charity Hospital being connected with the medical department for all purposes of professional instruction. In 1850 a chair of political economy and an academical or preparatory department were added to the university, beginning with 40 pupils.

With the exception of an appropriation for buildings, the support of the medical and law departments, and a portion of an estate as a site for the erection of a mechanics' institute, where lectures on scientific and mechanical topics were delivered and a library collected, no great success attended this new departure. By 1860 there were 40 academical students and 113 graduates. The medical department was closed during 1863, 1864, and 1865. Before the war there had been 4,119 students and 1,084 graduates in the medical school. This was the oldest medical college in the Southwest, the third south of the Potomac and Ohio rivers, and the fifteenth established in the United States. The proper university inauguration dates from 1845. The State had contributed generously to the original departments from that period until the close of the war.

The constitution of 1845 provided for the four faculties of the University of Louisiana. The authority was vested in thirteen trustees, with the governor, chief justice of the State, and mayor of New Orleans as ex-officio members, appointed by the governor with the consent of the senate. The department of law was known and noted for the legal talent represented in its professors, among whom Hon. Randall Hunt was conspicuous until his death in 1838. The founding of the legal system of Louisiana on the Roman civil law has always given to this school of jurisprudence an especial eminence in this department of professional education.

As early as 1847 an attempt was made to found the academic department of the University of Louisiana, but the State was estopped by a constitutional provision from the granting of additional contributions, and with the exception of a

few small private schools nothing was attempted. For a time the Rev. F. L. Hawks, D. D., LL. D., was president of the university, and Prof. Geo. C. Anthon, later of Columbia College, New York, occupied the chair of the Greek and Latin languages. The failure of the legislature in 1846 to make an appropriation compelled Professor Anthon to establish a preparatory school. President Hawks resigned in 1849 and Professor Anthon in 1850. The appropriation was continued for four years, at the end of which, in 1850, a full faculty was appointed. In 1851-52 there were 15, and in 1853-54, 13 students. A succession of presidents succeeded and the legislature was persuaded to make a few small contributions for buildings and furnishing. From a feeble existence the collegiate and preparatory departments emerged, about 1860, when there were but 40 students in the one and 100 in the other. In 1861 the institution closed, not to be opened until 1876. It will be sufficient for the purpose of this essay to state that all the departments of the University of Louisiana in New Orleans are now included in the corporation of Tulane University, by far the greatest achievement ever made in the State of Louisiana in the direction of the higher education, and one of the most hopeful and justly distinguished of the new seats of learning that have sprung up in the South since the dark days of sectional strife. Under the able presidency of William Preston Johnston, with an increasing attendance and a very able faculty in all departments, including the admirable arrangement of the Sophie Newcomb College for young women, Tulane University, in its beautiful group of new buildings, enters upon the century with a splendid prospect for its own success and a brilliant prophecy for the educational future of the city and State.

Although the purpose of the present essay is to present an accurate record of the development of the common school under State and local support and supervision in Louisiana, the story would be incomplete without a glance at the common-school environment, especially the denominational religious schools. We have seen that in all the States of the Union, from their earliest colonial or Territorial condition to their present situation as commonwealths, the condition of public instruction has depended largely on the state of public opinion concerning the fundamental question of the right and duty of the different religious bodies to assume the chief, or sometimes the absolute, control over the secular education of children and youth. In several of the foremost of the older States, largely settled and administered by a Protestant Christian population, the establishment of the common school was delayed sometimes well into the present century by the obstinate rivalries of the religious sects concerning what is called "the religious question." They all held in greater or less degree the belief that the school is practically an annex of the church, and should be used as a legitimate agency of sectarian religious propagandism. But in a State like Louisiana, settled and for many generations dominated socially and politically by a population drawn from the Catholic countries of Europe in the seventeenth and eighteenth centuries, it is not remarkable that even to the present day this factor must be considered in estimating the growth of the American system of unsectarian public instruction for all classes and conditions of people, in schools common to all and responsible only to the whole people as represented in the State. It would be manifestly unjust to bring against such communities the charge of indifference to education, or of unusual ignorance among the well-to-do class, on the ground of their long-continued neglect of, or even hostility to, a system of education at variance with the teaching of their church on this point of honest and radical difference of opinion.

While the State of Louisiana, despite a very intelligent and zealous common school public, generally backed by the public authorities, State and national, has never succeeded in achieving the success in the working of a public-school system of the majority of American States, it is also true that few American Commonwealths can boast a more attractive and justly distinguished body of superior

people in all departments of life. This to a degree can be attributed to the fact that within the past century no Southern American State has so profited by the immigration of able and even celebrated people from all parts of the Union and all foreign nations as Louisiana. The present writer calls to mind a private dinner in New Orleans, given by the learned and worthy rabbi of one of the Hebrew synagogues, where the eight guests, beside the host and hostess, represented as many European nationalities, all gentlemen of high personal consideration in the city.

And among the descendants of the original settlers of Louisiana from the Latin nations has been developed one of the most interesting of the many constituents of our cosmopolitan American life. From the earliest period of colonization until the outbreak of the civil war it had been the habit of the superior class of these people to send their sons to Europe for the secondary and higher educational training. Their young women had been to a great extent schooled at home, although many were sent North or even abroad. A complete history of the elementary, secondary, and higher education of this portion of the people of Louisiana would throw light upon the past record of the common school in the State, which is greatly needed for a just estimate of the education of the superior class.

The first of the seminaries established under the auspices of the Catholic Church for the schooling of girls, was founded by the Ursuline Sisters in 1727, and remains to this day one of the most prominent of its class. It has always been under the management of a high grade of teachers, and has aimed to fill out the highest ideal of female culture cherished in this communion. Its influence upon the social and public life of the State can hardly be overestimated. This was one of the earliest schools for young women established in the South; and it may be well questioned if the training therein received in New Orleans, from its earliest settlement, for the class of girls who represented the majority of its people, was not equal to that at the same period obtained by a corresponding class in any city of New England or the older Middle States.

In 1818 the Order of the Sacred Heart established a seminary of that type in St. Louis. In 1831-1835 this work was transferred to Louisiana, and several primary schools were set up in different parts of the State. It should be noted that all these church schools did not confine their labors to the daughters of the better-off families, but labored faithfully among the Indians and negroes, and to a considerable extent, especially in the earlier days of the colony, did hospital duty.

In 1837 the Society of Jesus established St. Charles College in the State and a similar institution in New Orleans in 1847. The latter was indorsed in 1856 by the legislature as a full university, as the College of the Immaculate Conception, under which name it still remains a flourishing institution, with an attendance in 1890 of more than 460 pupils of all grades.

In 1856 the Silliman Female Collegiate Institute was located at Clinton, East Feliciana Parish, under the auspices of the Presbyterian Church, and has retained its importance until the present time. The Methodist Episcopal Church is represented by the Mansfield Female College, in De Soto Parish, founded in 1854, with some assistance from the State in 1855. After a suspension during the war it was revived and is still in successful operation.

The Centenary College was a descendant of a college before mentioned. It dates from the year 1839, and owes its present existence to the zeal of several eminent divines of the Mississippi Methodist Church South. Its present name commemorates the one hundredth anniversary of the birth of John Wesley. First established at Brandon Springs, Miss., in 1845, it was removed to Jackson, La., and set up in the buildings of the College of Louisiana at that place. In 1860 it had reached an attendance of more than 200 students. In 1886 the number had increased to 259. During the war it suffered greatly from the alternate occupa-

tion of the place by both armies, and seems never to have entirely recovered from the wreckage of that period.

Jefferson College was reclaimed for a season from the decline suffered by it abandonment as a State institution. During the years 1862-63 it was occupied as barracks and almost destroyed in its building, furnishing, educational apparatus, and library. In 1864 it passed into the charge of a Catholic order and now exists under the name of St. Mary's Jefferson College. Franklin College, one of the original beneficiaries of the State, is now ruined.

The Baptist denomination is represented by Mount Lebanon University, established in 1853. During the war the endowment funds were lost, with the usual damage experienced from military and hospital occupation. A fire in 1887 completed the wreck and swept away all that had been done since the doleful days of 1861-1865. The institution is now in operation and is one of the few coeducational colleges in the State.

These are only a few of the great number of schools of every grade, private, neighborhood, family, denominational, and corporate, that within the past one hundred years have been so largely the educational dependence of the more favored class of the people of Louisiana. Although but few of any importance survive, the buildings of many are utilized by the common schools of the State, notably one by the State Normal School at Natchitoches, and the city of New Orleans even to the present day occupies a large number. The majority of these schools have labored under the disadvantage of an incompetent ideal of the education of young women. Although often assuming the much-abused titles, college, institute, etc., the majority of them have never risen above the ordinary high-school grade, with a distinct emphasis on "accomplishments," although an ambitious student could often acquire the foundation for a superior training in the classics. The great defect in these, as in the majority of schools of this class, is found in a superficial and pretentious habit of making "art" and "fancy work" of various sorts a prominent feature in the curriculum. But in almost every school of this sort there was found at least one, and sometimes more than one, really superior teacher. Ralph Waldo Emerson advised his daughter on going to a boarding-school "to find out who was the best teacher, and study what he taught." And as every successful student in any institution of learning can usually, like Thomas Jefferson at William and Mary College, trace his first impulse to honest mental work and the love of learning to one man or woman who for the time has been to him the representative of all that is worthy of achievement in the realm of knowledge, we should not underrate the importance of this class of institutions in the past.

The Catholic parochial school system has been an important element in the schooling of large numbers of the original population in the Louisiana territory, and to-day is responsible for the entire school training of multitudes of children in this and other States of the Union. While it has prevented, and still does largely prevent, the complete development of the common school, it has furnished the only opportunity of even an elementary schooling for many thousands of the children and youth of the State, and has been a powerful influence in the moral and religious training of the least instructed class of the white population.

At a later period, until the occupation of Louisiana by the Union Army under Gen. N. P. Banks, fresh from his experience in the common-school work of Massachusetts, the negro population of the State, with occasional exceptions, was left in absolute educational destitution. Even at present more than two-thirds of this people, until recently a majority of the population, are illiterate, after a generation of such schooling as has been possible in this all-out-doors Commonwealth. But of late, largely owing to the influence of several great schools established by the Northern churches, and the support of a State academical and industrial seminary, all of them every year more interested in the introduction of indus-

trial training for both sexes, the prospect for this important class appears to be improving.

The revised State constitution of Louisiana for 1845 provided for a complete system of public education, including free public schools, a "seminary of learning," and a "University of Louisiana," with stringent provisions for the protection of State school funds and a State superintendent of education to supervise this department. In 1852 a second revised constitution, in even more elaborate language, pledged the Commonwealth to the same policy. For sixteen years, from 1845 to 1861, the breaking out of the civil war, the State authorities labored in apparent good faith to translate this beneficent promise into an equally beneficent fact for every parish and school precinct of the 46,301 square miles of the extended area of Louisiana. It is estimated that during this period of sixteen years, while the public schools were in actual operation, the State expended the sum of \$3,840,000 (according to some authorities \$4,890,000) on the upbuilding of the system.

The public schools were supported by the income of the State fund from the school lands donated by the United States (786,000 acres), the taxation of 1 mill on the dollar of all assessed property, and after 1855 an additional poll tax of \$1 levied upon all the white male population over 21 years of age. The appointment of Mr. Alexander Dimitry as State superintendent was an assurance of the intention of the public authorities of the Commonwealth to try the experiment of universal education in good faith.

The number of educable white children from 5 to 16 was estimated in 1845 at 30,000, although the schools were open for at least three years to every white person under the age of 21. In 1847 the revenue available for the schooling of the children and youth was \$356,000. In 1850 there were, by a somewhat loose estimate, 692 school districts and 618 State public schools, with 22,000 children in attendance. In 1852 there were 647 schools outside the city of New Orleans, attended by half the school population from 6 to 16, with high schools in several of the parishes. By 1861 the attendance had declined to 39 per cent of the 96,522 educable children, although in the city of New Orleans 48 per cent was claimed. A superior high school was in operation at Baton Rouge, the capital city. In 1855 it was reported that in 681 school districts 687 schools, in 87 parishes, were in operation eight months in the year, there being 62,682 children in the State between 6 and 16, of whom the average school attendance was 36,000, with 1,000 teachers employed, \$250,500 being expended.

With this flattering record it is not easy to understand why the governor of the State in 1855 could report the public school system as in "an unsatisfactory condition—almost a failure." In 1856 the State superintendent, Dr. Samuel Bard, in an address delivered before the general assembly of the State, declares that more than \$2,000,000 had been appropriated for the public schools since their first organization; yet the fathers of the State had made no adequate provision for schooling the children, and in great measure this large expenditure had produced no effect. He declares that "within the past year, 1855, in 30 parishes 12,000 children attended school and 11,000 did not, there being paid out to teachers \$114,000 from an appropriation of \$142,000." These figures he presents "to exhibit the present operation of the system." It was evident, according to the speaker, that "nearly one-half of the white children of the parishes had not derived any advantage from the system." He urges on the legislature the passage of "a plain common-sense school law, such as could be drawn up by three business men in a short time." He complains that the State superintendent of education is compelled to work "in a sort of cane-brake entanglement of faulty and inefficient laws," and demands that he should have an opportunity to be indeed the head of a working system of education. He urges the training of teachers from "home material," and deprecates the habit of depending for teachers on the North, as they are out "of sympathy with Southern ideas and conditions,"

etc., and suggests for this purpose the establishment of a State normal school, with a model school annex, to create a proper teaching profession. About this time we hear of the formation of a school teachers' association, which seems to have been an attempt to revive a similar organization founded in 1838.

In 1855 Governor Herbert confirms the declaration of the State superintendent that "the scheme may be considered almost a failure. This was predicted several years earlier by men who had made the subject of public education the study of their lives. But their warnings were not heeded. A plan was inaugurated at one session of the legislature and entirely modified at the next. This system was first deprived of some of its legitimate power and of its means of influence. The functions of the body were thus transferred to some other agent, whose labors were afterwards curtailed of their proportions. It is not a system; it is a weltering confusion of chaos."

One has only to study carefully the amazing medley which, under the name of the school laws, in 1855, was sent forth from the statehouse, with the addition of the numerous enactments in behalf of favored localities, with a commentary of the social and material conditions of life in a rural country like Louisiana half a century ago, to understand the deceptiveness of the educational statistics in the department of common-school instruction during those sixteen years. It is almost incredible that, with such a division of responsibility and with so little power for the enforcement of the statutes, anything could be well done, or that the different agents employed could work with any degree of energy without perpetual conflict of opinion amid "confusion worse confounded." The State superintendent of education under such conditions could be only an amiable figurehead, poised on his educational lookout of contemplation over a realm of confused and misdirected activity. A radical mistake seems to have been made by intrusting the most important duties of administration to officials who in other States would be working on a good salary, but these were police justices, county clerks, etc. These persons, already burdened with the duties of their own peculiar offices, could only be held to the additional labor of superintending the administration of a system of common schools by the offer of a competent salary, for which there was no provision. In many cases they might have been personally indifferent or even hostile to the public-school system and would labor with more effect on the line of "how not to do it" than elsewhere.

Between them and the "directors" chosen by the voters of the school districts there must have been an endless opportunity of collision for precedence in administration and a general habit of misunderstanding. The complicated business of the management of the township school lands not under the control of the State was in itself sufficient for a conflict, even among officials of first rate executive ability. When we add to this the environment of the public school, the constant pressure of an ecclesiastical power always and everywhere pledged in advance against the American system of public education, a power which to a majority of the white people of Louisiana was practically a higher law, the sparseness of population, and the strange mixture of peoples, we need not wonder that, with the best intentions and for the time and place a generous expenditure of money, the work of consolidating the people in the support of an expensive system of common schools should have languished until the war came in like "a great flood and drowned them all."

The attempt to treat the history of such a condition of affairs as prevailed in this long period of, maladministration of the common-school affairs of Louisiana during the twenty years, from 1845 to 1865, would be a well-nigh hopeless and certainly unwelcome task. The lack of cooperation is evident at every point. Indeed, it was virtually impossible in a state of society so essentially aristocratic as that of the Louisiana of half a century ago to find that remarkable power of public administration, at once conservative of the best in the past and always on

the lookout for the necessities of the present and the possibilities of the future, which is the marvel of our American republican order of society, and never can be understood save by a people trained in the habit of "working together for good."

One exception to this failure in Louisiana was the success of the public schools of New Orleans, which, under the direction of a capable executive and an able educator, did fairly compass what they set out to do. In 1858 a boys' department was added to the Girls' Public High School of the city, subsidized by a gift of \$5,000, distributed at the rate of \$50 per capita to the students. In 1860 the State appropriation was raised to \$10,000 for buildings, conditioned on the city raising a similar amount, and that 48 pupils selected by the governor were to be admitted free of tuition.

The testimony of the faithful Dr. Lusher, who at a subsequent period acted as local agent for the Peabody Educational Fund in the State and as principal of the Peabody Normal School, is to the effect that these graduates were preferred above others and justified their "calling and election." But after the year 1858 every step in educational reform was a step toward the dark cloud of the oncoming civil war that, in 1860, swallowed up the entire South in a horror of darkness and confusion, wherein everything done for the common school since 1845 disappeared as under the stroke of a cyclone.

The outcome of the twenty years' work of the public school system of New Orleans—from 1841 to 1861—is given in the reports of the superintendent, Mr. William O. Rogers, so long a faithful servant of the people of that educationally afflicted city during the turbulent years of war, reconstruction, and rehabilitation until 1882, when he became an important official of Tulane University. According to this document it appears that, beginning in 1842, with a little group of 13 scholars and 2 teachers, in one schoolroom, under Mr. J. A. Shaw, the attendance increased to 319 in a month and 1,397 at the end of the first year, with an average attendance of 840. From that date the number steadily increased until, in 1859-60, there were 6,083 names on the register, with an enrollment of 3,415 and an average attendance of 3,044, with night schools containing 753. During these eighteen years 12,379 boys and 11,014 girls had entered the schools—23,393 in all.

The system in the first district was graded into district, high, normal, and night schools. Of these, ten were district schools, each district including a department for boys and girls, each school including four grades. As usual, the primary schoolrooms were densely crowded, and the superintendent cried aloud for more and better houses and more ample outdoor room.

Eighty-six boys had been admitted to the high school in 1859-60. The superintendent magnifies the importance, now unanimously acknowledged, of separating the small number preparing for college from the majority who were only taking a period of the secondary education as a preparation for active life, and urges the necessity of a high school building. There were 148 pupils in the girls' high school, which seems to have been organized in a practical way, free from the regulation incubus of Latin as a compulsory study, while the French language was very properly, in New Orleans, made a condition of graduation and promotion. A library and lyceum society had existed in the city since 1844, with a collection of nearly 10,000 volumes; 10,500 volumes had been read during the year, one-half the number "works of fiction." The superintendent of schools was the librarian, and seems to have been working on the same line as the present union of the public library and common school. A night school of 753 pupils and model schools with an attendance of 500 were testimony to the interest in education of the white laboring class. The State Normal School in this district made its third report. The city had complied with the conditions of the State appropriation of \$10,000, by the erection of a building at a cost of \$20,000. One hundred and sixteen pupil

teachers had been admitted, of whom 67 remained through the year. A preparatory class had been organized. The total expense for the entire system of public schools in the city in 1860 was in the neighborhood of \$90,000.

The first report of Superintendent Dimitry, first of the State superintendents, at the end of a nine months' service, gives 23,000 of a school population of 43,000 in attendance on the schools, at an average cost of \$6.21 for the school term. Thirty-nine of the 47 parishes of the State showed 704 school districts, with schools in session during an average term of six months and thirteen days, the entire expenses being \$340,000.

It would be instructive to quote largely from the report of Superintendent Dimitry at the end of the first year's experiment of the new system of general education. He appreciates the difficulties of the undertaking, but "he has never despaired of the cause if it shall be only reasonably fortified against unreasonable assault. With practical fortitude to bear the toil, with intelligent agents to carry the schools through their probation, and means measurably adequate to sustain them in their growth, there is no mistaking the result. Many a day will the friends of education have to struggle before they can get the people to realize the idea that the first of rights is the right of mind and that all others are denominations of this. It is a question between money and mind, the gift of God to creatures fashioned after His own image for incomprehensible destinies." Lofty words and true; a stern and wise summons to the people of any State yet battling in the everlasting conflict of mind with all its enemies.

The chronic weakness of the system of American common schools appears here, as in every State of the Union. It comes from the fact that the system of universal education is so largely conditioned upon the development of an urban as opposed to a rural civilization. In the governments of central Europe a despotic civil power does compel the masses of the people, even in the densely populated cities, to give their children a moderate amount of schooling for the use of the common life of the European subject. In our own land, whose institutions all tend to the creation of an exaggerated individuality of opinion and action, especially in the Southern States, where this feature of society was always most evident, it requires more than laws on the statute book or the most enthusiastic acceptance of educational systems to keep our strangely-mingled populations up to their full duty to their children. Compulsory education in the European form is here a virtual impossibility. Only a degree of popular interest never before attained in any land can suffice for the steady support of a system of free education subsidized by the State and sustained by local taxation. But, on the other hand, the moral and patriotic obligation to do this and the doing it in any degree is in itself a most valuable training of the whole community in the duties of a good citizenship in a republican state. That at the end of the first quarter of a century following upon a great civil war that swallowed up all educational affairs in the 16 Southern States of the Union, the responsible classes of all these Commonwealths have at one supreme effort lifted themselves up to "the height of the great argument" of universal education for all their people, is the best proof that the stern experience of their past half century of school life has not been in vain.

This appeared when, at the first opportunity offered for concentrated public action, from 1865 to 1880, the superior class in every State of the South took up the common school for all classes under the most discouraging conditions and carried it on after a fashion that won the approval of all civilized portions of the earth. The entire expenditure of the State of Louisiana in the attempt to support an adequate system of public instruction from 1847 to 1866, the close of the civil war, was \$4,795,000. Of the large sums voted during the war and the early period of reconstruction a considerable portion evidently did not reach the schools. Adding to this the sum appropriated to colleges and academies and other secondary

institutions, the entire sum expended for thirty years reached the amount of \$16,450,000. We must remember that this was in the day everywhere of comparatively small expenditure for public education. We can not withhold the testimony to the public spirit and zeal of the people of Louisiana in the cause of universal education. In New Orleans in 1860 the salaries of teachers in the public schools were well in advance of the majority of cities in the Union, \$2,280 for principal of high, \$1,500 for master of a grammar, \$1,020 for several lady principals, and \$600 for women assistants. Well might President William Preston Johnston, of Tulane University of Louisiana, in his able address on "Education in Louisiana" before the National Association of Teachers, in 1886, say: "The scattering of resources is really a squandering of public funds, and means waste and ruin, while concentration insures strength, stability, and ultimate success. It would be hard to find a more pertinent illustration, and the lesson has its value elsewhere than in Louisiana."

Mention may be made of the singular misappropriation or absolute waste of several large benefactions. Several years ago Hon. Randall Hunt, of New Orleans, read an address upon the subject of these large gifts which had been left to the State of Louisiana and the city of New Orleans. The record was a startling history of the loss of great benefactions and the strange neglect and misuse of golden opportunities for the children and youth. Beginning with gifts of houses and lands during the first years of the colonial life of the country in New Orleans, an illustrious company of benefactors could be named.

Julian Poydras, in 1838, established the Poydras Academy in Pointe Coupee Parish. The sum donated is not given, but it was amply sufficient for the additional support of two primary schools in each ward of the city. In addition to this Mr. Poydras established an orphan asylum. Both these institutions are in operation to-day.

Alexander Milne, a native of Scotland, left in 1839 a large amount of real estate in New Orleans to found an asylum for white orphan boys and girls, of which no trace remains to-day. He also founded a school in his native place in Scotland, which has been cherished and is still a reliable seminary of the secondary type.

The most munificent gift to the cause of education, perhaps the largest single benefaction of the sort in the country at the date, was found in the will of John McDonogh, who died in 1835 in New Orleans, leaving behind what was estimated as the largest fortune in the Southern States, for purposes of general education and charity. John McDonogh was born in Baltimore, Md., in 1779. His parents were Scotch people, in very moderate circumstances, but evidently persons of strong character and unusual intelligence. They gave to the boy such schooling as was at hand, and especially a love for music, which he says "acted as the charm of my existence, and was in many ways essentially the source of the little religion I possess." At an early age he was put to work as a commercial clerk in a house concerned in large American and European transactions. In 1804, as the result of two voyages in the interest of his employers to New Orleans, he settled and lived there until his death, in 1850, at the age of 71. In commercial pursuits he amassed what was then regarded a great fortune, and was reported as living in "magnificent style," a notable character in society, as early as 1809, at the age of 30. He served in the defense of the city under Gen. Andrew Jackson in 1815, and in 1819, at the age of 40, removed to a plantation on the "shore" of the Mississippi River, opposite New Orleans, where he lived in great seclusion, indulging his personal humors, with many of the eccentricities of bachelor life, until his death. He is said never to have passed a night in the city after this removal, and every morning was rowed in his skiff by his colored servant across the broad water to attend to his business in town. His later occupation was the making and caring for his real-estate investments in the growing metropolis of New Orleans and in various other favorite localities. His correspondence with learned

men in the country was extensive, and he was a frequent contributor to the press. He never married and had no heirs at law in whom he was especially interested. In his will he left a small estate in lands to the children of a sister; he emancipated his slaves and gave to each a Bible, and made arrangements for a free passage to Liberia, with a direction of how to get a living when there.

The remainder of his widely scattered property he bequeathed, in equal portions, to the city authorities of New Orleans and Baltimore, for the establishment of free schools and institutions, where the poor of all classes and both races should be educated, free of expense, in the common branches of an English education, with a proviso that the Bible should be always used as a principal reading book in all the schools. The will provided that none of his real property should ever be sold, but be loaned to good tenants for a period not to exceed twenty-five years at a time in order that all his possessions might be concentrated in a permanent fund to be forever appropriated to the cause of education. One annuity was reserved of \$25,000 a year to the American Colonization Society for the colonizing of free people of color during forty years in Africa. A second annuity, one-eighth part of the net yearly income from his entire estate, was to be paid annually until the entire sum was \$600,000, for an asylum for the poor of both sexes and races. A third annuity of one-eighth of all the yearly income of his estate was given for an institution for the relief of destitute orphan boys to the extent of \$400,000. To his native city, Baltimore, he bequeathed one-eighth of his estate, to the extent of \$3,000,000, for the establishment of a "school farm" for the use of poor male children, first in Baltimore, afterwards in every city and village of the State of Maryland, then in all the chief manufacturing cities of the East, the recipients to be of all classes and conditions of children and youth from 4 to 16. The pupils were to be supported in the institution, given a good English education, taught agricultural and mechanical trades, and instructed in the Bible and the Christian religion, the school farm, after forty years, becoming the residuary legatee of the asylum fund. After the lapse of the other testamentary funds all the property was to be concentrated in two grand portions for the education of the poor children of Baltimore and New Orleans.

During his thirty years of reclusive residence opposite the city Mr. McDonogh fought hard in various ways with large numbers of people in the city. He complains, in his will, that "every man's hand is against him," and draws up his severe indictment of a popular desire to plunder, harass, and generally insult him. But he writes that he leaves behind money enough to educate in the knowledge of the Lord and in the schooling of a good English education, if possible, every poor child in the States of Louisiana and Maryland.

The list of his estates thus bequeathed to the holy cause of education, if reliable, would seem to indicate a fortune larger than any man at that day possessed in the South, perhaps larger than any estate in the country. The bulk of it was in real estate, estimated by himself at a large future valuation, founded on his expectation that New Orleans "would become one of the greatest cities of the world." If it could have been collected and administered in the way he had anticipated, his anticipations might have been realized: "A huge mountain of property that would yield its increase to the honor of God and the benefit of generations yet unborn through all ages of the world."

But this grand benefaction suffered the fate that befalls so many magnificent schemes of public philanthropy, of which more than one example can be quoted to-day. A cloud of contestants rushed to the assault, and what with boundless litigation, the claims of defective titles, the popular clamor over his personality, and possibly a jealousy of his including the colored race in all his bequests, the wreck of the vast estate was almost completed. The result of several years' contention was that \$1,500,000 was finally passed over to the cities of Baltimore and New Orleans. It is estimated that a fair treatment of the property would have

realized \$10,000,000. From what is left the city of Baltimore has established an institution of the kind indicated in the donor's will. The city of New Orleans realized a fund of \$750,000, from which eighteen public schoolhouses had, up to 1898, been erected, with a fund estimated at \$1,800,000. An asylum for white orphans has also been built up from the remains of the McDonogh and Milne funds.

The popular opinion of the wreck of an immense estate is, however, believed by well-informed authorities to be not well founded. The estate is said to have been greatly overestimated by the owner, its value depending on the optimistic dream of a metropolitan greatness of New Orleans that never came. The plan itself, it is believed, was impracticable and so complicated and weighted with impossible conditions that it could never be executed, and in consequence it went the way of all exaggerated and romantic bequests conceived in the dreams of a recluse.

One result of this benefaction, which bears on its face the impress of the consecration of its donor to the cause of universal education, though hidden from him, has in a way come near the accomplishment of his benevolent intention. The school system of New Orleans, for which so much had been attempted in its earlier days, during the years following the civil war was so depressed from various causes that its most intelligent and devoted friends anticipated the most serious damage to the cause of free education in the city. It is not impossible that the provision of the present McDonogh fund, which resulted in the building of eighteen common-school houses of a style that attracted crowds of pupils and kept the schools before the people, was a very decided element in the final turn of the tide in the cause of public education in that great city, now, after many years of trial, apparently once more embarked on the flowing sea of industrial prosperity. One of the most attractive features in the condition and spirit of public-school affairs in New Orleans, as noted by the author of this essay in a visit in the spring of 1898, was a revival of interest in the memory of John McDonogh among the entire population of the city. In the schoolhouses bearing his name his portrait was everywhere present, often framed in evergreens, with a perpetual gift of flowers supplied by the children. His birthday is now observed with beautiful ceremonies, his biography read by the pupils of the schools, and a fund is being made up by the contributions of the scholars of all schools and both races for a monument, to occupy a conspicuous situation. The change from the old estate, in which the lonely man, writing his will, declares that "every man's hand is against him, while the children follow him in the streets with perpetual annoyance and insult," to the spectacle of to-day is only another proof of the fact, too often forgotten by the benefactors of the coming generation, that, with all its follies, failures, and depravities, our human nature never forgets those that trust in its essential rectitude. "The righteous are held in everlasting remembrance."

Other bequests of a similar character for the city of New Orleans might be noted, though somewhat apart from the purpose of this essay. The last of these large bequests has been the gift of Paul Tulane, a native of New Jersey, for many years a resident of New Orleans, which, united with the bequests of Miss Howard and Mrs. Newcomb, both of Northern descent, though for many years residing in the city, and the later bequest of Mrs. Richardson to the medical department of Tulane University, have resulted in the absorption of all the departments of the University of Louisiana in the present Tulane University, of which the Sophie Newcomb College for young ladies is the female department, as far as the university course, to which its graduates are admitted on equal terms with young men. This noble foundation can hardly fail to realize the uttermost expectations of the educational public of Louisiana from the beginning. The united gifts of Paul Tulane and Mrs. Newcomb possibly already have reached the sum of \$5,000,000. By the depreciation of real estate in New Orleans the institution has been able to place itself in probably the most attractive groups of university buildings in the South. In thoroughness of instruction, the ability of its faculty, the breadth and

adaptability of its curriculum, the fame of its professional departments, and the well-deserved distinction of its late president, William Preston Johnston, it leaves nothing to be desired except the hearty appreciation and cooperation of the State for its great success. Although the university was established in cooperation with the State, its present organization as a private corporation removes it from any dangerous complication with the ups and downs of State or municipal politics, while its unsectarian religious platform and hearty sympathy with the public-school interest of the city and Commonwealth give to the people the assurance against any narrowness or exclusiveness in its administration.

Especially in the departments of natural science and its application to the leading industries of the State, of the higher industrial, artisan, and artistic training of its students of both sexes, its broad and generous education in the English language and literature, its vigorous development of university extension through courses of popular lectures and instruction of classes outside its regular student body, it has already proved itself a model people's university. One of its most valuable services to the city has been the gathering of an excellent library, reading rooms, and a museum. In connection with the munificent gift of the Howard family for the establishment of a valuable institution for general study and consultation, the city of New Orleans has now, for the first time, a thoroughly organized public library, steadily increasing in value.

The difficulties that have hitherto beset the establishment of the public-school system of the city seemed in 1898 to be overcome. Under the efficient superintendence of the Hon. Warren Easton every department of the common schools for both races was firmly grounded and making decided progress. A new feature is the revival of the former normal school for teachers, with a broader administration and superior opportunities for a practice department. The arrangements for the secondary, higher, and industrial education of colored youth in the State institution and several valuable seminaries supported by the Northern churches are amply sufficient for all reasonable requirements of the city, with large attendance of students from all portions of the State.

Altogether it can be said with truth that in no State of the Union has the intelligent and persistent determination of the educational public to extend the blessings of the American common school to its entire population been more conspicuous than during the long period, covering nearly an entire century, since the acquisition of the territory of Louisiana by the United States. Nowhere have the difficulties and complications of nationality, race, and religion been more serious and apparently insurmountable, and nowhere have the "staying qualities" of an educational public of the American type been more apparent, and nowhere apparently more destined to be crowned at the opening of the new century with permanent success.

MISSOURI.

The loud call of the far-away Republic of Texas for free schools for the children, which resounded through the corridors of the legislature of Massachusetts, the foremost common-school Commonwealth in the inauguration of the great revival of popular education from 1835 to 1860, was followed by the State of Missouri. In 1839, two years after the election of Horace Mann as secretary of the Massachusetts board of education, the State of Missouri enacted its first school law, under which it has gone on "from strength to strength" during more than a half century to its present high distinction in the cause of universal education. This revival of 1835-1860 was not the monopoly of any State, even the States of New England, which first became conspicuous in it. It was a great and widespread

uprising of the whole American people in behalf of a more effectual system of educational training for American citizenship.

Through the first half century of the Republic, until 1830, much had been done in the way of disseminating information, collecting materials, and making various experiments in the direction of the best methods of educating the whole people. The result was that in the most favored school commonwealths the conviction was the strongest that a radical reform, especially in the organization, support, and supervision of common schools, was imperative. The entire group of the Northern States was moved in accord with the heroic labors of Mann, Barnard, and their associates in the old Northeastern States. Even the Southern States, that hitherto had resisted the appeals of their own most eminent statesmen and educators for a more extended schooling of their white population, were profoundly stirred, and in several of them efforts were made to bring the people and legislatures into line with the general movement of the country. In some cases these efforts were not without success; in all cases they were really a step forward, by a considerable body of their people, for better things.

We have already shown to what extent this invitation had been responded to in all the States of the South. It remains to put on record the action of Missouri, one of the most characteristic of the new States of the Union, in this direction. The preliminary steps by which this State paved the way for definite action, from 1820 to 1839, have already been detailed in a former essay by the present writer. The real common-school history of the State of Missouri began in 1839, when the first law for the establishment of a system of common schools was put upon the statute books.

At this date there would seem to have been the most ample provisions for the support of an effective scheme of public instruction, from the generous donations by the National Government of large areas of public lands, made in 1820, on the admission of the State to the Union, and during the subsequent years by important additions. In 1839 the public funds for the support of a complete system of common schools, including a State university in Missouri, were:

First. All past and prospective moneys deposited with the State by the act of Congress of 1836, commonly called the distribution of the surplus revenue.

Second. The proceeds of all school and other lands vested in the State by escheat, purchase, or forfeiture for taxes, with all the interest, dividends, proceeds, and profits of such moneys and lands. All these were known as the "State school moneys."

Third. The county school funds, consisting of all moneys that should be paid into the county treasuries for the use of common schools on account of fines, forfeitures, or otherwise. These were known as the "County school moneys."

Fourth. The original sixteenth section public lands, distributed to all the new States after the admission of Ohio to the Union, retained by the different townships, of which the sixteenth section was a component part. All these, with their income and the forfeitures and fines enforced for waste, trespass, or other causes, constituted a fund, denominated "the township school fund," for the use of the township to which it belonged.

The State fund had been so administered that there could be only a distribution of 60 cents per capita to the 50,000 children and youth between the ages of 6 and 13 in 1840. What were the additions from the county and township funds there seem to be no means of determining.

If the question of "The school in politics" were to be determined by an attempt to comprehend the intricate and political relations of this remarkable school law of 1839, we fear that a somewhat mythical personage, the educational politician, would find less favor than at present in the eyes of "the plain people." The school law of Missouri in 1839 is intolerably prolix, and seems constructed on the principle that common intelligence and honesty were so rare commodities in Missouri,

twenty years after it had emerged from its experience as a savage territory, that every act and device of a public-school official should be surrounded by a thorny and exasperating environment of preventives and defenses. Nothing could have been so sure to invite reaction among the friends, and furnish abundant satisfaction to the enemies of a common-school system as a statute of this quality, requiring the professional training of "a Philadelphia lawyer" for its comprehension and an omniscient court for its enforcement.

In brief, its provisions were—

First. The determination of the school fund of the State, as already noted, and the direction of the legislative and executive power of the State as the guardian and dispenser of its bounty to the children.

Second. A State superintendent of education, to be chosen by the State legislature and commissioned by the governor, to hold office for two years.

Third. The governor, attorney-general, and State superintendent of schools were made a board of commissioners for the management of the State school fund. A portion of the stock of this fund had already been invested in the Bank of Missouri.

Fourth. The sum distributed from the State fund should not exceed 60 cents for each child in the State, from the ages of 6 to 18.

Fifth. No township or school corporation could receive State moneys unless supporting a school of three months in the year by a qualified teacher.

Sixth. The moneys remaining after the general distribution should be added to the principal of the fund.

Seventh. The salary of the State superintendent of schools, for the vast labor of organizing and supervising the common schools of a commonwealth 70,000 square miles in extent, with a population in 1840 of 388,702, of whom 58,240 were negro slaves, with a very imperfect appreciation among the people of the meaning and functions of the common school, was \$600 a year.

Eighth. Each Congressional township was constituted a school district, which, in educational affairs, was subject to the county court, which exercised the general executive educational power, and used the common county officials as its agents.

Ninth. This county court managed the county and township school funds and had the power of loaning them, at a legal rate of interest, for a fixed term of years. When a school township was organized, the court, by the agency of the county officials, distributed the respective moneys from the income of the township, State, and county funds.

Tenth. The township was authorized to elect a commissioner and two to four inspectors of common schools, and a township clerk, this board constituting the school directors of the township. This local board should divide the township into a convenient number of school districts and apportion the township moneys among them, the conditions of the distribution being that each district should maintain a school of three months with a qualified teacher. The commissioners were the custodians and distributors of the township funds, and in case the funds were not used, they should be returned to the custody of the county court. These directors should report to the county clerk all needful particulars of the condition of the schools. The commissioner and inspectors of the township should examine teachers. All these officials were surrounded by an almost impenetrable fortress of rules and regulations concerning the faithful performance of their duties and the penalties of failure, and a fine of \$5 was exacted of any man elected as a school official who refused to serve.

Eleventh. Every school district should be furnished with a complete outfit of officials, consisting of three trustees, a clerk, and a collector, elected by popular vote. The district majority of voters could raise money by a tax on the people for the building and care of schoolhouses; also had the choice of the site; the tax not to

exceed 50 per cent of the amount of taxes imposed by law for State purposes. This body of local trustees should have power to hire teachers and fix their salaries, to establish schools for four terms in the year, and to fix a rate bill to cover the expense of the schools above the sum donated from the State fund. Each person sending a child to school should be assessed for a due proportion of the fuel used in the schoolhouse. The trustees should report to the directors of the township. All these local officials had the right of appeal to the State superintendent in any case affecting their administration.

Twelfth. By action of the county court, all towns and neighborhoods to which the United States Government granted special donations of school lands in 1812 might be incorporated for school purposes. Their school affairs should be under a board of five to nine directors, elected by the qualified voters of the place, who should have entire control of the educational affairs of the corporation. The city of St. Louis was especially authorized to conduct its educational municipal department under the direction of "the board of president and directors of the St. Louis public schools."

By an amendment to the school law in 1841, the power of appeal to the State superintendent of education was taken away and given to the county court. In the same year the office of State superintendent was abolished and his duties added to those of the secretary of state, with an additional salary of \$300 per annum. By an amendment in 1843 the sum distributed by the State must be limited to \$1 per scholar, and the moneys not called for must be reinvested.

It can not be a surprise that the second report of Superintendent James L. Minor presents the facts in the response made by the people of the State to this elaborate and exhaustive statute. In the introduction to this report, November 30, 1842, three years after the passage of the law, the superintendent says: "I regret that I have not the satisfaction of reporting to the legislature the fact that our system of common schools has been adopted generally through the State. The citizens of some counties have good schools under the provisions of our law, and have availed themselves of the advantages which it offers. But with many others a lamentable indifference, and in some instances a decided repugnance, to the system have been manifested, which have had the tendency, I fear, to retard, so far as the influence extended, the progress of general instruction." He acknowledges that objections have been made to the law itself as a formidable obstacle to the desired progress in education. "Its length, the number of officials which it creates, and the complicated detail of duty which it imposes" have been urged against it, as well as the sparseness of our population and the freshness of our country and the migratory and unsettled prospects of our people.

The superintendent devotes a good share of the middle space of his report to controverting this impression, and proving that the law is especially adapted to meet the present and future needs of the rapidly increasing population of the State. But the results of the three years' experience do not seem to justify his contention. Of the 52,000 persons of school age in Missouri in 1841 only three counties, containing 4,774 children, organized schools under the law, and they were attended by only 2,741 pupils. The State school fund had reached the sum of \$558,032.91, and the income available for distribution, at the rate of 60 cents per pupil, was \$19,531.15. Of this, in 1841, only \$1,999.60 was appropriated; leaving \$17,531.54 to be reinvested as an increase to the permanent fund of the State. The superintendent argues strongly against the policy of piling up the general fund while the sum appropriated is such a pittance as to discourage the friends and confirm the foes of public education. The largest amount given to any school district was \$49.20 and to any township of several districts, \$134.40. He says that the sum distributed should be raised to \$2 per capita. The superintendent not only bewails the lack of competent teachers, but he pointedly adds the uncertainty of their compensation, and the consequent want of respect in which they are held

by the community. The habit of loaning the county and township school funds was bearing its legitimate fruit. "In many cases the interest on this loan is paid very irregularly, and in some counties scarcely paid at all. Very little certainty exists in relation to any payment of the teachers from the State, and the chief source of dependence is the voluntary subscription of the patrons of the school, and the interest of the school fund frequently becomes merely a perquisite." The uncertainty of the payment of dividends on the State funds by the State Bank was so great that "assistance from the State seldom enters into the estimate of the salaries paid to the teachers." In general, this form of investment seems to have been characterized by "a total want of all calculation upon the probable operations of the bank. The air is full of high-sounding plans for the better management of these funds; all meaning that a great number of people desire to get their hands into this great pile of public money." The superintendent urges the legislature to hold fast to the present law and push to the uttermost all the opportunities for its more thorough enforcement.

The third report of Superintendent Minor reaffirms the apprehensions expressed for the safety and protection of the State school funds. Although in 1845 the fund had increased to \$600,000, the State Bank, in which it was invested, had failed to pay dividends. The legislature of 1844 had enacted that only \$1 should be appropriated for each pupil. But the failure of the bank to declare a dividend had thrown the school authorities back on the residue of the dividends left unappropriated in the treasury by the superintendent on the 1st of January, 1842. This failure was even more critical than any before. The total amount distributed by the State in 1843 was \$3,043.80, in the ratio of 60 cents to every child from 6 to 18. The amount available for 1844 would be only \$11,892.42 and in a ratio of 54 cents to each child. Meanwhile the number of children in the schools had increased from 6,192 in 1842 to 12,652 in 1843. The counties which had accepted the system were 28 in 1842, and, in 1843, 42 of the 77 in the Commonwealth. The superintendent urges the removal of the general school fund from the State Bank and the reinvestment in State stocks. He also urges the division of 500,000 acres of land donated to the State for internal improvement, which will furnish a very insufficient sum for any important movement in this direction—to the cause of popular education. By the combination of these funds he maintains that the sum of \$1,200,556.46 could be reorganized as a State educational fund, at 8 per cent, invested in State securities, which would give to every school child from the State 76 cents. The township funds from the sixteenth section lands should further increase the sum by \$2 for each child of school age. This sum, \$2.76, says the superintendent, "would relieve the parent from the whole expense of education, except the board of the teachers, which would impose a very slight burden." He also urges the establishment of a State normal school for the instruction of teachers.

There is no more convincing argument for the American common school than the fact that, when the people of any American State have for even one year had experience of its benefits, it has been impossible, save by a revolutionary crisis like the great civil war, to abolish it or permanently impede its progress. Notwithstanding the discouragement of the first six years of the experiment in Missouri, the fourth report, November, 1846, signed by Falkland H. Martin as State superintendent, shows a decided advance. "Although," he says, "our school system is still in a state of incipency, and must retrograde unless it is cherished by the watchful solicitude and permanent interest of the general assembly, yet, up to the present period, the public expectation has not been disappointed." The superintendent is able to report the satisfactory information that "considerably more than half the counties of the State have proceeded to organize and report to the public officials. In two more years the State school moneys will be appropriated to the children in every county in Missouri." In 1845 \$16,481.70 was distributed among

31,695 children of school age—6 to 18—giving the sum of 52 cents per capita. In 1846 \$23,702.02 was distributed among 40,896 children, 6 to 20, at 58 cents per capita. But as the procession of the children increased in number, the per cent of the distribution of funds diminished; \$20,148.38 available for the army of children 50,000 strong being practically less than before. The radical difficulty seems to have been that the State school fund, then amounting to \$575,000, was invested in the Bank of Missouri, which paid only occasional dividends, at $3\frac{1}{2}$ per cent, amounting to only \$110,000 for the six years of the operation of the school law, whereas at 8 per cent, then and there a reasonable rate of interest, the schools would have received an income of \$300,000. The superintendent urges the legislature to remove the funds from this financial prison house and liberate the bounty provided by the General Government for the enjoyment of the whole people. He also emphasizes the suggestion of his predecessors, that the 500,000 acres of land donated by the General Government for internal improvements, having been divided among the counties by legislative act, will at best afford \$6,000 to each, not enough to build a court-house, and urges their diversion to the State educational fund. He also renews the plea for a State normal school. The original school law of 1839 had proved to be a formidable hindrance to the cause of universal education. "It is," the superintendent declares, "much too complicated. In order to understand it sufficiently well for the most ordinary transaction, a thorough and elaborate study is required, demanding a larger share of the time of the various officers (all of whom render their services gratuitously) than can well be spared by them. Many of its provisions are so conflicting as to be utterly irreconcilable." He urges "a thorough and complete revision."

In 1845-1847 the general assembly reenacted the school law of 1839, with a large number of amendments and a few important additions. Among the latter was one altogether in the line of progress. By the statute of February 11, 1847, the school moneys of the State were ordered to be distributed among all the children and youth between the ages of 6 and 20. Superintendent Martin, in his report of 1848, shows that in 1847 \$48,579.78 was distributed among 55,204 children, 88 cents per capita, although the revised law indicated \$1 per capita as the sum to be appropriated. In the appropriation of 1848 all the counties save six were included. In the 542 municipal townships the justices of the peace, empowered by the revised law to make the enumeration, reported 142,398, an increase in one year of the school population of 90,294, exclusive of the children in the towns which had received special grants of lands from the General Government and were operating schools under local authority.

Under these conditions the sum received per capita would be less than half the previous appropriation. Another year would finish this game of working at cross purposes, which had been the point of chronic weakness in the action of the general assembly. The superintendent declares that in 1849 200,000 children will claim a share in the distribution of the State fund, and the number will increase in accumulating ratio as the years go on. "Unless the State school fund is in some way largely increased in a very short time the amount received by each child will be too small an inducement to keep up the organization which alone can entitle them to the use of the money. Unless prompt measures are adopted on this subject the system itself must gradually decline." He again emphasizes the project of securing what is left of the internal improvement fund, now being distributed in the characteristically shiftless way by which those precious gifts of the General Government were often wasted, as an addition to the school moneys. The revised school act of 1845 is said to have so reduced the responsibility of the State superintendent that he could not be supposed to know more of the actual condition of the public schools of the State than any active citizen interested in the subject. The tendency in all the States of the South at this period to divert power from the State in favor of the local governments, in

this case had made the State superintendency of education a practical impossibility. The superintendent calls attention to the condition of affairs in the years 1845-1847, and once more urges the establishment of a State normal school. The ratio of appropriation in 1848 gave but 40 cents to each child between the ages of 6 and 20.

The new secretary of state and superintendent of common schools, Hon. Ephraim B. Ewing, in the sixth biennial report, December 30, 1850, takes the educational bull vigorously by the horns. He shows that in 1850 the income of the State fund \$27,750.52, apportioned among 173,447 children, gave to each only 16 cents. The Bank of Missouri continued its disappointing career of making only occasional dividends. The estimate for 1851 gives \$64,000, to be appropriated among the children of all save five delinquent counties. A new flirtation with the school law had fixed the minimum school age at 5 years. The revision of 1847 had made it impossible that the State superintendent should be able to collect reliable statistics of public education. His attempts to interest the county authorities to make reports had confirmed Washington's favorite declaration, "Influence is not government." Only half the counties had responded to his request. A vigorous guess estimated the townships and school corporations at 900, with 1,600 school districts. The secretary insists on the necessity of the reinstatement of the State superintendency, clothed with power to obtain the statistical information needed for the proper administration of the system, and a supervision of the involved local machinery. He insists that the number of supervisors should be reduced to one county and one township superintendent, with full power to act in cooperation with the State superintendent.

An inquiry into the condition of the township sixteenth section fund revealed the fact that the amount donated in this way to townships was 1,132,920 acres, of which 531,883 acres had been sold for \$727,000, leaving 551,037 acres unsold, valued at 87½ cents per acre. This, added to the sum already realized, would give a State fund of \$1,206,755. There was a great difference in the value of the township lands, some being of good quality and furnishing an income sufficient to educate the children, while others were almost worthless. The county school funds seem to have been of little account, the moneys belonging to them being often appropriated to the general purposes of county expenditure. The school lands granted to the State were 40,000 acres, of which 31,000 had been sold. On the State school fund of \$575,000 there had been realized in eleven years \$342,172.41, an average of \$31,106.53 per annum.

In short, the chronic failing of many of the new States, acting on the fallacious theory of magnifying local and distrusting State superintendency, seems to have culminated in 1850 in Missouri in a condition of affairs in which the entire system of public instruction was brought to the verge of ruin through the lack of sufficient funds to meet the increasing demand for free public education, a scheme of "making bricks without straw" that wrought the death of many a well-constructed scheme put on the statute books of State and nation for the promotion of the "general welfare."

A small beginning had been made by the statute appropriating \$1,000 a year for the establishment of a department of pedagogics in the State University, which had been established in the village of Columbia, Boone County, in 1844, by the combining of \$177,900 from local sources with a sale of seminary lands, which had yielded \$70,000. It was asserted that in this sale the State authorities "traded off," for less than \$100,000, lands now valued at \$4,500,000, and emphasized the act by refusing for twenty-five years to grant the university any support. The superintendent exposes the infamy of this scheme for capturing the trust funds of the State, and indorses in full the suggestion of his predecessor in favor of a general normal school, with the added recommendation of the State teachers' institute.

In conclusion, he indorses the statement of his predecessor, that after ten years

of experience "the school system was complicated to such a degree as to render many of its legal provisions almost unintelligible, and greatly to impair its usefulness." In addition to this, he notes "the want of a faithful and vigilant supervision and inspection of schools and suitable methods of insuring the success of teachers." All the early schemes of the new States for the improvement of the teaching force, owing to the unwillingness of the people to impose more stringent methods, seem to have reacted with redoubled force on this State.

The superintendent sets forth with great cogency the argument for an effective State, city, and township superintendency of education, each concentrated in one person "with power to act." He closes by showing that the entire available school fund of the Commonwealth—State, city, and township—can not amount to more than \$1,800,000, which, with an annual income of \$150,000, would give every child of sufficient age but 75 cents per annum, and the steady increase of population would only add to the deficiency. In this report the assertion is made for the first time that during the eleven years of the existence of the common school system no responsible public official had plainly revealed to the people of Missouri the extent to which their great gift for universal education was being hampered by the action of the legislature, under the influence of political and financial theorists, who, in the endeavor to favor everybody and allow to every citizen the largest private freedom, so weakened the central power of the State that nothing but confusion and disaster could be expected in a cause so dependent on wise administration as the education of the children of a great and rapidly growing Commonwealth.

In the seventh report, January 6, 1853, Superintendent Ewing does little but reiterate the substance of his former contention, in even more eloquent and convincing terms, at greater length, and with an earnestness, directness, and force so decisive that it was evident that the State had found the first official who had comprehended the height and depth and length and breadth of this great public interest.

In 1853 there was appropriated \$58,411.08 among 193,840 children—30 cents per capita in all save five or six of the counties of the State. The impossibility of obtaining reliable statistics, with no power to command returns, the wasteful use of the public moneys as manipulated by the numerous local officials, the lack of expert supervision, the fearful incompetency of teachers, and the startling fact that from the entire fund, State and township, the children could obtain only 38 cents per capita, and that "the whole income accruing from this fund at the highest rate of interest would be sufficient only to support a three-months' school for a tenth of the present educable population of the State," was a revelation indeed to the educational public of Missouri. In the 56 counties from which statistics had been obtained it was ascertained that of 64,000 children more than 26,000 were not attending school, and a large population received instruction in no school whatever. The superintendent squarely faces the conclusion that taxation is the only remedy for the present unsatisfactory condition in which all the people wish to educate the children, but do not realize what universal education demands from an American Commonwealth. The superintendent urges the privilege and obligation of public taxation as the only way out of the present dilemma, which is rapidly passing over from a popular delusion to a public disgrace.

The report of J. W. Henry, "late superintendent of common schools," in 1854, is a decided falling off from the public declarations of his predecessors. He seems to have almost no effective "grip" on the work he was set to do, and in his general information concerning education in Missouri he appears to be "all at sea." The number of children of school age in the State is estimated at 203,658, of whom only 67,924 had attended the common schools during the past year. The superintendent concludes that at least 67,000 children had attended no school at all. While he seems to believe the legislature has made a liberal provision for the support of the common schools, he goes off into an eloquent arraignment of the indifference of the people to a system of public education supported by an expen-

diture of 30 cents per capita. There is a disparity in the supply of schoolbooks, the local commissioners of each township school system adhering to their own ideas. He pleads for an increase of the salary of the superintendent, who by law is required to visit 103 counties annually and deliver an address in each, and denies the usefulness of such an address, "which would be listened to only by a few literary men of the town." The act of 1849, requiring the State University to establish a department of pedagogics, had never gone into effect, and probably "can not be accomplished without further legislation." In short, the Commonwealth of Missouri had not yet recognized its practical leader in the cause of universal education, although more than twenty years had elapsed since the great note of progress had been sounded on the far-off Atlantic coast by the "grand commanders," Henry Barnard and Horace Mann.

But the period of awakening was at hand. The seventeenth general assembly had reestablished the office of State superintendent of education and located it at the seat of government in Jefferson City; a room in the capitol building had been assigned and the records of the educational department removed to it. But the new superintendent of education, Hon. E. C. Davis, turned to the archives of the State for statistical information and found himself disappointed. Although the State had established a system of public instruction in 1842 and during the thirteen years of its continuance had expended \$1,000,000, independent of large plans and professions, yet, writes the superintendent, "we can boast of no educational statistical materials upon which to base a system or to aid the department in the discharge of its duties." "An infirm policy and a mistaken economy has long held this department subordinate to others." The honor of inaugurating a more generous policy by the legislature is ascribed to "a gentleman from Holt and a member from Boone County." The superintendent, after an extended essay on the blessings of universal education, comes to the point of recommending to the legislature a practice, already established, providing for the education of all by free tuition of students from each county in the State University, to whom shall be furnished the expense of training for the profession of teacher. Money was to be appropriated for erecting buildings and providing the cost of instruction in the preliminary departments. The teachers' institute had sprung up in a number of counties and was recommended by the State superintendent. A recommendation concerning the selection of schoolbooks and methods of instruction furnishes an appendix to the report, in accordance with the provision of the revised school law of 1855. The number of school children and youth in all the counties was 200,346, the number taught in 1854, 74,084; number of male teachers 1,807, of female, 440. The whole amount paid to teachers was \$363,338.25, of which the sum of \$159,367.56 was derived from the common-school fund. There were 1,572 schoolhouses, built at an expense of \$30,487. The total amount applied to the counties was \$178,032.79.

The remarkable improvement in the school affairs of the State here indicated had culminated in the enactment of a revised school law in 1855. By this enactment the office of State superintendent of education, with a salary of \$1,500, had been established. His duties were similar to those belonging to the office in all the foremost States of the Union, among which we notice that of making recommendations for the management of school lands, preparing a uniform course of instruction, and collecting and disseminating information in regard to the plan and construction of schoolhouses. Another most important step forward was the setting apart 25 per cent of the school revenue for the use of the schools. By the new law a village of 200 inhabitants could be organized as a school township and receive a special subsidy from the State fund. The townships still remained under the educational direction of the county courts, as far as the management of the county and township moneys was concerned. The practice of loaning the school moneys was rescued from the loose business habits of the past, and no loans could

be made for a longer period than one year, with ample securities, and the duties of the county officials in this respect were more plainly defined.

A still more important new departure was the establishment of the office of county commissioner of education, to be appointed every two years by the county court, with the power to confer the office upon the county clerk. The duties of the county commissioner were to apportion the school moneys to the townships, visit and inspect every district school in the county once a year, direct the general course of instruction as it might be prescribed by the State superintendent, give encouragement and advice and examine all candidates for teachers, and have a general oversight and care for the entire business of schooling the children of the county, the compensation to be not exceeding \$3 a day for one hundred days in the year, save in the large towns and cities of the State. The old arrangement of three trustees in each district, elected by popular vote, was retained. The district meetings should have power to raise money for building schoolhouses, purchasing a library, apparatus, and school supplies, determine the site of schoolhouses, and distribute the payment for teachers' wages according to the length of the different school terms of the year. They could elect and remove teachers, expel pupils for improper conduct, call meetings for the imposing of a school tax by a majority of the voters of the district, and generally have charge of the school life in their respective beats; they were also to make out rate bills, from which only indigent parents were exempt. Strict directions were given to the trustees for the moral instruction of the pupils. "The English language and its rudiments" were to be taught in all common schools.

A separate article of the school law makes special provisions for the government of towns and villages that have received United States Government land grants for the use of the schools. Each of these can be chartered as a separate school corporation, with a board of five to nine directors, chosen by the votes of all qualified electors, each elector to be a citizen of the United States and a resident and householder of the community. This board of directors can manage the local school funds, lease or loan lands and lots for a period not exceeding twenty years, determine the number of schools, build schoolhouses, employ and fix the salary of teachers, make out rate bills, and generally manage the school affairs of the place. All these different bodies were required to send elaborate reports to the acting supervisors, and they to the State superintendent.

The report of Superintendent W. B. Starke in 1857 confirms the good omens of his predecessor. In the year 1856 there was subject to appropriation by the State the comfortable sum of \$217,684, to be distributed among 272,093 children, in a ratio of 80 cents to each child. In 1857 there was \$242,801.25, and the number of school children had risen to 302,323, a ratio of 78 cents per capita. One thousand and ninety-nine schoolhouses were built in the year 1856, in most cases by private subscription, with \$32,500 by direct taxation. In 1856 there were 2,409 male and 480 female teachers; and a total of \$379,800 was paid for public instruction, an excess of \$113,400.77 over 1855, \$91,000 of this excess being raised by the patrons of the schools from private funds. This report for the first time attempted to state the number of private schools of various grades in the State. It was believed that the number of children attending this class of schools was at least as large as the attendance upon the common schools. This estimate, in 1856, would give 195,000 children altogether attending school in Missouri, about two-thirds of the whole number between the ages of 5 and 20. There were 9 "colleges" and 48 academies, besides a large number of private schools of lower grade, in addition to the arrangements for schooling in public institutions.

In 1858 Superintendent Starke was able to report that every county in the State was organized into the common-school system. In 1857 the amount appropriated was \$235,811.94, the number of children from 5 to 20, 302,323; ratio, 78 cents per capita. In 1858 the amount had increased to \$244,993 and the number of

children to 341,121, only a ratio of 70 cents per capita. Of the sum appropriated in 1858 there was realized from bank dividends on the State fund \$80,440; from one-fourth of the State revenue, \$165,600. Of the 341,000 children of school age, 141,328 were in the district schools and as many more in private schools and academies, leaving about 58,000 between 5 and 20 years of age unaccounted for. But a considerable portion of those, from 12 to 20, had probably been under instruction at an earlier age.

The superintendent returns again to the all-important matter of the qualification of the teachers of the public schools. "Not one in a hundred has ever thought of teaching as a life business or spent time and labor in making special preparations for the duties of this noble calling." Of a majority of the teachers he says: "They are neither of us nor with us, for they come from all parts of the world, and if they live long enough some of them will be in all parts of the world again before they die. Nearly half a million dollars is annually taken from Missouri to pay teachers who have no permanent interest or residence in our State." The transition from this statement to the imperative necessity of normal schools is apparent, and the superintendent enlarges on the history and uses of these important institutions. The critics of popular education who to-day are depreciating the success of the normal-school system, State and city, will do well to refresh their memory by a perusal of the reports of all the early State superintendents of public schools, especially in the Western and Southern States, concerning the fearful incompetency of the teaching force. The fact that after sixteen years of the common schools in the great State of Missouri there were less than 500 women teaching school is in itself a point well worthy of consideration. And the additional fact that largely from the multiplication of facilities for the training of teachers in State and city normal schools the same State is now becoming a great source of supply for superior teachers for the entire vast region at the Southwest, and is known through the Union as a nursery of eminent educators, is a conclusive answer to the reckless and unintelligent criticisms from the friends of the old-time haphazard method of supplying the country with the teachers of all elementary and secondary schools. The superintendent wisely discredits the attempt to supply the present want by the subsidizing of existing colleges and academies, as in New York, Pennsylvania, and other States. He closes this eloquent and practical document by the blunt statement: "The right to hang a man involves the right to educate, and it costs more to try and hang one criminal than to educate one hundred children."

Superintendent Starke returned to the field in 1859 in a report which, in length and importance, casts into the shade every document of its kind that had hitherto been addressed to the half-awakened people of Missouri. Its opening pages are devoted to a succinct account of the past educational history of the Commonwealth. He pays the professional compliment to Ricky, of Holt, and Hickman, of Boone County, who were the active authors of the revised school law of 1853, under which the State had experienced so great a revival in popular education. In 1858 there were 4,916 school districts, 3,878 schoolhouses, 31 "colleges," 100 academies, 4,198 male and 855 female teachers, 367,248 children of school age, 159,941 attending school, \$580,767.50 paid to teachers, and \$107,599.76 to build and repair schoolhouses; total expenditure upon the school system, \$688,367.26.

Under the head of "Defects of the system" the earnest superintendent enlarges on—

First. The defects from the sparse population of portions of the State.

Second. The opposition and indifference of large numbers of people, who rely on the State distribution for a school of three or four months in the year. "Some of the schoolhouses are little better than a primeval log pen, with a horizontal gap on one side for a window and a vertical opening on the other for a door; without air in the summer and without light and warmth in the winter, in

which the children, perched upon high slab seats, spend a few months in the year in acquiring knowledge under difficulties; and with a broken door, it is not infrequently extemporized into a sheepfold or a pigsty during the long vacation."

He returns to the "old, old story" of the incompetence of the teachers, with a hearty compliment to the excellent public schools of the city of St. Louis, in the same State, and declares with emphasis that "the great and radical defect of our school system is the lack of well-qualified teachers to carry out its wise designs."

In view of the apathy of multitudes of people to the value of education, he quotes from the racy address of Hon. Henry A. Wise, of Virginia, to his constituents, setting forth the many absurdities that have been gathered about that familiar term "a self-educated man," and quotes largely from the most eminent Americans in support of education through schools and books. As a remedy, he calls attention to the publication of *The Missouri Educator*, a journal of education; suggests teachers' institutes, and quotes from Superintendent Powell, of Illinois; Draper, of Wisconsin, and Hon. Henry Barnard, of Connecticut, in support of his ideas of professional training for teachers. He enlarges on the importance of teachers' and common-school libraries and puts in a plea for the organization and management of the latter. The needs of the local and county commissioners are noted, and the failure of their futile and incompetent policy set forth. After twenty years, the school laws have been revised and re-revised into "a maze of casuistry and confusion," and the superintendent urges that no material further change be made. He urges the importance of the uniformity of text-books, and says: "If all the discarded schoolbooks of Missouri could be collected and sold at the price for which they were purchased, they would yield money enough to found a first-class college."

A bill was before the legislature for the establishment of a State normal school, with an appropriation of \$6,000, and the superintendent argues that the granting for the improvement of teachers of practically "the use of 2 per cent of the school money will make the remaining 98 per cent worth a great deal more than the whole of it is worth now." He says that the policy of establishing a normal school for every quarter of the State, where the people would furnish buildings and pupils, should be inaugurated. The State now has a population of 1,000,000; 5,000 teachers were required in 1859, and in ten years it is certain that 10,000 will be required for this service. He calls it "fooling" and "mischievous" to look to the private schools, colleges, and academies for this supply of instructors. "They will do just what they have been doing in this matter for years past, and that is pretty near nothing at all." The report closes with an eloquent and forcible appeal for this much-needed "new departure" in the interest of the better training of the children of the people.

It was fortunate for the State of Missouri that it followed the example of the New England States in retaining its State superintendent of education for a long term in office, in the case of Superintendent W. B. Starke. The State of Massachusetts during the past sixty years, since the first appearance of Horace Mann, has appointed only six men as secretaries of the board of education, including Mr. Mann and the present occupant of the office. Connecticut and Rhode Island can show even a better record of the continuous service of able men in this position. The Western and Southern States have suffered, and still do suffer greatly, from their habit of frequent change in their most important civil functionary, the term of four years in several of them being the utmost period of the administration of an official, too often nominated for political rather than educational considerations. At all events it is refreshing to open the record of 1861 in Missouri with the name of Starke still appearing on the pages of the stimulating document which his reports invariably were.

In the fourteenth report, January 15, 1861, the superintendent states that in 1860 \$637,314 were paid for the wages of 5,670 teachers—\$215,472 from State and

\$140,044 from township funds, \$60,500 from county funds, and the remainder by rate bills and the voluntary contributions of the people. In addition, \$184,308 had been raised by taxation to build and repair schoolhouses, making over \$850,000 expended for the instruction of 170,800 school children; but with this gratifying increase of school funds the superintendent is still haunted with the spectre of incompetency in the teaching force. He says: "It is fearful to reflect how few of this number have the intellectual and moral qualifications for this great work." He expatiates, with the breadth of view of a true statesmanship, on the value of the common-school system as the chief agency in training the children of great numbers of people now drifting into the State from all the nationalities, classes, and religions in the world into the great art of living together in the exercise of a true American citizenship, and dilates on the necessity of trained teachers to meet this important movement. His words read like a prophecy of the calamities that fell upon his State during the four subsequent years of civil war, when the people of every community were arrayed in contention over its final adhesion to or the repudiation of its union with the great Republic.

Indeed, the prophetic warnings of the wise and eloquent superintendent were scarcely uttered before the verification was at hand. The legislature of 1861 indorsed the cause of the Southern Confederacy, abolished the office of State superintendent of education, suspended the appropriation of the school funds and devoted them to the cause of civil war. A later movement of the loyal people of the State, in convention assembled, prevented this diversion of the school funds. The result of this was, in the year 1862, "the almost total suspension of the common schools all over the State, the disorganization of all civil affairs, and the fearful distraction pervading all classes." January 13, 1863, it is said, "in consequence of the war which has with unparalleled ferocity distracted the State for the last twenty months, the common schools are prostrated and broken up, the colleges have been converted into hospitals and schoolhouses into barracks, school teachers have laid down the ferule and taken up the sword, and parents have sent their children to learn war." It was not until 1864 that the legislature rallied and began over the great work of the training of young America. This educational revival in nation and State for the past thirty years is the most reliable pledge that whatever may happen hereafter the people of the United States in their own connection with each other "will not learn war any more."

In January, 1863, after the civil war had wrought its worst in the conflict that divided the people of Missouri, Mr. M. Oliver, secretary of state and ex-officio superintendent of schools, in the report already quoted from, remarks: "One of the surest ways of restoring and perpetuating peace, and of making things resume their former happy and prosperous appearance, is to be found in the organization and opening of schools in every neighborhood in the State." By act of the legislature, February 13, 1864, Secretary Oliver was ordered to resume the distribution of school funds. On the basis of the enumeration of children of school age, in 1860, he reported 385,649 between the ages of 5 and 20. The fund available for apportionment was \$169,685, and this was distributed at a ratio of 44 cents per capita. The secretary reports: "Nearly all the counties north of the Missouri River have their common schools in full operation, and in many counties south of the river (the disturbed region of the State) schools are opened, and daily more are in session." According to his statement, the war had cost Missouri nearly one-third her population of 1860. He urges with great force that "Nothing will promote a healthy immigration to the State like a system of common schools that is vigorous and effective. All immigrants, before leaving their old homes, who have the interest of their sons and daughters at heart, will always, other things being equal, select that county or locality where their children can be educated." He urges the reestablishment of the offices of State and county com-

missioner of education, which were abolished during the war period. The progress of the war, by 1864, had practically determined that the slave population of the entire South arrayed against the Union would be emancipated. Indeed, the proclamation of President Lincoln to that effect had already been issued. It was left to the five Southern States not in arms against the National Government, Maryland, Delaware, West Virginia, Kentucky, and Missouri, to dispose of their colored population in accordance with the almost universal convictions of the loyal States. The people of Missouri had called a convention that, early in 1865, would be expected to decide on this important subject. The secretary wisely places before the legislature the new obligations that will confront the State in several public matters dealing with the question of the civil status of the negro after emancipation. In any probable event, he urges the importance of elementary education, to prepare him for whatever condition he may be left in by the great act of deliverance from the chattel slavery that for forty-five years had, more than all other causes combined, retarded the progress of a Commonwealth so richly endowed by nature and so admirably placed for the occupation of man.

Here the present record may be suspended. In the year 1866 a new school law was passed by the legislature, more comprehensive and thoroughgoing than any previous statute, an event of sufficient importance to be regarded the inauguration of the new era of school-keeping, in which this great State has figured during the past thirty years with conspicuous energy and success. In 1866 a State teachers' convention was held in St. Louis and a committee was appointed to petition the general assembly for the establishment of a State normal school. The names appended to this document include Mr. T. A. Parker, State superintendent of education, and Mr. Ira Divol, well known for his connection with the public-school system of St. Louis. The chairman of the committee was Mr. William T. Harris.

It remains to notice the condition of public education in several of the large towns and cities which, at an early period, had received special appropriations of school lands from the National Government. These towns, by all legislation previous to 1860, were treated as separate school corporations, each in charge of its own board of school directors. In several of these, important movements had been made previous to the war, and the coming peace that set in motion the increasing tide of population from the open country to the large villages and cities imparted a remarkable energy to their educational affairs.

The city of St. Joseph, by a special act of the legislature in 1860, had established a system of public education. Its population was 10,000. Two small schoolhouses were erected and 6 teachers engaged for 360 pupils. The coming of the war suspended operations till 1864, when the work was again taken up with renewed vigor. Additional taxation was solicited and obtained from the legislature. Schoolhouses were built and seats provided for 1,000 pupils in all the departments of the graded system. The city in 1866 had risen to a population of 18,000 to 20,000, with 4,000 children of school age.

The city of Springfield had not moved for a municipal organization of schools in 1866. A large number of smaller places, some of them now important educational and social centers, at this time made their first effort at the local organization of their public graded-school systems.

The history of Missouri during this period culminates in the establishment of the public-school system of the city of St. Louis, the chief city of the State, and still the most populous and every way important city of the Union west of the Mississippi.

This deeply interesting history dates from the act of Congress in 1812, setting apart vacant lands in St. Louis and other towns in the Territory for school purposes. This act was supplemented in 1824 and 1831 by laws compelling individual claimants to prove titles within a specified time in four of the towns aforesaid.

The result of this legislation was that a residuum of the original grant of less than 50 acres was reserved to the city in 1874-75, valued at \$1,252,895, but for various reasons realizing the amount of only \$52,833.75.

The twenty years during which the city of St. Louis seriously undertook the tedious work of establishing its title to this munificent land grant, from 1813 until 1833, were chiefly spent in litigation over this disputed title. In 1833 a school board, entitled "The board of president and directors of the St. Louis public schools," was chartered by the legislature. Its chairman was the distinguished citizen, the Hon. Edward Bates, afterwards Attorney-General of the United States during the administration of President Lincoln. The usual popular, perhaps unavoidable, mistake was made of loaning the most valuable of the school lands for fifty years at an interest of 6 per cent, a transaction that for years deprived the city of the proper use of its great educational endowment. Ten years later, in 1845, the legislature was called upon for a more stringent statute to arrest what were suspected to be evidences of mismanagement in the administration of this important fund.

In 1836-37 the first public schoolhouse under this new dispensation was built, at an expense of \$3,500. Teachers were paid \$900 for males and \$500 for females. The board continued the building of schoolhouses from 1841 to 1850. But the meager income from the valuable landed estate of the city was a source of constant financial embarrassment. Up to 1851 the building of new schoolhouses was a constant source of contention. Indeed, the system was so unsatisfactory that in 1843 Dr. William G. Eliot, one of the most conspicuous workers in the upbuilding of all good things in St. Louis, replies to an inquiring friend from the East: "There is no public-school system in St. Louis. There are four public schools for boys and girls with 500 pupils; their management almost entirely left to the teachers, although nominally under a board of directors chosen by the people. Only \$4,000 income can be secured from the landed property. There were 80,000 people in St. Louis before there was anything done in behalf of popular instruction."

By 1854 the schools had so gained the favor of the people that several new buildings had been erected and a high school, with 70 pupils, had been organized. For a time the city had been deprived of the participation in the State educational fund, on account of its great prospective land endowment, but in the years of 1853 and 1854 this law was repealed. In 1848 Doctor Eliot led the first advance movement that has given the public schools of St. Louis their present celebrity by offering a resolution in the school board to the effect that a committee of three be appointed to petition the legislature for an amendment of the city charter, authorizing the laying a tax of one-tenth of 1 per cent on all the property of the city for the public schools. The doctor was appointed chairman of this committee, and largely owing to the wonderful energy, wisdom, and tact of Doctor Eliot in the educational and philanthropic affairs of the city, the petition was granted on condition that it should be confirmed by a popular vote. The city, by a unanimous vote, confirmed the act of amendment to the charter, and from that memorable day a new era dawned on the cause of popular education in that city.

The effect of the high school, for a long time moving in the usual grades, was gradually felt in the schools of the State. It supplied the need of the secondary education, until that time entirely in charge of private and denominational academies. The growth of the city was so rapid that the building of schoolhouses was continuous, and the schools suffered even for the lack of tenements for temporary occupation. It is claimed that the growth of the St. Louis school system has been a powerful influence on the great revival of public educational affairs through the State, especially in procuring the legislation of 1855, which appropriated 25 per cent of the entire revenue of the State government to public education. The Lancasterian system of instruction, that had prevailed at the opening

of the city schools, disappeared after the usual demonstration of its incompetence for the needs of an American community.

In 1857 the normal school of St. Louis was established, with Mr. Richard Edwards as principal. It had been so difficult to obtain competent teachers for the schools that in 1848 fifteen were brought from the East. Indeed, until a later date, the majority of the teachers in the public schools of Missouri were imported, and the State still held back from the establishment of a normal school, the plan for a department of pedagogy in the State university not having gone into effect. In 1857 the school interest scored a great point by the election of Mr. Ira Divol as successor of Mr. John N. Tice as city superintendent of schools, a position he held for several years with great and increasing usefulness. Superintendent Divol visited the different cities of the United States and reported the results of his investigations on his return. In consequence several important reforms were inaugurated in respect to the structure of schoolhouses and organization of the schools. In 1857 St. Louis had a population of 135,000, with a public-school population of 25,000, with only seating capacity in its buildings for 5,361. The city was full of children who were not in any school and the public demand for additional accommodations was rising to a clamor. By the payment of obligations due the city \$30,000 was invested in buildings and the old schoolhouses were repaired for the present occupancy. One of them, built in 1850, was named from Rev. Dr. William G. Eliot, the Eliot School.

The rapid progress of the schools was arrested by the breaking out of the civil war. The city of St. Louis, during the five years of its continuance—1861 to 1865—was the storm center of a great agitation, in which public opinion was divided, exasperated, and terribly tried by the military and civic operations that held the State to the Union and paralyzed the operations of the Confederate party in this important Commonwealth. At one period the schools of St. Louis were reduced to one-third of their former magnitude, and for two years they were impeded in this way. But the clearing of the political atmosphere and the abolition of the rate bill brought educational matters again to the front. A graded course of instruction was adopted in 1864; and in the same year the city tax for public education was one-tenth of 1 per cent; during 1865-66, two-tenths; in 1867, four-tenths; and from 1868 to 1875, six-tenths of 1 per cent on the entire valuation of the city.

It was at this time, when the cause of public education was becoming enveloped in the cloud of civil war that Mr. William T. Harris appeared in St. Louis as a teacher in the public schools. In 1860 he was appointed principal, and afterwards became superintendent of the public-school system of St. Louis. * * *

The history of the State University of Missouri, though established before the period of the civil war, properly belongs to the same period as that of the State normal schools, the years following the close of the war—1865 to 1900.

ARKANSAS.

In the year 1875 an excursion of editors, chiefly from the Western States, made a tour of the State of Arkansas. At the regulation banquet by which this class of the traveling public is usually entertained, a toast "The common-school system; without it the nation can not permanently prosper, with it the success of free institutions is placed beyond peradventure or doubt," drew from Mr. Edward Goodman, of Chicago, Ill., a striking object lesson, furnished by a comparison of the States of Arkansas and Michigan. Both these States were admitted to the Union in 1837. With a smaller physical area, a more severe climate, and a lower degree of fertility than its neighbor in the South, the State of Michigan, in the

forty years since its admission to the Republic, had become, in 1875, a powerful commonwealth, with a voting constituency of 221,000, a population of 1,250,000, of which 320,000 were children and youth of school age, and a taxable property valuation of \$272,000,000. The dense forests had been subdued, the original unhealthiness of the country had been overcome, and already the mining interest represented an annual outcome of \$15,000,000. In contrast, the State of Arkansas in 1870 polled less than 90,000 votes, with a population below 500,000, with less than 63,000 children in common schools, and the taxable property of the State less than half that of its modern sister. Meanwhile the vast mineral wealth of the State was still, as far as development was concerned, an unknown quantity.

The object of this speech was not to make an unfavorable comparison of these two States in the presence of the generous people who had welcomed their distinguished visitors with a true Southwestern hospitality. But the occasion furnished an admirable opportunity to enforce the vast importance of popular education in a new American State. The eloquent speaker continued: "The rapid advancement of Michigan is owing, first, to teeming immigration, and second, to her unsurpassed system of education. For years, while Arkansas lay in silence on the western banks of the Mississippi, comparatively unknown, the sons and daughters of New England were moving by hundreds and thousands to take possession of the beautiful prairie of the State of Michigan. At the very beginning they laid, deep and broad, the foundations of universal education. The result to-day is a schoolhouse in every school district, academies in every county, agricultural, normal, mechanical, theological, and other professional and industrial colleges through the State, and, above them all, the University of Michigan. What Michigan now is, Arkansas shall be, and more."

A visit to the capital of Arkansas, the beautiful city of Little Rock, and a true comparison of its present estate to that witnessed by the crowd of exploring editors twenty-five years ago, would reveal the potency of prophecy, when addressed to the great cause of popular education in this Republic. Perhaps no State of the South since that festival day, all conditions and circumstances considered, has done more for the education of its entire people than this commonwealth, that, until 1860, was regarded as almost on the border land of civilized America, and within the past twenty-five years has made such remarkable advances in popular education.

It was true that at the organization of the State in 1836 the duty to educate the people was recognized in the following clause of its constitution:

[*The Constitution of Arkansas, June 15, 1836.*]

ARTICLE VII.—*Education.*

SEC. 1. Knowledge and learning, generally diffused through a community, being essential to the preservation of a free government, and diffusing the opportunities and advantages of education through the various parts of the State being highly conducive to this end, it shall be the duty of the general assembly to provide by law for the improvement of such lands as are or hereafter may be granted by the United States to this State for the use of schools, and to apply any funds which may be raised from such lands or from any other source to the accomplishment of the object for which they are or may be intended. The general assembly shall from time to time pass such laws as shall be calculated to encourage intellectual, scientific, and agricultural improvement by allowing rewards and immunities for the promotion and improvement of arts, science, commerce, manufactures, and natural history, and countenance and encourage the principles of humanity, industry, and morality.

This section was included in the constitution of 1864-1865, as Article VIII, section 1.

The State of Arkansas, with an area of 52,138 square miles and 33,453,720 acres of land, had received from Congress 836,460 acres for common schools and 46,180

acres for a university. In 1840 the State had a population of 97,574. It has already been shown in a former essay of this series how this munificent donation was wasted by the reckless and careless handling that wrought havoc with so many of these large donations for the children. As late as 1854 the secretary of state, who was ex officio State commissioner of common schools, reported only 40 public schools, and complains of "the indifference that pervades the public mind on the subject of education." So complete had been the ruin of the original land grants of the nation that in 1870 the permanent income from this source was but \$35,192, while a careful administration of this patrimony would probably have yielded a State-school fund of \$2,000,000, possibly \$3,000,000. It was not till 1869 that the first public-school system for the State was established, and great additions have since been made to its efficacy by a score of able and zealous school officials, and the hearty cooperation of the legislature and people. More than half a million of dollars was expended for education in 1870, three-fifths from direct taxation. There were 70,000 children under instruction in 1870. But the process of raising a State from a long period of indifference to education is necessarily slow, and as late as 1870 there were 111,799 persons in the State unable to read and 133,339 who could not write. The new constitution of the State, of 1868, under the reconstruction government, contains an elaborate section providing for a complete system of popular education.

[Constitution of Arkansas, as amended in 1868.]

ARTICLE I—*Bill of rights.*

SEC. 23. Religion, morality, and knowledge being essential to good government, the general assembly shall pass suitable laws to protect every religious denomination in the peaceable enjoyment of its own mode of public worship; and to encourage schools and the means of instruction.

ARTICLE VI.—*Executive department.*

SEC. 1. The executive department of this State shall consist of * * * and superintendent of public instruction, all of whom shall hold their several offices for the term of four years and until their successors are elected and qualified. They shall be chosen by the qualified electors of this State, at the time and places of choosing the members of the general assembly.

SEC. 18. The * * * and superintendent of public instruction, shall severally reside, and keep all their public records, books, papers, and documents which may pertain to their respective offices, at the seat of government.

SEC. 19. The returns of every election for * * * and superintendent of public instruction, shall be sealed up and transmitted to the seat of government by the returning officers, and directed to the presiding officer of the senate, who, during the first week of the session, shall open and publish the same in presence of the members there assembled. The person having the highest number of votes shall be declared elected; but if two or more shall have the highest and equal number of votes for the same office one of them shall be chosen by a joint vote of both houses. Contested elections shall likewise be determined by both houses of the general assembly, in such manner as is or may hereafter be prescribed by law.

SEC. 21. The * * * and superintendent of public instruction, shall perform such duties as are now or may hereafter be prescribed by law.

SEC. 22. In case of the death, impeachment, removal from the State, or other disability of the * * * and superintendent of public instruction, the vacancies in their several offices thus occasioned shall be filled by appointment of the governor, which appointment shall be made for the unexpired terms of said offices, or until said disabilities are removed, or until elections are held to fill said vacancies.

SEC. 24. The officers of the executive department mentioned in this article shall, at stated times, receive for their services a compensation to be established by law, which shall not be diminished during the period for which they shall have been elected or appointed.

SEC. 25. The officers of the executive department and judges of the supreme court shall not be eligible, during the period for which they may be elected or appointed to their respective offices, to any position in the gift of the qualified electors or of the general assembly of this State.

ARTICLE IX.—*Education.*

SEC. 1. A general diffusion of knowledge and intelligence among all classes being essential to the preservation of the rights and liberties of the people, the general assembly shall establish and maintain a system of free schools for the gratuitous instruction of all persons in this State between the ages of 5 and 21 years, and the funds appropriated for the support of common schools shall be distributed to the several counties in proportion to the number of children and youths therein between the ages of 5 and 21 years, in such manner as shall be prescribed by law; but no religious or other sect or sects shall ever have any exclusive right to or control of any part of the school funds of this State.

SEC. 2. The supervision of public schools shall be vested in a superintendent of public instruction and such other officers as the general assembly shall provide. The superintendent of public instruction shall receive such salary and perform such duties as shall be prescribed by law.

SEC. 3. The general assembly shall establish and maintain a State university, with departments for instruction in teaching, agriculture, and the natural sciences, as soon as the public-school fund will permit.

SEC. 4. The proceeds of all lands that have been or hereafter may be granted by the United States to this State, and not otherwise appropriated by the United States or this State; also all moneys, stocks, bonds, lands, and other property now belonging to any fund for purposes of education; also the net proceeds of all sales of land and other property and effects that may accrue to this State by escheat, or from sales of estrays, or from unclaimed dividends or distributive shares of the estates of deceased persons, or from fines, penalties, or forfeitures; also any proceeds of the sales of public lands which may have been or may hereafter be paid over to this State (Congress consenting); also the grants, gifts, or devises that have been or hereafter may be made to this State and not otherwise appropriated by the terms of the grant, gift, or devise, shall be securely invested and sacredly preserved as a public-school fund, which shall be the common property of the State, the annual income of which fund, together with \$1 per capita, to be annually assessed on every male inhabitant of this State over the age of 21 years, and so much of the ordinary annual revenue of the State as may be necessary shall be faithfully appropriated for establishing and maintaining the free schools and the university in this article provided for, and for no other uses or purposes whatever.

SEC. 5. No part of the public-school fund shall be invested in the stocks or bonds or other obligations of any State or any county, city, town, or corporation. The stocks belonging to any school fund or university fund shall be sold in such manner and at such times as the general assembly shall prescribe, and the proceeds thereof and the proceeds of the sales of any lands or other property which now belongs or may hereafter belong to said school fund may be invested in the bonds of the United States.

SEC. 6. No township or school district shall receive any portion of the public-school fund unless a free school shall have been kept therein for not less than three months during the year for which distribution thereof is made. The general assembly shall require by law that every child of sufficient mental and physical ability shall attend the public schools during the period between the ages of 5 and 18 years for a term equivalent to three years, unless educated by other means.

SEC. 7. In case the public-school fund shall be insufficient to sustain a free school at least three months in every year in each school district in this State the general assembly shall provide by law for raising such deficiency by levying such tax upon all taxable property in each county, township, or school district as may be deemed proper.

SEC. 8. The general assembly shall, as far as it can be done without infringing upon vested rights, reduce all lands, moneys, or other property used or held for school purposes in the various counties of this State into the public-school fund herein provided for.

SEC. 9. Provision shall also be made by general law for raising such sum or sums of money by taxation or otherwise in each school district as may be necessary for the building and furnishing of a sufficient number of suitable schoolhouses for the accommodation of all the pupils within the limits of the several school districts.

ARTICLE X.—*Finance, taxation, public debt, and expenditure.*

SEC. 1. * * * The general assembly shall never levy a poll tax, excepting for school purposes.

SEC. 2. * * * Burying grounds, public schoolhouses, houses used exclusively for public worship, institutions of purely public charity, and public property used exclusively for any public purpose shall never be taxed.

SEC 15. The principal arising from the sale of all lands donated to the State for school purposes shall be paid into the treasury, and the State shall pay interest thereon for the support of schools at the rate of 6 per cent per annum.

In 1850 the census returns gave to Arkansas 3 "colleges," with 14 teachers and 150 students, with an annual income of \$3,100; 90 academies, with 126 teachers and 2,407 pupils, and an income of \$34,304, and 353 public schools, with 355 teachers and 8,493 pupils, with an annual income of \$68,411. The entire number attending school, as returned by families, was 23,350, with 16,817 white persons over 20 years of age unable to read. The population in 1850 was 209,897, with a school population of 40,000. In 1860 there were reported in the State 4 "colleges," with 225 students and an income of \$5,585; 727 public schools, with 19,242 pupils and \$120,613, of which \$13,356 was from public funds; 109 academies and other schools, with 4,415 pupils and \$58,146 income, of which \$8,645 was from public funds. At this date the population of the State was 324,143 white and 111,259 slaves and free colored, and 48 Indians, 435,450 in all, an increase of 107,000, 46 per cent, from 1850. The period from 1850 to 1860 was a time of great material prosperity—a six-fold increase in the short period of ten years. In 1860 there were 518 manufacturing establishments, with an annual product of \$2,850,578.

In 1866 Governor Murphy said: "No State in the Union is at present behind Arkansas in educational progress, and never in the history of the State have the people indicated a stronger demand for the establishment of a thorough system of common-school education at the public expense." With proper regard for the fervor of official rhetoric, it does appear that despite the wreck of the public-school funds at an early period the people by their own efforts had begun the good work of educating the white population in earnest by 1860. Fortunately the State was not to any great extent the theater of military operations during the civil war, and it emerged from the conflict in measurably good condition to move onward toward the encouraging state of affairs that now appears to prevail.

If the State of Arkansas, during the twenty-five years between its organization in 1836 and its secession from the Union in 1861, did not have a satisfactory system of public instruction it was from no lack of legislation upon educational affairs. The statute books are crowded with acts and amendments of acts looking to the building up of a complete system of common schools, not to speak of the frequent incorporation of academies. Indeed, at the first session of its legislature several of these academies were chartered, all, not excepting a parochial school, under the significant clause: "No preference shall at any time be given or any discrimination made in the choice of trustees, professors, instructors, instructresses, teachers, or students on account of religious sentiments, nor shall [any of these aforesaid officials] at any time make by-laws, ordinances, or regulations that may in any way interfere with or in any manner control the rights of conscience or the free exercise of religious opinion or worship." But in the case of one school and church two exceptions were made to this broad statement of religious liberty to the effect that "proselytes of abolition or Mormon doctrines shall be excluded from this seminary." The Antique Historical Society of Arkansas, at Little Rock, was chartered with the introduction: "Whereas that encouragement of learning and the dissemination of useful and entertaining knowledge are objects of vital importance to the people of the State," etc.

In 1838 the Government was authorized to sell what remained of the seminary lands (for the State University) and deposit their proceeds in the Bank of Arkansas until appropriated for the establishment of a university. In 1843 the legislature established a State board of education, consisting of the governor, president of senate, speaker of house of representatives, supreme judge of the State, and ten members of the general assembly, elected by ballot of the legislature, intrusted with full power to administer such a scheme of general education as the legislature might be disposed to set up. This was followed by the enactment of an

elaborate common-school law, sufficient, if it could have been enforced, to put and keep in school every child and youth in the State. The county court was authorized to appoint a commissioner to sell the school lands belonging to any district on request of its people and to order the election of three trustees who should have local control of the school established under this statute, to serve for two years. The land could be sold on a credit of ten years at not less than \$2 per acre, in 40-acre lots, the debt to be at interest at 8 per cent. The trustees could build a schoolhouse and hire a teacher able to instruct in orthography, writing, English grammar, geography, arithmetic, and good morals. The commissioner could buy school lots, or reserve 20 acres from the public domain for schoolhouse or cemetery lots. Only the interest of the school fund could be used for the support of schools, which were maintained chiefly by tuition fees of the pupils. The central board was to receive reports and set on its teachers the seal of certification that would reach every district in the State. A board of three commissioners, elected by the people, with the county clerk and judge, constituted a county board of education, which had the distribution of all school funds outside the sixteenth section originally granted, examined teachers, and visited schools once a year. The trustees could loan the funds at 6 per cent interest. The State was authorized at first to spend \$1,000, afterwards a more generous sum, \$1,515, to purchase books. All escheated lands, with the income of salt springs and other public properties, were devoted to the same fund. A portion of the surplus revenue received by the State was appropriated to the increase of the school fund. The townships were allowed to establish "laboring," probably industrial, schools.

In 1848 the university or seminary lands were diverted from their original purpose and distributed among the counties as a part of the common-school fund. At a later date the counties were authorized to build up academies, in connection with adequate subscriptions by the friends of secondary education. In 1850-51 a new turn of the legislative wheel placed the entire oversight of the public schools in the county court and put an elected commissioner in place of the local trustees, evidently with the hope that the interests of the schools would be better served by a small and responsible body of officials. Subsequent revision of the school laws, in 1853, provided for county commissioners or superintendents of schools, chosen for two years, whose duties were those ordinarily performed by those officials, and who were required to report every year to the secretary of state, on whom were imposed the duties of State superintendent of instruction.

But it was this very State official who in his report could name only forty schools, and complains of a general indifference to education among the people. It was evident, with the State law for this ruinous system of loaning to everybody who would agree to pay interest, with the fact that once out of the charge of the county commissioner there was no security for the handling of the funds, and the provision of a rate bill, that the system would not be adequate to the needs of a State one-third of which was always at the mercy of a rise in the Father of Waters, another area liable to frequent overflow, the great hill country of the west and southwest still a wilderness, the capital (Little Rock) as late as 1854 described by an English traveler as a village of 500 people without any feature of a political capital town, with a population of little more than 200,000 in 1850 and less than half a million in 1860, scattered over a vast area of 52,000 square miles, twice the extent of the State of New York. All this explains the partial failure of the State to educate its people. The "peculiar institution" held one-fourth its entire population in a bondage so relentless that in 1859 the State law forbade the emancipation of slaves and banished free negroes from the State. It was only after the baptism of fire through which the people passed during the four years of the civil war that this great border State righted itself and entered on a career of educational progress which in one short generation has made it an educational "object lesson" for all its neighboring States of the South.

TEXAS.

A year before Horace Mann, in Massachusetts, inaugurated the great revival of the American common school, at the close of the first half century of the Republic, a "far call" was heard from the new Republic of Texas in behalf of universal education, as then understood, below the line of 36° 30', in the Union before 1860. In 1833, by a law of the newly established government in Mexico, in the States of Coahuila and Texas all children were to be trained in Catholic schools and taught to kneel reverentially before the altar of the Roman Catholic Church. Against this edict Stephen F. Austin, in the spirit of old Connecticut, one of his various abiding places on his eventful journey from the cradle to the source of his final distinction as a father of a new country, embodied the protest of the American community, then domiciled in Texas, in the significant words, "We want free schools for our children."

On this line the battle of universal education has been fought from the establishment of the Republic of Texas, in 1836, through the more than sixty years of the dramatic history of that remarkable State. We are not surprised to find in the declaration of independence of the province, in 1835, the following impeachment of the Mexican Government: "It has failed to establish a public system of education, although possessed of almost boundless resources in the public domain, and although it is an axiom of political science that unless a people are educated and enlightened it is idle to expect the continuance of civil liberty or the capacity of self-government."

The constitution of the Republic of Texas, 1836, declared, "It shall be the duty of Congress, as soon as circumstances will permit, to provide by law a general system of education." In 1839 the Republic inaugurated the generous and statesmanlike policy that has characterized this Commonwealth through all the mutations of its changeful history of consecrating a great domain of public lands to the cause of universal education. By this act the area of 3 leagues was granted to each county for establishing "a primary school or academy." This was equivalent to a grant for common schools, as every academy would, by the necessity of the population, include all white pupils from 6 to 16, afterwards declared the public school age. The natural result of this experience of ecclesiastical interference in public affairs under the Mexican rule appears in the provision of the constitution of 1836 that no minister of religion should be eligible to the presidency or to a seat in Congress.

In 1837 we find the first record of the long line of statutes for incorporating academies and colleges, which, by 1860, had filled the State with private and denominational schools, often a hindrance to development of a public-school system—a system here provided for on paper not only by the magnificent donation of public lands but by a succession of laws, either of which, if thoroughly enforced, would have placed Texas at an early date at the head of the common-school States of the South. These academies and colleges were chartered on the nonsectarian system, as far as the provision that the school should be open to pupils of every religious faith. In one the payment of \$10 entitles a member of the corporation to a vote on the election of school trustees of the town where the school is situated.

This policy of donating large tracts of land as a basis for a permanent school fund through frequent grants to academies, colleges, and literary institutions has resulted in sixty years in providing the great prospective endowment of the common school system of Texas. In 1839, in addition to the 3 leagues given to each county, 50 leagues were ordered to be surveyed by a commission appointed by the President for the endowment of two colleges in the eastern and western sections of the Republic. In 1841, 4 leagues of land were given to a college at Gonzales and for a hundred years the descendants of all the defenders of the Alamo fortress, in 1836, were to be entitled to free tuition in this institution. In the same year

the Austin Lyceum was chartered, under the presidency of Burnet. In 1844 Hermann's German University was chartered, with a stringent provision that no religious test should be exacted of any teacher in the school; that all professors should be able to use the English language, and no strong liquors should be sold within a mile of the college. A league of land was thrown in as "a nest egg" for a future endowment. Baylor University, at Waco, that has become one of the best known of the Baptist denominational schools of the State, was one of the last chartered by the Republic. Several of the more prominent cities of the State have realized a handsome sum from the sale of these lands, originally donated for "a primary school or academy."

In 1845-46 the Republic of Texas, after nine years of experience as a "lone star," was admitted to the Union, with the proviso that four additional States might be carved out of its enormous area of 274,356 square miles, thirty-four times the area of Massachusetts, larger than the united Commonwealths of New England, New York, New Jersey, Pennsylvania, Virginia, and Ohio. The original necessity for the multiplication of slave States no longer exists, but it is by no means improbable that the people of Texas will yet insist on this privilege of division. Settled as densely as Massachusetts, Texas would support a population of 40,000,000. The State has 750 miles of seacoast on the Gulf of Mexico, with rapidly developing capabilities for a foreign commerce that will drain the boundless region between the lower Mississippi valley and the great mountains. Its situation between the twenty-seventh and thirty-ninth degrees of latitude brings it abreast of Greece, Rome, Egypt, and Palestine.

The policy of donating school lands continued after its admission to the Union. In 1854 the State set apart \$3,000,000 of the \$10,000,000 received from the United States for a State school fund. In the same year the State donated a certain quantity of land to all chartered railroad corporations for every mile of road put in running order, with the proviso "that they shall survey and set apart at their own expense every alternate section for public free schools." In 1856 the same condition was annexed to an act donating public lands for the benefit of navigation on the rivers of the State. It is understood that on the admission of Texas the State was accorded the unusual privilege of retaining sole possession of its entire territory. In 1873, after the close of the civil war, the first legislature following the continued Federal occupation of the State emphasized this already generous policy by a donation of half the remaining public domain, 84,000,000 acres, to free schools. In 1877 it was asserted that the State of Texas was in possession of 70,000,000 acres of public school lands, valued at \$50,000,000. The extent of the school lands of this great Commonwealth exceeds the entire area of all the New England States. In addition even to this, at different times the legislature has voted one-tenth or one-fourth its entire revenue for schools, with a liberal provision for general and local taxation for education. In fact, though one of the least of the educational States in the Republic in 1846, Texas authorized the city of Galveston to impose a local tax of one-half of 1 per cent for free schools, and in 1848 an additional act provided for a system of public instruction in that city.

The first constitution of the new Commonwealth of Texas in 1845 contains the following:

[The constitution of Texas, December 24, 1845.¹]

ARTICLE X.—*Education.*

SEC. 1. A general diffusion of knowledge being essential to the preservation of the rights and liberties of the people, it shall be the duty of the legislature of this State to make suitable provision for the support and maintenance of public schools.

SEC. 2. The legislature shall, as early as practicable, establish free schools

¹ The constitution of the Republic of Texas, 1836, declared: "It shall be the duty of Congress, as soon as circumstance will permit, to provide by law a general system of education."

throughout the State, and shall furnish means for their support by taxation on property; and it shall be the duty of the legislature to set apart not less than one-tenth of the annual revenue of the State, derivable from taxation, as a perpetual fund, which fund shall be appropriated to the support of free public schools; and no law shall ever be made diverting said fund to any other use; and until such time as the legislature shall provide for the establishment of such schools in the several districts of the State, the fund thus created shall remain as a charge against the State, passed to the credit of the free common school fund.

SEC. 3. All public lands which have been heretofore, or which may hereafter be, granted for public schools to the various counties or other political divisions in this State shall not be alienated in fee, nor disposed of otherwise than by lease for a term not exceeding twenty years, in such manner as the legislature may direct.

SEC. 4. The several counties in this State which have not received their quantum of lands for the purposes of education shall be entitled to the same quantity heretofore appropriated by the Congress of the Republic of Texas to other counties.¹

This document, it will be seen, reaffirmed the determination of the State to educate its white children, approved the principle of State and local taxation for schools, appropriated one-tenth of the public revenue raised by taxation to the same object, secured the inviolability of the State school fund and provided that the original grant of lands by the Republic of Texas to the counties should be confirmed and extended to all the new counties organized in the Commonwealth. The population of the State in 1836 was 50,000; in 1850, 154,034 white, 58,161 slave, and 397 free negroes, total 212,592. There were then 130 organized counties in the State. Five hundred and twenty leagues, 2,302,560 acres, were set apart at the admission of the State to the Union for education.

But from the beginning a succession of hindrances, despite the liberal action of successive legislatures, wrought a practical nullification of the intent of the superior class, until the close of the civil war brought with it the possibility of the great educational success of the State during the past thirty-five years. These generous grants of the public domain were coupled with the proviso that the land should only be loaned for a limited term of years. At that period there was land "to burn" in Texas. And with such an opportunity to buy at a nominal price, even to shirk the payment of interest or to buy on long credit, with a final repudiation of the debt and the reversal of the property to the State, operations capable of being repeated through an entire lifetime, it can readily be seen that available funds for the establishment of universal education were not at hand. Besides the fact that in 1850 the entire white (the only school) population of Texas was but 154,000 (not more than one of the present first-class cities of the Union) scattered over an illimitable area, with no modern facilities for traveling, its vast prairies almost impassable during several of the school months of the year, explains the reason why the establishment of schools demanded in the declaration of independence was so long delayed. Meanwhile the local education of the people, grouped in little neighborhoods, separated by material and social barriers during the twenty-five years previous to the great war, was largely carried on by private and denominational agencies. Of course this multiplication of private and denominational "colleges" and academies gave to the people able to educate their children in this way the opportunity for the kind of schooling then regarded competent for the exigencies of private and public life. In this way there was furnished to the country the group of able and energetic public men sent to Washington and retained for the public service at home.

¹ An act of the Republic of Texas approved January 26, 1839, granted to each county 3 leagues of land for the purpose of establishing a primary school or academy. The lands were to be located in the county, if good lands could be found vacant, and they might be surveyed in any sized tracts of not less than 160 acres. If lands proper for this use did not exist in the county they might be surveyed upon any of the vacant lands of the Republic at the expense of the county.

The same act directed a tract of 50 leagues of land to be set apart for the establishment and endowment of two colleges or universities thereafter to be created, the cost of survey being paid by the general treasury.

By 1855 the school fund, as the result of all legislation, supplied an income of only \$128,668. In 1854 the first general school law was passed. It was an elective statute, containing among other provisions the following:

The chief justice and county commissioners of each county were made a county board of education, empowered to divide the county into practicable school districts, and call an election for three trustees, to serve one year in succession. To these officials was entrusted the general working of the schools. The school revenues of the State were to be distributed per capita among these districts by the State treasurer, who was appointed ex officio superintendent of public instruction, and by the county officials. The \$2,000,000 spoken of was made a special school fund, which at 5 per cent furnished an income of \$100,000. Each district was expected to furnish a schoolhouse before receiving its share of the public funds. The freedom of the schools was not yet established—there being a rate bill for all able to pay—especially for filling out the time, while one-tenth of the State revenue was largely appropriated to the free schooling of poor children. Any primary department of a college or academy could be made a public school and subsidized by public funds. Amendments of the law in 1853 provided that the English language should be taught in all schools. In 1856 a mischievous law authorized the loaning of the school funds to railroad corporations. While this probably did facilitate the development of a large portion of the State by more rapid transit, it turned out a wasteful use of the school funds, large amounts of which were lost by the collapse of many of these corporations.

In 1856 \$10,000 was appropriated for the establishment of a deaf and dumb asylum at Austin, and arrangements were made to locate 20,000 acres of university lands. For many years the State benevolent institutions at Austin were under the management of the Bakers—uncle and nephew—originally from Maine, but well known as eminent teachers in Massachusetts. In 1858 the county courts were authorized to appoint boards of examiners for teachers. The amendments to the laws of 1854 in 1853 abolished the trustees and local district system, and made the county courts the guardians of public-school interests, the teachers being instructed to report directly to them. A subsequent amendment of the law in 1858 endeavored to arrest the waste of the school funds from the indiscreet loans to railroad and other corporations, and added the entire income of the sales of all public lands to the school fund.

Besides this record of legislation, gathered from the statutes of the State, there are few reliable sources of information concerning the actual result of so much lawmaking and such full and statesmanlike provisions for universal education. Superintendent E. V. Whittaker, who served during the period of reconstruction, in 1868 reports as follows: "I have not been able to find any official statement or record of the progress of education in Texas under these various laws, nor of the number of schools and teachers. There seems to have been but little inspiration, discernment, or progress. The State treasurer in his report complains of the clerical remissness of the counties in furnishing data. In the year 1861, for instance, out of a total of 124 original counties but 12 of the county courts made their reports as required by law. While the State was disbursing upward of \$100,000 annually for the support of public education, no summary of facts and school statistics were published or preserved." The superintendent presents such "fragmentary data" as the following:

"In 1854-55 the State treasurer, ex officio State superintendent of schools, reports a disbursement for public education of \$27,137. In 1856, 72,836 scholars with \$101,538 expended, \$1.38 per capita. In 1857, 87,000 pupils, \$106,000 expended, \$1.21 per capita. In 1858, 102,772 children, \$105,855 disbursed, \$1.03 per capita. In 1859, 101,181 scholars, \$113,154 expended, \$1.12½ per capita. In 1860, 104,447 pupils, \$104,447 expended, \$1 per capita. In 1861, 105,200 children, \$65,224 distributed, 62 cents per capita."

That the statements made by the superintendent of schools referred to did not misrepresent the actual condition of common-school education in the State during the period from 1845 to 1860 is shown by a report of the State treasurer, James H. Raymond, ex officio superintendent of common schools, in 1855. He states that "there is no provision in the law of 1854 by which the ex officio superintendent is to be furnished with a particle of material to construct a report." His source of information is the reports of twenty-eight chief justices, "not one of whom has thoroughly complied with his demand for information." From the published communications of these justices we gain an insight into the condition of educational affairs that explains the reason for the ill success of the generous action of the legislature. Of twenty-one school districts in one county in 1854 only two, and in 1853 only three, elected trustees. The slender amount of the fund to be distributed, \$27,138 in all—less than \$1 per capita—is assigned as one reason for this neglect. Another county reports but one district organized: "Almost everyone in our county being able to educate his own children, but little interest is manifested in the common-school system." Another county reports in 1855: "There are no schools organized under the statute." The small sum to be received, the sparse population, the difficulty of getting schoolhouses, etc., are assigned. Others report: "Some neighborhoods have very good schools on their own hook." In another county only 2 of 35 districts are organized, the reason assigned being "ignorance of the law, which is believed to be too prolix." Others make a better showing. In one 6 of 10 districts, in another 18 of 37, are organized. But still another reports only 4 in 15, and only 2 trustees qualified. One flatly repudiates the duty to organize, and 2 assert that there is no money, and the negligence of officials is largely responsible for the failure.

The city of Galveston, for which a special school law had been passed, elected trustees, but nothing more was done. The lack of funds is alleged as a cause of the failure. Another county organized 10 of its 21 districts. The judge of another county reports: "The law is a failure." Other justices suggest the raising of a charity fund, with a small amount required for paying tuition for poor children. Many counties report that the courts have no interest in the matter. One unfortunate county declares that it has no schools, and none have been asked for in the county. The monotonous report still comes in, "But little interest; only few districts organized." Doubtless the sparse population of the majority of these counties was the chief hindrance. The plan of distributing State aid to private schools did not seem to occur to any of these writers. It can not be questioned that, according to the report of one county, "60 cents a year is of no use in educating a child." The number of school children returned in 1854, for 100 counties, was 41,198. The moneys unexpended were supposed to lie in the hands of the county authorities, and became the occasion of legislative acts and a great deal of litigation. All the judges report a desire among the people to educate their children. It is probable that there were at this date a fair number of colleges for the better-off class, and a portion of the teachers were schooled in the academies and colleges, which were but another name for schools for the instruction of all who came.

But while for this and numerous other causes the people of Texas during the twenty-five years previous to the breaking out of the civil war did not realize the opportunities for the education of their children that the fathers of the State and the acts of their legislatures seemed to provide, the original declaration of Austin—"The people desire free schools for their children"—has never been forgotten.

In the year 1861 the secession of the State of Texas from the Union caused the suspension of the public-school system during the war. The State school fund of \$2,592,533.14 before 1855 had suffered depletion to the extent of \$1,285,327. The railroads had all forfeited their charters and were generally regarded insolvent. In 1868 there was due from the State to the school fund the large sum of \$3,549,418.58. The superintendent reports: "So largely has this great endowment been depleted

that it is very doubtful whether in its present condition an annual income of \$30,000 can be realized from it for the maintenance of schools."

The constitution of 1866, prepared during the temporary revival of the State government under the policy of President Andrew Johnson, contains wise provisions for the reorganization of the school funds, not only requiring the recognition of the land grants to counties and the alternate sections of railroad lands, but adds one-half the proceeds from the sale of all public lands. It also provided for a State board of education and a State superintendent of public schools.

By one provision the counties should have authority to negative the sales of their lands by the boards of trustees. The explanation of this apparent invasion of local rights seems to be that previously large losses had been incurred by the local officials disposing of these valuable properties for "a song."

This constitutional provision, although only of temporary effect, is here quoted entire, as a proof that even through the dismal period of civil war the determination of the people of Texas to educate their children was never abandoned. No fact in the history of popular education in the United States is more impressive than the steady growth of a common school public, from its inauguration under the leadership of Thomas Jefferson in Virginia, even before the establishment of the National Union, through long years of varied success and failure, until it emerged into public view from the wreck of the civil war as the most vital element remaining in the demoralized civilization of the seceding States, at once putting itself in friendly relations with the similar body of people in the North, and during the short generation from 1870 to the present time achieving such results as under similar circumstances find no corresponding record in the annals of mankind in any age or land.

[Constitution of Texas, June 25, 1866.]

ARTICLE X.—*Education.*

SECTION 1. A general diffusion of knowledge being essential to the preservation of the rights and liberties of the people, it shall be the duty of the legislature of this State to make suitable provisions for the support and maintenance of public schools.

SEC. 2. The legislature shall, as early as practicable, establish a system of free schools throughout the State; and as a basis for the endowment and support of said system, all the funds, lands, and other property heretofore set apart and appropriated, or that may hereafter be set apart and appropriated, for the support and maintenance of public schools shall constitute the public school fund; and said fund and the income derived therefrom shall be a perpetual fund exclusively for the education of all the white scholastic (inhabitants) of this State, and no law shall ever be made appropriating said fund to any other use or purpose whatever. And until such time as the legislature shall provide for the establishment of such system of public schools in the State, the fund thus created and the income derived therefrom shall remain as a charge against the State, and be passed to the credit of the free common school fund.

SEC. 3. And all the alternate sections of land reserved by the State out of grants heretofore made, or that may hereafter be made, to railroad companies or other corporations of any nature whatever, for internal improvements, or for the development of the wealth and resources of the State, shall be set apart as a part of the perpetual school fund of the State (and the legislature shall hereafter appropriate one-half of the proceeds resulting from all sales of the public lands to the perpetual public-school fund): *Provided*, That if at any time hereafter any portion of the public domain of this State shall be sold, and by virtue of said sale the jurisdiction over said land shall be vested in the United States Government, in such event one-half of the proceeds derived from said sale shall become a part of the perpetual school fund of the State.

SEC. 4. The legislature shall provide from time to time for the sale of lands belonging to the perpetual public-school fund, upon such time and terms as it may deem expedient: *Provided*, That in cases of sale the preference shall be given to actual settlers: *And provided further*, That the legislature shall have no power to grant relief to purchasers by granting further time for payment, but shall, in all

cases, provide for the forfeiture of the land to the State for the benefit of a perpetual public-school fund, and that all interest accruing upon such sales shall be a part of the income belonging to the school fund and subject to appropriation annually for educational purposes.

SEC. 5. The legislature shall have no power to appropriate, or loan, or invest, except as follows, any part of the principal sum of the perpetual school fund for any purpose whatever, and it shall be the duty of the legislature to appropriate annually the income which may be derived from said fund for educational purposes, under such system as it may adopt, and it shall, from time to time, cause the principal sum now on hand and arising from the sales of land or from any other source to be invested in the bonds of the United States of America, or the bonds of the State of Texas, or such bonds as the State may guarantee.

SEC. 6. All public lands which have been heretofore or may be hereafter granted for public schools to the various counties or other political divisions in this State shall be under the control of the legislature and may be sold on such terms and under such regulations as the legislature shall by law prescribe, and the proceeds of the sale of said lands shall be added to the perpetual school fund of the State. But each county shall receive the full benefit of the interest arising from the proceeds of the sale of the lands granted to them respectively: *Provided*, That the lands already patented to the counties shall not be sold without the consent of such county or counties to which the lands may belong.

SEC. 7. The legislature may provide for the levying of a tax for educational purposes: *Provided*, The taxes levied shall be distributed from year to year as the same may be collected: *And provided*, That all the sums arising from said tax which may be collected from Africans or persons of African descent shall be exclusively appropriated for the maintenance of a system of public schools for Africans and their children, and it shall be the duty of the legislature to encourage schools among these people.

SEC. 8. The moneys and lands heretofore granted to, or which may hereafter be granted for, the endowment and support of one or more universities shall constitute a special fund for the maintenance of said universities, and until the university or universities are located and commenced the principal and the interest arising from the investment of the principal shall be invested in like manner and under the same restrictions as provided for the investment and control of the perpetual public-school fund in sections 4 and 5 in this article of the constitution, and the legislature shall have no power to appropriate the university fund for any other purpose than that of the maintenance of said universities, and the legislature shall at an early day make such provisions by law as will organize and put into operation the university.

SEC. 9. The 400,000 acres of land that have been surveyed and set apart under the provisions of the law approved August 30, A. D. 1856, for the benefit of a lunatic asylum, a deaf and dumb asylum, a blind asylum, and an orphan asylum, shall constitute a fund for the support of such institutions, one-fourth part of each, and the said sum shall never be directed to any other purpose. The said lands may be sold and the fund invested under the same rules and regulations as provided for the lands belonging to the school fund. The income of said fund only shall be applied to the support of such institutions, and until so applied shall be invested in the same manner as the principal.

SEC. 10. The governor, by and with the advice and consent of two-thirds of the senate, shall appoint an officer to be styled the superintendent of public instruction. His term of office shall be four years, and his annual salary shall not be less than \$2,000, payable at stated times. And the governor, comptroller, and superintendent of public education shall constitute a board to be styled a board of education, and shall have the general management and control of the perpetual school fund and common schools, under such regulations as the legislature may hereafter prescribe.

SEC. 11. The several counties in this State which have not received their quantum of the lands for the purposes of education shall be entitled to the same quantity heretofore appropriated by the congress of the Republic of Texas (and the State) to other counties. And the counties which have not had the lands to which they are entitled for educational purposes located shall have a right to contract for the location, surveying, and procuring the patents for said lands, and of paying for the same with any portion of said lands so patented, not to exceed one-fourth of the whole amount to be so located, surveyed, and patented, to be divided according to quantity, allowing to each part a fair proportion of land, water, and timber.

The brief period of reorganization under the Johnson administration afforded no opportunity for the reorganization of the school system. By 1868 the State found itself in the hands of the General Government during the period known as

the disturbed era of reconstruction. A State superintendent of instruction, acting under these conditions, as we have already shown, could do little but lick educational affairs somewhat into shape. It was stated by the authorities that the school fund of Texas was an imperial domain of 4,850,630 acres. At an established price of \$2 per acre it was estimated that the State could realize \$9,000,000. But the public lands of the State at this period had been so loaned that there was little left of value to save from the gigantic waste.

The sum obtained from one-fifth of the revenue of the State, with what could be realized from other sources, it was thought would set on the ground "a system of primary schools, suited to the peculiarities of our country and population, and place instruction within the reach of every child of whatever color, condition, or race."

The generous provision for the State University in 1839, 221,000 acres of land, reinforced in 1856 by \$100,000 in United States bonds, and one-tenth of the railroad lands, were set apart for the establishment of this institution. The lands had been offered for sale on a credit of twenty years and were sold for \$3.34 per acre. But of this sum \$379,168 was absorbed during the civil war. In 1868 there was left \$134,478 in Government paper. The cheering words of the State superintendent read not so much as an encouragement and warning to the 600,000 people of Texas as a prophecy of what the present Commonwealth has achieved during the thirty years since their utterance. He writes: "From this war we have emerged with changed purposes and an altered destiny. We are not the same people that we were, and we can never be the same. For us the task is set to place our Commonwealth in line with the nineteenth century, and to readjust the course of the ship of state for a new distant voyage. A civilization rehabilitated and enlightened by new ideas is our chief end, and the education in them our pressing duty. Let the Commonwealth, in its organized capacity, provide the bread of knowledge for all its children and labor to establish this method of public security. Let our motto be, 'Universal suffrage requires universal education.'"

Here is the proper halting place in this deeply interesting record of the educational history of one of the most characteristic States of the Union. During the first generation of thirty years the broad and generous ideals of the fathers of the new Republic and State had been promptly responded to by the very liberal action of the people, as represented in the legislature. But the difficulty was evidently at the point where these ample provisions and good intentions were to be organized in a working system of common schools for the children of the white race. When the superior class, acting on the educational lines of the Southern States from which they came, had supplied themselves with private family instruction, neighborhood, academical, and what were known in the South as collegiate schools, there was left too small a margin in this sparsely populated immensity of domain to assure any permanent success in organizing what was so little known and generally distrusted as the common school of the Northern States. The remaining thirty years of the history of popular education in Texas, when written, will be a story of another sort, a record perhaps as remarkable, in view of all the circumstances and environments of the case, as any that can be shown, either in our own or any other country in modern times.

CHAPTER XI.

COMMON SCHOOL EDUCATION IN THE SOUTH FROM THE BEGINNING OF THE CIVIL WAR TO 1870-1876.

EMBRACING THE PERIOD OF PREPARATION FOR UNIVERSAL EDUCATION IN THE
ELEVEN CONFEDERATE STATES DOWN TO THE RECOGNITION OF THE COMMON
SCHOOL SYSTEM IN THEIR REVISED CONSTITUTIONS DURING THE PERIOD OF
RECONSTRUCTION.

By A. D. MAYO, A. M., LL. D.

Contents.—Introductory.—Elementary schooling of the freedmen in Washington during the war.—Beginnings of education for the freedmen in Virginia.—The Government of the United States in the education of the freedmen.—The educational work of Gen. Rufus Saxton among the freedmen of the Department of the South; of Gen. John Eaton among the freedmen in the Mississippi Valley.—The inauguration of the common school system among the colored people of Louisiana, by Gen. N. P. Banks, 1863-64.—The Freedmen's bureau.—The Peabody education fund.—The mission schools established by the churches and people of the North.—The Hampton Normal and Agricultural Institute.

In several previous essays in the Reports of the United States Commissioner of Education an attempt has been made to present a historical record of the growth of popular education in the original fifteen Southern or slave States, from the appearance of the elaborate scheme for schooling the whole people, proposed by Thomas Jefferson as early as 1779, to the breaking out of the civil war in 1861. By reference to these publications it will be seen that, while these States had undeniably more than once been moved by the combination of the educated and the upward pressure of a section of the secondary class of their population to a periodical establishment of the people's common school for white children, it was only in a few of them that anything that could be regarded as such an arrangement existed in 1860.

In the new State of Missouri and the old Commonwealth of Kentucky a public school system had already been established, and in several of the principal villages and cities in other States a good foundation was laid for future growth. In North Carolina, where at that time no city of considerable proportions existed, even few villages containing 5,000 people, a public school system for white children and youth, under the general State superintendency of Rev. Calvin Wiley, had been maintained for several years. In Delaware, Maryland, Virginia, North Carolina, South Carolina, Tennessee, Kentucky, Georgia, Alabama, Mississippi, Louisiana, and Missouri, a State university or college foundation claiming this rank had been in operation for periods of various duration. But in the majority of these States, outside a few chief cities like Baltimore, Md.; Wilmington, Del.; Charleston, S. C.; Savannah, Ga.; Mobile, Ala.; New Orleans, La.; Nashville and Memphis, Tenn., and other less important places, the attempt to establish the common school for all

white youth had failed. All these States had again and again been stirred by agitation for a system of popular education, proceeding from a growing educational public under eminent leadership. Attempts had been made in several States, more than once repeated, to establish an arrangement for schooling the white population, more effective than the unreliable method by the "old field," family elementary, private and parochial school, and the various types of the academical seminary for the secondary grade. But, owing to causes fully referred to in these essays, these ventures had either failed entirely or, in the more numerous instances, fallen into partial collapse.

As the swift and troubled years drifted all these States toward the "dread arbitrament" of war, which was to determine the future of the American Union, these efforts were baffled by the growing estrangement from the North and a popular distrust of its most characteristic institution, the common school. In the cities already named the system of public instruction was often administered by teachers and superintendents from the great educational centers of the North; but the masses of the white people in these fifteen States were denied the enjoyment of a free or even a competent tuition public school. The illiteracy of the white population in these States has never been correctly estimated or even known at home.

That the superior class in these Southern States was found at the breaking out of the war in a condition of great executive efficiency for the prodigious work to which it had set its hands, and that the masses of the nonslaveholding people—probably four times as numerous—did add a luster to the American name by their bravery and persistence, their spirit of sacrifice, and the endurance of awful suffering in their devotion to their great leaders, is now a matter of history. It must never be forgotten that of all modern peoples the people of the United States is the one that has been least dependent on what can be learned from books and taught through the agency of schools for the development of a national character, for the very form of government, order of society, the condition and opportunities of industrial life, and experience in public affairs by all classes of white people in the United States during the long colonial and nearly a century of the national life had from the first been in itself a university more stimulating, disciplinary, and inspiring than had ever before existed.

Even the 5,000,000 negro slaves, on their emergence from the darkness and twilight of their condition into the common life of freedom, will be best understood in their relations to a republican civilization. Here, in contact with a superior class, through a period of more than two hundred years, this people underwent the most rapid and effectual transition, from the depths of pagan barbarism to the threshold of a Christian civilization, on record in the annals of mankind.

There was certainly found during the period of the great conflict and the subsequent years of reconstruction—a period of fifteen years that sorely tested the mental and executive capacity of the Southern people—no such evidence of incapacity in the prosecution of a gigantic war under the most tremendous difficulties and the rapid recovery from absolute defeat and industrial ruin as would remand the population of these States to the category of ignorance. In fact, there was not in 1860 a population of 10,000,000 in any country that could make a more notable display of all the qualities necessary to the prosecution of a great war and the administration of public affairs than in these fifteen American Commonwealths.

Although the contest through more than seventy-five years for universal education in these fifteen States had borne fruit and, in 1860, was represented by a larger and more influential public than ever before, yet the South in 1860 was strongly wedded to the British system of education of half a century before. It is probably true, as claimed, that a larger proportion of the white youth of the male sex were gathered in institutions bearing the name of college and university in this than in the Northern section of the Union in 1860. It is true that many of these seminaries were in no elevated sense of collegiate rank and, with a few

notable exceptions, the majority of them were not abreast of corresponding foundations of the higher education in the North. But the very absence of facilities for good common school education, both in its elementary and secondary departments, forced large numbers of pupils into schools above their capacity and compelled the colleges for both sexes to confine themselves largely to the work of what is now regarded a secondary grade. In 1860 the South was better furnished than the North with military schools. But the absence of any thorough system of education under public supervision and the consequent dearth of reliable statistical information makes all attempts to set forth with accuracy the real condition of Southern education in 1860 well nigh an impossibility.

But of all that was actually on the ground in 1860, whether understated or overstated by conflicting estimates, the greater portion had certainly gone the way of all Southern affairs in the disastrous wreck of the entire industrial and social order through the utter collapse of the Confederacy and the emancipation of the five or six millions of negro slaves in 1865. The attempt to recall the educational expedients to which even the leading families of the country were left during the four years of conflict is so baffled by the lack of reliable information that it is only by the putting together of fragments, pieced out by personal recollections, that any competent presentation can be made. It is certain that several of the State universities, especially of Virginia and North Carolina, besides a number of denominational colleges, were held in session until the final collapse. But a majority of the lower schools were closed at an early period. In portions of the country not disturbed by the ravages of war certain local schools were kept alive, although the terrible drain on the people for the support of extensive military operations and a paralysis of industry made it impossible to sustain the larger academical schools in anything like their usual condition. There was, doubtless, a considerable amount of teaching of young children in the homes from which, long before the closing campaign, almost every capable fighting man, often the entire population of competent age, had been drafted away. The annals of this, the most picturesque of modern wars, are lighted up by the accounts of whole regiments of soldiers in winter quarters, and even large numbers of Confederate soldiers in Northern prisons, being classed in school work.

In one notable instance a school was organized in a great prison camp in which a college professor resumed his old seat and laid the foundations of future scholarship in the more ambitious youths. In several of the cities which, like Mobile, Ala., remained until a late period in possession of the Confederacy, the public-school system was kept alive. In the State of North Carolina it is told that 60,000 children were held in school until the final occupation of the State by the advancing army of General Sherman. In the border cities like Baltimore, Wilmington, Louisville, and St. Louis, the schools remained in session, although half crippled by the constant drain on the resources of the people and by the inability of the country to endure a heavy taxation.

But it is interesting to note that, amid the excitements of the prodigious conflict, the more thoughtful men of the South were pondering the future educational needs of the Confederacy. A remarkable instance of this is a report by Prof. E. S. Joynes,¹ then of Hollins Institute, in Botetourt County, Va., one of the best of the class of the female seminaries, which had remained in session almost to the end of the war. Professor Joynes was, even then, one of the most distinguished of the scholars and educators of the Atlantic South. He had studied abroad and enjoyed the acquaintance of some of the foremost minds of that period. He doubtless represented a considerable body of the leading teachers of these States in his idea concerning the building up, at once on the declaration of peace and the establishment of the Confederate government, of a complete system of public instruction mod-

¹ Reprinted as Chap. XII of this Report.

eled on the Prussian schools. So engrossed was he and the management of the Hollins Institute with the vision of the coming nation, that it did not seem to occur to them that the Confederacy itself was already smitten with death and tottering to its fall.

On the day that the news of the capture of Atlanta by the army of General Sherman was received in Virginia, August 20, 1864, this admirable report of Professor Joynes was read to the trustees of Hollins Institute and a vote recorded to reorganize that institution as a great normal school, especially for the preparation of the large number of educated women of the superior families already reduced to poverty, for the profession of teaching in the new public schools for all classes of the white children and youth. Professor Joynes has lived to witness the realization of far more than he prophesied, under a restored and reconstructed Union.

The most notable characteristic of our great civil war, wherein it differed essentially from all previous similar conflicts of national importance, was that the process of upbuilding the new American in place of the destruction of the old-time local and provincial order of society went on from the opening guns at Fort Sumter in 1861 until the last State was relieved from military occupation and its affairs restored to the charge of its own citizens, in 1876. This radical process, though inevitably misunderstood by the people of the eleven seceding States and very imperfectly appreciated even by the majority of the military and civic officials who were often compelled to participate in it by a powerful and almost unconscious movement among the loyal people of both sections, was evident from the first to the more thoughtful observers of affairs.

First came the immediate cooperation of the friends of the Union with the National Government in the border States of Maryland, Delaware, Kentucky, Missouri, and the portion of Virginia which, by geographical position, had already become a portion of the Northwest. These five Commonwealths were held fast, not in any impossible attitude of armed neutrality, but in open and assured support of the national cause. Each contributed largely to the preservation of the Union in all patriotic ways and at a far greater sacrifice than the Northern States. The people of West Virginia had also to overcome the natural pride of citizenship of the Old Dominion, and all these States put behind them the sentiment of loyalty to the South that elsewhere almost annihilated the attachment to the Union. From these five States went forth not less than a quarter of a million of white and colored Union soldiers, the former not inferior to the best fighting material in the Union armies, and the latter, with a larger body that rose up to welcome the onward march of the Republic, to a considerable degree at least neutralizing the aid and comfort given to the Confederate cause by the work of the slaves at home and their services as laborers in the camp. It may, indeed, be regarded an open question whether the Union could have been preserved without the aid of this reinforcement of physical and moral power given by its Southern loyal contingent to the growing conviction that the war was only the beginning of a complete revolution in society through every State of the South. By no one was this important factor in the great problem appreciated so completely as by the President of the United States. Mr. Lincoln, by his nativity and the peculiar training of his entire younger manhood, was himself an illustrious representative of this portion of the country and, from the first, understood the vast importance of its cooperation in the mighty undertaking of bringing all the fifteen Southern States into line with the remainder of the Union. The other forces that wrought to the same end were military and civic, acting in another environment of circumstances, although, of course, dependent on the emancipation act for their opportunity. And even that momentous act would have gone South weighted with a doom of destruction had it not been anticipated and at once responded to by these movements coming in rapid succession during the ten years that followed the advent of peace. They were all the offspring of the same moral and religious conviction that in both sec-

tions of the Union, from the foundation of the Republic, had developed the agitation against the existence of negro slavery.

For half a century this movement had been held in check by the political and industrial interests of the North, so complicated in their relations with the slave power. It was everywhere stigmatized, even in the free States, as the destructive agitation of a party of religious fanatics and political impracticables. It was, in reality, the result of the moral convictions of the foremost mind and heart of our own and all civilized lands. But it was better understood in the South than elsewhere that, if permitted to go on unchecked, it would not only abolish negro slavery, but change the entire organization of Southern society from a belated British to the coming American type. It was for a full generation an educational and moral rather than a political movement, a steadily gathering protest wherever the influence of the slave power appeared.

But now that the great conflict for the preservation of the Republic had ended by the virtual destruction of the entire order of slave society, the more thoughtful Northern leaders of the old antislavery movement at once realized the perils of the situation; for the end came only by the extinction of all the vital forces of the Confederacy. Eleven great American Commonwealths, with a population of 10,000,000 white and 5,000,000 emancipated colored people, lay prostrate at the mercy of the nation, wielding a victorious army of 2,000,000 fighting men, under conditions open to all the terrible temptations of military and civic ambition which have wrought the ruin of the proudest nations in history. The problem now was to begin, at once, the work of reconstruction at the foundations of society; at first to prevent the vast region occupied and overrun by the armies from lapsing into anarchy or being stricken with a social paralysis. The old leading men of these districts during the war were away in the army or "refugeeing" within the lines of the Confederacy. The negroes, as fast as emancipated by the army, even before the edict of the Government, were in peril of becoming a dangerous element. Under the Confederacy they had the life of the women and children and largely the menial offices of the army at their disposal. Everything was to be done for the salvation of the Southern people while the Union army was steadily battering down the strong bulwarks of the powerful and aristocratic order of society that represented the convictions and achievements of the South for two centuries.

In steady succession, evolved from the profound conviction that the Union could only be saved when these States were not only conquered by arms but their people brought in line with the progressive ideals of society and government certain to prevail in the Republic, came up four movements which, emerging from partisan controversy, were finally everywhere regarded as the soul of all the successful life of the future in the new South.

First came the appearance of the Christian people of the North following the Army as an agency of peace and good will, as far as possible restoring, rebuilding, and placing on the ground abandoned by the Confederacy the beginnings of a characteristic American society. The dominant motive of that original body, which reached out a helping hand to the enemy, was not only patriotic but friendly and Christian. These people spent themselves in giving relief to the helpless of both races left behind the retiring Confederate armies. From this movement was developed the necessity of organizing the swarming multitudes of the negroes, left behind in a conquered territory, into some scheme of civilized society through legal marriage, free labor, and civil order. Of necessity there was next developed the attempt at the instruction of the freedmen in letters, which was the beginning of the wonderful educational revival which in less than forty years has established the American common school in its full significance through the immense territory of these sixteen States. In this great work the army officials and members of benevolent institutions cooperated in behalf of all who would accept the proffered aid. This primary educational movement reached its culmination in the placing

of a provision for universal education in the revised constitution of every State during the early period of reconstruction by the vote of its own people within ten years of the close of the war. In doing this it developed a system of public instruction that in itself created the public opinion which has taken up the work and borne it on to its present auspicious result.

Second. Next came the great benefaction of the educational fund of \$3,000,000 by George Peabody; as he declared, "A gift to the suffering South for the good of the Union." At the time this was the largest and beyond all others the most important contribution to the education of a whole people for a republican government by one man in the history of the world. Its donor was a native of the State of Massachusetts, for a time a resident in the South, and ultimately a distinguished and successful merchant and banker in London, never having transferred his American citizenship. This remarkable gift in a peculiar way represented the entire interest of Christendom in the most radical feature of society in the reconstructed slave States.

Third. In due time came the establishment of the national Bureau of Education. Originally it was one of the many fruitful ideas of Henry Barnard, the chief literary apostle of the great educational revival in the North from 1830 to 1860. The idea was taken up in an enlarged form in response to the educational exigencies of the time. Before this the National Government had only in one way shown especial interest in the fundamental enterprise of educating the American people for sovereign citizenship. By the great act of the Congress of the old Confederation, confirmed by the National Congress, a vast domain of the public lands had been consecrated to the schooling of the children and youth of all the States hereafter to be admitted to the Republic. By this act the Congress of the United States not only laid the foundation of the new American civilization beyond the Alleghenies, but put itself on perpetual record as the sponsor for the common school. Now, by the creation of the national Bureau of Education, the Congress of the reconstructed Republic established an organization that, for the first time, could distribute among all the States the knowledge of what was in operation at home and of what was best done abroad in all departments of education. To the South especially this was a benediction, for without it the schooling of its people would probably have longer gone on in the channels of the old-time British aristocratic methods which, until a short generation ago, left great masses of Englishmen an uneducated population. The national Bureau of Education has become, beyond question, the most effective public educational organization in Christendom, not only by its admirable work at home, but reaching out to every nation and distributing everywhere the best results of that wonderful movement which already has made our own the children's age.

Fourth. Largely owing to the influence of these powerful departures, we trace the attempt in the Congress of the United States from 1880 to 1890 to inaugurate a generous system of national aid to education, virtually for the relief of the South. Although finally defeated, for the first time in American history this movement brought the whole subject of popular education for debate before the Congress of the United States. The remarkable series of discussions in the Senate of the United States, which three times passed "the Blair bill," will stand in history as, in many ways, the most important manifestation of the higher political and educational sentiment of the South at that period since the close of the civil war. The last word has not been spoken or the last effort made in this direction. It has only to be demonstrated to the American people what is now well known to all competent educators, that several of these States have practically reached the limit of their financial ability to sufficiently protect themselves from the widespread and perilous illiteracy which has already become a national peril to awaken another effort, even more radical and of accepted wisdom, for elevating the quality of American citizenship among several millions of our people.

It was not by accident, or even in answer to imperious necessity, that these four movements were along educational lines. The American church is still so bound in the toils of ecclesiasticism and sectarianism that the majority of its vast and beneficent plans for the public benefit of the people are prejudiced by its perpetual internecine war of sects, creeds, and parties. But, happily, in our country the educational field is in no such way distributed off and preoccupied by rival classes and schools. Here was an opening into the very heart of the Confederacy and, through the schools, to the hearts of the children. Here could the wise and good men, and especially the wise and good women of every sect, church, party, and social class, unite to lift up the illiterate millions of this extensive realm to the condition of mental, moral, and industrial intelligence, without which these States would have forever remained a conquered province, hopeless of genuine union with the remainder of the country.

It would indeed have been "the crime of the ages" had the North and the nation left the system of Southern education on the ground in 1860 amid the rubbish of the general wreck of 1865. That system, until half a century ago, was the same that prevailed in England and in more than one of the older States of the Union. Its merit was that it did give to the more favored class everywhere the best schooling then in vogue, and was the most efficient element for its training in the executive capacity in public affairs, which is the stronghold of every great aristocracy. In fifteen States it did lift up to the almost supreme control of public affairs a class, probably in 1860 more powerful for evil or good than any similar body of "first people" in any land. Its destruction at the downfall of the Confederacy, if not followed by a broader and more rational system, would have been a calamity to these populations for which the people who saved the Union would have been left with no excuse before the great judgment-seat of history.

It was the instinctive realization of this, not only by leading educators, but by the intelligent people of all orders, including all the great historic leaders of the people through the whole war period, that brought forth in succession this series of movements and measures by the cooperation of the military, civic, religious, industrial, and educational forces of the Union, all converging upon the supreme enterprise of laying in these States the final and permanent foundation of the American in place of the old-time provincial and local order of society, which was essentially the reproduction of the British order of a century ago.

If, indeed, it is granted to the great departed of this world to overlook and rejoice at the long-delayed fruition of their earthly labors, we may well recall the enthusiastic exclamation in the correspondence of Thomas Jefferson and John Adams: "You and I will rejoice in heaven over the coming of the glorious day of the education of the whole people!" It was given to Thomas Jefferson in his lifetime to see only the upper story of his comprehensive scheme for the schooling of the children and youth of his native State in actual operation. The University of Virginia waited half a century before the people's right to universal education was assured by the establishment of the present system of common schools. It will be remembered that Jefferson's original plan included the emancipation and training of the young slaves for freedom; but the Virginia of the old dispensation only responded to her great educational statesman by a provision for the schooling of poor white children, so meager and unreliable that even the "lower orders" either rejected or remained indifferent to it. But from the beginning of the existence of Virginia as a State in the Union the agitation inaugurated by the group of eminent public men who first represented the cause went on with increasing momentum. The movement was represented by a remarkable school literature, frequent educational conventions, and occasional trials of strength in the legislature.

It was one of the significant and almost dramatic events with which the fifteen years of the civil war and the period of reconstruction were crowded that the Gov-

ernment of the United States took up the American idea of universal education as related to the colored race almost in the opening months of the conflict. After a brief period of uncertainty, during which several of the commanders of the Union armies indulged themselves in sending back escaping slaves to their masters, Gen. B. F. Butler cut the legal knot in the tangle by declaring the negro bondmen in the districts occupied by the Union force, "contraband of war."

General Butler arrived at Fortress Monroe, where he was intrusted with an extensive command, including Virginia and North Carolina, on May 23, 1861, scarcely a month after the firing on Fort Sumter, in Charleston Harbor. On the same day the State of Virginia practically seceded from the Union through the passage of an "ordinance of secession" by the convention called to decide that question, although the vote of the people indorsing this action came later. On the following day three negro slaves belonging to Colonel Mallory, in command of the handful of Confederate militia gathered to oppose the advance of the national forces, arrived in the Union camp. Their master was proposing to send his numerous family of colored people to Florida, and these intended to remain. General Butler at once declared them "contraband of war," put them at work, and informed President Lincoln that he had decided on this way of treating all similar comers. This policy, emphasized by its striking title, at once struck a responsive chord of sympathy in the loyal heart of the North and, not being forbidden by the Government, relieved the military authorities from the prodigious annoyance of acting as a vast police organization for enforcing the fugitive-slave law in what was declared by the Government "an enemy's country."

THE ELEMENTARY SCHOOLING OF THE FREEDMEN IN WASHINGTON, D. C., AND VICINITY DURING THE CIVIL WAR.

Even before the action of General Butler had borne any permanent results in educating the "contrabands," the first considerable movement for their instruction had been inaugurated in Washington, the capital city of the nation. One of the most unique spectacles for the immense crowd of loyal people from the Northern States which thronged the national capital from the beginning to the close of the civil war was the camps and schools of the colored "contrabands." At the first disturbance in Virginia beyond the Potomac River, the drift of the negroes, either from the estates abandoned by their seceding owners or escaping from slavery, overwhelmed the metropolis like a mighty flood. Common humanity demanded that these poor people, including whole families and neighborhoods, should be saved from starvation and disease and be made comfortable. At first they were "corralled" in abandoned buildings and barracks, or, through the warm season, in camps located in different parts of the city; one of the groups, in "Duff Green's Row," near the national Capitol. The great necessity of the Government for labor, and the presence of thousands of soldiers and strangers in and near the city, gave occupation to the able-bodied. But as it was the policy of the Confederates to carry away with them a large number of this class for work in the army, there was left a great throng of the old and sick, women and children, in the growing multitude.

Doubtless this spectacle of the actual slave population, even of Virginia, was a shock to many of the most zealous advocates of immediate emancipation, to whom the negro had been, from the violent contention over his rights and wrongs through long years, the most romantic figure of his time. The spectacle of miserable ignorance, half-pagan superstition, and often beastly vice, furnished by these great collections of unfortunates, while it appealed to the pity and charity of all, must have suggested, often for the first time, the tremendous problem of the emancipation and development of the 5,000,000 slaves, suddenly thrust upon the American people by the clearing away of the smoke of the first gun fired upon the flag at Fort Sumter in April, 1861.

But it is not in the nature or the habit of the American people to long stand appalled before any problem, however obscure, in the domain of material, moral, or spiritual affairs. The ready response of the benevolent soon relieved the destitute, and there was work enough for those who were able and willing. As soon as the question of support was settled there was a concerted movement upon these people, as on a newly discovered mission field, from all the ecclesiastical and educational agencies in the North. We must remember that for an entire generation, while the Northern people had been profoundly agitated, even wrought up to the point of making the nonextension of negro slavery the occasion for the formation of the new political party that elected Abraham Lincoln to the Presidency in 1860, it had been absolutely impossible to get at the millions of slaves in the South for any religious or educational purpose whatever.

It was a severe legal offense in nearly all the Southern States to teach a negro slave to read. The free negroes were banished from several States, and in the latter years of this period no minister or teacher could safely have gone South indorsed by any mission proposing the material, mental, moral, or industrial uplift of the slave. The only legal contact of the Northern people with the five or six millions of the race was the obligation to aid the master in hunting his fugitive, or, in defiance of an imperative law enforced by heavy penalties, help the fleeing bondman to escape across the Canadian border to the protection of the British Government. So it is not at all remarkable that on the appearance of a swarming contingent of "contrabands," as the escaping slaves were called by General Butler at Hampton, in the nation's capital, the grand army of the zealous philanthropic and charitable organizations and private recruits from all the loyal States should take up its line of march to inaugurate a genuine "campaign of education," the mighty work of training these new candidates for American citizenship. In this crusade they were assisted in the District of Columbia by an enterprising and courageous colony of the colored people who had already established schools for their own children: collecting together many teachers and laying the foundation of what has since become the most complete system for the education of the colored race in the country.

The American Tract Society seems to have been the first of the religious organizations to appear with a definite plan of work among the "contraband" camps. As early as March, 1862, a meeting was held, almost under the shadow of the Capitol, in Duff Green Row, by an agent of this society, aided by several clerks from the Government departments, to enlist 60 candidates for common schools. It is significant that on this first day these poor people enjoyed a double emancipation, not only from their estate of chattel slavery, but from that other intolerable yoke of bondage that still galls the neck of several millions of children of all races and conditions in the United States, the learning to read by the obsolete and absurd A B C method. This fortunate first class of 60 was taught to read by a skilled teacher, after the "word method," about that time being introduced into the best elementary schools of the country. The first lesson was drawn from the Bible, and it was a great triumph to the pupils to be able to "read a whole verse in half an hour."

This school increased in numbers from week to week. A lady expert in the new method of instruction became prominent. Dr. Lorenzo D. Johnson, a well-known and able citizen of Washington, then in private practice and afterwards a surgeon in the army hospitals, was placed at the head of the work, which had grown betimes, and conferred on its early workers a title of honor more grateful than any bestowed by institutions of learning.

It is unnecessary to repeat the long and interesting story of the rapid progress of this effort for the uplift of the poor and lowly, beginning with the war and in Washington and ending only with its transferral to the charge of the organized system of public education of all grades, supported by appropriations from Con-

gress and local taxation in 1867. An elaborate account of all this can be found in the nineteenth volume of Dr. Henry Barnard's *Journal of Education* for 1870, with other interesting material, covering 200 closely printed pages, giving a full and fair account of the original movement in Washington for the schooling of the colored people, encouraged by some of the foremost men of the country, until it became a vital department of the common-school system in every Southern State. All the religious denominations in the country, from the West and the North, during the years of the war came to the rescue, and with occasional aid from the Government and constant cooperation from the nation gave the movement a prodigious momentum. Gen. James Wadsworth, of New York, in charge of the forces at Washington, afterwards killed in the battle of the Wilderness, representing a family celebrated at home both for its great wealth and zeal in the cause of public education, found here a new and broad field for his favorite philanthropy. The most distinguished public officials were attracted by the spectacle of this experiment of planting the American order of society at the nation's capital, which a year before had been one of the most noted slave marts of the country. On the night of December 31, 1862, the entire population of these camps were found on their knees in prayer to welcome the stroke of the city clocks on January 1, 1863, that ushered in "the great, the important day, big with the fate" of millions of their people, the abolition of negro slavery in the Republic.

In June, 1863, a freedmen's village was established on Arlington Heights, opposite Washington, in Virginia, where 250 children, just from the plantations, were put forth as the nation's "awkward squad" in the elementary drill of the people's common school. At a later date the most noted slave-pen of the city was remodeled into a common schoolhouse for white pupils. Great numbers of the colored elders bent over their schoolbooks. As Gen. Rufus Saxton reported from South Carolina, the colored soldiers carried their spelling books in one hand while lying on the field of battle, under fire, clutching their muskets with the other hand. Eminent visitors to the capital and diplomatists from foreign lands were escorted through the contraband schools by the Secretary of State, Hon. William H. Seward, whose utterance ten years before, "the irrepressible conflict between freedom and slavery" was denounced by the leading New York press as "bloody and brutal." In 1863 there were 40,000 colored refugees in and about Washington, and some 3,000 under instruction. Rev. A. E. Newton, of Philadelphia, now appeared, and afterwards became an important worker in the building up of the final system of excellent public schools for colored children and youth in the capital city.

Nearly 20 different associations and organizations, besides a large number of private enterprises, are on record as engaged in this work in 1864-65, including, probably, 5,000 children and adults in religious and educational training. In the autumn of 1867 the management of these was withdrawn, as it was believed that the trustees of the public school system were able to deal with the entire colored population. A few of the mission schools still held on, and out of this movement has been developed a group of large and useful seminaries for the secondary professional and industrial education of colored youth. One of these, Howard University, still receives a considerable yearly appropriation from Congress in aid of its secular, industrial, normal, and medical departments. The account of this and similar institutions will be given farther on, in connection with the history of the Freedmen's Bureau and the subsequent establishment of the present public school system of Washington and the District of Columbia. It is estimated that \$160,000 had been expended by the various benevolent agencies for education in Washington during the four years until 1866. But this is doubtless a very inadequate estimate, for during these years few persons of any substance visited Washington without leaving a substantial token of their interest.

The United States Government did not at any time assume the direct support

or supervision of these schools, although in many indirect ways it gave aid and comfort to the work. It was not here, at the capital, but in the field of military operation on the Southern Atlantic and the Gulf coasts and in the valley of the Mississippi that the great movement in behalf of the development of the new freedmen into respectable citizenship was organized on a vast scale, including possibly a third of the entire colored population of the fifteen slave States in its direct and indirect influence and the expenditure of many millions of money. We now proceed to give a brief account of these important operations, of which there has been left a complete record in the great library of public documents and private pamphlets, which indicate the significance of these fundamental agencies in the establishment of the complete American system of universal education in all the original States of the South.

But as early as April, 1862, the Congress of the United States came to the rescue in the most practical way by the passage of an act requiring that "10 per cent of the taxes collected from persons of color in Washington and Georgetown be set apart for the purpose of establishing a system of primary schools for the education of colored children residing in these cities." The boards of trustees of these cities were made custodians of the funds thus collected and of private collections given in addition, although at first the public opinion of the white population of Washington did not especially favor this beginning of the education of colored children at public expense. The result was that the sum of \$736.86 only was collected in 1862 and 1863. This unjust and grossly inadequate method of compelling the most destitute class, the freedmen, to educate themselves was a failure from the beginning. After numerous attempts to prop up a bad system administered with no good will by the local trustees, Congress, under the leadership of Senator Patterson, of New Hampshire, who came into public life from a professorship at Dartmouth College, New Hampshire, and later, after a brilliant administration of the office of State superintendent of education in that State, returned to his alma mater, where he rendered important service, placed the support of the colored schools of the city and District on the just foundation of a share in all public school funds, divided according to the per capita of population.

Under this law the first public school for colored pupils in Washington was opened in March, 1864, in the Ebenezer Church. Miss Emma B. Brown was engaged as principal, at a salary of \$500 a year. The school began with 40 children and soon increased to 100. A year later the first public schoolhouse for colored children was erected by a donation from Connecticut of \$1,000. In 1867-68, when Congress finally placed the system on a working foundation, there were 41 schools, 25 under private and denominational religious control, with 3,000 pupils and 70 teachers. The colored population of the District of Columbia then was 55,000, making a school population, from 6 to 17, of 9,225. Of the entire population of the District of Columbia, including Alexandria, in 1860 (about 14,000), 3,244 were slaves and 783 free negroes. In 1860 there were 10,000 free negroes and 3,000 slaves in Washington. At first the teachers in the colored schools were chiefly white, but their places were taken as soon as suitable persons could be found of the colored race. The board of three trustees, two of them colored, was appointed by the city authorities. Subsequently the control of the colored schools for both races was assumed by a board of education, appointed by the Commissioners, in whose hands the entire administration of municipal affairs of Washington is placed. The Commissioners are appointed by the President of the United States, and all legislative power of the District resides in Congress. There were some 2,000 colored children in 1869 gathered in 40 public, church, night, and industrial schools in the cities of Washington and Georgetown.

In the District of Columbia, outside the two cities, an attempt to establish a system for colored schools was defeated by the adverse vote of the people. The women of the District entitled to the franchise generally acted with the majority.

In the region outside the two cities the progress of educational reform was similar to that already recorded, and the entire District was finally included in the public school system.

The famous negro mathematician and astronomer, Banneker, was born in 1739, at Ellicott Mills, Md., adjacent to the District of Columbia, of free parents. Prior to 1809 free people of color voted in that State. Banneker lived alone and unmarried in a cabin on his father's farm, became a profound student of his favorite sciences, and died in 1804 at the age of 72. For thirteen years he published an almanac. The first copy was sent in manuscript in 1791 to Thomas Jefferson, who sent a copy to the Academy of Sciences in Paris. Its publication greatly interested Mr. Pitt, Fox, Wilberforce, and other celebrated men abroad. Jefferson, in his reply to Banneker, reiterated his deliberate opinion on the capacity of the colored race for education, calling them "our colored brethren and fellow-citizens."

BEGINNINGS OF EDUCATION FOR THE FREEDMEN IN VIRGINIA.

It would seem like the "dispensation" of an overruling Providence that the land clouded by the shadow of the first slave ship, the coast of Virginia, on Hampton Roads, near the present city of Newport News, should also have become the scene of the opening act of emancipation by the mandate of Gen. B. F. Butler, who decided that the slaves who wandered into his camp at Hampton were "contraband of war." On September 17, 1861, not six months from the opening of the great civil conflict, Miss Mary S. Peake, a colored woman, opened a school for colored children, assisted by the American Missionary Association, which during more than forty years past has been such a potent agency in the training of superior colored youth for the leadership of their race. In 1862 five additional schools were set up at Norfolk and Newport News, one in the old court-house at Hampton, and one at Suffolk. The Boston Educational Commission, under the presidency of Governor John A. Andrew, aided in the fund which sent more than 70 teachers to the South. In 1863 the emancipation proclamation woke up the colored people of every age to reach out and up toward the elementary schooling in letters and intelligent industry which was the only assurance that the new freedom would be a blessing and not a curse to their people. A great crowd of teachers, many of them women of excellent attainments, high character, and assured social position, from all the Northern States and from the Dominion of Canada, went into the portions of the South that were in the possession of the Union armies. In Virginia many of the country houses of the "first families" in the seacoast district thus occupied were appropriated for this use. The mansion of Hon. Henry A. Wise, of Accomac County, one of the most zealous advocates of the common schools for white youths before the war, was among the number. There were no less than 50 of these schools in operation, including those held at night for adults. In the city of Norfolk not less than 1,200 pupils were taught by 15 colored instructors. The year 1864 saw the number of schools and teachers doubled. All these schools passed under the administration of the Freedmen's Bureau in 1865. They were supported by the contributions of churches, associations, and private benefactions, although the Government, through the Army, gave indirect aid.

The fall of Richmond and the collapse of the Confederacy in April, 1865, found the Freedmen's Bureau on the ground and the educational work was greatly aided during the five years of its operation. Gen. Samuel C. Armstrong, after the close of the war, was placed as an agent of the bureau in ten counties of eastern Virginia and there received the first training in the normal school of experience in the intimate dealing with the people of both races for the remarkable administration of the famous Hampton Normal and Industrial Institute, begun in 1868. It was only two years later that the State of Virginia launched her present system of free

common schools, the same year that the British Parliament, under the lead of Mr. Forster, put on the ground its present important system of public and secondary instruction. The Virginia system was thoroughly American, even in advance of the scheme of Thomas Jefferson proposed nearly one hundred years before.

The first public schools in Richmond, Va., were established by a group of ladies from Boston, Mass., as a commemoration of the coming of peace, and among the original school buildings was one erected for the manufacture of Confederate ammunition and another the home, during the four years of its existence, of Mr. Jefferson Davis, president of the Southern Confederacy. The first Southern State that moved in the establishment of a complete system of common schools, including the colored people, was West Virginia, in 1863. By this act the townships were authorized, under certain conditions, to establish free schools for colored children and youth.

In later times, however, at the national capital and on the coast of Virginia, the introduction of educational work for the negroes was largely by the initiation or under the direction of the missionary boards of the different churches in the Northern States. It was only gradually that Congress came to the aid of the work, although several of the commanders of the Union armies, by contributions of rations, transportation, and shelter, showed a deep interest therein. But gradually the growing interest of the country in the training of teachers wrought its effect at the capital, beginning with annual contributions to the schools and followed by appropriations that assured the success of the common schools of the District of Columbia. The effort culminated in the organization of the Freedmen's Bureau as a national institution in 1865. The movement continued during the period of reconstruction till 1876, when the public schooling of the children of the section, as always in the Northern States, passed under the control of their own people. But even to the present day the Government has occasionally extended aid by the donation of public property in several States.

THE GOVERNMENT OF THE UNITED STATES IN THE EDUCATION OF THE FREEDMEN.

But the education of the 5,000,000 negro slaves, emancipated by the triumph of the Union in the civil war from the condition of chattels to that of American citizens, required far more than instruction in letters, however important that might be. The two hundred and fifty years of slavery had indeed been in itself a great university, and the history of the world may be challenged to present a spectacle so remarkable as the growth of the pagan, often a bondman, African of three centuries ago into the American negro slave of 1860. Bad as the "peculiar institution" could not fail to be in its relation to the immediate political and social South and the Republic, it did afford the African pagan savage, often a slave at home, the great opportunity of a training in a republican order of society under an arrangement that assured active contact with the upper strata of white American citizens; secured him from the curse of the three furies of the prayer book—"sword, pestilence, and famine"—taught him to work, and enabled him to obtain, even in a crude state, the language and the religion of the most progressive of northern nations. In 1860 he already stood on the threshold of modern society. All his training had been American, and all his aspirations were in the direction of the higher American life.

But it was evident that the old-time system of missionary effort among the "heathen," even if supplemented by schooling in letters, was only a portion of what was needed to lift this race, even in a century, to its fit relations with American civilization. What Sir Bulwer Lytton, as a university student in England seventy-five years ago, declared essential to the education of the ignorant lower classes of Great Britain—that the parents should be educated into cooperation with the schooling of their children—was here of the first importance. It

was necessary that an organization sufficiently extensive and powerful to enforce the right notions of living should become the motive power of a grand movement to change the entire life of the freedman; first, to emancipate him from his bondage and insure him in the rights of a citizen, and then to place him in a condition where he could learn, not only to read the English language, but to gradually change his entire attitude to life itself, so that, sooner or later, he might acquire that habit of mental and moral self-control without which freedom would be always and everywhere a "glittering generality," a curse rather than a blessing, to any people of any race.

THE EDUCATIONAL WORK OF GEN. RUFUS SAXTON AMONG THE FREEDMEN OF THE DEPARTMENT OF THE SOUTH.

The first attempt to deal with the colored people of the South, beyond Washington, in any large and decisive way along the lines of the American common school was made at Port Royal, S. C. Late in October, 1861, a naval expedition was sent to this, the most accessible seaport on the Southern Atlantic coast below Hampton Roads, and with it an army of 14,000 troops. The capture of the forts at Hilton Head opened up the entire neighboring region of the famous sea islands on the coast of South Carolina to the Union. At once the problem of dealing with the negroes in masses was forced upon Gen. Thomas West Sherman, in command. These islands were the headquarters of slavery on the South Atlantic coast. The extreme fertility and the production of a peculiar and superior quality of cotton had given them a world-wide reputation. Among their landed proprietors were owners of a thousand slaves. The sudden irruption of the Union forces on this paradise of the South had driven the white inhabitants away, leaving the standing crops in the fields and not less than 40,000 "contrabands" to be disposed of.

In this emergency General Sherman appointed Gen. Rufus Saxton to the entire administration of this, the most critical feature of the situation. The wisdom of this appointment was at once verified by the result. Rufus Saxton was born in the village of Deerfield, Mass., in 1824. He was the son of Jonathan A. Saxton, at the time editor of the *Greenfield Gazette*, the leading weekly newspaper of Franklin County. Soon after the family removed to the neighboring village of Deerfield, where the boy received all his elementary schooling in the celebrated Deerfield Academy, situated in an exquisite valley on the eastern verge of the Berkshire Hills, under the principalship of Mr. Luther B. Lincoln. He was graduated from the West Point Military Academy in 1849, at the age of 25, and at his graduation assigned to service in the artillery. For several years before the war he resided at West Point, as instructor in military tactics. He was appointed quartermaster of the fleet and army in the expedition to Port Royal, and it was in this capacity that he was called upon by General Sherman to face the problem of the disposal of the slave population before the proclamation of emancipation by President Abraham Lincoln in 1863.

The beginning of his administration was happily favored by circumstances. A crop of cotton, valued at many hundred thousand dollars, was awaiting the labor of the freedmen on the plantations of the sea islands. In the cultivation of these fertile lands was found the means of utilizing the labor of the negroes and meeting the large expense of supporting their families. Help from the North also at once flowed in. There was little confidence at first in military quarters in this experiment. The most discouraging predictions were made concerning the impossibility of working this great army of vagrant negroes. To undertake the formidable task of caring for and superintending such a body of disorganized people was to incur the coolness of friends, the social contempt of enemies, and the loss of caste in military society. But the young general came of a solid Puritan stock that was not appalled by the wrath, the contempt, or the indifference of man

when in the path of duty. For six months he kept his big brigade in order until, in May, 1862, relieved for service in northern Virginia. He returned in June, 1862, to the department, at first under the command of General Hunter, and remained until he was transferred to service on the coast and in the city of Charleston on the appearance on the coast of Gen. W. T. Sherman's army in 1865. On returning to Port Royal, in December, 1862, General Saxton received the following order from the Hon. Edwin M. Stanton, Secretary of War:

WAR DEPARTMENT,
Washington, D. C., April 29, 1862.

Brig. Gen. R. SAXTON.

SIR: You are assigned to duty in the Department of the South, to act under the orders of the Secretary of War. You are directed to take possession of all the plantations heretofore occupied by the rebels, and take charge of the inhabitants remaining thereon within the department or which the fortunes of war may hereafter bring into it, with authority to take such measures, make such rules and regulations for the cultivation of the land, and for the protection, employment, and government of the inhabitants, as circumstances may seem to require. The major-general commanding the Department of the South will be instructed to give you all the military aid necessary to enable you to carry out the views of the Government. You will have power to act upon the decisions of courts-martial which are called for the trial of persons not in the military service to the same extent that the commander of a department has over courts-martial called for the trial of soldiers in his department, and so far as the persons above described are concerned, you will also have a general control over the actions of the provost-marshal. It is expressly understood that so far as the persons and purposes herein specified are concerned, your action will be independent of that of the military authorities of the department and in all the cases subordinate only to the major-general commanding. In cases of actual suffering and destitution of the inhabitants, you are directed to issue such portion of the army ration and such articles of clothing as may be suitable to the habits and wants of the persons supplied, which articles will be furnished by the quartermaster and commissary of the Department of the South upon requisitions approved by yourself. It is expected that by encouraging industry, skill in the cultivation of the necessaries of life, and general self-improvement, you will, so far as possible, promote the real well-being of all people under your supervision.

Medical and ordnance supplies will be furnished by the proper officers, which you will distribute and use according to your instructions.

Yours, very truly,

EDWIN M. STANTON,
Secretary of War.

P. S.—Report frequently, once a week at least.

Under these orders, as herein set forth, until the establishment of the Freedmen's Bureau, General Saxton administered the affairs of the colored people over a vast district, including the lowlands of South Carolina, Florida and, until 1866, Georgia. At the close of the war it was his opinion that the Government was indebted to the negroes for their labor during this period. Not less than \$2,000,000 worth of cotton and other crops had been harvested and, as in the similar operations in the Mississippi Valley under Col. John Eaton, jr., the colored contingent fairly paid its way. General Saxton was also called to organize, equip, and drill considerable bodies of negro troops, both for the protection of the district assigned to him and for aggressive operations, in which they gave a good account of themselves as soldiers.

The report of the first year's operations under the order of the Secretary of War by General Saxton, with the accompanying explanatory documents, at the distance of a generation reads more like a romance of history than a record of ordinary military affairs. Apart from the drafting of all the able-bodied negroes into four regiments, by orders from Washington, there was no alarm of war in the immediate vicinity of Port Royal, although when several of the islands and a portion of the coast were evacuated by General Hunter 4,000 destitute negroes were thrown on the hands of the military commander of the department. Many of the

superior slaves of the entire region had been removed by their masters on the appearance of the Union forces, and the average of the large colored population remaining were found to be inferior in intelligence, morality, and general efficiency. Shut off for generations from contact with white and the better sort of their own people, they had never gained a firm footing, and the romantic Southland had been virtually their prison house. There was a general conviction in this section of country that rice and cotton could never be grown by free labor. A considerable portion of the officers and soldiers of the Union Army of this department were not in sympathy with the idea of General Saxton and the Government that here should be tried an experiment in the self-support, education, and general right living of the freedmen which might at once become an object lesson to the country in demonstrating the wisdom of the actual emancipation which came on January 1, 1863. The orders and circulars of General Saxton bear frequent testimony to the difficulties of the position, and he had often occasion to remind the Government of the numerous hindrances thrown in his way, and the existence of practices and habits among the soldiery and irresponsible people, who beset the plantations and camps, that were a disgrace to civilization. But, in view of all that happened during that eventful year, the General declares his conviction concerning the freedmen that, "delivered from the impediments which have crushed them so long, with the same laws and institutions to govern and protect them in their rights as white men and the teaching necessary in their condition, the negroes will soon make rapid strides toward improvement. The elevation of the mass is sure, and the country may feel no apprehension regarding the future of the freedmen."

Under the administration of the Secretary of the Navy, a special agent, Mr. E. L. Pierce, had been sent to the region immediately on its capture and occupation to begin the work of planting and general cultivation among the abandoned negroes. The Secretary of the Treasury, Mr. Chase, had ordered that all the standing crops found on the island should be harvested and used for the benefit of the freedmen, and that they should be encouraged to labor by the payment of wages. Here was expressed the fundamental idea of a republican order of society, free labor under the protection of the United States Government. The uttermost efforts of General Saxton during this critical year were devoted to this end. The entire district of the sea islands and such of the adjacent coasts as were in possession of the Army was placed in charge of 3 division and 55 district superintendents, who were occupied with the working out of this problem of free labor, with the most careful regard to economy, the training of the blacks as "hired men," with the prospect of becoming themselves owners and freeholders of land. The Government aid and the distribution of the large private charities that came to hand was restricted to the absolute necessities of the case and aid withheld from those who would not work. The working people were assessed a small tax for the sick and destitute. Every effort was made to save these bewildered and too often immoral and unmanageable people from the perils of universal dependence on the Government and private charity which could have no result but the absolute pauperization of the negro race.

More than 10,000 acres of cotton and corn were put in crops and 16,000 people were thrown upon the commander for support and protection, including all that their masters, on abandoning their plantations, regarded unprofitable to carry away. This number was increased by 6,000 additional refugees from the territory evacuated by the general in command. The lateness of the first crop was the cause of serious danger. But the outcome of the first industrial experiment was \$50,000 secured from the cotton and the gathering of corn and other products; sufficient to support the entire population with some few contributions from army rations. The principal difficulty seems to have been the bad behavior of some of the soldiers and the indifference and opposition of certain officers to the success

of the undertaking. The freedmen, as a body, were amenable to order and more than justified the expectations of the commander and the country.

The second year opened with more than 10,000 acres of land under cultivation. General Saxton reports "enough has been done to demonstrate that the cotton fields of South Carolina can be successfully cultivated by free labor, that the negroes will work cheerfully and willingly with a reasonable prospect of reward, and that, as a race, they are eminently fitted to provide for themselves. Their wants are few and simple. they are exceedingly anxious to acquire property, are fond of the soil, and the idea that they may become owners fills them with delight."

Happily, the man endowed with the power to inaugurate and responsible for the success of this momentous experiment in freedom was by birth, training, and all the associations of his previous life, "the right man in the right place." He fully comprehended the fact, so long denied or doubted by too many in high places in those days, that the guaranty of the success of the people is that education which is the training of the head, the heart, and the hand for self-support and well-ordered American citizenship. He at once looked about for the means of furnishing instruction to the negroes of all ages who could be brought under its influence. As the Government had not yet assumed the responsibility for this, he put himself in connection with associations of citizens of Boston, New York, and Philadelphia, which, under the direction of the foremost people of their communities, entered heartily into the beginning of this greatest of benefactions to the emancipated people. At once schools were established throughout the entire department. Nearly 2,000 children were in regular attendance, and many of the teachers, coming from the North, were of the highest capacity for culture, character, and station in life. Among those appearing from Philadelphia were a brother and sister representing a family long distinguished in the antislavery work. The sister was soon promoted to the more responsible position of wife of the young military commander.

The General reports: "Experienced teachers report that the progress of the pupils does not compare unfavorably with that of children in the common schools North. They all manifest an intense desire to learn to read and seem to have the intuition that it is by means of education they are to rise in the scale of citizenship. During the planting and harvesting seasons it is a common sight to see groups of children going to school after having completed their tasks in the field. The Northern associations have sent down large numbers of experienced teachers and schoolbooks and thousands of dollars in valuable articles of clothing to be distributed."

Here was, for the first time on a large scale, laid the enduring foundations of the American common school in the slaveholding States, on the soil of the Commonwealth that first broke away from the Union, in the heart of the slave population, at the bottom of the colored "slough of despond." A hundred years before, Thomas Jefferson had seen in vision the possible emancipation of the negro and his preparation for extradition to Africa or freedom at home, by his elementary instruction in letters and industries, under the supervision of the State. The one characteristic of the American system of common schools is that it shall "reach from the gutter to the university." Through seventy-five years of the national life a common school public had grown up in all the States of the South; in no State more earnest and intelligent than in South Carolina. Several attempts had been made to establish an efficient system of common schools for the white race, but all had gone to wreck on the reef of "local option," by which it was left to the people of every district to accept or reject the system. Much of the money appropriated by the State had been used for paying tuition for the poor white classes in private and denominational schools. The city of Charleston was an exception, and at the breaking out of the war it had in operation a system of graded schools,

under the supervision of the Hon. C. J. Memminger, during the war secretary of the Confederate treasury. Several of the leading teachers came from the North, one of whom represented the State of South Carolina in the Senate of the United States during the period of reconstruction. But never in all these 15 States had the system "touched bottom" in any provision for the public schooling of the blacks; indeed, in several of the States it was a crime under the law to teach a negro. Here was, therefore, the real beginning of a scheme of literary and industrial instruction, established and superintended by the Government of the United States, and carried on by cooperation with the benevolent citizens of different States of the Union. There had already been sporadic attempts at the schooling of the negro by private, church, and missionary schools, but no movement covering an area so large, so extended in its administration, with result so gratifying as here. To Gen. Rufus Saxton must be awarded the great honor of inaugurating and, for several years, personally superintending this experiment, which was practically a test of the capacity of the emancipated race to meet the demands of the American system of free labor and free citizenship.

No words written by any public official during this period of the war were more effective in their expression of the spirit and intent of the great act of emancipation than these from the first report of General Saxton: "Our first duties were to provide for the immediate necessities of the freedmen; organize their labor and fit them to become self-sustaining; establish schools for all who had a desire to learn; to demonstrate to the world that which has been denied and disbelieved by the many, that the South could be cultivated by the labor of free people."

The superintendents appointed for the management of the plantations were all obliged to take the following oath:

I, believing that negro slavery is a great enemy to humanity, do solemnly swear that I will faithfully perform to the best of my ability my duty as superintendent of plantations in this department, and, as such, will use all the means in my power so to educate and elevate the people under my control as to fit them to enjoy the blessings of freedom; that to the best of my knowledge I will deal fairly and honestly with them, and respect, and cause all others under my jurisdiction to respect their rights; that I will not engage in trade with them for my own profit or appropriate any of the proceeds of their labor to my own personal advantage. So help me God.

For service in this laborious, most disheartening and often dangerous field of labor, the division superintendents received \$1,000, and the district agents \$600 per annum.

That these words were not the rhetoric of an extreme theorist or an appeal for popularity at home is shown by the reading of the entire sum of orders and circulars sent forth by General Saxton during the five years of his administration in the department. The details of the industrial operations were watched with sleepless regularity, and every avenue to abuse noted and carefully guarded. The hindrances from the lack of sympathy and cooperation in the army were often accompanied by jealousy and opposition in high places, although he was always sustained by President Lincoln and Secretary of War Stanton.

In August, 1862, under orders from Washington, all the able-bodied colored men in the department were enrolled in military organizations, the first regiment of colored soldiers being under the command of Col. T. W. Higginson, well known in literary and reform circles. The conduct of these soldiers in action, and the general labors that came to them, were appreciated, and their bravery demonstrated by the subsequent assault of Fort Wagner, and the death of their young commander, Col. Robert Shaw, was commemorated in an order of General Saxton. An important movement toward the ownership of land by the freedmen was the building of houses and the assignment of plats of 10 acres to each family that would undertake the labor of keeping it in cultivation. One cause of great embarrassment to the educational officials of the district was the sale, under the

law imposing a tax on the Southern States for the support of the war, of large portions of the plantation lands of the sea islands. These estates often fell into the hands of private owners, who were able to offer superior inducements to labor, and this, with the enrollment of all able-bodied men as soldiers, deprived the industrial development of great numbers of the most effective workmen.

But, after all these complications, the commander of this great college of industry and education "moved upon the enemy's works," the slough of ignorance, superstition, shiftlessness, vulgarity, and vice, in a manner to "come off conqueror and more than conqueror" in this first experiment. During this year the proclamation of emancipation had come, and January 1, 1863, witnessed such a jubilee as never before had waked the echoes of these mysterious islands of the sea. An order of the commander established the routine of general management, and a commissioner was appointed to deal with all the complications of the statute. Frequent circulars from headquarters not only indicated the duties of every class of subordinates but used every fit opportunity to convey some important advice to the excited and restless children of oppression, almost "dazzled with excess of light" by their sudden introduction to freedom. In the year 1863 the important step was taken by the Government of the United States to sell the lands of the sea islands in plots of 20 acres to the freedmen, the tracts not to exceed 320 acres to any private purchaser. Any family could locate on alternate sections, and by the payment of \$35, \$1.25 per acre, secure a home by paying for it by installments, one-fourth paid at first, with credit during three years. This privilege was also extended to discharged prisoners and soldiers of the army, and finally included a tract of 40 acres. A commission for dividing the profits was formed and a system of contracts for labor was established by which the rights of the laborers were protected. A savings bank was established in the town of Beaufort. The wages of the laborers were declared the first lien on the crops upon the private plantations, and all attempts at unfair dealings were brought under military inspection. All contracts for laborers were brought under examination at headquarters.

With all its failures, defects, and disappointments, it must be acknowledged, on a fair review, that the work done by Gen. Rufus Saxton and the supervisors and teachers during these first years of the occupation of the sea islands was not excelled in any of the military or civic departments elsewhere. It was watched with the most intense interest at home and abroad by all who appreciated the practical significance of this experiment of freedom to the negro and its result upon the South and the entire nation.

The second and final report of General Saxton previous to his retirement from the post of military commander of South Carolina, Florida, and Georgia was rendered in December, 1864. It is largely occupied with a statement of his administration of the important and difficult duties imposed upon him by the original order of President Lincoln, through the Secretary of War, in June, 1862. His understanding of the purpose of the President and War Department in establishing this arrangement is expressed in the following quotation from the order of Secretary Stanton: "It is expected that by encouraging industry, skill in the cultivation of the necessaries of life, and general self-improvement you will, so far as possible, promote the real well being of the people under your supervision." His efforts to comply with this general direction, not only in the letter, but in the spirit of the President and his great Secretary of War, are detailed in this report, and the explanation of the apparent failure to realize more of the results fully set forth. Here, in the first general attempt on a large scale to deal with the complicated problem of the charge of the freedmen, the National Government drifted through a series of experiments and was embarrassed by conflicting conditions that might well make a complete success impossible.

It was evidently the desire of President Lincoln that here, in the very heart of

the old slave empire, should be fully tried the crucial experiment that was to determine the wisdom or unwisdom of emancipation. The idea included the training of the 15,000 negroes thrown upon the care of the army of occupation at Port Royal for the duties and responsibilities of freedom, by testing their capacity for free labor and the personal ownership and management of land, their ability to serve as soldiers, and their capacity to receive the instruction in letters and the Christian virtues essential to a self-supporting manhood and womanhood. In view of all these intentions in the working out of the problem, to General Saxton was assigned the command, with extraordinary powers. He was made directly responsible to the War Department, reporting to the President, as far as his own duties were concerned, not under the control of the military commander in chief of the Department of the South. In pursuance of what he understood by this arrangement, General Saxton seems to have proceeded during the first year's administration with confidence along a path beset with dangers and conflicts at every step with a success that warranted the most favorable anticipations for his colored constituency.

But it is easy to see by the light of subsequent experience that the position itself almost involved an impossibility. As it included both the organization of the negroes as laborers with a view to their becoming permanent occupants of the soil abandoned by their old masters, and as soldiers, it soon became apparent that a conflict of purpose would inevitably interfere with success. The army naturally claimed the services of these people in their old capacity of laborers and servants, to relieve the white soldiery, working in an untried climate, of all save actual fighting or purely military duties. The invitation to the negroes to enlist, with promise of fair pay, was carried out only in respect to the first regiment, and the arrangement was changed to a draft of all the able-bodied men, enforced by the most stringent military methods, while their pay was reduced and the occupation of General Saxton in the premises practically suspended. This policy to a great extent broke down the experiment of organized labor, as it left an area of more than 10,000 acres of cultivated land to be worked by the industrial incapables of the colony, the old and infirm, women, and children. The abandonment of a portion of the territory and coast threw several thousand of its people into the charge of the department, overwhelmed it with purely charitable work, and demoralized the industrial habits of the people.

At first the entire cultivated area of the islands was taken in charge of the new commander. General Saxton also, under an arrangement of supervisors of divisions and districts, established a strict and apparently workable system of cultivation that provided for the sale of cotton and the raising of provisions to relieve the Government from the financial expense of the experiment, give fair wages to the workmen, and support the schooling and clothing of the 15,000 freedmen. But this experiment was cut short by the action of Congress imposing a direct tax on all the seceding States for carrying on the war. Of course the forced sale of the sea islands was the only method of collecting the tax in South Carolina. So this entire body of valuable real estate was sold at auction and passed into the hands of private proprietors, completely upsetting the policy of the past year and dispensing with all the machinery for conducting the original experiment. A subsequent attempt was made to meet this exigency by inviting the negroes to purchase small homesteads, not exceeding 20 acres, sufficient land for a house and a small farm, enough to determine the ability for self-support. But this arrangement when completed was upset, and the land sold in quantities that made its purchase practically impossible for the freedmen. The numerous practical arrangements of General Saxton for the protection of the negroes against the greed of the new proprietors, with frequent interference of the soldiery and the constant perils that dogged the pathway of the contraband at every step out from his house of bondage, revealed the practical impossibility of his complying with these two adverse conditions.

The worst consequence of this reversal of policy was the almost complete loss of faith by the freedmen in the Army and the white man. Disappointed and baffled at every attempt to carry out the policy of the President, and practically impotent to arrest the downward rush of affairs, General Saxton placed his resignation in the hands of the Secretary of War, and was relieved from his special duties as at first outlined. The result of this change, and the secret history of the relation of the negro race in South Carolina to the Government of the United States during the period of reconstruction, it is not in the line of this essay, save in the educational field, to place on record.

But according to this report the one feature of the policy that seemed an exception to this general experience of disappointment was the schooling of the negro children and youth. Under a special arrangement with the missionary and other organizations in New York, New England, and Philadelphia, more than 100 teachers, many of them not only professionally skillful, but often of superior culture, Christian and social standing at home, were sent to Port Royal. While the small salaries of the instructors were paid at home, the Government, through General Saxton, provided shelter, transportation, and army rations, and assumed the general direction and supervision of this most interesting experiment. Several thousand of the children and adults of the freedmen were instructed, and the ability of the negro to receive education, as far as related to the elements of learning, was vindicated.

It is not necessary here to pass judgment on the complications of the different portions of this conflict that, like a blinding sea mist charged with a malignant malaria, rose and obscured the entire landscape of the situation. It was not strange that an attempt to do full justice to the freedmen by protection against the oncoming of the host of greedy adventurers that followed on the heels of the army to profit by every opportunity should have failed somewhat of success. All subsequent attempts to define the personal rights of the negro to the land were fated to come to naught, by the final policy of the Government, on the return of the Southern people to their old possessions. Indeed, the experiment at the sea islands was swamped in the changes of policy that ensued from the condition of political opposition in the North and the furious war of politics that followed hard on the close of the conflict of the armies. But it can be understood how, amid the tremendous exigencies of military operations, the work of the destruction of the Confederate armies was preliminary to everything else, since everything depended on the triumph of the Union cause. It was natural that the purely military man, intent on his own side of the great business, might easily become impatient and unjust to the man of broad ideas and Christian philanthropy who looked beyond the present, absorbed in laying the foundation of a new civilization for these people still wandering in the wilderness, not yet in sight of the promised land.

But it is a great tribute to the intelligence and Christian manhood of the noble leader of this first great experiment by the Government of the United States to plant the new American civilization even among the swamps of the South Carolina sea islands and coast, that in the closing words of his report he sums up his conclusions on the general theme in the following hopeful and prophetic words:

The experiment with the freedmen in this department is a success. Amid all their obstructions and in spite of all they have made constant progress and proved their right to be received into the full communion of freemen. They have shown that they can appreciate freedom as the highest boon; that they will be industrious and provident, with the same incitements which stimulate the industry of other men in free societies; that they understand the value of property and are eager for its acquisition, especially of land; that they can conduct their private affairs with sagacity, prudence, and success; that they are not ignorant from natural incapacity, but from the brutishness of their former condition: that they are intelligent, eager, and apt to acquire knowledge of letters; docile and receptive pupils; that they aspire to and adopt, as fast as means and opportunity admit, the social forms and habits of civilization; that they quickly get rid of in freedom

the faults and vices generated by slavery, and in truthfulness, fidelity, and honesty may be compared favorably with men of another color in conditions less unfavorable for the development of those qualities; that they are remarkably susceptible of religious emotions and in the inspirations of music; that, in short, they are endowed with all the instincts, passions, affections, sensibilities, powers, aspirations, and possibilities which are the common attributes of human nature. They have conquered a recognition of their manhood and right to be free, and vindicated the wisdom of your first order, to place arms in their hands, which I had the honor of receiving and executing. The senseless prejudices and bitter contempt against their race are disappearing before their peaceful and orderly conduct under their trials and provocations, their patient hope and heroism in war. Events for four years have been disciplining the mind of the nation to prepare it to give them full recognition and ample justice.

In this view it may be that the obstacles which beset their earlier path toward freedom were blessings, normal elements for the solution of the great problem of their manhood and their rights, as the atrocities and diabolisms, the murders and martyrdoms, the countless sacrifice of noblest lives in the war, may have been necessary to convince the American people of the utter and undeniable barbarism of slavery, and to inspire them with a determined purpose to build themselves up into a new nation and a new union upon the enduring foundation of justice, freedom, and equal rights of all men.

By the swiftly changing fortunes of the war, General Saxton emerged from the special labors and confusion of his original command to a position of even greater responsibility, with more satisfaction to himself. On arriving at Savannah, Ga., at the end of his famous "march to the sea," on January 16, 1865, Gen. William T. Sherman issued an order concerning the sea islands from Charleston south, the abandoned rice fields along the rivers, for 30 miles back from the sea, and the country bordering the St. Johns River in Florida, for the settlement of the negroes already made free by the act of war and the President's proclamation. This wholesale disposal of a territory larger than several of the older States of the Union to the freedmen was almost compelled by the fact that 40,000 of these destitute people were swept down to the seacoast by this tremendous march that thundered like a cyclone from Atlanta to Savannah. This extensive region was given absolutely to the colored people, and their able-bodied men were encouraged to enlist in the military service for their own defense. For the execution of this remarkable order General Saxton was appointed "inspector of settlements and plantations."

Here was a condition even more appalling than his original position of military commander. But soon after he engaged in this work he was appointed to the position of assistant commissioner of the Freedmen's Bureau for South Carolina and Georgia. On March 3, 1865, only a month before the general collapse of the Confederacy, Congress passed the act establishing this important bureau. At first the General had in charge the entire States of South Carolina, Florida, and Georgia. But in due time he was relieved from duty in Florida and Georgia and his oversight limited to South Carolina. His operations in this work will be noted in the general account of the Freedmen's Bureau, at a later period.

THE ADMINISTRATION OF GEN. JOHN EATON, JR., IN THE EDUCATION OF THE FREEDMEN IN THE VALLEY OF THE MISSISSIPPI.

A year later than the events already recorded on the Atlantic coast we shall see the Government of the United States engaged in an even more extended scheme, in the work of laying the foundations of the original plan of Thomas Jefferson, in the establishment of the common school in all its departments, among the freedmen of the Mississippi Valley and the Southwest. Almost a hundred years before, the Congress of the Confederation, followed by the first Congress of the Union, had responded to the act of Virginia, which ceded to the Republic her title in the larger portion of the region included in the five original States of the Northwest, by the magnificent donation of one thirty-sixth of all the public lands for the education of the children and youth of the coming millions of people that occupy

what is now the center of our seventy millions of population. Now, in 1861, the Republic returned to the good work so long suspended, and, through the authority of the military commanders down the entire coast line from Washington to Florida, laid the foundations in the soil first trodden by the feet of the bondmen of the vast and beneficent system of common schools for the whole people, under which more than 5,000,000 of children and youth are now instructed at the expense and under the supervision of every Southern State and Southwestern Territory.

But, as has been seen, at this early date, this act of the Government was supplemented and to a great extent supported by the efforts of the missionary bodies of the different Northern churches, benevolent organizations, and private workers in a field so novel and interesting. But it was left for the most notable educational feature of the war, like so much then originating in the country, to date from the valley of the Mississippi, and to find its originator in the great commander who brought the four years' conflict to an end on the soil of Virginia.

During the first two years of the civil war, until the spring of 1863, the operations of the Union armies in the States of Kentucky and Missouri, which still remained within the Union, prevented the extreme complication with the negro question which had at once appeared on the occupation of the coast of Virginia by the army of the East. There had been the same advance of the church missions and teachers, with the toleration of the military commanders, in the wake of the armies of the Tennessee and Cumberland, southward, as along the eastern coast, and already a great deal of the preliminary work of charity and instruction had been inaugurated. A leading book publication house in Cincinnati, Ohio, on the occupation of Nashville, Tenn., by the Union forces, is reported to have sent several thousand dollars' worth of schoolbooks gratis for the use of the negroes and poorer white people, and the wild expectations of the colored folk before the act of emancipation had been awakened by the idea that the knowledge of books was the key to the superiority of the dominant race.

But the first overland movement of the army of General Grant through southern Tennessee and northern Mississippi upon Vicksburg, following the desperate battle at Corinth, in the autumn of 1863, found the headquarters of the army of the Tennessee at Lagrange, a village in the southwest corner of that State, while the base of supplies for the advancing army was located at Holly Springs, Miss. A brigade of Ohio and Missouri troops, stationed at Grand Junction, Miss., a few miles from Lagrange, was commanded by Col. J. W. Fuller, of the Twenty-seventh Ohio Infantry. Its chaplain was Rev. John Eaton, jr., who, by the exigencies of war, was performing the duties of chaplain of the brigade. The route of the advancing army was through a region densely populated by negroes, and the appearance of the force of some 35,000 was the signal for the abandonment of the cotton plantations, with their growing crops, by their owners and a rush of the colored hosts upon the camps which at once threatened to become more perilous than any danger from the Confederate armies in front. This condition is thus described in the forcible language of Chaplain Eaton:

A slave population, springing from antecedent barbarism, rising up and leaving its bondage of centuries, and its local tendencies and associations surrounding the boasted influences and attractions of the master, in rags or silks, feet shod or bleeding, individually or in families, and pushing toward our armies. Their comings were like the arrival of cities. Often they met prejudices against their color more bitter than they had left behind. There was no Moses to lead, no plan in this exodus. The decision of their instinct or unlettered reason brought them to us. * * * They gave information for the guidance of campaigns, laborers for the various staff duties, took upon themselves all the serving of the Army for officers, hospitals, etc., and soon were accepted as capable of the soldier's discipline and endurance in all arms of the service and worthy of the soldiers' pay and honor. Out of those who came within our lines, probably not less than 80,000 have either died in the United States service or are still in it as laborers or soldiers. But there was a background to this sublime march of events. Ignorance, perverted ideas in taking liberty for idleness, including all the fostered vices and crimes of the old

system; cringing deceit, theft, absence of chastity, and the sundering of the family relations; tatters, nakedness, torn limbs, women in travail, helpless childhood, age and decrepitude, multiplied sickness and frequent death. The sublime dash and roar of the surge could not conceal the wreck or drown the piercing cry of distress. The Army shared its own food, shelter, and clothing. Charity, gathering in its small rills from the loyal mountains and villages, came faster in a full, gushing stream, bearing gifts and material. The laws of Congress had freed some; the proclamation all. The law of the Army—here the only expression of the law of the land—began to declare itself in behalf of the blacks. * * * The Army did all that was done to free, feed, shelter, protect, and give the negroes medical attendants, and furnished the only safe channel for the benevolence that came to its aid, added to protection, transportation, rations, and quarters, * * * it sought out of its forms of administering justice an adaptation to the peculiar condition.

Here was the appalling condition that confronted the commander of the American forces in northern Mississippi in the autumn of 1862, so different from any of the elaborate theories with which the enthusiastic antislavery public of the nation had been accustomed to entertain the country and Christendom during the long generation of agitation that preceded the war. Now had come in, as with the voice of a tempest, the era of experiment and education; and like an advancing host caught in a tropical hurricane, the Army of the Tennessee found itself arrested, besieged, and in danger of absolute demoralization from this precipitation of a multitude of undefinable extent across its line of march. The first peril was from disease. These poor people brought into camp all the hideous complaints that, like demons of destruction, dogged the steps of poverty, squalor, and the uncontrollable lives of an ignorant slave population at once set free. Every man with brains in his head and a heart in his bosom was thinking and feeling with all his might what could be done to evoke order from this fearful chaos, and the great contingent of mischief that, in the most patriotic army, is ever on the alert to gorge itself with its own vices, found here "an open city" of the evil one, wherein to find for itself a speedy fate of demoralization and destruction.

In the whole career of Gen. Ulysses S. Grant, the greatness of which a generation after his death is now fully becoming apparent to the American people, nothing is more characteristic than the decisive way in which he faced and disposed of this terrible crisis, at once relieving the Army in its perilous mission to open the Mississippi to the Union from the danger of being smothered in this cloud of black dust raised by its own advance, and planting in the very heart of the slave empire the permanent foundations of the broader and more Christian American civilization. And, as by a special favoring Providence, another young man from the same State, then so prolific in able executive characters—Ohio—was thinking and as far as possible acting along the same lines of advance as the general at headquarters. How it came about that at just this emergency the eye of the great commander fell upon this young man, to whom more than any other the South owes a debt of boundless gratitude for patriotic aid, comfort, and leadership in its opening "campaign of education," was never known to Chaplain Eaton. He does tell the story, like the chapter of a thrilling romance, how, after an evening in camp, passed in the company of his own friends of the Twenty-seventh Ohio, around a bonfire in the pine woods of Grand Junction, he found in his tent and read by the light of a tallow dip, the following order:

HEADQUARTERS THIRTEENTH ARMY CORPS,
DEPARTMENT OF THE TENNESSEE,
Lagrange, Tenn., November 11, 1862.

Special Order, No. 15.]

Chaplain Eaton, of the Twenty-seventh Ohio Infantry Volunteers, is hereby appointed to take charge of the contrabands that come into camp in the vicinity of the post, organizing them into suitable companies for working, seeing that they are properly cared for, and setting them to work picking, ginning, and baling all cotton now out and ungathered in field.

Suitable guards will be detailed by commanding officers nearest where the parties are at work, to protect them from molestation.

For further instruction the officer in charge of these laborers will call at these headquarters.

By order of Maj. Gen. U. S. Grant.

Well may the recipient of this "Order, No. 15" now say, thirty-eight years after he read this astounding summons, "Never in the entire army service, through the whole war, in the midst of battle, imprisonment, the roar of cannon, the explosion and destruction of ships, the horrors of the hospital or the terrors of surprise, or my own exposure to assassination, do I recall such a shock of surprise, amounting to consternation, as at the end of this brief summons to undertake what seemed to me an enterprise incapable of human achievement." The chaplain had never spoken to General Grant, and his previous contact with superior military characters in Missouri and the Southwest had not impressed him with the pleasure of such eminent acquaintance. He already knew enough to see at once the prodigious difficulties that would beset him at the outset. For already dissensions had commenced. Every vile or weak soldier or officer was already mired in the slough of an army of slave women, to whom chastity was like a word spoken in an unknown tongue. Every insolent army upstart "dressed in a little brief authority" was longing to domineer over a group of untrained negroes. In all that concerned the vast system of field labor he anticipated perpetual collision with the discipline and movements of the army. The clearing of the camps of the floating crowds of sick and dying, suffering with contagious diseases, was a task for a national sanitary commission rather than a young chaplain of volunteers. Filled with these apprehensions and determined, if possible, to decline the honor of leading this forlorn hope of the new civilization, the chaplain rode to Lagrange. To his surprise no obstacles such as he had met with during his previous experience barred his way to an immediate audience. On his tap at the door of the dining room of the hotel of the little village where the general held his quarters he was summoned to come in. On opening the door he saw a man of low stature, only distinguished in a room full of officers of the higher rank by his shoulder straps, seated at a little table, busy giving his final orders for the immediate advance of the army. At once he saw that all these persons were aware their commander in chief must be held in due respect. In place of the intemperate, incompetent, vulgar refugee from the old United States Army drifted into a post far beyond his ability to fill, as was the common report, he saw that here was a man to be followed, respected, and obeyed.

The chaplain was requested to be seated, and, on the clearing of the room, the General called him to his side with a beckon of the hand and the salutation: "So, you are the man who is to command the army of contrabands." He listened with admirable patience to the almost pathetic appeal of his visitor to be delivered from a fate so decisive as awaited any man who put his hand to that plow, and at the end replied: "You will at once proceed to carry out the order you have received. I appreciate the difficulties of the position. But, you see, I have called you to a personal cooperation. I have issued this order and will stand behind you in its enforcement."

From this time forth, in connection with General Grant's command in the valley of the Mississippi, Chaplain Eaton realized the full significance of his commander's promise to "stand behind him." At this first interview the General in the simple, direct, and business-like way in which he went about suppressing the revolt of eleven great Commonwealths, and their struggle to drive four additional border States into the maelstrom, talked out his own views concerning the "negro problem" as it was then and there presented. With growing astonishment, the chaplain, as he listened, noted with what a breadth of statesmanlike forethought and what marvelous control of the smallest details the subject had already been

thought out before he moved. He had a practical method for solving the problem; a firm grasp on the labor question, as far as it affected the host then preying on the army. He already appreciated the power of the religious and philanthropic agencies then at work, while he foresaw how embarrassing they might become in the hands of unwise and visionary workers. He said to the chaplain: "We must remember that these people are now freemen, and that they will not only become laborers but soldiers and citizens of the country."

Certainly a good Providence, working through a providential man, directed the choice of the new superintendent of the freedmen in four States, densely populated by the colored race. First and last, 700,000 of the freedmen came under the supervision of the new "commander of the army of contrabands." John Eaton, jr., was born in 1829, in southern New Hampshire, one of a family of many children. He was educated in the common schools of that day, and by work at the homestead afterwards, he joined the great crowd of scholars that were drawn to the Thetford Academy, under the presidency of Dr. Hiram Orcutt. He graduated at Dartmouth College in 1854, and, at the age of 25, went to Cleveland, Ohio, where, for two years, he was principal of one of the common schools. He rose in two years more to the superintendency of the common schools of Toledo, Ohio, then a growing city of 30,000 people. Three years later we find him at the Theological School in Andover, Mass., in the character of "resident licentiate." At the beginning of the war he enlisted as chaplain of the Twenty-seventh Ohio Regiment of Volunteers, composed in large part of his old friends and associates at Toledo. His early service was in the campaign in Missouri. He was present at the battle at Springfield, was twice captured and held as a prisoner. Through a series of disagreeable experiences he found himself, in 1862-63, following the divided command of Generals Halleck and Grant, and was present at many of the important operations and engagements that culminated in the final attempt of the South to block the way from the great Northwest to the Gulf by the establishment of a stronghold at Vicksburg. At the age of 34 he believed himself summoned, as by a voice from above, to a work the importance of which he only dimly understood and from which he shrunk instinctively as almost too great for human nature to encounter.

But the word of command had gone forth, and Chaplain Eaton was not the man to longer hesitate when duty, however appalling, pointed the way. He had not mistaken either the discouragement, the labor, or the personal peril of his new position. As soon as it began to take on the contact with the disaffected populations, amid which the army was operating, his life was in constant peril. More than one man was assassinated by being mistaken for him. Within a week he came in collision with a military official who defied his authority by depriving him of his means of transportation. He appeared with him, under arrest, before General Grant, who quietly informed his complainant that Chaplain Eaton's authority was supreme within range of his command. This decision was enforced six days after the original order by a second document, here reproduced:

HEADQUARTERS THIRTEENTH ARMY CORPS,
DEPARTMENT OF THE TENNESSEE,
Lagrange, Miss., November 17, 1862.

Special Order, No. 21.]

Lieut. Col. Charles A. Reynolds, chief quartermaster of the department, will furnish Chaplain J. Eaton, jr., in charge of the contrabands at Grand Junction, Tenn., at his requisition, such tools and other implements as he may require: also materials for baling cotton, and clothing for contraband men, women, and children. Unsalable soldiers' clothing will also be issued to him.

By order of Maj. Gen. U. S. Grant:

JNO. A. RAWLINS,
Assistant Adjutant-General, Commanding.

The operations of the new superintendency were further aided by the conferring of the title of "colonel" on Chaplain Eaton. After some delay he was finally given the title as "Colonel of the Ninth Regiment of Colored Volunteers of Louisiana," with a body of subordinate officers especially equipped for the work assigned him. He retired from the service at the end of the war with his present title of brigadier-general. It was only a few weeks after the beginning of his labors that the army of General Grant was compelled to retreat upon Memphis, Tenn., by the destruction of its base of supplies at Holly Springs, Miss. This necessitated the early removal of the superintendent of freedmen to that city, then a swarming hive of humanity, requiring the uttermost vigilance of administration for the public safety against all the perils of a situation so complicated. It was only by gradual steps that a system could be put in operation, which at once minimized the danger of anarchy and placed the numerous emancipated people in a condition to go onward toward the practical recognition of the liberty, which so far was little better than a "glittering generality."

The first efforts, of course, were directed to purging the camps of the elements so dangerous to the order, health, and efficiency of the soldiery. In this work General Eaton was assisted materially by the sanitary commissions, under the eminent leadership of Rev. Dr. Henry W. Bellows, of New York, and Rev. Dr. William G. Eliot, of St. Louis. Then came the organization of the colored working force, male and female, in relieving the troops, largely serving in an exhausting and unusual climate, from overwork, and in gathering the crops of cotton and corn. The cotton was sold and the avails turned into a military chest, and the corn and other produce contributed to the support of the army and its colored annex.

By the following summer, 1863, the scene of military operations was transferred to the vicinity of Vicksburg. Numbers of the freed people were gathered into camps and employed during the siege of the city. It was only a few days before the surrender of Vicksburg, on July 4, 1863, that General Grant, amid the anxieties of the closing days of this memorable siege, gave several hours to a patient listening and discussion of the first general report of Superintendent Eaton, followed by this important letter, addressed to the President of the United States:

NEAR VICKSBURG LANDING, *June 11, 1863.*

Hon. A. LINCOLN, *President of the United States:*

Finding that negroes were coming into our lines in great numbers and receiving kind or unkind treatment, according to the views of the troops they first come in contact with, and not being able to give that personal attention to their care and use the matter demanded, I determined to appoint a general superintendent over the whole subject and give him such assistance as the duties assigned him might require. Mr. Eaton was selected for this position. I have given him such aid as was in my power by the publication from time to time of such orders as seemed to be required, and generally at the suggestion of the superintendent.

Mr. Eaton's labors in his undertaking here have been unremitting and skillful, and I fear in many instances very trying. That he has been of very great service to the blacks in having them provided for, when otherwise they would have been neglected, and to this Government in finding employment for the negro, whereby he might earn what he was raising, the accompanying report will show, and many hundreds of visitors and officers and soldiers near the different corps can bear witness to.

I have the honor to be, very respectfully, your obedient servant,

U. S. GRANT,
Major-General United States Volunteers.

On the transfer of General Grant to the scene of war around Chattanooga, Tenn., in the autumn of 1863, Colonel Eaton was placed in direct communication with the Secretary of War, acting through the Adjutant-General. By the order issued March 5, 1863, the superintendent of freedmen was required to raise colored regiments for the supervision and protection of the negroes, and appoint assistant

superintendents, all subject to his order. By this comprehensive arrangement he found himself placed virtually in military control of the colored people in portions of the four States of Tennessee, Arkansas, Mississippi, and Louisiana, to the number of nearly 800,000, and intrusted with financial responsibilities which under ordinary circumstances would have amounted to \$350,000. During the first year "not a cent of money was drawn from the Government for the freedman on any account." A temporary tax on the proceeds of labor met the increasing expenses of this masterly campaign of practical education.

The assistant superintendents were chosen with great discretion. Spellman, Fisk, Warren, and Hawley were assigned to the different States, in a country double the extent of the British Islands, and Col. Samuel Thomas was appointed as assistant general superintendent, with full authority to act in the absence of Superintendent Eaton.

The able-bodied freedmen of both sexes were provided with work on the opening of the early Southern spring, according to circumstances. Partly by direct leasing of land upon the abandoned plantations, by hiring out to the loyal planters and arranging for their employment by people from the North who, in great numbers, flocked to the new field of enterprise with the wild expectation of realizing a fortune in a year, the complicated and exhausting work went on. At a later period, through the transferral of large portions of the colored department to Washington, a condition of spoliation was developed which at once left the superintendent of freedmen powerless to act, with the result that a grand carnival of mismanaged business, up and down the great valley, brought discredit to the Government, embittered the well-disposed of the home-staying Southern white people, and wrought demoralization among the freedmen. By the withdrawal of the main army, the military arm could only give protection as garrisons at a few important stations. By a Government order, Assistant Superintendent Thomas was made provost marshal of freedmen, to administer justice and evoke public order out of chaos. The next step was the placing the entire control of the freedmen under the direction of the assistant superintendents, reporting to their chief, and in 1865, at the close of the war, the entire direction of this department for several years was given to the Freedmen's Bureau.

It should be borne in mind that most of the disorder and friction between the authorities of the National Government and the people of the subjugated States, which has been by popular prejudice imputed to the Army, was really due to the presence of the great crowd of civilians who thronged the entire region, and operated in a way practically impossible of arrest by an army always on the point of being transported to new and distant fields of activity. It was not remarkable that a people like that of the United States, which during the entire colonial and national existence had never had the experience of a great civil war, and never, in large force, was the invader of any country save a wilderness of savages and brief campaigns in the Canadas and Mexico, should have been quite unaware of the European severe laws of war, and been inclined to act according to their own good will and pleasure in the districts left without the protection of the Army. The extreme bitterness of the opposing governments and the greed for gain that saw visions of sudden wealth in the plantation lands, from which was realized such a harvest of financial dust and ashes, the terrible hostility of the unlettered portions of the Confederate people, especially toward the emancipated negroes and their friends, explain much that no candid historian can attempt to justify. It was a happy day for the American people when this era of discord gave place to the renewed occupancy and local government of the conquered section by its own people, who hereafter must be held accountable for all that has henceforth occurred in the same direction. In the midst of the overwhelming tumult of the renewal of industry by the hiring of the colored people for work on the plantations from which a year before, during the war, they had fled as slaves, the labors of Superin-

tendent Eaton and his faithful and able corps of superintendents read like the struggle of a forlorn hope on the deck of a ship driven before a tempest, every instant threatened with destruction.

It was only after the removal of Superintendent Eaton to Memphis, Tenn., in the winter of 1862, that an organized method of teaching the freedmen in schools could be inaugurated. It was the policy of the Government in military occupation of any Southern city, as far as possible, to encourage and aid in the reestablishment of any system of public instruction it found in operation. In Tennessee such a system was found in the cities of Nashville and Memphis, and one of the earliest tasks of Superintendent Eaton was to complete the arrangements for public education by aiding the schools for the instruction of the freedmen of every age. The charge of the public schools in Memphis for the whites was assigned to the care of the military authorities. One little school in a tent, taught by a woman, was the corner stone of the scheme that for the first time planted the American system of universal education in its most characteristic feature—the education of all children and youth by the people—in the entire region of the lower Mississippi Valley. In rapid succession in Memphis, Vicksburg, Natchez, Little Rock, and Pine Bluff, Ark., and on the islands and the bluffs of the great river, the colored children and youth, and, to a considerable extent, the adults of these people, were brought under instruction. A small tuition fee, ranging from 25 cents to \$1.50 per month, was required of such families as were able to pay, while the destitute were taught freely. The teachers were almost exclusively from the North, and among them were many of the excellent men and women that came on an errand of mercy to a benighted people. As far as possible the poorer class of the white population of the country was included in these efforts, although thus far the work was difficult. In fact, at first the opening of the schools for the colored people was received by the illiterate and unmanageable class that for years had made the conquered States practically an enemy's country almost as a new declaration of war. It was evident both to the Southern and Northern people that a body of youth, initiated for a few years even in the elements of letters, could never again be enslaved, and as the vast majority of the Southern people, even to the very last, believed the Confederacy had "come to stay," it was noted that not only a portion of the old masters but especially the class who, never having owned a negro, were ready to fight and die to keep him in perpetual bondage, should have visited these schools on their opening with a malignant display of hatred, often amounting to violence. For several years the burning of colored schoolhouses, the persecution and occasional murder of their teachers, and a general hostility to the endeavors of the colored race to obtain schooling, was a part of the tumultuous history of the time. Superintendent Eaton was marked as the inaugurator of this hateful policy, and only by the protection of the good Providence that seems to guard the life of every man essential to a great advancement of the race was he kept alive. During the four years of the war the assistant superintendents stationed at the different points in the region in these four States were under the general direction of his superintendency.

Besides this difficulty on the ground, the work of the education of the negroes was greatly complicated by the rush of numerous church and private benevolent agencies to the field. The schools that were established by the various churches of the North did not willingly come under the direction of the superintendent of freedmen, while they often did expect liberal aid and comfort by the furnishing of army rations, the transportation and housing of their teachers, and the general forwarding of their enterprise. Of course this at once introduced confusion and the working at cross-purposes for a common end. It was found for a time almost impossible to maintain schools on the plantations that were removed from immediate military protection. This matter was brought to an issue through Order No. 26, September, 1864, by which Superintendent Eaton was authorized to appoint

superintendents of colored schools with power to act in all the details of their office. At several of the points on the Mississippi River the seven gentlemen delegated assumed direction. They only attempted to introduce the colored people, young and old, to the proprietors of plantations; to give industrial training, especially in good housekeeping and women's work for the girls and their elders; to establish orphan asylums; and generally to act as a benevolent committee of all work in relation to this people. An important part of their duty was the establishment of legal marriage among thousands of people who hitherto had lived under a system that was a proper university for the perpetuation of the social evil assumed to be a "race characteristic" of the negro. It is impossible to decide how many of the freedmen were included under the immediate protection of the Government during these four years' administration of Colonel Eaton as superintendent of freedmen in the Southwest. The reports of the different superintendents, as summarized in 1864, give more than 6,000 at school in nine different points on the Mississippi. Of course this includes but a small portion of the multitude that, even before the establishment of the Freedmen's Bureau in 1865, were brought under instruction by the great number of private educational and church agencies operating in this new and inviting field.

It is not the purpose of this essay to give the working of all the agencies for the education of the colored folk of the South during the war in detail. It is still to be hoped that both General Eaton and General Saxton will occupy the years that remain to them in preparing a reliable history of their great services and the outcome of all that was attempted in the way of planting the American in the place of the local and provincial type of society through the vast regions occupied by the armies of the Union and left to the perils of reconstruction by the advent of peace. A vast literature has grown up out of this important work, of which the proper arrangement and completion would be an interesting task for a competent historian, and from which could be gathered the explanation of much that is still hidden in obscurity or enveloped in the cloud of prejudice that still broods over the record of that mighty period. Enough to say, that this campaign of education for the most needy and neglected 6,000,000 of the American people, from 1861 during the succeeding years, closed by the incorporation in the revised constitution of every reconstructed Southern State of a provision for the establishment of the American common school, under the protection of the military power of the General Government which was an imperative necessity. It is doubtful if this purpose could have been achieved otherwise, and without the establishment and the vigorous support of the common school for all classes and both races, the union between the reconstructed States and the Republic would have been far more a matter of after-dinner oratory and a periodical interchange of "distinguished consideration" than that living and working together of all States and sections under the inspiration of common ideas and patriotic aspirations which is the only assurance of permanent republican nationality.

The great personal organizing faculty of Superintendent Eaton, with a wonderful exhibition of executive common sense and tact, was recognized by President Lincoln a few months before his death, in the following general order:

Colonel EATON:

You will continue your supervision of freedmen over the same territory and on the same principle as in the past, making such improvements as experience may suggest, until legislation shall require measures for further change.

A. LINCOLN.

FEBRUARY 10, 1865.

The subsequent work of Colonel Eaton, as associate commissioner with General Howard in the administration of the Freedmen's Bureau in 1865, his editorship of the Memphis Post, a journal established to promote national sentiment in the

Southwest in 1857, his two years service as State superintendent of public instruction in Tennessee during the brief period of reconstruction, and his call to the final and greatest work of his life, the practical development of the national Bureau of Education, lifting it from a bureau with three clerks and \$10,000 income to the organization it has since become, followed by his presidency of Marietta College, Ohio, which was left in 1890 for a position of retirement from public and professional occupation to the general work which often proves the most fruitful of the long years of a great man's life, form an interesting chapter of history. For more than twenty years, from 1863 to 1883, no man in the United States contributed more to the final establishment and increasing importance of the common-school system in the South than he. It would be difficult to name an important movement affecting that section of the country in which he was not deeply interested, and, oftener than was suspected, he was the most effectual personage in its direction and success. He was the trusted and confidential friend of the great soldier and the greater President, on whom the fate of the country more than on any special human agency depended during the momentous years of the civil war. In all legislation affecting the South he was afterwards in frequent consultation with the most influential public men. With no eminent literary talent and far too little ambition to preserve his own vast and versatile labors in historical form beyond the exigencies of an immediate official demand, his mind is to-day a most richly furnished library of representative facts, ideas, and personal memoirs which open avenues of light through a broad realm of national interest.
